appointed as the full-time Chairman and Chief Executive of the Bank. It may be of interest to you to know that our deposits increased by about 354% during this period of four years — from Rs 13.20 crores to Rs 58.86 crores while the number of branches went up to 184 from 89 showing an increase of 107%. The paid-up capital was increased to Rs 59.6 lakhs from Rs 13.8 lakhs and the reserves reached the mark of Rs 36 lakhs from a low level of Rs 7 lakhs during the same period. And the increase in advances was more than fourfold from Rs 8.82 crores to Rs 36.10 crores. The return on your

Industrial Finance Corporation of India

5 $\frac{3}{4}$ % Bonds 1985

PAYMENT OF INTEREST AND REPAYMENT OF PRINCIPAL GUARANTEED BY THE GOVERNMENT OF INDIA

AMOUNT OF ISSUE : Rs. 12,00,00,000.

ISSUE PRICE : Rs. 100.00 PERCENT.

REDEEMABLE AT PAR ON THE 30TH APRIL 1985

The Bonds are approved securities under the Indian Trusts Act, the Insurance Act and the Banking Regulation Act, and are also eligible for grant of advances to scheduled banks by the Reserve Bank of India. These are on the approved list of securities of the State Bank of India and are also eligible for investment of the accumulations of the Provident Funds, exempted as well as non-exempted.

Subscription will be received in cash/cheque at the Branches of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna from Monday, the 30th April 1973. The list will be closed without notice as soon as the total subscriptions amount to Rs 12.00 crores, and in any case, not later than the close of business on Friday, the 4th May 1973. The Corporation reserves the right to retain subscriptions received upto 10 per cent in excess of the sum of Rs 12.00 crores.

The Bonds will have a currency of 12 years, and will be repaid at par on the 30th April 1985. These will bear interest at the rate of 5 $\frac{3}{4}$ per cent per annum from the 30th April 1973. Interest will be payable half yearly on the 30th October and 30th April and will be subject to tax under the Income Tax Act 1961.

Copies of the Prospectus and application forms can be had from the Offices of the Reserve Bank of India as also from the Head Office of the Corporation at Bank of Baroda Building, 16-Parliament Street, P. B. No. 363, New Delhi-1, its branches/sub-offices at (i) Jivabhai Chambers, Ashram Road, P. B. No. 4049, Ahmedabad-9, (ii) 22-Mahatma Gandhi Road, P. B. No. 5091, Bangalore-1, (iii) 20-Forest Park, Bhubaneswar-9, (iv) Mehta Mahal (5th Floor), 15-Matthew Road, P. B. No. 3928, Bombay-4, (v) 4-Mango Lane (2nd Floor), P. B. No. 2483, Calcutta-1, (vi) G. N. Bardoloi Road, Chandmari, P. B. No. 30, Gauhati-1, (vii) 6-3-631 Zilla Parishad Road, Khairatabad, P. B. No. 11, Hyderabad-4, (viii) Aggarwal Building, Canal Crossing, The Mall, P. B. No. 319, Kanpur-4, (ix) Raji Building (3rd Floor), 147-Mount Road, P. B. No. 1080, Madras-6, (x) 43-Pataliputra Colony, Patna-13 and also from the Delhi Division at 5-Parliament Street (Jeevan Tara Building), New Delhi-1.

Arrangements will be made for listing of these Bonds at the Bombay, Calcutta and Madras Stock Exchanges.

Brokerage will be paid at the rate of six paise per Rs 100/- to recognised banks and brokers on allotments made in respect of applications for the Bonds tendered by them and bearing their stamps.

New Delhi,
Dated the 10th April 1973.
davp 806 (1)/73

C. D. Khanna
Chairman

investment in the shares of the Bank was doubled — from 6% it went up to 12%. The increase in bonus for the employees was almost threefold — from 4% it went up to 11%.

In the year 1972, our deposits went up to Rs 58.86 crores from Rs 43.64 crores as at the end of December 1971, recording an increase of 35%, slightly more than double the average increase of 17.4% in the banking system. Our advances stood at Rs 36.10 crores, recording an increase of about 40% over the previous year. The average credit-deposit ratio was 63.5%. I am very happy to report that our advances to priority sector formed 32% of our total advances.

Regarding the opening of branches, though we could not reach the mark of 200 branches as mentioned in my address last year, it proved to be a record year for us. We opened 43 branches in 1972 — more than 23% of the total number of branches, the increase over the previous year being 30.5%. I am happy to inform you that we have already obtained licences to open a number of branches in important places of our country both in the North and the South. As of today we have a total of 189 branches. Two more branches, one at Calcutta and the other at Panaji (Goa) will be opened shortly.

WORKING RESULTS

As you can gather from the facts and figures presented to you, every effort was made to increase our profits. The increase in our advances, in percentage terms, was higher than the increase in our deposits, although the rate of credit growth in the banking system dropped sharply from 13.5 per cent in 1971 to 6.9 per cent in 1972. Measures were also taken to reduce the cost of operation at various levels.

Turning now to our working results for the year 1972, I am pleased to report that our gross earnings reached the level of Rs 4.51 crores, showing an increase of more than 45%. However, mainly as a result of increase in the expenditure under salaries and allowances — partly due to the upgradation of the Bank into 'A' class and partly due to the fresh recruitment of more than 1,000 persons during 1971 and 1972 and also partly due to the expenses associated with the opening of a number of new branches in 1972, our increase in net profits could not be very high.

However, I am happy to say that our working ratio of salaries and allowances to the gross earnings declined to 0.30

from 0.32 in 1971. Our staff deposit ratio also declined to 42.5 per one crore of deposit from 43.5 at the end of 1971.

FOREIGN EXCHANGE

As regards the foreign exchange business, though we started it just about a year and a half ago, there was a significant improvement in the performance of the business during 1972. Eight of our branches, viz, K G Road-Bangalore, Fort-Bombay, Cochin, Hyderabad, Madras, Light House Hill Road-Mangalore, New Delhi and Guntur have already been authorised to deal in foreign exchange business. The proposed branches at Calcutta, Lucknow, Jaipur, Goa, etc, will be included in due course.

We have concluded agency arrangements with over 60 important international banks at almost all the important centres of the world.

HUMAN RESOURCES

As you are aware, we are passing through an era of rapid change. The new banking policy has added new responsibilities to the bankers. The progress and growth of a service agency like a bank inextricably depends on the performance of its personnel. About 52 per cent of our total number of branches were opened during the last four years. This rapid expansion of branches has created a problem of inadequately trained personnel at various levels. Therefore, we have to pay more attention to the planning and development of human resources of our

bank. I am glad to mention that the task of training our staff has been taken up in right earnest. During the year 1972 about 200 bank personnel at different levels, attended a wide variety of courses and seminars at different places.

I would like to assure you that every effort will be made to improve further the scope and quality of our services, not only through the opening of new branches and by offering new types of services but also by putting well-trained staff at the branches as well as at the Administrative Office.

OUR THANKS

I am immensely happy that my esteemed colleagues on the Board continued their unstinted co-operation and support throughout the year. I very sincerely thank all of them. My thanks are also due to the members of the Local Advisory Committees for their co-operation.

I must also thank the Special Officer, other Executives, Officers and the staff of the Bank for their continued loyalty and dedicated service.

I am extremely happy that we had another year of excellent industrial relations.

I am also very happy that our family of shareholders has grown further. I acknowledge with gratitude their confidence in me and my colleagues on the Board.

Thank you.

Note: This does not purport to be a record of the proceedings of the 41st Annual General Meeting of the Bank.

Triveni Sheet Glass

TRIVENI SHEET GLASS WORKS, Allahabad, promoted by D N Agrawal proposes to enter the capital market shortly with a public issue of 6.30 lakhs equity shares of Rs 10 each at par which are all underwritten by financial institutions. The proceeds of the issue will be utilised, for financing partly the company's Rs 2.47 crore project being set up at Iradatganj, Uttar Pradesh, for manufacture of 5 million sq metres per annum of sheet glass calculated on 2mm thickness by PPG process. This process is the only vertical process in which no foreign object or equipment comes in contact with the glass at the point of formation, for which the finished sheet glass has a lustrous-fire polished surface on both sides free from waves and distortions. The principal raw

materials for manufacture of sheet glass are silica sand, limestone, dolomite, feldspar, soda ash and sodium sulphate which are all available indigenously and most of them are in abundance within 250 km from the factory site. About 60 per cent of the company's total production, it is estimated, will be utilised by Hindustan Safety Glass Works and other companies and firms now controlled by D N Agrawal. The total capital outlay of Rs 2.47 crores will be met by share capital already subscribed (Rs 37 lakhs), proposed issue (Rs 63 lakhs), foreign currency loan from ICICI (Rs 36.70 lakhs), rupee loan from IFC (Rs 40 lakhs), from IDBI (Rs 40.30 lakhs), from LIC (Rs 25 lakhs) and from UP Financial Corporation (Rs 5 lakhs).

No Landmark, This

IN well-bred parliamentary democracies the judiciary, like Caesar's wife, is expected to be above suspicion — indeed above everything except discussion of the most polite sort. But accidents happen even in societies of impeccable pedigrees. One seems to have just happened in our own. In the aftermath of the government's decision to supersede three judges of the Supreme Court in appointing the new Chief Justice, some of the things which have been said by those on either side of the argument will hardly enhance the dignity and majesty of the judiciary.

One of the three judges who have resigned from the Supreme Court in protest against their supersession has accused the Prime Minister of having worked for his removal from the Court. The Prime Minister, he told a press conference on Tuesday, had been "greatly piqued" by his judgment in her election appeal and, ever since, her "agents" had been busy trying to build up a case against him. His speeches in Parliament were scrutinised, possibly his telephone was bugged, and a watch was kept on his movements. Turning to the effect of the government's actions on the "independence of the judiciary", the learned judge disclosed that "we have already several judges who take pride in notifying to the government their qualifications for being considered as 'committed judges'". The number of such judges was bound to increase in the years to come, he added.

If this be an insider's view of the judiciary and of the level at which relations are conducted between the executive and the judiciary, then the picture that emerges must shock those who have taken their Jennings and Bryce to heart. They may, nevertheless, take some satisfaction from the manner in which the legal profession throughout the country has responded to the government's action. With but few exceptions, members of the bar — from former attorney-generals and over-worked doyens of the profession to briefless practitioners in mofussil courts — appear to be agreed that grievous damage has been done to the status of the judiciary and, through that, to the very basis of the political system, by the manner of appointment of the new Chief Justice of the Supreme Court. However, even the protest of the profession has been rather less than full-blooded. For, apart from the three affected judges, not a single judge of the Supreme Court or any of the High Courts, not to mention any one from the lower rungs of the judiciary, has felt moved to press the point by resigning his job. Resignations by those directly affected — they do it all the time in the army — are not very effective in establishing high moral principles.

When it is all over, one may be sure, everyone on both sides will agree that it was a great fight for a noble cause. As the Minister for Steel, Mohan Kumaramangalam, told the Lok Sabha on Wednesday, the appointment of the new Chief Justice "will be a landmark in our judicial history in that it has opened up a debate on the rightness or otherwise of the convention [of appointment by seniority] and uncovered the reasons which must move the government in making appointments of this kind".

A wholly appropriate backdrop to this "landmark in our judicial history" and to the great "debate" raging over it is to be found in the judgment of the Madras High Court delivered last month in what has come to be labelled, with characteristic official ambiguity, the Keezhavenmani Arson Case. It would be no great surprise if most of the protagonists in the current great "debate" have only faint recollections, if even that, of the brutal mass murder which formed the subject of the judgment. For, it happened a long while ago, in December 1968, and even at that time it had not attracted much attention. True, 42 women, children and men had been burnt to death and almost an entire village in the Tanjore district of Tamil Nadu had been turned to ashes. But the victims were untouchable landless labourers and it was a dirty, filthy Harijan village. And those who had done the burning and the killing had been upper caste landlords. While the proportions may have been somewhat out of the ordinary, as a variety of crime it belonged to a very common genre indeed. What is more, as the judges of the Madras High Court appear to have taken pains to emphasise, the Harijan agricultural labourers had formed an agricultural workers' association under the aegis of the CPI(M) and had been putting forward demands for higher wages. Surely, those who are afflicted with such madness have been already marked out to be destroyed by the gods?

Nevertheless the state government had to go through the motions of bringing the culprits to book. So 23 landlords were charged before the Sessions Judge, East Thanjavur, who in November 1970 acquitted 15 of them and sentenced the other eight to prison sentences ranging from one year to 10 years — for burning to death 42 women, children and men. And now the High Court has set at liberty the eight convicted by the lower court. So, in sum, not a single person is being punished for 42 murders. One may well conclude that, since no human being has been found culpable, the Harijans of Keezhavenmani were indeed destroyed by the gods.

The judges of the Madras High Court have opined that the "intrinsic infirmities" of the evidence presented by the prosecution made it impossible for them to identify and punish the guilty. But this absolves nobody. This had been no sneaking crime, but mass murder committed openly. It was for the Tamil Nadu government to collect the evidence. This it failed to do, according to the judges. Of course, it would be calumny to suggest that this failure might have had a great deal to do with the fact that the victims of the crime had been Harijan landless labourers and their murderers upper caste landlords. After all, one must not raise questions about the class and social prejudices of the bureaucracy — except when it fails to do a particular minister's private bidding or to serve some political purpose of the ruling party. In cases such as Keezhavenmani, involving Harijans and upper caste men, landless labourers and landlords, the objectivity of the bureaucracy is to be taken for granted.

The judges of the Madras High Court have also expressed the opinion that those who set fire to the huts had no knowledge that 42 persons were inside one of the huts. It could be taken, therefore, that they had no intention of killing these people. It is possible that this conclusion indeed emerges from the evidence laid by the Tamil Nadu government before the Court, but it goes completely contrary to numerous contemporary accounts of the crime. One such account had said:

"It happened at night. The landowners came and burned twenty-eight of the houses to the ground. They locked up forty-eight casteless, mostly women and children, in one hut. They frightened them and drove them into the hut where they locked them in. Then they set fire to the building — a small hut.

"We got there in the morning and saw all the burned bodies. We came at three o'clock in the morning. All the bodies were there burnt to ashes... There lay all the bodies, forty-four bodies..."

"Fourteen were women. They were from twelve to twenty-four years old. There were only three men, all the others were children... One woman named Papamma had her one-year old child clutched in her arms; she was holding her child when she met her death. Mother and child. We couldn't separate the two bodies, they were clutching each other so tightly.

"When we investigated the case we discovered that the owners — three hundred of them — had marched to the village from the surrounding area. They were armed with guns, bird rifles and similar weapons..."

"No one lives in the village any more. The buildings are burnt out. It looks like a haunted place..."

The judges are astonished by the fact that all the 23 accused in the case should be landlords. To quote from a newspaper report of the judgment:

"Most of them were rich men owning vast extents of land and Gopala-krishna Naidu possessed a car. However much the mirasdars might have been anxious to wreak vengeance upon the CPM kisans, it was difficult to believe that they themselves walked bodily to the scene and set fire to the houses, unaided by any of their servants. Rich men, who had vast vested interests, were more likely to play for their safety than the desperate and hungry labourers. One would expect the mirasdars to have kept themselves in the background and sent their hired henchmen to commit the offence, which according to the prosecution, the mirasdars had personally committed."

Mirasdars could not have set fire to the huts. Why? Because they were "rich men owning vast extents of land." No further proof is apparently considered necessary.

In his impassioned defence of the appointment of the new Chief Justice of the Supreme Court, Kumaramangalam defended the government's right to look into the "philosophy and outlook of a judge in deciding whether he should or should not lead the Supreme Court". But as with the police and the civil service, the "philosophy and outlook" of judges become relevant only when some action of theirs discomfits the government as did, for instance, the Supreme Court's decisions in the bank nationalisation and privy purses cases. But it is definitely not polite or proper to look into judges' "philosophy and outlook" in situations like the Keezhavenmani murders.

Concluding their judgment the judges of the Madras High Court expressed the hope that "the dependents of those who had lost their lives in the holocaust [what a neutral word!] would be generously compensated by the government". That, after all, is the nub of the matter. The Harijans of Keezhavenmani had been killed because they had asked for higher wages. So give their dependents some money. And be a little generous if you can. That is all there is to it. This, clearly, is no "landmark in our judicial history". There are no noble causes involved, nor any great issues. There need be no debate in parliament; nobody need resign; and the work of not a single court need be disturbed for even a minute.

Exports

Illusion and Reality

THE latest figures released by the DGCIS indicate that exports in the 11 months of 1972-73 amounted to Rs 1,703 crores, reflecting a phenomenal annual growth rate of about 21 per cent. Though exports in March 1973 may not be in keeping with the trend noted in the first 11 months of the year, the overall growth of exports in 1972-73 would be around 20 per cent. A rate of growth of this order has never been achieved in the past, except perhaps in 1951-52 when there was an export boom, primarily on account of the Korean War. In the recent past, exports rose by about 13 per cent in 1968-69, largely due to the fact that exports in the previous year had not yet recovered from the unfavourable effects of the adverse weather conditions in the preceding two years. Viewed in this context and given the ever-growing credibility gap in respect of the DGCIS' trade figures, it is necessary to have a close look at the 21 per cent increase in exports claimed upto February 1973.

Assessment of the export performance last year would be difficult in the absence of full details about commodity-wise and country-wise export data. All the same, there is evidence to show that the export performance of a number of commodities was quite impressive in 1972-73. Exports of marine products, for instance, increased during the first 11 months of the last year by 9.5 per cent in volume (to 35,218 tonnes) and by about 37 per cent in value (to Rs 53.8 crores). Export of cashew kernels during 1972-73 as a whole, touched a new high of

Rs 68.5 crores, reflecting a nearly 12 per cent increase over the year. Exports of leather and leather manufactures in 1972-73 are estimated at Rs 81.7 crores as against Rs 39.2 crores in the preceding year. Similarly, exports of a number of other commodities like tobacco, oilcakes and cotton textiles increased appreciably last year.

Nevertheless, account has to be taken of certain unusual factors that helped to boost exports last year. The prolonged currency crisis leading to a realignment of the major currencies and the subsequent floating of the sterling, to which the rupee has been linked, have all resulted in an effective devaluation of the rupee against a large number of important currencies. Taking into account the directional pattern of India's exports, the effective weighted depreciation in the parity of the rupee may work out to about 6-7 per cent. Technically, the Indian rupee does not stand devalued *vis-a-vis* the East European countries, as the invoices are all expressed in rupees, but our exporters would naturally quote higher rupee prices to East European buyers as they do in respect of exports directed to other regions. There is evidence enough to show that unit values of exports in terms of rupees have increased, but foreign exchange earnings from exports would be lower to the extent of the depreciation of the rupee. Similarly, even if our earnings from exports to Eastern Europe have increased, the purchasing power of these earnings would be less since in respect of their exports to India the East European suppliers invariably make upward adjustments in invoice values quoted in rupees. Thus, it is necessary to deflate the figure of export earnings in 1972-73 appropriately so as to arrive at a figure of "effective foreign exchange earnings" through exports. Even on a conservative basis, last year's export earnings would have to be adjusted downward by about 5 per cent, or by about Rs 80 crores in respect of the export figure of Rs 1,703 crores for the 11 months.

The DGCIS has recorded exports to Bangladesh at Rs 36 crores upto September 1972. This figure, it is stated, excludes "substantial exports to Bangladesh" as these were not recorded by the customs authorities. By now it is well known that the DGCIS was asked by the Ministry of Foreign Trade to include all aid-financed exports to Bangladesh. This is certainly the correct procedure as far as recording of ex-

port statistics is concerned. But since these exports cannot be regarded as normal, it is necessary to have an idea of their magnitude so as to get a correct picture of the actual export performance last year. According to the Reserve Bank's Report on Currency and Finance for 1971-72, out of total aid authorisations to Bangladesh of Rs 164 crores upto end-March 1972, loans were Rs 33.6 crores and grants Rs 130.6 crores. By end of March 1972 Bangladesh had utilised Rs 35 crores worth of assistance. The Central Government Budget for 1973-74 indicates a higher loans figure of Rs 80 crores for 1972-73, suggesting that additional loans were sanctioned to Bangladesh subsequently. From the available information it appears that by now Bangladesh has drawn upon these loans and grants substantially and that exports to Bangladesh on account of these during 1972-73 are likely to be over Rs 150 crores. Of the total assistance given to Bangladesh, Rs 130 crores being in the form of outright grants, at least an equivalent amount of exports should be excluded in order to arrive at a meaningful figure of our exports last year.

Finally, it is also necessary to take into account the built-in upward bias in exports figures on account of short and shut-out shipments which are reported to the DGCIS with a considerable time-lag. It is estimated that the upward bias in the export data compiled on the basis of provisional shipping bills is over 3 per cent. It may be recalled that the DGCIS had to deflate its export figures by about Rs 40 crores for April-December 1971, suggesting thereby that the upward bias on account of short and shut-out shipments was about 4 per cent. Assuming that subsequently the DGCIS machinery got better adjusted to the new system of data compilation and reduced errors emanating from wrong adjustments on account of short and shut-out shipments, the likely upward bias in the exports figure for 1972-73 would be at least around 2 per cent. This would call for deflating the exports of the first eleven months of 1972-73 by at least Rs 25-30 crores.

If all the three factors, *viz.*, effective depreciation of the rupee, aid-financed exports to Bangladesh and the upward bias in export statistics on account of short and shut-out shipments, are taken into account, the figure of exports for the first eleven months of 1972-73 would have to be adjusted downwards

by about Rs 220-240 crores. This gives us a real increase in exports of Rs 60-65 crores, reflecting an increase of about 3 per cent over the corresponding period of 1971-72. It would be altogether more prudent to base our export planning for the future on this more modest figure.

Food Situation

Trade to the Rescue

AFTER Nagpur, Nasik, Malegaon and Sinnar, this week it was Tumsar in Bhandara district. Four more, including two policemen, have been added to the five killed in Sinnar. Though the bandh in Tumsar had been organised by the Mahavidarbha Rajya Sangharsha Samiti, the mob which attacked the houses of the local District Congress Committee president and another party notable was demanding food mainly. Against this background it may appear perverse to suggest that the wonder is that food riots have not been more widespread in Maharashtra than they have been. Certainly, if one takes seriously the state government's own figures of food supply and demand, of the state's requirements of food from the Central stocks and what it has actually got in the last few months, no other conclusion is possible.

Maharashtra is, of course, a food-grains deficit state and the state government has estimated its requirement out of Central stocks at 3.5 lakh tonnes per month. What it has been getting is far less. The quota for April, for instance, was 80,000 tonnes of wheat, 70,000 tonnes of coarse grains and 18,000 tonnes of rice — or 1.68 lakh tonnes in all. Within the state, since as far back as 1966 the two main crops, jowar and rice, have been subject to monopoly procurement which has been recently extended to wheat as well. Thus private trade on any significant scale in foodgrains produced within the state is ruled out. In other words, the bulk of foodgrain supplies in the state have to come from the government — either out of supplies from the Centre or out of procurement within the state. We have already indicated how inadequate supplies from the Centre have been recently. And procurement has been paltry this year, for which the state government has blamed the drought. Thus, the government was able to procure only 92,000 tonnes of paddy and 32,000 tonnes of jowar and, till the middle of April, 6,000 tonnes of wheat.

It is against this picture of avail-

ability of foodgrains for public distribution that the actual food situation in the state appears less dismal than it might have been. Not that it is not bad enough. The per capita foodgrain quota distributed through the fair price shops has been progressively reduced and the supply of foodgrains to these fair price shops has not been enough even to meet the reduced quotas. Outside of the fair price shops, prices have risen sky-high, with jowar selling at two to two-and-a-half times the official issue price of wheat. Yet even in the worst drought-affected districts of Sholapur, Osmanabad, Bhair, Aurangabad, Ahmednagar, Poona, Sangli and Satara, the food situation is less desperate than the state of availability of foodgrains with the government would suggest.

The answer to this lies in that, first, while on paper the only foodgrains coming into the state from outside are on Central government to state government account in fact there has been large-scale movement of foodgrains into the state on private account; and, second, while all the major foodgrains are supposed to be subject to monopoly procurement, private trade flourishes almost without let or hindrance in foodgrains produced within the state. And what is significant is that faced with a worsening food situation, the state government has moved in the direction of actually widening the scope for private trade. At the district level, the authorities have for long turned a blind eye to the operations of private trade on the argument that some foodgrains (in the 'open market') are better than none at all (in the fair price shops). Now the state government itself has moved to indirectly bless private trade. On April 26 the government announced its decision to remove all restrictions on the movement and sale of jowar, rice and wheat all over the state except in Bombay city, virtually dismantling its monopoly procurement scheme for the three crops. Under the new policy, farmers, co-operative societies, undefined 'associations', recognised dealers and "other suitable institutions" are permitted to move and sell jowar and wheat in market yards or weekly bazaars within "limits" to be fixed by the district collectors. The officials will also not now insist on production of levy certificates. The state government has also withdrawn, till the end of September, the administrative charges levied on foodgrains imported from other states. Finally, it has decided to grant licences for importing grains from other states "according to the rules in force".

The invitation to private traders could not have been more open — to move foodgrains freely within the state and to move in foodgrains from outside the state to the extent they can. What will remain, at the end of all this, of the take-over of wholesale trade in foodgrains is a subject which seems to concern the state government the least.

The concepts underlying the take-over of foodgrains trade have received some other severe knocks as well. Last Monday the political affairs committee of the Union Cabinet decided to increase the foodgrains allotment to Maharashtra to 2.5 lakh tonnes per month. Additionally, Maharashtra is to be permitted to import wheat from Punjab and Haryana "in consultation with the respective state governments". Actually, the Chief Ministers of Punjab and Haryana are reported to have themselves offered to supply wheat to Maharashtra and asked the Maharashtra government to send teams of officials for negotiating the deals. Even Kamla-Pathi Tripathi, the UP Chief Minister, is said to have told V P Naik that he would supply bajra and other coarse grains to Maharashtra on government account. Has anyone considered what the implications of such deals among state governments are for the success of procurement by central government agencies and for the Centre's ability to allocate the surplus foodgrains of the surplus states among the deficit states?

Watergate

Postscript to My Lai

THE beatification of Richard Nixon, that was progressing in recent years, has suddenly received a jolt. The scourge of Watergate is threatening to assume a dimension as demonic as that of the scandal of the Teapot Dome which irretrievably ruined another Republican President in the 1920s. Richard Nixon the lofty one, whose brilliant exploits in foreign affairs made him an easy romper home in the re-election battle last year, is back at square one, once more the Tricky Dick of the Herblock cartoons. The revelations about the shenanigans indulged in by the Republican party's hired espionage agents could form the ingredients of a 'b' grade Hollywood thriller. There is the more than usual quota of crooks, plied with secret money from mysterious and not-so-mysterious sources and not averse to taking recourse to the shadiest of means, including the deployment of professional goons, to do harm to the Democratic party. Who could have

thought even a few weeks ago that these sources were near enough to the White House itself? Bit by bit, as the curtain of hush-hush is lifted, it is becoming obvious that Nixon's close associates, including his very intimate personal staff, had a direct hand in organising the cloak-and-dagger operations; even the leading lights of the FBI had apparently chipped in to suppress evidence which could have incriminated the President's entourage in the Watergate episode. Nixon's earlier confidence that he could brazen his way through the affair by feigning shocked innocence has been greatly shaken by the tenacity with which both the Press and the Congressional Investigation Committee have continued to dig into the anatomy of the murky happenings.

It must be an immense tragedy for a nation who have to take it as the datum-line that their first citizen is far from being as clean as a hound's tooth. Those liberals who always had entertained reservations about Richard Nixon would now consider themselves vindicated. But is not Watergate nonetheless in the image of the United States as it has turned out to be in this, the eighth decade of the century? Moral principles are indivisible. In case the furtherance of the self is *uber alles*, and no crime—including the indiscriminate slaughter of defenceless men, women and children in distant lands—is to be flinched from for its sake, why demur if the President of the nation indulges in the most unscrupulous methods to advance his personal cause? Over a period of time, old-fashioned notions about good or bad have gradually been excluded from the corpus of American morality. It is the criterion of competence—the degree of efficiency to reach a set goal, however obnoxious it might be—that decides the preference function. In the matter of Vietnam too, the so-called radical upsurge in the US in the late 1960s was sustained—who can now doubt—as much by decent emotions as by selfish motivations; the spectre of American boys—their own boys—getting killed in large numbers was the greatest civiliser. Once the boys were back home, the majority of Americans perhaps could not care less about the actual denouement of the war, or how it was proposed to be ended. Few in the United States, for example, would even today be persuaded to admit that the Swedish Prime Minister was not far off in asserting that what the American war machine has done to Vietnam is comparable to Hitler's

pogroms against the Jews. Those who are veterans in organising My Lai and similar other episodes would hardly ever feel bashful at such a simple proposition as that of installing hidden microphones in the private offices of one's opponents.

Company Affairs

Unserious Intervention

A Correspondent writes:

THE question of the objectives and purposes of intervention by public financial institutions in the affairs of companies had become a subject of keen discussion some two years ago in the context of developments relating to the National Rayon Corporation and Synthetics and Chemicals. However, shareholders of these companies are still in the dark as to what has happened to the promises of radical reorganisation of these companies on the basis of the reports of the experts who were appointed to enquire into their management and working. Perhaps the annual general meetings, to be held shortly, will shed light on this question.

In the meanwhile, the Kapadias appear to have stepped up their efforts to capture the management of NRC. They are now thwarted only by a narrow majority of 6 to 5 on the Board of Directors. They have succeeded in getting the Articles of Association altered to provide for the appointment of a Managing Director, though they have so far failed to get one of their nominees appointed Managing Director. The day-to-day management of the company is being carried on by committees on which the Kapadias have a majority. However, they are unable to have their way because of not having a majority on the Board of Directors. Efforts are, therefore, afoot to get the Board of Directors enlarged. Moreover, the terms of the two directors appointed by the government under Section 408 of the Companies Act are due to expire on June 30 and the Kapadias are reported to be hopeful that the government will not renew their appointment. This expectation may be partly based on the transfer of the former Minister for Company Affairs, Raghunath Reddy, to the Labour Ministry in the last reshuffle of the Council of Ministers.

There are two other pertinent facts which need to be taken note of here. First, Sudhir Kapadia, son of Nimji-bhai Kapadia, a Director of NRC, has

become a Director of Maruti Ltd. Second, the Company Affairs Minister disclosed in the Rajya Sabha on Monday last that on January 3, 1972, a public limited company, Filtrona, had invested in 24,000 equity shares of Maruti of Rs 10 each. This investment was more than 10 per cent of Maruti's total subscribed capital of 200,070 shares, thereby contravening Section 372 of the Companies Act. But, as the Minister put it, this contravention had "ended" on March 1, 1972, when Maruti issued 46,000 additional shares — 6,070 more than required to bring down Filtrona's share to 10 per cent. The more significant fact, however, is that Filtrona is a company of the Kapadia group. Since the government's decision regarding the two nominated directors would be crucial, these developments, it is felt, strengthen Kapadias' hands in their bid to wrest complete control of NRC.

As for Synthetics and Chemicals, in spite of the promise given to the shareholders at the last annual general meeting by the Chairman, Tulsidas Kilachand, that the Board would take necessary action on the report of the Parekh Committee and inform the shareholders at the earliest, nothing seems to have been done for a whole year. The report of the Committee is said to have been accepted by the Board of Directors *in toto*, but the necessary follow-up action has not yet been taken. The LIC Director on the Board of Synthetics has gone abroad on an assignment and no one has yet been appointed by the LIC in his place.

The main recommendation of the Parekh Committee is reported to be the appointment of a full-time chief executive. It has been reported that three persons who were approached by the company had declined the appointment. Nevertheless, it is difficult to believe that it would be difficult to find a chief executive for Synthetics and Chemicals. The truth seems to be that, the Parekh Committee report notwithstanding, the present management does not want to relinquish its hold over the company.

Thus in the case of these two companies, intervention by the financial institutions has not been very effective from the point of view of the common shareholder. The reports of experts continue to be considered confidential and have not been released to shareholders on whose behalf the experts had been appointed to make their reports. It is clear that

if financial institutions like the LIC, ICICI, Unit Trust and the banks are to play an effective role in safeguarding the interests of the common shareholders, instead of dealing with the managements behind closed doors, they should deal with them openly at the annual general meetings, taking their stand publicly along with the other shareholders. Ordinary shareholders have no way of finding out what goes on in most companies. There are few independent directors on their boards; most directors come from what has been aptly called, the 'charmed circle'. Last year, the LIC took a commendable step by asking the chairman of Kohinoor Mills — incidentally, another Kapadia group company — to read its letter at the annual general meeting. Fortunately, the chairman complied with the request. (Most company chairmen ignore letters written by shareholders and do not even care to acknowledge them.) The LIC's letter criticised the management of the company and demanded the replacement of the existing management by a new one. Even here it would have been more effective if the representative of the LIC had been present at the meeting and had spoken, pointing out all the facts of mismanagement. Of course, there may be occasions when a word in private with the management might serve the purpose better than public exposure. But so far, behind the scenes action by institutional shareholders has not been very effective. NRC and Synthetics and Chemicals are cases in point.

Financial journals also can play a vital role in the fight against mismanagement of companies. Unfortunately, however, the quality of reporting of annual general meetings in our country is poor. Newspapers are content with publishing extracts from the statements of company chairmen or their remarks at the annual general meetings and rarely attempt to assess the validity of, or even refer to, points raised or criticism made by shareholders. Again, one finds hardly any critical analysis of Balance Sheets and Profit and Loss Accounts of companies in the newspapers. Such analysis would be of immense help to ordinary shareholders, most of whom do not understand company accounts. Financial journalism of the kind to be found in countries like USA and UK, which plays a significant role in safeguarding the interests of the small shareholders, has yet to develop in our country.

Calcutta Diary

A M

THE number of applicants registered with the different employment exchanges in West Bengal was 811,665 in 1972 as against 555,835 in the previous year. This, the arithmetic says, implies an over-the-year increase of 46 per cent. The rise over the year in the number of applicants who can be described as educated unemployed is even more frightening, something of the order of 75 per cent. It is anybody's guess whether there is any close correspondence between the incidence of registrations with the employment exchanges and the actual incidence of unemployment. Not all who are unemployed register, and not all who register are necessarily unemployed; they may simply be looking for a superior, alternative opportunity. A spurt of faith in the efficacy of placing one's name in the live register to secure a job can also lead to a sudden increase in registrations in a particular year. But these caveats all belong to the genre of pettifogging foot-notes. One has merely to look around, and check the data on fresh industrial investments, maintenance outlays, supply of raw materials, the power situation, and the rush of new entrants in the labour market. The rate of economic and industrial growth being what it is, a near-fifty per cent increase in the number of the unemployed in the course of 1972 does not appear to be an improbable estimate. That to some it may be an unpalatable one is neither here nor there.

The fact of rising unemployment has been compounded by the fact of rising prices. The general index of retail prices must have increased by more than 15 per cent over the year. If you concentrate on the major items in the 'consumption basket' of the working class and the lower middle class, the rise in retail prices has been anywhere between 20 to 40 per cent, and let no minister ensconced in the ten square miles of New Delhi dare to contradict this statement. The unemployed tend to park themselves with their friends and relations belonging to these lower income groups, and latter have certainly not been compensated, in terms of money wages, by anywhere near the extent of the price rise. Distress, and discontent, are thus spreading with every day.

But a period of discontent is also a period of opportunism. The principal factors underlying the mounting hardship of the people are the inability — or reluctance, whichever way you want

to put it — on the part of the government to discipline prices, and economic stagnation, for which too a fair share of the responsibility devolves on the authorities, ours being claimed to be a planned economy. These are inconvenient categories of truth. Recourse is therefore taken to diversionary games. One such game is currently on in West Bengal. Suddenly, almost all the local newspapers have started a collective braying; they demand a compulsory employment quota for the so-called 'sons of the soil' in the factories and establishments located in the state. The newspapers are not alone; they have been joined by the student and youth wings of the ruling party. It is an unabashed exhibition of parochialism at its basest. Statistics are being bandied about to prove that, in both industry and trade, the 'sons of the soil' constitute a minority among the employees. Only 44 per cent of all industrial employees in the state are reported to be Bengalis: in cotton textiles the corresponding proportion is 47 per cent in jute, as little as 25 per cent, in iron and steel, 40 per cent; in glass works, 40 per cent; in paper, 37 per cent. In non-factory and commercial establishments, the 'sons of the soil' constitute only 42 per cent of the total number of employees, that too made up mostly of clerks and typists. In the administrative categories, it is pointed out, Bengalis hold only 5.7 per cent of the total posts; in the technical and sales categories, their proportions are 10.6 per cent and 4.8 per cent, respectively, of the total. Of cars and lorry drivers engaged by commercial establishments, nearly 99 per cent are migrants from other states.

Each of these tit-bits of statistics may be correct, but the interpretation is placed upon them is what matters. For historical reasons, Bengal has traditionally drawn on the supply of migrant labour from other States, especially from the States in the eastern region. This has been as much on account of an initial reluctance on the part of large groups of Bengalis to enter some occupations and trades as on account of the abysmally depressed economic conditions in, for example, the countryside of Orissa, Bihar and eastern Uttar Pradesh. In the upper echelons of commercial jobs, Bengalis may have perhaps found entry somewhat difficult because of their generic notoriety as 'political hotheads'. But the major reason for the aggravation of the pro-

blem of unemployment in the state is certainly the prolonged state of industrial recession around these parts. The coal-steel-transport equipment-heavy engineering complex of industries continues to be in doldrums, there has been hardly any expansion in recent years in public or private investments, and the government's pricing policies for intermediate articles have affected severely the momentum of industrial and commercial growth in the eastern states, particularly West Bengal.

Where industry and commerce are stagnating, employment opportunities cannot grow fast either, and picking on migrant labour cannot alter the objective reality. The nefarious game is nonetheless on. If you are unable to provide job, then, the near best thing, you try to channelise the wrath of the unemployed on those who are with jobs. Apparently a kind of division of labour has been decided upon: the baser elements in the ruling party take the low road and the leaders at the top pretend to stick to the high road. While the prominent ones talk of national purpose and the need to streamline industrial policy and the imperativeness of raising the rate of savings, investment and all that, the lumpen elements go about shouting slogans which insist on the speedy replacement of 'outsiders' by 'sons of the soil'. That similar demands have from time to time been voiced in the neighbouring states is considered to be a good enough ground for raising the sectarian spectre here. Even if it were possible to supplant some migrants by 'sons of the soil' at the margin, it would only scratch the surface of the problem; without a thorough overhaul of the industrial capital stock in the state, calling in turn for a several-fold increase in aggregate investment, the burden of unemployment will remain what it is. But these considerations are not mentioned; the appeal is invariably to the crudest emotion. It is as if once you concentrate on the poor rickshaw-puller from Balasore, or the textile spinner from Muzaffarpur or, the lathe operator from Azamgarh, and try to snatch the bread away from his mouth, that by itself would lead to the redemption of Bengali youth.

Not one word of admonition has flown from the direction of New Delhi for those who are indulging in this dangerous game. When the flesh of the flesh misbehave, you turn the other way. And certain groups of industrialists — including even those who are from outside this state —, are not, one suspects averse to such a parochial movement gaining in strength. There is no lack of rationale in their calculus: they can, after a point, ask the government to

relax the provisions of the Industrial Development and Regulations Act and the Monopoly and Restrictive Trade Practices Act, for only then, it would be argued, they could create more jobs for the 'sons of the soil'. This would be putting economic theory truly on its head, for monopolies restrict output and employment. But opportunism is as opportunism does.

How shall one describe this cynicism which deliberately, and systematically, slaughters truth for the sake of narrow, short-term party interests? The problem of generating more income and employment for the youth of West Bengal cannot be dissociated from that of the millions who live in horrendously wretched conditions in Orissa, Bihar, Uttar Pradesh and other states. The strategy has to be a common strategy, and measures for employment creation in the region have to be integrated into one whole scheme. To provide relief to West Bengal and its youth, one must first create bases of intense economic activity right in Bihar, Uttar Pradesh and Orissa. It should be difficult to identify the districts and regions in these

states where distress is acute and where the largest flow of migration occurs. The solution to the problem of mass unemployment in West Bengal should be sought in concentrated programmes of economic development in these districts in the outlying states. If this fact is not recognised and a mindless agitation is mounted against the outsiders, the outcome is easy to foresee. The avaricious capitalist, coming from outside, who makes his pile in this state but remits it elsewhere, will go scot free. But, sooner or later, the righteous wrath of the 'sons of the soil' will come down upon the poor handcart puller from Orissa, the destitute jute worker from Bihar, the impoverished mason from Uttar Pradesh. Lynchings will become the order of the day, to be followed by counter-lynchings. A state of quasi-civil war will descend upon the areas with concentration of industrial workers and low-earning tradesmen. Meanwhile, though, the rate of capital formation will dip further and prices will keep merrily spurt-ing; prices, after all, are no respecter of the 'sons of the soil'.

CAPITAL VIEW

The 'Legal Situation'

Romesh Thapar

THE legal profession certainly shares many vital characteristics with the oldest profession in the world, but it has, surprisingly, managed to preserve for itself a position of exaggerated eminence. Something of this strange situation was highlighted by the over-reaction to the appointment of a new Chief Justice of the Supreme Court following the supersession of three of his senior colleagues. We are asked to shed tears over the rape of the judiciary and there are dire warnings about the arrival of "totalitarianism".

It is extraordinary that educated, articulate people like lawyers can so confuse themselves. It should be apparent to even the dullest free enterprising mind that the fantastically complex operation to consolidate democracy within an exploding population of 550 millions must inevitably have its impact on the judiciary which is called upon to interpret laws which are a radical departure from those we are accustomed to. The developing collision between Parliament and the Supreme Court was a reflection of the change taking place over the subcontinent.

Change is either carried out by a

controlled shaking up of existing structure or by revolutionary destruction of these structures. The shake-up at the Supreme Court was necessary. For twenty-five years, a *status quo* system prevailed. Even judges were appointed without much concern for the quality of selection. Obviously the Supreme Court could not remain aloof from the tidal currents building all around. Yet, this is precisely what so many legal luminaries, senile and not-so-senile, sought.

LEGAL RIGMAROLE

The total disarray within the Supreme Court was well illustrated by the eleven judgments delivered by the Full Bench on the recent constitutional amendments. A whole week has passed, but there is no clear idea in many quarters as to what finally was the judgment. Broadly, Parliament's right to amend has been established, but there is so much legal rigmarole in the judgments that the lawyers and solicitors can now look forward to a record harvest in fees from clients who will have no recourse but to test the judgments in various courts.

However, it is not these aspects of the "legal situation", if it may be so described, which attract attention. We are being given the impression that the superseded were outstanding legal minds. This is poppycock. Indeed, it is now that we must assert to get men of quality appointed as judges. Procedures for selection must come under review. Appointment should be for life, with salaries assured on retirement, to ensure real independence.

We are tired of senile old men giving us pompous lectures about the independence of the judiciary when we know that lobbying for jobs by judges is a feature, of the current scene. We are also cynical about the claim that only judges are fair-minded and should head committees of inquiry. Attitudes to courts and judges are undergoing profound changes. We can no longer jog along in the old grooves left behind by the Imperial British.

At this point, a word of advice to all the grasping lawyers who have at last found themselves a cause. They had better study the practices prevalent in other countries, even in the United Kingdom and the USA. Indira Gandhi, who has politically to manage this bundle of contradictions that is Bharat, has been more than patient. And she knows well enough that a Supreme Court determined to block the social transformations necessary to stabilise our society would merely spark a revolution. The gentlemen who are protesting do it for reasons other than the future of the rule of law.

Of course, this is not to suggest that there is no danger from the unscrupulous politician, and his kind seems to be on the increase. Even as judges become conscious of a new value system and the objectives arising from it — a vital consideration for a sprawling and developing continental federation — they have to be rigorously just in the interpretation of the new laws, for political gangsterism can also hide its true face behind all manner of deceptive slogans. For this reason, the selection of judges and their appointment for life is of paramount importance. The energy of the legal profession would have been better spent on these and related issues.

We await the appointment of the new judges to the Supreme Court. The exercise to locate the most outstanding professionals who understand the challenges before us is so limited that the scope for lobbying and fixing appointments is immense.

Commitment, alas, is often the badge of the charlatan. Indira Gandhi, using the powers vested in her, will be judged when the full picture of the reorganisation of the Supreme Court has been sketched. It should not be so difficult to find dispensers of justice who understand the change overtaking the subcontinent, and who are not manipulatable.

Meanwhile, the organised effort to smear those who "collaborate" — as also the pathetic campaign, to make the Sikris, the Shelats, the Hegdes and the Grovers into heroic figures — is very unhealthy. It will attract a counter-attack which might prove much more merciless, particularly with regard to certain rather inflated reputations in the legal profession. In

this context, the "legal advice" to the Prime Minister had better be above reproach. We certainly cannot take that for granted on the basis of past experience.

And, finally, one last comment. Do we really have to get so excited over the smart-sayings of Sam Bahadur who is now our one and only Field Marshal? Our MPs will have to be re-educated in England before they even begin to understand this one-man show we have let loose upon ourselves. Interestingly enough, everyone was busy not so long ago condemning V K Krishna Menon who ordered disciplinary action against Sammy Boy for "unpatriotic" statements while he was a serving officer!

COMPANIES

Prospering despite Minor Complaints

Hansavivek

CENTURY SPINNING has been given a 'letter of intent' for manufacture annually of 30,000 tonnes of chemical pulp, 20,000 tonnes of dissolving grade pulp, 10,000 tonnes of speciality pulp, and 30,000 tonnes of writing and printing paper, with the stipulation that a new company in the joint sector be formed to implement the project. Meanwhile, construction work of the company's cement project is going on. However, supply of equipment for the main cement manufacturing unit, by ACC Vickers Babcock, has been delayed. The plant is expected to go into production in early 1974. The joint venture project for a textile mill in Indonesia has made good progress. Initially, the project envisages a spinning unit of about 14,000 spindles. Century's participation is to be in the form of equity capital of about Rs 36 lakhs out of the total capital of the company of Rs 80 lakhs. The proposed body corporate is to be formed in Indonesia. The company's contribution to the capital will be in the shape of supply of plant, machinery and equipment from India.

Century's tyre record plant continues to work satisfactorily, but tyre record consumption has been adversely affected by labour trouble at the plants of some of the tyre manufacturers and also on account of power shortage. The Tariff

Commission has completed its enquiry into the cost details of tyre yarn. The company has represented to government that its production is lower and that it has been incurring losses in exports. STC, through which exports of tyre yarn are canalised, has not yet finalised the cash incentive scheme to compensate for export losses. Last year, the company exported 863 tonnes of tyre yarn, worth about Rs 62 lakhs, to countries such as Holland, UK, Austria, etc. The caustic soda plant has been working satisfactorily. Selling price of caustic soda was increased by Rs 60 per tonne. The company has also represented to government that release of imported wood pulp for the rayon plant is far less than its requirements and that it is also consuming indigenous pulp whose quality is not very satisfactory and whose price is substantially above that of imported pulp. Efforts to renovate the textile mills are being continued.

During 1972, Century's net sales increased by 7 per cent but gross profit could look up by 5 per cent, reflecting contraction of margins. The board has recommended a total dividend of 40 per cent, with a final of 20 per cent. The final distribution is payable on the capital as doubled by a bonus issue. Last year, the company paid a total of 45 per cent.

BAYER (INDIA) has taken on hand to

produce chloroquine phosphate from a more basic stage from locally available raw materials. The company's negotiations with government for grant of industrial licences for substantial expansion of rubber chemicals and intermediates thereof and technical pesticides have reached a final stage. Implementation of these major projects is expected to start by the middle of this year. The company is also still negotiating the conditions of the 'letter of intent' for manufacture of toluene diisocyanate, an essential raw material for polyurethane foaming units. Some settlement is expected to be reached in the course of this year. All the divisions contributed to the company's good results for 1972. Sales were a-fourth better compared to the previous year and gross profit was about a-third higher. Dividend has been stepped up 5 points to 20 per cent, which is expected to be exempt from tax. Besides, gift shares have been allotted on a one-for-five basis. The ratio of inventory/sales has been brought down from 28.46 per cent to 23.76 per cent. The company's financial position became very comfortable. After meeting requirements of fixed assets, increased working capital, and payment of long and short-term loan instalments, as at the year-end a surplus of Rs 65 lakhs was invested in short-term deposits with bankers, whereas at the beginning of the year, there were borrowings of Rs 70 lakhs. Exports were increased from Rs 7 lakhs to Rs 21 lakhs, in the competitive international market. Henceforth, the company will be liable to pay income-tax on its entire profits and may also become liable to surtax, since the benefit of accumulated relief under Section 80 J of the Income-tax Act has been fully used. The company spent Rs 20,000 for advertisements in souvenirs of a political party. Emoluments, amounting to Rs 2,000 and above per month, were paid to 53 employees.

ASIAN CABLES is paying a maiden dividend of 7.5 per cent. The company experienced contraction of margins last year, despite considerable increase in sales. A provision of Rs 33 lakhs has been made for development rebate reserve to wipe out the entire arrears on this account. A resolution proposed for the annual meeting seeks shareholders' approval for commencement by the company of the business of manufacture and sale of all types of electrical goods, apparatus and materials and of chemicals of all varieties and descriptions. What, in fact, has been affecting the company's perform-

ance is the very low capacity-utilisation of its plants. For instance, during 1972, the company produced only 11,560 million core metres of IVC/VIR insulated cable and flexible cords, against installed capacity of 49,378 MCM. Similarly, output of ACSR/AAC was 277 tonnes and of magnet wire 452 tonnes, against the installed capacities of 800 and 1,200 tonnes, respectively. Production of power cables was also lower at 1,578 tonnes, against the installed capacity of 1,696 tonnes. The company paid to auditors Rs 28,600, including Rs 8,600 "in other capacity".

WESTERN INDIA MATCH COMPANY complains that its sales last year were affected by severe competition and under-cutting of prices in many markets on account of the growth of match production by small-scale producers who evade excise duty. The estimated government revenue losses are placed at around Rs 3 crores per annum. The company expects reintroduction of excise banderols, as recommended by the government commission appointed to review this problem, by the

end of the current year. This, according to the management, will be a salutary step. As the cottage sector continues to improve its organisation and selling methods, the company is taking steps to protect its markets, develop its products and meet new challenges. The drive to introduce cardboard boxes was very successful and 23 per cent of the total output last year was partially or wholly in cardboard boxes. Wax match sales deteriorated, as the cost of this special execution does not leave the trade with enough margins at the prices the consumer is willing to pay.

During 1972, the company produced 3,691 million boxes of matches against 3,892 million boxes in the preceding year and sold 3,634 million boxes against 3,852 million boxes. Production of paper, which had suffered in 1971 from industrial unrest and other causes, rose by 46 per cent to reach 6,752 tonnes, the highest level so far achieved by the mill. Output of chlorates and perchlorates also increased from 5,304 tonnes and 20 tonnes to 5,696 tonnes and 51 tonnes respectively, but that of salt decreased from

25,645 tonnes to 15,184 tonnes because of "extremely adverse" weather conditions at the Vedaranium salt works. WIMCO's total net sales advanced by 18.6 per cent, while gross profit declined by 11.5 per cent over the respective previous year's levels. This outcome is attributed to rising costs of raw materials. Phosphorous, which had risen by 25 per cent in 1972, rose by another 30 per cent in 1972. The company has to buy this chemical from a sole indigenous producer whose price is well above the landed cost of imported phosphorous. Glue prices went up by 15 per cent and paraffin wax by 26 per cent. "Irresponsible behaviour" by labour and their leaders at the Madras factory escalated into a stoppage from October last. The necessity of feeding the Madras area from other points has added to freight and other costs. Looking to the favourable market prospects for perchlorates, the company has applied for expansion of licensed capacity to 100 tonnes. The company is now producing serviceable magnetic electrodes at Ambemath. Output is at present limited to two shifts because of power restrictions.

NEW DELHI

Drawn and Quartered

SEVERAL interesting reports, obviously inspired from the right quarters with considerable skill, have appeared in newspapers recently about structural changes under way in the Yojana Bhavan. These changes are supposed to be actuated by a grand design on the part of the Commission's present leadership to restore the Commission to its old glory as the focal point of the social and economic development of the country. Changes in the allocation of work among the Members of the Commission, the creation of an elaborate machinery under the Planning Minister for monitoring and evaluation which will report directly to the Prime Minister and the induction of some managerial personalities, mainly in the new monitoring and evaluation organisation, are cited as steps calculated to revitalise the Commission.

A closer look at the manner in which work is actually going on in the Yojana Bhavan, however, gives a very different idea of what is happening to the Planning Commission. It would appear that the style of the present leadership of the Commission is sapping the Commission's ability to function as a body and undermining its effectiveness. Individual Members of the Commission are assigned particular jobs which they do in isolation. There is no interaction, not even communication, among them. The Commission has no common view on the broad trends in the economy or on policy questions. The Deputy Chairman functions not so much as head of the Commission as a Cabinet Minister holding the planning portfolio; he, therefore, stands apart from and above the Commission and its individual Members. The Members are thus reduced to the position of officials and personal advisers to the Planning Minister on matters on which their advice might be required. The deleterious effects of this state of affairs for the character and spirit of the Planning Commission are already beginning to be felt.

NO MEETINGS

The Approach to the Fifth Five-Year Plan was not the product of a collective effort by the Commission. As for the formulation of the annual plan for the current year, which is now ready at last, it has turned out to be no more than an arithmetical exercise to put to-

gether the budgets of the central and state governments. The idea of making an assessment of the progress of the Fourth Plan last year has been all but given up. In these circumstances, it has not been found necessary to even hold meetings of the Members of the Commission.

The Prime Minister had indicated some time ago that a major task for the Planning Commission after the formulation of the Approach to the Fifth Plan and before seriously taking up work on the draft outline of the Plan was the preparation of a policy frame which will give substance to the broad objectives outlined in the Approach paper. However, it now appears that the Commission is not to be associated with this crucial task at all. The idea being put forward is that the work of formulating policies on subjects under their respective charge is that of the executive ministries. It would of course be open to the ministries to make use of the expertise available in the Planning Commission. Thus not the Commission as a whole but individual experts — Members or other officers of the Commission — may help and advise the Ministries.

What has been happening is that the Cabinet sets up its own sub-committees on particular subjects of interest. By virtue of his position in the Cabinet, the Planning Minister is invariably a Member of these committees, together with some of his other Cabinet colleagues. The sub-committees then set up other committees to examine the issues at the expert level and report to the Cabinet sub-committees through the concerned executive ministries. It may happen that one Member or the other of the Commission may be associated with the preparation of reports for the Ministries and the Cabinet sub-committees. This is what happened in regard to the take-over of wholesale trade in foodgrains and wages policy. In both cases, S Chakravarty was chairman of the experts panel. But it was made very clear that he was heading the panels as an expert and not as Member of the Planning Commission. The Commission as a body thus had nothing to do with either exercise. The conclusions of the panels and their reports went directly to the concerned ministries and were not made available

to other Members of the Commission.

A new virtue which is being claimed for this arrangement is that there will be no confrontation between the Commission and the executive ministry or the Cabinet on policy matters. But is the best way to avoid a confrontation to keep the Planning Commission altogether out of the picture in economic policy making? And if this is to be the Commission's role in policy formulation in crucial areas, what function is it expected to perform in the preparation of the Fifth Plan, in the whole or sector-wise? Again, under these arrangements, the status of the Deputy Chairman of the Planning Commission is completely subordinated to his status as Planning Minister. The office of the Deputy Chairman of the Commission has as a result lost all identity and significance. It is as if the Planning Minister were holding this office *ex-officio*.

'TALENT' FROM PRIVATE SECTOR

This manner of functioning of the Planning Commission has given rise to quite a few piquant situations. Thus we have a full Member of the Commission who is also concurrently the chairman of a public sector undertaking. He presents the so-called crash programme for fertilisers on behalf of his undertaking directly to the executive ministry concerned. The Planning Commission as such has not processed the programme or had anything to do with it. Yet the programme will necessarily carry the weight of the Commission behind it because its chief sponsor is a Member of the Commission. The same Member, again, is chairman of the Action Committee for public sector undertakings. This Committee is also totally outside the purview of the Planning Commission, having been set up by the Union Cabinet in response to a resolution passed by the All-India Congress Committee. As chairman of the Action Committee, he has associated all manner of experts from the private sector as consultants on generous fees to probe and supervise the work of various public sector corporations. These experts are reeling off reports, some of them of very questionable value. Simultaneously, a cell for project evaluation is being created in Yojana Bhavan under the charge of the same Member. In association with private consultants, the cell will examine new projects proposed for the Fifth Plan. Managements of a number of public sector undertakings

are understandably getting very restive about these goings on. Meanwhile, one may confidently expect that in a few months a number of foreign consultants will descend on Yojana Bhavan and many of the public sector undertakings to advise on what should be done to improve their management, performance, etc.

Finally, there is the new monitoring and evaluation division being set up under the care of the Planning Minister which will report directly to the Prime Minister and not to the Commission. This is supposed to be the answer to the problem of ensuring better implementation of the Plans. This division has provided berths for the much-touted entry of certain managers from the private sector. How exactly this division will function and what its relationship with the executive ministries responsible for implementing Plan projects will be, are matters still not very clear. But there are already openly-expressed misgivings that the division may become an instrument of arm-twisting available to the Planning Minister in relation to his other cabinet colleagues.

There is a keen race to attract 'talent' from the private sector in all sections

of the government these days. The professional manager is becoming the *sine qua non* of efficiency and more rapid growth. In the process, it does not seem to be realised that there are limits to the effective use of large numbers of managers from the private sector in the government administration. The managements of the public sector undertakings in particular will now have to reckon with not only the civil services bosses as hitherto but also the new busybodies from the private sector.

While the Planning Commission has ceased to function as a body and the work of preparing the draft of the Fifth Plan has been stalled, the executive ministries are going ahead with their work without any reference to the objectives and commitments set out in the Approach to the Fifth Plan. The Task Forces set up under the aegis of the different ministries to prepare sectoral programmes are proposing targets and allocations totally out of step with the Approach document. Similarly, the issue of new licences bears no relationship with the changes in the composition of production proposed in the Approach paper. Everything and everybody appears to be moving at cross purposes.

KRISHI MELAS

Gilt of New Technology Wearing Off

(From a Special Correspondent)

FROM the middle of February to the end of March this year could be described as the season of Farmers' Fairs. Most of the Agricultural Universities and Research Institutes in North India — including those at Pantnagar, Hissar, Ludhiana, Jabalpur, Udaipur, New Delhi and Karnal — organised their Krishi Vigyan Melas, as the Farmers' Fairs are known, during this period. The Melas are being organised by the different agricultural universities for the past several years to expose the farmer to the latest agricultural research done by them.

In the early years, the Melas attracted large crowds of farmers and proved an important medium of communication from the extension point of view. However, it has been noted in the case of some of the institutions that, despite wide publicity, the number of farmers visiting the Fairs is on the decline. This could be attributed to several factors, such as the absence of side attractions like VIPs to in-

augurate the Fairs; the fact that most of the new seeds distributed at these fairs are no longer as new or as scarce as they used to be in the past; the belief of the farmers that the same material is exhibited every year without anything substantially new being added; and, finally, the farmer's disillusionment resulting from his discovery of wide gaps between the experimental results demonstrated in the Fairs and the actual performance of the new technology on their own farms.

The farmers' disappointment on the last two counts could be clearly seen from the questions put by farmers to experts at the Vichar Goshtis, or discussion sessions, at the Melas. The discussion sessions at which agricultural scientists and farmers discuss problems face to face have been an interesting, and at times even exciting, feature of the Melas. As it is the 'progressive' farmers or those having solid practical experience of farming

who are generally the principal participants in the discussions with the scientists, the debates have at times thrown up very relevant points. For instance, it was pointed out by some farmers in one of the Melas that in the context of fast-changing farm technology, the Village Level Worker, because of his limited technical equipment, has become an obsolete and rather irrelevant agency for extension work. The argument may be extended even to the higher-level extension officials of the state agricultural departments and the subject matter specialists in some of the areas. They also suffer from rapid obsolescence of their skills unless they are provided with regular in-service training to refresh and update their knowledge. This is one of the arguments generally advanced by the protagonists of the transfer of extension activities from the state agricultural departments to the agricultural universities.

Another point often raised by the farmers relates to their claims about the relative superiority of the farmers' distilled wisdom to the theoretical knowledge of the scientists on farm problems. That there may be some truth in this claim is indicated by a number of examples. In some cases, as it has been noted, the cultural practices followed by farmers who achieved the highest yields to win the title of Krishi Pundits were at variance from the practices and input doses recommended by the subject matter specialists to maximise crop yields. Similarly, it is said that the innovation of 'brick plantation technique', evolved by the desert scientists at Jodhpur to be used for afforestation, owes its origin partly to the farmers' experience that to ensure better germination of the tree and bush seeds in desert areas, the fruits containing the seeds should be fed to animals, particularly sheep and goats. The animal dung containing the undigested plant seeds, not only protects the seed against sterility, climatic hazards and pests but also provides necessary nutrients and conserves moisture necessary for the sprouting of the plant.

Such examples could be multiplied. This underscores the fact that farmers' experience, though unrefined, could contribute to the better understanding of agriculture by scientists. If this does not happen, the reason should be seen in the failure to establish a two-way communication system, which is one of the important functions of the Extension Departments in the Agricultural Universities.

A large number of questions raised in the discussion sessions at the various Krishi Melas this year pertained to the experience of the farmers with the new technology recommended by the agricultural scientists. A majority of the farmers complained that both in terms of physical yields and net economic returns, the new technology (particularly HYV wheat) has given much lower performance on their fields compared to the results (including those of the National Demonstration Schemes) demonstrated at the Melas. The scientists' stock answer was that the relatively poor results were due probably to the farmers' failure to use the inputs according to the recommendations. However, there could be

BIHAR

The Seven Blind Men...

N K Singh

DESPITE what some opposition leaders called its "indirect bribing" of voters and despite its widespread use of cars and jeeps, the Congress suffered a humiliating defeat in the prestigious by-election for the Banka parliamentary seat when it finished a poor third and even lost its security deposit. The election result must have come as a big jolt to the powers that be who left not a single stone unturned to retain the seat left vacant by the death of Congressman Shivchandrika Prasad.

A report published in *Searchlight*, a Patna daily, stated that "a top Congress leader who was one of the managers of the Congress poll campaign" had said that his party had spent about Rs four lakhs, besides the expenditure the government might have incurred over the various central and state ministers' trips to Banka. About a fortnight before the election the whole constituency was divided into 15 zones, each under the charge of a minister while Chief Minister Kedar Pande was busy visiting one or other area of the constituency almost every day. And of course, Union Railway Minister L N Mishra was there to supervise the election campaign.

All this, plus the "indirect bribing" of voters! Just three days before the election, Deoghar was promised the status of a district. Four days before the polling, Union Home Minister Uma Shankar Dikshit laid the foundation stone of a bridge in near-by Korha. The Railway Minister, in the meanwhile, gave an assurance that he would

many other reasons for the performance gap of the new farm technology in the two situations, such as: lack of uniformity in the accounting system followed by the two for estimating input costs, large number of constraints and uncertainties affecting input availability to the farmers (which are almost unknown to the operators of experimental farms), and the tendency to overstate and understate the achievements on the part of the scientists and the farmers, respectively. A farmer in one of the Mela discussions even went to the extent of accusing the scientists that they had been largely responsible for 'provoking' the government to set up the Raj Committee on Agricultural Taxation.

The reasons advanced for the Congress defeat are many and varied. L N Mishra, the Congressman-in-charge of the Banka election and the acknowledged boss of the party in Bihar, said that the division of votes between the Congress and the CPI was "one of the main causes of our defeat". The CPI agreed. For Ram Lakhan Singh Yadav, a leader of the dissident Bihar Congressmen, it was the "wrong choice" of candidate which caused the debacle. The candidate had been nominated by the high command in disregard of the PCC recommendation. The defeated Congress candidate, regarded as a nominee of Jagjivan Ram, found traces of internal sabotage. She blamed a close associate of L N Mishra, PCC President Vidyakar Kavi, and R L S Yadav for her debacle. She alleged that some of these persons had even passed Congress election funds to other candidates.

Such accusations are not surprising in view of the widespread factionalism in the state Congress. There are four main groups within the state Congress: one led by L N Mishra and his younger brother Jagannath Mishra, Power Minister of Bihar; another led by Kedar Pande and his two Cabinet colleagues, Ramesh Jha and Bishwa Narayan Singh; a third led by Jagjivan Ram and his Bihar representative Daroga Rai, a former Chief Minister and presently Finance Minister in the Pande Ministry; and a fourth group led by dissident R L S Yadav. Besides, there are several small groups. According to recent reports, the groups headed by Jagjivan Ram, Kedar Pande and R L S Yadav have made common cause against L N Mishra. Pande and Yadav had closed-door talks with Jagjivan Ram recently about, what their spokesman described as, "extricating the party from Mishra's stranglehold".

Some, especially the communists-turned-Congressmen, said that the "lack of ideological commitment among the Congress workers" and the relatively better performance of Madhu Limaye's "thousands of educated and bright young workers brought from Maharashtra" were responsible for the Congress debacle and Socialist victory. Congress workers had shown a lack of will to defend the government's policies. In fact, most Congress workers drafted for the election campaign had been critical in private conversation of these policies.

George Fernandes, jubilant over the victory of his party's candidate, said that "earlier in Bombay and now in Banka people have given a clear de-

monstration of their frustration and disillusionment with Indira Gandhi's party and government". The bulk of about five lakh voters of Banka had used the by-election as an opportunity to express their resentment against the growing economic problem in general and in particular, against the government's decision to reimpose rent on uneconomic holdings, against the take-over of the wholesale trade in grain which had paradoxically hit the petty retail traders most, and, last but not the least, against the unattractive procurement prices offered by the government following the take-over. Though Fernandes did not say so in that many words, his party derived maximum benefit from the last mentioned issue. Soon after returning from Banka, Fernandes issued a statement in Patna demanding the raising of procurement prices of wheat from Rs 71-76 to Rs 100 per quintal. The explanation given was that the biggest hit were the small and middle peasants due to the higher cost of production incurred by them. Now the Socialist Party has even passed a resolution in favour of a rise in procurement prices.

Another wise man, a representative of the Fourth Estate, thought that it was wrong to construe the Banka verdict "as a swing against the ruling party". In a by-election, party labels did not weigh as much in the voter's mind as they did in a general election. Limaye was a well known political personality and parliamentarian and his victory was a personal one.

But it was left to Raj Narain to present the most original viewpoint: Congress had not lost the Banka seat, but had actually won it through Madhu Limaye's victory. According to Raj Narain, the ruling party had in fact fielded three candidates — Shakuntala Devi (Congress), Vasudeva Yadav (CPI) and Madhu Limaye (SP) — to divide the votes and block his (Narain's) entry to Parliament. So, Limaye's victory was a victory for the ruling party.

Like the seven blind men, all these observers and politicians failed, some deliberately, to perceive the election elephant. Caste is the Freudian instinct of Bihar electoral politics. Bihar is a state where caste loyalties manifest themselves blatantly in elections. Out of about 5 lakh voters in Banka, one lakh are Yadavas, one lakh Harijans and other backward castes, 60,000 Rajputs, 45,000 Brahmins and 35,000 Muslims. In the ultimate caste analysis, Limaye had several advantages over all the other candidates. The upper

caste people were obsessed with the idea of 'teaching the Congress a lesson'. They resented the selection of a backward caste candidate on the ground that "an upper caste candidate had no chance". Hence their anxiety to prove that the upper caste people had it in them to work for the success of an upper caste candidate, regardless of party labels. In the present case their choice fell on Limaye. All the other contestants, except Raj Narain, were from a backward caste. Specifically speaking, the Brahmins voted for Limaye because they were angered by the denial of the Congress ticket to a Brahmin nominee who had represented the constituency in the past. Besides, Limaye was, after all, a Brahmin.

The Rajputs, who were instrumental in bringing about Limaye's defeat in Monghyr in 1971, helped him in a big way this time. Though the Congress(O) leader, Satya Narain Singh, had promised his party's support to Raj Narain, this did not have much effect. It was only a lukewarm kind of support: Singh had declined to campaign personally for Raj Narain. Besides, Raj Narain was a Bhumihaar, a caste supposed to be the traditional enemy of the Rajputs — and there had recently been a quarrel between the Bhumihaar and Rajput factions in the Gaya session of Congress(O). Furthermore, most of the Rajputs were farmers, sore over the compulsory wheat levy. So they ultimately chose Limaye to be their man against the government.

NAXALITES

Prisoners and Patron Saints

M R

FOR months now, Parliament has been assured again and again that the Naxalite movement, all but smashed up, is in a state of disarray. Ministerial pronouncements to this effect have also carried the ominous suggestion that the movement, fragmented mainly over the specifics of strategy even after the controversial annihilation tactic had been abandoned or at least suspended, would not be allowed to regroup on the basis of an agreed tactical line.

At the same time, thanks to the inexplicable solicitude displayed by Bhupesh Gupta and the CPI, the Prime Minister wrote to the Chief Ministers of the 'infested' states pleading for humane treatment of the Naxalites, especially those in prison and under detention. This indicated a differentiat-

The Yadav vote, thanks to R L S Yadav, who claimed that he could sway his castemen whichever way he wanted, also became anti-Congress and was divided between the two Yadav candidates belonging to the CPI and the Jan Sangh. As the CPI candidate had a better winning chance, he bagged most of his castemen's votes. This was reflected in the CPI's improved number of votes: from 70,000 in 1971 to 76,500 in 1973.

The Muslims had become anti-Congress and anti-CPI because of these parties' attitudes on the Aligarh University Act and allied matters. Their choice also fell upon the non-Congress candidate with a better chance of winning, Madhu Limaye.

Though the Congress candidate enjoyed some advantages because she belonged to a backward caste, part of the backward communities' vote was taken by the CPI and the Jan Sangh. The Socialist Party and the SSP also bagged sizeable chunks of this vote. It is not that the Congress did not practise casteism. The 20-odd ministers camping at Banka worked on caste lines. Brahmins were deputed to manage Brahmin votes, a Rajput minister for Rajputs, Banias for Banias, Kurmis for Kurmis, and so on. Yet the Congress failed miserably. The simple fact is that the attempts by the ruling party, the CPI and the Jan Sangh to exploit the caste prejudices of the Banka electorate failed while the Socialist Party's succeeded.

ed, political approach to a political problem in place of the law and order approach. Siddhartha Shankar Ray, the West Bengal Chief Minister, pretended to welcome the Prime Minister's suggestions and even claimed that his government was acting upon them. As for the other major 'infested' state, Andhra Pradesh, the Union Home Minister has assured Bhupesh Gupta that the state government was constantly reviewing the cases of the Naxalites in the light of the Prime Minister's suggestions.

While all this might be good for public consumption, both from the government's point of view as well as from Bhupesh Gupta's and the CPI's in fact there seems to be really no change in the government's approach. The Orissa Sarvodaya leader, Ratan Das, who has

been campaigning for the commutation of the death sentence passed on Naga-bhushan Patnaik, got an altogether different impression when he met the Prime Minister in mid-April from that conveyed by the Prime Minister's letter to the Chief Ministers. The Prime Minister bluntly told Das that she refused to believe that there had been any change in the Naxalite tactical line. Further, after the Supreme Court had struck down Section 17(a) of the Maintenance of Internal Security Act there has been no move, not even in West Bengal, to release those held under the impugned provision of the Act. In fact, the West Bengal Chief Minister has given the impression that the state government was in no mood to countenance any large-scale release of Naxalite prisoners. On the contrary, a systematic campaign has been launched in the press about the alleged spurt in Naxalite activity in West Bengal. There is a sinister pattern in the attempt to link cases of gun-snatching and cop-killing with revival of Naxalite activity. Murders resulting from crude Congress factional rivalries in the state have also been ingenuously ascribed to the Naxalite's annihilation campaign. All this has provided the smoke-screen for fresh arrests in the state, by giving the public the impression that not only would it be imprudent to release those in prison but that prudence required the rounding up of many who had escaped arrest in the past.

It was against this background that the National Convention for the Release of Naxalites, unmistakably a CPI-sponsored show, took place in New Delhi on April 20 and 21. Perhaps the CPI thought that a general release of prisoners was in any case round the corner and that it should be in a position to appropriate the credit for it. Again, it has been reported that about 180 Naxalite prisoners in Andhra Pradesh have gone over to the CPI which wants to secure their release so that they could provide much-needed cadres for the party in the state. The CPI also hopes perhaps that release of Naxalite prisoners in West Bengal may benefit it similarly. Or it could be that the government itself at one stage thought of releasing the prisoners and wanted the CPI to get some credit for it. Finally, the convention also had the objective of discomfiting the CPI(M). The CPI(M) could not participate in the convention so long as its scope was limited to securing the release only of Naxalite prisoners. For, the CPI(M)'s cadres are also victims, especially in West Bengal, of the draconian laws

invoked against the Naxalites.

The discussions at the convention did not help to establish the CPI's *bona fides*. George Fernandes, Chairman of the Socialist Party, posed the question straight: as proof of its *bona fides*, should not the CPI, which heads the Kerala Ministry, get Achuta Menon to release the Naxalites detained there? (There are 60 Naxalites held under MISA in Kerala without any specific charges against them.) Bhupesh Gupta's answer to this was far from convincing. After all, the CPI was only a partner in the coalition ministry in Kerala and it was not running the whole show. As it turned out, the convention went beyond what the sponsors had bargained for. It demanded the release not only of Naxalite prisoners but of all democratic and leftist prisoners, whichever party they belonged to. The convention also denounced the detention of persons without trial.

The convention might, nevertheless, have served some purpose by highlighting the problem of 32,000 Naxalite prisoners in the country. Reports from the states suggested that while the West Bengal government's emphasis was on MISA, in Andhra Pradesh the provi-

sions of the Indian Penal Code regarding conspiracy seem to have come in handy. The exact break-up of Naxalite prisoners of various categories in West Bengal (undertrials, those serving prison sentences and those detained under MISA) is not available, but there is little doubt that thousands have been held without trial, or even any prospect of trial, for years (some since 1967-68). A large number of these come under the category of 'undertrials'. In Andhra Pradesh, there are only two MISA detenus. The state government's preference was for framing on vague charges of conspiracy those who could not be killed off in "encounters". And these conspiracy trials take a long time to start. Many have been in prison in connection with the Parvathipuram conspiracy case awaiting trial since 1969. The trial has been a non-starter, with the prosecution citing 830-odd witnesses which means it will take a few years. Some of the leaders accused in this case have been simultaneously charged in several other conspiracy cases. Short of a political decision by the state to drop these cases, the best that these leaders can hope is to be out on conditional bail for the rest of their lives.

WEST BENGAL

No Hope for MISA Detenus

OF the nearly 2,500 prisoners detained under the Maintenance of Internal Security Act (MISA), in West Bengal as many as 1,760 were held under Section 17(a) of the Act which was struck down by the Supreme Court. It is characteristic of the present Congress government in the state that even weeks after the Section was struck down by the highest judiciary of the land, only about a couple of hundred of the illegally detained prisoners have been released. Of them, again, most were re-arrested at the jail gates under some other section of the same black Act.

Anticipating the Supreme Court's judgment, the State's Inspector-General of Police had suddenly sought to create a scare of Naxalite recrudescence after having for months past claimed credit for the successful liquidation of the Naxalite 'menace'. But he found no takers for his myth — not even among friends in the establishment Press, who came out with a number of stories about serious political churning among the Naxalite residue. The Press also highlighted widespread condemnation among the rival Naxalite groups of the senseless violence that had marked the last

phase of the late Charu Mazumdar's leadership.

This is not to deny, however, that violence and crime are very much in the air in West Bengal. Murders, robberies, extortions, etc, have become a part of life. But the number of 'anti-social' elements among the MISA prisoners will not exceed 100. Excluding the CPI(M) activists, who constitute roughly a third of the MISA prisoners, the rest of those held under MISA come from Naxalite ranks. The non-political Naxalites have long since flocked to the Congress.

The threat to law and order in West Bengal today comes not from the ranks of CPI(M) or CPI(ML), but from the periphery of the ruling party itself. For instance, on April 27, a local chieftain of the Congress youth was shot at in North-East Calcutta and the whole district was subjected to the paralysis of a local *bandh* for two consecutive days. The colleagues of the injured Congress youth leader, including three Congress MLAs from Calcutta, in public statements clearly hinted at the hand of their factional rivals behind the outrage

A few days back, the Congress MLA from this area had been attacked in broad daylight. The MLA belongs to a faction opposed to that of the present victim. On April 26, two local leaders of the Congress youth were produced before the Additional Chief Presidency Magistrate on charges of rioting with deadly weapons and attempts to murder during an intra-party clash in North-West Calcutta.

The three Congress MLAs mentioned above are reported to have submitted to the Chief Minister a long list of anti-social elements challenging him either to arrest them or to give them good

conduct certificates.

A former Advocate-General of West Bengal, Ajit Datta, said recently: "I was at Santiniketan on the day Section 17(a) of the MISA was struck down. I found the local boys rejoicing on the road. I knew that the boys were rejoicing for nothing; their friends would not be freed. They would be detained under other charges." Datta has proved to be completely right. The present regime needs MISA not for checking violence, which is now a Congress monopoly, but for suppressing the steadily growing anger of the bamboozled masses.

SOUTH

Behind the Dindigul Debate

Mohit Sen

THE continuing mosaic that is the politics of Tamil Nadu, is shown up in the contest at Dindigul. There are three chief contestants — the Anna DMK, Kamaraj's Syndicate, and the DMK. The Congress too is fielding its candidate and so is the Forward Bloc. In the latter's case, the Thevar caste of the candidate indicates that the Forward Bloc might be contesting more to cut into the vote of the Anna DMK candidate than to give itself an MP. The case of the Congress is different. There is, of course, the interpretation that this would be the best way in which it could help the Anna DMK by cutting into the vote of the Syndicate. But this appears rather farfetched.

It is wrong to imagine that four years have passed to no effect and that there is a traditional Congress mass base which Kamaraj has somehow won over. In fact, the Syndicate has got a considerable mass base in the state, which is very largely due to the prestige, organisational skill, and hard work of the former Congress president. But the leadership and cadres of this party have even more clearly demarcated themselves from the Congress — as was evidenced by Kamaraj's presence at the Swatantra convention. It is quite solidly a part of the Grand Alliance and seeks to function and present a definite identity on that basis. It has, therefore, to fight as such.

The real motivation behind the setting up of a Congress candidate is the view of an important section of the Congress leadership in the state and at Delhi, that the Congress can serve as the rallying point for the anti-DMK forces in Tamil Nadu. The

idea is to establish the Congress presence in the state, and to undo the tactic that led to the surrender of contest in the 1971 elections to the Assembly. Nobody can quarrel with the desire of any political party to assert its existence; what one can certainly doubt is whether the form and time of this assertion are propitious. Only very recently the Congress had worked out a line that, in Tamil Nadu, its two enemies were the Syndicate of Kamaraj and the DMK of Karunanidhi. It resolved to unite with all other forces and parties to defeat these two enemies. It has been widely reported that some of the Congress leaders were not happy with this position. They neither liked the total opposition to Kamaraj nor the approach toward alignment with the Anna DMK of MGR. A compromise between these two trends has led to the decision to contest on one's own but

with the main thrust of the campaign against the DMK and Syndicate. At the same time, the Anna DMK is to be criticised as being unable to provide a viable alternative and advised that it should fold up and its members and followers should join the Congress.

One by-product of the Congress decision to contest has been the withdrawal of the CPM's candidate. That party had declared that it was willing to develop some kind of co-operation with the Anna DMK, provided it had no truck with the Congress. In any event, its present stand is to be welcomed. It would lead to a measure of common campaigning and help towards consolidation of the Left and democratic forces in the state. It will, after all, be necessary for the CPM leadership to explain why it has decided to favour the Anna DMK as against all the other forces — or why it has decided to favour anybody at all. And there would be the consequences following from support to the candidate supported by the CPI also.

The turn of the political wheel in Tamil Nadu has posed afresh, urgently, and in a specific form, the unity of the Left and the democratic parties and forces — which is the key problem of the country as a whole. The element of radicalism that formed an important part of the appeal of the DMK under Annadurai has neither disappeared nor found its way to any other party to any significant degree. The split of the DMK finds this radicalism veering behind what may be considered the heir of the dream and drive of Annadurai. After all, in Tamil Nadu, not only was the undivided Congress faced with a petty bourgeois and intermediate strata-based political formation, but it was not very much divided in the 1969 climacteric; it was this formation that split after Karunanidhi had swung

to the Right. The lack of programmatic clarity on the part of MGR's following should not lead to any underestimation of either its radicalism or the possibilities inherent in this radicalism. There can be no worthwhile Left and democratic unity in this state which does not take into its scope this vast and seething force. The politicalisation of this force, as of any other mass force, will take place through direct experience and the explication of this experience. Making sophisticated grimaces at it from the sidelines would not help. The stability and final shape of this trend are not matters of immediate concern.

It is not possible to make any predic-

tions about the poll results in Dindigul. It is after all, a single by-election. It could have become a pace-setter, whatever the concrete results, had the Congress not taken the stand that it has. Banka does not appear to have satisfied the masochists in that party. Nevertheless, campaigning in a parliamentary constituency involves a fair amount of political agitation. And, contrary to the views of the supercilious, the masses do to a considerable extent listen and learn and weigh the speeches against the exacting realities of their life. From generalities the issues do acquire a greater concreteness. There can be no doubt that the Dindigul debate will result in further mass awakening.

fied to understand foreign policy problems of all countries and is accordingly posted anywhere — from Soviet Russia to Argentina; the specialist has no place in it at any stage, although in the foreign services of countries of Europe and America he has been directing foreign policy affairs to an appreciable extent.

FOREIGN POLICY FORMULATION

News and policy analysis is done by the Press and the missions abroad have largely tended to see their function as consisting of despatching reports based simply on published material through diplomatic bags. Ambassadors do meet the Foreign Office men of the country of their postings and send their own assessments based on such meetings. But this is rare in normal times and cannot therefore form the major source of material for foreign policy formulation. In the United States, Soviet Russia and the European countries, foreign policy formulation is assisted to a great extent by the specialist research staff working in the external affairs and allied ministries. In the United States, for example, besides the State Department — which has a large research wing of its own — the President's National Security Adviser and the Pentagon (at the CIA headquarters) have their own research wings too, which engage in contemporary and perspective planning. One of the reasons why the Pentagon is suspected of having a large say in the shaping of US policy may well be that the CIA headquarters has a more competent and better equipped centre for perspective planning in foreign affairs than does the State Department. The position papers prepared by the research staff have a much greater role in the formulation of US foreign policy than do bare ambassadorial reports.

In India, the situation is highly unsatisfactory. The Policy Planning and Review Division of the Ministry of External Affairs, which is formally entrusted with this work, is, as expected, headed by a career diplomat and is very inadequately staffed. Two years ago, it had one Joint Secretary, one Deputy Secretary, and two Research Officers. Although the posts of three Deputy Secretaries and several Research Officers were sanctioned, they remained unfilled for several months. The situation has apparently deteriorated since then. Of the two Research Officers, one has left the Ministry and joined a research institute in the same grade.

The functioning of the External

FOREIGN POLICY

Where Bureaucracy Thrives

J A Naik

FOREIGN policy planning has remained by and large neglected in post-Independence India. Under Nehru, the need to institutionalise foreign policy planning was never explicitly felt. Nehru's towering personality and his keen interest in foreign affairs made this largely a personal preserve of the Prime Minister.

If Nehru's profound interest in foreign affairs tended to give a personal content and style to foreign policy making, the lack of a dominant political leadership in South Block since Nehru has tended to strengthen the hands of the bureaucracy of late and deprived India's foreign policy management of imagination and initiative.

FOREIGN AFFAIRS

Foreign policy-making suffers from want of competence in both the Lok Sabha and the External Affairs Ministry. Indeed, the Congress Parliamentary Party is probably the weakest link in the foreign policy formulation process. It is difficult to find even one or two members in the large Congress Parliamentary Party who can speak with knowledgeability on foreign affairs. In such a political milieu, the file-bound, administration-running, and status-quo oriented bureaucracy inevitably acquires the decisive voice in policy making.

Policy planning has been generally divorced from personnel planning in the political field, while in administration it has been generally equated with personnel planning. Thus hardly any

attempt has been made in the Congress Party to induct into the Congress Parliamentary Party persons who have some knowledge of the different fields required for running the nation's administration. Though the Foreign Affairs Department of the All-India Congress Committee is more than four decades old, it has hardly functioned in the 25 years since Independence. At the time of the Congress split, its total staff consisted of one secretary and one stenographer — the latter normally busy with the work of other offices. Parliament's Consultative Committee on Foreign Affairs is normally summoned by the Minister to furnish it with *post facto* information rather than to obtain from it *ex ante* consultations on foreign policy matters. Although the Committee is supposed to meet twice during each session of the Lok Sabha, of late its meetings have been less frequent and less regular. During Dinesh Singh's tenure of the Ministry, for example, it met only twice in three years — on both occasions to discuss the 'officially given' agenda of Nepal and South-East Asia.

The External Affairs Ministry presents a slightly more encouraging aspect, though by no means a very hopeful one. The principal defect of the working of the External Affairs Ministry continues to be its rather faulty personnel policy, inadequate organisation, and uncoordinated functioning. The generalist, who has qualified for his job on the basis of subject-personality tests in his early twenties, is supposed to be quali-

ed ministries. The Ministry of External Affairs does not have a division specialising in military affairs, nor does the Policy Planning and Review Division have a military affairs specialist at any level. A team of military affairs specialists could do much of the intelligence activities in New Delhi, as it is estimated that about 90 per cent of the intelligence information can be now found in published sources. The need to collect information from published sources is at least as much important as

This is striking when we look at the number of economic posts created in our missions abroad. More than one-third of India's total foreign trade is with the East European countries and Soviet Russia stands second among our trading partners in order of importance. Of the total of 63 economic posts in our missions abroad, the highest are in the US (six) followed by the UK (four), Belgium (three) and Canada, Sri Lanka, West Germany, Italy, Japan, Pakistan, Thailand and the UAR (two each). Despite Russia's number two position among our foreign trade partners, the Indian Embassy in the USSR has only one economic attache, while even a minor trading partner such as Thailand has two!

INADEQUATE ARRANGEMENTS

South Block seems to view the function of the economic attache short-sightedly as one of earning convertible currency for the country rather than as that of promoting the country's imports and exports. It seems to have been conveniently decided that the STC Office in Moscow would acquaint the Soviet Trade Organisations with the Indian goods and that its Soviet counterpart in New Delhi could do a similar job in India. This has not only proved a hopelessly inadequate arrangement but seems to have contributed to the development of *ad hoc* trade promotion between the two countries. In view of the indifferent quality of Russian products, it is necessary that the Foreign Trade or External Affairs Ministries should have a team of technocrats familiar with Soviet and western products, as well as a team of researchers exploring the COMECON countries' trade activities and production trends. Indeed, our trade mission in Moscow could be made large enough to carry out such research in the Soviet Union itself.

Another glaring shortcoming in our foreign policy planning is the apparent lack of co-ordination among the concern-

ed ministries. The Ministry of External Affairs does not have a division specialising in military affairs, nor does the Policy Planning and Review Division have a military affairs specialist at any level. A team of military affairs specialists could do much of the intelligence activities in New Delhi, as it is estimated that about 90 per cent of the intelligence information can be now found in published sources. The need to collect information from published sources is at least as much important as

normal intelligence activity. There seems to be little co-ordination even in this respect among the Ministries of External Affairs, Defence and Home. The Military Attaches send their reports to the Defence Ministry, but the latter does not have a wing specialising in external affairs which could analyse and assess trends from the point of view of foreign policy formulation, nor does the External Affairs Ministry have a wing of specialists in military affairs to assess the strategic value of such information.

Preparing for Powell

ALLOW me to attempt a strictly neutral diary of what may be seen as a chain of events in Britain 1973. To a reader it may seem a random selection, but it is one that has forced itself on me. The last part of the last item would read "The police suspect one man on a Lambretta. A South London firm has agreed to assist the police by building a model of the scooter. The local priest in Brixton, South London, has set up a fund of £40 to help the victims of the fire-bombs." If I were to balance in my posture of neutrality, there I would have to leave it.

At the risk of breaking a rule of journalism and writing advertisements for myself, I must declare my interest in the last item. In the early hours of the morning of March 16, six shops in South London, belonging to black people, were wrecked by fire-bombs. Nobody was killed, but several people were seriously injured. I myself lived above a bookshop called Unity Centre in Brixton, the predominantly West Indian ghetto of South London and was asleep at the time the bomb crashed into the shop and set it violently ablaze in seconds. I was the only occupant and got out by finding my way down from a second floor window. The Asian families, who lived above the other places that were bombed that night, suffered similar adventures. All the premises attacked, with the exception of Unity Centre, which was initiated by the Black Panther Movement, were grocery stores and the like, run as small family businesses by people of Asian origin, from the subcontinent or from Africa. Apart from the political symptoms, evident in the state of the nation, no warnings were given of this outbreak of right wing terror. No politician publicly made a comment after the event. The television men asked two of the shopkeepers to appear, which they did, saying that they could see no conceivable reason for the attacks and no political motive as, indeed, they weren't involved in politics.

A few days earlier we, the collective that runs Unity Centre as a bookshop and cultural-political meeting place, had been given a sort of warning, to which we reacted no more than analytically. The Monday Club, the fascist wing of the Conservative Party, issued a statement through two prospective Council candidates to the effect that our bookshop disseminated 'black power' and 'terrorism' and that such a venture was unwelcome in the community. The two

members involved tried to stimulate a controversy in the Houses of Parliament concerning the donations that Unity Centre had received from the Council for Community Relations. It is common knowledge that over the last few years, all attacks on the property and person of blacks (notably the Paki-bashing assaults) followed stimulation from the Powellite faction of the Conservative Party and the National Front.

To start the diary at the beginning:

(1) The immigration law came into operation on the first of January this year. The Act distinguishes between the right of entry and the right to free employment of white and black people.

(2) The newspapers, prompted by the Home Secretary, began a campaign of propaganda against 'mugging', characterised for the nation as a war of crime in which black youths beat up old-age pensioners and take their money and spectacles off them. Following this, in a nationally publicised trial four black youth were accused of mugging persons unknown and sentenced after a trial in which only police witnesses gave evidence for the prosecution. In March, a judge in Birmingham sentenced a black youth of sixteen to twenty years imprisonment for stealing 30p (six rupees) and five cigarettes in a 'mugging' incident. Again there was widespread newspaper support for the judgment.

(3) Two Pakistani youths were shot by Special Patrol police at India House, and the government spokesman implied that 'foreigners' involved in political action run the risk of losing their lives.

(4) In February a pub owned by a West Indian was burnt down by a fire-bomb a few days after a barber shop in the same area got the same treatment because it caters to African hairstyles.

(5) The chief television channel, BBC 1, gives Enoch Powell a prominent Sunday spot to publicise his views on 'immigration' and the black threat to England, and the sponsors of the programme comfort him with the news that 80 per cent of the public who phoned in supported his views.

(6) Three millionaires begin a campaign within the Conservative Party championing with their money Enoch Powell's candidacy for leadership of the party. With the legislation banning strikes, freezing wage increases and allowing profits to run away under

pressure of Eurodollar speculations, Health has begun the job. The Tory party is beginning to indicate that he is not the one who can complete it. Powell awaits his turn and turns his speeches away from the country's economic crises to the erosion of the British way of life as a result of the presence of blacks.

This diary has to speak for itself. Just as the financing of the Shiv Sena in Maharashtra remained an undeclared but open secret, the financial support for the neo-fascist National Front is also a mystery not too difficult to solve. A clue to its solution is the virtual indistinguishability of the Front's platform on the key issues from that of the Monday Club organisation of the Conservative Party. It is the Front's boast that "the ordinary people of Britain are fed up with dishonest politicians, Conservative and Labour", though this does not stand in the way of accommodating Conservative politicians on their platforms.

Their mindless slogans of 'Britain for the British', 'Humane repatriation for all those of non-British origin', etc; the support from the small-time shopkeepers and landlords for their organisation; their much vaunted identification of exploitation with Jews; their declared admiration for Hitler; all these are part of a familiar scenario. A few Lambrettas, a few bottles of paraffin and a few yards of wick don't add up to a movement. The alarming fact that goes with it, is that the forces of law and order are making no attempt to discredit or annihilate the movement. The state has confined itself in the last year to forming para-military squads of anti-picket police, special patrol groups for immigrant areas and anti-Irish squads in their non-public 'special branch'. The dramas of detection which the courts have staged and the newspapers have publicised, have had as their victims the unorganised personnel on the periphery of the working class movement. The latest of these cases is of a Goan called Tony Soares. The Black Liberation Front to which he belongs runs a newspaper called *Grass Roots*. Tony has just been convicted of 'incitement' because *Grass Roots*, a year ago, copied out a page of the Manual of the Urban Guerilla which instructed readers on how to make Molotov cocktails. He hasn't been sentenced yet as the judge, being presented with a remark in one of his diaries to the effect that Enoch Powell was preparing to attack the black population as Hitler had the Jews, has sent him for psychiatric reports. "Mr Powell would never do such a thing", he said "you're mad to think it."

The UNIDO Guidelines

Bimal Jalan

Guidelines for Project Evaluation, United Nations Industrial Development Organisation, 1972; pp xvi+383.

I

IT is a pity that the publication of these Guidelines, written by Partha Dasgupta, Amartya Sen and Stephen Marglin has been so delayed. The work on these Guidelines seems to have started at about the same time as the work on the OECD Manual on Industrial Project Analysis;¹ however, while the OECD Manual was published in 1968, the publication of the UNIDO volume had to wait until 1972. This delay has had an unhappy consequence. Almost by default, the OECD Manual has come to occupy the pride of place as a guide to social cost-benefit analysis in developing countries. It has already won many adherents, and development economists as well as agencies concerned with project evaluation by now have an enormous amount of intellectual capital invested in this particular method of project evaluation. As a result, it may happen that these Guidelines will not receive the attention that they deserve.

SPECIAL MERITS

Compared with the current favourite — the OECD Manual — the special merits of the UNIDO Guidelines are fourfold.² Firstly, there is a clear recognition in these guidelines that the objectives of different developing countries may differ, and therefore, the considerations that affect the choice of projects may vary from country to country. Thus, it is a gross simplification to assume that the right shadow prices can be derived independently of the country's objectives. This is a refreshing change from the OECD approach where all countries, irrespective of their own objectives, are expected to obey the dictates of international markets for determining the accounting or shadow prices of their goods and services. Secondly, project evaluation is viewed as a means of achieving national planning goals rather than as a preferred substitute for national planning. Thus, the Guidelines state that "a national plan that is a consistent forecast of the future defines a strategy of development, within which project formulation and evaluation are tactical

elements" (p 133). The plan is supposed to set the basic ground rules, whereby "the project formulators and evaluators charged, say, with water resources development know whether to consider projects whose capital outlay total £100 million or £1,000 million over the plan period" (p 132). In the OECD approach, no such restraints exist on the project evaluators; they are the ones who would decide whether £100 million or £1,000 million should be spent on water resources development or somewhere else. The role of planners in this approach is minimal; they are expected to confine themselves to making demand forecasts and guessing how scarcities will change so that project evaluators can do a better job of evaluating projects.

ACTUAL AND PROJECTED POLICIES

A third merit of the UNIDO Guidelines is that the procedure for derivation of shadow prices recommended by them is based on actual and projected policies of governments rather than on an idealised notion of "optimal" policies based on some defunct theoretical model. This, of course, is a reflection of the general viewpoint of the guidelines, that the appropriate realm for project evaluation is the tactical, not the strategic, and that project evaluators should be concerned with knowing what the governments want rather than prescribing what they ought to want.

Fourthly, and perhaps most importantly, in the UNIDO Guidelines, considerable emphasis has been placed on the role of the political leadership, rather than economists and technicians, in making choices which involve value judgments. In contrast to the OECD posture, it is also good to be reminded that "one should not look to benefit-cost analysis as a means of substituting 'objective', 'quantitative' and 'hard' analysis for 'subjective', 'qualitative' and 'soft' judgments, at least not for some time to come. Benefit-cost analysis can sharpen the focus of policy makers' intervention in project evaluation, but it cannot as yet reduce this process to a routine that, once set in motion by appropriate value judgments on the part

of those politically responsible and accountable, would — like the universe of the deists — run its course without further interference from the top" (p 172). The strictures of the guidelines on the role assumed by civil servants and technicians can also, with some justification, be applied to the OECD approach. To quote, "all too often they discourage the political leadership from intervening in what they wrongfully consider to be their own exclusive sphere of competence. They obfuscate the necessarily political nature of the standards that govern benefit-cost analysis..." (p 138).

II

The broad outline of the method recommended in these Guidelines is easy to state. The net benefits of a project are measured in terms of the net contribution that the project makes to aggregate consumption over time. Aggregate consumption is thus the *numeraire*, and all items in a project's account are valued in terms of aggregate consumption. Units of future consumption are discounted at the appropriate social discount rates reflecting the relative value that society places on future consumption *vis-a-vis* present consumption.

SOCIAL OPPORTUNITY COSTS

The estimation of the net aggregate consumption benefit is best carried out in successive stages of approximation. The first approximation is to estimate the net present consumption benefit of a project at market prices. Since net benefit is the value of output minus costs, this requires estimation of the value of goods and services physically produced by the project and costs incurred in achieving that output. Output is defined as goods and services that would not have been available in the absence of the project, and costs are defined as the maximum alternative benefits forgone. In the first approximation, both the output and costs are measured at their market prices on the assumption that market prices adequately reflect social opportunity costs.

The second approximation involves the adjustment of the market prices of specific resources wherever these prices do not reflect the real contribution of the resources to the aggregate-consumption objective. The general principle is to value both outputs and inputs according to the criterion of consumers' "willingness to pay". Thus,

for example, if the output is a consumer good and adds to the supply, the estimation of the amount that consumers will actually pay for this additional supply is a convenient approximation. If, on the other hand, any consumer has a monopoly power in buying, then a correction would be required since presumably the consumer's willingness to pay would exceed what he actually pays. Similarly, with costs, if the use of an input in a project causes a decline in the amount of that input available to the rest of the economy by an equal amount, then the market cost is a convenient approximation to the value of the input. If, on the other hand, inputs are rationed, or if there are monopoly powers in buying or selling at some stage, then suitable corrections would be required.

REQUIRES SPECIAL ATTENTION

Valuation of two items requires special attention, i.e., foreign exchange and labour. In the Guidelines, both these items are also valued at their opportunity costs, estimated according to the criterion of willingness to pay. Thus, for example, if the foreign exchange market is perfectly competitive, the official exchange rate would adequately reflect the domestic willingness to pay. If, however, the official market rates understate the domestic willingness to pay for foreign currencies, then it would become necessary to estimate the true aggregate consumption value, expressed in domestic currency, of a unit of foreign currency. The valuation of labour involves taking into account a number of factors which pull in opposite directions; however, the general principle is the same. If the necessary conditions involving competitive markets can be assumed to hold, the market price, or wage rate, of a particular grade of labour may be taken as an appropriate measure of willingness. If not, labour would have to be valued at a shadow price taking into account the impact of employing a unit of labour on production in the rest of the economy as well as social cost and benefit of present and future aggregate consumption.

After market prices have been adjusted to reflect social opportunity costs, the project evaluator can move on to the third and final approximation to the net aggregate consumption benefits of the project. This consists in taking into account the fact that the social value of funds devoted to investment may exceed the social value of the same funds devoted to consumption. In the

final approximation of net benefits, it is, therefore, necessary to divide the total costs and benefits according to groups of gainers and losers, and to estimate the respective marginal savings propensities of each group. For this purpose, in the Guidelines, three groups of gainers and losers have been distinguished, i.e., the workers, the government and the private sector. The net benefits flowing to these three groups from the project are then divided into proportions that are saved and consumed by each of the three groups. The amount devoted to savings is valued at the shadow price of investment, which reflects the social value of investment relative to consumption. The shadow price of investment (p^{inv}), which is simply the present value of future consumption made possible by a unit of investment, is calculated by taking into account the marginal propensity to save of the economy (s), the marginal rate of returns on investment (q), and the social discount rate (i). The

simple formula is $p^{inv} = \frac{(1-s)q}{1-sq}$

There is, of course, a different p^{inv} for each discount rate; it is also obvious that the higher the discount rate, the lower the shadow price of investment.

BROAD PRINCIPLES

These, in very brief, are the broad principles. The actual calculation of the relevant shadow price is, of course, a much more complicated affair, and the reader is referred to the Guidelines for detailed discussion of the recommended procedure. Incidentally, for arriving at net social benefits, the Guidelines make a careful distinction between "shadow prices" and "weights". The term "weights" is reserved for those national parameters that directly reflected political value judgments. In this category are the weights reflecting judgments about the distribution of income and other objectives that have to be reflected in social cost-benefit calculation. This category also includes the social rate of discount, which reflects the relative weight on aggregate consumption at different times and is, therefore, a proper subject of political choice. Shadow prices, on the other hand, are those prices that require no new value judgments beyond those that are introduced in the definition of weight. Prices of investment, labour, and foreign-exchange belong to this category. For example, once the social discount rate (which belongs to the category of weights) is known, the shadow price of

investment can be calculated without calling for any further value judgment.

The distinction is important because in the UNIDO approach weights are considered as *unknowns* of the problem of project formulation and evaluation, and shadow prices are treated as functions of the unknown weights. Since weights are unknown, project evaluators are supposed to evaluate projects on a number of alternative assumptions regarding weights to be placed on different objectives as well as the social discount rate. The alternatives that are optimal in different ranges of parameter values are then expected to be presented to the policy makers for explicit choice. The task of making the policy makers aware of the critical role of national parameters by spelling out the implications of choosing one variant over another is expected to be performed by the Central Planning Office. This "bottom-up" procedure, recommended by the Guidelines, is to be distinguished from flow of information characteristic of the 'top-down' planning in which policy makers determine shadow prices in advance of project formulation and evaluation.

A SEPARATE OBJECTIVE

In the Guidelines, there is a long discussion of the national objectives that are relevant for project evaluation. Of these, the redistribution objective is considered a separate objective, which has to be given an appropriate weight in project selection. While this objective can be measured in several ways, the measure proposed in the guidelines consists mainly of separating out certain depressed classes or groups and attaching special additional weights to the consumption they enjoy. On employment, the view taken is that additional employment in a country with surplus labour is desirable, but not for the sake of just employing people. Rather, it is desired for the sake of other objectives, such as income distribution and the efficient use of national resources. Thus, the employment goal need not be reflected in project evaluation as a separate objective. Similarly, the objective of self-reliance is also considered a derived objective. The desirability of this objective, therefore, is to be judged not for its own sake, but through its impact on consumption opportunities today and in the future. The shadow price of foreign exchange, in this approach, essentially reflects the contribution that a unit of foreign exchange is likely to make to aggregate consumption rather than to balance of payments.

III

As mentioned earlier, compared with the OECD Manual, the general approach of the Guidelines to the question of project evaluation has much to commend itself. It is, of course, quite possible that on specific points as well as on matters of procedure, one might take a somewhat different view than of the Guidelines. For example, it may be questioned whether, for project choice, it is really necessary to estimate the benefits flowing to three groups of gainers and losers (i.e., the government, the private sector, and the workers), and estimate their likely total savings according to their respective marginal propensities. For one thing, the process of estimation, recommended in the Guidelines, does not go far enough since the variation in marginal propensities within the groups (particularly in the private sector) is likely to be as significant as between groups. This is because the marginal propensity to save of capitalists at any point of time is likely to depend on consumption standards already reached, and will vary as between different classes of entrepreneurs (e.g., big capitalists and new entrepreneurs). More fundamentally, however, the aggregate consumption of capitalists as a group is likely to depend on the share of total private investment in the economy rather than on particular projects undertaken by them. In other words, aggregate private consumption is likely to depend on the size of total assets held in the private sector rather than the form in which such assets are held. Thus, as long as funds released from not investing in a proposed project can be invested elsewhere, it would not matter, insofar as capitalist consumption is concerned, whether that specific project was accepted or rejected.

UNNECESSARY TO DISTINGUISH

It may, therefore, seem unnecessary to distinguish among projects according to whether the benefits flow to the private sector or to the government, particularly if the government itself has the power to regulate the total size of the private sector. If it does not have the power or does not wish to exercise it, as pointed out above, project choice *per se* is unlikely to affect the aggregate private consumption in the economy as a whole. So far as the social cost of workers' consumption is concerned, this can be adequately reflected in the choice of the shadow wage rate without the need for any further ad-

justment. If the above view is correct, one can stop short of the third stage of the evaluation procedure recommended by the Guidelines. The task of project evaluators as a result would become much simpler.

The irrelevance of present-day economics to most problems of human concern has been a matter of some debate in the academic community in recent years. It is unfortunate that these Guidelines, which represent the work of three well known economists, provide further evidence of the emptiness of much of economic theorising on matters of practical policy. Examples of empty theorising abound; what is supposed to be theoretically right usually ends up being practically impossible or unrealistic or both. For example, there is a long discussion on the criterion of willingness to pay and derivation of demand curves for estimation of shadow prices for domestically produced goods used by the project. However, in none of the four case studies included in the Guidelines, does this principle find application. Price adjustments are made for foreign exchange, skilled labour and unskilled labour; however, when it comes to other resources, it is tacitly assumed that all the remaining resources are correctly priced by the competitive market mechanism! Similarly the elaborate procedure for calculation of the value of foreign exchange is based on a number of 'technical' assumptions which are far too numerous to state here. However, what is interesting is that the carefully constructed edifice breaks down totally once imported goods are assumed to be rationed rather than distributed through the market mechanism. If goods are rationed, there is no practical way of imputing willingness to pay — unless once again producers can be assumed to be perfect competitors which, of course, they are not.

WASTED EFFORT

The discussion of shadow wage rate, no doubt erudite, represents another wasted effort insofar as its practical application for purposes of project evaluation is concerned. Three considerations are supposed to determine the shadow price of labour: the direct opportunity cost or the marginal productivity of labour, the indirect cost incurred as a result of the reallocation of resources in favour of consumption accompanying expansion of employment, and the social benefit derived from redistribution of consumption in favour of workers. As the authors themselves emphasise, in our present state of know-

ledge, empirical measurement of any of these factors presents a formidable task. However, undaunted by these difficulties, they proceed to derive formulae for measurement of these factors based on a number of simplifying assumptions. As it turns out, the applicability of the formulae thus derived is limited only to cases where the expansion of public sector employment takes place at the expense of private capital formation and capitalists' consumption. Moreover, even in such cases, the data requirements of the formulae are such that it would be a rare planning agency which can do justice to them. Nor perhaps do the authors really expect it to.

The volume is expected to be read by non-economists. However, the liberal use of the jargon and the highly technical level of discussion are likely to put it beyond the reach of all but the most assiduous. Not many policy-makers or project evaluators are likely to survive a sentence such as "switching values of national parameters defined by zero values of these co-efficients (of choice variables) divide the range of national parameters into sub-ranges that indicate the relative importance of various objectives implied by the choice of one project variant over others" (p 147). There is also no step-by-step summary and outline of the proposed method; the only place where one can find a concise statement is in the case studies. As a guide to the method, the case studies are, however, inadequate because they do not go into the question of derivation of appropriate shadow prices, which is the main object of discussion in the book.

Nevertheless, the book is an important contribution to the economics of project evaluation. In particular, it should be compulsory reading for project enthusiasts in the aid agencies, and economists in development centres and advisory services abroad.

Growth and Social Justice

Political Economy of 'Garibi Hatao'

K R Ranadive

If the debate over the so-called 'New Economics' underlying the 'Garibi Hatao' programme has failed to shed much light, it would seem to be primarily for two reasons: (i) the problem involved has been wrongly posed as growth versus justice, and, (ii) it is hoped that by "standing economic theory on its head" a simple solution to the problem can be obtained.

This paper seeks to analyse the relationship between growth and social justice and to discuss the relevance of existing economic theory to this relationship.

While the focus is more on the theoretical issues involved, the discussion is related to the current Indian situation.

"With most problems nowadays the economic answers are only political questions" — Joan Robinson: "Collected Economic Papers, II".

INDIA'S uncanny capacity to coin slogans has secured international recognition. With the President of the World Bank putting his seal of approval on the latest addition to the stock of slogans which we have accumulated over the last two decades, the latest one of 'Garibi Hatao' promises to become the epitome of policy goals for the world at large.

The so-called 'New Economics' underlying the 'Garibi Hatao' programme seems, however, to have thrown many into complete disarray.¹ The debate which has been going on in this area has created more din than was called for. If it has failed to shed as much light, it would seem to be primarily for two reasons: (i) the problem involved has been wrongly posed as growth versus justice and (ii) it is hoped that by "standing economic theory on its head" a simple solution to the problem can be obtained. The present paper seeks to analyse the relationship between growth and social justice and to discuss the relevance of the existing theory to this relationship. While the focus is more on the theoretical issues involved, the discussion is related to the current Indian situation.

ABOUT 'NEW ECONOMICS'

Discussion about 'New Economics' is now bound to appear as flogging of a dead horse. Those concerned with planning and economic policy have already given it a decent burial. After having created the impression — quite erroneously — that it was time to rectify the overemphasis on growth in the

earlier plans, Yojana Bhavan has adopted a more sober posture. The new Approach Paper, prepared under the stewardship of the new Planning Minister, pointedly states that "growth and equality are both indispensable to a successful attack on mass poverty" and "it is inadmissible to ignore or underplay either factor."² Rehabilitation of conventional wisdom should provide solace to those disturbed souls who were worried that growth was being played down in the name of promoting social justice. The anti-growth lobby need not, however, bemoan the premature death of 'New Economics' because the latter was anyway a still-born babe. If anything was premature, it was the christening of it as 'New Economics'.

Neither the Prime Minister's address at the Annual Meeting of the FICCI³ nor the first Approach Paper⁴ submitted by the Planning Commission to the National Development Council denigrated growth as such. To say that "Growthmanship which results in undivided⁵ attention to the maximisation of GNP can be dangerous" and "increase in the GNP must be considered only as one component of a multidimensional transformation of society" (as the Prime Minister did) or that "elimination of abject poverty will not be attained as a corollary to a certain acceleration in the rate of growth of the economy alone⁶ (as the Approach Paper did), is merely to imply that growth is necessary but not sufficient for promoting the ends of justice. If the novelty of 'New Economics' is seen in explicit recognition of this obvious fact, we must all be said to be suffering from short memories. The First Plan had clearly stated that "the elimination of poverty cannot, obviously, be achieved merely by redistributing existing wealth.

Nor can a programme aiming only at raising production remove existing inequalities.⁷

How valid is the assertion that growth was overemphasised in the earlier plans at the stage of formulating the approach? Given India's commitment to the goal of economic and social justice, those entrusted with formulating plans could never opt for maximisation of GNP as an end in itself, leave alone as the only end. Differences in wording apart, the objectives of economic policy have reflected the interpretation put by the First Planning Commission on the Directive Principles of State Policy — viz, to create "an economic and social order based on equality of opportunity, social justice, the right to work, the right to an adequate wage and a measure of security for all citizens."⁸ Development along socialist lines was expected to secure "rapid economic growth and expansion of employment, reduction of disparities in income and wealth, prevention of concentration of economic power and creation of the values and attitudes of a free and equal society".⁹

That actual results belied these intentions is a different matter altogether. It is, of course, not uncommon to assess India's growth performance during the two decades of planning in terms of aggregate or per capita growth indicators. This is the global counterpart of individual precept: Better to count your blessings than bemoan your misfortunes! Yet, in terms of the criteria implicit in the overall policy objectives underlying India's development plans, the performance has to be judged as unsatisfactory. The rise in the share of the higher income groups both in income and consumption, the increase in the proportion of population below the 'poverty line', the growth of cons-

picious consumption on the part of the rich, the increase in the concentration of economic power in the non-government corporate sector, all point to an unequivocal conclusion that 'social and economic justice' has remained an unfulfilled promise.

It is essential to bear in mind that the Indian experience during the last two decades is not unique but conforms to the global pattern. The experience in many developing countries has clearly shown that concentration on economic growth objectives — maximisation of per capita GNP — does not subserve desirable social aims such as (i) provision of productive employment opportunities for all those seeking work, (ii) elimination of abject poverty by raising the minimum living standards, (iii) narrowing of income disparities and (iv) reduction of concentration of wealth and power. The Secretary General of the United Nations was constrained to observe in the 1970 Report on the World Social Situation that "although the per capita incomes rose in all regions during the United Nations Development Decade, social conditions have generally deteriorated and social policies have frequently failed to bring about improvements in mass levels of living, or to meet new social problems."¹⁰ As is to be expected, the reaction to this experience, not only in India but elsewhere also, has been that we should strive for growth with justice. This is the rationale for the emphasis on the needs of the poorest strata of the population.

OLD WINE IN OLD BOTTLE

To seek the novelty of 'New Economics' in the emphasis placed on the needs of the poorest strata of the population — "a direct attack on the problem of unemployment, underemployment and massive low end poverty"¹¹ — is to succumb to the weakness, not uncommon in underdeveloped countries, to take pronounced intentions too seriously. Having won a massive mandate from the people on the basis of a programme with 'Garibi Hatao' as the centrepiece, the ruling party has no option but to make that appear the main thrust of the Fifth Five-Year Plan. A closer scrutiny of the contents of the present anti-poverty programme, however, clearly shows that it does not represent a radical departure from what was attempted in the earlier plans.

The contents of the present anti-poverty programme may be summarised as: (i) provision of employment opportunities so that the poor have incomes, (ii) gearing the pattern of investment

and composition of output to the consumption pattern of the poor, (iii) ensuring the availability of the basic elements of consumption at stable prices, and (iv) provision of social consumption, i.e. education, health nutrition, etc. It is difficult to label all this as in any sense innovative or new, since all these ingredients were very much there in the earlier plans.¹² If the present anti-poverty programme is much more massive than similar programmes in the earlier plans, so is the total size of the plan. The Approach Paper itself admits that the anti-poverty (i.e. the employment generating and social welfare) programmes, though "very important from the point of view of social justice, would nevertheless be a comparatively small part of the total plan".¹³

The very fact that the planners have felt the need to reiterate with greater emphasis the contents of the earlier plans, reflects their awareness that achievements have fallen short of intentions. Yet, the implied suggestion that this was due to resource constraint not only must fail to carry conviction but must cast serious doubt on the feasibility of the programme which is now being proposed. The general assertion made by the Commission, that "the economy has now reached a stage where larger availability of resources makes it possible to launch a direct attack on unemployment and underemployment and poverty, and also ensure adequate growth", (emphasis added) has hardly any firm foundation as even a casual perusal of the Mid-Term Appraisal would clearly indicate.

For that matter, the debate on the issue has also revealed inadequate appreciation of the basic problem involved. To some, the relationship between growth and justice is a non-issue and what is at stake is the "time pattern of growth in GNP". This fails to bring out the complex relation between intertemporal distribution and distribution at a point of time. To some, the conflict is primarily to be attributed to "crash modernisation strategy" followed in the developing countries with the consequent "productivity disparity between segments of the economy which has no historical parallel".¹⁴ To still others, what was wrong with Indian Planning was not "the overall approach and strategy of development" but the failure of the planners "to work out the operational policies, programmes, and projects" and of the political and governmental machinery "to carry out their own appropriate tasks in the development process".

The debate over the so-called 'New

Economics' has provided ample proof to strengthen Marx's contention that "vulgar socialism (and from it in turn a section of democracy) has taken over from bourgeois economists the consideration and treatment of distribution as independent of the mode of production and hence the presentation of socialism as turning principally on distribution".¹⁵ The answer to the question "Is there a conflict between growth and justice?" is "It depends" — because the relation between the two is not independent of the institutional structure of economy. "Any distribution whatsoever of the means of consumption is only a consequence of the distribution of the conditions of production themselves. The latter distribution, however, is a feature of the mode of production itself. ... If the elements of production are so distributed (i.e. they are in the hands of the non-workers in the form of property in capital and land), the present day distribution of the means of consumption results automatically."¹⁶

It may be conceded that ingenious fiscal policies could be designed to alter the market determined distribution by taxation and/or subsidies, so as to reconcile the requirements of growth and justice. It is futile, however, to ignore the basic difference between economies where the level of employment and the distribution of income are determined by institutional and legislative decisions and the "mixed" economies where the discretionary planning powers of the government have ultimately to affect the strategic variables through the diffused workings of the price mechanism. Multiplicity of policy instruments, simultaneously operated, often produces results contrary to what is intended. More basically, democracy does not permit choice of hard options and the soft ones which are chosen are implemented more by default. As a result, the economic laws of the system assert themselves, notwithstanding the gamut of policy instruments.

This is precisely what has happened in India during the last two decades. Faulty legislation and inefficient implementation in the field of taxation have given to "the standard rates of [income] taxation a spurious role in public life" and failed to reduce post-tax incomes of the higher income groups. Increase in incomes has not led to rise in savings but has pushed up consumption levels of those for whom they were already high (implying that savings constraint was underestimated). As a result, the demand pattern implicit in the income structure, widened by the development process, has asserted itself in spite of

is it because of?) capital issue control and licensing policy. Output-mix is shifted not only in favour of output-producing capacity but also in favour of low-priority consumption goods and capital goods directly and indirectly needed for their production. The low-priority consumption goods, being the type consumed in the Western countries, have involved use of modern technology. The result has been low rate of growth of employment, higher turn to physical and human assets, and talk of draft on scarce foreign exchange and continued domination of the developed countries involved in the port of foreign technology.¹⁷ At the other end, availability of food has proved the major constraint on the growth of non-agricultural employment. The prices of food of coarser varieties have risen relatively faster, to the detriment of the lower income groups.¹⁸ While in the pre-1965 period, this may be attributed to the limited possibility of increasing food production in a situation of technically stagnant agriculture, the increased availability of food in the post-1965 period has not brought about a reduction in food prices. The 'big farmer' bias has made mockery of the Agricultural Prices Commission and belied the implicit assumption of the received economic theory that "the state is an impartial arbitrator, not committed to any particular class or group." The continued faith in the policy instruments to ensure both growth and justice, which is implicit in 'New Economics', suggests that the implications of the experience of the last two decades have not yet been fully grasped. The economics of 'Garibi Hatao' is not only the same old wine but in a new bottle. If anything, the alcoholic content of the wine must be found to have been slightly reduced! There has been a subtle change in the policy goals — less emphasis on reducing income inequality and more on relieving poverty.¹⁹ The Approach Paper categorically states that "when we talk of the elimination of poverty as a goal of development, what we have in mind is not the relative concept but a notion of what could reasonably be considered as an absolute level of poverty." The poor and the consequences of poverty tend to attract greater attention than the rich and the sources of poverty even in richer nations. That they should attract all the attention in a poor country, where poverty is far more pervasive and appalling, is inevitable. Yet this cannot justify concept of poverty in terms of absolute subsistence standard.

Without denying the fact of absolute poverty, it should be obvious that every generation's poor are those that are below the average standard of living. Such a concept of poverty has an additional advantage. The basic reason why the last 20 years have witnessed a lengthening shadow between promise and fulfilment of social and economic justice is inequality of incomes and wealth and the consequent concentration of economic power. The relative concept of poverty, in the sense of percentage of population below average income, acquires an added significance as it serves at the same time as a measure, even though the crudest one, of inequality of incomes.

NECESSITY FOR GROWTH IN A POOR COUNTRY

While all the excitement over the so-called 'New Economics' has been much ado about nothing, the basic question involved, viz, the relationship between growth and justice, cannot be written off as a non-issue. It is very much an issue and an old one too. The necessity for 'growth' in a poor country can hardly be a matter of debate. This self-evident point needs to be laboured because the anti-growth lobby is likely to be erroneously interpreted as reflecting the environmental theorists' concern for ecological balance. The growing revulsion against 'growth' in the developed countries²⁰ has been reflected in many preferring to interpret GNP as Gross National Pollution instead of Gross National Product and in some suggesting use of Gross National Welfare in place of Gross National Product as a maximand. The developed countries have certainly moved far away from the early days of development in the United States when Walt Whitman wrote lyrically of the cheerful sight of smoke pouring from industrial chimneys!

More importantly, there has also been a good deal of speculation about whether growth, even if wanted, is in fact possible for very much longer.²¹ The computer-based 'vision' of the limits to growth on this planet within the next 100 years does not, however, imply fear of the advent of 'Stationary State'.²² Rather, it implies hope that mankind would soon realise the need — and the sooner it does so, the greater the chances of success — to strive for "a controlled, orderly transition from growth to 'global equilibrium'" (with population and production in carefully selected balance). The only snag in this 'vision' of a "society in which [man] can live indefinitely on earth"

...with the state of 'global equilibrium' so designed that the basic material needs of each person on earth are satisfied and each has an equal opportunity to realise his individual human potential" (emphasis added) is its feasibility. After all, this must entail a significant change in the existing power structure, not only within countries but also between countries; and therein lies the rub.

Developing countries can, of course, learn a lot from the problems which the developed countries are facing today as a result of their singleminded dedication to high growth rates over the years. For instance, decentralisation of industrial capacity to avail of the natural capacity of the environment to absorb and dissipate wastes at a lower level of damage can be accepted, even if it implies from the short run point of view some loss of potential output because of less 'efficient' resource use. Yet the immediate environmental problem of the poor countries is that of poverty itself.²³ The pollution is caused not by industrial wastes but by the fact that a vast mass of population is condemned to their permanent ghettos of hunger and malnutrition, squalor and misery, disease and decay. In a country like India where 40-50 per cent of the population have incomes below Rs 20 per month (at 1960-61 prices) and 70 per cent are below the average income which itself is low by any standard, no serious economist can question the necessity for both larger and growing output. Nor can the role of the state in ensuring this, whatever its implications for choice for the privileged few, be denied.²⁴

'GROWTH' NOT SUFFICIENT

Yet it is equally futile to deny that growing output need not necessarily promote the ends of justice. The question "Is there a conflict between growth and justice?" cannot be answered unequivocally unless one spells out what is 'growth' and what is 'justice'. Except in a one-commodity world, there is no unambiguous measure of size of national income. A heterogeneous collection of goods and services cannot be added in physical units but only aggregated in value terms. Aggregation in value terms involves use of existing prices which reflect existing distribution of income (itself a consequence of distribution of ownership of given productive resources which are sources of income) and the demand pattern implicit in it. To infer from the fact that "since all consumers purchase at the same or at least similar prices"...there is a community marginal rate of substitution between every

pair of commodities and that is equal to the ratio of their prices"²⁵ involves "illicit aggregation" because it implies that there is social consensus in what is produced independently of distribution. Unequal ownership of 'corn' which can be used to produce bread or cake results in more cake and less bread being produced by altering the relative prices because (i) either the rich prefer cake to bread (and the resource allocation conforms to their preference pattern which exerts greater weight) (ii) or bread is an 'inferior' commodity (resource allocation is affected by differences in income elasticities of demand). If more bread and less cake were produced, there would be an effect, *ceteris paribus*, on relative prices favourable to bread consumers and hence to the poor.²⁶

Thus production and distribution are two different aspects of the same process not merely in the sense that in the very process of production incomes are generated and distributed. Production and distribution are interdependent in a more fundamental sense, viz, distribution determines what is produced and by whom it is determined. The size-distribution dichotomy — and consequently the separation between productive efficiency and distributive justice — has no theoretical basis.

This has implications for the concept of justice itself. The value premise underlying objective of social justice has to be "all men are equal". As such, they have a 'right' to equal opportunities not only in their narrow economic pursuits but more broadly in the fulfilment of their personality. The underlying value premise of justice is thus not maximum aggregate welfare but right of every individual to equal opportunity. Justice, therefore, needs to be interpreted as fairness and not as a "kind of efficiency" as the economists trained in the utilitarian tradition implicitly do. Justice as fairness has its roots in some kind of social contract — fictitious, no doubt — in which parties seek a "just" aggregation or resolution of their individual interests by a "firm commitment in advance" on "principles of appraisal" by "free persons who have no authority over each other".²⁷ The case for equality of incomes ceases then to be uneasy as it has been in the utilitarian tradition. Absolute equality may not be feasible, but it is only with concept of justice as fairness and as an end in itself and not as a means to promote general welfare that measures promoting equity are likely to have a fair chance. While a poor country can ill-afford the luxury of inefficient use of re-

sources, efficiency becomes relative to the distributive goals explicitly accepted.

The interdependence between size and distribution is even more complex in the context of 'growth'. When it is asserted that growth is necessary for promoting the ends of justice, the implied reference is to growth of output-producing capacity and the implied model is a two-sector model — one producing a consumption good and the other a capital good which can be used in the production of both. Assuming that (i) the poor have income only from work and the rich get composite income, i.e., income from work and the whole of the income from ownership goods, and (ii) the poor do not save and the rich do not consume, even to maintain the population at the same level of living standard, a part of the resources have to be devoted to 'maintaining capital intact' (unless one makes an additional unrealistic textbook assumption that the capital goods last forever!). To maintain a growing population at a rising level of living, distribution of resources has to be shifted even more in favour of the capital goods sector. This is essentially a problem of intertemporal distribution: less output of wage goods 'today' in favour of more output 'tomorrow'. If the employment potential of the capital goods sector is lower than that of consumption goods, the choice involved becomes equivalent to a choice between less employment 'today' in favour of more employment 'tomorrow', and even this has implications for distribution of real income among the existing poor shifting as it does against those who fail to get employment.

It is true that the society should not be myopic like individuals and therefore should have a longer time horizon and a lower rate of discount. Yet, even the society cannot have infinite time horizon and/or a zero rate of discount. The latter because even the planners may have to give a little more weight to the living than to the unborn — not because the latter have no votes but because the poverty of the former is too appalling to be ignored. The infinite time horizon is ruled out because the system cannot be geared to "build more mills that should make more mills forever".²⁸ Growth of output-producing capacity is for production of consumer goods and the most relevant question is, what type of consumption goods the capacity is being increased for.

This exposes the additional limitation of the two-sector model, viz, the assumption that the rich do not consume. Not only do the rich consume

but their consumption basket is different from that of the poor. Even if they save more, saving is mainly saving to spend later. If the growth process increases the incomes of the rich at a faster rate than the incomes of the poor — as it actually does, if assets are privately owned, because the shift in the sectoral distribution of labour force and in the composition of output increases the return to physical and human capital relatively to human effort²⁹ — the desired consumption baskets of the two become even more differentiated (in terms of the weight of 'luxury' products) because of differences in income elasticities of demand for different consumption goods. What we need, therefore, is a three-sector model: (i) sector producing consumption goods for the rich, (ii) sector producing wage goods for the poor, and (iii) sector producing capital goods (which can be used in the production of any of the three goods). The model can be easily extended to *n* sectors to allow not only for many consumption goods but also for capital goods directly and indirectly needed for production of various consumption goods. What has to be planned is not growth of productive capacity but the composition of consumption goods in the production spectrum — consumption profile over the time horizon (each consumption good sector being vertically integrated to include capital goods directly and indirectly needed for its production).³¹ The interdependence between size and distribution is complex in the context of growth, essentially because the problem of intertemporal distribution is intertwined with that of distribution at a point of time. Emphasis on rate of investment independently of pattern of investment, on rate of growth of GNP independently of content of GNP, is mainly responsible for clouding the understanding of relationship between growth and justice. To reconcile the two, what is needed is not only 'saving squeeze' but 'consumption twist'.

All this, of course, sounds very trite. But then economists should be the first to admit (if they are honest) that most of the time what they talk, shorn of technical jargon, is so. Economics, after all does not admit of spectacular discoveries. As Pigou said a long time ago, "it does not shatter atoms or weigh stars". In the context of our discussion, what seems trite needs to be elaborated because many of us seem to miss the full implications of ignoring the 'distribution-consumption-production' nexus. Of course, economists are no less prone to hum popular tunes than others.

Growth with social justice having become the catchword of the day, the most popular theme to talk and write about today is composition of output and content of growth (with 'composition' and 'content' italicised!). If, however, a bewildered would-be Ph.D. aspirant, vainly looking for a subject for his dissertation, were to opt for "Two Decades of Planning", he would have a different story to tell.

PLANNING MODELS

Planning models which provided the framework for successive Five-Year Plans in India — whether as "post-facto" rationalisations of investment decisions taken on political grounds" or explicitly designed as basis for plan formulations — ignored effectively the heterogeneity of consumption goods. If the Harrod-Domar type exercise of the First Five-Year Plan explicitly involved concern for 'saving squeeze' only, the Feldman-Mahalanobis type of structural model of the Second, with its emphasis on 'transformation' constraint and the supply of capital goods, involved implicitly the assumption that there would be no difficulty in ensuring the 'saving squeeze'.³² The more sophisticated intertemporal-multisectoral models developed during the period of the Third Plan by Chakravarty, Eckaus, Lefebvre and Parikh (CELP), were designed to work out "the logic of an intertemporally consistent multi-sectoral planning model" dealing with "optimisation over time". They still failed to work out even a logical solution to the problem of reconciling growth with justice because they assumed "consumption of constant composition" in each period which, in effect, implies one consumption good. As one of the authors of the model himself admitted "clearly the assumption of a fixed-consumption pattern, in turn, implies the CELP model assumed identical, constant returns to scale tastes for each individual, thus ruling out explicit consideration of the question of the effects of changes in income distribution on consumption patterns".³³ Even the wage-goods approach, embodied in Vakil-Brahmanand model (offered as a rival to Mahalanobis model), with its emphasis on the need to minimise the time required to attain full employment, failed to take account of the full implications of the existing income inequality for output-mix. It was assumed that until the attainment of full employment "real wages [would be] held to the minimum possible" and that luxury consumption would be prevented.³⁴

The Indian economists were, of

course, in good company. The prophet of 'New Economics' Mahbub ul Huq, whose piece in *Insight*³⁵ has triggered off the discussion, had categorised "the heart of the growth problem [as lying in] maximising the creation of surplus".³⁶ His concept of 'socially Necessary Rate of Growth' required the plan size to be adequate to (i) maintain per capita income, (ii) absorb net current additions to labour force during the plan period, (iii) keep the country abreast of its underdeveloped neighbours in its economic race with them, and (iv) maintain the momentum of development and lead to a self-sustained rate of growth in the long run.³⁷ While Haq recognised the deficiency in Pakistan's long-term growth model insofar as it remained "entirely divorced from demand analysis" (which was attributed to "the complete absence of basic data"),³⁸ that this implied that the required 'consumption twist' became an unknown variable was not realised. This was essentially, however, because Haq started on the wrong foot when he asserted that "it is... immaterial who owns the surplus — whether 'the capitalist' as in a free enterprise economy, or 'the state' as in a communist economy".³⁹ No distinction was drawn between 'creation of surplus' and 'realisation of surplus', because the success in ensuring the required 'saving squeeze' was taken for granted. Not only was inequality of incomes considered as providing potential for raising the average saving ratio but the danger in "redistributing incomes in the name of social justice" from the viewpoint of realisation of surplus was clearly pointed out.⁴⁰ Mahbub ul Huq of 1963, who maintained that "a philosophy of growth [makes it necessary to] shelve for the distant future all ideas of equitable distribution and welfare... [that] these are luxuries which only developed countries can afford" or that "growth philosophy demands that the expenditure on the provision of social services should be given less emphasis",⁴¹ is certainly different from Mahbub ul Huq of 1972. The most important gain from working in International Organisations seem to be the opportunity of 'Learning by Seeing'!

It may be said in defence of Huq that insofar as "planning in Pakistan [had] not proceeded... within the framework of any definite political philosophy"⁴² the "philosophy of growth" underlying the strategy of planning he elaborated could be regarded as a "technical exercise". Huq himself realised that "planning cannot proceed indefinitely in such a philosophical vacuum"

and suggested that "the Third Plan [should be] within the framework of a more socialistic philosophy than the previous two Plans".⁴³

The Indian economists, however, had no justification for ignoring the likely conflict between growth and justice, given the explicit commitment to the goal of economic and social justice in the plan framework. It could, of course, be argued in their defence that they interpreted the "development strategy" broadly to cover "the whole complex of policies by which government can influence the form and rate of economic development": import and investment licensing, fiscal policy, exchange control, labour and wage legislation, credit schemes, interest rates, public sector projects, and so on. After all, the planners had shown sufficient awareness of "changes in the pattern of economic activity" as "development alters the level as well as structure of demands and supplies [which in turn] changes the allocation of resources".⁴⁴ They had also provided various policy instruments to make the chosen strategy compatible with the basic objectives. In all good faith, the economists expected them to be operated effectively. True to their creed, not only did they take the institutional structure as given but ignored the constraints it involves for successful operation of policy instruments which run counter to the rules of the game of the existing system.

More surprising has been their reluctance to take cognisance of this crucial factor even in their *ex post* assessment of the performance of the Indian economy during the two decades of planning. It is not uncommon to assess India's growth performance during the two decades of planning in terms of aggregate or per capita growth indicators and find it "impressive". It would be difficult, however, to deny that in terms of the ultimate objectives, the performance has been far from satisfactory. Yet the economists have not even felt the need to use 'shadow prices' in calculating the rate of growth of GNP, although they use the concept in formulating planning models despite the fact that in that context "it begs a number of questions and recreates a spurious impression of objectivity".⁴⁵ If in calculating the growth rate of national income, they were to 'inflate' the 'implicit deflator' to make allowance for the higher rise in price of food, particularly coarse foodgrains, and put zero valuation on the growth of output of 'luxury' products — because of their being outside the spectrum of planned

consumption profile — the 3.6 per cent annual rate of growth of national income during 1950-51 to 1970-71 would turn out to be very much lower. It would be wrong to infer that there has been less justice because there has been less growth. As conventional measure of growth rate of GNP is irrelevant and needs to be replaced by one which embodies the relative social significance of different goods and services in terms of the ultimate goals of policy, the correct inference would be the reverse: there has been less growth because there has been less justice! This is not semantics for it implies that in plan formulation growth rate *per se* is irrelevant. The insistence on working out the overall rate of growth in the Fifth Five-Year Plan reflects, therefore, concern for an irrelevant magnitude, which is logically unwarranted (unless it is a sop to the growth lobby!).⁴⁶ If Economics of 'Garibi Hatao' cannot throw off the shackles of conventional wisdom even to this extent, it certainly has a dubious claim to be called 'New Economics'!

RELEVANCE OF EXISTING THEORY

The hope that a simple solution to the problem of growth with justice can be obtained by "standing economic theory on its head" is naive. There is already a growing scepticism about the "relevance" of "western economic theory" to explain "the variation in the wealth of nations" or analyse the problems of underdeveloped countries.⁴⁷ The more basic question, however, is, where is the economic theory which is to be stood on its head.

None of the existing growth-distribution theories is adequate to explain the complex relationship between intertemporal distribution and distribution at a point of time which is the crux of the problem of growth with justice. The neoclassical theory which purports to provide "an impersonal and politically neutral solution to what was for Ricardo 'the principal problem in political economy'" fares, of course, the worse. This is not only because its implicit assumptions cannot bear close scrutiny but because, in extending its microeconomic concepts to macroeconomic field, the concept of Capital-in-General shows itself as a broken reed. While the 'value of capital' — varying as it does with wage rate and profit rate — is neither useful nor necessary to determine technical choice, the concept is necessary to understand the distributive implications of growth process in an economy where capital goods or the claims to them are privately owned.

But what determines wage rate and profit rate? Whatever the justification in steady state growth models for assuming either the real wage or the profit rate to be exogenously determined,⁴⁸ for the problem in hand, the approach has nothing to recommend it. Nor is there any justification for assuming uniform profit rate as is done in the context of the theory of long term normal prices. Imperfections in product and 'factor' markets need to be specifically taken into account to understand the changing structure of prices, which is one of the variables determining the distribution of real income.

The most serious limitation of the existing growth-distribution models is their assumption that all sectors grow at a uniform rate implying the existence of a composite commodity of fixed and invariable composition through time. The deficiency cannot be got over merely by assuming non-proportional expansion of *per capita* demand for different commodities with increase in *per capita* real income in accordance with Engel's Law.⁴⁹ This may be adequate to take account of structural changes inherent in the growth process and of sensitivity of relative prices to changes in pattern of demand. It still leaves out two crucial elements: (i) that output-mix at a point of time is a function of income distribution and the pattern of demand implicit in it and (ii) that shifts in output-mix are affected by changes in income distribution resulting from the process of growth itself.

This is the "Second Crisis of Economic Theory" which the saddened Joan Robinson — her anguish all the greater because of the "throne of superfluous economists" she sees around her — talks about in her Ely Lecture. "The first crisis arose from the breakdown of a theory which could not account for the level of employment. The second crisis arises from a theory that cannot account for the content of employment".⁵⁰ The received doctrine has no solution to offer to the growth-justice riddle!

BEYOND ECONOMICS

The two crises are, however, very much related. The reason why the first crisis has yet not been resolved is precisely the one why the second has come up. Arguing against the prevailing orthodoxy, it was natural that Keynes should have tried to prove that government expenditure could increase the level of employment. The actual operation of the "Keynesian" policies has clearly shown that "what employment

should be for... which primarily concerns the allocation of resources between products but... is also bound up with distribution of products between people" is as important as level of employment. On the one hand, high level of employment, maintained through government spending on armament production, has "turned into a nightmare" Keynes's "pleasant daydream" of exhaustion of the need for investment, euthanasia of rentier, elimination of poverty, and civilised life for all. On the other hand, the problem of maintaining near full employment without inflation has defied solution because at the heart of it lies the question of the sanctity of the existing distribution. The apparent economic answer to the problem of level of employment has turned out to be a political question!

The reason why received economic theory has no answer to the distribution puzzle is not far to seek. Theory which accepts the institutional structure as given and assumes if not identity of interest, at least social harmony — in the sense that there are "no irreconcilable conflicts of interest between social groups" —, is naturally ill-equipped to provide the answer. The main run of economic theory has been characterised by "a strange lack of power considerations". The neglect of the role of power can be made good only by going beyond the narrow confines of economics. While "movement along our narrow specialised trails" offers prospects of elegant results, "economics as a separate science is unrealistic, and misleading if taken as a guide in practice. It is one element — a very important element, it is true — in a wider study, the science of power" (Bertrand Russell). If the plea "to stand economic theory on its head" provides inspiration to tackle the problem of growth and justice in a wider perspective, it would serve a useful purpose. Else, merely redefining the development objectives without analysing institutional structure, property relations, and sources of power, is a meaningless exercise. Any attempt to graft a 'Chinese' solution on an 'Indian' economy is foredoomed to prove futile.

ICSSR

INDIAN COUNCIL OF SOCIAL SCIENCE RESEARCH

IIPA Hostel Indraprastha Estate, New Delhi-110 001

Short-Term Training Courses in Research Methodology

The ICSSR invites applications from those:

- Students who are intending to register for Ph.D.;
 - Research scholars who are in the initial phase of their Ph.D. work;
 - Lecturers; and
 - Research workers
- who wish to participate in any of the training courses in Research Methodology listed below:

Venue	Course Director	Duration
Foundation Courses		
1 A N Sinha Institute of Social Studies, Patna-1	Prof. Sachchidananda	June 4 through July 18, 1973 (6 weeks)
2 Indian Institute of Public Administration Indraprastha Estate New Delhi-110 001	Prof. A. P. Barnabas	May 14 through June 23, 1973 (6 weeks)
3 Council for Social Development, 53 Lodi Estate, New Delhi.	Dr Prodipto Roy	Nov. 5 through Dec. 17, 1973 (7 weeks)
Discipline and Technique Specific Courses		
4 Sociology-Social Anthropology Department of Anthropology and Sociology University of Saugar Sagar (MP) 470003	Dr Leela Dube	Nov. 5 through Dec. 1, 1973 (4 weeks)
5 Social Work Tata Institute of Social Sciences Sion-Trombay Road Bombay-88.	Mr P. Ramachandran	June 3 through June 30, 1973 (4 weeks)
6 Human Geography Institute of Development Studies University of Mysore Manasagango-tri Mysore-6.	Prof. R. P. Misra	October 1 through 27, 1973 (4 weeks)
7 Political Science Deptt. of Political Science, Rajasthan University, Jaipur	Prof. Iqbal Narain	Date to be decided (6 weeks)
8 Data Processing Council for Social Development, Lodi Estate New Delhi	Dr B. N. Mukherjee	October 5 through 20, 1973 (2 weeks)

Selected candidates will be paid for their travel; their boarding and lodging will be free. Please write for the application form immediately to:

- 18 See Report of the Committee on Distribution of Income and Levels of Living Part II, pp 32-33 and pp 110 and 113.
- 19 Alternative variants worked out for the Fifth Five Year Plan are based on assumed reduction in consumption inequality. This would imply that either the tendency for income structure to widen, which is inherent in the growth process, is underestimated or it is assumed that the saving ratio can be stepped up.
- 20 As representative examples, reference may be made to E J Mishan: "The Costs of Economic Growth" and J K Galbraith: "The New Industrial State".
- 21 See "The Limits to Growth" by Donella H Meadows, Dennis L Meadows, Jorgen Panders and William W Behrens.
- 22 There is, of course, a school of thought, closely identified with John Maddox, editor of the British magazine *Nature*, which vehemently challenges the 'Doomsday Prophets'.
- 23 This would be in keeping with the view Boulding has been presenting for a long time, viz, "Environment is simply part of the capital stock of human welfare.... Consequently, when we are evaluating the environment, we are also evaluating man himself as part of a total system.... Unless there is a 'public', i.e, unless the people who share the enjoyment of public goods and the distress of the public bads (emphasis added) constitute enough of a community to permit public action... public bads will not be disposed of adequately... The presence of pollution is a symptom of the absence of community". See Kenneth, E Boulding: Discussion: "The Political Economy of Environmental Quality", *The American Economic Review, Papers and Proceedings*, May 1971, pp 168-69.
- 24 Familiarity with affluence may also breed, if not contempt, ennui, at least with the mode by which it is ensured, as it seems to be happening in Sweden. While retaining its capitalist structure (80 per cent of all industrial enterprises are privately owned), the country provides 'socialised paradise' of the most developed welfare state. Of late, however, people are beginning to grumble about, among other things, having too little choice in how they live. (vide Robert Roth, 'Sweden: Too Much Paradise?' *Deccan Herald, Weekly Magazine*, Sunday, November 5, 1972.
- 25 Dorfman, R: "Prices and Markets", p 91.
- 26 The interdependence between size and distribution of national income is thus rooted not in the fact of multiplicity of commodities and services constituting national income but unequal ownership of 'corn'. Imagine a situation where two individuals possess equal amount of 'corn' and have access to the same technological possibility of transforming bread into cake. If both have the same preference pattern, both would equate their common marginal rate of substitution on production side with that on consumption side. If preference patterns differ, each would produce the same output-mix at a common price ratio and through exchange acquire the commodity-mix which makes him better off than before the exchange. If equilibrium condition is specified such that total quantities of the two commodities after allowing for exchange are exhausted, neither of the two individuals can have greater weight in the determination of the common price ratio. It is not valid therefore to maintain that line of absolute equality in Lorenz curve implies equal distribution only in one commodity model (vide C T Kurian, *op cit*). With equal ownership of 'corn' it still implies equal distribution of real income even in multicommodity model whether the composition of consumption is the same or different for two individuals.

Taxation of Agricultural Wealth and Income

A Note on the Raj Committee's Report

E T Mathew

The Raj Committee's report has provoked a great deal of public discussion since it was submitted in October 1972. As the major recommendations are well known by now, this article does not attempt to recount them here. Instead, the author comments on some of the more important aspects of the Report.

FAMILY AS TAX-PAYING UNIT

THE Committee has recommended that the family should be the tax-paying unit for assessment of agricultural as well as non-agricultural (non-corporate) incomes. It is perfectly valid to argue that since ceilings on land holdings have been applied to family holdings, the Agricultural Holdings Tax also should apply to family holdings. Clearly, no other argument is required to justify adoption of the family as the tax-paying unit in respect of AHT. But the Committee has deemed it necessary to advance the argument that "the family and not the individual earner is the recipient of income from all sources of production activity in which the members of the family engage severally or jointly" (pp 90-71, Report) in defence of its preference for the family as the tax-paying unit. And, interestingly, it goes on to argue that the same criterion should be extended to the non-agricultural sector. Now, there may or may not be a case for adopting the family as the tax-paying unit for non-agricultural taxation. But the case does not necessarily rest on the suitability of the principle for the agricultural sector.

Essentially, the case for treating the family as the tax-paying unit is based on equity. "People in equal income positions should be treated equally, independent of their source of income."¹ Suppose there are two families, A and B, of equal size. Let us assume that in family A the husband alone works and that his annual income is Rs 12,000. In family B, both husband and wife work, their annual incomes being Rs 7,000 and Rs 5,000, respectively. Family B had a total income of Rs 12,000, like family A. Under the existing rules and at the prevailing rates, family A will be liable to pay Rs 924 and family B, Rs 220 towards income tax, ignoring concessions in respect of contributions to provident fund, life insurance policy, etc. Though these two families have equal incomes, the income tax liability of family A is over four times that of family B. The inequity has arisen as a result of treating the husband and wife separately for income tax purpose.

It is important to note that if income tax were proportional in rate without exemptions, the tax liability would be the same for the two families referred to in the preceding paragraph regardless of the unit on which liability was placed — the individual or the family. If on grounds of equity, we argue that two families with equal (aggregate) incomes should be treated equally for tax purposes, it follows that two families with equal incomes but unequal number of dependents should be treated differently. For instance, a family of seven with a given income will be less well off than a family of two with the same income. This is recognised by granting exemptions in relation to family size. Under the income tax rules now in force in India, differences in family size are not taken into account in determining the tax liability. Every assessee is provided an initial exemption of Rs 5,000 regardless of the size of his family. The assessee may well be an unmarried person earning Rs 5,000 annually or he may be a married person with a wife and six children to support and having an income of Rs 10,000. It is surprising that the Committee which argues that "in equity two families with equal incomes should bear tax at similar rates irrespective of whether the income is earned by one member or by several members jointly" (p 91), is silent on the problem posed by differences in family size. In most families where the wives go in for salaried employment, they do so because the husband's salary is insufficient. The larger the number of children, the greater the pressure on the wife to supplement the husband's income. If in equity it is argued that two families with equal incomes should pay the same tax, we may also argue that of two families with equal incomes, the smaller family should pay more tax than the larger family.

Some tentative suggestions regarding exemption for dependents are given below. Instead of providing a blanket exemption of Rs 5,000 for all assessees, we may fix a much smaller amount as the personal allowance for each dependent including the assessee as is the practice in USA. In USA it is \$600

presently. In terms of per capita incomes prevailing in the two countries, six hundred dollars in USA is a much smaller amount than Rs 5,000. In India we may fix Rs 1,500 as the personal allowance. This would mean that a family of two (husband and wife) with an income of Rs 3,000 will not have to pay any income tax. Similarly a family of 4 (husband, wife and 2 children) will not have to pay any tax if their income does not exceed Rs. 6,000. If this system is followed, it will also be perfectly legitimate to permit families to file individual or joint income tax returns. If the husband files his tax returns individually and claims dependents' allowance for all his children, the wife in her return can claim allowance for herself only.

The above proposal might be objected to on the ground that it goes contrary to the population policy pursued in our country. In fact this question has been debated in many developing countries. As Prest points out: "Opinions can legitimately differ about the influence of financial considerations on birth rates. But unless and until it can be shown that such factors have no effects at all, it seems necessary to discuss them."² Generally low-income families have more children than middle and high-income families. Low-income families, because of their low incomes, pay either no income tax or nominal income tax. Hence a system of income tax allowance for dependents (children) cannot have any decisive influence on their family size. On the other hand, it is highly improbable that high-income families will go in for more children to take advantage of the income tax allowance. The cost of rearing an additional child including the cost of education is most likely to offset the income tax advantage. However, in view of the fact that the government has been actively supporting family planning one is justified in recommending that "children's allowances for tax purposes ought to be on a niggardly rather than a generous basis."³ There are several ways of making children's allowances for income tax purposes "niggardly". One is to limit the allowance to a certain number of children,

TABLE : PERCENTAGE DISTRIBUTION OF ACREAGE UNDER DIFFERENT CROPS IN KHARIF AND RABI SEASON, 1960-61, IN SIHAJHARAD, BIHAR

say, three. This is what J E Meade recommended for Mauritius.⁴ Another method is to set a lower allowance for children compared to the allowance granted for the tax-payer and the spouse. In the words of Due, "Costs of maintaining a given level of living clearly do not rise proportionately with numbers of dependents. Many basic costs of operating a household are, at least over a considerable range, independent of the size of the family. Accordingly, the figure justifiable for the first child or other dependent is less than that for the tax-payer and the spouse, and that for successive children less than the amount for the first."⁵ Of course, it is possible to have many variants of this alternative. In this note we will not argue which alternative to choose. We may sum up our main contention in the preceding paragraphs thus: If on equity grounds family is adopted as the tax-paying unit, on the same grounds differences in family size should be given due consideration.

RATEABLE VALUE FOR CROP-GROUPS

To take care of cases where more than one crop is grown on the same holding, the Committee has suggested that the crops in a district/tract be suitably grouped into a few crop-groups, the average rateable value for each such group be worked out and the rateable value of an agricultural holding determined on the basis of the rateable values of the relevant crop groups.

There are two problems involved in this procedure. The first problem is posed by holdings where one crop is followed by another crop within the same year or in the subsequent years in a standard rotation of crops. The second problem is posed by holdings where more than one crop is cultivated simultaneously. This is the problem presented by mixed-cropping.

The estimation of rateable value for holdings where a standard rotation of crops is followed need not present any serious difficulty. Farm management data can be used to prove this point. For instance, take the case of Bihar. Farm management data on cropping pattern for Shahabad district in Bihar⁶ show that paddy almost entirely dominates the kharif season in all the regions. In the rabi, on the other hand, quite a large number of crops are grown such as kesari, wheat, gram and other miscellaneous legume varieties. Their relative importance (in terms of acreage under cultivation) varies from zone to zone. The relevant data are summarised in the Table.

It is clear that once we have data for each tract or zone which falls into the above pattern, the estimation of rateable value for holdings under different crop-groups (for each zone) cannot be too difficult. For within the same zone, rotation of crops remains the same from year to year. This is the typical situation in most states. The other problem posed by holdings where several crops are cultivated simultaneously — the problem of mixed cropping — is typical, perhaps, only of Kerala. Of course, there is an element of mixed cropping in the case of standard rotation also as can be seen from the Table, but this is only marginal as a single crop dominates whether it is the kharif season or the rabi season. Even in Kerala, mixed-cropping is applicable only to 'garden lands'. The paddy fields as well as the plantations follow a definite pattern of monoculture where inter-planting of different crops is ruled out. Mixed cropping is followed only in the case of crops like coconut, tapioca, banana and other plantains, yam, ginger, etc. Out of a total sown area of 29.16 lakh hectares in 1969-70, the area that could possibly be used for mixed cropping amounted to 16.96 lakh hectares.⁷ It, however, does not follow that this entire area was in fact devoted to mixed cropping. The actual area under mixed crops must have been much smaller since it is quite logical to assume that there are quite a good number of gardens exclusively devoted to coconuts and tapioca. Unfortunately, we do not have any comprehensive data for the entire state to show the extent of area under mixed crops. The Farm management study for Kerala refers only to one type of mixed cropping, namely, the coconut-tapioca mix.⁸ And obviously, it refers only to sample households selected for the study. In all, 19 sample cultivators in Quilon district out of a total of 150 selected for the study (spread over two districts, namely, Quilon and Alleppey) were reported to practise mixed cropping of the coconut-tapioca type. The area under this crop-mix accounted for 2.1 per cent of the total land comprising the sample and 7.4 per cent of the total garden land in all holdings. In view of the comparatively limited information on mixed cropping provided by the Farm Management study for Kerala, we may have to resort to other ways of tackling this problem. In general, the most feasible method will be to count the number of trees where perennial crops like coconuts, arecanuts, etc., are combined with AHT on the leased out portion? Fur-

seasonal crops like tapioca. And it is well known that wherever perennial crops are combined with seasonal crops, the latter plays a relatively minor role in terms of income. Further, in view of the recommendation of the Committee that for holdings with rateable value of less than Rs 600, the Agricultural Holdings Tax should be fixed at the flat rate of one rupee per holding, one does not have to worry about estimating rateable value for holdings below 1 or 1.5 acres on which mixed cropping may be followed.

The Committee has preferred the potential income basis to the actual income basis. There may be a valid case for preferring potential income to actual income as a proper base for agricultural taxation. But the preference cannot primarily be based on the difficulties involved in the computation of actual income as the Committee argues. If the computation of actual income is difficult so is the computation of potential income. In fact, the Raj Committee report has been criticised on the ground that the procedure involved in arriving at the rateable value is bound to be time-consuming and very expensive.⁹

However, in underdeveloped countries agricultural taxation based on potential income can serve as a very effective form of incentive taxation. While those who neglect their lands will be penalised, others who take good care of their lands will be rewarded since potential income is based on average performance.

OPERATIONAL VERSUS OWNERSHIP HOLDING

The Committee has recommended that the AHT should be applied to operational holdings and not to ownership holdings. This can be justified on the basis of valid economic reasoning. If income from farming (estimated in one manner or another) constitutes the tax base, it is operational holding and not ownership holding that is relevant because one does not necessarily have to own land in order to derive income from land. The Committee, however, seems to be more impressed by the administrative convenience of this distinction. It also thinks that "the adoption of this basis will discourage illegal or concealed leases of land because if a landowner leases out land without getting it duly registered, he will be liable to the payment of AHT on the same" (p 45). But how could illegal leases of land be prevented as long as the market rent received is larger than the

ther, farmers would be encouraged to make false lease-outs to relatives and friends to take advantage of lower rates of tax. Apart from all these considerations, it is most likely that in a situation where land hunger is acute and land distribution is highly skewed, illegal or concealed leases of land will persist.

In this context we may also refer to an ambiguity in the recommendations of the Committee. The rateable value of a holding is taken to be equal to its gross output minus costs of cultivation including irrigation expenses. The Committee has proposed that normally deduction at the rate of 40 per cent of the value of gross output may be allowed on account of costs of cultivation. In the case of leased-in lands it is obvious that rent has to be paid. However, it is not clear whether the 40 per cent deduction includes rent on the leased-in lands.

IMPLEMENTATION OF PROPOSALS

The task of implementation of the Committee's proposals is divided into two parts: the first part which applies to operational holdings with rateable value of Rs 5,000 or more should be undertaken by all the state governments immediately on a uniform basis; the second part which is related to operational holdings with rateable value below Rs 5,000 may be left to the judgment and convenience of each state government. One can understand the Committee setting a longer deadline for implementation of the second part in view of the greater preliminary work required by the much larger number of holdings falling in this category. But we cannot understand why the matter should be left to the judgment and convenience of each state. Once it is left to the discretion of the state governments, the chances are that the AHT will never be implemented for holdings with a rateable value below Rs 5,000. This would result in a dual system of taxation for agriculture. A likely concomitant of this arrangement is that attempts will be made to include holdings with rateable values in higher ranges but close to Rs 5,000 in this category in order to take advantage of the lower rates of land revenue.

The separation of agricultural and non-agricultural incomes for tax purposes causes not only loss of revenue to the government, it also violates the principle of horizontal equity as between different tax payers. Hence suggestions have come from different sources for the integration of agricultural and non-agricultural incomes for

purposes of taxation. The Committee is of the view that complete integration of the two categories of incomes would not be a satisfactory solution to the problems of inequity and evasion. It has, therefore, recommended a partial integration of the two incomes in determining the rate of tax applicable to the non-agricultural income assessable under the Income Tax Act, 1961. According to the scheme of partial integration proposed by the Committee, both the agricultural and non-agricultural components of a tax-payer's income will be aggregated and the tax on the non-agricultural portion will be levied as if it were placed in the top slabs of the aggregate income. While the idea of integration is commendable, the Committee's proposals may be criticised on at least two counts:

(1) A major factor which weighed with the Committee in recommending the AHT based on rateable value was the great difficulty in computing actual agricultural income (pp 71-72 of the Report). Now, for partial integration, the Committee is resorting to the very same actual income from agriculture. If computation of net income from agriculture is possible for the purpose of partial integration, it should be possible also for the exclusive taxation of agricultural incomes by state governments. Then why bother about introducing a new tax, AHT?

(2) The partial integration proposed by the Committee is too partial. While agricultural incomes are clubbed with non-agricultural incomes under the Central income tax no such aggregation is recommended for the taxation of agricultural incomes. This is certainly inequitable because there is discrimination in favour of agriculturists with non-agricultural incomes below the exemption limit. The main difficulty which the Committee foresees in clubbing agricultural and non-agricultural incomes for purposes of agricultural taxation would arise when assesses happen to derive their agricultural income from more than one state and each state insists on levying a tax on agricultural income originating in its territory with reference to the taxpayer's total income from all sources, agricultural and non-agricultural. Surely, the number of assesses who derive agricultural income from more than one state cannot be so large as to present any major problem. Further, even granting that there are quite a numbers of such cases, it cannot be too difficult for the states concerned to arrive at a mutually satisfactory arrangement regarding the sharing of the proceeds.

East Coast Breweries

EAST Coast Breweries and Distilleries are making good progress in the civil constructions at the Paradeep port site for their brewery which is to manufacture 50,000 hectolitres of beer per annum at a cost Rs 1.5 crores.

The company has awarded the turn-key contract, for building their brewery at a cost of Rs 1.08 crores, to Larsen and Toubro who are experts in the field. In this connection an agreement has been signed on March 30, 1973, and an advance of Rs 27 lakhs has also been made to the contractor.

Some of the salient features of the agreement are that the brewery will be provided with a "Steincker" Brew House of West German origin which has a world-wide reputation as one of the most modern and versatile Brew Houses, an expert German Brew Master for one year, and training in West Germany free of cost for six months for one of the company's experienced Indian Brew Masters. The contractor has also guaranteed production of quality beer of international standard and in record time of 18 months from the date of the agreement. The company is expected to go into full production in the second half of 1974.

FROM THE CHAIR

Guest Keen Williams Limited

Statement by the Chairman, Mr K C Maitra

THE following is the Statement by the Chairman, Mr K C Maitra, on the occasion of the Forty-third annual general meeting held in Calcutta on April 27, 1973:

It is my pleasant task to welcome you to this 43rd Annual General Meeting of your Company. The Accounts and Directors' Report have been circulated and with your permission I shall take them as read.

BOARD OF DIRECTORS

It is with very genuine regret that I have to announce to this meeting the retirement from GKW of Sir A Ramaswami Mudaliar. When your Company went public in 1956, Sir Ramaswami joined the Board as one of the first non-executive Directors elected to assist in the guidance of GKW in its new form. As it happens I also became a Director that same year, and hence for 17 years it has been my personal privilege to work with Sir Ramaswami in building up your Company to its present position. His wise and mature counsel has been of inestimable value, and on your behalf and mine I am glad to have this opportunity to record our sincere appreciation of his services.

You have already been informed of the appointment of Mr K K A Ramachandran as Deputy General Managing Director of your Company from 24th November 1972. The appointment recognises Mr Ramachandran's long service in key roles within the Company, and I warmly commend it to you.

OPERATIONS DURING 1972

The salient details of GKW's performance are given in the Directors' Report, and I would merely wish to comment on and amplify certain major themes.

First, to someone like myself whose lifetime work in India has been concerned with the power generation and distribution programme, it is distressing to see our country passing through yet another power crisis. If that crisis had been caused by exceptionally rapid growth in demand, we would in a sense rejoice—if, that is, production of food and industrial goods was rising very fast, unemployment falling, inflation coming under control. But the crisis is in fact due to worsening operation of facilities we already have, and incidentally cannot be wholly or even mainly blamed on last year's deficient monsoon. The power programme is the most vital cornerstone in all our plans for economic growth and social

justice, in both the industrial and agricultural sectors. All necessary steps must be taken to improve the maintenance and running of existing generating capacity, and to restore the rate of growth in that capacity to the peak figures reached in 1968/71.

On the brighter side, it is a pleasure to record a second year in succession during which we in GKW have enjoyed good labour relations, with consequent benefit both to the Company and to our employees. It is not sufficiently often stressed that achievement of a full year's wages and bonus is by far the best contribution which trade unions

Mr K C Maitra

and management can make to working people's standard of living—rarely is the loss of wages due to industrial action made up by later gains, even if a concession is secured from the employer. How much more disastrous, then, is that type of industrial action which is directed towards a political purpose. Power struggles between different political factions, conducted through rivalry for control of unions, cause untold hardship to working people with no conceivable gain for themselves. I earnestly hope that this ugly feature of the industrial scene may be quickly banished.

Lastly, may I recall the warning I gave last year, of how the combined impact of inflation, high tax rates, and growing volume of business would eat into liquid resources. How right this proved to be! We have inescapable obligations to finance stocks, both to maintain employment and provide customer service, and we believe it right to cover modest expansion from self-generated resources. The need for

retention of earnings in an inflationary economy is therefore high, and the pretax profit level required to achieve those retentions is of course higher still.

EXPORTS

I again have to report that we are dissatisfied with our export performance: it is ahead of 1971, but below the best figure achieved in 1968. At that time, certain products of your Company were permitted for export which are now forbidden due to domestic needs, and we were also engaged in support of some overseas contracts which have not repeated.

That markets appear and disappear is a fact of life in the export trade. The American import surcharge in 1971, and trade problems with Sudan and Yugoslavia, are other obvious examples. This is not a complaint, merely an observation on what exporting means in real life. It implies that to be successful an exporter must above all have the ability to respond quickly to new opportunities. I would therefore strongly urge the utmost simplicity and speed of operation in any official procedures connected either with exports directly, or with procurement of supplies to support export production.

I am particularly perturbed by the export bond included as Appendix 35 of the import Trade Control Handbook. It is entirely right that where an industrial licence, or an import licence either for materials or capital goods, is granted against a promise of exports, the licence holder should pledge to achieve those exports. What is questionable about the present bond, however, is the length of time for which the commitment can run—which I understand can be up to 10 years renewable at Government's option for a further five years; who can honestly claim to forecast world markets 15 years ahead? Still worse is the provision which requires surrender of twice any shortfall to a state trading body for sale at such prices as they can realise. Bluntly, this means dumping: it also means that an overseas customer of an Indian exporter knows that he need only hold his orders, whereupon there will be available twice the quantity at cut prices! Surely a formula can be devised which meets national needs without publicly threatening to penalise exporters in this manner?

One other facet of exports is worthy of mention. A component supplier like GKW is not always best placed to export—currency earnings are higher if an electric motor is exported rather

than the stampings inside it, higher still if a consumer durable containing a motor is exported. We may therefore do better by helping our customers to export, and I hope that Government will be prepared to recognise this type of contribution to the total export effort.

BONUS ISSUE

I am glad to be able to report this year that consent has been received for our Bonus issue, and the shares will be allotted amongst members on the day of the AGM.

I also have to announce that the consent includes a clause requiring fresh equity issue to Indians only in the sum of Rs 50 lakhs inclusive of premium, within twelve months of the consent—that is, by 1st February 1974. The clause is directed towards reduction in foreign equity holding, and has been accepted by our majority shareholder Guest Keen and Nettlefolds Ltd UK. The issue may also be used to meet current guidelines on reduction in foreign equity as a condition of expansion schemes. Details have yet to be settled with Government and the Reserve Bank, and proposals may be expected to be put to an Extraordinary Meeting in due course.

PROPOSED SANKEY WHEEL SHARE PURCHASE

You will also observe in the Directors' Report that consent for the proposed purchase of further shares in Sankey Wheels Limited by your Company has been refused by Central Government. We are considering a further representation: it is sad that a proposal to increase our investment in West Bengal, and reduce the effective foreign equity holding in Sankey Wheels, has not been readily accepted to be expedient in the public interest.

CURRENT PROSPECTS AND OUTLOOK

I said a year ago "The problem of 1972 may be summarised by saying that we have to run quite fast just to stay where we are, and maintain the 1971 profit figures". This proved to be the case: where we achieved good turnover growth—or "ran quite fast"—we just about managed to offset cost increases; but where volume declined, profitability declined sharply and this fed through to the results of GKW as a whole.

The three years 1969/70/71, for India as a whole, featured a series of favourable trends working to reinforce each other—agricultural revival, industrial growth, improving political stability, good growth in power generating capacity, and so on. It was therefore to be expected that 1971 would be a peak year, but from about April 1971 onwards warning signs began to appear. The temptation now is to blame any current problems on last year's mon-

soon, but I suggest that study of trends in 1971/72 will show that the monsoon merely accentuated problems that were already endemic in the economy.

Our 1972 results thus showed lower profit from higher turnover than 1971, but I think they also represent a stronger base from which to move forward. I again feel that we will have to "run quite fast", but I am cautiously optimistic that 1973 compared to 1972 will show more encouraging figures than 1972 compared to 1971. I would add three qualifications: first, as a nation we must be serious about tackling inflation, which implies considerable self-discipline; secondly, to give any chance of controlling costs, all companies must be given reasonable opportunities to expand; and thirdly, although I appreciate the pressures which inflation puts on organised labour, management and unions must seek to solve the problems without industrial action—which can only make those problems worse.

PUBLIC SECTOR, JOINT SECTOR, PRIVATE SECTOR

I would like to use my annual allotment of general comment, to make a contribution to the debate on 'Sectors'. Let me start with "Garibi Hatao" and "Holding the Price Line", two great needs of the day. The only cure for poverty is efficient use of resources for rapid increase in the supply of needed goods and services. The only cure for inflation is a rate of increase in real wealth at least equal to the increase in money. These are two economic truths, independent of politics.

Rapid increase in real wealth (that is, supply of needed goods and services), with efficient use of resources (that is, low cost), is also the method by which surplus value is generated, leading either to reinvestment of that surplus in fresh productive capacity for further growth, or a return to the original investors which enables a successful enterprise to attract fresh funds when needed.

Where the original investors are private shareholders, they put their money in to the enterprise in the expectation of gain, justified because they also take the risk of total loss. If a private sector venture does not yield surplus value, therefore, shareholders may be sadly disappointed but the risk was intrinsic to their investment.

But when public money is invested, it is in effect the savings of the people. In a developing country like India, indirect taxation, yielding small sums per head from the mass of the people, is the major source of revenue. Even corporate tax falls in the end on ultimate consumers who are in the main poor. Foreign aid is given to help the poor,

not the rich.

The model on which our early Five Year Plans were based required that tax effort and foreign aid, invested mainly in public sector basic industry, should be yielding in the early '70s massive surplus value for reinvestment and self-sustaining growth. The Government are in a position of sacred trust to the poor of this country to achieve that surplus value and reinvestment. It is not my purpose to attack public sector management, which works under possibly more severe handicaps than we do in the private sector: in any case, both sectors have strong units and sick units, success is not the prerogative of either! My sole purpose is to urge our political leaders to accept the nature of their trusteeship, and to set as a central political objective—fundamental to socialist purpose—that regardless of sector those who hold in trust the nation's scarcest resource, its stock of capital, must manage that stock to generate surplus value for return on investment and for re-investment.

Only if achievement and reinvestment of surplus value is accepted as a public good, rather than denigrated as 'the profit motive', will we have a climate in which either joint sector or private sector can successfully operate. It is surely damaging to the national interest that companies whose ability to supply competitive goods and services has been proved by their growth to large scale, should be denied expansion or subjected to increasingly onerous or impossible conditions. Government is right to encourage new entrepreneurs, which the country badly needs; is it not a little irrational also to say in advance that if they succeed and grow into substantial companies, they will be suspect and probably attacked as anti-social? Surely what the country needs is successful enterprise, in every sector!

If trusteeship of scarce capital is given the importance it deserves, there need be only one rule for joint sector—the rule of self-reliance. After the initial subscription, no further public money should be invested in a joint sector enterprise unless it could raise that money by normal commercial criteria. This is a hard rule, with many implications: superficially capitalist in approach, profoundly socialist in purpose. It gives effect to the stated objective of combining public money and professionalism in management, self-reliance in the terms I have described is, the one true test of professional management.

To encourage private sector participation, two incentives should also be considered. Income from a joint sector enterprise to its private sector partner

should not be subjected to double taxation (as profits in the joint sector enterprise, and as dividend to the partner); and for every lakh invested in a joint sector company, the private sector partner could be permitted an equivalent investment in its own expansion.

It may be argued that my approach is wholly directed towards growth and ignores the aspect of social justice. This criticism misses the key point, that the first and foremost contribution which managers of capital must make to social justice is to safeguard the existing capital stock and provide for its growth. A more important criticism is that surplus value as I have described it, will arise most in the production of goods and services for the main purchasing power in the economy: again, in at least two cases, I can reply that social justice is served. The largest single purchaser is the State, reflecting the needs of the common man; and in a number of important consumption goods, small per capita purchasing power multiplied by many millions of buyers forms a huge market.

But public policy will still require intervention to make goods available for social purposes to people who cannot afford the full economic price. My plea would be that such intervention should be effected in a manner which does not conceal the true use of resources, nor diminish the incentive to efficient management. Merely to restrict the income of producing units, in any sector, through prices which do not cover genuine costs generally leads to a vicious circle of declining quality, lack of maintenance of assets, and lack of reinvestment. Direct subsidy, on the other hand, or 'cost plus' procurement pricing, generally leads to managerial inefficiency. I would suggest that the concept of excise duty drawback could be applied in selected home market cases: if we are prepared to use this technique to bring goods within the price range of rich overseas buyers because we need their currency. I see no reason why it could not also be used to bring goods within the range of carefully defined Indian buyers for identified social purposes. Even more radical would be a concept of negative excise, which would be the obvious Indian parallel to the concept of negative income tax now being studied in some western countries. It could be an excellent mechanism for distributive justice, whereby excise levied on luxury goods for the wealthy could be used directly to lower the price of essentials for the needy.

May I conclude by reaffirming that we in the private sector have skills, and a sense of dedication, which are

available to serve the national interest. Our skills are mainly in the efficient management of resources for growth in the real wealth of the nation, and it is by pursuit of this aim that we are already one important cylinder in the engine of social change. This is where the major contribution of industry in any sector to social change will always lie. We may undertake limited direct social action, such as provision of medical services, but overwhelmingly this type of activity must be undertaken by the State—they alone have the skills and organisation, and cover the whole population rather than just those who happen to work in organised industry. Through taxation, and through increase in real wealth, we of course contribute to social purpose in this field also. We are proud of our position in the country, and can only hope that proper appreciation of what we have to offer will in turn lead to realisation of our full potential.

OUR ASSOCIATES

It is again a pleasure to acknowledge the continuing ready support given by

Guest Keen and Nettlefolds Limited, UK, and in particular the personal contribution of Mr H S Killick whom we are glad to have with us today. Since joining our Board he has been a frequent visitor, getting to know our people and problems in situ, and his encouragement and practical support are most valuable.

CONCLUSION

My last, and perhaps pleasantest, task is to thank all our employees, at all levels, for their efforts in meeting the difficult conditions of 1972. The fact that this is customary from the Chairman on the occasion of the AGM should not be allowed to diminish the very sincere nature of the tribute. Nobody knows better than the man at the top how much a Company relies on the combined efforts of all the people in it; we have a first-class team, and it is this strength in GKW which gives me great confidence for our continuing success.

Note: This does not purport to be a record of the proceedings of Annual general meeting.

Government of India

4½ PER CENT LOAN 1980 TO BE ISSUED AT RS. 100.00 PER CENT AND REPAYABLE AT PAR ON 12TH OF MAY 1980.

5 PER CENT LOAN 1984 (SECOND ISSUE) TO BE ISSUED AT RS. 99.50 PER CENT AND REPAYABLE AT PAR ON 1ST OF JUNE 1984.

5½ PER CENT LOAN 2003 TO BE ISSUED AT RS. 100.00 PER CENT AND REPAYABLE AT PAR ON 12TH OF MAY 2003.

Subscriptions to the above loans will be received simultaneously and will be limited to a total of Rs. 500 crores (approximately). Subscriptions may be in the form of (i) cash/cheque or (ii) Securities of the 4 per cent Loan 1973 which will be accepted for conversion at par. Government reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

2. If the total subscriptions received for the loans exceed the notified figure plus the amount of ten per cent retainable as aforesaid, partial allotment will be made in respect of the cash subscriptions received and the balance refunded in cash as soon as possible. Interest on the securities of 4 per cent Loan 1973 will be paid at the rate of 4 per cent per annum upto and inclusive of 11th May 1973 at the time of issue of the new securities.

3. Interest on 4½ per cent Loan 1980 and 5½ per cent Loan 2003 will be paid half yearly on 12th May and 12th November. In the case of 5 per cent Loan 1984 (Second Issue) the interest for the period 12th to 31st May 1973 will be paid on 1st June 1973 and thereafter interest will be paid half yearly on 1st December and 1st June.

4. Interest on all the loans now issued together with interest on other previous Government securities and income from other approved investments will be exempt from income-tax subject to a limit of Rs. 3,000 per annum and subject to other provisions of Section 80L of the Income-tax Act, 1961. The value of the investments in the loans now issued together with the value of other previous investments in Government securities and the other investments specified on Section 5 of the Wealth Tax Act will also be exempt from the Wealth Tax upto Rs. 1,50,000/-.

5. Subscription lists will open on the 12th of May 1973 and close on 14th of May 1973 or earlier without notice.

Applications for the loans will be received at :—

- Offices of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna;
 - branches of the subsidiary banks of the State Bank of India conducting Government treasury work except at Hyderabad; and
 - branches of the State Bank of India at other places in India.
- For full particulars please apply to any of these offices or branches.

The Engineering Industry builds the frame-work for industrial growth.

DENA BANK
helps strengthen the frame

Through more than 525 branches and correspondents throughout the world, DENA BANK serves industry, commerce and trade.

Studied Topsyturnviness

THE regulation bravado notwithstanding, an undercurrent of concern is discernible in government about the progress in wheat procurement. Only in Punjab are things proceeding smoothly. Elsewhere, actual purchases are lagging considerably behind expectations. In Bihar, for example, as against a target of 600,000 tonnes, barely 600 tonnes had been procured till the end of April. The situation is worse in the minor wheat-producing states. Even in Haryana, the rate of public purchases is only marginally higher than it was last year.

It would be easy to heap the blame for all this, on the one hand, on the takeover of the wholesale trade in foodgrains, or, on the other, on the nefarious doings of the dispossessed private traders. On the face of it, an attempt to dispense with private traders in a year of rising prices and depleted government stocks was bound to prove a misadventure. Yet a little deliberation would show that the major deficiency lies in the topsyturviness of priorities. Complete takeover of wholesale trade is not feasible without monopoly purchase of grains on the part of the State. It is well known that once the produce leaves the farmer's homestead, its subsequent movement is a matter over which the government and the public distribution network have no control. A government which professes not to mind the obliteration of private wholesale trade should not, other things remaining the same, mind procuring the grain on a compulsory basis at the source either. This would impart optimum efficiency to wholesale operations as the chain of intermediaries would be shortened all the way. Once a producer levy is imposed, whether or not wholesale trade is taken over becomes an irrelevant issue; for, once the procurement target has been fulfilled via the levy, private trade would in any case be left high and dry.

That, even in this grim year, in none of the states has the ruling party come out in support of the producer levy, renders the government's protestations about its determination to reach the procurement quota suspect. There is an apology of it in Madhya Pradesh; elsewhere it is silence. The glamour associated with the takeover of wholesale trade is welcome; but not so the associated measures for making a meaningful operation of it. The formal elimination of private wholesale trade need not affect any interests; wholesalers may continue to operate through the proxy of retail merchants who, more often than not, are their direct agents. A producer levy would provide no such escape hatch: you have to collect the grain from where it first pours in, i.e. from the bigger agricultural holdings; such a remedy is therefore bound to be unsavoury if the owners of these holdings happen to be your proteges. Was the government hustled into the kind of decision it took on the basis of half-baked academic exercises which failed to take into account the socio-political realities, or was the takeover of wholesale trade preferred to the imposition of a producer levy by opportunists wanting both to hunt with the bounds and to run with the hares?

What does the government propose to do in case the procurement of wheat falls considerably short of the target? With prices of foodgrains up by nearly 25 per cent over the year, there will be substantially greater pressure on the public distribution system in the coming months. As against a quantity of 10.2 million tonnes distributed last year, public distribution could be as much as 12.5 million tonnes in 1973 — assuming that the kharif harvest turns out to be normal. How the arithmetic for this order of public distribution is to be worked out in case the procurement of wheat fails to exceed 7 million tonnes, has to be a matter of public concern. The Prime Minister's forthcoming trip to Canada may have something to do with explorations for wheat from that country. In any case, the credit tranches with the IMF should be availed of. Also, given the minimum lead-time needed to bring the food in, rather than wait for the monsoon, orders for additional imports will have to be placed right away. The ostentatious worry over spoiling the international market for grains may be aimed to show how carefully calculated our purchases are; but there is a season for such demonstration — which is not the present one, with reports of food riots trickling in almost every day from all parts of the country.

Meanwhile, bracing itself, as it were, to bridge the gap through indigenous supplies, Krishi Bhavan — with the emergency rabi production programme now behind it — has dished out an emergency kharif production programme with a view to achieving a total production target of 115 million tonnes of foodgrains during 1973-74. The state governments have been requested to send in, as early as possible, proposals for extra funds that would be required to make the programme a 'success'.

What 'success' constitutes may be gauged from the experience of the emergency rabi programme which is claimed to have yielded good results. The aggregate expenditure on the programme, according to official sources, has been as much as Rs 148 crores, and the resulting additional output of wheat in the current season is about 4 million tonnes. One would have thought, however, that even without an 'emergency' programme production of wheat should have normally gone up from 26 million tonnes last year to 30 million tonnes this year.

It is not just idle curiosity, therefore, if one wants data separately, on the expected additional output from the normal programme of kharif expansion and on what was expected from the proposed emergency programme. The second question to ask is whether the additional expenditures are going to be in the nature of enduring investments or akin to shot-gun outlays which need to be repeated year in and year out for sustaining production at a particular level. Finally, one must also know the exact manner in which such emergency outlays are going to be spent: for example, who are to receive the additional funds and precisely for what purpose? It is possible that, in the name of an emergency kharif programme, the government would begin to disburse fiscal resources anywhere around Rs 200 to Rs 300 crores. For a poor country, resources of this order are not for burning. If in 1970-71, the foodgrains production had already touched 108.4 million tonnes, and if the decline in the subsequent two years was on account of adverse weather, then, given normal weather, even on the assumption of a trend rate of growth of 2.6 per cent per annum, aggregate output in any case may be expected to reach 115 million tonnes in 1973-74. What then is the supposed rationale of an emergency programme?

Such a programme launched in the kharif season will be essentially for raising the production of rice. Going by the report of the official Committee on the Assessment and Evaluation of the Performance of High-Yielding Varieties of Paddy in the IADP Districts during 1966-67 to 1970-71, provision of indiscriminate funds to improve productivity of paddy lands ought to be frowned upon. In all these years, even in the IADP districts, the acreage under high-yielding varieties of paddy in the kharif season was consistently way below the target. It was

not merely higher yields which determined the choice of cultivators for a particular variety, but also such other factors as the period of maturity, milling quality, consumer preference, marketability, susceptibility to pests and diseases, etc. The Committee has dwelled on the need for further research on plant breeding for evolving different high-yielding varieties suitable for the widely varying agro-climatic conditions in the country. The application of fertilisers too, it has found was at lower than the recommended rates in a large number of cases. In view of all this, any large-scale outlay of funds for raising kharif output, which would obviously stress greater use of fertilisers and propagation of existing high-yielding varieties of seeds, may be wide of the mark. It may allow leakage of funds which might line particular pockets but would contribute precious little toward raising the productivity of paddy lands. One last question needs to be asked: If all programmes for raising output are supposed to be contingency ones, what, pray, is happening to the regular schemes?

Bank Credit

Collapse of Economic Management

THE facts and figures of the runaway expansion of money supply in the last two years are by now fairly well known. Taking 1971-72 and 1972-73 together, money supply increased by 30 per cent or by Rs 2,129 crores. This was only slightly less than the increase of Rs 2,240 crores in the preceding four years from 1967-68 to 1970-71. The annual rate of growth of money supply rose continuously from 8 per cent in 1967-68 to 14 per cent in 1972-73.

Faced with these facts, the Reserve Bank had but one tattered fig-leaf behind which to hide itself. It could argue that the entire expansion in money supply in the last two years had been on account of net bank credit to government. This is borne out by statistics. Thus net bank credit to government did expand by Rs 2,297 crores in 1971-72 and 1972-73 taken together whereas the increase in the preceding four-year period had been only Rs 1,243 crores. Even in the two worst drought years of 1965-66 and 1966-67, net bank credit to government had expanded by only Rs 740 crores.

The Reserve Bank's case was that it could not be blamed for the expansion

in net bank credit to government over which it had no control. What it was answerable for was bank credit to the commercial sector which, through the strenuous pursuit of a restrictive credit policy, it had managed to restrain fairly severely. Thus, to the extent possible, it had used its power to control bank credit to the commercial sector to offset the continuous spurt in net bank credit to government. In his letter to commercial banks last March, for instance, the Reserve Bank Governor had taken credit for the fact that "for two consecutive years there has been a slight contraction in net bank credit to the commercial sector, which has offset to some extent the large increase in net bank credit to government". In the same vein he had proceeded to dispense the following advice to banks: "Since budgetary deficits are persisting, the aim of credit policy should be to see that net credit to the commercial sector does not stimulate further expansion of money supply. The need is greater than ever before to ensure that credit limits are sanctioned commensurate with actual production requirements".

But developments of the last few weeks have snatched away the Reserve Bank's fig-leaf and exposed the complete ineffectiveness of its so-called credit policy. In the busy season which has just ended (November 1972 - April 1973), there has been a phenomenal increase of Rs 884 crores in the advances of scheduled commercial banks compared to a rise of only Rs 355 crores in the last busy season. Excluding food procurement credit, the expansion was of the order of Rs 877 crores compared to Rs 426 crores. The increase in net bank credit to the commercial sector (i.e. net of time deposits) was Rs 493 crores compared to Rs 140 crores in the last busy season. Together with the expansion in net bank credit to government, the increase in money supply was Rs 1,289 crores compared to Rs 765 crores in the 1971-72 busy season.

The Reserve Bank had expected a credit expansion of the order of Rs 500 crores, net of food procurement, in the 1972-73 busy season. Though the actual expansion has been much larger, the Bank has not thought it fit to explain what went wrong and where. Perhaps advisedly, since even a slightly close look at the composition of the rise in bank credit in recent months will establish beyond doubt that for all the control it exercises over the commercial banks, the Reserve Bank might as well not have been there.

A significant part of the expansion of commercial bank credit in the last few months represents a new manifestation of the financial profligacy of state governments which had been sought to be curbed in May last year by denying them overdraft facilities from the Reserve Bank. The state governments, it is now evident, have simply taken recourse to the commercial banks. This has been done through state government bodies like electricity boards and state industrial development corporations borrowing from the banks to finance expenditure which would otherwise have been met out of the state exchequer.

A major push to the recent credit expansion by commercial banks also appears to have been provided by the sheer surfeit of liquidity with the banking system. To put it simply, with their deposits rising rapidly, the commercial banks found they just had to lend their funds somehow to stay out of the red. One manifestation of their desperation was the notorious rate-war among banks. Data on the increase in advances of individual banks are not available, but there is evidence to support the presumption that banks with relatively large surplus funds and low credit-deposit ratios have accounted for a large part of the credit expansion. About 30 per cent of the increase in credit has been accounted for by the State Bank group which, in the process, raised its credit-deposit ratio from 64 per cent to 71 per cent. Similarly, the Punjab National Bank is said to have managed to raise its credit-deposit ratio by fully 12 percentage points from 55 per cent to 67 per cent during the busy season. Quite clearly, banks desperately on the prowl for customers are unlikely to worry about such matters — which are supposed to be the very essence of a rational credit system — as the purposes for which the borrower wants funds or whether he in fact needs all the money that he is asking for.

This is borne out by evidence which suggests that significant proportion of bank funds have gone to finance stockpiling of a number of commodities. Data on stocks levels reported in the government's latest Economic Survey show that stock levels in quite a number of industries were higher during January-September 1972 than in the corresponding period of 1971. The use of bank funds for building up inventory also perhaps explains the large increase

of Rs 145 crores in inland bills discounted compared to the increase of about Rs 35 crores in the last busy season. It also appears likely that companies have used short-term bank funds for long-term investment purposes. This is suggested by the fact that the disbursements of the term-lending institutions in 1972-73 were actually lower than in the previous year, whereas the IDBI had in its annual report for 1971-72 anticipated a 25 per cent rise in disbursements.

To appreciate the full import of the credit authorities' failure to check the expansion of bank credit, a good part of which has presumably been used to finance stockpiling and speculative inventory build-up, one has to look at the price situation. On April 21 the index of wholesale prices showed a rise of 16.2 per cent over the level a year ago. Prices of food articles had risen by 19 per cent, with those of rice having risen by 17 per cent, of wheat by 11 per cent, and of jowar, bajra and pulses by between 15 per cent and 40 per cent. Edible oil prices had risen by 40 per cent and sugar prices by 8 per cent over and above a rise of 35 per cent in the previous year. The index for industrial raw materials had risen by 39.6 per cent and, within the group, that for ground-nuts by as much as 72.6 per cent. Despite the improved supply of raw jute and raw cotton, their prices had risen by 31 per cent and 20 per cent, respectively. The price index for manufactures also had risen by 7 per cent and, within the group, the index for intermediate products had risen by 13.5 per cent. Prices of cotton manufactures, which had no reason to go up, rose by 4.2 per cent. Only jute manufactures, in which the scope for manipulation in the domestic market is limited, experienced a fall of 5.2 per cent in price during this period. Considering these steep and all round increases in wholesale prices, the rise of less than 7 per cent in the two official consumer price index numbers in the first 11 months of 1972-73 (April-February) speaks more for the infirmities of the indices than for the actual behaviour of consumer prices during the period.

Against this background of increase in prices, the wildfire expansion of commercial bank credit in the latest busy season is more proof, if any were needed, of the abandonment of all effort to manage, not to speak of plan, the economy.

Judiciary

Choosy Conscience

BAR associations all over the country continue to be exercised over the supersession — and subsequent resignation — of the three Supreme Court judges. What the government has done, they argue, tolls the bell for democracy. Not one of them, however, has found either the time or the inclination to comment on the happenings following the judgment of the Supreme Court on Section 17(a) of the Maintenance of Internal Security Act. Three weeks have elapsed since this Section was declared null and void. But follow-up activities by the state governments which had detained people under this Section have been extraordinarily tardy.

In West Bengal, for instance, nearly 1,800 individuals should have been let out of the prisons following the Supreme Court order. If the state government had even a minimum of respect for the Constitution and the judiciary, it should have released these people immediately. After all, the detention of everyone of them became illegal the moment the Court gave its judgment. The Government of West Bengal, however, has pleaded that it would take a while to sort out the cases of different people held under the Act and to prepare the list of those who were detained under Section 17(a), that after this list is prepared it would have to find out where these individuals are being detained, and that only then will it be possible for the overworked administration to pass the orders of release for these prisoners. Viewed in this way, the state government can hardly be blamed if this entire process takes several weeks. The onus is thus on the affected parties to go back to Court to seek damages against the government or the detaining authorities for the patently illegal detention spanning the period between the delivery of the Supreme Court judgment and the formal order of release in each case. But it is not so simple. They must be able to prove that the government had acted in a *mala fide* manner; otherwise their plaint is bound to fall through.

It is against this backdrop that one has to assess the possible consequences of New Delhi's coup against the Supreme Court — and, particularly, of Mohan Kumaramangalam's breathtaking announcement that, from now on, ap-

pointments to the higher judiciary would take place after due consideration of the social philosophy of the individual judges. It will be for the government of the day to determine what the current fashion is, and what criteria are to be applied for deciding what is 'backward' or 'forward' looking. For example, if the one thousand seven hundred and odd individuals in West Bengal, who have not been released despite the striking down of Section 17(a) of the MISA, were to sue for damage against the authorities, it would be for the judiciary to decide whether the dilly-dallying on the part of government was intentional or otherwise. The delay in issuing the release orders, the government may claim, was because it had to sort out the 17(a) cases from the non-17(a) ones; the persons affected could allege that the delay was on account of the fact that the authorities were using the time to concoct new cases against them so that they could be re-arrested as soon as they were let out. Called upon to arbitrate on the issue, how many judges would be henceforth found who would dare not to give the government the benefit of the doubt? Those who decide not to accord the authorities the benefit of the doubt might be put down as 'backward-looking' — or at least some members of the judiciary may well come to think so. The government's coup — and the explanations proffered in support of it — therefore deserves to be condemned, not because some individuals have been passed over for promotion, but because the judges after all are human beings, given to mortal ambitions, mortal apprehensions and mortal foibles, and, where the government is God, the individual members of the judiciary may indeed come to cultivate a healthy fear of that God. It is on such ground that authoritarianism can take root. And that, for the leading clique of barristers and other legal luminaries, the phenomenon of illegal detention or detention without trial does not connote the end of the world whereas the end comes for them only when some of their dear brothers are deprived of promotion, promises fertile ground for that authoritarianism.

Maharashtra

Twice Blessed Bagaitdars

Our Correspondent writes:

SWEET are the uses of the drought — for some. Last year, alarmed over the kharif crop failure, the Central

government launched its crash programme for boosting the output of rabi cereals. All sorts of miracles were claimed on behalf of the crash programme at one stage. In the event, the actual increase in rabi output is now estimated to be no more than 4 mn tonnes. How much of this increase is attributable to the crash programme, there is no knowing. What is known, however, is that at the very least some Rs 200 crores have been spent on the crash programme. Most of this money has gone to the main rabi foodgrains producing states. But the other states have had their share as well.

The Maharashtra Finance Minister had, while presenting the state budget for 1973-74, described the Rabi Crash Programme in ecstatic terms as "an extremely imaginative programme" — no doubt because, as he himself put it, it "is financed out of 100 per cent loan assistance from the Government of India outside of the Plan". The alacrity with which the Maharashtra government took advantage of the programme was evident in the Finance Minister's budget speech: "The amount sanctioned by the Government of India to us was nearly Rs 25 crores. This is not taking into account a short-term loan of Rs 16 crores given by the Government of India for purposes of seeds and fertilisers. Despite the fact that the government had to take this programme at very short notice and also that actual work began in October last, we are likely to exceed the expenditure sanctioned by the Government of India by a few crores."

From October last till now the Maharashtra government has spent over Rs 50 crores under the rabi crash programme. This is, of course, in addition to the spending on its normal agricultural programmes. Yet it has not occurred to the government to assess what has been the impact of all this spending on the output of rabi foodgrains. This coyness is only partly explained by the need to paint a grim picture of the food situation in the state so as to extract the maximum supplies from the Centre. The other part of the explanation clearly is that the state government does not want to draw too much attention to the beneficiaries of its lavish spending lest the question be raised as to what arrangements it has made to procure the additional foodgrain output for government stocks.

Given the government's deliberate silence on the subject, one has to rely on stray unofficial estimates. For instance, according to one estimate, in Ahmednagar district, big bagaitdars, taking advantage of government expenditure on the crash programme, have grown over one lakh tonnes of wheat on some 30,000 acres. This estimate has come from a leading Congressman of the area, E S Nimbalkar, a former vice-president of the Maharashtra Pradesh Congress. It may be argued that when the desperate need was to raise production, the government could not be too finicky about the benefits of its crash programme going to the larger farmers. But it needs to be asked, nevertheless, what has been done with the increased production. The fact is that, though monopoly procurement in Maharashtra was recently extended to wheat, none of the additional production as a result of the crash rabi programme has been procured by the government. All of it has been left with the bagaitdars for them to sell in the open market at fancy prices. Thus the bagaitdars of Maharashtra have been twice blessed by the drought. In the first place, it brought them the benefit of large government spending on the crash rabi programme, assured them supplies of fertiliser and seeds and even all-too-scarce irrigation water; on the other hand it has also ensured them sky-high prices for their increased production.

As the food shortage in the state has become increasingly critical resulting in empty fair price shops and food riots, instead of making any effort to squeeze out the grain hoarded by the bagaitdars, the state government has done precisely the opposite. The official press note on the state government's new foodgrains policy deserves to be quoted at length on this point. It says: "Government had issued instructions on 31st March, 1973, allowing agriculturists to take their levy-free wheat and jowar to weekly bazars or markets for sale after they obtain a certificate from the village talathi that it is levy-free stock. With a view to improving the arrival of levy-free jowar and wheat in the market yards and village bazars and to enable the consumers to get their requirements of foodgrains during the difficult situation now prevailing government have decided that the agriculturists should be permitted to move their stock of jowar and wheat without insisting on produc-

tion of levy certificate from the talathi. Government is pleased to reiterate that there would be free movement of jowar and wheat within the state excluding Bombay Rationing Areas. Collectors are also being instructed not to impose any restriction on the above free movement. Recognised dealers, who may be co-operatives or other suitable institutions, should make purchases in market yards or in bazars within the quantity limit fixed by the Collector of the receiving district or any officer nominated by him not below the rank of a Tahsildar."

In other words, having helped the bagaitdars in every way to increase their grain production in the name of the drought and the failure of the Kharif harvest, the Maharashtra government is now proceeding, in the name of the critical food situation prevailing in the state, to enable them to realise extortionate prices for their hoarded grain. Sweet indeed are the uses of the drought and the food scarcity for the bagaitdars of Maharashtra.

Small Farmers

No Structural Reform

THE Minister for Agriculture announced the other day in Parliament that credit for small farmers and the weaker sections would be liberalised. This statement came in the wake of the poor performance of the government's various "growth with social justice" schemes launched three years ago. According to official estimates, out of the Fourth Plan allotment of Rs 67.50 crores for the small farmers scheme, only Rs 9.88 crores has so far been spent. In the last four years the co-operative banks have disbursed only Rs 13.89 crores as short-term loans and Rs 21.54 crores as medium and long-term loans, while the commercial banks have disbursed Rs 0.94 crores as short-term loans and Rs 1.19 crores as long-term loans to small farmers. These disbursements are evidently much below the expectations of the government. Only about 15 per cent of the allotment for these schemes has so far been spent. No wonder the government is worried about the situation.

At a seminar on the SFDA/MFAL schemes held in New Delhi a year ago under the auspices of the Agriculture Ministry, it was stressed that the co-operatives would have to play a vital role in making these schemes a success. It is unnecessary to say that the co-operatives have come nowhere near ful-

filling their assigned role. That nothing better could be expected should have been clear to anyone aware of the root causes of the failure of these institutions to finance small farmers. The All-India Rural Credit Review Committee (1969) had analysed the reasons for the failure of the existing co-operative agencies to finance small farmers and came to this conclusion: "To some extent, this may reflect their lack of credit-worthiness which, in turn, is a result of the uneconomic nature of their farm business. To the extent that their consumption credit needs cannot be met within the limits of the repaying capacity as represented by a proportion of the value of their crop, the way out is to increase and institutionalise their income, e.g. through organised public works or the provision of subsidiary occupations such as dairy and poultry so that all their credit requirements may be met... we would emphasise that apart from these, there are a number of instances in which small cultivators are denied credit even when the amount is within their repaying capacity. A variety of facts account for this. The most important of these is the traditional conservative approach of the influential and better off sections of cultivators who dominate the co-operative and run it as a closed shop. Prejudice and indifference towards the small man — sometimes based on caste or other sociological factors — also account for this attitude of exclusiveness."

These considerations were, however, conveniently forgotten while formulating the small farmers' development agency schemes. It was expected that with certain marginal adjustments and procedural reforms the flow of credit to the small and marginal farmers would increase. One of the more important 'reforms' was the provision of a 'risk cover fund'. Wherever the co-operative agency took extra risk in providing credit to small farmers the risk of recovery would be covered by provision of a certain percentage of the loan advanced as a lump-sum grant to the society. The expectation is that as a result the society would feel confident enough to make larger loans to farmers engaged in "uneconomic business". But was it the risk of non-repayment that had stood in the way of disbursement of loans to small farmers earlier? Evidently not. The real obstacles were "the prejudices and indifference towards the small man" of those in charge of the co-operatives. The co-operatives are dominated and run as closed shops by the better off sections

of cultivators. While formulating the SFDA and MFAL schemes, the government did not touch these crucial problems and the results are what they are. Nothing short of a structural reform can cure such a deep-rooted and fundamental deficiency. It is necessary that the influential sections of the better-off cultivators in the villages should be dislodged from positions of dominance in the co-operative set-up. If the government is not prepared to take such a radical step, it would only be subjecting the small farmer to the agony of having the carrot of a fair deal perpetually dangling in front of him.

Asian Development Bank

Progressing but under Japanese Influence

THE ADB's annual report for 1972 shows that the Bank has made encouraging progress during the last five years of its operations. Also it has shown enhanced interest in commercial loans to the less favourably placed countries. ADB's loan commitments increased well over sevenfold, from \$41 million in 1968 to \$316 million in 1972, taking its aggregate loan commitments to a sizeable \$955 million in a short period of five years. Though the size of ADB's lending falls far short of the total requirements of the Asian region, the effectiveness of these loans has increased — as India has said it will not take any loans from ADB and as Japan, too, would not be a recipient for obvious reasons. Moreover, the performance of the ADB is far superior to that of the African Development Bank though both started their activities almost about the same time.

Though ADB's structure and method of operations are patterned similarly to the World Bank's, its sectoral lending appears to be different from that of the World Bank — probably because of the decisive voice of the Japanese in its management. ADB has laid greater stress on industry, agriculture and water supply by allocating nearly one-half of its funds as compared with the World Bank's 28 per cent for these. The allocation made by ADB to education is almost insignificant at 0.7 per cent of the total as compared to 2.7 per cent by the World Bank. It may be recalled that the World Bank, which started its activities on highly conservative lines by making only project loans for meeting almost exclusively the foreign exchange component of the projects, has come to accept the need for giving non-

project aid largely through its soft loan window — the IDA. The ADB does not appear to have recognised the importance of this type of aid in its lending operations.

Of the total loan commitments of \$954 million, about 79 per cent, or \$753 million, are from its ordinary capital resources and the remaining \$201 million from its special funds. The concessional loans granted out of the special funds are certainly on harder terms than those provided by the IDA. They bear an average interest rate of 2 to 2.5 per cent and have a repayment period of 25 years with a grace period of five years, whereas IDA credits carry only a service charge of 0.75 per cent and have a repayment period of 50 years with a grace period of 10 years. Similarly, the other loans granted by the ADB out of its ordinary capital resources are on much harder terms. For instance, the loan commitments made by the ADB during 1972 carry an interest of 7.5 per cent as compared with the World Bank's of 7.5 per cent and their maturity period is also shorter than that of the World Bank loans. Thus ADB's lending pattern as well as the terms fixed by it for its indicate that it is a much more conservative institution than the World Bank and has not tried to adapt its practices to suit the poverty-stricken Asian region.

The financial position of the ADB was strengthened last year through a substantial increase in its share capital, from \$1,194 million to \$2,986 million. Since only a small proportion of the share capital is called in, the ADB is expected to rely increasingly on market borrowings for its financial operations. Secondly, in view of the usual time lag between loan commitments and actual disbursement of funds, ADB's total borrowings are still small at \$230 million. Borrowings through bonds floated in Japanese and US markets totalled \$84 million and \$70 million accounting, respectively, for 36 per cent and 32 per cent — or together for over two-thirds — of the total borrowings so far. During last year, bond issues were made for the first time in Luxemburg and Italy — about \$9 million and \$18 million, respectively. It is interesting that, though Luxemburg is not a member of the ADB, it has agreed to participate in the development of the region. The present international financial situation is quite conducive to borrowing activities of institutions such as ADB, in view of the vastly increased loanable funds in the Euro-currency markets which are estimated to have doubled in the last

two years to over \$100 billion on a net basis. It should also be noted that Japan being the only capital-surplus country in the region, a large amount of the borrowed funds of ADB have to come from the non-regional developed countries.

While the voting powers vested in the regional countries is 76.5 per cent of the total, voting powers of Japan, India and Australia account for 20.2 per cent, 9.7 per cent, and 8.9 per

cent, respectively. Since India and Australia are not in a position to contribute materially to the crowning activities of ADB, and since Japan has accumulated huge foreign exchange reserves which it would like to commit for enhancing its own prestige and influence in the Asian region, one may expect ADB to continue its lending operations more and more on conservative lines as in the past, operating essentially under the influence of the Japanese.

DIRECTORATE GENERAL OF SUPPLIES & DISPOSALS DISPOSAL WING: COMMODITY SECTION

TENDER PROGRAMME FOR THE MONTH OF MAY, 1973

SL. No.	Tender No.	Location	Stores	Date of opening	Offers to remain open up to
1.	DGS & D/C PM/543987/16 dt. 4-1-73.	Cordite Fy., Aruvan-kadu.	Nitric Acid Plant.	25-5-1973	25-7-1973
2.	DGS & D/CPM/5439 91/46- dt. 12-4-73.	Custom House, Madras.	Watch spares.	29-5-73	30-7-73
3.	DGS & D/CPM/5439 88/18, dt. 4-1-73.	Tuticorine Harbour Project, Tuticorin-4.	Gantry Cranes.	30-5-1973	30-7-1973

Tenders should reach this office to the above named by 2-30 P.M. to be opened at 3.00 P.M. in public on the respective dates, mentioned above.

Each tender must be accompanied by the Deposit-at-Call Receipts, one representing 5% of the tendered value as Earnest Money and other representing 5% of the tendered value as security Deposit, subject to maximum amount of Rs. 1 lakh. Tendered forms containing particulars of stores, conditions of sales and permit to view the stores at site, etc. can be had @ Rs. 5/- per set payable in cash or by Money Order from the Cashier DGS & D, New Delhi, Director of Supplies and Disposals, Calcutta, Bombay, Madras, and Kanpur.

Tender fees are non-refundable and tender sets are non-transferable.

All sales are strictly on the basis of 'AS IS WHERE IS'.

OFFERS WILL BE CONSIDERED STRICTLY ON THE TENDER TERMS. IF THERE IS ANY DEVIATION OFFERS SHALL BE IGNORED. D.G.S. & D. RESERVE THE RIGHT TO REJECT ALL OR ANY OFFERS WITHOUT ASSIGNING REASONS THEREOF.

Parliament Street, New Delhi.

CAPITAL VIEW

The Focus Is on Judges

Romesh Thapar

If the lawyers who have been protesting against appointments to the Supreme Court have proved anything it is that they are now about the most politically inept section of our society. The illiterate would have done better in an agitation which had the unthinking support of several sections of our people who imagine that they are the guardians of some unique kind of democracy.

As was to be expected, our lawyers proceeded to describe their clients — Shelat, Hegde and Grover — in the most euphoric terms. At one stage, it was planned to present them as outstanding legal luminaries. Reports appeared of weepy, weepy scenes. Yes, lawyers weeping... believe it or not. Then, suddenly, came the switch. Shelat, after all, was to retire in a few weeks. Grover was too obviously non-descript to be built up into any kind of figure. And, so, Hegde donned his armour.

It only required a single press conference by Judge Hegde to convince everyone that he himself was the proud possessor of all the qualities which he attacked in Judges — intensely political, committed, subjective and prejudiced. The press conference and the earlier mess of judgments from the Supreme Court, should have been the base of the government's counter-attack, a careful, persuasive exercise to convince the most confused that the Supreme Court needs urgent reformation and that procedures will be set up to ensure its genuine independence. The Prime Minister could have lifted the debate to this level by her own intervention — something along the lines of her comments in Kerala.

LOST OPPORTUNITY

But this was not to be. She decided to remain aloof and to let the lawyers in her team take up cudgels. Naturally, Mohan Kumaramangalam, attacked viciously by Hegde, fought back in similar style. Several of his statements, liable to misinterpretation, could have been less aggressive and better phrased. As for Law Minister Gokhale, he was found drumming a tune which had already been played. A great opportunity to educate the nation on the fundamentals of judicial independence in a fast-changing society was lost in the noise of

Significantly, while a whole motley crowd of political have-beens, opportunists and the like, are gathering regularly to denounce the "dictatorship" of Indira Gandhi, public attention is turning to revelations about the behaviour patterns of the judges of the Supreme Court. Enough has been published to cause misgivings, for considerable power is placed in the hands of these men. A closer look at the quality of the men appointed to the Supreme Court is causing further dismay.

Apart from the fact that the superseded judges got to their present positions by a process of superseding others — and the record of the senile luminaries leading the lawyers' agitation is none too bright! — it is most disturbing that some of the more recent appointments to the Supreme Court show that ability, reputation, or commitment to the broad objectives of national endeavour, were never considered. The probe is on, and it suggests that the Prime Minister's advisers in legal matters, particularly in appointments, have been pushing their friends and relations.

BALL STILL IN PM'S COURT

Whatever the damage done by the lawyers' agitation to the image of the Congress Party in the towns, the last word is still with Indira Gandhi. The final judgments on these developments will be passed after the vacancies in the Supreme Court have been filled. Any move to 'pack' the Court with non-descript yes-men will do irreparable damage to the status of the courts. Procedures must be set up which ensure that, while the judiciary is powerfully independent of the Executive, it is not in confrontation with Parliament. Naturally, such procedures must concern themselves with the selection of outstanding men. A judge cannot be a politician, but he possess a deep understanding of men and movements.

Even the most solid supporters of the ruling party, persons who see the urgent need for shaking the moribund institutions of the *status quo* and who seek no reward for their support, are worried by the lack of procedure and principle in staffing the judiciary. This has been a problem of long standing, but it assumes new importance following recent developments. Indeed, it is

the GOI could have addressed itself to this problem before shaking the lazy norms of Supreme Court promotions. The quoting of precedents from other countries is tiresome. We have to work out precedents for ourselves which will stand the test of crises in the future.

DEFINING AREAS AND CRITERIA

Appropriately, the focus is on the judges, their selection and appointment, their tenure of office, the guarantees for their independence, and the natural disciplines which should surround them. From this cogitation, many repercussions will follow. We are moving into a situation which will call for more wide-ranging structural changes in other areas of democratic functioning till now the preserve of small coterie of manipulators. May be, the GOI should start locating the areas instead of being pushed into them without proper preparation.

Fortunately, all this is happening against the background of an internationally-publicised scandal involving the US Presidency. This, I suppose, helps our imitative elite get things into proper perspective.

May 7

Firestone

FIRESTONE, USA, one of the world's largest producers of rubber and latex, produced 87 million pounds of natural latex during the company's fiscal year ending October 31, 1972, which represented approximately 15 per cent of the total world latex production. The company converted its Cavalla, Liberia, plantation to latex production exclusively several years ago and continues its replanting programmes with higher yielding trees. Latex production is expected to start at the company's Ghana Rubber Estates by 1975. World consumption of natural latex is expected to increase by 70 per cent over the next 10 years, according to Firestone. The company estimates that consumption will increase to 1 billion pounds by 1982 from 613 million pounds in 1972. The United States will continue as the largest market for latex, but European markets are also expected to grow rapidly in the next decade. The fastest growth, about 135 per cent, will be in the carpet industry, which already accounts for nearly half of all natural latex consumed in the US. Natural latex is also used in the dip-pod goods industry, rubber threads, adhesives and foam products.

Calcutta Diary

A M

THIS is an individual's sample investigation spread over a few cursory weeks, and may well therefore be somewhat imprecise. Still, a scanning of the so-called national newspapers, reveals, in the course of a period of six consecutive weeks recently, a particular Cabinet minister had on the average delivered five speeches a week. These are of course the speeches which got reported in the press. If, for each such speech reported, there was another which missed the limelight, the minister must have been on the public rostrum on the average for ten occasions during a single week. Since on each occasion he was supposedly talking on issues pertaining to his portfolio, there must have been a written text. The text must have been prepared by officials at a fairly senior level. These officials, in their turn, must have depended upon drafts sent up from below; the drafts too must have gone through a few intra-mural rubbings. A ministerial speech therefore embodies an impressive quantum of official resources, and let nobody ask what the opportunity cost is.

There are around fifty ministers in the Government of India. In the close to twenty states, barring minor exceptions, the average number of ministers should be, give or take a few, twenty-five or thereabouts. The ministerial population in the country must therefore be wobbling at the figure of one-half of one thousand. If each of them is as determinedly public forum-minded as the sampled Cabinet minister, the proportion of public resources expended on their speeches cannot but be staggering. The proportion of total newspaper space taken up by the speeches would be equally impressive. There is little ground for subscribing to the notion that the sampled minister is out of the ordinary. He is not; it would even be difficult to claim that he belongs to a particular species; he is just one of a genus.

A CULTURAL PATTERN

This fetish for the spoken word has been otherwise defined as oral eroticism. The overwhelming part of the cerebral energy is devoted to the concoction of words. It may be a surrogate function of actually doing something; in a manner of speaking, it reflects a kind of defence mechanism too. Mini-

sters have honestly come to think that their survival depends upon the frequency with which they find themselves mentioned in the press. Survival depends upon divinity, divinity in turn depends upon oracular pronouncements, but what is the point of oracular pronouncements if these are not published in newspapers? There is, besides, the harsh reality of competitive pursuits: if one minister addresses a couple of seminars on, for instance, automation and social justice, can another minister afford to be far behind: he too has to, for dear life, find a platform he can pontificate on socialism and export promotion. A cultural pattern therefore emerges. The newspapers sustain the ministers, ministers in their turn sustain the newspapers. It is a rather cosy arrangement whereby the papers divide their space between categories of advertisements: advertisements for the ministers and for consumer products and such like. The only difference between the two kinds of advertisements is that those for consumer products are paid for, while those for ministers are free. Depending upon the corporate tax rates, perhaps even 50 to 60 per cent of the total cost of the advertisements for consumer products are, in the final analysis, paid for by the tax-paying public, just as the entire expenses in connection with ministerial speeches are covered by them. Therefore it is the people who have to pay for the advertisements which the newspapers print. Advertisements are in the nature of importunings. Ministers importune, the producers of consumer goods importune, but those toward whom the importunings are addressed have to bear the cost. This does not make sense, but there it is under a system where the consumers are alleged to be sovereign and the people are allegedly equally sovereign to choose the politicians to rule over them.

A Cabinet minister, if he has to make ten speeches a week, cannot possibly have frighteningly original things to say on each occasion. He does not have the time to think, nor do his cronies who have the time to prepare the drafts. As in the case of consumer products, the emphasis therefore falls on packaging, the speeches are embellished by generous doses of smart-alecism. Cliches are touted as profundities. The corrosive game goes on all round the year, and year after year.

The tragedy is aggravated when ministers, at least some of them, come to believe in the packaged products, namely, themselves. They are by and large ordinary human beings; it is the quirk of politics which has pitchforked them into public prominence. But, in the manner of public relations hacks who hold as self-evident the banalities with which they describe their products, the ministers too, after a point of time, start to consider themselves as infallible luminaries. Perhaps, here too, the same defence mechanism is at work. In the current vogue of populism, when so much of sham is being propagated in the name of the people, the only stratagem by which the ministers feel they can survive is by creating a baffle-wall between themselves and the people. Which is why the kind of high living to which they transport themselves becomes a necessity. What begins as a necessity soon becomes a habit, and what becomes a habit after a while turns into a legend; from legend to godliness is the shortest possible haul.

BADGE OF SURVIVAL

Hypocrisy thus becomes the badge of survival. In the world of make-believe which newspapers and public relations agents help to create, fakery emerges as being indistinguishable from the face of reality. If you believe yourself to be God, you are God. A God is entitled to his ten perorations per week.

There is no retreat for the people either. It is Jean Paul Sartre's *Huis Clos*: they have to buy the consumer goods, and they have to read the reports on the speeches by the ministers. In the olden days, when one could subscribe to a journal like *China Reconstructs*, one was wont to make gentle fun of the droll reports in that journal of various economic and technical activities which were transforming that country. These were arid, heavy, dull stuff; it was often a torture to negotiate through the humourless reconnaissance of what Comrade Miss Ling or Comrade Master Lee had single-handedly achieved in this or that village in this or that remote province. In retrospect, were these however any inferior to the dreadful drivel which our newspapers serve — or are forced to serve — about ministerial doings? Could it be, one wonders, that the entire mystery of the disparate rates of economic growth of the two countries lies in this fact that while our newspapers consist of pontifications by ministers, *theirs* consist of narrations of events? Where achievements are

short, you necessarily have to fill in by invocations of divinity.

This difference also permeates the style of living. A Chou En-lai is entitled to use a Government car only when he is on official duty. After hours, or on a day off, if he wants to drop in on friends and relations, he has to ride his bicycle. Such a thing would be un-

heard of in our climate: divinities do not ride on bicycles. Politicians set the style, but why pick on politicians alone? Academicians like Ragnar Frisch in Norway or Jan Tinbergen in Holland used to reach their offices on bicycles. Make a similar suggestion to their counterparts here: they would rather be dead.

LETTERS TO EDITOR

Comprehensive Area Development Programme

A SPECTRE of zachitis is haunting A.M. At least so it appears from his Calcutta Diary in the issue of February 17, 1973. It has blurred his vision so much that he cannot distinguish between the Comprehensive Area Development Programme drawn up by the State Planning Board in West Bengal and the agricultural developments in the Punjab, Haryana and Maharashtra. He misses the point by a mile when he finds in the CADP scheme the provision for compulsory land consolidation. Some of his observations regarding integer programming based on continuous masses of land consisting of 10,000 acres perhaps follow from this. CADP does not call for any consolidation of holdings. It aims at co-ordinating all the developmental activities undertaken by the different governmental agencies in an area under a local Project Authority to be set up for the purpose. The objective is to select initially areas where such a concerted effort is likely to yield maximum returns by proper planning of the pattern and intensity of cropping and through generation of secondary employment. Activities ancillary to modern agricultural processes, e.g. operation and servicing of mechanical equipment, marketing of inputs and output, etc. and industries based on agricultural products are planned for the total area as a unit. A characteristic consequence of the type of uncoordinated development activity undertaken so far is the underutilisation of the scarce infrastructure facilities even when they are provided at a great cost. This is due very often to a lack of complementary facilities in the same areas. Investment on complementary facilities in such areas will enable fuller utilisation of the infrastructural facilities created so far. All this has been termed as "technological consolidation" as

against ownership consolidation.

Some confusion is reflected in the statement by A.M. that the development process in the state will not proceed beyond the boundaries of the CADP areas, which can be 10 per cent of the aggregate cropped areas at most, during the Fifth Plan period. This is far from being true. None of the developmental programmes of the different governmental agencies meant for the whole of the state is being curtailed. The main thing is that their activities in the CADP area will be co-ordinated under the local Project Authority, leaving priorities in other areas to be determined by agencies currently responsible for them. To the extent a CADP area receives special attention from the agencies the other areas may seem to suffer. But the aggregative returns for the whole state is expected to be appreciably larger by such allocation of resources. Since natural resources like water, soil and other factors are not evenly distributed over land, one has to submit to the natural advantages in according priorities to sites for agricultural development.

The credit system proposed in the CADP area is aimed to complete elimination of the mahajani system of money-lending which can charge a rate of interest as high as 100 per cent per annum, or even more. The Project Authority in the CADP area will provide the entire credit, including that required for maintenance, directly to the tillers at the market rates used by the commercial banks. Since the whole of the area is to be brought under the scheme, plot by plot enumeration will be undertaken to identify the actual tillers on the soil. The Project Authority will purchase the produce from the cultivators directly and arrange for their storage and marketing through official

agencies. The producers can be given advances against any stock deposited with the Project Authority which will share any profit that may arise from marketing operations with the producers. The cultivators would be relieved from the burden imposed on them by the intermediaries through this process. Subsidy now available for small and marginal farmers along with a system of rebate for prompt repayment of loans is to be introduced to free the poor peasants from the burden of usurious debts. The deficits on this account for a project will be met from the aggregate surplus earned by the Project Authority from its activities. This is a built-in mechanism for redistribution of income within the project area.

Since the source of inspiration for the scheme to its originator lay in years of experimentation in actual field work within the state itself its provisions are more earthbound compared to schemes advanced hitherto. CADP envisages the need for strict enforcement of the existing enactments regarding the ceiling on land, share of the sharecropper and debt settlements in the state. It calls for conferring statutory powers to the Project Authority to implement the legislations on land reforms. It is a pity A.M. ignores the distinctive features. He has given the dog a bad name, zachitis, and then simply hanged it.

How to Judge a Judge

CONSIDERING that lawyers-turned-politicians have long dominated the Indian political scene, it is not surprising that the out-of-turn appointment of one of the judges of the Supreme Court as the Chief Justice of India has attracted all-round attention and given rise to widespread debate. In comparison, the "angry and hungry" crowds — as the Press described them — of food-gatherers turning into rioters, in Nagpur and in other parts of the country, seem to be of only secondary importance, though the issues involved here are fundamental.

Appointments to high offices have long since ceased to be relevant to the common man. Moreover, if civil service rules lay down that merit and not mere seniority is the criterion for promotion even for low-paid functionaries, why should it be any different for such important office as that of the Chief Justice of India?

The only question that would remain unanswered is, how to judge a judge.

But if — as has come to be accepted — the initial appointment to the Bench is largely a matter of political selection, why should the introduction of just the same process in the further selection to the highest office be condemned?

Only those who are unduly naive would continue to believe that for appointments to public offices there is a process of selection based on merit — a *queue*, as it were, where people take their turn in the order of their relative merit. The era of patronage dawned years ago in this country, and it is engulfing slowly but surely the areas left untouched. There is nothing new to cause undue concern to any discerning observer.

The reported appointment of a number of top private sector executives as 'Advisers' to the Planning Commission with almost the highest rank that could be given within the permanent executive, is another instance. There are no discernible objective criteria on the basis of which the selections have been made. They are just made, and that is all. Further, while on the one hand the ruling government condemns the business houses it is these very houses — such as Hindustan Lever, Union Carbide, Mahindra and Mahindra not to speak of Tatas — that contribute top executives and policy-makers to the government! But to be correct, this too is not new: the Petroleum Ministry at the Centre had always the reputation of being advised by an adviser drawn from Burnah Shell.

The crucial point is that there is no such thing as 'policy' known to government. Only expediency, pure and simple. If this is kept in mind, the apparent mystery about the actions of the government will easily dissolve.

Fifty Years of Soviet Achievement?

APROPOS, our article 'Fifty Years of Soviet Achievement?' (Volume VIII, Number 8, February 24, 1973), we are surprised at the title which is different from the one we had originally given and does not, we feel, represent our viewpoint. We have no doubt about the many achievements of the Soviets over the last five decades. And in our article, we have tried to present a brief-account of the seminar together with a gist of

the papers presented for discussion at the seminar.

There is also a printing error in the last sentence of the first paragraph in column two (p 451). The sentence should read: "Similarly, it was observed that the contribution of private farm-

ing might not be as large as was pointed out in the paper". The word 'not' is missing in print.

Thinking of buying a TV Set?

Save for it under our CUMULATIVE DEPOSIT SCHEME

This Scheme brings you the highest returns, higher than even Fixed Deposits.

Save for that new TV Set under this Scheme.

Buying it will not be a burden at all.

Study this chart. It shows how this Scheme can be real boon:

Deposit.	Months.	Amount. Repayable.
Rs. 1000/-	18	Rs. 1100/-
Rs. 1000/-	33	Rs. 1200/-
Rs. 1000/-	46	Rs. 1300/-
Rs. 1000/-	60	Rs. 1400/-
Rs. 1000/-	69	Rs. 1500/-

Deposits are accepted even in the multiples of Rs. 100/- under this Scheme.

Full details from any of our Branches.

Production Suffers but Dividend Unchanged

Hansavivek

DUNLOP INDIA has secured a 'letter of intent' for manufacture of steel cord and textile reinforced conveyor belting and fan and vee belts at a new factory in Goa, but its proposal to expand capacity at the Ambattur factory by two lakh tyres and tubes with the addition of balancing equipment is still under government's consideration. The expansion programme for 2.5 lakh automotive tyres and tubes at Ambattur was completed during 1971, but total tyre production in 1972 was lower than in the previous year owing to heavy production losses at the Ambattur factory on account of go-slows and strikes, culminating on two occasions in the declaration of lock-outs. As a result, a total of 84 working days were lost during 1972 and another 23 days during the current year. The company's

offices in Calcutta had to remain closed too for more than 45 days owing to unrest created by "an unrecognised splinter union, in its bid to obtain recognition". Total production of automotive tyres was 15,68,000 against 17,23,000 last year, and the installed capacity of 18,00,000. Automotive tubes production was 15,49,000 against last year's production of 15,88,000 and installed capacity of 17,00,000. Although domestic sales of non-tyre products, such as conveyor and transmission belting, hoses, and fan and vee belts, increased by 18 per cent, the company's total net sales were slightly lower than in the previous year. Gross profit dropped by 42 per cent, owing to increases in costs. Despite substantially lower provision for taxation on account of the reduced profits, together with increased

capital allowances on the expansion projects completed during the year, net profit was more than halved. A good part of the unchanged dividend of 20 per cent will come from the past reserves.

The company was permitted by government to issue 10 lakh equity shares of Rs 10 each at a premium of Rs 11 per share as 'rights' on a one-for-ten basis against its application for issue of 15 lakh shares at a premium of Rs 4 per share on a 3-for-20 basis. Dunlop continued to be the largest exporter in the tyre industry, by exporting to 79 countries and earning a total of Rs 322 lakhs in foreign exchange. The company exported a variety of goods, including bicycle accessories and sports goods made by small-scale manufacturers. The chairman observes that there has been no increase in automotive tyre and tube prices since November 1968 and that the Bureau of Industrial Costs and Prices is yet to make recommendations on the company's application in early 1971 for a price increase. He adds that costs have been conti-

Net profit/capital employed	5.91	10.74	16.86	9.25	16.47	16.48
Inventories/sales	26.57	23.83	6.65	10.77	14.65	18.84
Wages/sales	17.66	15.48	21.61	26.15	8.61	7.16

uously rising and that the last Budget would have the effect of further inflating raw-material costs by Rs 150 lakhs in a full year. Prospects for the immediate future, according to him, are "even more disturbing" owing to the drastic power cuts in Tamil Nadu — on account of which production at the Ambattur factory has been at "minimum levels". This situation is likely to continue for the first half of the year.

WOOLCOMBERS OF INDIA has secured 'letters of intent' for expansion of combing capacity by 1.5 million lb per annum and for installation of 600 shoddy spindles, both to be in Uttar Pradesh. Land for these projects is being acquired; and applications have been made to government for import of suitable machinery. The company has manufactured, for the first time in India, lanolin anhydrous suitable for the drugs and cosmetics industries. Orders have been placed for import of machinery required to replace some of the old noble combs. The company received, for the first time, a 'token' licence for the import of raw wool. The tops produced thereof met with good demand and their sales increased from Rs 44 lakhs to Rs 152 lakhs last year. Production of wooldrops during the first 8 months of the year was satisfactory, but fell from September owing to 'go-slow' tactics by workers. Frequent power shutdowns were also responsible for the drop in output. While total net sales increased by 29 per cent to Rs 421 lakhs, gross profit advanced by 36 per cent to Rs 121 lakhs. Borrowings were almost entirely repaid, and the ratios both of inventories/sales and of wages/sales were brought down appreciably. Equity dividend, maintained at 12 per cent, found a much better cover than in the previous year. The board has also recommended issue of bonus shares on a one-for-five basis. The company has made investments of Rs 107 lakhs in shares of other companies, including Rs 93 lakhs in the subsidiaries — Indian Fibres and Jubilee Mills. Jubilee Mills' working last year was affected by 'heavy inroads' made in the powerloom processing work by processors not using power and enjoying a favourable excise tariff. The company's application under Section 372 of the Companies Act for the purchase of shares of Swan Mills is still pending with government. The company has invested about Rs 14 lakhs in shares of Swan Mills. Notes appended to accounts reveal that the company is contingently liable for an estimated Rs 55 lakhs — being increase in wages, etc, in terms of an Industrial

Tribunal Award, appealed against by the company. The number of employees entitled to receive emoluments, amounting to Rs 2,000 or more per mensem, increased from 8 to 13 over the year.

POLYOLEFINS INDUSTRIES' directors say that the Income-tax Department has invoked the provisions of Section 154 of the Income-tax Act to withdraw the development rebate of Rs 316 lakhs granted for 1968, allowing it to be carried forward and to be set off against future profits. This has been done presumably on the ground that the necessary statutory reserve has not been created in 1968. The company has been advised that, in view of the losses incurred in that year, it was not incumbent upon it to create any statutory development rebate reserve. A writ petition has been filed in the Bombay High Court, which is likely to come up for hearing shortly. According to the company's calculations, the statutory development rebate reserve to be availed of as at the end of 1972, in respect of plant and machinery, is estimated to be Rs 280 lakhs. Last year, a reserve of Rs 145 lakhs was created. Of this amount, about Rs 4 lakhs relate to expenditure on plant and machinery installed in the year and the balance to expenditure on plant and machinery installed in earlier years. PIL has received the industrial licence for expansion of manufacturing capacity, from 20,000 tonnes to 30,000 tonnes per annum. Last year, the company manufactured 'Hostalen' almost to its licensed capacity, in spite of the planned biennial shutdown for overhauling of the plant and machinery. Despite the pressure on costs, the company maintained a stable price policy as well as profitability by improving the performance of the operations and by better utilising plant and machinery. The company has taken steps to implement the project for manufacture of n-Butene-1. Dividend has been stepped up two points to 12 per cent, which actually finds a better cover than last year.

ASHOK PAPER MILLS, which was established in 1957 for setting up an integrated pulp and paper mill at Rameshwarnagar in Darbhanga district of Bihar and could not complete it owing to paucity of funds, is now being helped by the governments of Bihar and Assam and the financial institutions to rehabilitate the original project and also to put up a new unit at Jogighopa in Goalpara district of Assam. Total cost of both projects is estimated to be Rs 26.14 crores, of which Rs 6.53

crores represent net investment already made at Rameshwarnagar. The balance of Rs 19.61 crores is proposed to be raised by issue of additional share capital (Rs 4 crores), loans from IDBI, IFCI, ICICI and LIC (Rs 15 crores), and deposits from dealers (Rs 61 lakhs). In order to wipe out the accumulated losses incurred over the years, the company's share capital was reconstructed by reducing the paid-up value of equity shares, from Rs 10 to Rs 1.50 each. The company is now issuing additional equity capital of Rs 4 crores in shares of Rs 1.50 each. Of this, the governments of Assam and Bihar will take up Rs 143 lakhs and Rs 57 lakhs, respectively, and the public will be offered shares of the total value of Rs 2 crores. The entire public issue has been fully underwritten by IDBI. The subscription list will open on May 18 and close on May 30, or earlier, but not earlier than May 21. A part of the plant and equipment of the Rameshwarnagar unit is proposed to be shifted to Jogighopa, where abundant raw materials, water, power and transport facilities are available, to raise the daily capacity to 120 tonnes of pulp and 90 tonnes of paper. Also, certain sophisticated machinery is intended to be installed at Rameshwarnagar for production of 40 tonnes of speciality paper and 10 tonnes rag pulp per day. The Jogighopa unit will supply 30 tonnes of dry bamboo pulp per day to the Rameshwarnagar unit, which is expected to go into production by December next. The Jogighopa unit is scheduled to go on stream by May next year.

ANDHRA BANK has earned a net profit of Rs 16.11 lakhs for the year ended December 31, 1972 against Rs 12.21 lakhs in the previous year. The Reserve Fund and other Reserves received Rs 9 lakhs raising it to Rs 60 lakhs against a paid-up Capital of Rs 50.44 lakhs. The dividend has been stepped up to 10 per cent from 8 per cent. Deposits of the bank rose to Rs 109.50 crores from Rs 79.91 crores, representing an increase of 37 per cent. Advances increased to Rs 68.51 crores from Rs 52.48 crores, representing an increase of 30.5 per cent. Investments were higher at Rs 38.19 crores (Rs 30.44 crores). Advances to the priority sectors, viz, agriculture, small-scale industries and exports, were Rs 19.87 crores which was 29 per cent of the total advances spread over more than 81,000 accounts. During the year under review 40 branches were opened out of which 35 are located in Andhra Pradesh. The Bank had 278 branches as at December 31, 1972.

WANSON (INDIA), Poona, manufactures Wanson Thermopac, India's first liquid-phase heating system. It uses easily available thermal oils in a closed circuit to carry heat to the process and back while remaining in the liquid phase at temperatures in excess of 300°C. The Thermopac consumes only 5 per cent of the power required

for all-electric systems and the total operating cost is 75 per cent lower. It can replace electricity for most industrial heating requirements with connected loads from 50 kw to 1000 kw. The Wanson Thermopac is made in collaboration with Establishments Wanson of Brussels.

case, the system cannot work properly without sufficiently stringent controls on prices and distribution and the establishment of joint organisations of producers to administer the controls.

Whatever the solution that is finally accepted, what these exercises imply is that a significant upward revision of prices of industrial products is now considered necessary. As it is, food prices have been exerting much pressure on the general price level in recent years. Now it is expected that the prices of manufactures will do the same. In these circumstances, it is apparently pointless to talk of holding the price line, much less of bringing down prices — as government spokesmen sometimes do lightly in Parliament and outside.

FROM OUR CORRESPONDENTS

NEW DELHI

Costs, Prices and Profits

THE latest bout of inflation in the economy has once again raised the spectre of Indian exportables getting priced out of world markets. This threat is sought to be met, predictably, by adding to the plethora of export incentives, tax concessions and fiscal subsidies. But it is not only exports that have to reckon with the price barrier. The problem arises also in connection with new investments in the economy. At the present level of prices of capital goods, specially after the steep increase in the last Budget in customs duty on imported machinery and equipment, which still form an important component of new investment, it is becoming difficult to realise an adequate rate of return on new investments. Investors are, therefore, not interested in committing investible funds to new ventures. It is not the political uncertainties, nor even the apprehensions about the radical postures of the ruling party, including the recent nationalisation measures, which are holding up investment. It is the prospect of poor returns. Not only private industry and business but the government also is convinced that something has to be done to improve the profitability of investment. The Industrial Development Ministry and the Heavy Industry Ministry are particularly concerned about this.

The problem does not concern the private sector alone. It has a vital bearing on public sector investments as well. Consider the proposed new steel plants, for instance. The capital cost of these plants or even that of the substantial expansion of existing plants such as Tisco or Bhilai will be so high that they cannot be expected to make any profits at all, even if they are ably designed, efficiently constructed and operated at full capacity. The same applies to several other projects propos-

ed to be taken up in the public sector. From these considerations originated the idea in the Industrial Development Ministry of tackling the problem from the side of prices of end-products. This approach now has the support of the Ministry of Heavy Industry as well. The suggestion is that the price structure should be so readjusted that it will ensure economic returns on investments. No final decisions on this problem have been taken so far, but some interesting proposals have been put forward.

One of the proposals to emanate from the Industrial Development Ministry is that there should be a two-tier system of prices under which the old units will continue to receive the prevailing prices for their products while the new ones, set up at higher capital cost, will be entitled to higher prices. This arrangement would be obviously very difficult, if not altogether impossible, to administer. How can the buyer be compelled to pay different prices for the same product in the market? The proposal was then modified and it was suggested that new units should be allowed substantial excise and other rebates to make their products competitive with those of the older ones. This comes up against the objection that, as a result, the fiscal structure will be further complicated and, further, that it would amount to subsidising the new units from the public exchequer. The idea that is now being canvassed most forcefully is that there should be a system of pool prices which will compensate the new units to the extent necessary to offset their capital cost disadvantage. The administration of the pool prices is also a tricky business, however. It has already been attempted in the case of steel, coal, cement and some other industrial products. But the experience has not been very satisfactory. In any

Holding Companies: Losing Appeal

The idea of forming holding companies to improve the efficiency of public sector enterprises is fast becoming a subject of ridicule. The recent statement in Parliament by the Finance Minister, in reply to a question, that his Ministry was thinking of organising a holding company for all the government financial institutions has only added to the merriment on this subject. We already have in the Finance Ministry the Department of Banking which was organised after the take-over of the 14 larger commercial banks. This Department may justifiably claim that it is the holding company for the public sector banks just as the Minister of Heavy Industry claimed, while rejecting the proposal of a holding company for machine tool units, that his Ministry was itself a holding company for all the activities and undertakings under its charge. Is the idea that another full-fledged department — dressed up as a holding company, which is the fashionable thing these days — be organised in the Finance Ministry on the pattern of the existing Banking Department?

The justification put forward for forming a holding company for the public financial institutions is interesting. According to the Finance Minister, since all the public institutions gave loans to or held shares in private sector companies, there was often some duplication. Also, these institutions were not able to organise effective participation in the management of the private companies. The holding company, as the apex body, would be able to co-ordinate the working of the financial institutions in both spheres. It

would exercise the rights flowing from ownership of shares and from lending to private sector companies and nominate government representatives on the boards of these companies.

So far the idea had been that the holding companies for various industries would exercise this function in respect of the shares owned and loans given by public financial institutions in respect of private sector companies within their sphere. The proposal to set up a holding company for the public financial institutions runs counter to this idea. Could it be, then, that it is a move to clip, howsoever slightly, the wings of the steel holding company, which was to exercise the rights of public financial institutions in Tisco and other private sector companies falling within its scope. In the present climate of New Delhi marked by constant jockeying for power and influence not only by ministers but by high officials as well, and by shifting patterns of alliances and conflicts at different levels of the government set-up, all manner of moves may be expected to be made for reasons other than those openly stated.

Whatever the reasons which prompted the Finance Minister to talk of a hold-

ing company under his ministry, the holding company concept is apparently beginning to lose some of its appeal. The Industrial Development Minister is maintaining a total silence on the subject while the Heavy Industry and Food Ministries have declared their distaste for the idea. Not that the holding company concept has no supporters left. For instance, the Action Committee on Public Undertakings, under the chairmanship of Planning Commission Member M S Pathak, strongly favours it, particularly for the fertiliser industry.

In the meanwhile, the only holding company actually floated so far, the Steel Authority of India Ltd, has little to show for itself. It is still at the stage of being assembled and housed. The chairman of the holding company, who incidentally took charge of the Ministry of Steel as its Secretary before assuming the office of the chairman of the holding company, appears to have got sucked into the routine functioning of Secretaries to government departments. Indeed, from the looks of it, his primary position has become that of Secretary to the Ministry and his office as chairman of SAIL appears as a sort of *ex-officio* position.

WEST BENGAL

Public Demonstration of Internal Crisis

THE house that Congress built in West Bengal only about a year ago is all in shambles now — apparently due to irreconcilable factional infightings. Physical assaults, including murders and attempted murders, local bandhs, demonstrations and counter-demonstrations, ultimatums to the Chief Minister with conflicting demands by the rival factions, are all part of the workaday routine in intra-Congress politics at present. All this finds its echo in the Assembly Chamber — resounding from the Speaker's right. If, and to what extent, these surface manifestations of irreconcilable contradictions within the Congress ranks are due to deeper social malaise, can be left to social and political scientists to settle.

Meanwhile, to recount some of the very recent events in the State capital itself. First, there was a reported assault on a city Congress MLA, soon followed by the shooting of a youth leader of the rival faction. Then there were two consecutive days of local bandhs, in protest of the shooting; leading MLAs of the faction, to which the injured youth leader belongs, organised a pro-

test demonstration in front of a local *thana*; they also submitted a long list of 'rowdies' to the Chief Minister demanding their arrest within 48 hours. During the next few days, the police picked up 11 persons, apparently from the list supplied. There followed another short bandh in the extremely vital Sealdah area, in protest against these arrests — particularly of a student leader who was also caught in the net.

The Sealdah bandh paralysed the transport and normal life of an important city nerve-centre, from early morning to 1 p.m. It also prevented many school final examinees from reaching the examination halls in time. The bandh was withdrawn only after the Chhatra Parishad leader and Minister of State for Home (Police), Subrata Mukherji, arrived at the scene. The bandh had been organised by his faction of students and youth leaders. This faction, for its part, served a 72-hour ultimatum on the Chief Minister, demanding an end to the police *zuloom* against the Congress workers of East Calcutta — particularly against those following the leadership of Priya Das Munsi, MP, and

curiously, the Police Minister, Subrata Mukherji.

About the same time, the General Secretary of the South Calcutta District Congress Committee issued a public statement protesting against the actions of some Congress MLAs who were "trying to organise police atrocities on devoted Congress workers" by branding them 'rowdies'. The statement levelled counter-charges of 'rowdism, black-marketing' etc, against those MLAs. The chief spokesman of this group of Congress MLAs, in turn, publicly expressed his intention to seek protection of the Assembly Speaker as, he said, he felt insecure and threatened. The chain reaction thus goes on gathering momentum.

If the infighting of the Congress in the city proper has a bizarre look about it, it assumes a more dangerous aspect in the suburbs. A suburban Congress MLA complained in the Assembly that "Belgharia had become a paradise for rowdies who were moving freely about with bombs and pipe-guns in broad daylight. Elected representatives could not enter the area for fear of being attacked. Hooligans were masquerading as Congress workers and assaulting 'real Congressmen'." He further said that, on April 29, at about midday, nearly 200 rounds of ammunition had been spent by anti-social elements in the Belgharia area after "two notorious anti-socials" had been arrested in the morning. Three persons, including a girl, were accidentally hit in the wild and indiscriminate firing which the anti-socials resorted to "as a means of spreading terror", he added.

Significantly, both of the rival factions, while making contradictory demands on the State Chief Minister threaten him that they would lodge complaints with the Prime Minister if their demands go unfulfilled within the stipulated time. Caught in the cross-fires of the two groups, the condition of the two groups, the condition of the Chief Minister has become quite pitiable. Though, the other day, he told some press correspondents that "the situation has not yet reached such a pass that one should give up everything else and devote one's attention solely to them [the rival factions]", in reality Ray's efforts for reconciliation, in which he was prompted by the Prime Minister herself, have failed dismally — his private dinner to the leaders of the rival factions notwithstanding.

The bitter clashes between the two groups of the young MLAs of the ruling

party have spilled over into the mass fronts. The Chhatra Parishad is virtually split into two; and the Congress trade union front, divided into three broad groupings, is in worse straits. The Calcutta University Students' Union, captured by the Chhatra Parishad in the last election, is deadlocked as a result of the intra-Congress clashes. And infightings among the Congress trade unionists have led to strikes, lockouts, and closures of many establishments.

If the younger MLAs are bent on settling scores by violence and bandhs, their elders, including middle-aged ministers, often resort to even cruder methods. The comic-opera episode, in which, Health Minister Ajit Panja, temporarily holding the Local Self-Government portfolio, led a procession of garbage-laden lorries from the city to the suburban residence of the Commissioner of the Calcutta Corporation and bullied him into giving in writing the impossible commitment that the city would be freed of the long-accumulated refuse within a week, was not exactly an innocent indiscretion. It was a calculated move in the tussle, over the

NORTH

Hope from the Himalayas

PERHAPS the most encouraging news of the past fortnight for the northern region is about the fast melting of the snows on the Himalayan slopes. The entire economy of Punjab and Haryana, and to some extent also of Rajasthan, hinges upon this phenomenon. For three years running, 1970 to 1972, sufficient quantities of snow did not melt owing to the spells of cloudy weather in April, May and part of June. Though the people of the plains were thus spared the agony of a sweltering summer, the overshadowed sun almost proved disastrous to their economy, which is governed by Bhakra power the quantum of which in turn depends on the flow of water into the huge reservoir known as Gobind Sagar. When this reservoir gets only half filled, owing to inadequate melting of snow in the April-June period and scanty rains in the catchment areas of the Sutlej in July-August, both power generation and release of water for irrigation suffer a setback. The recurring power crises during the past three years were particularly disconcerting. Thousands of tubewells in Punjab and Haryana were rendered idle. The power cuts caused heavy losses to agriculture and industry — officially estimated at over Rs 100

crores in Punjab alone — apart from untold hardship to industrial workers as a result of curtailed shifts in factories and lay-offs.

leadership of the North Calcutta District Congress Committee, with the permanent holder of the Local Self-Government portfolio, Prafullakanti Ghosh. Ghosh had been temporarily relieved of his portfolio, following his hospitalisation after a serious jeep accident. Panja's quixotic move was, conceivably, calculated to achieve two results; first, to outshine Ghosh by recording some major achievement during his temporary tenure of the Local Self-Government department — and, for this, he was delaying the relinquishment of his temporary charge, despite strong pressures from Ghosh —, and second, to humiliate an officer picked up by the latter for the Corporation's key post. The whole thing backfired, however, and Panja himself became an object of criticism and ridicule.

The inner crisis of the Congress has assumed such major proportions that the State Congress leadership is having second thoughts about carrying through the planned series of district and block-level conferences, lest they turn into a public demonstration of an insoluble internal crisis.

RELiance ON HYDEL POWER

The basic flaw in the set-up is the excessive reliance on hydel power. The planners failed to anticipate the possibility of acute shortages of water and provide alternative means of power generation to meet the mounting demand. Ill-planned electrification programmes at the behest of politicians have also been partly responsible for the current gap between demand for and supply of power, estimated at 450 MW. In the 1971 summer — a particularly bad season for Bhakra — the inflow into Gobind Sagar was at times less than 5,000 cusecs, as against the normal 8,000 to 9,000 cusecs. Since then, the outflow has often been twice the inflow as a result of which the water level has been falling steadily, almost reaching the "dead level" of 1,440 feet after which power generation has to be stopped to save the turbines from damage. More or less the same situation continued during 1972, resulting in frequent power cuts in the northern states.

This year the snows have yielded to the blazing sun and the depleted Bhakra reservoir has started filling up. The present inflow of 19,000 to 19,500 cusecs is believed to be a record, exceeding the 17,758 cusecs touched in 1956. The increase in the water level has gladdened the hearts of Bhakra engineers who have described the April and early May inflow as "something unique". During the fortnight ended May 5, the water level increased by 23 feet. This may be taken as a guarantee of restoration of power supply and hence of brighter prospects in both agriculture and industry, especially if the rain-gods smile on this region once again. In fact, the engineers' calculations are that the coming year would be the best for Bhakra. An expert team from the Geological Survey of India is already probing the effect of the thaw of the glaciers on the inflow into the lake.

In the meanwhile, however, with the 16,000 powermen's strike in Haryana showing no sign of an early end, because of the adamant attitudes of status-conscious Ministers and bureaucrats, the industries in that state are grinding to a halt. Initially, the state's Electricity Board was able (through special accommodation provided on request by the Bhakra Management Board) to show that power supply was "even better than normal" despite the strike. But the pretence could not last, and gradually the reality has dawned upon the authorities that the public cannot be misled. The strike gained momentum, with large batches of powermen offering themselves for arrest in Delhi and many jails filled to capacity. After remaining "stern" for over three weeks, the Board officials agreed under Central pressure to start negotiations with the strikers' representatives. However, since the government is unwilling to yield ground, the talks have reached a deadlock.

Incidentally, Haryana has gained the dubious distinction of having seen prolonged strikes in quick succession by one category of government employees and then another, with the authorities each time adopting a callous attitude. Chief Minister Bansi Lal's "firmness" misfired in the college teachers' strike last winter, then in the school teachers' strike (during which the government pursued a systematic campaign to terrorise the teachers) and also in the current agitation of non-gazetted powermen. The powermen's demands are simple enough — implementation of a recent agreement for the grant of interim relief and removal of anomalies

in pay-scales. The latest threat comes from subordinate government employees and road transport workers who intend to go on strike from May 12. Since the state government launches a campaign of repression whenever there is a strike, the agitators shift the scene of activity to Delhi. The Organising Secretary of the Haryana Subordinate Services Federation, who is on a fast-unto-death in Chandigarh in support of the powermen's strike, has urged the state government to read the writing on the wall and "not to play with fire and burn its fingers". Unless the government agrees to give the employees their due share, he has warned, there would be "a mass agitation which would paralyse all governmental activity in the state". Already, the power strike has paralysed industrial activity and also held up threshing operations on farms. This in turn has slowed down the flow of wheat to the markets and hindered procurement.

Ironically, while Punjab and Haryana are starved of electricity, the vast hydel potential of Himachal Pradesh (about 8.5 million kW) remains unexploited.

TAMIL NADU

Dindigul Sweepstakes

M R

AFTER its resounding debacle in Banka, the Congress is playing for high stakes in Dindigul where it has little chance of winning. The Dindigul Lok Sabha by-election is the focal point of all the contradictions in Tamil Nadu politics. The alignments at the by-election reflect these contradictions: the DMK which is defending the seat is backed by the Muslim League, the ADMK has the backing of the CPI and CPI(M) and the splinter Tamil Nadu Muslim League, the Congress(O) has the Swatantra party's support and the Congress is going it virtually alone.

Even since the 1969 schism, the Congress in Tamil Nadu has been a sparse quantity because the bulk of the party went with Kamaraj. The Congress has had no occasion to measure its independent mass base in the state. All it had to go by was Indira Gandhi's image. But the high command was inclined to draw a fine line between Kamaraj and the rest of the Syndicate in the hope that eventual merger of the two Congress wings in the state was a possibility. At the 1971 elections to the Lok Sabha (when Tamil Nadu

The Public Works Minister, Ram Lal, told the Himachal Assembly last month that Rs 200 crores would be required to harness this potential. He invited the Punjab and Haryana authorities to step in and construct power projects in Himachal territory with mutual collaboration so that the perennial power famine in the region could be wiped out. The Himachal government has already approached the Planning Commission to include at least seven power projects based in the state for execution in the Fifth Plan. These projects, estimated to cost Rs 30 crores, would produce 260 mW of power.

PUNJAB'S PROPOSAL

Punjab, however, has other ideas on the subject. It has not only demanded a 1,000-mW nuclear power station in the state but has also proposed an investment of Rs 520 crores in the Fifth Plan to increase the installed capacity of thermal plants in the state by 1350 mW. But considering the long gestation period of all such plans, immediate relief can only be expected through nature's bounty.

also chose to hold its Assembly elections), the Congress found itself an inconsequential force and struck a humiliating bargain with the DMK because Indira Gandhi's stake lay in winning as many Lok Sabha seats as possible from the state even if it meant the effacement of her party at the Assembly level. In return for the DMK-led front's support in a few Lok Sabha constituencies, the Congress agreed to abdicate its role as a state party by keeping out of the contest for the Tamil Nadu Assembly. The DMK was shrewdly establishing a point here: it was for all purposes a one-state party with mutually exclusive roles — the ruling party in Tamil Nadu and an opposition party at the Centre. As a corollary to this, it wanted the Congress to limit itself to contesting a few Lok Sabha seats because it was the ruling party at the Centre and should not play even the role of an opposition party at the state level. For the high command it was not an unreasonable price because it did not want the Congress(O) to establish a beachhead in Tamil Nadu while its ministries in

Gujarat and Mysore were about to disintegrate.

In Tamil Nadu, it was a virtual polarisation between the DMK-led compact and the Congress(O) while the CPI(M) tried to provide a feeble third front. After the poll, the Congress leadership expected the gradual erosion of Kamaraj's strength in the wake of Indira Gandhi's massive victory and the political-organisational crisis that overcame the Congress(O) in the rest of the country. But this did not materialise and the Congress(O) still had the cadres and the organisation while the Congress was but a splinter owing its relevance to Indira Gandhi's position at the Centre and the DMK's sufferance in Tamil Nadu.

In mid-1972, the Congress thought of asserting its identity by promoting and participating in a patently kulak-oriented agitation against the DMK government. But the high command realised that it was too early to force a confrontation with the DMK because the Congress(O) was still the viable alternative to the DMK in the state and Indira Gandhi's following had no independent mass base yet. The Prime Minister disowned the agitation her lieutenants, C Subramaniam and Mohan Kumaramangalam, had promoted and even the CPI had begun backing. Secondly, the kulak demands were hardly the issue on which the Congress should have chosen to confront the DMK.

So things had to await the crisis in the DMK with the resignation of M G Ramachandran in October 1972 and the emergence of the ADMK. The Congress then banked on M G Ramachandran to split the DMK down the middle and threaten Karunanidhi's majority in the legislature. Alternatively, it expected Ramachandran and the CPI to engineer a 'mass upsurge' to create a law and order situation. Either of these would have had the same consequence — Central intervention followed by fresh polls. But the outcome of such a poll would still be uncertain. In any case, there has been no real split in the DMK, Karunanidhi's majority is almost intact, the defections have not been forthcoming and Ramachandran's campaign has petered out, while the Centre is prevaricating on the inquiry issue.

Institution of an inquiry into the corruption charges might have prompted Karunanidhi to have recommended dissolution of the legislature when he still commanded the majority. But even Ramachandran did not want fresh elections: all he wanted was a new DMK

ministry excluding its present incumbents.

Barely a month before the Congress decided on contesting the Dindigul seat, its political conference (held at Dindigul) called for a third front in the state, to fight both the Congress(O) and the DMK. There was no more hope of a rapprochement with Kamaraj and the Congress(O) and the ruling party at the Centre had decided to take the initiative for a new strategy. The obvious allies in the third front were to be the ADMK and the CPI. But as events proved, the front was a non-starter. The Congress thought that as the sponsor of the front, it would be its leader and qualify for the unconditional support of the two allies at the Dindigul by-election. Any compromise at Dindigul would deprive it of yet another chance to assert its identity and to attempt building an independent mass base.

There is yet another aspect to the Dindigul episode. Just as L N Misra drew the predictable lesson from Banka that failure of the Congress to forge an alliance with the CPI cost it the contest, Mohan Kumaramangalam is out to prove this point again when Indira Gandhi's candidate is trounced at Dindigul. If the Congress is soundly defeated, it would be convincing proof that the Indira wave has ebbed, at least in Tamil

INDUSTRIAL LABOUR

Apolitical Opportunism

Sumanta Banerjee

WHEN, many years ago, the Delhi Development Authority decided to push the growing manufacturing industry into the peripheral areas of the capital — such as Okhla, Najafgarh, or Shahdara — it could not have imagined that these would develop into aneurysms threatening the protected complacency of the posh bungalows of Ministers, Secretaries, and MPs which adorn Lutyen's New Delhi.

All the familiar features of urban poverty and degradation have ripened in these peripheral areas. Crowded slums, mazes of lanes and by-lanes housing pimps, prostitutes, smugglers and cut-throats, and an industrial proletariat sustained by a job-protective trade unionism, are all concentrated in these industrial suburbs.

While the capital's middle-classes and white-collar government employees

Nadu and Bihar, and the Congress cannot afford to alienate the CPI. There is apprehension among the CPI's friends in the Congress that Indira Gandhi is about to execute a manoeuvre to the right, ditching the CPI if necessary. This is the lesson they have drawn from her death sentence on the Socialist Forum last month.

The Congress does not expect to win at Dindigul and therefore should be content with establishing its identity as a party. Indira Gandhi's programme and policies would be submitted to the judgment of the Tamil Nadu electorate for the first time. If the DMK loses convincingly, the Congress can still revive the third front strategy and prepare for the next Assembly elections, whenever they take place. Another attempt can be made to work up a mass upsurge or to force Karunanidhi to resign and seek a fresh mandate. Altogether, an attempt might be made to seek a new political balance in the state if there is a reasonable chance of Congress gaining even marginally from it. An inquiry into the corruption charges is still the lone trump card Indira Gandhi has. If used before the Dindigul poll, she would be playing into the hands of the CPI-ADMK alliance because the campaign for it originally came from the latter. So it might be reserved for a future occasion, depending on the voting pattern Dindigul reveals.

have been lulled by promises of 'Garibi Hatao' and concessions by way of higher emoluments, those living in Okhla, Najafgarh, Moti Nagar and such other industrial estates, and forming the bulk of the city's unemployed, lumpen-proletariat, and working class, have remained unaffected by the political gimmickry. With the intensification of the economic crisis in the past year and more, these sections of Delhi's population have been the first to feel the pinch of the price rise and the shortages of essential commodities.

FIRST EXPLOSION

The first explosion came at Shahdara some months ago. Although the ruling party and its faithful ally, the CPI, claimed that the opposition parties had provoked the riots to "sabotage Indira Gandhi's progressive policies", the signs

of genuine grievance among the people were unmistakable.

More recently, there has been unrest in the Mayapuri-Najafgarh industrial area. On April 30, in response to a strike call given by trade union organisations in support of striking textile mill workers, workers of various factories came out into the streets. There were clashes with the police. Two workers received bullet injuries when the owners of a printing press fired upon a group of workers who had arrived to get the press closed. Workers also clashed with shopkeepers of the area, who refused to close down their shops in response to the call for a bandh.

Some features of the incidents need to be noted. For instance, there was an attempt by the mob to raid and loot the godowns of the Food Corporation of India. At another place, a sub-inspector of police was badly beaten up by the people. Overall, though the mob violence was unorganised and sporadic, the targets of attack indicated the main thrust of public discontent.

The incidents of April 30 throw some light on the realignment of political forces in Delhi. The call for the bandh was given by the CPI(M)-led Centre of Indian Trade Unions, by the Socialist Party-dominated Hind Mazdoor Sabha, and by the RSP trade union front known as the United Trade Union Congress. It was also supported by a section of the Indian National Trade Union Congress. The involvement of a section of the INTUC placed the ruling party in an embarrassing position. It cannot now dismiss the whole affair as the work of saboteurs.

The fact is that the division within the INTUC is linked with the recent differences within the Congress party itself. The section of the INTUC supporting the strike call and led by Kishori Lal and J S Dara (president of the Delhi unit of the INTUC) is said to have the blessings of Chandra Shekhar, member of the Congress Working Committee and known to be opposed to the CPI-Congress alliance. The other section of the INTUC is aligned to Subhadra Joshi, a firm ally of the CPI.

The CPI(M), for its part, has taken advantage of the differences within the INTUC to come to an understanding with the anti-CPI group of the INTUC. The pattern of alignments which thus began to emerge from the start of the textile workers' strike in Delhi, from April 11, still continues to develop.

About 28,000 workers of Delhi's five textile mills — belonging to the Birla and Shri Ram groups — had been agitating for quite some time for a

wage revision. Their demands were for a minimum wage of Rs 300, interim relief to all workers, 100 per cent permanency on the basis of job requirements, and houses or house rent allowance.

In 1970, the AITUC-affiliated Kapra Mazdoor Ekta Union had been strong among Delhi's textile workers. But AITUC's willingness to agree to the management's suggestion that the question of wage revision be referred to a tribunal, as well as its acceptance of an interim relief at a rate much lower than was demanded by the workers, alienated it from the workers.

It is obvious that the CPI and the AITUC were caught napping by CITU which made inroads during all the intervening years. INTUC, the other important trade union organisation in the field, was ridden with splits. It was in these circumstances that the more militant trade unionists among the workers decided to go on an indefinite strike to press their demands after they had failed to obtain any action from the government.

The isolation of the CPI was evident in the preparations for the strike. April 11 was fixed as the date for the strike jointly by the Kapra Mazdoor Lal Jhanda Union (CITU), Rashtriya Textile Mazdoor Sangh (INTUC), and Kapra Kamgar Sabha (HMS), after they had consulted with the Kapra Mazdoor Ekta Union (AITUC). The latter backed out, however, at the last moment, and combined instead with the Jan Sangh trade union organisation to give a separate strike call as from April 18. But the strike began as scheduled on April 11, indicating the support of the overwhelming majority of workers for the CITU, INTUC and HMS.

Nevertheless, the CPI-Jan Sangh syndicate has become active in the trade union field since then. Immediately after the April 30 incidents, both came out against the strike call and condemned violence. In Delhi, shopkeepers and petty traders form the base of the Jan Sangh. These sections naturally refused to support the striking textile workers or even to join the April 30 bandh. According to CPI(M) workers, who went to the Lahori Gate area to persuade the shopkeepers to close their shops, they were actually attacked by RSS volunteers. On May 1, shopkeepers observed a hartal, in protest against the previous day's violent incidents. A public meeting was held at Moti Nagar. Along with Jan Sangh leaders, the CPI trade union leader of Delhi, B D Joshi, addressed the gathering. The international workingmen's

day was thus chosen to sanctify the unholy alliance between communalists and communists.

The entire affair reeks of the apolitical opportunism of the big trade union leaders on one hand, and of the growing frustrations of the working people on the other. The pure economism on which the Indian working class movement is floundering, is nowhere more manifest than in the Delhi textile workers' strike, where elements as diverse as the CPI(M) and the ruling Congress are united. The difference in their basic approach to a programme for change has receded into the background in the fierce competition to obtain material benefits for the employed workers. That such benefits are bound to be reduced to insignificance after some time, in the vicious spiral of inflation and wage increase, is completely disregarded.

The CPI seems to have reached the final stage of opportunism, its claims to being communist notwithstanding. In its desire to insulate the CPI(M) in

Kerala and West Bengal, it has allied with the Congress in these stages — justifying the alliance on the ground that the Indira Congress had turned 'progressive'. In Delhi, on the other hand, to save its dwindling base among the working class, it has jumped on the anti-government bandwagon; but again, in its fanatical opposition to the CPI(M), it has thought it fit even to befriend the Jan Sangh. The party's theoreticians are yet to come out with a political rationalisation of this latest alignment.

Meanwhile, the textile workers' strike is still continuing. The Labour portfolio being in charge of a Minister of State, who has little power to summon the textile magnates or to enforce a settlement in favour of the workers, the only way people can give vent to their feelings is through violent outbursts. But the Shahdara, and later the April 30, incidents in Delhi are only the early rumblings of a much bigger storm.

May 5

The 'Cycle of Violence' in West Asia

Bhabani Sen Gupta

MUCH of the recent discussion in the Security Council on the Israeli commando raid on Beirut centred on the Israeli Arab 'cycle of violence'. Ironically, however, the resolution finally adopted by the Council was so toothless as to be totally wanting in arresting the cycle, not to speak of reversing the process. In order to please the Americans, Britain and France watered down their original resolution which would have warned Israel that further violent onslaughts on the Arab countries could invite UN sanctions against the Jewish state. The resolution, as finally passed, pleased Israel much more than the Arab countries who once again returned from the UN with the frustrating realisation that as long as the United States does not change its policy of blind support for Israel, the cycle of violence will not break nor will there be any firm steps forward towards a just and durable peace.

Even as the Security Council was debating the question of violence in West Asia, the Israeli Defence Minister, Moshe Dyan, threatened Lebanon with more serious raids. Israel, he declared, was embarking on a policy of pre-emptive rather than retaliatory attacks on Arab countries harbouring Palestinian partisans. What he said in effect was that as long as the Palestinian guerillas lived in and operated from

Lebanese or any other Arab territory, Israel would choose the time and place of attack, and these attacks would not necessarily be confined to real or imagined guerilla bases. Dayan's declaration was, for all practical purposes, a pre-emptive offensive against the Security Council itself.

If the logic of the Israeli case goes unchallenged, it will amount to a scandalous distortion of historical and contemporary facts as well as acceptance of a sinister doctrine of might as the sole determining element in relations among sovereign states. The *International Herald Tribune* has pointed out that what Israel is trying to do is to equate "an act of terror" with "an act of war". "Acts of terror are the work of individuals or groups, responsible to no one but themselves, acting outside all forms of international or municipal law. Acts of war are performed by States, who do have a responsibility, however ill-defined, to the world community. For them, a government, a nation, can be held accountable, not as individuals but collectively."

The Israeli argument might have some force if Israel had offered a solution to the 25-year-old Palestinian refugee problem which is its own creation. Even the United States recognises that Palestine is the heart of the Arab-Israeli problem, and that this problem

cannot be resolved without satisfying the legitimate rights and aspirations of the Palestinian people. Israel, on the other hand, has taken the extreme position that the Palestine problem does not exist, that there have never been a Palestinian people, and that these people cannot be a party to a settlement in West Asia. *Le Monde* reported on January 20, 1969 that "asked about the role of the Palestinians in any future peace settlement, Foreign Minister Abba Eban said, 'They have no role to play'." *Newsweek* of February 17 1969 carried the following: "Asked whether the Palestinians were not also entitled to their homeland, Prime Minister Levi Eshkol answered, 'What are the Palestinians?'" The Israeli Military Court at Ramallah ruled in April 1969: "The Palestinians are not a party to the conflict between Israel and the Arab States." Finally, Golda Meir was reported by *The Sunday Times* of June 15, 1969, as declaring, "There was no such thing as Palestinians. It was not as though there was a Palestinian people and we came and threw them out and took their country from them. They did not exist."

This stunning attempt to wipe out the facts of history, even history within man's living memory, places the Palestinians in a position of utter desperation. For 25 years they have looked on the United Nations for a settlement that would either allow them to return to their homeland or compensate them for the losses they have suffered. Neither the UN nor the Arab countries themselves have been able to satisfy their just and legitimate demands. Numerous reports of the UN refugee relief bodies operating in West Asia have warned the international community during the last 25 years that the Palestinians were getting increasingly desperate and that continued failure to resolve the problem would introduce a new, uncontrollable element in the Israeli-Arab conflict.

This new element is now a fact of the West Asian situation and it is recognised as such by all countries except Israel. However much one may deplore the acts of violence of the Palestinian partisans, one cannot just wish them away. Essentially, the Palestinians are struggling for legitimate political rights and their struggle is as much of a national liberation movement as that of the people of Angola and Mozambique against Portuguese colonialism. Add to this the fact that one million Arabs are being forced to live in the territories seized by Israel from its Arab neighbours

in the June 1967 war; this is the largest colonial empire wrested by any country in the world since World War II. Israel's refusal to withdraw from these territories and its resolve to integrate them with the Jewish state create another objective situation of violent resistance of a suppressed people to colonial subjugation. Israel, then, has been entirely responsible for creating the objective environment of Palestinian violence. Israel is now bent upon using this objective situation as a doctrine of permanent pre-emptive strikes against Arab countries where the Palestinians may be living in large numbers.

WHO STARTED THE CYCLE?

The incontrovertible historical fact is that the cycle of violence in Palestine was started by the Zionists long before the state of Israel was born and that the Israelis since 1948 have systematically and deliberately pursued violence against the Palestinians and against those who have officially seen justice in the demands of the Palestinians. Between the mid-thirties and 1948, three Israeli terrorist gangs, Hagannah, Irgun and Stern, indulged in methodical and highly organised violence against the non-Jewish population of Palestine, often with the connivance of the British authorities, but sometimes causing the latter considerable annoyance and embarrassment. The terrorist exploits of these gangs have been eulogised in numerous Israeli publications as well as in the memoirs of several Zionist leaders. Many of the leaders of these gangs now occupy strategic positions in the Israeli official hierarchy: what is even more significant is that the cult of violence has been exalted to the level of official ethos.

In 1948 violence was adopted as the only effective means to drive out the Arabs of Palestine from their homeland. The massacre of the Arab population of the Deir Yassin village on April 9, 1948 became, in the words of Arthur Koestler, "the psychologically decisive factor in this spectacular exodus" of the Arabs from Palestine. That the forced exodus was planned Zionist policy is confirmed by numerous documentations. John Glubb records in his autobiography a conversation in December 1947 between a British army officer and a Jewish official of the Mandate Government. The British officer asked "whether the new Jewish State would not have any internal troubles in view of the fact that the Arab inhabitants of the Jewish State would be equal in number to the Jews?" The Jewish official replied,

"Oh no! That will be fixed. A few calculated massacres will soon get rid of them."

Colin Legum showed conclusively in an article in the November 26, 1972 issue of *The Observer* that it was Zionist terrorists during the Mandate period who provided the model and precedent which Black September and the PFLP are now following, and that it is "the State terror practised by the Government of Israel which drives many Palestinians to resort to what they regard as counter-violence."

In a rejoinder to Legum's article, David Watkins, a member of Parliament, pointed out that between October 1953 and September 1972, Israel had indulged in 12 major acts of violence against the Palestinians and/or populations of neighbouring Arab countries, and that each one of these actions was performed by the regular armed forces of Israel. In these 12 major acts of organised terror, about 1,000 Arabs were killed and thousands wounded; in a series of attacks in Gaza and the West Bank, between June and October 1967, as many as 17,000 Arab houses were demolished. Since the June 1967 war, Lebanon alone has been the victim of at least 30 acts of Israeli aggression, all in the name of striking at the Palestinians. Ten of these took place in the past 15 months, in spite of several condemnations by the Security Council. And now Israel has threatened Lebanon with more serious pre-emptive attacks if the Lebanese Government cannot get rid of the 300,000 Palestinians living in that country since 1948.

Israeli violence against the Arabs has, then, three serious and systematic dimensions. First, the violence inherent in extending the frontiers of Israel by war and conquest; it involves the enslavement and occasional extermination of hundreds of thousands of Arabs. Secondly, the dogged attempt to make the world community forget the existence of the deprived one million Palestinians. Thirdly, the self-assumed "right" of the Israeli Government to strike at the Arab countries in order to punish the Palestinians. It is the combined impact of this three-dimensional cult and practice of violence that is pushing the West Asian problem towards another explosion. Neither the UN nor the great powers will be able to resolve the crisis unless they grapple with this crucial factor. The cycle of violence in West Asia is of Israeli make. It is the violence of conquest, of empire-building, of annexation and colonisation in an age of liberation of all oppressed peoples.

Unfulfilled Task

Leela Visaria

Indian Census in Perspective by S C Srivastava, Census Centenary Monograph No 1, Office of the Registrar General, New Delhi, 1972; pp vi+416; Rs 8.75.

THIS book attempts to provide a "historical setting" to census taking in India and a few other countries. This is done essentially through a useful chart (in fact, a list) of the items included in the Indian census schedules since the beginning of census activity (1867-1872) until 1971 (pp 14-21), as well as a comparative statement of the concepts (or instructions and explanations) used for each item (pp 145-202). More than half the book (pp 203-414) is devoted to a comparative listing of the questions and definitions (or explanations) included by some selected countries of the world in their latest censuses of housing and population together with the United Nations recommendations relating to each item. The countries for which the listing is provided are Australia, Brunei, Canada, Sri Lanka, England and Wales, Hong Kong, India, Indonesia, Japan, Korea, Malaya, Pakistan, Philippines, South Vietnam, Thailand, Union of Soviet Socialist Republics, United Republic of Tanzania and United States of America. (The USSR apparently does not have a census of housing and therefore the housing census items relate to 17 countries.) Also listed in the volume are the titles of tables compiled in successive Indian Censuses, arranged according to the topics with which they deal (pp 113-127). The book has also reproduced all the census schedules that were canvassed and used in the 1961 and 1971 censuses of India (pp 93-112).

There is no doubt that these compilations, as well as the inclusion of the Census Act of 1948 (pp 23-30), in a single book will be useful to students as well as others who wish to get initiated in census analysis. The text, which runs through about 90 pages, includes a discussion of the development of census activity in various countries of the world as well as in India, a very brief discussion of the objectives, essential features and usefulness of the census and a rather general discussion of the various census operations such as preparatory work, enumeration, data processing, evaluation and analysis of results, their dissemination and record-

ing of the census experiences by those who conduct it. Unfortunately, the attempt to provide a historical or an analytical review of these operations as conducted in India is restricted to only the last two censuses of 1961 and 1971. Further, the discussion of the 1971 census is naturally limited by the fact that the book, released in 1972, must have gone to the press fairly soon after, if not before, the 1971 census enumeration was conducted. The chapter devoted to the evaluation of the census data barely does justice to its important theme and certainly the author has made no attempt whatsoever to evaluate available census data. The chapter merely outlines the types of errors that are likely to be found in census data, such as errors of coverage (over-or under-enumeration), and errors in reporting and recording of information and briefly discusses, at a very general level, some standard methods (such as post-enumeration sample or complete checks of certain areas, consistency checks, etc) used for the evaluation of census data. The author makes no attempt to indicate the efforts of other scholars to evaluate census data and their main findings.

The organisation of the book leaves a lot to be desired and one feels rather disappointed at the sketchy discussion of many important issues. A few inaccuracies have also crept in. On page 122, a reference is made to a migration table, compiled in the 1941 census. The title of the table is given as "age, last birthday". To the best of this reviewer's knowledge, none of the 1941 census tables, compiled for the major provinces, included any tabulation of data relating to birth place by age. The readers may like to know that the published 1941 census data for Assam, the then Madras Presidency, Punjab, the United Provinces and Baroda and Coorg did not at all include any table on migration (i.e. place of enumeration cross-classified with the place of birth). However, for the then states of Ajmer-Merwara, Cochin, Gwalior, Hyderabad, Mysore and Travancore, migration data are available for the entire population; whereas for the Provinces of Bihar,

Bombay, Central Provinces and Berar, Orissa and West Bengal, some migration tables — detailed or broad — were compiled and published on the basis of a two per cent sample of population. Similarly, on page 127, it is stated that information on fertility was collected only in the censuses of 1971 and 1931 (the latter on the basis of a "special enquiry"), while earlier on page 19 it is noted that information on fertility was collected in the 1951 census as an optional item in the then states of Bihar, Madhya Pradesh and Travancore-Cochin. (Unfortunately, however, the data for Bihar were not considered worthy of publication.) Even here the author is far from consistent insofar as for some states he lists the precise questions (e.g. for Travancore-Cochin), whereas for others (e.g. Bihar) only the topics covered under the optional questions have been given. Further, even the 1941 census had included a question on the number of children born (and surviving) to married women and this is noted on page 16 as well as on page 156. Information on this subject was even tabulated on the basis of a 2 per cent sample for some of the provinces, although there is reason for some reservations about the procedures of sampling and the validity of the relevant data. Such inconsistencies may mislead and confuse novices and should be corrected in the next edition of the book.

The book is useful essentially as a compilation of the procedures of housing and population censuses conducted in India and other selected countries of the world. Perhaps, it would have been more useful if for the pre-1951 censuses, the author had attempted a separate inventory of the so-called "imperial" and "provincial" tables compiled in different Provinces and native states (or agencies). However, the task of placing the Indian census in perspective remains unfulfilled.

Production Relations: Achilles' Heel of Indian Planning

Pradhan H Prasad

Planning in India has been viewed mainly in terms of investment planning. This emphasis on investment planning can be traced to the influence of the long-period theories of development which entirely overlook the significance of much more essential factors than the level of investment.

Increase in the supply of the means of production and savings is obviously an important factor in explaining the course of economic history through centuries, but its significance is completely overshadowed by the importance of changing production relations. It is the failure to assess the importance of the production relations aspect of economic dynamics that is, by and large, responsible for the Indian plans achieving so little. This article analyses this aspect of Indian economic development in the light of facts collected in three districts of Bihar.

The analysis indicates that, unless the existing semi-feudal institutional set-up is replaced by a higher stage of production relations, any attempt at investment planning in areas and sectors where a semi-feudal institutional set-up exists—the agricultural sector, for instance—will be an exercise in futility. It is only when institutional changes have taken place that the decks will be cleared for investment planning.

PLANNING in India has been viewed mainly in terms of investment planning and the yardstick to measure the success or failure of planning has been essentially the rate of growth of per capita output at constant prices. Investment has remained the kingpin of the preferred models for development in our planning. The first Five-Year Plan embodied a projection of aggregate growth generated by capital accumulation financed essentially by domestic savings. The model was of a Harrod-Domar type. In the formulation of the Second Plan, the Fel'dman-Mahalanobis model was used to evolve investment allocation criteria. The preferred models for the Third and the Fourth Plans were almost similar. The basic strategy for elimination of poverty has mainly been linked with two factors: a rising rate of growth of domestic product at constant prices and a declining rate of growth of population.

The basic approach remains almost the same in the Approach to the Fifth Plan (1974-79), except that there is an attempt to carve a frame of distributive justice essentially in terms of reduction in inequality of income and consumption. Even when it is clear that, for the little over two decades of planning, the rate of growth has been inadequate and that the major portion of the growth is explained in terms of technical progress in agriculture; the emphasis continues to be on

investment planning. It is, therefore, clear that the principal urge towards planning in our country has been the desire to achieve a high level of investment. This is sought to be done by formulating detailed expenditure plans for the public sector of the economy, mainly in terms of diversification of economic activity in the industrial sector, massive investment in agricultural infrastructure and in social overhead capital. It is not surprising, then, that the size of successive plans has shown a rising trend. The public sector outlay in the Second Plan was about 135 per cent higher than that in the First. The size of the Third Plan was 86 per cent higher than that of the Second and the size of the Fourth was also about 86 per cent higher than that of the Third. The envisaged size of the Fifth Plan is about 112 per cent higher than that of the Fourth.

The emphasis on investment planning can be traced to the influence of the long-period theories of development which were originally formulated by the Classical economists and have invariably associated development with accumulation. Though there is nothing false in these theories, they entirely overlook much more essential things. It is no secret that attempts to verify these theories statistically have left an important proportion of historical growth unexplained. Increase in the supply of means of production and savings is obviously an important factor in explaining the course of economic history through centuries, but it

is completely overshadowed by the importance of changing "production relations". It is the failure to assess the importance of the "production relations" aspect of economic dynamics that is, by and large, responsible for so little achievement in development. A frontal attack on technological progress and capital accumulation, as the two most important elements in development, would have been the most obvious and direct approach provided the economy were marked by a higher stage of "production relations" than something similar to feudalism.

What has been lost sight of in the process of constructing planning models in this country is that the different regions of the country find themselves at different historical stages of "production relations". Our approach to planning, as we have seen, assumes implicitly that regions do not differ so far as "production relations" are concerned. It is this implicit assumption which is responsible for so little emphasis on institutional change. That is why our planning models overlook the important policy challenges in vast areas of the country resulting in persistent regional imbalances. We propose to analyse this aspect of development in the light of facts collected by us in three districts of Bihar. It should be noted that the facts which are being presented here were not collected with a view to ascertaining the "production relations" in the region. Therefore, these facts, when viewed in the context of the "production re-

lations" in an area, will be found to contain some gaps. Even then meaningful inferences can be drawn from them.

II

We conducted two studies based on the survey of the three districts in Bihar. The survey of the districts of Purnea and Saharsa was conducted for an evaluative study related to the economic benefits in the Kosi Command Area. We surveyed 1,597 households from 11 villages of the area. The reference period for the survey was January-December 1970. Another survey of 760 households from 12 villages of Monghyr district was conducted with a view to assessing the structure of rural unemployment in the area. The survey was conducted in the period January-June 1972. The data collected in the course of the surveys throw considerable light on the existing "production relations" in the area.

The districts of Purnea and Saharsa lie in the north-east corner of Bihar forming an important tract of the Gangetic plain north of the Ganges. The combined area of the two districts is about 10.71 per cent of Bihar's total area and it holds about 11.16 per cent of Bihar's population. The area accounts for about 12 per cent of Bihar's net Area Sown. The dependence on agriculture is pronounced. According to the 1971 census, the percentage of workers in the agricultural sector to total workers in the area is 88. The corresponding percentages for Bihar and India, respectively, are 80 and 69.

The total area of Monghyr district happens to be about 5.65 per cent of Bihar's area and it accounts for about 6.91 per cent of the population of Bihar. The percentage of workers in the agricultural sector to total workers in the area happens to be about 82.55. It accounts for 6.56 per cent of Bihar's Net Area Sown. It should be noted that the varied geographical conditions in the state of Bihar are represented by the district. The Ganges flows through the district from west to east dividing it into two parts of unequal sizes and of different characteristics. The northern and the smaller part resembles North Bihar. Central Monghyr represents the South Bihar Plain and the southern part represents the rocky plateau region of South Bihar.

The districts of Purnea and Saharsa are served by the Kosi Eastern Canal and Rajpur canal system which was opened for irrigation in the mid-sixties. The Project Report visualised that, on full development, the canal system would irrigate annually about 18.03 lakh acres of land in the two districts. The maximum achievement in terms of the irrigated area till 1969-70 was about 3.53 lakh acres. The gap between the potential created and actual utilisation is very serious in the context of under-utilisation of scarce means of production in the area. There are some technical and topographical reasons for under-utilisation of irrigation potential in the area, as discussed in the Kosi Technical Committee Report, 1971. To some extent inefficiency and lapses on the part of the irrigation Department, Government of Bihar, are also responsible for the under-utilisation. But this was not all. We found that the Kosi Canal system, for the present, can irrigate as much in the rabi season as in Kharif season. In such a situation we assumed that if irrigation water is made available to a certain area in Kharif, it can also be made available to the same area in rabi (with all the technical and topographical flaws and inefficiency and lapses on the part of the Irrigation Department). Hence, we estimated season-wise irrigation-size of the households. It is evident from Table 1 that utilisation of available irrigation facilities declines with increase in the size of holdings (assuming that the larger Kharif irrigation size of a household, the bigger is its land ownership holding size).

To evaluate the character of demand for labour consequent upon availability of irrigation in the Kosi Command Area, we analysed the data of those cultivating households who do not hire labour for cultivation (Table 2). This showed that in such households the increase in demand for labour consequent upon availability of irrigation varied between 66 and 80 per cent. The increase in demand for labour consequent upon availability of irrigation was not found to be statistically significant in case of other households.

The practice of using attached labourers happens to be fairly high in respect of the big land-owning classes in the Kosi Command Area as revealed by the Survey of 973 revenue plots (Table 3). Attached labourers were found to have no subsidiary occupation in any of the three districts.

There were reports of widespread

indebtedness in the area. We could not, however, accurately estimate the extent of indebtedness in the Kosi Command Area because of reluctance on the part of a certain section to part with such information, illiteracy and our own inexperience in formulating questions in this context. But the data gathered from persons who volunteered information show that the highest rate of interest stipulated was 80 per cent per year and about 69 per cent of the indebted households agreed to pay rates of interest higher than 30 per cent per year. We modified the questionnaire for our survey of Monghyr district in view of our experience in collecting information concerning indebtedness and loans. We found that in Monghyr district households normally taking consumption loan were about 57.09 per cent of the total households. The situation appeared to be worse in the case of labour households where about 72.16 per cent were found to be normally taking con-

sumption loans. A detailed survey of a sample of 96 labour households consisting of 469 persons revealed that 25 households during the period July 1 to December 31, 1971 and 16 households during the period January 1 to April 30, 1972 could not mention the rate of interest at which they had borrowed.

The practice of share-cropping is widely followed in the area. About 24 per cent of the total households in the Kosi Command Area and about 17 per cent of the total households in Monghyr district were found to be leasing-in land. These may be underestimates as there was a general reluctance on the part of the share-croppers to part with such information. According to the 1961 Census, the percentage of households leasing-in land to total cultivating households was 54.8, 56.6 and 41.7, respectively, for Purnea, Saharsa and Monghyr. Except for a very minor percentage of recorded share-croppers others are no different from tenants-at-will of the feudal system, sharing half of the gross produce with the landowners. The recorded share-croppers, however, share at the rate of 75:25 and have certain legal rights against eviction. There is no practice of cost sharing, except that the landowner shares half of the irrigation charges in some areas.

Field experience has shown us that, at least in Bihar, averaging of agricultural wages is not justified. In almost all areas there exists a traditional rate payments in excess of which occur in very exceptional cases. More often, the employers take advantage of the weak economic position of the labourers to pay them less than the traditional rate. In the Kosi Command Area the wage rate, inclusive of the payment in kind, for agricultural labourer for most of the year varied (cross-section variations) between Rs 1.50 and Rs 2.00 per day and during the paddy harvesting period from Rs. 2.00 to Rs 3.00 per day. Rs 3.00 per day was recorded only in villages near Purnea town. The wage for jute retting varied from Rs 1.75 to Rs 2.50 per day. The lowest wage (i.e., Rs 1.75 per day) was recorded in Kasba Block in the month of March 1971. In Monghyr district, the institutionally determined wage rate for agricultural operations was found to be between Rs 1.50 and Rs 2.00. None were found to have received more than this, while some were found to have received less than the lower limit.

Some more light is thrown on general characteristics by the data available from the detailed survey of the sample labour households (96 households) in Monghyr district. The average per household income of 96 per cent of the households was found to be below Rs 1,000 per annum. The per capita monthly income of the sample was found to be Rs 20.2. This, when viewed against the fact that a per capita consumption expenditure of Rs 30 per month is deemed to be minimum consumption expenditure at 1972 prices in rural areas, shows the extent of abject poverty prevailing in the area. It should be noted that only 3 persons during the period July 1 to December 31, 1971 and 2 persons during the period January 1 to April 30, 1971 declared themselves not at work for want of work, though 22 persons considered themselves physically and in other ways unfit for work in July-December 1971 and were found to be working in January-June 1972.

III

The Analysis of the aforesaid facts and data suggests a model. We find share-cropping a prominent feature of the model. In the Kosi Command Area we found small owner cultivators using almost 100 per cent rabi irrigation (which is needed mainly for cultivation of wheat). These cultivators normally grow paddy or jute in Kharif and wheat in the rabi season. The low level of utilisation of rabi irrigation by big landowners suggests that the share-croppers do not grow wheat as a second crop, possibly because being poor they lack resources for wheat cultivation and because the existing sharing practice hardly offers any incentive to the share-croppers to put in extra labour. It is needless to emphasise that if crop-sharing for the second crop only is tilted in favour of share-croppers, there is likelihood of more intensive use of land and labour, bringing additional benefit to both the landowners and the share-croppers. At least the practice of wheat cultivation by using available irrigation facilities by small owner-cultivators indicates this. But it is not encouraged by the landowners. This indicates that those landowners who extensively leaseout lands are interested more in preventing the strengthening of the economic condition of the share-croppers than in maximising their rate of return from land. Similar was the case with respect to improved seeds

and other innovations.

The other prominent feature of the model is usury. Widespread poverty compels the rural poor, consisting mainly of share-croppers and agricultural labourers, to take consumption loans at exorbitant rates of interest whereby indebtedness becomes a permanent feature for these households and they are compelled to accept a semi-slave condition of living. A little mathematical exercise will show that a labour household of two workers (one male and one female) and three dependents will fail to get an income of Rs 30.00 per capita per month even if they get employment for 300 days in a year at the prevailing wage rate in the area. It should be noted that the data showed only very few persons declaring themselves not at work for want of work and still the poverty seemed to be widespread. We found from field experience that in most cases the creditors do not expect ever to get the stipulated interest and principal from such rural poor. These creditors are mostly of the big landowning class. Instead of using their savings for investment in the agricultural sector, they use them for giving consumption loans so as to increase their hold on the rural masses. Usury is thus practised mainly to perpetuate the indissoluble bond between the direct producer and his overlord — the rural rich. As no system can afford to give less than a subsistence living to direct producers, the so-called financial assets of the creditors continue to increase year after year. But as the system guarantees only a subsistence living to the direct producer and no more, while the rest is pocketed by his overlord, the overlord does not bother about increasing the level of his book-entry financial assets (which he knows he can never get). It is futile to look for any debtor-creditor equilibrium in such a situation in the strict neoclassical sense of the term.

The above mentioned facts and data regarding low utilisation of available resources (such as irrigation facilities, etc) and low demand for labour by big land-owning class are also essentially directed towards preventing the strengthening of the economic condition of the direct producer rather than maximisation of their rate of profit or rate of return. For example, in the context of the share-cropping system the landowners know that if the share-croppers are encouraged to take to intensive cultivation or to adopt new

agricultural practices, etc, the rates of return from land, for both the parties, will be higher than before. But this would also strengthen the economic condition of the rural poor thereby ultimately freeing them from semi-feudal bondage. This would subsequently result in a demand for higher wages and better conditions for work in the agricultural sector and also loss of usury income and other indirect economic losses to the rural rich.¹

It was found that about 10 males and 12 females who declared themselves not in the labour force in July-December 1971 were working in January-June 1972. In the case of females this can be explained in terms of pregnancy or their having small babies requiring constant care. Short period illness may be another explanation for both, males and females. But there is another explanation based on field experience and that relates to the customary nature of work (for example, those attached to such lands which are cultivated only in the rabi season known as 'chowmas' land) which is the characteristic feature of semi-feudal production relations.

The essential feature of the model is thus reflected in the big land-owning classes (who are the main constituent of the rural rich) approaching the whole process of production and distribution with a view to strengthening their control over land and their hold on the rural masses, resulting in a set-up (which we may call semi-feudal) where an indissoluble bond between direct producer and his overlord is maintained by resort to "production relations" essentially characterised by the two modes of appropriation, namely, the share-cropping and usury. This results in semi-servile condition of living and a low level of consumption (may be lower than that which gives minimum cost per work unit)² and hence mass poverty and low productivity of land and labour (which is understood mainly in terms of disguised unemployment), under-utilisation of resources and almost negligible net investment in the agricultural sector. The system is so well-entrenched and so hopeless from the point of view of the direct producers as a class that a significant number of the exploited exhibit complete indifference even in knowing either the extent of their indebtedness or the terms and conditions of loans. This enables the rural rich to operate the levers of power with coercive ruthlessness (of which there are any number of illustra-

tions in this part of the country). It is not surprising, then, that the vast majority of direct producers (the bulk of the rural poor) do not even come forward to avail of the legal rights that they possess. For example, not many share-croppers come forward to record their share-cropping rights which would have given them some economic benefits and additional legal security against eviction. It appears that the semi-feudal system, for the time being, is not only in stable equilibrium endogenously but also remains inimical to economic development in this part of the country.

The above analysis thus indicates that unless the existing semi-feudal institutional set-up is replaced by a higher stage of "production relations", any attempt at "investment planning" (in areas and sectors where such a semi-feudal institutional set-up exists) will be an exercise in futility. Hence, in such areas and sectors, the pride of place in our approach to planning has to be given to institutional changes by enforcing a low ceiling on land holdings and debt redemption measures associated with such economic activities as would generate widespread supplementary income in rural areas.³ Unless this aspect of development is seriously taken note of, the chances of rural transformation in the vast sector of the country appear to be dim. It is only when such institutional changes have

taken place that the deck will be cleared for "investment planning". It is not suggested here, that "investment planning" has no place in the planning. It has its relevance in areas and sectors which are not feudal or semi-feudal. What is suggested, here, is that top priority must be accorded to institutional changes in view of the fact that agriculture is the primary occupation of the vast majority of the masses and that a vast sector of our economy finds itself in the grip of a semi-feudal institutional set-up. Even in areas which depict semi-feudal characteristics, one can attempt at such investments as have a long gestation lag (such as investment in irrigation schemes) along with policies to bring about a change in the institutional set-up so that the transformed set-up gets ready to gain by such investment after the gestation lag is over.

Punjab Breweries

PUNJAB BREWERIES, promoted by the Punjab State Industrial Development Corporation, is setting up a modern brewery near Ludhiana for annual production of 75 lakh bottles of pale beer of the Pilsner type. The company has made collaboration arrangements with Skoda (India), an associate of Skoda of Czechoslovakia, through their collaborator Vulcan Laval. A financial and management collaboration has been entered into with East India Hotels, which has a chain of hotels in the country. Total project cost, estimated at Rs 205 lakhs, is proposed to be financed by share capital (Rs 105 lakhs) and term loans of (Rs 100 lakhs). PSIDC will take up equity shares worth Rs 41 lakhs and EIH of the value of Rs 19 lakhs. The public is being offered,

through a Prospectus, equity shares of Rs 20 lakhs and 9.5 per cent cumulative redeemable preference shares of Rs 25 lakhs. The entire public issue is fully underwritten. The subscription list will open on May 14 and close on May 25, or earlier, but not earlier than May 16. The plant is expected to commence commercial production in August. According to A S Chatha, managing director of PSIDC, the company should be in a position to pay a maiden dividend of 10 per cent out of the earnings of the second year of production and step up to 15 per cent and 20 per cent, respectively, in the subsequent two years. Consumption of beer in Punjab is already very high, and is expected to increase by about 20 per cent per annum in the next few years.

Centre-State Financial Relations

I—Scope of the Finance Commission

The Sixth Finance Commission has nearly completed its round of the state capitals. The state governments have made known their respective positions on the matters within the Commission's purview.

Economic and Political Weekly considers it important that while these matters are sorted out within the Commission over the next six months, they should be continuously examined and re-examined in public. To this end, it is proposed to discuss in these columns, between now and October-end, the various aspects of the issues involved.

WHETHER or not it is desirable that the state governments should have adequate resources of their own to meet the responsibilities which the Constitution places on the states, is a question which need not concern us here. As the Fifth Finance Commission put it, "the imbalance between the functional responsibilities assigned to the states and the financial resources allocated to them, which is a general feature of many full-fledged federations, also exists in India".¹ But the Indian Constitution can be said to take due note of the imbalance involved in its scheme of things and to provide for the necessary transfer of resources from the Union to the states. One can thus start straight-away with the premise that, within the framework of the Indian Constitution, transfer of funds from the Union to the states must take place. This is necessary to rectify the imbalance referred to above.

The broad scheme of financial transfers from the Union to the states was summed up by the Fifth Finance Commission as follows:

"A number of taxes, though levied by the Government of India are collected and retained by the states (Article 268); the net proceeds of seven items of taxation, though levied and collected by the Government of India, are entirely assigned to the states and distributed among them in accordance with the principles of distribution formulated by Parliament (Article 269). In addition, a percentage of the net proceeds of income-tax is assigned to the states (Article 270). The proceeds thus assigned to the states do not form part of the Consolidated Fund of India. Union excise duties can be shared with the states if Parliament so decides (Article 272) and almost from the commencement of the Constitution excise duties have been so shared. In 1950-51 the receipts from income-tax and excise duties proved nearly one-half of the Union tax revenues so that the divisible pool was by no means inconsiderable. Further, Article 275 recognises the necessity for grants-in-aid of revenues of states which may be in need of assistance. Different sums can be fixed for different states, so that the weaker states can be given specific assistance to meet the necessary expenditure in the proper dis-

charge of their duties to their people. Article 282 provides for grants by the Union to the states for any public purpose."²

Two things ought immediately to be noted here. First, where the Articles of the Constitution dealing with the transfer to the states of tax revenues levied and collected and by the Union Government do not require 100 per cent devolution (as under Article 269), the percentage of Union tax revenues (under Articles 270 and 272) to be transferred to the states is not laid down. Secondly, none of the above mentioned Articles lays down the principles on the basis of which distribution has to be made among the states. Both of these are matters which are left to be decided periodically on the advice of a quasi-judicial body called the Finance Commission, to be appointed every five years, or earlier, if considered necessary (Article 280).

As for transfers in the form of grants, again, neither for grants-in-aid of revenues to states "in need of assistance" (Article 275) nor for public purpose grants (Article 282) is the amount laid down by the Constitution. While Article 275 grants-in-aid are to be fixed on the advice of the Finance Commission, Article 282 grants are left entirely to the discretion of the Union Government. Thus the principles of financial transfers from the Union to the states are, it should be clear, fully embedded in the Indian Constitution. In fact, not only does the Constitution recognise the need for such transfers but it also calls for a regular periodic review of these transfers. In the words of the Fifth Finance Commission, "a distinguishing feature of the Union-state financial relationship in India is the explicit recognition in the Constitution of the varying nature of this need [presumably, of the states for funds to meet their responsibilities] and the provision of a periodical review of the situation by a quasi-judicial body."³

The very first question that one must raise, in a series of this type, is whether this quasi-judicial body, called the Finance Commission, charged as it is with the task of (a) periodically review-

ing the Union-state financial relations and (b) recommending the scheme of financial transfers for the following quinquennium, enjoys the necessary freedom to perform this task.

As indicated above, the Articles of Constitution dealing with the devolution of tax revenues in part do not either lay down the amounts to be transferred from the Union to the states or the principles on the basis of which these amounts are to be distributed among the states. But still there can be, and is, argument whether or not the language of the Constitution, in general and of the relevant Articles, in particular, provides any indication of, or insight into, the possible guidelines for both the determination of the quantum of transfers of tax revenues as well as the manner of its distribution among the states.

Let us first see what the plain language of the Constitution reads like on the subject of financial transfers from the Union to the states. Under Article 268, stamp and excise duties on medicinal and toilet preparations "shall be levied by the Government of India but shall be collected (a) in the case where such duties are leviable within any Union Territory, by the Government of India, and (b) in other cases, by the states within which such duties are respectively leviable." Thus as far as Article 268 duties are concerned, it is clear that their proceeds can be collected directly by the states within their territorial jurisdictions and retained by them.

Article 269 lists seven types of duties and taxes. These include: "estate duty in respect of property other than agricultural land", "taxes on railway fares and freights", and "taxes on the sale or purchase of goods other than newspapers, where such sale or purchase takes place in the course of inter-state trade or commerce". These taxes and duties are "levied and collected by the Government of India but shall be assigned to the states". The net proceeds from any such duty or tax, "except insofar as these proceeds represent proceeds attributable to the Union

Territories, shall not form part of the Consolidated Fund of India but shall be assigned to the states within which that duty or tax is leviable in that year and shall be distributed among those states in accordance with such principles of distribution as may be formulated by Parliament by law" (emphasis added).

Thus, out of the net proceeds of Article 269 taxes, one should first take out the portion that "represents proceeds attributable to Union Territories". The balance has "to be assigned to the states within which that duty or tax is leviable in that year" and then "distributed among those states in accordance with such principles of distribution as may be formulated by Parliament by law". What, one might ask, is the significance of this distinction drawn in the Constitution between "assigning" the distributable net proceeds to "the states within which that duty or tax is leviable" and "distribution" of these net proceeds among those states? Is this distinction meant to place some constraints on the manner in which the net proceeds of the concerned tax or duty are to be distributed? Or, is this distinction drawn for precisely the opposite reason, namely, to give complete freedom with respect to the principles to be followed in the distribution of these net proceeds? These are important questions because, as we shall note immediately hereafter, they arise with respect to both income-tax as well as excise duties — devolutions wherefrom are the major sources of financial transfers from the Union to the states. But, unfortunately, they have not been faced so far.

As for tax on income other than agricultural income, it too "shall be levied and collected by the Government of India" under Article 270, but only "such percentage, as may be prescribed, of the net proceeds" excluding (i) "proceeds attributable to Union Territories" and (ii) proceeds attributable to Union Territories, "shall not form part of the Consolidated Fund of India but shall be assigned to the states within which that tax is leviable in that year, and shall be distributed among the states in such manner and form as may be prescribed".

The differences and similarities between Article 269 and Article 270 need to be noted. First, while the entire net proceeds of Article 269 taxes excluding those attributable to Union Territories are to be assigned to the pool for distribution among the states, only the prescribed percentage of the net proceeds is to be assigned to the pool for distribution. Secondly, before arriving at the net proceeds of income-tax to be assigned to the states' pool, a further deduction has to be made with

respect to "the proceeds attributable to Union emoluments". The similarity between the two Articles lies principally in the fact that both Articles require the net proceeds or a percentage thereof — whichever is distributable among the states — first to be assigned to the pool and then to be distributed in accordance with the principles of distribution which may be prescribed or laid down by Parliament by law.

Under Article 272, Union excise duties are to be levied and collected by the Government of India "but, if Parliament by law so provides, these shall be paid out of the Consolidated Fund of India to the states to which the law imposing the duty extends sums equivalent to the whole, or any part of the net proceeds, of that duty, and those sums shall be distributed among the states in accordance with such principles of distribution as may be formulated by such law".

Thus, while under Article 269 the entire net proceeds of the taxes and duties, though levied by the Union, are assignable to and distributable among the states, and while under Article 270 only the prescribed percentage of the net proceeds of income-tax is assignable to and distributable among the states, the net proceeds under Article 272 dealing with excise duties could all be retained by the Union unless Parliament by law so provides. But once Parliament does so provide by law, the procedure to be followed once again has to be that the prescribed proportion of the net proceeds shall be paid out to the states' pool.

Neither under Article 270 pertaining to income-tax nor under Article 272 pertaining to excise duties does the Constitution lay down how the proportion of the net proceeds to be assigned to the states' pool should be determined. Again, neither under Article 270 nor under Article 272 has the Constitution laid down what principles should govern the distribution out of the states' pool. Constitution makes it clear, in unmistakable terms, that the "principles" or "the manner and form" of distribution will have to be as laid down by law or as prescribed.

In the light of the above, it would appear that, insofar as transfers of tax revenues are concerned, the Finance Commission is placed by the Constitution under no constraint whatsoever in recommending whatever proportions of income-tax and excise duty revenues of the Union, it considers right and desirable to be transferred to the states. Nor does the Constitution seem to place any constraints on the principles on the basis of which the Commission may choose to recommend the distribution of the amounts, thus transferred from the Union to the pool, among the various

states.

It is worthwhile stating here that while the freedom given to the Finance Commission in the matter of tax transfers is unqualified, there is introduced in the Terms of Reference of the Sixth Finance Commission (such was the case for the Fifth, though not for the earlier, Commissions) a sort of qualification. The Terms of Reference require that, in making its recommendations on various matters before it, which naturally include tax transfers, the Sixth Finance Commission "shall have regard to the resources of the Central Government and the demands thereon on account of expenditure on civil administration, defence and border security, debt servicing, and other committed expenditures or liabilities." If the arguments were made that in any scheme of financial devolution it was only to be expected that genuine needs of the Union Government would have to be provided for, this would hold good right from the very outset. The question cannot be avoided as to why the Union Government considered it necessary to introduce this specific requirement in the Terms of Reference of the Fifth and Sixth Commissions.

Let us now pass on to transfers by way of grants. Article 275 "grants-in-aid of revenues" are meant to be given to the states "in need of assistance". Article 282 grants are, on the other hand, meant to be given "for public purposes". It has to be noted in the context of grants that, while Article 280 places a specific obligation on the Finance Commission "to make recommendations to the President" as to "the principles which should govern the grants-in-aid of the revenues of the states out of the Consolidated Fund of India", the same Article makes no mention of public purpose grants by the Union to the states. This omission of a reference to public purpose grants could be taken to mean that the Constitution did not wish to bind the Union Government to distributing public purpose grants on the recommendations of the Finance Commission.

While the Constitution does enjoin upon the Finance Commission to suggest principles for the determination of grants-in-aid, it, at the same time, stipulates that these grants-in-aid should be given to the states "in need of assistance". The Constitution does not, however, lay down how the states' respective "need of assistance" has to be measured. Could this not be taken to mean that the Finance Commission has been given complete freedom to lay down its own yardsticks for the measurement of the states' "need of assistance"?

It is in this context that the words, "and different sums may be fixed for

different states", seem to acquire significant meaning. Surely, here the Constitution could not be just ruling out the possible demand for equality with respect to the absolute "sums" to be transferred by way of grants-in-aid. Such a demand would be so obviously absurd that it is extremely doubtful if the Constitution had to provide a safeguard against such a possible demand. On the other hand, these words could well have been added to emphasise the extent of freedom which the Constitution was conferring on the Finance Commission in the fixation of grants-in-aid to the states. It is significant to note here that these particular words, "different sums may be fixed for different states", do not appear in Article 282 relating to public purpose grants. Thus it could be argued that the freedom given to the Union Government in giving away Article 282 public purpose grants to the states is not absolute or unfettered when compared with the freedom given to the Finance Commission in the fixation of the Article 275 grants-in-aid.

If the above reading of Article 275 with respect to the freedom given to the Finance Commission is correct, then why, it may be asked, is it that the Terms of Reference of the Sixth Finance Commission require that in recommending "the principles which should govern the grants-in-aid of the revenues of the states out of the Consolidated Fund of India and the sums to be paid to the states which are in need of assistance", the Commission should give regard among other considerations to six considerations specifically stated in the Terms?

To avoid the impression that in fixing the terms of reference of the Sixth Finance Commission a major departure has been made in this respect, it must be said immediately that even for earlier Commissions the Union Government — rather the President to be more precise — had made similar stipulations although the specific considerations required to be taken into account for this purpose were not the same for all the Commissions.

While the merits and demerits of the specific considerations which the Sixth Finance Commission has been asked to pay regard to in the fixation of Article 275 grants-in-aid need to be gone into — and will be examined when we come to the actual discussion of grants-in-aid — the broader question needs to be asked right here is whether the Constitution entitles the Union Government to lay down any norms or guidelines whatsoever for the Finance Commission to follow in the fixation of Article 275 grants-in-aid. It clearly does not. It is true that whatever sums

this regard will be in the nature of recommendations only, which Parliament may after due consideration well reject; but that being so does not entitle the Union Government to say to the Commission in advance what considerations it needs to bear in mind in making its recommendations and computations with regard to grants-in-aid of revenues to the states. It almost amounts to saying to the Commission: If you chaps don't make the recommendations on our basis, the Union Government would have nothing to do with them.

Now a view might well be taken that the Terms of Reference do not really impinge on the Finance Commission's freedom. After all, even when the Union Government has laid down some specific considerations to be borne in mind by the Commission, care was taken to ensure that the Commission could, if it considered necessary, take other considerations as well into account. Also, there is nothing which prevents the Finance Commission from giving any weight to any or all of the considerations spelled out in the Terms of Reference if the Commission so decides in the formulation of its recommendations on the subject of grants-in-aid. While there is considerable substance in this view, the fact cannot be overlooked that, by laying down certain specific guidelines in the Terms of Reference, the Union Government has all along sought to give a certain direction to the thinking of the successive Finance Commissions on the subject of grants-in-aid to states and that this the Union Government is not entitled to do under the Constitution. Also, it cannot be easily denied that in actual practice the successive Finance Commissions have largely accepted the guidelines thus laid down in the Terms of Reference for the fixation of grants-in-aid to the states. In fact, as we hope to bring out in the next instalment in this series, if it were not for this extra-constitutional attempt on the part of the Union Government — of laying down guidelines for the Finance Commissions — their approach to the whole question of financial transfers would probably have not reached the impasse it has now reached.

Under Article 280, it is the duty of the Finance Commission to make recommendations with respect not only to tax-transfer and grants-in-aid but also to "any other matter referred to the Commission by the President in the interest of sound finance". It is presumably on the strength of this provision that the Sixth Finance Commission has been asked, firstly, to undertake a general review of the states' indebtedness to the Centre and suggest changes in the existing terms of repayment of

Centre, and secondly, to review the policy and arrangements in regard to the financing of relief expenditure by the states affected by natural calamities and examine *inter alia* the possibility of establishing a National Fund to which the Central and state governments may contribute a percentage of their revenue receipts.

It is, in fact, being said on the strength of these two additional items in the Terms of Reference of the Sixth Finance Commission that this Finance Commission is particularly well placed to make a significant contribution in the field of Centre-state financial relations. There is no doubt that these two additional items referred to the Sixth Finance Commission are extremely important, and we propose to examine them in detail in the course of this series; but it must not be overlooked that any recommendations that the Commission might make with respect to these two items will be less binding on the Union Government than the Commission's recommendations with respect to tax-transfers and grants-in-aid.

In spite of the fact, therefore, that important additional items have been referred to the Sixth Finance Commission, it holds true that its Terms of Reference seek to impinge on the freedom and authority which the Constitution confers upon the Finance Commission.

In sum and substance, the constitutional position appears to be that the Finance Commission enjoys the greatest amount of freedom in the matter of both grants-in-aid as well as tax-transfers from the Union to the state governments. If, and to the extent that, the Terms of Reference come in the way of the exercise of this freedom, the Sixth Finance Commission would be well within its rights to ignore the Terms of Reference. The important thing, however, is not the mere exercise of freedom but the purposes and objectives for which it is sought to be used.

Appendix

PROVISIONS OF THE CONSTITUTION BEARING ON THE WORK OF THE FINANCE COMMISSION

Article 268

(1) Such stamp duties and such duties of excise on medical and toilet preparations as are mentioned in the Union List shall be levied by the Government of India but shall be collected

(a) in the case where such duties are leviable within any Union territory, by the Government of India, and

(b) in other cases, by the States within which such duties are respectively leviable.

(2) The proceeds in any financial year of any such duty leviable within any State shall not form part of the Consolidated Fund of India, but shall

(1) The following duties and taxes shall be levied and collected by the Government of India but shall be assigned to the States in the manner provided in clause (2) namely:

- (a) duties in respect of succession to property other than agricultural land;
- (b) estate duty in respect of property other than agricultural land;
- (c) terminal taxes on goods or passengers carried by railway, sea or air;
- (d) taxes on railway fares and freights;
- (e) taxes other than stamp duties on transactions in stock-exchanges and futures markets;
- (f) taxes on the sale or purchase of newspapers and on advertisements published therein;
- (g) taxes on the sale or purchase of goods other than newspapers, where such sale or purchases takes place in the course of inter-State trade or commerce.

(2) The net proceeds in any financial year of any such duty or tax, except insofar as those proceeds represent proceeds attributable to Union Territories, shall not form part of the Consolidated Fund of India, but shall be assigned to the States within which that duty or tax is leviable in that year, and shall be distributed among those States in accordance with such principles of distribution as may be formulated by Parliament by law.

(3) Parliament may by law formulate principles for determining when a sale or purchase of goods takes place in the course of inter-State trade or commerce.

Article 270

(1) Taxes on income other than agricultural income shall be levied and collected by the Government of India and distributed between the Union and the States in the manner provided in clause (2).

(2) Such percentage, as may be prescribed, of the net proceeds in any financial year of any such tax, except insofar as those proceeds represent proceeds attributable to Union emoluments, shall not form part of the Consolidated Fund of India, but shall be assigned to the States within which that tax is leviable in that year, and shall be distributed among those States in such manner and from such time as may be prescribed.

(3) For the purposes of clause (2), in each financial year such percentage as may be prescribed of so much of the net proceeds of taxes on income as does not represent the net proceeds of taxes payable in respect of Union emoluments shall be deemed to represent proceeds attributable to Union Territories.

(4) In this article

- (a) "tax on income" does not include a corporation tax;
- (b) "prescribed" means,
 - (i) until a Finance Commission has been constituted, prescribed by the President by order, and
 - (ii) after a Finance Commission has been constituted,

prescribed by the President by Order after considering the recommendations of the Finance Commission;

- (c) "Union emoluments" includes all emoluments and pensions payable out of the Consolidated Fund of India in respect of which income-tax is chargeable.

Article 271

Notwithstanding anything in article 269 and 270, Parliament may at any time increase any of the duties or taxes referred to in those articles by a surcharge for purposes of the Union and the whole proceeds of any such surcharge shall form part of the Consolidated Fund of India.

Article 272

(1) No Bill or amendment which imposes or varies any tax or duty in which States are interested or which varies the meaning of the expression "agricultural income" as defined for the purpose of the enactments relating to Indian income-tax, or which affects principles on which under any of the foregoing provisions of the Chapter moneys are or may be distributable to States, or which imposes any such charge for the purposes of the Union as is mentioned in the foregoing provisions of this Chapter, shall be introduced or moved in either House of Parliament except on the recommendation of the President.

(2) In this article, the expression "tax or duty in which States are interested" means

- (a) a tax or duty the whole or part of the net proceeds whereof are assigned to any State; or
- (b) a tax or duty by reference to the net proceeds whereof sums are for the time being payable out of the Consolidated Fund of India to any State.

Article 275

(1) Such sums as Parliament may by law provide shall be charged on the Consolidated Fund of India in each year as grants-in-aid of the revenues of such States as Parliament may determine to be in need of assistance, and different sums may be fixed for different States:

Provided that there shall be paid out of the Consolidated Fund of India as grants-in-aid of the revenues of a State such capital and recurring sums as may be necessary to enable that State to meet the costs of such schemes of development as may be undertaken by the State with the approval of the Government of India for the purpose of promoting the welfare of the Scheduled Tribes in that State or raising the level of administration of the Scheduled Areas therein to that of the administration of the rest of the areas of that State:

Provided further that these shall be paid out of the Consolidated Fund of India as grants-in-aid of the revenues of the State of Assam sums, capital and recurring, equivalent to

- (a) The average excess of expenditure over the revenues during the two years immediately preceding the commencement of this Constitution in respect of the administration of the tribal areas specified in Part A of the table appended to paragraph 20

- (b) the cost of such schemes of development as may be undertaken by that State with the approval of the Government of India for the purpose of raising the level of administration of the said areas to that of the administration of the rest of the areas of that State.

(2) Until provision is made by Parliament under clause (1), the powers conferred on Parliament under the clause shall be exercisable by the President by order and any order made by the President under this clause shall have effects subject to any provision so made by Parliament:

Provided that after a Finance Commission has been constituted no order shall be made under this clause by the President except after considering the recommendations of the Finance Commission.

Article 279

(1) In the foregoing provisions of this Chapter, "net proceeds" means in relation to any tax or duty the proceeds thereof reduced by the cost of collection, and for the purposes of those provisions the net proceeds of any tax or duty, or of any part of any tax or duty, in or attributable to any area shall be ascertained and certified by the Comptroller and Auditor-General of India, whose certificate shall be final.

(2) Subject as aforesaid, and to any other express provision of this Chapter, a law made by Parliament or an order of the President may, in any case where under this Part the proceeds of any duty or tax are, or may be, assigned to any State, provide for the manner in which the proceeds are to be calculated, for the time from or at which and the manner in which any payments are to be made, for the making of adjustments between one financial year and another, and for any other incidental or ancillary matters.

Article 280

(1) The President shall, within two years from the commencement of this Constitution and thereafter at the expiration of every fifth year or at such earlier times as the President considers necessary, by order constitute a Finance Commission which shall consist of a Chairman and four other members to be appointed by the President.

(2) Parliament may by law determine the qualifications which shall be requisite for appointment as members of the Commission and the manner in which they shall be selected.

(3) It shall be the duty of the Commission to make recommendations to the President as to

- (a) the distribution between the Union and the States of the net proceeds of taxes which are to be, or may be, divided between them under this Chapter and the allocation between the States of the respective shares of such proceeds;
 - (b) the principles which should govern the grants-in-aid of the revenues of the State out of the Consolidated Fund of India;
 - (c) any other matter referred to the Commission by the President in the interests of sound finance.
- (4) The Commission shall determine their procedure and shall have such

powers in the performance of their functions as Parliament may by law confer on them.

Article 281

The President shall cause every recommendation made by the Finance Commission under the provisions of this Constitution together with an explanatory memorandum as to the action taken thereon to be laid before each House of Parliament.

Article 282

The Union or a State may make any grants for any public purpose, notwithstanding that the purpose is not one with respect to which Parliament or the Legislature of the State, as the case may be, may make laws.

Hesitant Approach to Science and Technology

B V Rangarao

In the NCST's Approach to the Science and Technology Plan, science as an activity involving the pursuit of knowledge and as a cultural need is accepted, but the emphasis is on commercialisation. The anxiety is to use science and technology. While it is, of course, necessary to use science, consideration of science as an integral part of the social and economic order is missing.

THE last decade was one of frustration for the Indian scientific community, in spite of the increases in grants. On the other hand, during the fifties, science and technology had been given unconditional support and protection by the government. As in several other areas, funds for research were channelled through individuals and organisations headed by them.

Having generally agreed that the enormous growth in scientific manpower, institutions and infrastructure has not led to commensurate social benefit, even the most orthodox in science and technology have supported the idea of planning scientific and technological activities in co-ordination with the agricultural, medical, industrial and socio-economic programmes in the country.

In November 1970, at the Third Conference of Scientists, Technologists and Educationists, called by the then existing Committee on Science and Technology (COST) to assess the implementation of the Scientific Policy Resolution (1958), it was strongly urged that a plan for Science and Technology should be prepared by the proposed National Committee on Science and Technology (NCST) in close association with the Planning Commission.

The subsequent policy formulations and institutional activities appear to have been influenced by the recommendations of that Conference. But some of the proposals have been seriously distorted. Thus, contrary to the recommendations, the NCST reports to the Cabinet through a Cabinet Minister and not through the Prime Minister.

The Approach to the Science and Technology Plan brought out for the first time in the country by the NCST in January 1973 involves the labour of hundreds of researchers and managers in different areas. Unlike much

of the NCST's labours over the last 15 months which have been devoted to preparing 'sectoral' science and technology plans in some 24 socio-economic areas, the Approach is undoubtedly the most important output of the NCST so far. Since plan formulation and implementation must be undertaken conceptually, methodologically, and institutionally as an integral part of socio-economic and defence planning, the seriousness it deserves is obvious. The NCST's task is particularly difficult in a country where diversity is more common than co-operation.

The Approach document, containing five chapters, deals with:

- (1) science-society relations (Introduction);
- (2) present state of the research system;
- (3) Strategy for planning science;
- (4) immediate programmes to be taken up; and
- (5) organisational problems — including size of the STP, and the mechanism for its financing.

Science, as it is understood today, has only a short history — although in wider sense it is as old man's efforts to survive. In Western Europe, scientific activity was pursued in different countries in varying institutional forms and content, and it made social adjustments with feudal and capitalist orders. In North America, the heterogeneous society, free of feudal bonds and consisting of those who were already in conflict with their parent systems, accepted science more readily. This has given North Americans an advantage in economic advancement, as science was highly commercialised. In the USSR, the compatibility between science and the social order has been greater than in Western Europe, and the benefits therefrom have been better too. So far as one can see, science has not been integrated to the optimum degree in

any society.

By the end of World War II, it came to be generally realised that science and technology are necessary for the preservation of prosperity of the advanced countries as well as for the uplift of the underdeveloped countries. The finances allotted to this activity during the post-World War II period have been unprecedented. All sections are anxious to be associated with and sometimes embrace science, but not many have realised how intimately science and technology are inherent components of their life and social living. In fact, the 'neutral' quality of Science and Technology is used for socio-economic advancement without altering the social norms. These fallacies are becoming apparent to increasing number of people with responsibilities in public life, only in recent years.

In the Approach to the STP, science as an activity involving the pursuit of knowledge and as a cultural need is accepted, but the emphasis has been on commercialisation; the anxiety is to use science and technology. While this is entirely laudable and necessary, consideration of Science as an integral part of humanity seems to have been missed.

This limitation arises because symptoms are considered as causes and material goals defined earlier than social outlook. In the Approach to the Fifth Plan itself, 'removal of poverty' is given priority. Yet poverty is a social consequence of the working of the prevailing order. Those who are privileged in a society are reluctant to alter it, but welcome more wealth being created in which their share would be high. Thus their desire is that science and technology should create wealth, without disturbing the prevailing social and economic order.

Science, along with technology, has been reduced in the Approach to the STP to a mere 'tool' or 'chief agent'

to be made readily available for a potential 'buyer'. Though it is sometimes called a 'modernising force', the urge to 'commercialise' and 'Capitalise' is obsessive. S and T are treated as a commodity that can be 'transferred', 'imported', 'modified', 'adopted' and 'used'. The UNCTAD study quoted, indicates that the direct financial costs to developing countries of importing technology, are already around \$ 1,500 million — equivalent to 5 per cent of their exports other than oil, about 40 per cent of their debt servicing costs, and nearly 60 per cent of the inflow of direct private investment. UNCTAD have also estimated that this figure will grow to \$ 9,000 million by 1980. As Anthony Wedgwood Benn stated: "Now all of a sudden, people have woken up to the fact that science and technology are just the latest expression of power and those who control them have become the new bosses, exactly as the feudal landlords who owned land or the capitalist pioneers who owned the factories became the bosses of earlier generations." [1] It is unfortunate that those who plead for science and technology have in mind the material prosperity and gadgets visible abroad, yet completely overlook the qualitative modifications science can bring about in the social order.

No two societies can achieve a similar pattern of material progress, even if they follow identical policies. This is because the emerging pattern is the outcome of an *interaction* between these policies and the prevailing socio-economic order. When one fails to comprehend the complexity and intricacies of the problem, the solutions offered are piecemeal. Without fully appreciating this, the Approach continues to pursue — indeed argues for intensification of the pursuit of — the furrow we have been following in regard to scientific and technological institutions since Independence, viz, designing of new organisations or dismantling of existing organisations merely because the United Kingdom has done so. To this has now been added imitation of other countries too. We have now institutionalised science and technology to a much greater extent than any advanced country has done. In size, too, we have the largest technological manpower. Despite all this, we still look to countries in Europe and North America for inspiration. Johnson has quoted technological developments in Egypt, Ghana and India whose ecological and social consequences have been unfortunate. "Aid-givers and aid-receivers... have been much too impatient, and have assumed that borrowed Western ideas will modernise any society. International scientists and technologists must perceive ways of encouraging the less deve-

loped countries to generate their own socially viable technology."

Scientific advances in communications, medicine, agriculture, etc, are instrumental in raising expectations of achieving equality and popular power and changing the social order. While it is accepted that economic growth and social advancement are complex social activities, it is expected in the Approach that these objectives could be achieved by importing a few forms. This is a naive view. These forms are more likely to be resisted and rejected by the societies as organic bodies.

All in all, the NCST has been unable to bring out in the first chapter of the Approach what social factors are in conflict with the advancement of scientific knowledge and its applications and how to bring about the necessary adjustments to fulfil human aspirations created by science itself. It is necessary to realise that each social system has certain limitations and attainment of rapid advances with outmoded and relatively static social orders is not possible. Technology does not surrender to mere exploitation.

THE PRESENT STATE

The very division of research activity into basic, applied and developmental is inherited from the western capitalist system. In the spirit of imitation, another category 'oriented basic research' was added a few years back. This category has arisen out of the Tree of Knowledge model devised long time back in Europe. The very concept of this chain of fundamental discovery, applied research, innovation and development work in that order is questioned by historical evidence and the present day technological processes.² The steam engine, along with the condenser, was in use before the laws of thermodynamics were formulated.

The institutional form for science in India is as good as that anywhere else in the world. The 104,000 scientific and technical personnel in R and D establishments, the third biggest next to those in the USA and USSR, is nearly equal to that in the three most advanced Western European countries (UK, France and West Germany) put together. The numbers of councils or committees are no less impressive. Financial support for research has increased by about one hundred times in the last 25 years. The activities in these institutions and the training imparted are not geared to meeting local social needs, resulting in simultaneous unemployment and non-availability of skilled personnel, brain drain, import of technology and wastage of laboratory efforts. The NCST has failed to enumerate the factors that have led to this mismatch. The deficiencies it mentions

— lack of criteria for allotment of finances and evaluation of research, policies toward import of technology, and the communication gap between industry and research laboratories — are symptoms rather than the disease. The absence of a common goal between industry and research establishments accounts for the communication gap. Attempts to build bridges with more institutions without creating common goals are likely to add to the cost without bringing the desired results.

In the pre-World War II period, no country, except USSR, had a definite policy for science. Its absence in colonial India was, therefore, no surprise. In UK they had a Haldane Report and some years later Hill produced one for the Indian colony. Hill or his colleagues should have produced similar reports for other British colonies.

History may be interesting and sometimes useful but in the rapidly changing world contemporary events and their socio-economic relations are more important. In the Approach it is pointed out that 90 per cent of all scientists ever born are alive. But 90 per cent of them are not living in the advanced countries; more than 10 per cent are in India alone. The exponential growth of science implies a high degree of influence of society. Without a discussion on the 'interaction' of science with society, there is stress on the 'need of inverse interaction' of society on science.

The imbalances in sectoral financial allotments, the personality cult, *ad hoc* policies for science, etc, follow from the lack of connection between science and the prevailing social order. Except with the initiative of major political forces, the structural alterations necessary to achieve compatibility between technological needs and the existing social norms cannot be obtained. In fact only in those countries where such structural changes were introduced has science and technology been able to make important contributions. The accelerated growth that is possible — as indicated by the examples of at least Western Europe, North America and USSR — was achieved in different periods and with varying social systems. This problem may be beyond the scope of a committee of ten to solve, but it is necessary to highlight the issue and open a debate.

STRATEGY FOR SCIENCE

After having realised that "We do not, as yet, have an adequate rationale for dealing with such a complex system", the NCST has inevitably resorted to a "process of trial and corrected error" as a "methodology for [science] policy formulation". The very attempt to prepare a plan for science and techno-

logy, in spite of the above limitations, is to be appreciated.

The basic strategy proposed has four aspects: (1) provision for and satisfaction of the basic minimum needs of the population; (2) achievement of self-reliance; (3) import of technology; and (4) deriving maximum socio-economic benefit from the scientific and technological resources built up so far and the "activities currently underway". There are contradictions among these different aspects. They help justify all the present research programmes. Past experience indicates this trend. When defence orientation was the slogan after 1962, each research worker claimed that his project had a defence potential. Similarly, when export promotion and import substitution were campaigns every research activity was justified and the calculated foreign exchange saving were fantastic.

To the NCST, social advancement appears synonymous with the Euro-American order. Is it necessary to bring everything into the market economy to improve the life of the people? The capacity of metropolitan societies to absorb technology is over-estimated. In this country we have not studied seriously the diffusion rates of different technologies among different sections of the people. The guess that medical technology has the highest diffusion rate in rural as well as urban areas and created more problems appears to have some basis. Agricultural technology is accepted but better results cannot be derived as the auxiliary sections do not co-operate to the necessary extent. The least diffusion rate is for industrial technology, managed by the urban based and Western educated who are reaping the maximum social advantage. It is not only in science and technology that we have not evolved the norms of evaluation but also in other professions. The social rewards are not commensurate with the service rendered to the community. This basic deficiency, which makes the system incompatible with science and technology, should be eliminated.

The ills of dependence and technology import are well elaborated in the Approach. Such technology is often unsuitable not because of the degree of science content but as it is created and marketed with high pressure salesmanship to reap profits and not to serve the social needs of a poor society. It is scandalous that in certain sectors while the production is not even one-quarter of the needs, 25 per cent of the sales returns should be spent on publicity and advertisement. A score of foreign collaboration agreements have been signed to make garments and imported cotton is required for under-

garments in a society where 40 per cent of the population live below the subsistence level. Export promotion is only a pretext. For instance, someone should assess what fraction of the capacity of luxury hotels is occupied by foreign tourists paying in foreign currency.

If the sections that decide the social programmes are reconciled to the unproductive urbanisation, the existing evils are the consequence. If investments to create land values of Rs 10,000 per sq m are accepted, even after increasing cement production four or fivefold it will be impossible to spare any for the construction of primary schools in Delhi, leave alone irrigation and communication facilities in rural areas. After all this, it is adding insult to injury to say that rural communities are less receptive to science and technology.

If industry and government are keen to import knowhow let them at least follow the Mexican example where legislation has been passed invalidating the monopolistic and imperialistic clauses of such import agreements which are generally not allowed in the countries of origin.

Technological research and industry have strong bonds with establishments abroad, without any links among themselves inside the country. This is not peculiar to India. In each society where science and technology are made meaningful to their respective societies the bonds with foreign agencies are broken or at least weakened to make them build bonds with other sections of their own society.

Employment should be to produce materials but not *vice versa*. In fact if policies are geared to real production, the demand for technical personnel is bound to grow beyond the present availability.

AREAS OF PROMOTION

Though it is reiterated that the objective of the science and technology plan is to provide basic minimum needs of the common man such as food, clothing, housing, health, education, water supply, communication, etc, this is not substantiated by the programmes suggested. This arises out of the 'orchestration' of diverse interests in the chaos of the 'free' market. Though the value of certain aspects of the atomic energy programme is doubted, there is no suggestion of evaluating the existing programmes in the context of the Plan. It is proposed to bring more land into cultivation. This is a primitive solution to enhance food production. Our need of uncultivated land is no less.

It is stated in the Approach: "We must take great care to assess where

we should actually initiate full-fledged national programmes and where we should generate capabilities on a more modest scale even as we closely follow international developments. This assessment must be decided for each area in the light of the status of the technology in the industrial countries, our existing capabilities, the minimum critical finances involved and the importance of the national need to be met by the technology concerned." But there is no mention of the relative weightage to be assigned to each of these factors. It is doubtful whether any priorities are arrived at after all this exercise, when cryogenics, solar energy utilisation, magneto hydrodynamic (MHD) power generation, desalination and biological control of pests are all clubbed together.

A few days after the release of the Approach document a spokesman of the Atomic Energy Department announced that it had been decided to go ahead with MHD power generation. It was also stated that a 2 MW generator would be set up soon and later a 25 MW one. This smells of some collaboration with the USSR as that country has already experimented with 2 MW plant and has probably completed a 25 MW generator of MHD type. The policy of self-reliance thus gets mutilated at birth. In fact, this programme does not stand even the vague tests prescribed in the same document. As pointed out by Benn [1]: "Even if looked at from a purely practical point of view it would appear that the main barriers to human advance lie more in our failure to apply well established techniques than in our tardiness in evolving new ones."

ORGANISATIONAL PROBLEMS

It is gratifying to see that several suggestions made at the Third Conference are to be implemented, though a considerable number of them are also left out. The 'basic reforms in the working culture of scientific administrative establishments' are overdue; it has yet to be seen how fast the 'existing values and regulations' and the weighty statutes and precedents, hegemony, hierarchy and bureaucracy can be eliminated from science.

While pleading for self-reliance, scientists should themselves curtail their need for foreign exchange and foreign visits, instead of asking for more.

Establishment of a Marine Resources Development Commission is welcome but several committees might be outliving their usefulness and the composition of several governing bodies of research councils and institutions is hierarchical and requires to be radically changed. The Sarkar Committee recommended the

abolition of the CSIR Governing Body, but similar bodies exist everywhere else.

It is proposed to set up a centre for research on polymers and elastomers. There is no doubt regarding the need for such research but in organising technological research, projects and institutions should not be permanent entities; instead, regrouping and re-orientation should be the policy. Already we have a large number of research institutions and there are scientists working in different places on polymers. To build up viable groups and organisations in these places would be more appropriate so that considerable duplication can be avoided and scientists after completing a given task can take up new challenging problems and avoid frustrations.

In the Approach document it is pointed out that the information services in the country are very poor. But no concrete suggestions are made. In fact, the cost of these inefficient services has been very high in foreign exchange. Due to lack of appropriate services each library competes in subscribing to a large number of expensive foreign technical periodicals. Even the maintenance of the back numbers is highly expensive. Though they are indispensable, their use is limited. If efficient documentation services are provided, multiple subscription to foreign journals can be reduced considerably without hampering the facilities.

The 'Mathew Effect', under which greater recognition goes to some 'emi-

nent' scientists primarily because of certain exterior reasons, is widely prevalent. "Science is anti-authoritarian, ideas cannot be accepted because of the character or qualities of their protagonist... The elitist trend runs contrary to the tenets of universalism"[4]. We can have any number of scientists but science can neither flourish nor survive unless the necessary climate is provided. Democratisation in science should aim at the elimination of anti-science practices prevalent in our institutions. Steps should be initiated to inculcate science in policies and social behaviour.

Introduction of a research cess is overdue. But its management requires very careful consideration. The functioning of existing research associations is unsatisfactory. Routine operations in industry such as quality control are put under research heads. There is a risk of some industrial units grabbing these funds and using them for non-research purposes.

In spite of all the limitations, the Approach, with the lightest pink shaded cover and not even 'pinkish' inside, is welcome. The Minister of Science and Technology, in his Foreword, points out that the National Committee and its associates do not constitute a repository of all wisdom. He wants a thorough discussion to evolve a suitable plan. Unfortunately yet typically, except the three conferences sponsored by the NCST itself at Kanpur, Bombay and Madras, and editorial comments by daily newspapers there is no serious

discussion among the working researchers in the laboratories or the academic societies. The lack of social awareness and interest in science policy are made apparent by the absence of any debate. But there has to be a plan, to be modified with suitable objective analysis instead of the trial and error process. What appears as a correction often manifests as another error when it is introduced without a comprehensive study. While welcoming the idea to have an Approach to the Science and Technology Plan, the research community and the associated sections should be reminded of their responsibility to study this aspect seriously.

Bilateral Trade Agreements

The Indo-Sudan Experience

Priya Mutalik-Desai

India and Sudan signed a trade protocol for the 18 months from July 1971 to December 1972. India's trade with Sudan is regulated by trade agreements first entered into in 1965. The volume of trade both ways has been progressively increasing over the past seven years.

However, recent developments have caused a stalemate in Indo-Sudanese trade relations. Experience with other bilateral trade agreements too, which were intended as aids to trade promotion, similarly indicates how there can be a sudden disruption of such trade leading to heavy losses.

The issues that are raised in this context are: What are the major conditions for the success of trade agreements as durable bases for trade? What are their limitations if any? These problems are considered here against the background of Indo-Sudanese trade.

SUDAN occupied the eighth rank in 1970-71 in India's export trade accounting for about 2 per cent of India's total exports; on the other hand, India's share accounted for about 10 per cent of Sudan's export as well as import trade. India's exports to Sudan rose

from Rs 948 lakhs in 1960-61 to Rs 3,827 lakhs in 1970-71. On the other hand, imports from Sudan increased from Rs 941 lakhs to Rs 2,094 lakhs during the same period. While exports averaged to Rs 859 lakhs during 1960 to 1966, this average spurted up to Rs

2,168 lakhs during 1965-66 to 1970-71. Similarly the average imports increased from Rs 1,092 lakhs to Rs 1,738 lakhs between 1960-61 and 1970-71. It may be noted from Table 1 that the balance of trade was favourable to India for four out of eleven years and that India earn-

ed a large surplus of Rs 1,733 lakhs in 1970-71.

Sudan's share in India's exports to Africa has been well over 20 per cent while the share in imports from Africa has amounted to more than 12 per cent since 1966. During these years, Sudan has emerged as the second largest market for Indian goods in Africa, ranking next only to the UAR.

A cursory glance at the commodity composition of the trade brings out the following major features of this trade. Tea, cotton piecegoods, jute manufactures, fabrics of art silk, synthetic fibre, spun-glass, and made up articles wholly or chiefly of cotton, constitute the major commodities of exports from India. The heavy reliance on traditional export commodities is being reduced by increasing exports of engineering goods, which contributed between 12 and 23 per cent of total exports to Africa during 1969-70 and 1970-71. On the import side, raw cotton is the sole important commodity and makes up more than 90 per cent of our imports from Sudan. Gum arabic forms a very small percentage of our imports from Sudan. This can well be termed as a highly concentrated pattern of trade.

It is beyond doubt that the trade agreement considerably helped to take imports and exports on to a higher level than before. At the same time, the diversification witnessed in India's exports to Sudan was completely lacking in India's imports from Sudan. The basic imbalance in the trading pattern is the direct consequence of the disparity in the levels of development achieved by the two economies. Although Sudan is attempting to broaden the structure of exports by introducing groundnuts and skins and raw hides, unless there is a structural transformation of the economy, such diversification will be difficult to come by.¹ A large variety of items for export and import imparts flexibility to the mutual exchange of goods and avoids friction resulting from limited choice of goods.² Trade agreements in this situation, apart from furthering trade to higher levels, lend specificity and moral compulsion to the trade relations between two countries.

A special feature of the Indo-Sudanese trade agreement has been its indefinite duration, as it is not necessary to renew the agreement every year. The framework of the agreement provides for the most favoured nation treatment to be extended to Sudan and development of the economic and commercial relations on a wide front.

A trade protocol is to be negotiated

TABLE 1: INDIA'S TRADE WITH SUDAN, 1960-61 TO 1970-71

(Rs lakhs)			
Year	Exports	Imports	Balance of Trade
1960-61	948	941	+7
1961-62	1039	1056	-26
1962-63	896	1711	-815
1963-64	785	852	-67
1964-65	634	901	-267
1965-66	817 (13)	574 (10)	+243
1966-67	1457 (20)	1738 (19)	-281
1967-68	2075 (29)	1152 (12)	+923
1968-69	1847 (25)	2150 (14)	-303
1969-70	1985 (23)	2722 (19)	-737
1970-71	3827 (28)	2094 (12)	+1733

Note: Figures in brackets indicate Sudan's percentage share in India's export and import trade with Africa.

Various issues of *Monthly Statistics of Foreign Trade of India*.

every year in May-June, covering the period July 1, to June 30, to decide upon the annual export and import targets on the principle of balanced trade. However, the latest agreement, for 18 months, was the first time that one of such a long duration was concluded between India and Sudan — commencing on July 1, 1971, and extending upto December 30, 1972.

The trade plan, which is a rupee payment agreement, envisaged exports from either country worth £33 million. Under the terms of the agreement, India was to import substantially more cotton than in the previous periods. It was expected that Sudan would supply 350,000 bales of cotton and so that India would emerge as the largest buyer of Sudanese goods during the period. India was also to import substantial quantities of gum arabic and raw hide, though no target was set for this. On the other hand, India was to export tea, jute manufactures, textiles, spices, lentils, and non-traditional items, particularly engineering goods, totalling to £28.8 million — the balance of £4.2 million being covered up by an in-built inherent imbalance of the previous year.

Indian exporters not only fulfilled their quota of £28.8 million during the first 12 months of the agreement, but even exceeded it by about £7 to 8 million; meanwhile, exports from Sudan have been lagging far behind. Of the £33 million deal, £32 million will account for cotton alone. So far, Sudan has exported goods worth only £10 million. The Bank of Sudan suddenly suspended franking of licences to review the trade between the two countries; India also took an extraordinary step by declaring an informal ban on Indian exports to Sudan to settle payments difficulties. While Sudan's trade

ministry wants to pass on the blame for the impasse to India, India too seems to have many grievances. According to India, Sudan has already exceeded the ceiling by £7 to 8 million. Sudan has also exhausted whatever technical credit could be normally given. Sudan supplied less cotton than agreed to in the trade agreement, was unprepared to pay the rest in sterling. £40,000 are also outstanding from Sudanese shippers on account of short weight and poor quality claims. Indian traders complain that shortcomings in Sudanese supplies increased after the export and import trade was nationalised by the Sudanese government. They had been demanding a higher price for less quantities of cotton. And the latest difficulty arose on account of Sudanese demand for carrying charges to be paid in advance for shipments. Sudden dislocation in the flow of goods between the two countries has thus resulted in a large number of export goods to Sudan being stranded at Indian ports. Against the background of past performance and in the framework of the trade agreement, the importance of the trade and commercial relations between the two countries could be judged. India's and Sudan's economies are complementary to each other. Sudan is one of the most important suppliers of extra long staple cotton required for India's textile industry. Sudan has also a near-monopoly of gum arabic, which is an important raw material for the textiles, chemicals and pharmaceuticals industries. India, on its part, is supplying various traditional and non-traditional items essential to the development of Sudan's economy. However, during the coming decades, expansion of trade through trade agreement alone cannot be taken for granted. Sudan's trade potential, the structure of

its foreign trade, its trade policy, and its changing relationships with other countries, will be major factors influencing future trade relations between India and Sudan.

Sudan is the largest country in Africa with an area of 1 million square miles, and has a population of 15 million. Its per capita gross domestic product increased from £ 33 in 1964-65 to £ 36.4 in 1969-70. While industry contributes a small percentage (9 per cent) to total GDP, agriculture accounts for about 43 per cent of total GDP. The major industries in Sudan are iron ore, manganese, chromites, cement, petroleum products, cotton lint, cotton textiles, footwear, knitwear, readymade clothes, sugar, vegetable oil, canned fruits, vegetables, macaroni and spaghetti, confectionery, soft-box leather and hard leather. For fulfilment of its domestic requirements, Sudan government is giving liberal concessions and incentives for development of light and food industries. Even though industrial development continues to receive attention, its contribution to the total GDP remains low.

The five-year Economic and Social Development Plan, 1970-71 to 1974-75, envisages increase in GDP at an average rate of 8.1 per cent as against 2.7 per cent in the previous five years. Taking into account the annual increase of population by 2.8 per cent, the GDP per capita is expected to be jacked up to £ 47.6 by 1974-75. Economic trends in Sudan give hope of speedy development. The Economic Commission for Africa considers the economic outlook for Sudan as favourable.³

In the sphere of foreign trade, Sudan

for some time has been strictly following the policy of maintaining its balance of trade with all the countries with which it trades — mainly with a view to conserving hard currency. Several government corporations emerged to handle export and import trade by June 1970, after the nationalisation and confiscation of foreign establishments. This implied the elimination of private exporters and importers, and a change in the organisational structure of foreign trade.

Sudan's trade with the socialist countries specially the USSR is increasing. Its export and import trade with the USSR increased by 9 and 6 times, respectively, during 1960-1970 (United Nations, *Monthly Bulletin of Statistics*, July 1971, p x vii, Special Table B). The socialist countries supply mainly machinery and equipment, textiles, sawn timber, sugar, pharmaceutical products, hospital equipment, fertilisers, etc. The EEC countries are also playing a sizeable role and their share is around 25 per cent in the total trade. Growing trading relationships with UAR, Libya, and China, need to be reckoned with as well. The UK is trying to maintain its share in the Sudanese market. On the other hand, imports from India and Japan are gaining ground. Since the western establishments in Sudan were liquidated and drastic changes were introduced in the import policy of Sudan, imports of a number of popular Western brands have come to an end. This has certainly provided better scope to a number of other countries to promote their exports.

In forging wider economic relations

with Sudan, one of the important factors is participation in its development projects. Thus, while Russian experts have helped in formulating the development plans, the Chinese have provided interest-free loans and technical assistance in various fields of development. Sudan and Soviet Union also signed a \$45 million three-year agreement, under which Sudan will mainly sell cotton to the USSR in exchange for Soviet building and farm equipment.⁴ Japan has offered to finance the establishment of an agricultural scheme and a sugar factory. India, too, has agreed to participate in development projects in Sudan. Though it is difficult for India to help Sudan in the big way that the Russians, Chinese and Japanese have done, supply of railway wagons, transmission towers, conductors and couplers at competitive prices has been very useful for the development of the railways in Sudan.

The various developments mentioned above not only indicate that Sudan is a promising market for various consumer and capital goods but also that there are formidable competitors in that market. The expansion of India's trade with Sudan could, therefore, be interpreted as an added effect of the 1965 trade agreement. Whether the present trend will be sustained in future as to become almost automatic, is a difficult question to answer. Perhaps this query may form part of a deeper question of the basis for evolving trade relations among developing countries which are at different stages of development.

A look at Sudan's total exports and imports as well as at its foreign exchange reserves shows that Sudan had an unfavourable balance of trade during the entire period, 1965 to 1971 (excluding 1970 when Sudan enjoyed a small surplus), and that its foreign exchange reserves have also dropped from £ 59.7 million in 1965 to £ 27.9 million in 1971.

Raw cotton continued to be a major foreign exchange earner for Sudan, fetching more than 60 per cent of total earnings in 1971. In 1970, cotton prices were higher than in 1969, and this trend seems to have continued. In its desire to earn more foreign exchange, Sudan is trying to export more to the countries of Western Europe. At the same time, promotion of trade with socialist countries is also being vigorously pursued on different considerations. Since a large number of consumer and capital goods coming from China, USSR, and various other socialist countries, as well as from Japan, are cheaper than the goods coming from India,

Sudan could be easily induced to export cotton to these countries in exchange for them.

Sudan is interested in importing traditional goods such as tea, jute manufactures, and cotton textiles from India; but in all these fields, India faces tough competition either from East Africa and Ceylon in tea (tea from these regions is cheaper than Indian tea) or from Pakistan (jute manufacturers), China and Japan (cotton textiles). An example of the headway cheaper Chinese goods have made in Sudanese markets may be found in the following. In 1970, Sudan's government decided to put up co-operative department stores in various parts of Khartoum for selling all types of consumer goods to the public. To make this experiment successful, the co-operative society was given a licence to import £ 0.5 million worth of stores from China, the stress being on the imports of cheaper goods (The Government of India, Ministry of Foreign Trade: *The Journal of Industry and Trade*, Volume XX, Number 11, p 1316). Due to this major limitation, future exports of these goods will have to be watched very carefully. At present, Sudan does not want to cross the ceiling for trade turnover agreed to under the trade agreement with India. Given the exports of traditional goods this amounts to restricting the imports of non-traditional goods from India. Since Sudan's trade with India is based on 'balance the trade' principle, more imports from India means more exports especially of cotton from Sudan to India. This is the reason which lies at the root of Sudan's unwillingness to raise the ceiling or to exceed it. It would be worthwhile to see what makes Sudan disinterested in exporting more cotton to India.

India has always been pressing Sudan for more long staple cotton needed in the production of the finer varieties of cloth. India has been the single largest importer of cotton from Sudan and about 20 per cent of the total cotton shipments were sent to India in 1969.⁶ But to step up the cotton exports still further to India would severely restrict Sudan's ability to export more cotton to some other interested parties. For instance, during the last few years, the strength of the demand from the communist bloc for Sudan's long staple cotton was such that the disposal of accumulated surpluses was almost complete and, in 1970, the incoming crop too was being committed.⁷ Sudan has established closer economic co-operation through trade agreements and is receiving wide-ranging aid from the socialist

TABLE 3: SUDAN'S EXPORTS, IMPORTS, BALANCE OF TRADE AND FOREIGN EXCHANGE RESERVES

Year	Exports	Imports	Balance of Trade	Foreign Exchange Reserves (£ million)	
				Cotton	Exports
1965	67.96	72.29	-4.33	59.7	31.36

bloc countries for its development projects.⁸ Under the economic co-operation agreement with China, Sudan was granted a development loan of \$ 35,000,000 to finance the building of roads, bridges, and a textile factory. Thus Sudan's cotton exports are getting increasingly tied to the socialist countries.

Sudan is also faced with another dilemma the solution to which is being found by turning to West European countries. With a view to achieving diversification in its export and import trade, and also to arrest further fall in foreign exchange reserves, hard currency earnings have become increasingly important to Sudan. This function could be fulfilled by higher exports of cotton and of some other items to the West European countries. This has been reflected in the rise of cotton shipments to these countries from 15,042 thousand Sudanese pounds in 1966 to 20,979 thousand pounds in 1969.⁹

An additional factor affecting the surplus of raw cotton for exports is the need to meet the growing internal consumption of cotton. Internal consumption of cotton increased, from an average of 22,000 tons in 1964-66 to 31,000 tons in 1970.¹⁰ This was also reflected in the production of textiles, which was stepped up from 36 million metres in 1965 to 92.7 million metres in 1969.¹¹ Future increases in internal consumption will make considerable inroads into the available surpluses of cotton for exports.

Thus, the mounting pressure of foreign exchange reserves, the need to replenish them through exports to non-agreement countries, such as the West European countries, the need to fulfill the growing demand for cotton from the socialist countries under the trade agreements contracted, the rising internal consumption of cotton on the growth of its textile factories are likely to be the restricting-factors in the growth of Indo-Sudanese trade. The Sudanese government is also unwilling to offset the higher exports of cotton to India against

India's export goods due to the latter's higher prices.

These same factors are also responsible for diverting the supplies of cotton to the non-trade agreement areas, such as West Europe as well as trade agreement areas like the socialist countries. It is to be noted that all the socialist countries have trade agreements with Sudan and that they extend substantial facilities under their programmes of export and imports market development.¹² Provision of such liberal facilities is beyond India's financial capacity. The speedy expansion in trade between India and Sudan is based not only on commercial considerations but is also motivated by the Charter of Algiers. It is supposed to be an expression of two developing countries' desire to help each other in their drive towards economic development. Its success will, therefore, be determined by a search for some basic factors that lend durability to the technique of trade agreements.

The major emphasis in Sudan's Five-Year Plan on development of agriculture and water resources, would be very conducive to the growth of exports of agricultural implements and machinery from India. A detailed survey of the Sudanese economy and its development plan would provide a list of such items needed for the development projects in Sudan and so easily acceptable in that market. This type of exercise has become essential in view of the recent happenings in the case of various trade agreements which have sounded serious warnings to the development of trade among the developing countries in the Afro-Asian and Latin American regions on the basis of trade agreements.

A few lessons could be drawn from the recent disruption in Indo-Sudanese trade. First, in a developing country characterised with an inflationary situation at home, the domestic market becomes more remunerative and attractive for the producers. However, through various measures such as export

incentives and compulsory exports, we are creating a class of outward-looking producers. But disturbances in the functioning of the trade agreements dampen the spirit of exporters and stall any movement in the direction of this vital change. For instance, the controversy over the Indo-Russian wagon deal affected exporters greatly.

Secondly, so far, most of the African countries enjoyed a favourable balance of trade with India. During the last few years, a perceptible change is taking place in the form of either a decline in this balance or a favourable balance for India. It could be that, so long as these countries enjoyed favourable balance of trade, they were not worried about increase in India's exports. The situation is now slowly reversing in favour of India, and it is not unlikely that the Sudanese will have second thoughts regarding the furtherance of trade through such agreements. At the same time, countries at the higher stage of development such as India, will have to show greater accommodative spirit by way of acceptance of other export items from trading partners instead of insisting on our own needs for a particular commodity.¹³ Otherwise there might result serious damage to the future trade relations between the two developing countries.

Sudden stoppage of trade with Sudan is not a solitary instance in point. One could look back and find similar instances with regard to Indo-UAR and Indo-Yugoslav trade agreements. The whole issue of trade agreements between developing countries merits greater attention and clear thinking in order to understand the problems involved — instead of looking for patch-work solutions as and when the trouble erupts.

Trade contracts are a looser form of co-operation. They will always have limited value and operate with difficulty if certain precautions are not taken. Trade agreements imply specific trading arrangements for selected commodities with assurances of a market for the selling countries, sources of supply for the buyer countries, and some stability of trade volume or price or both regarding traded commodities. Within the broad framework of a trade agreement, therefore, price competitiveness and prevention of undue rise in prices of export items are essential considerations.

The success of trade agreements largely depends on intensive commercial surveys of the respective country's trade potential, a proper understanding of the country's development plan, a careful study of the country's needs, and provision of opportunities for the disposal of surpluses emerging out of plan

fulfilment. In planned development, a country profitably creates surpluses of certain commodities which it desires to dispose of through exports. It also faces shortages of a number of goods which can be met through imports. Therefore, the operational significance of trade agreements may be considered as an intermediary that brings together the planned surpluses and deficits of two countries, thereby relieving the countries in a planned and systematic manner to their mutual advantage. Additionally, trade agreements must be backed by regular export promotion measures, scrutiny of evolving balance of trade situation from time to time, and regular visits of government survey-teams to maintain the progress of trade agreements. Otherwise, it will only result in bouts of trade expansion, followed by a period of trade stand-still. Prompt solutions to intricate organisational problems, such as provision of credit facilities, willingness to carry forward surpluses and deficits, preparedness to exceed the purchase and sale of certain commodities, occasionally, will also speed up their implementation. In sum, a proper perspective will go a long way to create the right kind of climate for expansion of trade among bilateral trade partners and convert the instrument of trade agreement into a dynamic agent of trade expansion.

- 12 One of the principles underlying trade relations between the planned economies and developing countries is that developing countries can repay credits with goods. This is a great advantage, specially to those countries in which industrial enterprises have been built with the assistance of the countries with planned economies. This method of repaying credits stimulates the export of the products of the new enterprise, which, as a consequence, make fuller use of their capacity. Also refer to, UNIDO — 'Export Market Development in the Centrally Planned Economies of Europe', in United Nations "Development of Industrial Exports", New York 1970, pp 93-113.
- 13 For instance according to Egyptian sources the biggest hurdle in the further expansion of Indo-UAR trade is India's reluctance to buy non-traditional items. Cotton constitutes the biggest single item in India's imports from the UAR and the latter is sore on this score. *Economic Times*, Volume XII, Number 170, August 21, 1972, p 1.

Losing Struggle

THE Economic and Financial Classification of the Central Government Budget, published every year by the Minister of Finance, groups government expenditure, firstly, according to economic categories, such as consumption, savings, capital formation and financial investment, and, secondly, according to the purpose of the expenditure, such as social and economic development, defence and administration. There is, besides, also a cross-classification by both economic and functional categories. From an analytical point of view, the classification suffers from certain serious limitations. Firstly, it covers only the Central government budget and does not include the state budgets and budgets of semi-government bodies, which are substantial beneficiaries of financial devolution from the Centre. Nor is the expenditure of the state governments and semi-government bodies classified in a similar manner anywhere else. Disbursements of the state governments taken together now almost equal those of the Centre. It is unfortunate, therefore, that neither the Finance Ministry nor the Planning Commission nor the Reserve Bank systematically attempts economic-cum-functional classification of the state government budgets.

There is also much scope for improving the methodological base of the Economic Classification of the Central Government budget. In many cases the classification of expenditure is arbitrary and without any firm empirical basis. For instance, the central assistance to states and union territories, given in the form of block grants, is allocated between current and capital grants in the ratio of 1 : 1. Similarly, grants for the crash schemes of rural employment have been divided in the same ratio between 'current' and 'capital' grants. In the Central government's own direct expenditure, one-half of the provision for creating jobs for the educated unemployed has been treated as capital expenditure and the other half as consumption; of the latter, again, one-half has been treated as wages and salaries and the other half as current purchases of commodities and services. One-fifth of the provision in the 1973-74 budget for advance action on the Fifth Plan has been treated as 'building and construction' and four-fifths as "machinery and equipment"; thus the entire expenditure has been included under direct capital formation by the Central government. It is not clear in what proportion expenditure on the crash rabi agricultural programme (whether financed by grants or loans or directly incurred by the government) has been classified between current and capital expenditure. The cross-classifications show that between 1971-72 (accounts) and 1972-73 (revised estimates), there was an increase of about Rs 120 crores under capital expenditure on agriculture and about Rs 220 crores under total expenditure on agriculture.

Of the Central Government's total expenditure of Rs 7,840 crores in 1972-73, a little over one-half (51.3 per cent to be exact) or Rs 4,025 crores was spent on 'social and economic services'. The balance went for non-developmental purposes. The proportion of total expenditure on 'social and economic services' had been as high as 58.4 per cent in 1965-66, when the investment-income ratio in the economy had touched its peak. It subsequently dwindled to 46.7 per cent in 1971-72. The revised estimates for 1972-73 thus show an improvement over 1971-72. The major sectors to register an increase are: other social services (by Rs 144 crores); agriculture (Rs 209 crores); industry (Rs 196 crores) and transport and communications (Rs 144 crores). Of these, the increase under the first head is due entirely to the crash programme for rural employment and the educated unemployed. In agriculture, the crash rabi production programme is responsible for the larger expenditure. In industry the larger disbursement were partly by way of subscription to the share capital of public sector corporations to manage recently nationalised industries such as the general insurance corporation and Bharat Coking Coal. In other words, a part of the apparent increase in expenditure on 'social and economic services' in 1972-73 will not have a commensurate impact in terms of building up the production potential of the economy.

Expenditure on 'social and economic services' is budgeted to remain almost stagnant at Rs 4,056 crores in 1973-74, even though there is an increase of over Rs 500 crores in anticipated tax receipts and other income. On paper, this is partly attributable to the lower figure of the deficit financing indicated in the Budget — Rs 85 crores against Rs 550 crores in 1972-73 and Rs 460 crores in 1971-72. However, all indications — the impending revision of government employees' salary, larger food subsidies and the crash kharif programme — point to the likelihood of deficit financing rising to a figure as large as in the last two years, but without any corresponding increase in the expenditure on 'social and economic services'.

Looking at it differently, of the total expenditure of Rs 7,840 crores in 1972-73 (revised estimates), Rs 2,718 crores or 34.7 per cent was spent on capital formation (directly by the government, as well as by transfers for capital formation). Here, again, capital formation as a percentage of total central government expenditure had formed 49.9 per cent in the Second Plan and 46.9 per cent in the Third Plan. It would have been higher in the Third Plan period but for the sharp increase in defence expenditure in 1963-64. Subsequently, capital formation has consistently declined to as low as 32.2 per cent in 1971-72, even though in the intervening period the economic situation was considered relatively satisfactory.

Within the capital formation expenditure, direct expenditure by the Central government amounted to Rs 749 crores in 1972-73, i.e. only 9.6 per cent of the government's total expenditure. This is expected to go up by about Rs 152 crores in 1973-74, of which Rs. 150 crores would be on account of advance action on the Fifth Plan. On the other hand, gross financial assistance for capital formation is expected to stagnate at Rs 1,986 crores in 1973-74, as against Rs 1,969 crores in 1972-73.

The suggestion that increase in defence expenditure is responsible for the decline in the proportion of expenditure on development is not borne out by facts. Defence expenditure as a percentage of total expenditure had reached the peak ratio of 25.4 per cent in 1963-64 and had continued at 22-23 per cent till 1965-66. Yet expenditure on capital formation was kept high in those years. Thereafter defence expenditure never went beyond 22.8 per cent and in fact in 1972-73 it declined to only a little over 20 per cent at which level it is expected to remain in 1973-74 too. In other words, while larger and larger resources have been mobilised by the government in the name of defence and development, both have received declining proportions of the government's total expenditure. It may be suggested that rising debt services are responsible for a smaller proportion of funds being available for defence and development. This too is not true; in respect of the Central budget, at least three-quarters of interest payments are offset by interest receipts. Over the years, interest receipts have in fact grown faster than interest payments. In 1972-73, for instance, interest receipts amounted to

Rs 720 crores, while interest payments aggregated Rs 768 crores. Even wages and salaries of central government employees formed only 13.4 per cent of the total expenditure in 1972-73, which was the proportion in 1964-65 and 1965-66 (though there have been fluctuations in the intervening years).

If lower proportions of total government expenditures are being spent on capital formation, defence, wages and salaries and debt services, where do the funds go? They go so in the form of larger and larger transfers to state governments for purposes other than capital formation. In 1965-66, such transfers amounted to only Rs 472 crores or 12 per cent of total expenditure. According to the revised estimates for 1972-73, these amounted to Rs 1,433 crores or 8 per cent of the Central government's total expenditure.

The overall picture that emerges is one of fiscal mismanagement, almost continuously since 1965-66. In that year the domestic saving and investment rates had reached the peak levels of 11.1 per cent and 14 per cent of national income, respectively. This was made possible by a sharp improvement in public sector savings and investment. Public sector savings in 1965-66 were 2.4 per cent of national income. In 1971-72 they were 1.5 per cent. The net savings of the Central government, estimated in the Economic Classification of the Budget at Rs 458 crores for 1972-73 (revised estimates), are only marginally higher than the level of Rs 426 crores achieved in 1965-66. Needless to say, as a proportion of national income, the decline is very sharp.

Likewise, public sector investment has hardly risen since 1965-66, even at current prices. Expenditure on capital formation had reached a level of Rs 1,805 crores in 1965-66. For the next five years, upto 1970-71, such expenditure in absolute terms and at current prices remained below that level despite an increase of 40 per cent in the government's total expenditure during the period. In 1970-71 expenditure on capital formation was Rs 1,805 crores. The increase of about Rs 914 crores in gross capital formation of the central government in the two years 1971-72 and 1972-73, formed hardly 37 per cent of the increase in the government's total expenditure. It does not even equal net credit to the Central government from the Reserve Bank

(i.e. central financing) which amounted to Rs 1,178 crores in these two years. Besides, the increase of Rs 914 crores in capital expenditure does not offset the rise of nearly 50 per cent in the cost of investment during the period 1965-66 to 1972-73. In other words, the government's capital formation expenditure is losing the struggle to even stay where it is in real terms.

Poona Riots

Can Government Complain?

A Correspondent writes:

IT may or may not have been a coincidence that communal riots broke out in Poona on May 16, the day of the Poona and Maharashtra bandhs organised by the Left parties in protest against the food shortage, the spiralling prices, and the mismanagement of the drought relief works. Very likely it was not a coincidence. Yet the two events have to be seen separately — something which reports in the newspapers have, almost without exception, failed to do — if only to appreciate better such connection as there may be between the two.

Leftist political forces had been preparing for the Poona and Maharashtra bandhs for many days. The CPI, the Socialist Party and the Lal Nishan Party had, at an all-party conference, formed the Dhanya Kapat Virodhi Kamgar Sangharsh Committee (Workers' Action Committee against Reduction in Food-grain Quota) in which the Jan Sangh had joined as well. On May 16, workers from factories, middle-class bank and insurance employees, and state transport workers took out a massive procession to the Poona Collector's office to present a memorandum protesting against the phenomenal rise in prices and drawing attention to the plight of the 5 million workers employed in the famine relief projects and demanding 12 kg of foodgrains per head per month. The Poona workers' strike was successful and peaceful.

The bandh was a success also in many other places in Maharashtra. Vehicular traffic on the Poona-Ahmednagar road, the Poona-Sholapur road and the Poona-Pandharpur road came to a complete halt for a few hours on May 16. More than 15,000 people from the nearby villages demonstrated in front of the Tehsil office at Saswad in Poona district and presented a memorandum to the

tehsildar demanding that the rise in prices of essential commodities be curbed and that the foodgrain quota be raised to 12 kg per head per month. Similar events took place in other places such as Ahmednagar, Rehuri and Kopergaon.

But, in Poona, even as leaders like S M Joshi and Baba Adhav of the Socialist Party and A D Bhosle of the Lal Nishan Party were addressing a largely-attended meeting of workers, far away from the place of the meeting, in Nana Peth, stones were thrown on the Chand Tara Masjid and a few shops belonging to Muslims were set fire to. Within minutes, large parts of Poona city were engulfed in communal violence. There can be no two opinions about the seriousness of the riots. Quite apart from the published casualty figures of 5 killed and over 330 injured — which may be taken to represent, as usual, a substantial undercount — the Police Commissioner of Poona had to ask the army to be kept on a stand-by alert, and the Central Home Minister and the Maharashtra Chief Minister rushed to Poona the next day. An aggressive section of the majority community had apparently made careful preparations to spark off the riots. Last month, on April 22, unsuccessful attempts had been made to provoke violence by throwing acid bulbs on a Muslim procession. On the same day, local Shiv Sainiks took out a procession to assert the 'sacred right' of citizens to play music on public roads, irrespective of the location of masjids. This provocation too failed. But, as the events of May 16 showed, the communal trouble-mongers were not to be denied for long.

And they have at least one major factor in their favour at the present juncture. The successive food riots in Nagpur, Nasik and other parts of the state, the Bombay bandh on May 15 and the one to follow on May 25, the Poona and Maharashtra bandhs on May 16 as well as its own intelligence reports, appear to have convinced the government about the existence of simmering mass discontent capable of being organised with even a minimum of effort on the part of the opposition parties. In this situation, what could be better than communal riots to divert the people's attention from their economic plight and frustrations. In this may lie the connection — to be sure, a connection of a very different type from that suggested by newspaper reports — between the Poona and

Maharashtra bandhs and the communal riots in Poona.

It is customary for official spokesmen to make soothing noises after every communal riot — whatever may have been the government's lapses of omission and commission in the actual handling of the riot. In this case, however, the pronouncements of the Central Home Minister, Uma Shankar Dikshit, in Poona on May 17 have struck a very different note. Communal riots take place because "people lose their heads" at "minor provocations here and there". And according to a news agency report Dikshit further said that a major reason for such riots was the prejudices and restless minds of backward and minority community members, adding that a particular community had been under a peculiar tension which had made its members restless after the 1971 war.

It was quite unnecessary for the Central Home Minister to have gone any further and identified which particular community he had in mind. That task can be left to forces such as those behind the Poona riots. And in the process, if the discontent among the people over their economic condition gets pushed into the background, can the government really complain?

Indo-Bangladesh Trade

A More Realistic Basis

THE one-year limited trade and payments treaty between India and Bangladesh, which was extended by three months, will expire at the end of June. Officials of both countries have already initiated a dialogue in the hope of arriving at an acceptable package deal

which would form the substantive part of the next trade agreement which has to be signed before the present treaty expires so as to avoid any disruptions in trade between the two countries.

The current trade treaty has had a chequered career over the last 14 months and caused much uneasiness in both trading partners. Particularly, the provisions relating to border trade in particular — which were intended to facilitate the exchange of perishable commodities and of articles of daily use — often brought forth allegations against India. Under the border trade provisions, persons residing upto 16 km of the border were issued permits which allowed them to carry across the border goods of personal consumption in specified quantities as well as money of upto Rs 100 once a day. However, due to the unsettled nature of the population as well as the difficulties of administration in Bangladesh, border trade in fact led to large flows of some essential commodities, such as fish, from Bangladesh into India lured by higher prices. Border trade was suspended in October 1972 on Bangladesh's initiative.

While the current trade agreement had envisaged balanced trade worth Rs 25 crores each way during April 1972 to March 1973, the actual trade is expected to be much below this level. Even with the extension of the period of agreement by three months, India's exports to Bangladesh are estimated to be around Rs 18.5 crores and imports at Rs 14 crores. The major shortfall in Bangladesh's exports to India is in fish; as against Rs 9 crores indicated in the agreement, Bangladesh could sell to India fish valued at only Rs 1 crore. Exports of semi-tanned hides and handloom products to India did not take place on account of their relatively

SUBSCRIPTION RATES

6 months	Rs 40	
1 year	Rs 75	Rs 110
2 years	Rs 140	Rs 210
3 years	Rs 200	Rs 305

Concessional Rates for Teachers and Students

6 months	Rs 18
1 year	Rs 35
2 years	Rs 60
3 years	Rs 80

Concessional rates are not applicable to students and teachers outside India.

higher prices in Bangladesh. To make up for this shortfall, Bangladesh has agreed to step up sales of raw jute, from the committed figure of Rs 7.5 crores to Rs 10 crores.

On the other hand, though it may appear that India's exports to Bangladesh are below the targeted figure, there have been massive movement of aid-financed goods from India to Bangladesh. The official figures about foreign assistance indicate that, during the fiscal year 1972-73 alone, Bangladesh received Rs 1499 crores of aid from India. In view of the large Indian assistance to Bangladesh by way of supplies of essential commodities, the size of India's commercial exports to Bangladesh does not correctly indicate the size of the total flow of Indian goods and services to that country.

Bangladesh would have to give serious thought now to the type of trade agreement it wants to have with India. It is reported to be in favour of continuing the present rupee trade agreement. This has obvious advantages for Bangladesh so long as it continues to have a debit trade balance. By the same logic, India appears to be in favour of shifting to a different pattern of trade so that net balances are settled in some hard currency, such as sterling or dollar. True, the movement of goods from Bangladesh to India has been slow and faltering; while exports to India would earn rupees that could be used for purchases only in India, exports to other countries earn free foreign exchange that could be utilised for purchasing from the most favoured sources. Nevertheless, the not-so-comfortable foreign exchange reserves of Bangladesh make imports from India attractive.

Economic relations between the two countries would henceforth be on a more realistic basis as the amount of loans or grants that India can give Bangladesh will be small. Both countries may be able to avoid misunderstandings by carrying on trade under the next trade agreement in hard currency, though this may result in a lower volume of trade between the two countries. At the same time, the reported Indian initiative to revive border trade, though in a limited way, by licensing people to cross the border for the weekly markets appears to be ill-advised. Border trade has been suspended since October 1972 at the insistence of Bangladesh and it is best to leave its revival to Bangladesh.

Government and Big Farmers

Accent on Incentives

A COMMITTEE of the Planning Commission has not only recommended the imposition of a betterment levy, more or less on a uniform basis, all over the country, but has further suggested that the levy be collected in the form of a surrender of excess land. This, the Committee felt, would simultaneously serve two purposes: the government would have additional revenue, and land reforms would move ahead.

In the world of reality, no such thing is likely to happen. The aggregate yield from betterment levies, taking all the states together, is currently less than Rs 1 crore per annum. Overall public outlay since Independence toward provision of irrigation facilities, bunding, road building, land reclamation and so on, in contrast, certainly exceeds Rs 5,000 crores. What is however to be done? Now that the Green Revolution, even on official reckoning, has encountered some little local difficulties, the emphasis once more is on raising production and productivity in agriculture. Any loose talk of relatively stiff imposts on the big farmers through betterment levies and similar devices will therefore be considered very inappropriate.

In his budget speech, the Finance Minister paid homage to one of the common places of the Raj Committee's recommendations, but its principal recommendation regarding an agricultural holdings tax is gathering the expected moss. If pressed hard, New Delhi would say that the Committee's proposal has been sent out to the state governments for eliciting their reaction; after all, it is the states which have to implement the recommendations. It is not difficult to anticipate what the reaction is going to be. The same factors which prevent New Delhi from insisting upon a compulsory procurement levy would also inhibit it from goading the states to experiment with any substantial fiscal impost upon the affluent farmers.

New Delhi's pragmatic rationale may be as follows. You should mount your attack on one front at a time. You can afford to alienate the wholesale traders because their number is not large, and in any case their political predilections have been generally with certain opposi-

tion parties, particularly the Jan Sangh in the north. On the other hand, the surplus farmers, that is, those who have benefited from the new irrigation system and public works and would be harmed by a strict enforcement of land reforms, are numerous; politically, they continue to carry a lot of punch. As a party thriving on the spoils system, the Congress can hardly be expected to alienate the big producers at this juncture. In view of the difficult position in the world grain market, the party has to fall back on the surplus farmers in the northern parts of the country for obtaining the wheat necessary for running the public distribution system.

That should not, however, prevent the Congress from walking up and down simultaneously on both sides of the same street. It can keep pontificating on the need for time-bound land reforms, for speedy reconstruction of land records, for betterment levies and steep irrigation rates. It would not, however, disturb excessively the existing production and tenurial relations in agriculture. Lest incentives are affected, proposals such as for an agricultural holdings tax and the enforcement of betterment levies would be locked away. The onus for the slow pace of land reforms would be shifted on the tardiness of the records of rights. And has not the Minister of State for Planning already supplied the information that in at least five states, Andhra Pradesh included, there is no surplus land to be distributed. Most of the other states are likely to stumble on a similar finding.

Should one expect anything different: is it at all fortuitous that the person who heads the *kisan* cell of the AICC is one of the leading gentlemen-farmers in Haryana, and has been consistently against all radical proposals emanating from the Planning Commission and the Agricultural Prices Commission? He certainly knows which side his bread is buttered. There is no reason to doubt that the Congress party does not either.

Because of a go-slow at the States' People Press, we regret that this issue is smaller than usual and its publication has been delayed.

—Ed

Petroleum

Up the Garden Path

IF incantation were enough to exorcise the influence of the foreign oil companies from the country, the task would have been achieved long ago. There is no count of the number of times successive Petroleum Ministers have affirmed and reaffirmed the government's intentions towards these companies. On March 30 D K Barooah was telling Parliament that the government was committed to bringing the entire production, refining and distribution of petroleum under the public sector. Six weeks later, on May 7, he was once again assuring Parliament that it was the government's policy that the commanding heights of the country's oil economy should be controlled by the state.

But even as these incantations have been repeated over and over, the actual circumstances of the country's petroleum industry have changed in favour of the foreign oil companies. Three major developments have contributed to this. First, the output of petroleum products, which was just enough to meet requirements around 1970, has been steadily falling behind demand. The gap, which has to be filled by imports, now stands at about 3 mn tonnes and will widen to 8 mn tonnes in the next two years. The government has failed either to formulate a rational fuel policy which would have kept down the demand for petroleum products or plan for a rapid enough expansion of refining capacity. Second, thanks to the virtual collapse of the ONGC and the suspension of exploration activity, the production of crude oil has stagnated at around 8 mn tonnes and may well decline to 4 mn tonnes in the next few years. Given the order of expansion of refining capacity called for to meet the demand for petroleum products, this points to a state of almost total dependence on imported crude oil. Third, as a result of the series of collective and individual agreements between the oil producing countries and the international oil companies, the prices of crude oil, and correspondingly those of oil products, have gone up steeply in the last two years. For instance, the price of light Iranian oil imported into this country has gone up from about \$1.28 per barrel in 1970 to \$2.25 per barrel at present.

The first of these three developments

has made nonsense of the government's policy of not allowing the foreign oil companies to fully use the capacities of their refineries on the ground that partly these capacities had been clandestinely installed. Faced with the alternative of importing oil products, it does not make sense to be too finicky about the antecedents of such refining capacity as there is in the country. Indeed, the medium-term prospect is of the oil companies being allowed to further expand their refining capacity, the government's public fulminations against them notwithstanding. The second development has already forced the government to reverse its policy with regard to offshore oil exploration and throw open the field to foreign companies on terms which would, among other things, give these companies the right to a share in the oil that is discovered and produced. Given the links among the international oil companies, only the

very naive will believe the government when it claims to be putting the screws on the oil companies already operating in this country even as it tries to cajole affiliates of these same companies to come to its rescue by finding oil offshore. The significance of the last of the three developments lies in the fact that it has vastly increased the cost to the government — in terms of the foreign exchange expenditure on imports of crude oil and oil products — of not allowing a larger role to the international oil companies in exploration, production and refining of oil in the country. This should be absolutely clear to the government. And so when the petroleum Minister declares that the government is committed to bringing the entire production, refining and distribution of petroleum under the public sector, he is, to put it simply, deliberately leading the country up the garden path.

Calcutta Diary

A M

THESE are cynical times, and the dividing line between sentimentality and ridiculousness can be altogether thin. This piece, nonetheless, is dedicated to slushy emotions. Toss it away if it nauseates you.

Mrinal Sen's *Calcutta '71* has a claustrophobic last scene, claustrophobic because it cuts across notions about what may or may not happen in our ordinary world of reality. Certain unnamed goose-stepping gunners shoot down a starry-eyed, defenceless young man against the vast expanse of a misty early morning in the Calcutta *maidan*. No bird chirps, the young man dies a writhing death, the sound of the shots is no doubt drowned in the seeming indifference of the heartless city. It does not matter though. About everybody knows the identity of the young man, and of the goose-stepping gunners. Everybody knows, but few will talk. You ask no questions, and you will be told no lies. Mrinal Sen has his difficulties. He has to have a cover, he must keep on making the kind of films he wants to make. An open accusation hurled at the police would not possibly have passed the Central Board of Censors; his sources of funds too would have dried up. The killers therefore remained unnamed.

But the film was hardly a parable, that particular episode hardly an allegory. You talk in private with senior men belonging to the administration: from the second quarter of 1970 onwards, they will admit, the police were given summary powers to hunt down and kill 'undesirable' elements. Dead men generally carry no tales, and the evidence of such killings is claimed by oblivion. The social and political philosophy of those in power determines the contours of 'undesirability'. Once these were spelled out, the police had the *laissez passer* to go to town, really and truly, on a murder binge. No need to conform any more to the droll literalness of 'self-defence'; no need for the irritant of a proper search warrant and of regular witnesses as was the wont during the days of the British; young people, once they have been defined as undesirable, could now be swiftly despatched to their deaths. (Those who agreed to join the ruling party of course got a reprieve; that, including the new phenomenon of the police and prison authorities donning the role of recruiting agents for a particular political organisation, constitutes a different, though related, story.)

The other week in Rajya Sabha, a member was heard to wail: even though dubbed a terrorist, he had no

fear during the British regime of being shot down in the street in a sudden action to be subsequently described by the police as an 'encounter', as has been the fate of a nephew of his in this city. A minister was quick to answer the member. Fighting the British, was he explained, quite all right, all of us were then together; now that the house is ours, it is however different; we have to do 'something' even if it be our own nephews and nieces who try to destroy it from within. The 'something', obviously, is what the minister considers to be a polite euphemism for point-blank killing, under the open sky, of unarmed, defenceless young men and women. The British might have cavilled at this 'something', but not us. When we are dealing with our own nephews and nieces, the rule of law is dispensable.

A rich farmer, whose cost of raising a quintal of wheat is Rs 40 but who sells it to the retailer at Rs 100, most assuredly does not destroy the house from within; he only realises a profit. A wholesale trader, who finances the farmers to the hilt so that they would keep back the grains on his behalf till the price sky-rockets, does not destroy the house either; he is merely misbehaving, for which he is appropriately admonished, and maybe he can expiate his sin by contributing to this or that political fund. In case the borrower happens to be a filthily rich specimen with whom he boozes in the evenings, a chairman of a nationalised bank, may purposely charge a lower rate of interest, relax the requirements for margin and forget to insist on collateral; there is no question of punishing him; he, it is to be assumed, is not destroying the house, but helping to strengthen its superstructure. An industrialist, who deducts the employees' contribution to the provident fund from the wage bill of the workers but fails to deposit it at the right quarters, is guilty of unfortunate behaviour, but the government will be aghast at the suggestion that he be shot without trial; he may be at most legally proceeded against. The import-export tycoon, who has expanded his black money operations through systematically under-invoicing exports and over-invoicing imports, is, come to think of it, something of a laik; kindly arrange, if you can, a party ticket for him at the next biennial elections to the Rajya Sabha. The senior civil

servant, who diverts to the black market relief material intended for refugees or arranges to give away scarce fertilisers or steel to the shady ones, who grease his palm the most and thereby vitiates national priorities, may perhaps be warned or transferred to another job, but, since he is not a petty clerk swearing by some Marxist group or other, you cannot even invoke Section (2) of Article 311 of the Constitution to remove him; he is not a security risk. The merchant, who adulterates the cooking medium with a poisonous substance or adds stone chips to the rice, will, even if caught, be permitted to behave himself from now on; he is not one who, by any stretch of imagination, can be described as a saboteur of our system; he is not for burning. Take the politician who has used his ministerial tenure to pile up a couple of crores of rupees by disbursing licences and such like, or the chief minister who lays out a guest house in New Delhi entirely at the expense of the state so that his wife, who happens to be a Member of Parliament, need not face any problem of accommodation in the capital; neither of them deserves to be stigmatised; they are following the norms. If a landlord wantonly kills a score of Harijan women and children before breakfast, let the creaky wheel of justice in due course take care of that; no reason at all to get worked up over such trifles. If a share-cropper is driven out of his field by the landlord's men and his family is reduced to starvation, take it easy; the social revolution we are striving for — one can have a direct quote from the Prime Minister here — cannot be ushered in in a day. Minority groups will suddenly be set upon, their houses razed to the ground, their properties looted; a few perfunctory arrests will take place, bail will follow, and there will be no occasion to demand any stiffer action against the criminals; of course they are not to be shot. Tycoons may conceal income and evade tax and keep cocking a snook at the government machinery; no special measures will be recommended to bring them to book — they do not destroy the house from within; they will not be shot. Cheats, cut-throats, profiteers, speculators, embezzlers and worse rascals, none threatens the house from within: the rack-renter does not, the land grabber does not, the stealer of public funds does not. For each crook

or ragamuffin, there is the due protection of the law, the due process of the law; thievery and nepotism and robbing the poor do not harm the entrenched ones, they do not destroy the house which the authorities are jealously mounting guard over; they are, almost, honourable professions.

It is a question of values. The operator in the black-market does not challenge the system; the crime he commits does not, in the short run, affect the life and living of those who constitute the authority; given appropriate arrangements, the latter may even come to share the profiteer's loot. Till as long as you pay the appropriate obeisance to the social foundations of the polity, you can get away with murder, or, which is the same thing, were you to commit a murder, the country's Constitution will lovingly protect you against executive excesses. The protection will be withdrawn the moment you begin to indulge in dangerous thoughts in the manner of Mrinal Sen's young man. It would be futile to try to sell the thesis to the authorities that such dangerous thoughts represent the purest species of patriotism. Given a certain hinterland of objective circumstances, sensitive young men and women will, despite the Defence of India Rules, the MISA and the Ministry of Home Affairs, continue to dream wild dreams, and to think grotesque thoughts. The central issue in patriotism, one would have thought, is the courage and the will to give up the lure of comfortable existence for the sake of an ideal. This is at least how the concept was defined, even along these shores, prior to 1947.

Barring the dangerous young men and women, try to name even one set of people in the country who practise the self-abnegation which politicians preach from time to time. It is the cult of the self all over, beginning with the minister-politician down to the road engineer's overseer. Such is the moral code we have succeeded in evolving over the years that if you are young, you are welcome to turn into a heroin-addict or a bum or a knife-wielder; but whatever else you decide to be, you must not turn to dreaming extravagant dreams, such as of transforming the society through a revolution, in case the colour of the revolution is other than green.

This measures the magnitude of the

contemporary Indian tragedy. All that lives must die. None in India are more intensely alive than the young men and women who are prepared to sacrifice — and in many cases, have sacrificed — their all so that a new society could emerge. They therefore must die, shot like dogs under the canopy of the open sky in concocted encounters with the police. Those among them who somehow escape death will be locked away, if not under the MISA, under a wild assortment of charges bearing the overwhelming hue of after-thought.

CAPITAL VIEW

Our 'Watergates'

Romesh Thapar

EVEN as the Watergate story engulfs political life in the US and makes the future of Richard Nixon highly uncertain, the politician in other lands has been busy convincing himself that he is an angel compared to the US President's once-trusted lieutenants. This is quite an exercise in self-deception, and it goes without saying that Delhi is ahead in this particular game. How many times over the past week have I heard some one or the other say that our chaps are not nearly as bad. What a testimonial, even if it were true.

The temptation to talk about 'our Watergates' is strong. After all, the massive collection of political funds, from every businessman-industrialist who had something to process through the labyrinth that is government today, set the base of corruption in public life several years ago. A number of ministers, who still enjoy the confidence of Parliament, are continuously talked of as the foster-fathers of the system which has given the ruling party more money than it can use. A few have fallen by the wayside because they were greedy and pulled too much out of the kitty for themselves.

We haven't started the large-scale forging of election campaign materials to damage opponents or yet used a variety of Home Ministers to 'bug' and 'plague' persons we do not like. These elements of the Watergate revelations, as practised by the ruling elite, have startled millions all over the world who have a democratic conscience; this

What is the number of nephews and nieces languishing behind the bars in this great liberal democracy of ours? Thirty thousand, forty thousand, fifty thousand? How many have been summarily shot, in prison or outside, so as to ensure that the house is not destroyed from within? Why bother about them; they dreamed, they do not deserve any better. While the young ones are despatched to their fate, many of the unscrupulous ones, come January 26 and August 15, will be honoured by the state. These may be rogues and scoundrels, but they enrich the system.

qualification is required, as the Soviet and Chinese Press has not printed a sentence on the subject, and probably that goes for all those who have made forging, bugging, and plaguing a way of political living. But the Watergate business, like films on sex and violence, will spawn operators devoted precisely to what is supposed to be condemned. We should get our share of this fall-out in the next general elections.

Gangsters are now very much a part of political organisations in India. Every party trades on them. The evidence? Whenever there is a clash between rival political groups, the much-maligned police have to begin a round-up of 'badmashes' and 'goondas'. The question naturally forms: Why aren't these elements kept under lock-up or close discipline in the normal course? Ask the police chiefs, and they will tell you that every 'gang leader' has a patron in the political hierarchy.

A cursory look at the scene in Calcutta will convince. There is much indignant talk about the atrocities of the police, but even as the political radicals give vent to their anger they accept 'police protection' by never referring to it. Almost every prominent politician of Right and Left is 'protected' from one or the other gang. What a cosy life! And yet, a day may dawn when one kind of gang establishes its hegemony, and the 'protection' is withdrawn.

These are the ugly facts of our politi-

cal life which are glossed over. Watching the Delhi scene, one often wonders at the cost of providing outriders and gunmen for a whole variety of nondescript ministers and factotums. The system of 'protection' reaches a level of absurdity when these personalities arrive at the local golf course accompanied by outriders and gunmen — and proceed to play fully protected! They seem to have lost the capacity of moving around like ordinary citizens.

The situation has strange dimensions. The more the police force is compelled to protect a decadent ruling class, the less its capability to cope with the thugs and gangsters operating against the people. The sharp rise in crime is directly attributable to the extraordinary protection we provide the politician and his populist activities — violent strikes, demonstrations, gherrillas, clashes and the like. This anarchic mess which parades itself as a possible alternative to the existing government is sought to be preserved in its pristine state; but the cost is heavy.

It is possible to see the Opposition moving to study the techniques adopted by Nixon's dedicated staff for use against the power and patronage of Indira Gandhi. We have been in the midst of a scandal-a-day situation for some time. How these stories affect popular thinking is difficult to assess. Presumably, there is a point at which anything begins to be believed. Nixon has reached this point. Indira Gandhi has to see to it that she is not brought to a similar predicament by a slow process of attrition.

We keep wondering when the axe will begin to fall on those who have made the Congress Party a convenient screen for all manner of 'deals'. What is sought are not the purges of the committed and uncommitted as advocated by Planning Minister Dhar; for these are meaningless labels used very often by sophisticated charlatans. What is sought is action against a wide spectrum of corruption. Only then will the committed emerge to salvage the party of Gandhi and Nehru.

For the moment, to mix images, there is not a flicker of a stirring. Yes, the Congress monolith snoozes, even though the grain is being openly hoarded and power generation is folding up because maintenance is lacking...

And soon Parliament will be on holiday.

May 14

Dividend Maintained on Profit Decline and Diversification

Hansavivek

ELPRO INTERNATIONAL has commenced regular production of cobalt-60 teletherapy equipment, which it is the first to have developed indigenously. With orders for more units in hand, including three for export, this will constitute an important addition to the company's medical systems line. Other medical systems products, introduced last year, were a fluoroscopic and radiographic unit, a 20 MA x-ray generator, and an x-ray diagnostic table. Meanwhile, the new 198 KV lightning arrester has met with good response. But the company's results last year were affected by the "depressed economic environment following the Indo-Pakistan war" and the poor monsoon. Alnico magnets for household meters and x-ray products

were the hardest hit. Sales to government, which normally account for about half of annual turnover in these lines, was greatly reduced. Lightning arresters are entirely taken up by the State Electricity Boards. Lack of funds with SEBs, drought conditions, and a slow-down on rural electrification, very much reduced sales. Power shortage throughout the country has in fact had a very unfavourable impact on electrical products. Moreover, the growth of the radio market, to which the speaker magnet sales are tied, also slowed down from previous years.

With a sharp drop in sales, margins shrank and profit was sharply down. One-fifth of the maintained dividend of 12 per cent is short-earned. The cur-

rent year holds out promise of improved performance. The household meter business is showing signs of picking up. This should help the company's meter business. Government spending on social services is also resuming, and an increase in orders for x-ray equipment has been noticed. The Income-tax Department has made an application to the Income-tax Appellate Tribunal to make a reference application to the High Court in respect of its order allowing capitalisation of certain expenses. The tax liability in question is about Rs 6 lakhs.

SCHRADER-SCOVILL DUNCAN, which completed only 12 years of its existence last October, has accumulated reserves of Rs 57 lakhs against a share capital of Rs 46 lakhs. Besides, nearly one-fourth of the share capital comprises gift shares issued by capitalisation of reserves. The company is operating with entirely its own funds and has not borrowed any money. On the

other hand, as at the year-end it had put about Rs 37 lakhs in fixed deposits and earned Rs 3 lakhs by way of interest. During 1971-72, the company experienced a slight contraction of margins despite higher sales. On account of increased tax liability, net profit was actually lower than the previous year's. But the dividend, maintained at 25 per cent, still enjoyed a good cover. The current year's prospects, however, do not look bright, since production at the plant came to a standstill from February 9 last, following a 'walk-out' by workers, over their demand for increased wages. Efforts at arriving at a settlement through the conciliation machinery continue, but the management contends that the revised terms offered to workers compare 'favourably' with the rates of wages in comparable industries. Loss of production apart, additional levies imposed in the last budget, and substantial increase in copper and zinc prices in the international market, will push up cost of raw materials, considerably. Various avenues for diversification of the company's activities within the framework of the government restrictions are being explored by the management.

INDIAN VEGETABLE PRODUCTS' latest accounts are for 12 months and are therefore not strictly comparable with those of the preceding year, which covered a period of 15 months. But the former show a substantial improvement over the latter. Although net sales dropped by about 27 per cent to Rs 498 lakhs, gross profit advanced by 50 per cent to Rs 27 lakhs. This was mainly due to increased contribution from the chemicals division. Production of vanaspati continued to be "uneconomical". Government gave effect to some of the recommendations of the Tariff Commission in August 1972, but it is stated that, with increases in processing charges, etc, that had taken place in the meantime, the revised price formula was already out of date. Ratios of inventories/sales and wages/sales showed significant increases over the year. With a higher ratio of net profit/capital employed, dividend maintained at 17 per cent found better cover than in the previous year. The board has also proposed to issue bonus shares on a two-for-five basis.

VOLTAS proposes to diversify its activities and to share with other companies within as well as outside the country

the experience and knowhow acquired over the years. To enable the company to provide technical and managerial assistance to other concerns and to enter into joint projects, the object clause of the memorandum of association is proposed to be modified, subject to confirmation by the court. The company has been active in the agro-industrial sector and now intends to participate more extensively in this field by adding to its existing operations in the tractor, pump, sprinkler irrigation and allied fields, such activities as the manufacture and sale of pesticides, fertilisers, agricultural chemicals, etc, and by undertaking the running of experimental farms, soil-testing and similar activities. It is also proposed that the company's electrical division be expanded with a view to conducting the business of research in the field of electronics and to manufacture electronic, electrical and mechanical devices, spare parts, and accessories. The annual general meeting of the company, originally scheduled to be held on February 26, has been postponed to May 28, because of the disruption in the normal working of the company as a result of the continued staff agitation. Meanwhile, the board has declared and paid an interim dividend of Rs 17 per share for the year ended August last in place of the payment recommended for shareholders' approval at the annual meeting. The directors say that continuous demonstrations and work-to-rule at the — Thana works reduced the value of output in the six months ended February last to Rs 363 lakhs at works transfer prices, as against Rs 548 lakhs in the corresponding period last year and the budgeted level of Rs 661 lakhs. During the first four weeks of March last, the value of output was approximately one-fifth of the value during the same period in the preceding year. It is also stated that, on March 28, five officers of the company were 'gheraoed' for 4 hours and 'rescued only with the assistance of the police. Operations at the Thana works had to be discontinued following this instance of 'forcible restraint'. According to the management, the principal issue preventing a return to normalcy is the insistence of the employees' federation, that the use of electronic data-processing within the company must be 'subject to its control giving them the right to determine when, where and how this necessary management tool should be used'. No

other company in India is subject to such restrictions. The company has given categorical assurances against any adverse effects on employees as a result of the use of EDP. Because of the differences regarding the use and control of EDP, the issue of revision of the dearness allowance scheme in Bombay and other issues which could benefit employees have remained unsettled, it is stated.

VIDARBHA IRON AND STEEL, a new company, is putting up a mini-steel plant at Nagpur by installing a 10/12-tonne arc furnace and a 7-tonne per hour section rolling mill. The molten steel capacity will be 18,000 tonnes per annum on a three-shift basis, and the rolling mill will be capable of producing structurals and rods of mild steel, medium carbon steel, and constructional low alloy steels. The factory is expected to go into production in January next. The main raw material is scrap, which is adequately available in the nearby region. The total capital outlay, estimated at Rs 120 lakhs, will be financed by share capital (Rs 50 lakhs) and long-term loans from SICOM and MSFC (Rs 70 lakhs). The public is being offered, under a Prospectus, equity capital of Rs 30 lakhs in shares of Rs 10 each at par. The subscription list will open on June 7 and close on June 18 or earlier, but not earlier than June 12. A sum of Rs 2.50 per share will be payable on application, an equal sum on allotment, and the balance of Rs 5 per share in calls. Jayant S Dalal, chairman, expects the company to earn a gross profit of Rs 37 lakhs on a turnover of Rs 145 lakhs in the first year of production and pay a maiden dividend of 10 per cent out of it. According to him, sales, and profit should gradually rise to around Rs 170 lakhs and Rs 43 lakhs, respectively, in the fifth year of production. On this basis, dividend could be stepped up to 12 per cent in the second year, 15 per cent in the third, 18 per cent in the fourth, and 20 per cent on the fifth. The substantial loans from the state financial institutions apart, the company will be entitled to certain other incentives, such as refund of sales-tax on raw materials and finished goods and exemption from octroi duty, since the plant is located in a 'developing area'.

NEW DELHI

Land Reform Is Dead, Long Live Land Reform!

THE report of the Task Force on Agrarian Relations under the Chairmanship of the Land Reforms Commissioner, P S Appu, is a strikingly candid document. Going through it the only conclusion that can be reached is that genuine and radical land reforms are simply not possible within the established social and political order. Based on the report of the Task Force, guidelines are reported to have been issued to state governments for implementation of the land reforms programme in the Fifth Plan. But if the constraints on implementing the programme so sharply underlined in the report are taken into account, the guidelines completely lose all operational and practical value. To be sure, the programme contained in the guidelines has everything to commend it. But where are the instruments and sanctions to ensure that even a fraction of this programme is carried out? The guidelines completely evade this issue.

It is worth quoting from the report of the Task Force where it outlines the principal reason for the poor progress of land reforms:

"Enactment of progressive measures of land reforms and their efficient implementation call for hard political decisions and effective political support, direction and control. In the context of the socio-economic conditions prevailing in the rural areas of the country, no tangible progress can be expected in the field of land reform in the absence of the requisite political will. The sad truth is that this crucial factor has been wanting. The lack of political will is amply demonstrated by the large gaps between policy and legislation and between law and its implementation. In no sphere of public activity in our country since Independence has the hiatus between precept and practice, between policy pronouncements and actual execution, been as great as in the domain of land reforms. With resolute and unambiguous political will, all other shortcomings and difficulties could have been overcome; in the absence of such will even minor obstacles become formidable road blocks in the path of Indian land reform. Considering the character of the political power structure obtain-

ing in the country it was only natural that the required political will was not forthcoming." Again, says the Task Force in another part of its report:

"In a society in which the entire weight of civil and criminal laws, judicial pronouncements and precedents, administrative tradition and practice is thrown on the side of the existing social order based on the inviolability of private property, an isolated law aimed at the restructuring of property relations in the rural areas has hardly any chance of success."

Having said this, the Task Force need not have taken the trouble of formulating fresh guidelines within the old socio-political framework to go on with the land reforms programme in the next plan period. The exercise must appear a ritual, known to be so in advance and of no political significance. The Task Force indeed been honest and real enough to admit as much. Refer in particular to the slogan of "land to the tiller", it says quite forthrightly that this objective will never be achieved in the prevailing conditions of our society. The Task Force says:

If the slogan "land to the tiller" is to be "meaningful and honourably implemented", land should go to those who cultivate it, namely, those who perform the various operations like ploughing, sowing, trans-

ing, harvesting, etc. Conversely, persons who do not personally participate in these operations should not be allowed to own land. "We are, however, inclined to think that in the context of the social, economic and political conditions prevailing in the country such a law will not be enacted, and if enacted will not be implemented".

The aim, therefore, has to be far more modest — not land to the tiller, but reduction in the "incidence of absentee ownership of land". The definition of personal cultivation contained in our land laws has been a major factor in the systematic and large-scale ejection of tenants. It is now proposed by the Task Force that personal cultivation should require at least some supervision of the land pre-empted for such cultivation either by the owner himself or by a member of his family and should further require that the supervisor should live in the village where the land is situated or in a nearby village.

Going back to the abolition of statutory landlordism in the early fifties, the Task Force report recalls that the abolition of intermediary tenures had resulted in about 20 million tenants coming into direct contact with the state and large areas of privately-owned forest land, grazing land and culturable wasteland being vested in the state. The compensation payable for this was about Rs 600 crores out of which about Rs 275 crores had been actually paid in cash and bonds. Even so, "it is a moot point whether the abolition of intermediary interests conferred any new economic benefits on the tenants". The programmes which could have made some impact on rural life and the agrarian structure are tenancy reform, ceiling on holdings and redistribution of land. None of these programmes has made any headway. In some respects the situation has actually worsened, as may be seen from the large-scale eviction of tenants, the spate of "voluntary surrenders" and the liberal exercise of the right of resumption of land for personal cultivation. While tenancy reform and ceiling on land are known to have failed miserably, the report of the Task Force points out that even consolidation of holdings has worked to strengthen the landowners' position and weaken that of the tenant and the actual cultivator. The report has the following to say about consolidation of holdings:

A major weakness of the programme was that consolidation was done without taking effective steps to ensure security of tenure to tenants, particularly sharecroppers. In the result, consolidation of holdings has led to large-scale ejection of

tenants. For one thing, when holdings were fragmented even a resident landowner found it difficult to cultivate personally all the plots of land constituting his fragmented holding and, therefore, perforce he had to lease out some portions of his holdings to sharecroppers. After the holdings were consolidated, the landowner found it both feasible and profitable to cultivate 'personally' the entire area and he spared no effort to get rid of the sharecroppers. For another, the relationship of sharecropping tenancy subsisted in respect of a specific plot of land easily identified in the field. Once consolidation was effected, the identity of the particular plot that the sharecropper had been cultivating was lost and he could be automatically ousted from the land. "Thus the consolidation of holdings has often turned out to be the *coup de grace* for the sharecroppers".

Having made this frank assessment of the impact of the land reform programme so far, the Task Force proceeds to spell out the programme for the Fifth Plan. The major aims of the programme as spelt out by the Task Force are: plugging of loopholes in the existing tenancy laws, enactment of ceiling laws, and distribution of surplus land. How, so long as the social-political framework remains what it is, these programmes will be less doomed to failure in the future than in the past the Task Force does not say. But it has some interesting suggestions to make on implementation. It proposes that a new administrative set-up, independent of the established revenue and administrative machinery, be created which would devote itself exclusively to implementation of land reforms. It would be invested with the necessary powers to get round legal difficulties and other obstacles.

The question to be asked, however, is how will such an administrative set-up be able to perform without political support, which is the essence of the matter according to the Task Force itself. The existing administrative arrangements have failed mainly because of the political constraints on it. The Task Force itself brings this out forcefully in connection with the failure to prepare the records of rights in land and tenancy and to bring them up-to-date. According to it, the bureaucracy's attitude to implementation of land reform is generally lukewarm and often apathetic. This is inevitable since, like the men who wield political power, those in the higher echelons of the administration also are "substantial" landowners themselves or they have close links with the big landowners. Village functionaries like patwaris, etc., are invariably petty landowners and are also under the sway of the big landowners. The report goes on to

say that even in these few cases where the administrators tried to implement land reforms honestly and efficiently, they were frustrated by the political bosses and were, for instance, "hastily transferred elsewhere". In these circumstances, the idea that a new organisation will do the trick is clearly naive.

Very interesting in this context are the observations of the Task Force about the pressures that might be organised from below to achieve land reforms. According to the report, so far land reforms have been essentially the gift of a benign government and the intended beneficiaries of land reforms, weighed down by crippling social and economic disabilities, have been passive, unorganised and inarticulate. The Task Force says: "In our view a certain degree of politicalisation of the poor peasantry on militant lines is a prerequisite for any successful legislative-administrative action for conferring rights and privileges on them." But how is the poor peasantry to be politicised on militant lines and who is to attempt the task, are left unanswered.

A serious weakness of the Task Force's otherwise very interesting report is that it has failed to take into account the trend of agrarian policy since the launching of the new agricultural strategy in the mid-sixties. It makes only a passing reference to the large public investments in agriculture and in the rural areas after Independence and to the fact that the benefits of this investment have gone mainly to the well-to-do farmer so that the disparities in wealth and incomes in the rural areas have widened further. The Task Force does note the "unplanned spread of mechanisation" which will not only accentuate the inequalities but also reduce employment opportunities. But these references to "the impact of public investments and modern technology on the agrarian structure" appear to have had no influence on the reports recommendations about the pattern of agrarian change or reform which are put forward in the usual conventional framework.

Indeed, this is the basic contradiction in the political leadership's entire approach to rural and land problems. Thus, the recent meeting of the Congress Working Committee, for instance, in the same resolution called for imposition of ceilings on land holdings and distribution of the surplus land on the one hand, and for a massive effort to support farmers to expand marketable surpluses on the other. It can be safely said that the first task is to be treated

as a ritual to be proclaimed to sustain the radical pretensions of the Congress; it is the second task which is to be seriously carried out. Land reform in favour of the tenant and the sharecrop-

per simply does not square with the new agricultural strategy — and the leadership knows it. And between the two, it is the new agricultural strategy that will prevail.

difficult to evolve a mutually acceptable manner of revalidating the extension of those Central laws and institutions, the usefulness of which for the people of the state is accepted. In this category would fall the extension of full or limited jurisdiction of institutions such as the Supreme Court, the Auditor General and the Election Commission to the state. But that seems to be the limit as far as Abdullah is concerned.

The Government of India could also afford to be a little flexible. It might find it difficult to withdraw the application of, say, Articles 356 and 357 of the Indian Constitution to the state, empowering Parliament to declare emergency, or the provisions regarding the status of the head of the state, who is now nominated by the Centre instead of being elected by the state legislature as was done during Abdullah's tenure of power. But there are areas where efforts could still be made.

The basic fact is that failure completely to bridge the gap, between the positions of the dissident Kashmiri leaders and the Government of India need not lead to relapse to the old situation. Whatever might happen to the Beg-Parthasarathy talks, it is important to take steps for the consolidation of the momentous improvements that have already taken place

in the politics of the state and to avoid possible pitfalls in taking the process further.

The basic question thus remains of restoration of trust. There might, for instance, be less resistance to the enlargement of Kashmir's autonomy if Kashmiri leaders are able to inspire confidence in the rest of the nation that the national interests would be safe in their hands. Likewise, a lesser degree of autonomy might satisfy the people of Kashmir if they are convinced that Kashmiri interests are safe within India. In order to promote such mutual confidence, the share of the popular leaders of Kashmir in responsibility and power must be gradually enlarged. Avenues will also have to be provided, not necessarily formal, for some of them — in particular for Sheikh Abdullah — to play their due role at the national level. In view of their belief in secular ideals which remained almost unshaken in spite of all the vicissitudes of Kashmir politics, and in view of the obvious shortfalls in building a secular India, this role can be extremely valuable.

In this context, the free hand that was given to the dissidents to contest the elections to the civic bodies and then to run them, was a step in the right direction.

The danger of relapse in the political situation in Kashmir arises not merely on account of the possible failure of agreement between the Government of India and the dissident Kashmiri leaders on the quantum of the state's autonomy and the manner and extent of the latter's share in power, but also on account of certain built-in tensions in the politics of the state that have started to surface again — paradoxically, following its normalisation.

The slogan of plebiscite used to provide a massive outlet to the popular discontent in the valley. As that outlet is getting closed, the body politic of the state will no longer be immune to reactions of the people against administrative and political lapses on the part of the government. In fact, while tending to be reconciled to remaining a part of India, Kashmiris are becoming more conscious and sensitive about their rights and their entity. In a way, the friendly embrace of Sheikh Abdullah might prove more dangerous for the ruling Congress party than his past opposition. For, if the differences become less marked and if the sharing of power becomes a distinct possibility, the protective

shell of ideology and vested interest around the party will wither away. Its ranks are likely to become more prone to the ideology of Kashmiri patriotism and to the spell of its hero.

How would Jammu react to these developments in the valley? So far, every Chief Minister after Sheikh Abdullah had taken Jammu's support for granted. His promise to fight the challenge of the secessionists in the valley was enough to rally round him the people of Jammu. Particularly by raising the anti-Abdullah bogey, he could divert popular attention away from the regional sentiments, parties and leaders in Jammu.

That bogey can no longer be used in view of the new roles of the Sheikh and the Chief Minister and their apparent mutual cordiality. At the same time, reared in an anti-Abdullah role, the Jammu wing of the ruling party may not be much of an asset to the Chief Minister in his attempts to bridge the gap. The ideological and organisational under-pinnings of the bridge thus do not promise to be strong enough to withstand the emerging diverse pressures of Kashmiri patriotism, regional sentiments of Jammu, and claims of Indian nationalism.

The Delhi parleys on Centre-state relations are a cause of further misgivings in Jammu. First, there is a feeling of being by-passed. Secondly, any possible enlargement of the state's autonomy, as demanded by the Kashmiri leaders, is feared not only as weakening the state's link with the Centre but also as reinforcing the so-called Kashmiri domination over Jammu. Unless an appropriate mechanism of reconciliation is evolved soon, the reassertion of Kashmiri identity and of pent-up regional sentiments of Jammu might start a fresh chain reaction.

It may be recalled that in the early fifties a similar chain reaction was the major cause of the process of erosion of popular support for Kashmir's accession to India. Due to tensions between the two principal regions of the state, divergent tendencies developed in Jammu and Kashmir on the question of the state's relations with the Centre. These tensions culminated in the crisis of August 1953, when Abdullah was removed from power and jailed.

Must history repeat itself? Must the current tensions be allowed to grow and cause a relapse in the political situation of the state? It should not be difficult to accommodate

Jammu's urge to be consulted and to have its say in any discussion on Centre-state relations. Jammu's fears can largely be neutralised by a clear recognition of its personality within the state and by providing appropriate safeguards for equitable share for the two regions in various fields.

The five-tier internal constitutional set-up — evolved by the J and K State People's Convention which was convened by Sheikh Abdullah a few years ago — offers a fair basis for a dialogue between the representatives of the three regions of the state, on inter-regional relations. It envisaged autonomy to all the regions of the state — subject to maintenance of its integrity — and further decentralisation of political power to the districts, blocks and panchayats.

In fact the question of inter-regional relations should take precedence over that of Centre-state relations. For, as the Sheikh has said while releasing the draft on the internal constitutional set-up, "a discussion on external relations of the state without setting its internal house in order was like putting the cart before the horse". Moreover, much of the difference between the dominant opinions of the two principal regions on the status of the state was a result of their mutual tensions. Thus, the fear of so-called Kashmiri domination motivates Jammu's urge for greater integration, which in turn causes anxiety in Kashmir about its distinct entity and inspires movements for larger autonomy.

The bridge-makers will, therefore, have to first concentrate on bridging the present divergence of popular sentiments in the two main regions of the state. Past experience and the patient intellectual work that has been done to harmonise regional aspirations should prove valuable guides.

Mere haggling on the subjects to be divided between the Centre and the state would be a lop-sided approach to the problem. Recent developments — internationally, nationally and locally — provide a unique opportunity for working out some basic transformations in the polity and politics of Jammu and Kashmir state. What should also assist this process is the realisation that, unless the present gains are consolidated, alternative avenues for discontent and means of reconciliation of rational urges discovered, and emotional energies of the people directed to social and economic growth, the process of relaxation and normalisation in the state may once again be put out of gear.

KASHMIR

Must History Repeat Itself?

Balraj Puri

IT does not seem easy — nor need it be necessary — for Sheikh Abdullah and the Government of India to arrive at a complete agreement. For, as the basic fact of Kashmir's accession to India is not in dispute, disagreement on the extent of autonomy may not prove so disastrous. If disagreement between the DMK and the Union Government, concerning the powers of the states, did not prevent the DMK from coming to power in Tamil Nadu and becoming an election ally of the Congress, why should the present stand of Kashmiri leaders come in the way of their playing a legitimate role in the affairs of the state and the country? In fact there is hardly any federal country which has achieved complete unanimity on the division of subjects between the Centre and the states.

However, the current parleys between Mirza Afzal Beg and G Parthasarathy are obviously of limited usefulness. The exercise of preparing a catalogue of acts and constitutional provisions, extended to Jammu and Kashmir state since 1953, in which the emissaries of Sheikh Abdullah and the Government of India have been patiently engaged for the last many months, has certainly been helpful in avoiding and postponing a confrontation. This in itself may not lead to a solution, which must be sought at a different level and through a different approach.

The Government of India would have obvious difficulties in restoring to the state its status of 1953 which has been demanded by Sheikh Abdullah. Yet the difficulties of the Sheikh in further climbing down from his stand should be no less obvious. That stand is based not only on his belief — shared with some other parties in the country — in greater devolution of powers to the states but also on the special historical and political situation of Kashmir. For, according to him, in rejecting Pakis-

tan and opting for India in 1947, an important consideration for the people of the state was a categorical assurance by the Government of India of an autonomous status to the state within the country. The Sheikh further argues that, unlike the other princely states, the process of integration of Jammu and Kashmir with the Indian Union has been forced since 1953 — when he was removed from power and imprisoned.

Nevertheless, there is in this stand certainly some scope for flexibility. In addition to the subjects that were ceded to the Centre by the state under the Sheikh's stewardship until 1953, there have been other measures of integration since then. The Sheikh concedes that not all of these are bad. His main objection is to the manner of their imposition, rather than to their merit. It should not be

WEST BENGAL

Preserving the Corpse of the Alliance

THE Congress-CPI alliance in West Bengal which had reached its nadir a short while ago has been saved from immediate collapse by the agreement reached by the leaders of the two parties at a meeting on May 10. The alliance, reduced to a mere formality as its partners intermittently clashed, often quite sharply, inside the Assembly and outside, reached a critical point when Moni Sanyal, the CPI chairman of the Howrah Bridge Commissioners — a statutory body formed for the construction of a new bridge across the Hooghly to connect the twin cities of Calcutta and Howrah — was unceremoniously dismissed from his post without any prior intimation to, let alone consultation with, the CPI or Sanyal himself. A late night letter from the government communicated to Sanyal that his services as chairman of the Commissioners had been dispensed with. Insult was added to injury when Chief Minister S S Ray, intervening in a discussion raised by the aggrieved CPI MLAs in the State Assembly, tauntingly retorted that the CPI contingent of MLAs had entered the Assembly by hanging on to the coat-tails of the Congress.

There was much anger in the CPI, understandably. Party circles, including the Press at the disposal of the party, unleashed a campaign to the effect that Sanyal had been removed from his post on account of his stiff opposition to some of the shady deals in regard to the award of contracts, etc. A section of the party even started talking about the need to terminate the alliance with Congress. The dominant section of the leadership of the party, however, took a much milder position and merely wanted to be satisfied about the reasons for Sanyal's removal. There is nothing to show that at the recent talks with the Chief Minister, the reasons for Sanyal's unceremonious packing off were explained to the satisfaction of the CPI leaders. Ray has, however, admitted that his retort about CPI's electoral achievement lacked decorum.

Reiteration of the importance of the survival of the alliance apart, the only concrete achievement of the Congress-CPI meeting is the formation of a liaison committee with representatives of the two parties. In the

present circumstances, the liaison committee can be little more than another frill added to the virtually formal alliance. The Congress has been falling to pieces over the sharing of power and positions in the administration and in the mass organisations. It cannot spare even a few crumbs for its alliance partner. It is also inconceivable that the government's policies, shaped by pressures within the ruling party, can be modified by any intervention from the CPI whose legislative support is absolutely redundant for the continuance of the government.

Why then this make-believe of a liaison committee? There are some compelling reasons on both the sides. On the Congress side, the preservation of the corpse of the alliance is necessary for checking the revival of a united Left movement. Siddhartha Sankar Ray knows that his 'coat-tail' statement was only a half-truth as it ignored the CPI's role as the spearhead of anti-CPI(M) moves and manoeuvres in the crucial 1969-71 period — moves and manoeuvres which had enabled the ruling party to isolate the CPI(M), disrupt Left unity and unleash terror against the more militant opposition forces.

The flare-up of intra-party violence within the Congress and the rising public indignation against the MISA and other similar laws have for the moment tended to somewhat restrict the use of terror against the CPI(M) and other Left forces. On top of it, the growing disillusionment with the Congress and the discontent created by the accelerating crisis of the economy have been steadily preparing the ground for a united opposition against Congress misrule. In the circumstances, the Congress cannot allow the CPI to drift towards a united Left grouping. The basic direction of political development in West Bengal has already become clear from the fact that, despite many serious differences among them, all the non-CPI Left parties have been moving together in mass actions and that even the Socialist Party, which has a strong ideologically anti-communist core, has decided at its recent conference to work jointly with CPI(M) in mass movements. The Congress must, therefore,

continue to have the CPI tagged to its tail if an all-in anti-Congress mobilisation has to be thwarted.

Within the CPI, apart from the compulsions arising from its national political line and the interests of Kerala ministerial politics, the dominant leadership of the State unit of the party has its own vested interest in the alliance with the Congress. The present leadership of mediocre and relatively unknown elements had gained the upper hand in the party, with the blessings of the party centre, when the midterm polls of 1971, by reducing the strength of the party from 33 in the previous House to 13 in the new, had proved the worthlessness of its policy of equidistance from both the Congress and the CPI(M). If the cornerstone of its new policy, i.e., alliance with the Congress, is given the go by, the return to the top of the more popular displaced leaders cannot be prevented for long. On the other hand, the displaced leaders, though they are reported to be extremely critical of the Congress and its government, are not yet ready to advocate a full-fledged alliance with the CPI(M). And, they have learned to their costs that a third front in between the Congress and the CPI(M) has no chance of making its mark in this state. They too have no alternative to the present uncomfortable berth in the alliance with the Congress. Hence, the present agreement on the preservation of the mummy that is the Progressive Democratic Alliance (PDA).

*

"The quarrels among the West Bengal Congress youth are no longer confined to the stage of statements and counter-statements — the quarrels have reached the stage of pipe guns and pistols. Both sides are now engaged in collecting ammunitions and if these quarrels are not settled immediately, then within a short while there are bound to be large-scale murders and assaults. Moreover, Siddharthbabu will not be able to stop the murderous clashes promptly with the help of the police only."

— Political Correspondent of *Ananda Bazar Patrika*, Calcutta, May 12, 1973.

"Siliguri, May 13 — In a raid on the parallel Congress office at Alipurdwar last night, police seized a gun, 11 cartridges, 27 bombs and a huge quantity of bomb ingredients. The office has been set up by dissident Congressmen of Jalpaiguri district, spearheaded by several party MLAs."

— *The Statesman*, Calcutta, May 14, 1973.

STEEL

Thinking 'Big'

(From a Special Correspondent)

THE tentative steel programmes for the Fifth Plan and beyond are based on calculation of per capita consumption of kilogrammes of steel as a measure of development and progress. However, while it is readily accepted that foodgrains can be, and have to be, rationed, steel capacity planning is still done without closely examining how much steel can be deliberately denied to the demand-makers. On the basis of loose assumptions, it has been decreed that the country will need to make more than 15 mn tonnes of saleable steel or 22 mn tonnes of ingot steel by 1980. Of this, a little less than two million tonnes are for export. Projecting 90 per cent utilisation of installed capacity, the plans are for 17 million tonnes of saleable steel capacity by 1980 and 37 million ingot tonnes capacity by 1985! The questionable presumptions here are, first, that steel plants will be able to work at 90 per cent capacity soon after their completion and, second, that we can add some 13 million tonnes of ingot steel capacity by the end of the seventies. We can't — and we don't need to.

NON-ESSENTIAL CONSUMPTION

After first assuming that the country needs to instal another 13 million tonnes of ingot capacity by the end of the decade, (some planners say the need is even more), various quick exercises are being done these days on how best to achieve these questionable ends. First of all, the fiscal question. Thirteen million tonnes of steel capacity will cost more than Rs 5,000 crores on optimistic estimates. Coal and iron ore mines, railway transportation and all the rest will be additional. The CEDB had one and a half years ago presented the government with two feasibility reports — one for the expansion of the Bhilai plant from 2.5 million tonnes to four million tonnes and the other for a two million tonne plant at Vijayanagaram. The report on Vijayanagaram, as well as a similar report by Dasturco on the Visakhapatnam plant, showed that these two plants might lose forty or fifty crores

of rupees a year under the present rules of capital supply to steel plants, interest rates and steel prices based on old capital block rates applicable to the Indian Iron and Steel Company. Dasturco and CEDB were then asked to do some cost-cutting exercises. The former came up with an exercise which asked for relief for steel plant imports from the burden of customs levies and what not. The CEDB suggested an increase in the size of the plant as well as production of more flat products which fetch higher prices.

On grounds of producing mainly the higher priced items in the interest of profitability, Bokaro, Rourkela, Bhilai, Vijayanagaram and the expanded TISCO plant will all go flat. And when more flats are available than can be used with real benefit to the nation, there will, of course, come the pressing demands for expansion of the luxury consumer goods industries which can convert the surplus flats into the second refrigerator for the Peddar Road or Ballygunje home, and who knows perhaps for making throw-away steel cans for the Bombay milk supply scheme. Don't take this as a flight of fancy, however weird the supposition, because licensing records show that during the Bangladesh emergency the country did import steel to make furniture. These steel intermediates were not available indignously at that time because of the collapse of the roof of the steel smelting shop at Rourkela. The Vasant Vihars of New Delhi are an eye-sore example of how the demand for steel can be pushed up, while, without violating any of the fundamental rights, architects can be compelled to design and householders forced to build houses which do not unduly strain the productive capacity of the steel industry.

Having assumed that the country will need a capacity of 22 million ingot tonnes by the end of the decade, the Steel Ministry asked CEDB to prepare a feasibility report on "expansion" of Bhilai to seven million tonnes and beyond and Bokaro to ten million tonnes. The feasibility report on the

Bhilai expansion to seven million tonnes will reach the government in a few weeks along with CEDB's detailed project report on the expansion to four million tonnes. Expansion of Bhilai to four million tonnes (that is, adding one and a half million tonnes to its present capacity) and Bokaro to 4.7 million tonnes ingot have been decided upon. These additions will leave about seven million tonnes of capacity creation to meet the tentative Fifth Plan target of capacity. If the decision is to add three million tonnes more at Bhilai and five million tonnes more at Bokaro (proposals agreed to "in principle" with the Russians already), then we may forget for some years the Vijayanagaram and Visakhapatnam plants as well as additions at Jamshedpur. An array of technical experts, including those in the CEDB, are opposed to going in for massive plants, whatever the source of foreign assistance.

The attempt to get started on massive expansion of Bhilai and Bokaro is tied mainly to the Soviet willingness to provide the steel plant machinery on credit. The government seems to think that it has no other option. The indigenous plants to make steel plant machinery, erected mostly with Soviet and East European technical and financial aid, have lagged behind requirements, to put it mildly. The addition of 13 million tonnes of ingot capacity will need about 15 lakh tonnes of equipment and special structural. Including the production of the still-slumbering Heavy Engineering Corporation, the indigenous output will be perhaps about five lakh tonnes during the Fifth Plan. This means that some ten lakh tonnes of equipment and structural will have to be imported. The Russians are ready, on their own terms, to provide the wherewithal to build a large part of the additional capacity at Bhilai and Bokaro.

DIFFERENT APPROACH

But take a look at the consequences. If Bokaro is to be 10 million tonnes and Bhilai seven million tonnes, then when the total steel capacity reaches 22 million tonnes, more than 75 per cent of the steel production will be tied to Soviet technology. Nearly half of the capacity will be at one centre. Also, a single spark of management-labour difference will be enough to close down almost one-half of the

country's steel capacity. And what about management? Is it being readily presumed that there are managers of proven mettle in the private sector to take over the management of the Bokaro and Bhilai giants? In any case, it is a bizarre concept to build gigantic steel plants with Soviet aid and then to hand over their management to veterans from the private sector. (After all, if the monopolies are fettered, private sector managers have no other way to climb up except by going public!)

With Bokaro at 10 million ingot tonnes, the total tonnage to be moved in and out will not be less than 45 million. The railways have proved themselves incapable of properly feeding the present Hindustan Steel plants at 4 million tonne ingot annual production, which the three plants reached in 1972-73. In the first few months of this year, these plants were not sure whether the coal would be there the day after.

An altogether different approach to steel planning would be to begin by re-working the estimates of steel requirement on the explicit assumption of drastic curbs on non-essential consumption. The HSL plants are supposed to have a total installed capacity of nearly six million tonnes, though the best annual rate of output so far has been only four million

tonnes. The capacity rating is not absolute, but relative mainly to the quality of the feedstocks and secondly to the standard of human performance in the factory. There could be concentration on improvement of the coal, coke and ores that are fed into the furnace and on other efforts for a better rate of production. If European standards could be reached, not to talk of the higher Japanese standards, steel production from HSL's present capacity could be much more than six million tonnes. This exercise would not need large imports.

The new capacity to be created should similarly be more or less attuned to production expectations from indigenous capacity in machine-building with carefully restricted and matched machinery imports. With greater self-reliance, there are bound to be competitive tenders for the sale of the selected items of steel plant machinery from the West as well as from East Europe and Japan. Instead of calling each other names, both CEDB and Dasturco may perhaps blossom out into real pioneers building the country's first swadeshi steel plants. This was an aspiration dating back to the embryonic stages of Bokaro. On the other hand, two more tied commitments to the Russians on Bokaro and Bhilai may doom the Indian steel industry to decades of dependence.

of regional development, regional movements and national integration.

It was mentioned by participants that disparities in regional development were a prime factor promoting regional movements. Such disparities were the result of: (a) differences in resource endowments, including natural and locational advantages, and human resources and historical experience; and (b) imbalances in political power between regions that led to a transfer of resources (including migration of people in search of employment) which often favoured one region (usually the better endowed one) at the cost of another. Sometimes, the pattern of relationship between a developed region and a backward one was so sharply unjust and exploitative that it could even be called 'inner colonialism'.

An additional cause of disparities in regional development was identified as being the imposition of a common pattern of development throughout the country, ignoring the fact that a region might have potentialities for an entirely different pattern of growth. The result has often been non-realisation of regional potentialities.

Approaching the problem from another direction, it was pointed out that the causes of regional disparities were not different from the causes of vertical (class) inequalities which have intensified in the course of development. This, it was pointed out, means that no solution can be discovered for the one kind of disparity in isolation from the other. It was recognised that in addition to regional disparities in development, there were other factors leading to recurrent regional movements. The growing urge for participation in democratic processes and in development was identified as an important motivation in regional movements. It was argued that the giver politico-administrative structure, and often the given size of states, was no conducive to democratic participation. The distance between the centre and the periphery, between the decision making machinery and the masses, was much too great. In this connection many participants felt that smaller states with a thorough-going change in the politico-administrative structure along the line, from grassroots level to the Union centre, would be a corrective step. Those who favoured this view argued that these steps would not only ensure greater democratic participation and national integration

but also be conducive to development (economic and social) according to the genius of the people of the region.

Contrarily, it was pointed out that these steps were not the real solution because the problem was not one of lack of participation and regional disparities in development but of the class basis of political power and there was no reason to believe that this class character would undergo any change with smaller states. Fears were actually expressed that regional movements were often whipped up by the very class which rules and are directed in support of the interests of this class rather than the progressive goals of participation and an egalitarian pattern of growth.

It was also pointed out that in an inequalitarian, stratified society, where social consciousness varies between different strata, it is likely that different strata will perceive the overall society in different ways and may have different preferences concerning where power, resources, etc, ought to be located. In other words, it is still an open question whether the deprived strata of society would find it in their interest that power be located within smaller or larger regions.

A formulation which received wide support among the participants was that, to the extent that India has accepted and is operating a political system of which democratic participation and social equity are integral parts, it followed that regional assertions which were based on demands for greater participation and equity were to be considered not as disintegrative but as contributing towards greater integration. In other words, it would be a serious mistake to characterise such regional movements as threats to national integration. On the contrary, in generating demands which primarily reflect the urge for greater participation in governance and development, such regional movements pay a tribute to the integration which already exists rather than question it.

The question of development and integration was considered in this context and it was pointed out that one cannot undertake one without the other, i.e. isolate one from the other. They are mutually dependent and reinforcing processes. It was further said that increasing differentiation was a function of development and that differentiation was a precondition for integration. Hence, the process of dif-

ferentiation — which, needless to say, is not to be equated with disparity — is not to be looked upon as antithetical to the process of integration. Hence, differentiation is to be welcomed and encouraged rather than frowned upon.

But the logic of differentiation in the context of development, the participants felt, was only economic but also social and political. In other words, differentiation would tend to be expressed not only economically but also socially and politically. Regional identities, regional assertions and regional demands are bound to grow as development proceeds. What is important is to evolve an approach to understanding and, eventually, meeting these growing aspirations adequately. Are they only to be condemned as fissiparous, disintegrative tendencies? Are they only to be regarded as reactionary, non-progressive and diversionary movements of a class of vested interests? No fully satisfying and generally convincing answers could be obtained for these questions. However, it was largely felt that regional movements are expressions of the democratic aspirations of the people and ought, therefore, to be dealt with on the basis of certain normative standpoints. These were stated as follows:

The politico-administrative system should be such as to ensure maximum participation of the people in the tasks of governance and development.

The system should enable maximum development, measured not

only in terms of some abstract or national criterion but in terms of a pattern which is directly meaningful to and commonly shared by the people of the area.

The areas of commonality are therefore important. They are expressed in terms of various aspects of social existence — social, cultural, economic — and in terms of ecology and physical resource endowments. It would be a mistake to single out only one, e.g. language or religion. Experience on the subcontinent has amply proved in the last 25 years the futility, and sometimes disastrous consequences, of this kind of one-sided approach.

It was pointed out that the task of formation of such regions, as will at once meet all the socio-political, planning and developmental needs, has yet to be done. Very often, the variety of aspects which go to form a 'region' cut across one another. Further, it is not as if these remain fixed in time. Rather, they shift over time with various emphases. In such circumstances, it is necessary to ensure that the politico-administrative structures are dynamic and flexible enough to be able to adjust themselves to regional aspirations. It was further argued that the 'regions' should not be looked upon as homogeneous units, which they are not and that regional movements should not be understood as being directed towards isolation and independence. On the contrary, movements for smaller region formation, by definition, are movements also towards greater integration and interdependence.

REVIEW

The Farm and the Farm Family

Economic Viability of Farms in Udaipur District (Rajasthan) by B K Tandon and B S Mardia; Department of Economics, School of Basic Sciences and Humanities, University of Udaipur, Udaipur, 1971; pp 249 + xvii, Rs 35.

THE book under review is based on a study sponsored by the Research Programmes Committee of the Planning Commission and conducted during 1967-68 in a "typically small farms district in a state which is characterised by large farms". It covered a sample of 320 farms spread over 16 villages in the four selected tehsils of the district. The central objective of the study was to "test the viability of farms, especially small farms, and to locate the key factors which account for the same" (p 90). Viewed against this central objective, the study leaves much to be desired.

Regional Development and National Integration

(From a Special Correspondent)

REGIONAL movements for autonomy, sometimes culminating in demands for the splitting of existing states into smaller ones, are a problem that has attended on all efforts at national integration in India. These movements have been occurring ever since independence and were in fact, anticipated even earlier, i.e. during the independence movement when the Indian National Congress resolved that states in independent India ought, as far as possible, to be linguistically homogeneous. This was by and large achieved in the fifties. But this by itself cannot, and has not, either solved the problem of regional autonomy or changed the basic character of Indian polity — that of a successor state to

the colonial regime. In fact, our politico-administrative structures continue to be, basically, those inherited from colonial times.

A workshop was organised in Delhi on February 15-16 by the Institute of Economic Growth in collaboration with the ICSSR and the Research Committee on Sociology of Regional and Urban Development of the International Sociological Association to discuss the problem of regional movements and their causes and also to work out an approach to them which would lead not only to a better understanding of the forces that shape them but enable a constructive channelling of such movements. In particular, the task was to understand the relationship between the various aspects

The authors devote little space to the discussion of key concept like 'viability' and 'small farm'. Guided more by operational convenience than the ultimate utility of their results, the authors have adopted simple working definition of the terms. Viability is defined in terms of the break-even criterion. All operational holdings the value of whose output at farm prices covered or exceeded the value of all inputs, including utilised family labour, were considered viable. Judged by this criterion nearly 44 per cent of the sample farms were found viable. However, in the Indian context, where it is difficult to meaningfully segregate the farm from the farm family, the break-even criterion would be highly inappropriate for judging viability. Narrow profitability of an enterprise — on the basis of currently and directly used inputs — which overlooks the maintenance requirements of the farm family — in a sense, a part of the fixed cost of the farm — can hardly serve as an indicator of viability. A farm cannot be treated as viable simply because it gives some net margin over cost, if this margin proves too small to sustain the family operating the farm.

It is largely because of disregard of the 'totality' of the family farm or rather the artificial segregation of the farm and the farm family that the authors have been able to conclude that in the situation of Udaipur district "tenant farming is not a losing proposition . . . the main contribution of the tenant is his (actually utilised) labour for which he is better rewarded than the landlord. This ownership itself does not confer any special benefit unless it is followed by intensive farming" (p 85).

PART OF FIXED RESOURCES

Similarly, while discussing farms which were completely unirrigated and yet viable, the authors observed that "their viability is accounted for by their very small size where burden of overheads is so small . . . that even small investments pay off" (p 87). These arguments would imply that under-utilisation of fixed farm assets (which gives rise to high overhead cost) is the principal source of non-viability. But in the situation of Indian family farms, family labour — nearly 42 per cent of which remained unutilised, according to the present study (p 143) — is very much a part of fix-

ed resources and if maintenance of family labour is taken into account while judging the viability of the farms, the results of the study would be completely altered. With the help of correlation analysis it is concluded that "viability of farms had its key determinants in the size of farm and the extent of fragmentation, tenure status, irrigation facilities, literacy, use of improved inputs and technology and product mix (p 97). Thus really no relevant factor is left out. But this type of 'this-is-important-and-that-is-also-important' approach can hardly guide an action programme. A closer study of the relevant tables would suggest that the list of "key determinants" could have easily been shortened.

SENSELESS COMPARISONS

Regarding small farms, a working definition was adopted which (irrespective of the known differences in resource base, e.g. soil rainfall and irrigation in the selected areas) treated all farms below 2 hectares as small farms. Those between 2 and 6 hectares and above 6 hectares had been treated as medium and large farms, respectively. The classification is said to have been adopted to facilitate all-India comparison (which is hard to find in the whole book, except in Table 6.1). Moreover, in view of the wide differences in soil-climatic conditions and the productivity of land, one does not see much sense in such comparisons. However, the authors of the present volume are not the only people to be blamed for adopting such an approach.

According to the study, farms below 2 hectares constituted 66 per cent of all operational holdings and covered 53 per cent of the area in Udaipur district. (Incidentally, the SFDA now operates in the district.) The corresponding figures for the selected tehsils were 82 per cent and 56 per cent, respectively. As the sample contained only two large farms, the whole study deals with the comparative position of only small and medium-size farms. While presenting the details, the pattern of the Farm Management Studies is broadly followed. The quantitative details presented in more than 80 appendix tables are an important contribution of the study. Gross income per farm and per hectare (in the case of sample farms) was found to be Rs 2,405 and Rs 1,931, respectively. The per-hectare expenditure on small farms was higher (Rs 1,540) compared to

medium farms (Rs 1,273). Farm business income showed an upward trend with increase in size of farm. It was Rs 499 and Rs 623 in the case of small and medium farms, respectively. When comprehensive cost was considered, there was net loss of Rs 226 and Rs 23 per farm in the case of small and medium farms, respectively.

NOT BY LAND ALONE

Of the total 320 sample farms, 43.7 per cent were viable according to the break-even criterion. The proportion of viable farms was 33.2 and 44.7 per cent in the case of small and medium farms, respectively. The vast majority (86 per cent) of the viable small farms had 60 to 100 per cent of their area under irrigation (p 87), which underscores the need to take into account the total resource base rather than only the physical land surface while classifying the farms as big or small. It is also observed that livestock enterprise actually depresses the farm economy and makes only a negative contribution to the viability of farms (p 74) — warning to the protagonists of a "white revolution" through small and marginal farmers.

The study confirms most of the facts revealed by similar studies in other areas. For example, most of the small farms belong to the lower castes; there is high incidence of tenancy (leasing in) in the case of small farms; there is a relatively heavy burden of overhead capital and under-utilisation of owned human and bullock labour on small farms; there is relatively low and slow adoption of new technology by small farmers; development, extension and co-operative agencies have neglected the small farmers; the moneylender-cum-trader is still a strong force in the village economy, etc.

The study concludes with some suggestions for improving the economic conditions of the farms in the district. Most of the remedies suggested are well known, e.g. improvement of irrigation facilities, consolidation of holdings, provision of farm credit, education of farmers and creating awareness among them, etc. What is striking is the authors' complete disregard of the realities of the situation in Rajasthan when they demand more and more activities through Panchayats and co-operatives which have proved a miserable failure in the state.

From Reformist Princes to 'Co-operative Kings'

I — Political Change in Pre-Independence Kolhapur

Donald B Rosenthal

This paper examines how the character of political relationships in Kolhapur state/district has changed during the past century and what the present pattern of political leadership in that district looks like. While the part that social structure has played in these matters is notable, the roles played by particular men and, equally important, the contingent nature of those roles, need to be emphasised.

For, contrary to that school of political analysis which attributes much stability to the past, the political history of Kolhapur embodies the search for additional bases of power, conditioned, no doubt, by the social structures and technological possibilities of an era but significantly independent of them. The result is that those men of ambition who are able and willing to enter into political life can influence the actions of others and direct the course of events of their times, if only on the small stage provided by local political activity.

What should be stressed here is that by 1962 to speak of the bases of political power in Kolhapur district, meant not only to refer to those with formal power in state or local legislative bodies, or to men with a voice in the district party, but also to those most active in the new economic institutions of the district — institutions which drew upon governmental financing organised under the guise of co-operative economic activity. Indeed, so important have the major co-operative institutions become as political arenas in their own right — for they have control of important financial resources which can be manipulated to the advantage of individuals or political groups — that contests for control of bodies like the district board, do not seem to raise as basic or potential a threat to the positions of major political leaders as do challenges to their control of taluka and district co-operative institutions.

Part I examines these political processes upto the merger of Kolhapur state with independent India. Part II deals with the highly personalised style of Kolhapur politics during the period 1947-67. Part III looks at the trends towards routinisation and institutionalisation of Kolhapur politics during the past few years.

MORE than the social science literature sometimes appears to concede, political change is a process owing much to a combination of individual will and political opportunities. While these two dimensions may be conditioned to a considerable extent by forces of a cultural or social structural character, there is still left an area of indeterminacy in political life which allows men of unusual will to seize opportunities and to turn those opportunities in directions which are not readily predictable from preceding circumstances. Studies of political history in India have recognised the role of such men in national political life — men like Gandhi and Nehru — whose exercises of will during particular periods in history turned events in unanticipated directions. Most recent studies of Indian local politics, however, have been so much concerned with the 'determinants' of public behaviour — with the structures on political life imposed by such factors as caste, class,

religion and landowning patterns — that they have tended to overlook the degree to which even at the local level the shape of political life is a function of individual ambition and the availability of political prizes to which men can turn those ambitions.¹ For individual political actors, of course, the 'meaning' of political ambition and the purposes of power may vary considerably. For some, power is an end pursued and accumulated in its own right — a seeking for both the substance and insignia of control over the lives of other men. For others, the attainment of political position may be a means of achieving further ends like wealth or status or preserving those resources which have already been acquired by the individual. For still others, a rarer breed, the accumulation of political power may be a means toward the end of making alterations in the structure of political and social relationships among men.

In the present paper, we shall exa-

mine how the character of political relationships in one district of India has changed in the past century and what the present pattern of political leadership in that district looks like. While we shall note the part that social structure has played in these matters, we shall also be emphasising the roles played by particular men and, equally important, the contingent nature of those roles. For, contrary to the school of political analysis which attributes much stability to the past ('tradition'), we shall argue that as embodied in the political history of Kolhapur, the search for additional bases of power is a constant of Indian history, conditioned, no doubt, by the social structures and technological possibilities of an era but significantly independent of them. The result is that those men of ambition who are able and willing to enter into political life can have an influence on the actions of others and can direct the courses of events of their times if only on the

Shahu and the Non-Brahman Movement

Until India became independent in 1947, Kolhapur was a princely state which operated under British direction.² Created as a separate Maratha state in 1731, Kolhapur experienced a series of short and ineffective reigns after the British established hegemony in 1818. It was the death of a young prince that caused the ruling family to adopt a ten-year old boy of a high-status local family as the heir to the throne in 1884 and it was only in 1894, at the age of twenty, that the youth, who had been given the royal name of Shahu, was actually invested with such limited powers as the position of a maharaja held.

Once he attained his majority, however, Shahu moved on two political fronts: 1) to increase his own political power within the princely realm of Kolhapur; 2) to raise the status of the non-Brahmans (and particularly the Marathas) both in Kolhapur and in western India more generally. It is impossible to assign a priority of motives to Shahu, but part of his achievement lay in linking his own political ambitions to a larger cause with which many persons of both high and middle status wished to associate themselves. Equally important, though we must be careful in attributing motivations where evidence is insufficient, it is interesting that he chose a route for increasing the stature of his *gadi* and his own political standing in the larger Marathi-speaking region that employed the British to his own ends while seeming to conform to British preferences for political order in the subcontinent.

During the period of discontinuity within the Kolhapur ruling house which had preceded Shahu's reign and for a time that followed the start of that reign, the British relied heavily on a small group of Brahman administrators to fill important subordinate posts in the Kolhapur administration. Chitpavan administrators who had figured large in the Poona-based Maratha empire, had followed the British into Kolhapur and assumed a major political role in the kingdom subordinate to the British. By non-Brahman default as much as by Brahman skill in taking advantage of educational and administrative opportunities made avail-

able by the British, Brahmans (including both Chitpavans and others) had gained an influence over Kolhapur public life far out of proportion to their actual representation in the population. For, out of the total population of the state, no more than four per cent were Brahmans and only part of these were the administratively-active Chitpavans. Yet, the Brahmans were by far the most literate group in the population and they dominated the educational, administrative and religious structure of the kingdom.

The non-Brahmans were by no means a unified group at the time, nor were they to become so subsequently. Still, attempts at their consolidation as a political force were to be identified with some of Shahu's most notable activities over the next thirty years. At the top of the non-Brahman hierarchy were the Maratha nobility, perhaps eight per cent of the total population, who (like Shahu) traced their lineages to north Indian Rajput families or to the military and administrative associates of Shivaji. Contrary to views of the 'caste system' that see it frozen in time and space, the boundaries of Maratha status seemed to shift with historical circumstance and political opportunity. The lower boundaries of the group were particularly indistinct, but even for those Marathas of considerable wealth and political power there was a lack of societal agreement about the status to be accorded in matters bearing on religious ritual. Here the role of the Brahmans became crucial because an important function of the Brahmans had always been to legitimate status claims. The Brahmans could and did employ that responsibility as a political resource in denying even to Maratha rulers their status claims as Kshatriyas and granting to them only those inferior rituals consistent with Shudra status. Members of the ruling house had been accorded Brahmanic recognition as Kshatriyas, but Brahman practice sought to restrict the status to narrow a stratum as possible, thus granting to Brahmanic authority effective influence over the legitimation of claimants to political authority. Even Shahu, whose family status was very high within the Kolhapur nobility, found himself subject to the scrutiny of local Brahman priests over his claims to being a 'true' Kshatriya because he was not of the direct male line of the preceding princely family. As we shall see, how-

ever, Shahu did not conform to Brahmanic authority in these matters, thus setting off a chain of events that still reverberates in Kolhapur public life.

While the Marathas were identified at the turn of the century as a small elite group of landlords with claims to high status, the vast body of local Hindu peasants were called Kunbis. The line between Marathas and Kunbis was an indistinct one. What the subsequent non-Brahman movement in Kolhapur and other areas of the Marathi-speaking region did was to erase that line so that today the Maratha 'caste' constitutes over forty per cent of the population of a district such as Kolhapur. While distinctions of noble and 'commoner' familial origins continue to be made *within* the 'caste', such distinctions are of less importance (except for family matters like marriage) than the impact of political life on the consolidation of the former Maratha and Kunbi groups.³

In addition to a variety of smaller artisan and agricultural castes, and an untouchable population of about twelve per cent of the population, Kolhapur was notable for a substantial number of Jains and Lingayats (together forming about ten per cent of the population). These two ancient religious communities had rejected significant elements of Brahman dogma including the peculiar precedence in the social order accorded to the Brahmans to themselves. The Jains and Lingayats, therefore, brought to the public life of Kolhapur an alternative set of values which were available to leaders who might choose to oppose Brahmanic interpretations of appropriate political behaviour. While by no means as educated or as urbanised as the Brahmans, they did include a larger proportion of educated and town-based individuals than did the Maratha-Kunbi configuration.⁴ Within the circle of 'available' non-Brahman elite groups one might also count the tiny community of CKPs numbering about 300 individuals in 1881. A community which claimed a status equal to the Brahmans — a claim which the Brahmans had always stridently rejected — the CKPs were a source of men of talent who were to act as advisers to Shahu and to take an active part in the non-Brahman movement elsewhere in Maharashtra.

As early as 1875, Mahatma Jyotiba Phule had set to work from Poona to build a non-Brahman movement which

would both raise the aspiration levels of the non-Brahmans and undermine the religious and political authority of the Brahmins. However, his organisation, the Satyashodak Samaj (Truth Research Society) languished after Phule's death in 1890. Perhaps it was too radical in its appeals for an end to casteism and an introduction of egalitarian values in public opportunities.

Certainly, Shahu's initial challenges to Brahmanism were of a different and milder nature. Surrounded at first by Brahman advisers, Shahu simply tried to increase the number of Marathas in his immediate service and took a CKP as a senior adviser. His first major steps toward social reforms were in the field of education where during the decade after his succession he encouraged the founding of community hostels for non-Brahmans to live in while attending school in Kolhapur. Royal patronage was extended to hostels not only for Marathas, but for Jains, Lingayats, Harijans, Muslims and other communities. In 1902, however, Shahu took the further step of ordering that quotas be established so that half the posts in the state's service would now be open to the 'backward classes' — essentially all the communities save Brahmins and CKPs. Thus, educational opportunities for the non-Brahmins proved to be the opening wedge for undermining Brahman hegemony in the state's administration.

Open warfare had already erupted between the ruler and the Brahmins on another front when in 1900 an officiating priest refused to perform the full Kshatriya rites for the ruling family because they were not, according to the priest, eligible for rites due to Kshatriyas. This dispute set off a chain of events in which the Brahmins and the Maharaja struggled with each other for religious and political authority. It should be noted that the ruler was not claiming the right of such ceremonies for all Marathas, but only for himself as a 'true' Kshatriya. In questioning the appropriateness of providing the rites to Shahu, however, the Brahmins were also indirectly attempting to deflate his political claims as a direct successor to Shivaji and seeking to downgrade the legitimacy with which he might hope to pursue the non-Brahman reforms on which he had already embarked.

This rather narrow dispute also was entangled in the politics of the early

nationalist movement — a movement which did not gain real ground in the state until the 1940s. Many of the early nationalists in Maharashtra — particularly those associated with B G Tilak — were themselves Brahmins who supported the Brahman side of the conflict with Shahu as a means of affirming the 'traditional' values which their brand of nationalism represented.⁵ The British at different times either adopted a policy of non-interference in these 'parochial' disputes or supported the aspirations of the non-Brahmins, particularly those non-Brahmins like Shahu whose anti-Brahmanism was mixed with continuous verbal expressions of support for the British presence and for British policy in India and elsewhere.⁶

In addition to his activities in education and in encouraging non-Brahman employment in the state service, Shahu also made some efforts to encourage industrial development in his state. A major spinning and weaving mill was started with his help in 1906 and after it ran into difficulty, the state administration took it over and operated it rather successfully. Various co-operative activities were also started by those associated with Shahu's reforms.⁷ (In part, these actions in the co-operative sphere were directed at weakening the power of Brahman moneylenders in the rural areas.) Shahu's efforts at mobilising the economic potential of the state as a possible political resource in fighting the non-Brahman battle and in enhancing his own power in the state were counterbalanced by the achievements of some of his enemies.

Thus, among the feudatory dependencies of Kolhapur state were some minor chiefs whose Brahman ancestors had established permanent claims to local titles and estates through direct grants from the Brahman Peshwas. These feudatories were politically troublesome to Shahu and provided a source of backing (both financial and political) to some of the anti-Shahu activities of the Brahman priesthood. In particular, the Brahman *jagirdar* of Ichalkaranji had long been a source of irritation to the Maratha rulers of Kolhapur and, partly in response to Shahu's economic activities and partly in order to develop his own base, the chief of that feudal holding in the north-eastern section of the state (bordering on what is now the state of Mysore) encouraged the growth of

the weaving industry in his territory, a matter to which we will return later in the paper.

In 1911, the educational reformism of Shahu and his personal war with the Brahman priesthood took a new turn with the formal establishment of a unit of the Satyashodak Samaj, Phule's old organisation, in Kolhapur. The following year, Vedic (Brahmanic) ceremonies began to be performed by non-Brahmins and the goal of a non-Brahman priesthood was confirmed in 1913 when the Maharaja gave a grant to the Satyashodak Samaj to teach non-Brahmins to perform priestly duties. These activities reached their climax in 1920, when after another series of conflicts with the Brahmins, Shahu created a religious *math* for the non-Brahman priesthood headed by a young Maratha then studying at the western-oriented Fergusson College in Poona.

While such religious reforms did not long survive Shahu's death, the excitement created by these religious disputes had a profound impact upon the thinking of a generation coming to maturity in Kolhapur and other nearby areas of western India and provided an important impetus to a more far-reaching non-Brahman movement which was to take shape both in Kolhapur and elsewhere in the region during the 1920s.

In the area of rural economic life, Shahu took various steps in the direction of reform. Perhaps the most important was the abolition of the Kulkarni *watan* in the villages of Kolhapur in 1919. Traditionally, various service functions were performed in the village in return for grants of rights in land or in produce called *watan*. Responsibilities over administration of these grants were vested in village headmen (Patils), but much of the actual administrative work was assigned to the Kulkarnis, village administrative officers. Both positions tended to become hereditary in the village. The Patils, who were usually non-Brahmins, were frequently illiterate; the Kulkarnis, who were generally Brahmins, were often literate, with the common result that effective control of the records and of corollary economic power in the village passed into the hands of the Kulkarnis.⁸ To break Brahman power at the village level, Shahu moved to abolish the Kulkarni *watan* in 1913 and to substitute a group of appointed *talatis* (village record keepers) directly under state administration rather than on a heredi-

tary basis from within the village. Insofar as practicable, Shahu moved to appoint non-Brahmins to such posts, even going so far as to select several 'untouchables' to these highly responsible and economically sensitive positions.⁹ While regarded as a major social and political reform directed toward opening opportunities to a wider segment of society, it should also be recognised that the reform was a way of enhancing the authority of Shahu and the state's central administration as against local chieftains, both Brahman and non-Brahman.

These events took place just as the non-co-operation movement of 1919 — Gandhi's first venture into national political leadership — was getting under way and added to the fuel of conflict between the urbanised Brahman nationalists and the non-Brahman elite which remained loyal to the British raj. During these years, many non-Brahmins in Marathi-speaking sections of Bombay (like the non-Brahmins of Madras)¹⁰ put their intra-regional and inter-caste quarrels above the nationalist cause. Indeed, for a time that cause was associated in many non-Brahman minds with Brahman aspirations to domination over Indian society. Thus, it was with some support from the British that Shahu, particularly in the last years before his death, played an active role in helping to sponsor non-Brahman activities not only in education but in communications (by encouraging the start of anti-Brahman newspapers).

Though Shahu was essentially a conservative reformer — very few actions of his involved any measure of democratisation or other elements of political reform within his own state — the increasing secularisation of political life associated with his latter years and the legitimacy his throne lent to movements for educational and social reform among 'Marathas' (now defined to include not only Kunbis but, by extension, other non-Brahman communities as well) gave rise to a younger generation of political reformers whose political impact was to be felt first outside Kolhapur before it reacted back upon the political life of the state.¹¹ Shahu, it should be noted did sponsor educational societies and social reform activities in his later years, not only in Kolhapur but elsewhere in Bombay. Within Kolhapur, the development of Rajaram college during Shahu's reign

(at a time when higher education was not generally available to non-Brahmins from neighbouring districts) provided educational opportunities to a group of young men who were to have continuing importance for the next fifty years) in the public life of the region. More important they were to spread the atmosphere of reformism elsewhere that they first encountered in Kolhapur.¹²

Rajaram and the Nationalist Movement

If Shahu was an inveterate activist and reformer, his son Rajaram was not. As we have already indicated, Shahu's reforms stopped short of major innovations in political relations. Limited attempts were made to reorganise municipal government in Kolhapur city during Shahu's regime — mainly to improve the representation of non-Brahmins among the membership — but these reforms were minor. Rajaram continued many of the policies his father had introduced but he neither associated himself with the political movements that arose during the period of his reign (1922 to 1940) nor did he move to enhance his personal stature by making his own innovations. The equivalent of a district local board (but functioning as a state assembly in Kolhapur) was created in the 1930s to deal with development matters in the rural areas, but most members were appointed and there was little extension of the principle of responsible government to the state level under the princely regime. As a result of Shahu's reforms, there was a gradual loosening of Brahman influence in the state, but Kolhapur became a political backwater at a time when a non-Brahman movement was taking on more militant overtones in parts of nearby British India¹³ and the nationalist activities of the Congress under Gandhi's leadership was galvanising the attention of some urbanised elements in the population.

Demands for greater political participation began to appear in Kolhapur only in the late 1930s. In 1937, an agitation was organised which among other items demanded a lowering of the land revenue assessed on agricultural land, restrictions on the conversions of farm land by the royal family to private use (for hunting grounds) and a measure of responsible government. The agitation was led by Madhavrao Bagal, a journalist and artist in his

early forties, and Ratnappa Kumbhar, a young (then aged 29) rural-born public worker. Bagal, whose father had been employed in the state service, was a Maratha with a passionate commitment to the iconoclasm of the most militant wing of the Satyashodak Samaj. He expressed his ideas in public with a fiery style that attracted popular attention. Kumbhar, a Lingayat, was a less colourful figure but early gained a reputation as an effective organiser. When the agitation of 1937 became institutionalised in 1939 as the Kolhapur Praja Parishad, Bagal became that organisation's President and Kumbhar its General Secretary. Though Kumbhar, in particular, expressed sympathies toward the nationalist movement, the early Praja Parishad was essentially oriented to Kolhapur public life.

Both of these men, plus others who followed them, came out of those institutions which Shahu had founded to advance non-Brahmins educationally. Kumbhar, the son of a potter and small farmer, had received his BA in 1933 in Kolhapur; Bagal had been sent to Bombay under Shahu's patronage to study art. When they turned against the state government and formed the Praja Parishad in 1939, they were immediately placed in prison and were only released in 1940 in a general amnesty issued by Rajaram on the birth of his only child, a daughter.

A ban continued on their organisation, however, until early 1942 when a meeting of the group was allowed in the state. B G Kher, Congress Chief Minister of Bombay (during the period 1937-39 when the Congress co-operated with the British in running the province) presided at that meeting.¹⁴

Later in the same year, however, the 'Quit India' movement organised by Gandhi kindled a nationalist spirit throughout Bombay and sparked a following in some of the princely states. Nationalists like Kumbhar left Kolhapur and entered British India to work directly against British rule. The Praja Parishad seems to have functioned only fitfully in the state from this period until 1945-46, though it managed to control the Kolhapur municipality in elections held during this period. However, its internal unity was already in danger for Kumbhar clearly placed nationalism ahead of sectional advantage, whereas Bagal's loyalties were more equivocal. While sympathetic to Gandhianism, he placed a higher value on the autonomy of Kolhapur as

a non-Brahman state and more generally, the realisation of higher status for non-Brahmans in Indian society than upon national independence as such.

Still, at the time of Rajaram's death in 1940, the political equation in Kolhapur placed the Praja Parishad on one side and the princely regime on the other. (The Brahmins by then, it should be noted, had largely faded from the scene as a major political force.) The former drew support particularly from the urbanised-middle class (though its leaders had some ties with the rural population) — a class which the princely regime under Shahu had worked to foster. Though Bagal was a Maratha, Kumbhar and a number of others active in the Parishad came from the smaller religious communities or the CKPs. Indeed, the Parishad was organised earliest and most effectively in the more prosperous areas of the state (the north-east) where the Lingayats and Jains are concentrated. These communities had made particular use of the educational opportunities extended by Shahu and Rajaram during their regimes. When nationalist aspirations organised in the Congress by Gandhi began to filter into the Kolhapur area, members of these minorities were especially attracted to the Gandhian cause, possibly because of the mixture of Jain themes and aspirations to egalitarianism found in Gandhian ideology.

In sum, the reforms initiated under Shahu and continued by Rajaram made it difficult for the Praja Parishad to reach over the heads of the rulers to the Maratha and lower-status Hindu rural masses, though the Parishad did reach sections of the Jain and Lingayat communities in the rural areas and some of the urbanised Marathas, particularly in Kolhapur city. At least in the early years of the Parishad the state was unwilling to accommodate the movement and the Parishad was not strong enough to challenge the regime's base. Instead, the regime made use of the more 'established' Maratha class of landowners and non-Brahman government servants to run the administration and to hold the elective posts filled by narrow franchise for the Kolhapur municipality and the Kolhapur state assembly. Rajaram did attempt in 1939 to counter some of the appeal of the Parishad by creating a Rayat Sabha (Peasants Association) to act as an organisational front for the regime and the Sabha went so far as to put forward a few 'demands' which

would have modified governmental arrangements slightly.¹⁵ However, it was not able to set an independent course. The Sabha lasted only about a year and collapsed with the death of Rajaram in 1940.

The Kolhapuri Brand of Nationalism and Indian Independence

Rajaram's death, occurring at a time when there was no male heir to the *gadi*, gave the British an opportunity to choose a child from Nagpur as heir and to impose a regency which lasted until 1946, when the child died. The period of the regency coincided with the war and permitted the British Resident a certain freedom of action in associating the state with the war effort at a time when the Congress was opposing that effort in British India — Little substantial change occurred in domestic politics in Kolhapur during this period.¹⁶

Upon the death of the child heir to the throne, a dispute developed over the succession. The man finally recognised by the British, Shahji, was the son of Rajaram's sister and ruler of the small state of Dewas Senior,¹⁷ but his choice was intensely disliked by many members of the Kolhapuri elite including Rajaram's widows.¹⁸ They, however, finally agreed to his succession, allegedly with the understanding that the eventual succession to Shahji would allow some recognition of the interests of Rajaram's daughter, Padmaraje, particularly if she had a son. While this dynastic dispute was essentially conducted within the nobility, events by 1967 as we shall later see, were to make it a matter of concern to the public of Kolhapur and to the political leadership of the state of Maharashtra. In 1946, the choice of Shahji was apparently not a popular one. At the same time, there was much sympathy for Padmaraje, the young daughter of the late Rajaram and through her for the preservation of the revered Shahu's direct line.

The fact that the new ruler was neither popular among the Maratha nobility attached to the court nor among the masses, made the task of organising demands for popular participation in government easier. Bagal and his co-workers were able to come forward in 1946 to solidify a wider following for the Parishad, especially among Marathas in the city of Kolhapur. He received support in this endeavour from leaders of the non-Brahman movement in Bombay like

Keshavrao Jedhe and Shankarrao More, who shared many of his anti-Brahman sentiments. Kumbhar, who did not return to Kolhapur politics until 1947, thus found himself in a somewhat weakened position within the Parishad as jockeying for leadership of that body occurred.¹⁹

As we noted earlier, there were already tensions between Bagal and Kumbhar by 1942 as Kumbhar chose to follow more nationalistic commitments outside Kolhapur while Bagal's commitments were within the district and to a politics which gave priority to righting the injustices done to the non-Brahmans in the past. Left to their own devices, these leaders might have followed a number of different courses, but by early 1947 they had become participants in a series of political conflicts which extended both their activities and the political life of the state into regional and national politics.

At first glance, it might be appropriate to simply link Kumbhar with the generation of all-India nationalists who directed the Indian National Congress under Gandhi. In many respects, this is a correct assessment of the situation. However, it is notable that at the top leadership level, men like Gandhi and, particularly, Vallabhbhai Patel were Gujaratis who represented certain economic and regional interests in politics of western India. Within Bombay state in particular Patel's political following was strongest in Gujarat and in Bombay city among the business classes. It was less secure in the Marathi-speaking region. Within Maharashtra, furthermore, divisions existed between Brahman political activists who dominated the state party organisation until the late 1930s and the non-Brahmans led by men like Jedhe and More who demanded a more effective voice in the Congress. Thus, when Kumbhar associated himself with the nationalist-Gujarati wing of the Congress and Bagal aligned himself with the Maharashtrian non-Brahman section of the organisation, they were following courses of action which both conformed to conceptions of where they felt the interests of Kolhapur lay and where their own chances for personal political advantage were likely to be greater.

Into this emerging rivalry, Shahji threw a tactical bone. After forming a first ministry which had little public support, he sought in late 1947 to construct a second body of ministers which would be better able to rally public backing for a policy of state

autonomy — a policy which would be of greatest advantage to himself and also, possibly, to the state in coping with the consequences of Indian independence.²⁰ It is alleged that he hoped to fend off merger of the state into what had been British India for time by gaining the backing of a 'arishad ministry.²¹ In the original understanding about the ministry, Bagal was to be Prime Minister of the state and Kumbhar was to hold a major portfolio. However, Kumbhar demanded the post of Home Minister in the new Cabinet, which was expected normally to go to the Prime Minister. The two leaders of the Parishad split on this issue and rather than concede to each other or compromise, neither man entered the ministry. Instead, Vasantrao Bagal — Madhavrao's brother and a lawyer who had been a rather mild supporter of the Parishad²² — assumed the Prime Minister's post. The new ministry was a mixed bag. It included several who were loyal to Shahji or to no single group as well as a few representatives from the Parishad.

A series of events in 1947-48, none of which were the result of causes internal to Kolhapur, further exacerbated relations between Bagal and Kumbhar with results that were to affect district politics in Kolhapur for the next twenty years. Three of these events are particularly notable: continuing conflict over the merger issue; the assassination of Gandhi and its consequences; and the creation of the Peasants and Workers Party (PWP) in Maharashtra.

Although negotiations over the merger of Kolhapur into Bombay state began even before independence, Shahji temporised about the merger of his state. Pressures from the Kumbhar section of the Parishad in favour of the merger worked in the direction being sought by the national government, and particularly, by Patel, the Central Home Minister. On the other hand, as national independence approached and was realised, Bagal evidenced increasing reluctance to take Kolhapur into a Bombay state which he feared would be dominated by Bombay city and Gujarati economic and political interests. This was evident in early 1948, when Bagal's followers held a special meeting of the Parishad at which a resolution was passed stating that they wanted merger with a separate Marathi-speaking state of Maharashtra but not with the Bombay state

that existed. Until Maharashtra was created, these followers of Bagal called for the retention of Kolhapur's distinctiveness as a political unit. (Though it may now be too long after the fact to be trustworthy, Kumbhar's supporters claim that his demand for the Kolhapur Home Ministry in 1947 reflected his desire to prevent Bagal from obstructing the efforts of the notional government to effect a rapid merger of Kolhapur into Bombay.) Something of the character of this dispute can be seen in Bagal's attacks on Kumbhar and his close associate, M C Shresthi, at the time. Bagal was quoted in a local newspaper as having said that Kumbhar "could not get power in the [Kolhapur] state or state assembly and hence he is trying hard for the merger of Kolhapur state. If he or his community man [Shresthi] would have gotten some powers he would not have started an agitation for the merger of Kolhapur state. He is communal minded. Jains and Lingayats hate the masses."²³ This statement was followed a month later by a resolution opposing merger passed by the Praja Parishad under Bagal's direction.²⁴

With the assassination of Gandhi, as in other parts of western Maharashtra, there was arson and looting on a large scale directed against Brahmins. While Vasantrao Bagal and many leading Maratha politicians in Kolhapur, were not directly implicated, Madhavrao Bagal and some outspoken non-Brahman figures in Kolhapur were imprisoned. They were later released and formal charges were never brought,²⁵ but the riots provided the Central government with an opportunity to abolish the prince's ministry and to impose direct rule over the state from the Centre.²⁶ It was during this interim period that the measures toward full integration of the state into Bombay were completed.²⁷ The series of steps taken up to the merger and particularly the sweeping manner in which the arrests were carried out left a bitterness in Kolhapur that has lingered on long after, especially among Maratha political activists in the city.

The 1947-48 period witnessed the attempts of Vallabhbhai Patel's forces within the Congress to gain control over the party organisation at the national and state levels. Resistance in Maharashtra to this effort at dominance by the leaders associated with Patel in Bombay state came from non-Brahman leaders like Jedhe and More, who had organised a Peasants

and Workers League within the Congress by 1947. When, in 1948, the national party promulgated a new constitution which called for an end to all autonomous "parties" within the Congress (a move aimed nationally against the Nehru-inclined Socialists),²⁸ Jedhe's League also came in for criticism. Rather than abolish that League, More and Jedhe withdrew from the Congress and formed their own Peasants and Workers Party (PWP) in Maharashtra — a party which took on some of the colouration of the earlier non-Brahman movement in the region. In Kolhapur they received the backing of Bagal and his supporters.²⁹

Bagal's affinity for the PWP cleared the way for Kumbhar to become the chief leader of the Congress organisation in the district, though a Congress organisation would have to be built from the ground up. His personal friendships with Patel and Kher, who had again emerged as Chief Minister of Bombay, made his task of gaining Bombay state government recognition for his activities all the easier. As a result, upon formal merger of Kolhapur into Bombay in early 1949 and its conversion into a district, a District Congress Committee (DCC) was established and Kumbhar became president of that body as well as a member of the All-India Congress Committee (AICC). Since Kolhapur had not been part of India when the national and provincial elections preparing the way for independence were held in 1946, the national government had to nominate members of the Constituent Assembly (which doubled as a provisional parliament) and in January 1950 Kumbhar was designated a member of that body. It is also contended that he had a major voice in the selection of other members of parliament and members of the Bombay legislative assembly. Among the latter was Shresthi, Kumbhar's close associate.³⁰

For the non-Brahman movement more generally, see the forthcoming dissertation by Gail Omvedt, Department of Sociology, University of California at Berkeley, and various papers privately circulated by her.
- 3 The Bombay Government's *Gazetteer* for the 1880s expresses the lack of distinction in the following terms, "some families perhaps have an unusually large strain of northern or Rajput blood, but as a class Marathas cannot be distinguished from Marathi-speaking Deccan Kunbis with whom all eat and the poorer intermarry" (p 65), and again, "Kunbis are socially lower than Marathas. But a well-to-do Kunbi classes himself a Maratha and poor Marathas freely and openly marry with rich Kunbis" (p 89), *Gazetteer of Bombay*, XXIV: *Kolhapur* Government Central Press, Bombay, 1886.
- 4 According to the 1881 census, nearly 80 per cent of Brahman males were literate as compared to less than 11 per cent of the Jains and Lingayats and less than nine per cent of the other non-Brahman communities. Mudaliar, *op cit*, p 11.
- 5 The Moderates led by G K Gokhale, who had been born in Kolhapur, did evince a greater sympathy for the attempts of Shahu to raise the social position of the non-Brahmans than did Tilak's Extremists, who supported Shahu's opponents.
- 6 Thus, one scholar argues that the Government of Bombay encouraged Shahu's anti-Brahman movement as part of its "anti-sedition" campaign directed against the largely Brahman nationalists in the first two decades of the century. Personal communication, I F S Copland, July 18, 1972. A Kolhapur informant insists however that the extent of Shahu's support to the nationalist movement has not been adequately researched.
- 7 One of Shahu's associates founded a Weavers Co-operative Society in 1906 and an urban co-operative bank in 1911. Mudaliar, *op cit*, p 28.
- 8 Latthe, *op cit*, pp 508-11.
- 9 *Ibid*, p 499. In the last years of his life, Shahu gave considerable encouragement to B R Ambedkar in organising the untouchable community in Maharashtra.
- 10 For the non-Brahman movement in Madras during the same period, see Eugene F Irschick, "Politics and Social Conflict in South India:

- The Non-Brahmin Movement and Tamil Separatism 1916-1929", University of California Press, Berkeley and Los Angeles, 1969.
- 11 See, for example, Gail Omvedt, "The Non-Brahman Challenge in Poona: 1922-26", mimeo.
- 12 Bhaurao Patil, one of the first residents of the Jain hostel supported by Shahu, went on to become the founder of an educational society (the Rayat Shikshan Saunstha) which today operates hundreds of educational institutions in Western Maharashtra. That society has played a key role in raising the educational level of rural non-Brahmans. Political leaders like Y B Chavan, Balasaheb Desai, Yeshwantrao Mohite and other non-Kolhapur-born figures prominent today in the politics of Maharashtra were educated in Kolhapur while it was a centre for non-Brahman education in the region.
- 13 Gail Omvedt, "Non-Brahmans and Communists in Bombay," paper presented to the Maharashtra Studies Conference, Philadelphia, May 5-7, 1972 and published in *Economic and Political Weekly*, April 21 and 28, 1973.
- 14 The Indian National Congress at Gandhi's insistence discouraged the organisation of units of the party in the princely states. Instead, it chose to focus its attention on the British as the principle opposition to the nationalist movement. Informally, however, Congress, leaders from British India maintained contacts with groups inside the princely states and gave encouragement to those elements sympathetic to the Congress. In that connection, see Richard Sisson, "The Congress Party in Rajasthan" University of California Press, Berkeley and Los Angeles, 1972. During World War II, prominent Maratha leaders associated with the princely regime in Kolhapur tended to back the war effort as an opportunity to demonstrate the continuing loyalty of the Marathas — as a "martial race" — to the British.
- 15 Among its requests were an end to nominated members in the state assembly and in the Kolhapur municipality. A suggestion was also made that greater resources be invested in co-operative institutions by the Kolhapur government.
- 16 The Kolhapur municipal election of 1944 resulted in a Parishad victory that made Bagal president of that body. He resigned in August, 1946, in a dispute over the authority of the presidency.
- 17 For a picture of Shahji as a youth, see E M Forster, "The Hill of Devi".
- 18 Rajaram had two wives: Tarabai, the mother of Padmaraje, and Vijyamala, the younger wife. Tarabai acted as regent during the period of the adopted male heir.
- 19 The reasons for Kumbhar's late return to public view unclear, but

there was a price on his head as late as May, 1946 *Pudhari* (Kolhapur), May 1, 1946. He may also have been implicated in the well-known Jejuri temple incident in which certain nationalists seized treasures from a temple on behalf of their cause.

- 20 The first ministry lasted from about June, 1947 to November of the same year. The second was formed in late 1947.
- 21 Shahji's reluctance to merge Kolhapur into India is indicated in V P Menon, "The Story of the Integration of the Indian States, Orient Longmans, Bombay, 1956, pp 199-200.
- 22 Vasantrao had served as President of the Kolhapur municipality in 1941.
- 23 *Pudhari*, January 1, 1948.
- 24 *Pudhari*, February 28, 1948, reports that leaders of a Maratha caste organisation in Kolhapur called on the Marathas not to favour the merger of the state into Bombay and to back the Praja Parishad.
- 25 The reasons for holding Bagal and some of his co-workers in preventive detention have never been disclosed. They deny any complicity in anti-Brahman violence.
- 26 Central rule was declared on March 19, 1948. A few days later, the Administrator appointed by the Central government banned all *taalim sanghs* (wrestlers associations) from operating because they were seen as "dangerous to the peace" of Kolhapur. It is widely intimated that the *taalim sanghs*, with which a number of leading non-Brahman politicians were associated, were particularly active in the anti-Brahman violence.
- 27 Merger was announced on February 1, 1949 and further steps towards that end were taken on March 1. The state did not become a district unit till August of the same year, however.
- 28 Myron Weiner, "Party Politics in India", Princeton University Press, Princeton, 1957, pp 52-58.
- 29 After the government's announcement of the merger, Bagal backed the entry of his followers in the Praja Parishad into the PWP. In the same statement, he called upon his supporters to work for Samyukta Maharashtra. *Pudhari*, February 20, 1949.
- 30 In addition to being nominated as MLA, Shresti served on the nominated district local board, which acted as a local government for the rural part of the district. There were forty nominated members on that body which replaced the Kolhapur assembly. The Central Administrator appointed until conversion of state into a district of Bombay served as Chairman and Shresti as "non-official" President of the local board. *Pudhari*, July 30, 1949.

Political Economy of Indian Agriculture

What Is It All About?

Ranjit Sau

Recently there was a seminar in Calcutta on the political economy of Indian agriculture. This note is not a report on it; nor is it an appraisal thereof either. This note only presents the author's personal views and understanding on the scope and method of the political economy of Indian agriculture, activated as they were by the Calcutta seminar and crystallised in course of subsequent reflections.

All science would be superfluous if the outward appearance and the essence of things directly coincided.

Karl Marx

I

The Setting

VIEWED in the perspective of stagnation in the preceding half a century the performance of Indian agriculture, since the fifties, has been quite appreciable in terms of production. The official euphoria, jolted now and then though, culminated in the conclusion that just give only more inputs like fertiliser, insecticides, high-yielding variety seeds, and Indian agriculture would turn the corner. The pleasant corollary that inevitably followed from it was that the *status quo* in agrarian relations need not be much disturbed even in the wake of increasing demand for foodgrains due to industrialisation. The jump from the two-and-a-half per cent to five per cent growth rate is a matter of technology alone, supported meanwhile by a mixture of PL 480 and radical slogan-mongering.

Since the morrow of independence the feudal landlords and rich peasantry have been a powerful force. Whatever they have given, under pressure, as a concession for their own survival, they have got back many times over in other forms. In the fifties they gleefully bowed to Otto Schiller; in the sixties they have gladly prostrated at the feet of Theodore Schultz and Norman Borlaug.

Farm management surveys in the meantime threw up enough cud for economists to chew. Is the output per acre inversely related to farm size? If so, why? If not, why? What about the input per acre *vis-a-vis* farm size? Production functions galore are fitted to discover the returns to scale, to prescribe the ideal farm size, to sermonise on the input mix. In the din and bustle of regression coefficients, standard errors and correlation coefficients, economists did not hear the rumblings down below. Workers and

peasants, to them, were mere dim shadows from the far-away land, or just simple numbers for arithmetic exercise. Occasionally their per capita incomes had to be computed, but only to be fed into the regression equation.

Telangana, Kakdwip were too remote for the professor of economics — too isolated and incidental, too far from the ivory tower. The battle of the ballots was much nearer his heart, much more elegant, sophisticated and amenable to fancy analysis. In those days revolution seemed as far off as the von Neumann ray. But Srikakulam, Naxalbari are an entirely different matter: the professor stopped in the middle of deriving asymptotic properties of the von Neumann turnpike. Or, if he was performing the Chow test or inverting the Leontief matrix he said good-bye to it and got down to listen what was happening outside. Not sure what he was looking at, not able to understand what it was all about, not yet capable of disentangling the mass of phenomena to discover the essence of the situation, the professor was bewildered; but his zeal for knowing the world certainly surpassed his transient incapacity, and that zeal in turn was excelled by his desire to see the world change, change for the better.

Across the range of mountains in the north, in the vast sweep of another subcontinent a profound experiment, a historic transformation, is taking place. At this very moment, when the Indian peasant is pitifully trudging along behind a lonely furrow, millions of his like on the other side of the mountains, mightily united as one man, are taming the river, blossoming the desert. How can the Indian economist at this epic moment go on computing the marginal productivity of bullock labour, or of cow-dung! Cow-dung may be sacred, but its marginal productivity is no longer that much interesting!

Here, however, is a trap which the economist, well versed as he is in the

correspondence principle and comparative static analysis, is likely to fall into unless he is sufficiently alert. The two sides of the mountain are not simply two alternative steady-state equilibria, to be romantically compared, passionately evaluated, and wishfully chosen from. The transition from the one to the other is a historic process; and history does not repeat itself mechanically.

II

Political Economy

Political economy in the widest sense is the science of the laws governing the production and exchange of the material means of subsistence in human society.¹ The conditions under which men produce and exchange vary from country to country, and within each country again from generation to generation. Political economy therefore, cannot be the same for all countries and for all historical epochs; it is essentially a *historical* science. It deals with material which is historical, that is, constantly changing; it must first investigate the special laws of each individual stage in the evolution of production and exchange, and only when it has completed this investigation will it be able to establish the few quite general laws which hold good for production and exchange in general. The mode of production and exchange in a definite historical society, and the historical conditions which have given birth to this society, determine the mode of distribution of its products. Indeed, the laws which are valid for definite modes of production and forms of exchange hold good for all historical periods in which these modes of production and forms of exchange prevail.²

Political economy came into being as a natural result of the expansion of trade; at its birth it was a science of enrichment growing out of the merchants' envy and greed. Political economy in the days of mercantilism concerned itself with the art of ensuring

that at the end of each year exports should show a favourable balance over imports; and for the sake of this ridiculous illusion thousands of men have been slaughtered.³

The eighteenth century, the century of revolution, also revolutionised economics. But it was only half a revolution in that the eighteenth century political economy did not question the validity of private property; it only unfolded the laws of private property. The system of free trade based on Adam Smith's "Wealth of Nations" was of course an advance, and a necessary advance at that. It was necessary to overthrow the mercantile system with its monopolies and hindrances to trades, so that the true consequences of private property could come to light. It was necessary for all these petty, local and national considerations to recede into the background.⁴ It was necessary to purge economic relations of feudal taints in order to increase the productive forces and to give a new upsurge to industry and commerce. Economists like Smith and Ricardo had no other mission than that of showing how wealth is acquired in bourgeois production relations. Poverty is in their eyes merely the pang which accompanies every childbirth, in nature as in industry.⁵

Ricardo consciously makes the antagonism of class-interests, of wages and profits, of profits and rent, the starting point of his investigations, naively taking this antagonism for a social law of Nature. But by this start the science of bourgeois political economy had reached the limits beyond which it could not pass. Already in the lifetime of Ricardo, it was met by criticism in the person of Sismondi.⁶

The continental revolution of 1848-49 also left its impression on bourgeois political economy. With the claims of the proletariat no longer to be ignored, economists tried to harmonise the interests of capital and labour. Hence a shallow syncretism, of which John Stuart Mill is the best representative, noted for his attempt to reconcile irreconcilables.

Now comes Marx with the critique of the bourgeois political economy, a critical analysis of capitalist production, and in the process he lays the foundation of the Marxian political economy. Lenin advances the Marxian political economy further, by extending it to the era of imperialism and proletarian revolution.

Meanwhile, bourgeois political economy has got a shot in the arm, by the contribution of Keynes; it has got a fresh lease of life and has become

all the more retrograde, under the title of neoclassical economics. When imperialism is perpetrating its most savage attack on humanity in various parts of the world, it defies even simplest common sense how neoclassical economics could impute rationality, efficiency and optimality to the capitalist system. How can it gloss over the glaring contradictions of capitalism and live in the mystic world of perfect competition with consumer's sovereignty and the harmonious honeymoon of capital and labour, of the metropolis and the colonies and neo-colonies, of the exploiter and the exploited?

The professor of economics who is now groping towards Marxist-Leninist political economy has been typically a slave of neoclassical economics so long. The recent events in India and around the world have suddenly flashed in his eyes with all the dynamic impact of the apple which fell at the feet of Newton.

III

Method of Political Economy

Before Karl Marx, the method in political economy, as in every other science, was essentially metaphysical. Metaphysics looks upon phenomena as immutable and disconnected, as moving only under the action of external forces. It investigates only the most striking properties of an object and considers its different aspects either separately or in superficial, accidental connection.

Bourgeois economists express the relations of production, the division of labour, credit, money, etc., as fixed, immutable, eternal categories. They explain how production takes place in the above-mentioned relations, but what they do not explain is how these relations themselves are produced, that is, the historical movement which gave them birth.⁸ They investigate haphazardly selected facts and events, and then attempt to formulate laws of economic theory on the basis of such particular facts chosen at random from the universe of facts. For instance, production, as distinct from distribution, etc., is presented as governed by eternal laws which are independent of history.⁹ But facts cannot be artificially co-ordinated if their real, essential connections are ignored or distorted. As Marx says, "crass empiricism turns into false metaphysics, scholasticism, which toils painfully to deduce undeniable empirical phenomena by simple formal abstraction directly from the general law, or to show by cunning argument that they are in accordance with that law."¹⁰

A further example of crass empiricism and false metaphysics is the at-

tempt in neoclassical economics to deduce the theory of distribution according to marginal productivity from the statistically estimated Cobb-Douglas production function, no matter how high is the correlation coefficient.

As Engels defines it, the task of economic science is rather to show that the social abuses which have been developing are necessary consequences of the existing mode of production and at the same time also indications of its approaching dissolutions; and to reveal, within the already dissolving economic form of motion, the elements of the future new organisation of production and exchange which will put an end to these abuses.¹¹ And the only scientific method for this Marxist-Leninist political economy is the method of materialist dialectics. It is the direct opposite of Hegel's method even though it is based on a critical adaptation of it.¹²

The dialectical materialist method in political economy, as in every other science, consists of the doctrine of the unity and struggle of opposites. The splitting of a single whole and the cognition of its contradictory parts is the essence (one of the 'essentials', one of the principal, if not the principal, characteristics or features) of dialectics, observes Lenin. The condition for the knowledge of all processes of the world in their self-movement, in their spontaneous development, in their real life, is the knowledge of them as a unity of opposites. Development is the struggle of opposites.¹³

The production relations of every society form a whole; it is metaphysical to consider a subset of them in isolation from the whole. Economic categories are only the theoretical expressions, the abstractions of the social relations of production. These categories are as little eternal as the relations they express. They are historical and transitory products. Social relations are closely bound up with productive forces. In acquiring new productive forces men change their mode of production; and in changing their mode of production, in changing the way of earning their living, they change all their social relations. The same men who establish their social relations in conformity with their material productivity, produce also principles, ideas and categories, in conformity with their social relations.¹⁴

It is thus understandable why England in the eighteenth and nineteenth centuries with the emergence and development of capitalism produced the protagonists of bourgeois political economy, Smith, Ricardo and

Mill; why in the early nineteenth century the German professors, submerged as they were in the waters of feudalism, found it difficult to grasp the bourgeois political economy imported from England, and finally why today the Indian economists coming as they do from the upper middle class relish the delusions of neoclassical economics.

IV

Indian Agriculture

First of all, it is somewhat artificial to divide the economy into two sectors like agriculture and industry; and it is definitely illogical to treat agriculture in isolation from the totality of the productive sphere of the economy. However, the form of manifestation of the mode of production being different in agriculture as compared to industry it is admissible to focus attention on agriculture alone, of course keeping in full view the entire perspective. The process of development of agricultural capitalism, for example, is historically triggered off and reinforced by developments in industry.

One of the basic tasks of the Marxist-Leninist political economy of Indian agriculture is to identify and analyse the contradictions inherent in the development of agriculture in India. The contradictions are to be understood in the Marxian dialectical sense, as opposed to the metaphysical sense of Proudhon in the form of mere 'good side' and 'bad side', 'advantages' and 'drawbacks'.

The economic categories have to be scientifically defined, not just copied from the scriptures, for the categories themselves are historical and transitory products. The extent of capitalist development in Indian agriculture and its prospects in future are important questions in the context of class struggle. In order to analyse these questions the categories of wage-labour, commodity production, and so on, have to be carefully formulated. It is interesting to note that agricultural capitalism in recent times has advanced more in north-west India where the incidence of wage-labour was initially much lower rather than in the north-east where its incidence was relatively high. Furthermore, the so-called new agricultural technology with high-yielding varieties of seeds, etc., involves extensive use of machinery in agriculture which in turn generates a higher form of capitalist production relations. But on the other hand, in view of the requirements of labour at critical points, the farmers with the new technology prefer to use attached

labourers, or permanent labourers, rather than casual labourers. They even go to the extent of giving some land to the workers to keep them tied. Such phenomena may tend to give the impression of resurgence of semi-feudalism; but it would be too stereotyped an understanding of the situation.

The professor of economics would again fall prey to his neoclassical hangover, if he just compares the respective rates of profit of moneylending, of self-cultivation of land, and of leasing out of land; and then concludes that the owner of land would prefer self-cultivation should the rate of profit be highest in it. For these are not three, mutually exclusive, competitive, activities. The semi-feudal landlord may find it profitable for him to wield all the three modes of exploitation simultaneously, to the utter dismay of the neoclassical theory of marginal productivity of investment.

The poverty and exploitation of the masses of agricultural labourers and small cultivators may strike a chord of moral indignation at the heart of the professor. But it is only petty-bourgeois humanitarianism and philanthropy to sympathise and weep over it, not unknown since the days of Saint-Simon, Fourier, Owen and Proudhon. It is the task of the Marxist-Leninist political economy to show that the social abuses which have recently been developing are necessary consequences of the existing mode of production, but at the same time also indications of its approaching dissolution; and to reveal, within the already dissolving economic form of motion, the elements of the future new organisation of production and exchange which will put an end to those abuses.

With the differences in distribution, class differences emerge. Society divides into classes: the privileged and the dispossessed, the exploiters and the exploited, the rulers and the ruled; and the state from this stage onwards acquires the function of maintaining by force the conditions of existence and domination of the ruling class against the subject class.¹⁵ The Marxist-Leninist political economy of Indian agriculture therefore has to be concerned with the class relations in the country, and with the exercise of the machinery of state to protect, safeguard and promote the interests of the ruling classes in the shape of the terms of trade between industry and agriculture, between regions, between crops, and also in various other forms.

In the ultimate analysis class relations determine the direction and momentum of economic growth;

hence the alignment of classes and their interactions must be a core topic of the Marxist-Leninist political economy of Indian agriculture. As Lenin once said: the primary object of any study of the agrarian question is to establish the basic data for characterising the class substance of agrarian relations.

Now we come to the question of the place of such tools of analysis as mathematics and statistics in Marxist-Leninist political economy. Until the very recent past the use of mathematics in economics was considered by Marxian economists as a major concession, if not a surrender, to the bourgeois methodology. Kantarovitch's work on linear programming, for instance, had a difficult time getting recognition in the Soviet Union. The fundamental question really is whether mathematical abstractions are scientific abstractions. Scientific thinking, indeed, is "the process of a series of abstractions, the formation and development of concepts, laws, etc.". "Man cannot comprehend, reflect, mirror nature, as a whole, in its completeness, its 'immediate totality'; he can only eternally come closer to this, creating abstractions, concepts, laws, a scientific picture of the world."¹⁶

Evidently, for the sake of convenience, mathematical models indulge in abstractions which completely divorce them from reality. While scientific abstractions are a means of getting at the essence of an object, occasionally the abstractions of a mathematical model in effect lead to just the opposite. Such abstractions, such use of mathematics, is non-dialectical and hence inadvisable. But this should not be taken to imply that the very use of mathematics in economic analysis is always tantamount to a retreat to bourgeois economics; or more specifically, that the use of different calculus invariably means the acceptance of marginalism and neoclassical economics with all its ramifications. One must guard against such orthodox dogmatism.

The use of statistical inference in economic analysis belongs to a different group. The main danger with it is that it can quickly degenerate into crass empiricism, or what may be called correlation fetishism. Hegel warned against manipulations of facts for 'explanation' of theoretical propositions. He wrote in his "Science of Logic" that such 'adjustment' serves only "to disguise the trick of Cognition, which take up the data of experience one-sidedly (the only manner in which it could reach its simple definitions and formulas), and does away with refuta-

tion from experience by proposing and taking as valid experience not in its concrete totality but as an example, and only in that direction which is serviceable for the hypothesis and theory. Concrete experience being thus subordinated to the presupposed determination, the foundation of the theory is obscured, and is exhibited only from that side which is in conformity with the theory".

But, then, any tool of analysis can be misused; and powerful tools like mathematics and statistics can be equally powerfully misused. On the other hand, there is no analytical method which can never fail at the band of a crank or a crook.

By the same token one can argue that even though the premises and method of bourgeois political economy, classical as well as neoclassical, are metaphysical and hence reactionary all its tools of analysis are not *ipso facto* rendered unredeemable. Two examples may be cited in this connection: one, the production function and the other, the hypothesis of utility maximisation as such. Let us elaborate.

True, production function has been used as a particularly mischievous concept in neoclassical economics. There are instances where its abuse has reached the height of stupidity and notoriety.¹⁷ Nevertheless this function does not constitute the kernel of reaction in neoclassical economics. The existence of an aggregate production function, the degree of substitutability among the inputs, etc, have been questioned even by the staunchest defenders of neoclassical economics themselves. The bourgeois political economy would not be affected substantially even if the input coefficients are given to be fixed. The crux of the issue lies somewhere else, in its metaphysical view of society. Conversely, the admission of an aggregate production function with factor substitutability need not necessarily rob the Marxist-Leninist political economy of its scientific character, provided the method of analysis is materialist dialectical as it should be. The fact, however, remains that I am yet to see a Marxist-Leninist economic analysis relying explicitly on a production function as a purely, but compactly, descriptive device of technological possibilities, and shorn of its reactionary connotations.

Lastly, the hypothesis of utility maximisation *per se*. Yes, by association as well as intention, the school of marginal utility analysis has been in fact guilty of the crime of trying to impute rationality, efficiency and opti-

mality to the capitalist system while actually it possesses none. The consumer's sovereignty under capitalism is a notorious hypothesis in the face of reality where the capitalist system itself determines the taste, preferences and attitudes of the consumer. The Arrow-Debreu-Walras general equilibrium, premised as it is on utility-maximising consumers, is a futile attempt to invent harmony, and to overlook class contradictions under capitalism. Furthermore, the theory of demographic differentiation as developed by Chayanov¹⁸ with the calculus of utility maximisation by the peasant fails in its attempt to contradict the Marxist-Leninist theory of class differentiation among the peasantry. Elsewhere I have shown that Chayanov's theories of rent, interest and capital accumulation in a peasant farm are wrong, even granted his basic postulates.¹⁹

Still one wonders why a Marxist-Leninist analysis cannot have a premise of utility maximisation in certain specific cases. The disintegration of the middle peasantry into the ranks of capitalist farmers or proletariat under the impact of agricultural capitalism is an integral part of the Marxist-Leninist theory of peasant behaviour. Besides, the role of the middle peasantry in peasant rebellion and revolution in countries like India is a problem of paramount importance. In any case, if it is possible to analyse the process of disintegration of the middle peasantry under the hypothesis that a middle peasant tries as if to maximise the utility of his income balancing against it the disutility of his labour, over and above a minimum, subsistence income, there is no reason why this approach should be ruled out *a priori*. Obviously, such an analysis neither condones capitalism nor commits itself even unwittingly to the myth of consumer's sovereignty in a capitalist system. Nor does it follow the footsteps of Chayanov. Besides, its method appears to be fully materialist dialectical. It is also consistent with the spirit of what Baran and Sweezy say: "Taking from the bourgeois science everything that can be useful to the construction of a new society, it [the Marxist-Leninist political economy] must combat everything that is being used for the preservation of the old. As a variant of Marx's last thesis on Feuerbach might state: At the present time science is creating the conditions for changing the world; what matters, however, is the nature of the change for which it is used."²⁰

I need not even invoke here the

Leninist principle of modesty and self-criticism to simply say that this note is intended only to pose the relevant questions squarely; by no means does it aspire to say the last word on the subject. Cognition is an infinite process; and its trajectory is not always monotonic.

FROM THE CHAIR

Chairman, Mr R G S Nairn's Review

The following is the address by the Chairman, Mr R G S Nairn, at the 47th Annual General Meeting held on May 14, 1973, at Calcutta.

I have pleasure in welcoming you to the 47th Annual General Meeting of the Company.

As the Director's Report and Accounts for the year ended 31st December, 1972, have been in your hands for some time, I should like, with your permission, to take them as read.

THE YEAR'S TRADING

Sales of Dunlop automotive tyres and tubes were lower than in 1971 because of serious production losses suffered at the Ambattur factory due to industrial unrest. This intensified the shortage of truck tyres in particular and a major part of our marketing effort during 1972 was directed at ensuring equitable distribution. Special steps had to be taken to ensure essential supplies for Defence and State Transport undertakings.

Sales of our Industrial Products exceeded those in the previous year, but the demand/supply gap in some products, particularly conveyor belting, widened further due to limitations in our manufacturing capacity.

EXPORTS

The bulk of our export earnings come from nylon truck tyres manufactured at our Ambattur factory. Special cycle tyres for the USA market are also manufactured at Ambattur. Extraordinary efforts had to be made on the export front to make up for the production losses at Ambattur. I am, therefore, particularly glad to inform you that we continued to be the largest exporter in the Tyre Industry in 1972 earning a total of Rs 3.22 crores. I feel I should mention here that this export achievement would not have been possible without the unstinting help we continued to receive from our associates in the UK through whom we enjoy the benefits of their world-wide organisation.

Our increasing expertise in international marketing also enabled us, as an Export House, to export a variety of goods made by small-scale manufacturers.

PRODUCTION

Production of automotive tyres and tubes at our Sahaganj factory in 1972 was marginally higher than in 1971 but the problems of power cuts and absenteeism continued.

At our Ambattur factory, we experienced production losses due to lock-outs on two occasions resulting from industrial unrest. A total of 84 working days were lost during the year.

Production of our Industrial Products at our Sahaganj factory was satisfactory.

PERSONNEL

At the Sahaganj factory, which worked without interruption during the year, a tripartite long-term agreement giving substantial benefits to the employees was signed with the recognised unions on 2nd May, 1972.

A tripartite long-term agreement was also signed at the Ambattur Factory on 17th May, 1972. This, unfortunately, was only after an interruption of work for 43 working days due to a stay-in strike and unruly activities by a section of the employees, followed by a lock-out. Work was again interrupted at this factory from 13th November, 1972, for similar reasons, resulting in the loss of 64 working days of which 41 days were lost during the year under review. The factory reopened from 29th January, 1973, and since then the labour situation at the factory has remained satisfactory.

In the Company's Calcutta offices an unrecognised splinter union, in its bid to obtain recognition, created industrial unrest during the year. Following a strike on 1st November, 1972,

and violent activities by the supporters of this union, the Company was compelled to declare a lock-out from 2nd November, 1972. The offices were reopened from 18th December, 1972, and since then the labour situation at the Company's offices in Calcutta has been normal.

It was unfortunate that your Company, in spite of its progressive labour policies, experienced industrial unrest during 1972 mainly due to inter-union and intra-union rivalries.

I sincerely hope that there will be no recurrence of the problems we experienced last year and that all employees will put in their best efforts in these difficult times to maximise output. Industry has to meet its social obligations. Similarly, labour should also appreciate their social responsibilities to maximise production and help to fully utilise scarce manufacturing resources.

PROFIT AND LOSS ACCOUNT

The inflationary trend in costs of raw materials continued during 1972 and personnel costs also increased substantially. One of our problems is the freedom on the part of most of our raw material supplies to increase their prices without obtaining the Government approval that the Tyre Industry requires.

The last price increase that was agreed by Government for automotive tyres and tubes was in November, 1968. Since 1968, the cost of production of automotive tyres and tubes has increased by approximately 11% up to the end of 1972 for your Company. In addition, the last Central Government Budget will have the effect, in a full year, of further increasing raw material costs by as much as Rs 1.5 crores. A request for a price increase made early in 1971 by the Tyre Industry was referred to the Bureau of

Industrial Costs and Prices, and a decision is still awaited.

Following the completion of our expansion programme at Ambattur, your Company's production capacity was increased substantially and personnel and service facilities were geared to meet this increase. As a result of industrial unrest at the Ambattur factory this extra capacity was not utilised and the additional overhead costs, to which your Company was already committed, had to be absorbed during the year.

These factors have led to the very sharp decline in profit before tax for the year.

After providing for taxation, the balance of profit for 1972 was insufficient to maintain the rate of dividend which was paid on the Company's Ordinary shares for each of the past three years. After giving full consideration to the unusual circumstances affecting the trading results, and also bearing in mind the substantial earnings retained during past years, amounting to Rs 4.44 crores in the last 3 years alone, your Directors have transferred Rs 72.36 lakhs from General Reserve to make up the deficit.

MANUFACTURING CAPACITY

I have already mentioned the increasing truck tyre shortage in the market during 1972. From February this year an acute shortage of power in Tamil Nadu due to a poor monsoon has resulted in a power cut of 75 per cent at our Ambattur factory. We have made every effort to minimise the effect of this power cut by taking emergency measures, including the supply of rubber compound from our Sahaganj factory. Nevertheless, we are losing very large quantities of truck tyres each month. You can well imagine the market situation that is likely to develop in this essential commodity for which there was already a shortage at the beginning of the year.

We hope that supply of normal power will be available in Tamil Nadu from July after the monsoon sets in.

Although the present situation in Tamil Nadu is abnormal, it highlights the need to create adequate capacity for automotive tyres and tubes. Road Transport is an essential part of the infra-structure and a severe shortage of automotive tyres could have major economic implications. No matter how effective the Tyre Companies are in controlling distribution this can at best only alleviate a severe shortage situation marginally. Ultimately, sufficient installed capacity, and production, must be available to ensure adequate supply of an essential product like automotive tyres

for the domestic market, with a surplus available to meet the varying and more exacting requirements for export.

RESEARCH AND DEVELOPMENT

Your Company is fully conscious of its responsibility to give increasing emphasis to research and development. It will interest you to know that we employ around 300 scientific and technical personnel of whom about 50 per cent work on development projects. The development aspect of our business is being given greater emphasis at all levels of our management structure. This applies not only to R & D activities in terms of product design, equipment development and materials development, but also in the development of control systems applying the latest computer techniques for which, incidentally, there are export possibilities. I mentioned last year that we are establishing a Research and Development Centre for cycle tyres and tubes. Apart from serving our own needs, this will enable us to sell know-how to companies in the Dunlop Group world-wide. We plan to complete this project during 1973/74.

At the same time, I should give you a perspective of the scale of our R & D operation in relation to the total R & D activity of the major international tyre companies. Even if we spend a crore of rupees per annum during the next few years on R & D, it will be insignificant in comparison with the expenditure by the international companies. For example, the Dunlop/Pirelli research organisation spends well over Rs 30 crores per annum. And to this amount must be added the enormous expenditure by international raw materials suppliers, equipment suppliers, vehicle manufacturers and allied industries. Regardless of the competence of our local R & D team, the comparable expenditures just do not permit us to achieve results which would ensure competitiveness at the international level.

It is for this reason that we have continually urged the Government to renew our Technical Aid Agreement with Dunlop UK, which was terminated in end-1969. We have just received a letter from Government informing us of the terms on which they are prepared to agree to the renewal of this Agreement. These are at an extremely low level by international standards for the type of knowhow that we seek to facilitate development of our own indigenous R & D activities. We have referred the matter to our collaborators and are awaiting their comments.

FUTURE PROSPECTS

We have had set-backs last year, and

1973 is not likely to be a satisfactory year because of the production losses that are inevitable at the Ambattur factory due to the present drastic power cut. However, I feel that these set-backs are short term and, I therefore, view the future with optimism.

After a full enquiry by the Monopolies and Restrictive Trade Practices Commission, and based on its recommendations, the Government has issued a letter of intent to us against our proposals for the manufacture of steel cord and textile reinforced conveyor belting and fan and V-belts at Goa. We are now closely examining the details of this project. One of the clauses in the letter of intent asks us to purchase India Tyre and Rubber Company (India) Private Limited, and this is also being examined.

To meet the growing market shortage, we submitted a proposal to Government to increase capacity at our Ambattur factory by 200,000 truck tyres and tubes. I am pleased to be able to inform you that we have just received a letter of intent for this project.

A letter of intent from the Government for the manufacture of 50,000 dozen Tennis Balls is being progressed. These will be manufactured at the Sahaganj factory.

We have spent large sums of money on re-equipment at the Sahaganj factory and our future plans involve modernisation wherever necessary to meet future market demands.

On the opposite side of the coin, there will be the increasing problem of maintaining profitability in the face of continually rising costs. Although we are doing everything possible to improve efficiency and control expenses in every aspect of your Company's operations, the full impact of these rising costs can be offset only partially by such measures.

Your Company has always believed in allocating large funds for development, both in terms of man-power resources, and plant and equipment. To this must be added our increasing emphasis on R & D. This development expenditure is possible only if adequate surplus is generated. Therefore, I hope that the request to Government to permit a reasonable price increase for automotive tyres and tubes will be considered favourable in very near future.

In conclusion, I would like to thank all our employees for the efforts they are making to enable a speedy recovery from our present temporary set-backs.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

CREDIT POLICY : HOW NOT TO DO IT

Participatory Planning!

DURING the past six months the Planning Commission has had discussions with the Parliamentary Consultative Committee on Planning, with state governments, with central ministries, with representatives of opposition parties—ranging from the Jan Sangh to the CPI(M)—and with numerous other leaders of opinion. Late last year the Cabinet discussed the draft of the Approach to the Fifth Plan in four lengthy sessions. The National Development Council too has had its say. Parliamentarians have had an opportunity to discuss the Approach document in both Houses.

On each of these occasions a number of participants have made major criticisms of the Approach paper—criticisms about the realism of assumptions such as a 5.5 per cent rate of growth and a 7 per cent rate of growth of exports, about the feasibility of lowering the consumption of the top 30 per cent without lowering their income, about what the price rise of the last two years means for the Rs 51,000-crore outlay figure, about the credibility of an exercise that begins by assuming an annual growth of 5 per cent for each of the Fourth Plan's last two years, about the extent to which the government's decisions (for example, regarding industrial licensing) diverged from what the Approach paper said was needed, about the airy-fairy passages regarding wages and incomes policy and labour relations . . . and so on and so forth. At the end of each of these sessions, the Minister for Planning and his colleagues in the Commission have thanked the participants profusely, have told them how useful their comments have been for the Commission and have assured them that each of their comments will be borne in mind by the Commission as it continues its work on the preparation of the Fifth Plan. And, if one is to believe the talk in Delhi, each of the participants—whether he be a member of the CPI(M) or the Jan Sangh, whether a Cabinet Minister or an ordinary parliamentarian—has left satisfied and content; each has left with the feeling that yes, indeed, the country at last has an open-minded Planning Commission.

This is public relations of a high order. The achievement in having charmed so many people seems all the more outstanding when one notices that the numerous comments, suggestions, criticisms, bits of advice, tips of wisdom and words of wit have not made the slightest difference to the Approach paper. Not a single assumption has been altered, not a decision been changed, not a policy clarified since the end of October when these "consultations" began. So what we are witnessing is not just public relations of a high order. It is cynicism of a very high order too: the belief that all that the participants want is to be invited to meetings, to hear their own voices, to be treated to a lunch or two, to be thanked profusely and to be complimented lavishly for their insights; and a conviction that none of them will read the next version of the paper to see if any of their comments has made a difference to the Plan.

Now we learn that leading economists too have had their say at two day-long meetings. The economists seem to have done better than the politicians. They came away not only after a lot of talk but also with a lot of paper. Among the documents that were distributed to them was "A Technical Note on the Approach to the Fifth Five-Year Plan of India". As a good technical note should be, this one is short on text and long on numbers. In addition to the usual cyclostyled tables it has 59 tables straight from the computer—each a formidable print-out, 14" x 11". The precedent of releasing information of this kind is indeed an excellent one and it is to be hoped that the Commission will continue to release technical information. Even among the innocent, however, candour is seldom complete. The note leaves unanswered most of the questions that have been raised in the last six months.

The broad outlines of the model are familiar by now: a consistency model revolving around a 66 x 66 input-output matrix. The one innovation is that, instead of having one vector for private consumption, the model has two. By this device it is able to take into account the effects on private consumption of redistributive policies in a mechanical sort of way. In a mechanical sort of way because surely the fairly massive redistribution of consumption that is contemplated in the model will—if it is ever carried out—affect private investment, the decisions of households to hold assets of different kinds, the availability of certain types of goods for exports, incentives to work, and so on. The model—a first attempt in this country to incorporate distributive assumptions into the conventional input-output consistency models—naturally does not go so far as to take account of these varied effects of the redistribution policies it advocates.

The principal conclusion of the model too is well known by now: that self-reliance, redistribution of consumption and rapid growth are compatible because

MAFATLAL GROUP

the consumption basket of the poorer sections is less import intensive as well as less capital intensive. It is however a long jump from using the model to argue this general proposition to using it to argue that, indeed, we need only Rs 3,000 crores in gross aid over the Fifth Plan or that net aid (excluding interest) will indeed be pushed down to zero in 1978-79. The model is too blunt an instrument for establishing the veracity of such fine estimates.

Small changes in the co-efficients and in the assumptions about exogenous variables or a few alterations in some of the behavioural assumptions will alter considerably the estimates of variables like aid flows. Among the components of final demand, for instance, exports and public consumption are entirely exogenous. As for investment, the overall figure for five years is derived by multiplying the assumed change in GDP between 1978-79 and 1973-74 by an aggregate capital output ratio—a ratio whose estimate can obviously be adjusted by a few decimal points without anyone being able to question the adjustment. In regard to the other component of final demand, private consumption, the difference between the runs with redistribution and those without it depend largely on the assumptions one makes about the differences in the consumption patterns of different income classes. We are told that NSS data are available for 22 product groups and about a dozen expenditure classes. How has this information been translated into co-efficient for 66 product groups and 27 expenditure classes? There are vague hints of mysterious "special tabulations" but nothing more. Surely, as so much depends on these co-efficients the reader should have been told at least something about the assumptions on the basis of which these translations have been made. This is particularly so because, as is well known, the NSS data are not well suited for assessing the import-intensity or capital-intensity of the consumption of different expenditure classes. This is on account of two reasons. First, while NSS data are very detailed for agricultural commodities and those requiring little processing its coverage of consumer durables and manufactures in general—the very items for which consumption patterns of the rich and the poor are most dramatically different—is perfunctory and highly aggregated. Secondly, NSS coverage of the high income groups is notoriously deficient. In fact, one of the lessons that the quantitative exercises of this Note teach us is the urgent need to redefine the commodity categories and expenditure classes for the NSS rounds. For, the

country is concerned now, it is much less necessary to have expenditure details for 85 different agricultural commodities—including jowar and jowar atta, bajra and bajra atta, maize and maize atta, ragi and ragi atta, etc, various types of vegetables, pan (leaf) as distinct from pan supari and so on — than it is to have more details about manufactured consumer goods, in particular manufactured durables of various sorts. Apart from increasing the number of manufactured goods on which expenditure data are to be collected, the NSS should think of different ways of aggregating these goods into broad categories. We have traditionally aggregated commodities by looking at their final use: "transport equipment", or "residential houses". These schemes should now be supplemented by efforts to aggregate commodities by the similarity of their input structures. Then alone will the NSS data help us answer the questions that our planners say they are interested in.

These questions—about translating data from 22 product categories to 66 categories, from 12 expenditure classes to 27, about assumptions regarding exogenous variables and co-efficients—are not idle ones. The Note suggests that for a very large number of variables the authors of the model have had no better basis than projecting forward the trend of the past few years or assuming that the sectoral composition of 1965-66 will continue to hold or, in some cases, putting all their trust in something just as an act of faith, as in the case of the rate of growth of exports. Moreover, it was earlier reported that running the model with and without redistribution did not make much difference to the rates of growth of the 66 sectors. In October-November last year, when reports of these results had begun to trickle out, this invariance of the results to drastic redistribution had caused much comment. The explanation given was that at the level of aggregation at which the model was handling the economy one could not expect anything different: the rate of growth for "cotton textiles" as a whole may not vary much but everyone knew that once redistribution took place the types of cotton textiles that would be produced and their import content would be very different from what they would be without redistribution. The new rates in the preferred variant of the model are substantially different from the rates that were presented in September/October last year. The changes are attributed to "further scrutiny of the results". In many cases this new element—"further scrutiny

than redistribution. For it turns out that the difference between the old results and the new ones is more than the difference caused by the redistribution in, say, the old set of results. For this as well as other reasons, it is best not to take the first and second decimal places of the rates of growth too seriously. The planners have little control over developments in most of the sectors for which these finely adjusted rates of growth are being estimated or targeted. And even in the case of those sectors over which they may be presumed to have some control, they and the Ministries do not seem to have made up their minds as to what exactly they are aiming at. The thinking about fertilisers is a good case in point. The Approach paper published in January and this Technical Note suggest that the target for nitrogenous fertilisers in 1978-79 is to be 3.9 million tonnes of nitrogen. The Ministries of Agriculture and Petroleum and Chemicals have been telling whoever will listen (e.g., the Estimates Committee of Parliament) that the production target of nitrogenous fertilisers for 1978-79 is 5.2 million tonnes—and not 3.9 million tonnes. Similarly, one has to search very hard in Delhi to find someone who believes that we will really have an extra 61 million tonnes of coal in five years—as the Technical Note and the Approach paper assume we will.

In a situation such as the current one the principal function of numbers should be to highlight the magnitude of the effort that has to be made and to pinpoint the important policy decisions that have to be taken. Press reports in November last year had implied that in her address to the full meeting of the Planning Commission the Prime Minister had said that the Commission should draw up policy papers about matters on which decisions had to be taken urgently. Little seems to have been done on this front. In fact, the latest one hears on the subject is that the idea of framing policy papers is being altogether abandoned by the Commission.

Bombay Bandh

A Private Affair

A Correspondent writes:

CONSIDERING that he had organised it, George Fernandes, the Socialist Party and Hind Mazdoor Panchayat leader, had necessarily to claim that the Bombay bandh on May 25 had been a complete success. Nevertheless, the claim was not without some basis. Photographs published in newspapers the next day bore witness to the fact that life in the

of the city had indeed been brought to a halt.

How this came about was a different matter, however. First, Fernandes was able to keep BEST buses and taxis—he controls the unions of BEST workers and taxi-drivers—off the road, thus completely closing down public road transport in the city. Car owners too did not venture to take out their vehicles after the experience of the earlier bandh on May 16 when a large number of cars had been stoned and damaged. The sheer lack of the means of transport, rather than any sympathy for the objectives of the bandh, was thus a major factor responsible for a large number of people staying off work on May 25. If it was merely a test of his control of BEST workers and taxi-drivers, then George Fernandes may be said to have proved his point.

Second, an equally important, if unwitting, contribution to the success of the bandh came from the Shiv Sena which had opposed the bandh. The threats and counter-threats exchanged between the Shiv Sena, whose capacity for sparking off violence is taken very seriously indeed in Bombay city, and the organisers of the bandh created a general feeling that the day of the bandh would be marked by clashes and violence and this again persuaded a large number of people to stay away from work; some large business and commercial organisations even chose to formally close their establishments for the day. Such, then, being the factors making for the 'success' of the bandh, George Fernandes's claim that the bandh represented a massive vote of no-confidence by the people of Bombay against the Congress governments in Maharashtra and at the Centre has to be taken at rather less than its face value.

The more important question, however, relates to the value of the bandh as a political weapon. The bandh is the hartal of the freedom movement days under a new label. However, whereas there may have been a case for uniting the entire Indian people—industrialists, businessmen, petty traders, white-collar workers and industrial labour—against the British, one would have thought that today any political party with radical pretensions would see its task principally as that of sharpening the awareness of economic and social differences and antagonisms among the major groups in society. The bandh, on account of being addressed to the entire population of a city, on the other hand, creates a totally false sense of community of interest among these different groups. As if, say, the upper middle class, the industrial workers and the slum-dwellers of Bombay stood in the same relation-

ship *vis-a-vis* the government or shared a common stake, or lack of it, in the present political-economic system! And the way bandhs are organised, the results can be truly bizarre. For instance, it should surprise no one if it turns out that proportionately more car-owners, more shop-keepers, more restaurant-owners and more white-collar workers 'participated' in George Fernandes's bandh than did industrial workers. Surely, it would be ridiculous to suggest that these are the groups which have the most, or for that matter any, reason to be unhappy with the economic situation or with the government's policies. Quite a few of them have made a pretty penny for themselves out of the innumerable shortages and the inflationary price spiral.

This basic weakness of the instrument of the bandh apart, in the case of the Bombay bandh on May 25 its sponsors appeared to have deliberately decided not to make any use of it to heighten the industrial working class's awareness of its problem or even to give it any sense of special participation, let alone of leadership, in the bandh. Their refusal to make common cause with the communist parties which had organised the earlier bandh on May 16 testified to this. Further, processions and morchas of workers were explicitly forbidden by the sponsors on the bandh day; and no particular political activity among the city's working classes either preceded the bandh or has followed it. In fact, one suspects that even the BEST workers and the taxi-drivers regard participation in George Fernandes's Bombay bandhs as a private obligation they owe to him in return for the benefits that accrue to them as a result of the trade union organisation he provides them with.

The supposed 'success' of the May 25 bandh has reportedly inspired George Fernandes to think in terms of making a bid for the Lok Sabha seat from Bombay just vacated by R D Bhandare on his appointment as Governor. This is perhaps the most apt summing up of the purposes and consequences of the bandh.

Credit Policy

How Not to Do It

THE Reserve Bank, it may appear, has been at last goaded into doing something about the runaway expansion of commercial bank credit of over Rs 1,000 crores since the end of October 1972. It may also seem that the package of measures announced by the Bank this week is a particularly tough one, consisting as it does of increase in the

Bank rate from 6 per cent to 7 per cent, raising of banks' cash reserves from 3 per cent to 5 per cent, stepping up of the net liquidity ratio (NLR), which determines the banks' cost of borrowing from the Reserve Bank, from 37 per cent to 39 per cent and stipulation of a minimum interest rate of 10 per cent on bank advances, with some exemptions.

As a result of persistent deficit spending by the government and the unprecedented expansion of commercial bank credit, money supply has expanded by 16 per cent over the year. And this when there is acute shortage of a wide range of major consumer goods and industrial raw materials and the rise in the general price level over the year has been the highest on record. Even the Reserve Bank cannot keep up its eternal pretence that all the commercial bank credit has gone for "productive purposes". In his letter to commercial banks this week the Governor has been forced to admit that there has been "excessive use of bank credit, particularly for building up inventories".

However, if the Reserve Bank thinks that its latest measures will have any worthwhile impact on the monetary and price situation, it is likely to be proved wrong. For one thing, it has inexplicably waited for the busy season to run its full course before announcing its measures—clearly an instance of trying to close the stable doors after the horse has fled. Second, the measures that have been announced have little relevance to the current monetary situation, particularly the wild-fire expansion of commercial bank credit.

The stipulation of a minimum lending rate of 10 per cent on commercial bank advances may be deemed to be the most important of the Reserve Bank's measures. Commercial banks have been generally charging interest ranging from 9.5 per cent to 10.5 or 11 per cent. An increase of half a percentage point in the cost of borrowing over these levels is hardly likely to unduly diminish the profitability of stockpiling scarce commodities. The Reserve Bank's own studies on company finances brings out what a small proportion of total cost interest charges form—largely because of the low interest rates charged by public sector lending institutions. Besides, advances against some so-called 'sensitive' commodities like foodgrains, oilseeds and vegetable oils (including vanaspathi), sugar, gur and khandasari and cotton and kapas already attract interest at 12 per cent under the Reserve Bank's selective credit controls. There is little evidence to suggest that even this has significantly discouraged stockpiling of these com-

modities. As for the public sector borrowers, the stipulation of the minimum rate of 10 per cent may impinge on their cost structure, but is there any basis for assuming that the borrowing decisions of bodies like electricity boards and state industrial development corporations are influenced by the interest rate?

For all the mystique that still surrounds the Bank rate, the decision to raise it by one percentage point is unlikely to achieve very much. It has been pointed out that a Bank rate of 7 per cent is unprecedented in the monetary history of this country—as if it was the absolute level of the Bank rate that was material irrespective of the real cost of capital or prices of physical goods and services. That apart, in March the Reserve Bank had already raised the penal rate for banks' borrowing from the Reserve Bank for the initial one percentage point fall in the NLR from 6 per cent to 8 per cent. Despite the raising of the Bank rate to 7 per cent the penal rate has now been retained at 8 per cent, though the minimum NLR has been increased by 2 percentage points following the raising of the minimum cash reserve requirement.

The impounding of a part of banks' deposits implicit in the raising of the cash reserve, again, is unlikely to be effective on account of two interrelated factors: the fast rate of growth of banks' deposits and their relatively low credit-deposit ratios. The credit-deposit ratio for all banks is around 70 per cent today, whereas the banking industry has been used to ratios of around 80 per cent. At the current level of deposits of about Rs 8,800 crores, even after allowing for the impounding of about Rs 200 crores by the Reserve Bank, banks could lend another Rs 650 crores or so. Banks' borrowings from the Reserve Bank stood at Rs 122 crores on May 18, almost all of which must be against export and food procurement credit eligible for concessional refinancing irrespective of the NLR. Once banks are able to meet the statutory liquidity and net liquidity requirements, the impounding of deposits in the slack season would only amount to an additional outlet to commercial banks for investment of their surplus funds. Banks would only have to transfer a part of their investment in treasury bills to cash reserves with the Reserve Bank. The return of 4.75 per cent offered on these reserves is as good as the new 4 per cent yield on treasury bills or the 4.51 to 4.56 per cent yield on short-dated securities. As for the monetary impact of the impounding of deposits, given the extent of the government's recourse to the banking system recently, direct invest-

ment by commercial banks in government securities, including treasury bills, will have, other things being equal, the same expansionary influence on money supply as the banks' surrendering a part of their deposits to the Reserve Bank as cash reserves which the Reserve Bank, in turn, would lend to the government.

The more basic issue raised by the Reserve Bank's latest credit policy measures is that, faced with a difficult price and monetary situation, the Bank still has to fall back on influencing the overall availability and cost of commercial bank credit through use of conventional instruments like the Bank rate and the commercial banks' reserve ratios. In this respect, one may ask, what has been the precise gain from the nationalisation of the major commercial banks four years ago? Nationalisation of these banks, together with the control which the government already had over the long-term financial institutions, would, it had been claimed, make it possible for the government to ensure that the utilisation of the community's financial savings would conform to priorities laid down in the Plans. Implicit in this claim was the assumption that the government and the Reserve Bank would indicate to the nationalised banks a scheme of priorities with regard to the use of their resources and exercise sufficient direct control over their operations to make sure that these priorities were observed. The actual course of events since the nationalisation of the major banks, and in particular the runaway credit expansion in the last few months, have shown how completely misplaced this assumption was. In terms of the Reserve Bank's ability to influence the pattern, or even the pace, of credit expansion, the fact that the country's biggest commercial banks are now government-owned has clearly made no difference.

Not to talk of long-term credit planning, the Reserve Bank has failed to prevent the use of bank credit to stockpile commodities which have been known to be in short supply and the prices of which have been continuously rising. And this when the Bank operates a credit authorisation scheme under which it scrutinises and approves all large commercial bank advances which, among them, account for roughly two-thirds of total bank credit. Not unexpectedly, the accent of the credit authorisation scheme is on the narrow financial soundness of the advances and not on the rationale of use of bank funds in the larger context of the availability and prices of major goods and commodities. This indifference to the problem of use of bank finance to stockpile commodities in short supply is also evident from the fact that in the new statistical returns devised by the Reserve

Bank for collecting banking data from the commercial banks, the earlier practice of reporting security-wise information on bank advances has been dispensed with.

In a period of steep and continuous rise in prices, stockpiling of raw materials in short supply and withholding of supplies of finished goods from the market can become more profitable operations than normal production activity. There is no reason to believe, therefore, that even if the Reserve Bank's latest credit policy measures make a significant impact on the availability and cost of bank credit—a highly questionable assumption, as has been argued above—it is inventory-building which will be selectively discouraged and not other uses of bank finance.

Exchange Rates

Helpless before Dollar Imperialism

THE Deputies of the Committee of 20 on International Monetary Reform have gathered again in Washington to discuss the draft outline of a scheme of monetary reform. Their first three meetings generated more heat than light and, without even a semblance of a consensus emerging among the major developed countries, the latest round of discussions are unlikely to be more fruitful.

Central bank governors of the major industrial countries indicated at their recent monthly meeting at Basle that any fundamental reform of the international monetary system was still a long way off. Most of the governors were pessimistic about the chances of anything tangible emerging before the next annual meeting of the IMF at Nairobi in September. In the meantime, they were convinced that floating exchange rates were the best means of dealing with crises created by speculative capital flows. It is ironic that central bank governors and policy-makers in the developed countries who were only a few years ago opposed to a regime of even flexible exchange rates with bands wider than those permitted under the Bretton Woods system are now expressing their faith in floating exchange rates. The pendulum thus appears to have swung to the other extreme and we now hear paeans to the glories of floating exchange rates.

The admiration for floating exchange rates is not born out of any conviction about their merits but stems from the fact that the policy-makers in the developed countries find themselves helpless in the face of the basic ills plaguing the present international monetary sys-

ECONOMIC AND POLITICAL WEEKLY

tem. With the collapse of the gold-dollar standard and the ever-growing US payments deficit—no end to which appears in sight even after two major dollar devaluations within a period of 14 months—footloose dollars amounting to a few hundred billion are roaming the world in search of a strong currency which would be able to maintain a stable exchange rate. A potentially more dangerous dimension was added to the problem when the US reportedly encouraged American multi-nationals to flood dollars into West Germany in the first half of February and again in March, first, to impose a second dollar devaluation and, then, to force the European countries to follow Japan in floating their currencies upwards. Given the weak bargaining position of the Europeans *vis-a-vis* the US on account of their military dependence on it, the European countries cannot seal their borders against unwanted US capital flows. They are fully aware of the consequences of the firm stand taken by the US in favour of free international capital flows which have helped the US to establish, as well as acquire already established, major industrial ventures in Europe. The central bankers of Europe and Japan have also realised at great cost to themselves that it is not possible to revert to a fixed exchange rate system without strong controls on capital movements. Thus the new-found love for floating exchange rates is more an expression of political helplessness against the new type of dollar imperialism of the US than a case of belated recognition of the truths propounded by Meade, Friedman, Johnson, *et al.*

That central bankers now have no policy option other than to keep their currencies floating does not mean that floating exchange rates will satisfactorily solve the problem of unwanted capital flows. Despite the fact that the trade position of the UK has not improved but has in fact worsened after June 1972, when the sterling started floating, the exchange rate for the sterling, which had at first drifted down from \$2.60 to nearly \$2.30, has gone up to very close to its old parity of \$2.60. The up and down swings of the floating sterling in the last 11 months were primarily the result of capital flows either way and not of changes in the competitive position of the UK. A question which those who are now arguing in favour of floating exchange rates have to answer is whether they would like the framework of international movement of goods and services be subjected to distortions arising from disruptive speculative capital flows. Once speculators learn how to operate in a

regime of floating rates, they will soon learn how to manipulate it to their advantage. If the world community does not want the international trade network to fall a victim to the distortions imposed by the far less important aspect of free capital flows, floating exchange rates will have to be replaced once again by the par value system.

In this context, it is time for countries like India to reconsider the wisdom of pegging their exchange rates to those of floating currencies like the sterling. So long as the sterling was drifting downwards, it was considered a blessing in disguise inasmuch as it amounted to a devaluation of the rupee. But now to allow the rupee to float upwards along with the sterling and appreciate in relation to other currencies shows sheer lack of initiative on the part of our policy-makers. Export industries are now passing through a phase of uncertainty due to the sudden appreciation of the sterling to which the rupee is pegged. Particularly, exports invoiced in dollar are reported to have been substantially affected. In the context of the domestic price spiral and the tight foreign exchange position, it would be a great pity if exports have to suffer on account of an exchange rate policy that does not respond quickly enough to changing external factors. Even if it is assumed that India does not have any option other than to float, it does not mean that the rupee has to float passively with the pound sterling without suitable adjustments in the exchange rate.

CPM

Cause for Anxiety

A Correspondent writes:

FOR those who still look to the CPM to provide leadership to the radical forces in the country, the recently ended Cochin conference of the party's trade union wing, the CITU, must have come as a stab of pain. After long deliberation on such diverse themes as unemployment, misuse of workers' provident fund monies and the ruling party's abuse of the state of emergency, the DIR and the MISA, all that the leadership was able to offer were a few innocuous statements on the present economic crisis and a vague outline of agit-prop work for party cadres. The CPM leaders evaded crucial questions like the role of the working class and its leadership in this deepening crisis with innocuous statements about the need to replace "the capitalist-landlord rule by a democratic regime led by the working class".

Perhaps none of this should really

have come as a surprise. For, barring its early adolescence, and especially after its electoral victory in West Bengal in 1967 and the spell in the secretariat in Calcutta, the CPM leadership has never betrayed much taste for radicalism. The Madurai Conference last year had provided the propping for the party's ideological pragmatism. At Madurai, the dissenting supporters of the non-parliamentary path were pushed aside and a "consensus" was forged in favour of joint action with "radical democratic forces". True, the General Secretary of the party, P Sundarayya, caused a mild flutter when, referring to the party's electoral debacle in West Bengal, he said that "the [election] outcome is the direct result of the days of legality of parliamentary politics and the complacent outlook generated by them". However, this was immediately followed by the clarification by Sundarayya that he was not holding up, even by inference, the non-parliamentary way as an alternative. All that he had intended to suggest was that "democracy was being subverted by the ruling class".

Of course, the CPM has its dilemmas. It cannot, for instance, abandon its radical postures, lest it alienate its cadres. The result is that the party leadership has to obfuscate its resolutions on various national and international questions by liberal recourse to semantics, while maintaining a rigid hold of the party organisation and gagging dissenting voices. How determined the gagging can be was seen at the Muzaffarpur Kisan Conference when the dissenters from the official line on the agrarian question, who included some of the foremost leaders of the party from Kerala and Punjab, were forced to stay away from the conference.

What has come to the CPM leadership's rescue appears to be the lack of a viable alternative political force. It is in this context that one suspects that the CPM leadership must be scanning reports of revival and regrouping of Naxalites with almost as much anxiety as the Congress itself. The CPM cadres, after their experience of the last three years when they allowed themselves to be used against the Naxalites only to find that they were to be the next victims of the police and the government, may be rather less willing to engage in another internecine campaign of annihilation against the Naxalites at the bidding of their party leaders.

LIC and PNB Ltd

Helpful Advice

THE directors of Punjab National Bank Ltd has stated in their annual report

for 1971, the latest available, that "the company has been legally advised that in making advances or loans or in discounting bills, the provisions of Section 293(1)(c) of the Companies Act would not be contravened". The Section in question only requires the board of directors of a company to take the approval of the shareholders at a general meeting before launching on such activities. It is not known if this formality was observed by PNB Ltd, but the Jains, commanding as they do the majority of the voting rights, have evidently lost no sleep over this technicality. PNB Ltd has placed deposits and made loans and advances. It has also formed subsidiaries—namely, Punjab Properties, which has acquired land in Delhi, Ganga Alloy Steel and Punjab Mercantile and Trading.

The questions that arise are: is PNB Ltd, which is extending loans, a banking company? If it is, can it have subsidiaries? If it is not a banking company, can it make loans and advances? Is the legal advice obtained by the Jains acceptable to the Reserve Bank, the Banking Department of the Finance Ministry and the Company Affairs Department?

It is not in the matter of legal advice alone that the Jains have been fortunate. They got a firm of auditors to assess the price that they should pay to minority shareholders of PNB Ltd who wished to exercise their cash option. And, believe it or not, the independent evaluation showed that the shares were worth just Rs 33 against the compensation of Rs 51 received by PNB Ltd, or just 65 per cent of what the government had paid for the shares. LIC took objection to this and persuaded the Jains—the auditors' evaluation notwithstanding—to raise their offer to the minority shareholders to Rs 40, thus saving these shareholders from a loss of about Rs 70 lakhs. Even so there is doubt whether the new price of Rs 40 still does not constitute an underpayment. It has been pointed out that at this price PNB Ltd shareholders would get 78.4 per cent of the compensation per share received by the company against 72.6 per cent received by shareholders of Union Bank, 71.6 per cent received by shareholders of Canara Bank and 77.1 per cent received by shareholders of Bank of India. On the other hand, shareholders of Central Bank did manage to get 81.5 per cent and those of Bank of Maharashtra 84.2 per cent of the compensation per share.

It was suggested in these columns that shareholders of PNB Ltd should get Rs 43 or at any rate Rs 42 per share ("Fruitful Controversy", April 28,

p 772). The compensation received by PNB Ltd per share was Rs 51. From this should be deducted Rs 3.40 per share for dividend paid out of reserves till 1971. The loss from sale of compensation bonds may be assumed to be Rs 1.80 per share. The net value per share would thus be Rs 45.80. There is a further deduction of Rs 4 per share, being estimated capital gains tax liability. There is no knowing if this liability has been overestimated, the estimate having been made by the company's auditors. But even after all these deductions, the cash option per share works out to Rs 41.80. Accountancy is a tricky business: other calculations have shown the cash option at Rs 41.62 and Rs 41.51 per share. But even taking the lowest of these estimates, namely, Rs 41.51 per share against the Rs 40 now offered, there is a clear underpayment of Rs 1.51 per share or about Rs 15 lakhs on a million shares. This gain to the Jains arises because if shareholders, LIC, UTI or anyone else sought to take the company into liquidation, the proceedings would go on for years. The ultimate blackmail thus comes from the law.

This is not the end of the story of underpayment. The cash option offer by PNB Ltd of Rs 40 per share is exclusive of dividend for 1972 and dividend for the period till the payment is actually made. It now turns out that the dividend for 1972, mentioned at Rs 2.20 when the cash option offered was Rs 35.80 per share, is likely to be pared. Such paring will also apply to dividend for the period after 1972. The justification for the dividend reduction would naturally be the lower profit from 1972 onwards. Why profits have declined after 1971 is not difficult to divine. We have LIC's public statement that the investments made by the PNB Ltd may not have been in the best interest of the shareholders. But not in the best interest of which shareholders? Not the Jains, surely?

Bengalis, Biharis and POWs

Unpacking the Package

THE police roundup of Bengalis stranded in Pakistan and the subsequent introduction of the POW trials issue at the International Court of Justice by Islamabad could be taken at face value and seen as an obvious means of pressurising Dacca and Delhi to release the Pakistani POWs and to soft-pedal the impending trials of the 195 POWs who have been arraigned on criminal charges. Islamabad's thought process may well envisage that the enclosure of Bengali

civilians with barbed wire or their incarceration in police lockups would raise enough of an uproar in Bangladesh to cause the Bangladesh and Indian governments to release the POWs, which could quickly be followed by the repatriation of the Bengalis in Pakistan, as Islamabad would have no use for them once it got back the POWs. But this scenario would probably be considered as too optimistic by Pakistan's own reckoning. After having held the POWs for 17 months, Delhi is unlikely to hand them over without having anything to show in exchange.

It is, therefore, possible that Bhutto and his advisers are planning to spring a surprise on Delhi and Dacca and seize the initiative by rounding up the Bengalis scattered all over Pakistan and then declaring that they will be repatriated to Bangladesh unconditionally. This would have a most discomfiting effect on Dacca and Delhi and could also create tensions between the two. Once the Bengalis are back in Bangladesh, India would find it even more inconvenient to hold on the prisoners for Dacca's sake, though it is possible that the latter would agree to their release after the Bengalis have been returned. On the other hand, the case for holding on to the POWs could be strengthened—in Dacca's view—as the POWs could then be regarded as a means of bargaining for the simultaneous handing over to Pakistan of the POWs together with a large number of Biharis. Delhi would then again be carrying the can for Dacca. And indefinitely too, as Bhutto has no intention of further alienating potential Sindhi nationalists by importing more of the Urdu-speaking groups against whom the riots last year in Karachi, Hyderabad and other towns in Sindh were directed.

To forestall any such unilateral Pakistani move which could place India in an unenviable position, it would be prudent for Delhi to start negotiating with Islamabad—if possible with Dacca's consent and if need be, without for a two-sided package deal rather than the three-cornered one which has already been offered. The negotiations should be over the return of the POWs and the Bengalis to their homelands. For the moment, there is little that can be done for the Biharis except to leave them where they are and persuade Dacca to treat them with some compassion. Perhaps, it could also be suggested to Pakistan that it would be possible for India and Bangladesh to keep that Bihari issue in abeyance if Pakistan were to withdraw the POW trials issue from the International Court of Justice.

Thicker Denier, Thinner Margin

Hansavivek

BARODA RAYON's letter of intent for the expansion of rayon yarn capacity has been revalidated. The company has applied for an import licence for the proposed cellophane plant and also expects to receive soon a letter of intent for manufacture of nylon tyre cord. The company has submitted a petition to the Gujarat High Court for sanction of the proposed scheme of merger of Gujarat Polyamides with it. Meanwhile, the company's profit-margins suffered considerable deterioration last year. Despite the shortage of a number of vital materials and difficulties of transportation, particularly by rail, production was maintained at the previous year's level on 100 denier basis. Net sales were some 30 per cent higher, but gross profit slipped by 24 per cent. It is stated that the company has lost much of its hold on the finer denier market owing to keen competition from big manufacturers. It had to go in for thicker deniers, which offer thinner margins compared

to the finer deniers. Besides, the company's contribution under the voluntary price and distribution scheme, agreed to between the spinners and weavers, went up from 50 per cent to 57.62 per cent of the production on account of the revised agreement effective from January 1972. The company also continues to supply upto 10 per cent of production at a "highly concessional rate" against the export of art silk fabrics. The management is concerned over the increase in manufacturing cost arising from rise in wages and cost of raw materials, coal and services. The turbine of the power plant had to undergo heavy repairs, which cost the company over Rs 8 lakhs last year.

Commenting on the current year's prospects, the directors say that the concession in excise duty enjoyed by the smaller units for the last 5 years has been withdrawn in the last budget. Import duty on wood pulp has been raised along with duties on sulphur and spare

parts that are being imported. All these factors would further raise cost of production. It is intended to refer the incidence of this increase in cost to an independent firm of auditors under the voluntary distribution scheme. Meanwhile, a fresh charter of demands has been received by the company from the employees. This too will increase the wage bill.

USHA MARTIN BLACK (WIRE ROPES) is setting up a unit at Bangalore for the manufacture of wire drawing and allied machines. The company's industrial licence for manufacturing 7,200 tonnes of steel wire and wire ropes on a double-shift basis has been endorsed by government to allow production of 10,800 tonnes per annum on three-shift working. Part of the imported plant and equipment required for the manufacture of fine wire ropes has been already received. These expansion and diversification projects involve a capital outlay of Rs 210 lakhs, a part of which is proposed to be raised by an issue of 2,36,833 equity shares of Rs 10 each at a premium of Rs 2.50 per share and 20,000 cumulative redeemable 'B' pre-

ference shares of Rs 100 each carrying dividend at 9.5 per cent per annum at par. Both equity and preference shares are proposed to be issued as 'rights' to the holders of respective classes of shares. The company also proposes to issue bonus shares on a three-for-five basis. Government approval has been secured for investment of Rs 25 lakhs in equity capital of Usha Alloys and Steels, promoted for the manufacture of 50,000 tonnes of high/low carbon alloy steel billets per annum at Adityapur near Jamshedpur. It is believed that, once this new company starts production, UMB will be assured of quality steel which is required in increasing quantities to meet the growing demand of the company's products. UMB has produced good results for 1972, with higher sales and profits. Dividend has been raised by four points to 20 per cent.

LAXMI VISHNU TEXTILE witnessed a quick change in its fortunes during 1972, with gross profit doubling itself following a less than 35 per cent advance in net sales. Net profit was nearly threefold, which enabled the company to wipe off the entire accumulated loss (Rs 25 lakhs) and clear arrears of bonus for earlier years (Rs 13 lakhs) as also of dividends on preference capital including the amount due thereon for the latest completed year (Rs 11 lakhs). The way has thus been cleared for resumption of payment to the equity shareholders who were last paid a mere three per cent for 1963. The company's export performance was even more spectacular—with export sales aggregating as much as one-third value of production. These good results have, of course, occurred in a year of bumper cotton crop, when raw cotton prices were considerably lower than in the previous year, but a good deal of contribution has also come as a result of the programme of reorganisation and renovation being carried out at the mills for some years now. Last year alone, Rs 42 lakhs were spent on this programme, besides Rs 30 lakhs on repairs to old plant and machinery. The management intends to incur further substantial expenditure on the programme in the current year so as to avail of the benefit of development rebate which is likely to be withdrawn after May next.

FOOD SPECIALITIES experienced a sharp contraction of margins during 1972, when gross profit dropped by 18 per cent even though net sales advanced by 13 per cent. Net profit was 24 per

cent lower, with the result that even dividend reduced by four points to 25 per cent was just covered. Export sales increased by 49 per cent to Rs 131 lakhs. In the course of a voluntary demarcation of the milk shed area, the company ceded territory to government milk scheme. Despite the smaller district, milk deliveries were increased by 34 per cent. Prices of all raw materials rose considerably, but no pronounced shortages were experienced. Last year, the factory at Moga was brought within the extended municipal limits. All raw and packing material are now subjected to octroi duty. The power shortage in Punjab and Tamil Nadu gave rise to anxiety, though production did not suffer. Batchwise production of instant tea at the pilot plant in Cherambadi continued. The company's application to government for sanction to capitalise part of reser-

ves and issue bonus shares is still pending. Nearly 70 per cent of the share capital is held by the holding company, Nestle's Holdings. The auditors were paid Rs 15,005 for out of pocket expenses and fee for 'other work', besides Rs 21,000 as audit fee.

MAHARASHTRA SUGAR's board proposes to transfer the assets and properties of the company's distillery, potable liquor and cube and confectionery plants to Maharashtra Radio and Electronics, a wholly-owned subsidiary, with a view to segregating the sugar undertaking from the non-sugar undertakings. The decision has been influenced by the consideration that in the event of nationalisation of the sugar industry the non-sugar undertakings be saved from the government action. The board feels that such a course will not adversely affect the shareholders in any way.

Calcutta Diary

A M

THE incendiaryism at Lucknow has proved a point: the distinction between certain kinds of student leaders and ordinary hooligans is almost blurred out. And yet, how many politicians will have the honesty to own that Lucknow is not an aberration, or that it is their sins coming home to roost?

Over the past twenty years, the injunction in the Constitution notwithstanding, the decision-takers at the Centre as well as in the States have shrunk away from the task of spreading free and compulsory primary education. Disseminating elementary education in 550,000 villages in the country implies a lot of hard work. If it is to be more than a pretence, the solution of many other ancillary problems beyond providing for physical facilities or teachers would be called for. An economic content is inherent in the experiment: for containing the phenomenon of drop-outs, one must be able to arrange for, for example, mid-day meals and milk for the offspring of the poor, who constitute the overwhelming majority of the children of school-going age. All this was too much for those who wanted to have a relatively cushy time. The likely negative consequences of primary education had also to be considered. Eradicating illiteracy is to permit the possibility of landless labourers and small farmers becoming increasingly aware of the world around them, of the potential for development latent in them, of the opportunities denied to them every day. From learning the three r's to getting organised for political action can be a short haul. Why play hostage to fortune; better go slow on primary education. Class interests therefore win out with the politicians; the outlay for primary education under the Plans is invariably short-changed.

At the same time, there is, to borrow the World Bank cliché, the revolution of rising expectations to reckon with. You cannot maintain the trappings of a parliamentary democracy without humouring populist notions along. Education must spread. Since primary education is out, passion therefore, gets diverted to starting colleges and universities. A certain middle-class glamour attaches to such institutions; the necessary organisational effort to set them up is also minimum. Besides—what is to be welcomed—, very few of the filthy poor will be able to join them. The sights are therefore set high. For each Assembly constituency, have at least one college, for each Par-

liamentary one, at least one university. The target having thus been laid down, the politician gets down to the business of cajoling public funds for such institutions of higher learning. No questions are asked about the quality of the scientific and technical equipment that is installed. Whether it would be possible to recruit teachers of adequate standards is never gone into. These are trivialities, and should be brushed aside. For by starting, in a mad hurry, these colleges and universities, at least three important purposes are accomplished. First, you keep trapped several thousands of young men and women in the educational system for an extra number of years; the pressure on the labour market is, to that extent, reduced. Second, you are also able to satisfy the ego of these young people—if they cannot have jobs, at least let them have degrees. Such degrees may have only scrap value, the academic quality obtaining in the institutions may be an affront to all scholastic standards. But the politicians would not be denied the accolade which become their due following the opening of another college or university in their constituency; it enables them to put their conscience to sleep. A new educational institution moreover, means a new source of spoils: jobs can now be on sale, and even, as in some universities, Ph D degrees, with the usual kick-backs.

Universities therefore turn out to be the gay arena for applied opportunism. Public funds are up for grab, and higher education provides the essential apologia. Charlatans and illiterates come to occupy professorial chairs, norms of selection are watered down till they cease to exist. The same thing happens to standards of admission. The politics of survival ordains that no questions be asked, and each and every aspirant at the portals of the university be allowed entry. The quality of instruction being what it is, the young men and women, who scramble in, soon discover other sublimations. They begin to play as little politicians, learn to import all the skulduggery from the world outside. Politicians too start appreciating the advantages of using captive groups of young people from the educational institutions for campaigns at election time and other critical occasions. A line of communication is established between the groups of politicians and groups of students; the arrangement provides mutual satisfaction, and also perhaps tends to a certain traffic of finance. After a while, bilateralism gives way to

multilateralism, as groups of teachers find it convenient to hit up alliances with political as well as student elements. Student bodies are infiltrated by hard-boiled, professional goons who arrive on the scene with expert knowledge of manoeuvres and machinations. The atmosphere gets gradually vitiated. One thing leads to another. Soon the cult of the knife supplants the cult of learning. Since everybody yearns for a degree, the cult of the knife also takes over the examination system. The student leaders decide the modalities for setting question papers and holding examinations; they organise community cheating; they also insist on exercising a veto over the manner of scoring answer scripts and tabulation of results.

By now, the politicians have been caught in the trap. The student leaders can blackmail them till doomsday. They keep dossiers on politicians, on their stealings and thievery, on their debauchery and fornications. Those who have carved out a career as student leaders are the regular go-betweens between politicians and politicians, or politicians and businessmen. They know fairly everything about shady deals over licences and bank loans. They have got the politicians where they want; they, more than anybody else, know the several faces of the miserable, platitude-mouthing hypocrites. Call it just deserts or no, the hoodlums masquerading as students thus find it easy to take over the system. The folly of the politicians catches up with them. Honest work among the people, building the base from below are no longer the 'in' thing; rather, politicians take recourse to thuggery: get money from the industrialists and traders, borrow the muscles from the thug, exploit the students, and a political career is built. This trend has established itself firmly during the more recent years. From ministers down, the edifice is one of unrelied corruption. The hoodlums can afford to challenge the sanctimonious politicians to get rid of them. They know that they are bound to win out, because the politicians would not dare to face the risk of public exposure.

Lucknow is not *non pareil*. The story is repeated wherever higher education has become a negotiable commodity and politicians have sold themselves down the drain. About anybody can get himself admitted to a university, even the worst specimen of the social scum; he is honoured and placed on the pedestal of the politician, and by scheming groups of teachers, whose own credentials are more than suspect. Given his clout, sooner or later he will come to hold a succession of key positions in the party organisation, and may even find a place

in the State cabinet. Has any politician ever stopped to wonder how an ordinary housewife feels when she sees someone as eminent as, for example, the Prime Minister closetted with a person who, barely two years ago, would have been described as a common criminal? Times have changed, the street ruffian has donned the party apparel and has learnt to speak the appropriate, cliché-ridden slogans. He is now invited to inaugurate literary soirées or speak on the nature and significance of non-violence in national life. No one need be surprised if, even while he is speaking, tucked away around his waist is a vicious-looking knife; or if the unusual padding you notice on the left shoulder of his *kurta* is the tell-tale sign of a barely concealed weapon. It may not be quite

pre-history since he had last used that knife or that gun, maybe to finish off a former pal who fell out with him over the sharing of the spoils from breaking open sealed railway wagons.

The rebellion of the armed constabulary has befogged the issue, but the crucial question which Lucknow raises is still about the dress which has been allowed to pollute the political process. One can almost wager that no MISA would even be applied to get at the arsonists who parade as students. They have, thank heavens, on ideology, they are career-minded criminals, and you need their help at election time. One must learn to be reasonable: what is burning down a few universities for such noble philanthropists?

CAPITAL VIEW

A Lesson from Uttar Pradesh

Romesh Thapar

IN ruling political circles it is customary to describe the present sprawling, teeming, backward Uttar Pradesh as not only the sixth largest state in the world, a fact based on fecundity, but also as the critical element in the stability of continental, multi-cultural India. Well, judging from the events of the past few weeks in this homeland of Prime Ministers we have every cause to say a prayer. The heartland of India is now a septic focus.

The revolt in the Pradesh Armed Constabulary (PAC), the sacking of Lucknow University, and the PAC's refusal to surrender arms represents a critical moment in the history of free India. The wide and ramified spread of political corruption, the steady erosion of the morale of institutions and organisations which act as the cement of democratic functioning, the growth of the conviction that only angry and violent protest can win redress on long pending demands, the break-down of normal disciplines among those who must function under discipline, the entry into public life of openly avowed operators on the make, and the officially encouraged attitude of compromising with every charlatan who can muster a mob, are the major elements of the crisis that is upon us. And it is not confined to Uttar Pradesh. The perceptive in the GOI understand this.

The argument that it is economic stagnation which is the cause of our troubles, an argument mouthed with

much dexterity by all manner of "operators" and "thinkers", is facile, dishonest. No one denies the role of economic growth in cushioning the crises of an exploding population, but the shattering revelation that the economic capacities built up over our 25 years of independent existence are less than 50 per cent utilised in so many vital areas points to the real truth. We cannot advance without solving this problem on a war footing. The first casualty of populist anarchy has been productivity. The second casualty has been the maintenance of the assets built up over 25 years. And now we are entering the phase of dislocation and closure of units of all description.

ENOUGH IS ENOUGH

Enough is enough. The demand for a return to discipline is crystallising faster than most observers suspect. The opportunist tactics of the trade unions, whose leadership has been utterly oblivious of the magnitude of the crisis facing the country, are under close scrutiny. The attempt to disrupt the railway system around Delhi through lightning strikes and go-slows, at a time when the movement of food makes the difference between survival and explosion, has sparked an official toughness which reflects a new and growing mood in the Capital. Strikes in the Railways have been banned for a period of six months. Any fresh moves to disrupt other critical areas will obviously see the ban ex-

tended. The implications don't need spelling out.

The return to discipline during this emergency will be complex, tension-packed, even violent, but it has to be ordered. No sane government can permit the kind of incipient anarchy that is reported from various parts of the country. The obsession to unionise policemen reveals the plans of those who are determined to exploit the present situation whatever the cost. This is not to suggest that the Congress party is without guilt. It has sponsored a tit-for-tat approach in its battle with opponents, and now it is reaping the whirlwind. We can only hope that between now and September, as normal disciplines are being asserted, Indira Gandhi will punish by sacking those of her colleague and lieutenants who are discredited. The nation is tired of carrying this deadwood.

At this point of writing, the future of the Congress set-up in Uttar Pradesh is under debate. Clearly Chief Minister Tripathi, sitting unconcerned over the messiest situation in India, must go. But who is to replace him? Another white-capped nut or someone with the potential of relevance? Or President's rule? Whatever the decision, it should be motivated by the desire for a basic clean-up. Elections can wait—for three years, if need be. Any approach short of this will only encourage disruption elsewhere, in the heartlands and beyond.

Indira Gandhi, cornered as never before, will probably emerge sooner than later in a tougher, remorseless mood. The central apparatus is likely to feel the impact of these currents. Looking at the scene, what are its prominent features? A Food Ministry tripped up by a Planning Commission determined to gamble with a grain take-over. A Ministry of Mines unable to feed coal to the Ministry of Power and the Ministry of Railways. Ministers of Industry compelled to think of agriculture and marketing. Ministers of Supply and Commerce in little co-ordination, yarn or no yarn. A Home Ministry electioneering and without proper intelligence from the states. A Foreign Ministry building fences. A Labour Ministry playing union politics. And a Finance Ministry busy as usual, holding up what little moves. We'll not talk of the Law Ministry, for the moment! There's a lot to be done. Where does one begin?

The Prime Minister cannot stop short at merely correcting aberrations in the states. Parallel action will be needed at Central level to restore credibility, particularly in a period which has to mark a return to disciplined productivity. Old

Delhi hands refuse to believe that speedy developments are on the way. The situation is tortuous and the selection of action points is the subject of considerable controversy. Then again, disciplined productivity requires immediate attention to long-standing grievances. Obviously, "the system" has to cut through the jungle of talk before it can act. When this talk lessens we will begin zero-ing on certain fundamental corrections.

However, the questioning is fairly precise and persistent? Will a co-ordinated comprehensive view be taken of the

inter-locked causes of the crisis? Will the policy-makers be able to resist their attraction for peripheral issues and remain fundamentalist? Will the ruling party stop looking for scapegoats to cover up its own sins? And will our leading political personalities learn to work together in some degree of mutual trust? A mouthful of questions, but they suggest that we are not all that confused.

Uttar Pradesh may have taught us quite a lesson.

May 28

THE FOURTH ESTATE

Big Brother in the Newsroom

Nireekshak

NEWSPAPERS have been rather full of sex scandals recently. Once upon a time they were taboo in our so-called responsible English language Press. But the scandals galore of recent weeks seem to have freed these newspapers of their inhibitions and now they are vying with each other to do one better on the subject.

In the treatment of these scandals our newspapers are yet far behind the Press in Europe and America. The reference here is not primarily to the big headlines and jazzy lay-outs but to the investigative aspect of newspaper reporting in the West. It was exposure by the press which led to the resignation of the British ministers, Lord Lambton and Lord Jellicoe. Scotland Yard followed up the newspaper allegations in these cases and found them substantially true.

Compare this to *l'affaire Kittur* in India. Though it was the talk of the town in Bangalore for some weeks, no newspaper dare report it. Only when the matter figured in the privileged precincts of the legislative assembly did the Press take it up. Kittur's resignation, which followed press reports of the proceedings of the Assembly, gave the scandal the credibility it needed to survive for some time.

The Mysore Government, like the British Government, will in all probability survive the Kittur episode which will no doubt be hushed up to save many a reputation. Who, after all, are the investigators? The police and its intelligence wing! The Press is just reporting what the police probes reveal.

Nothing more, nothing less.

This is not, of course, the first sex scandal to hit the headlines in the Indian Press. In the late 1950s there was the Nanavati case which figured very prominently in the newspapers. At least one paper, *Blitz* of Bombay, enjoyed a circulation boom on account of its reporting of the case. In the early 1960s the Indian Press, thanks to the foreign news agencies, covered the Profumo-Christine Keeler scandal in Britain rather extensively.

The Nanavati case and the Profumo scandal helped our newspapers to shed some of their inhibitions about sex, and crime stories with a sex angle started appearing on their local pages. This marked a significant change in the attitude of our news editors. But they had to wait another ten years to discover another Profumo and a Nanavati. In between, minor peccadilloes of businessmen (recently, of a Delhi businessman) and of government officials (of a Press Information Bureau official the other day) have continued to figure in the Press. The last two years have also seen a proliferation of magazines and journals with the accent on sex scandals. These, one is assured, command rather impressive circulations.

Incidentally, the language Press often takes the lead in publishing reports of sex scandals. They (and presumably their readers) appear to be less inhibited than the so-called responsible English language press. A Gujarati newspaper has recently alleged that a sex scandal bigger than the Kittur affair is brewing in Ahmedabad. A minister and an MLA

are alleged to be involved in it. The paper has even predicted that, when the scandal bursts into the open, it may spell the end of the Oza ministry. So far, however, no government has fallen because of a sex scandal. These scandals are trivia and serve to cover up far bigger lapses on the part of those in power and to sidetrack the real issues of our time.

This is true of much else that seems to occupy the newspapers. The Watergate scandal in the United States, the Lonrho bust-up in Britain and the Maruti issue in this country have no sex angle to them. Yet they are serving the purpose of distracting public attention, sometimes with the abetment of the establishment and sometimes without it. After all, what is Watergate? A trivial incident which has been magnified by the American Press into a major crime. According to one Robert L. Thornton, an American, who some weeks ago wrote an angry letter to the London *Economist*: "The truth about Watergate is that anyone who dares to challenge the Press, no matter who, can be brought to his knees If you really want to view with alarm, consider the power of the Press in a democracy with an independent television system, subject to absolutely no control and violently monopolistic. Traditionally, we haven't worried too much. Powerful governments constrained powerful networks and *vice versa* and the public interest was relatively safe. But when it is demonstrated that the government is helpless in the face of a vindictive Press, I'm frightened. Even a very good foreign policy and a domestic policy that, whatever its limitations, was just what the common man wanted weren't enough to protect the most powerful politician in the world . . . Most of us have thought Big Brother would appear in the White House. We were wrong. He lives in a New York newsroom."

One may not share the above writer's views on the blessings wrought on the American people and the rest of mankind by President Richard Nixon. But Watergate has served to underscore the awesome power of the mass media, including the Press, in the United States. It is interesting, though, that the power of the mass media is noticed only when it is used to oppose the established political authority, not when it works in close collaboration with the latter—as, for instance, when the American mass media worked hand in glove with successive American administration to give the American people a thoroughly warped view of the People's Republic of China for two whole decades and more.

FOODGRAINS TRADE TAKE-OVER

Who Killed Cock Robin?

(From a Special Correspondent)

IN a country characterised by wide fluctuations in production and frequent shortages of foodgrains, leaving foodgrain distribution to the mercy of the "invisible hand" of the market has grave dangers. Despite the reiteration of this fact by a number of commissions, the Government of India took too long before it finally decided to take over the wholesale trade in foodgrains, beginning with wheat. But the hasty manners in which the wheat trade has been taken over gives it the appearance of an *ad hoc* and casual measure rather than a well thought-out policy. There are a number of gaps in the way the take-over has been effected. These go a long way in explaining the current slow pace of wheat procurement and may even defeat the basic objective of the take-over in the long run.

According to the latest official estimates, total rabi wheat production—the fanfare over the emergency rabi production drive notwithstanding—would be about 30 mn tonnes compared to 36 mn tonnes last year. Of this, about 11 mn tonnes are estimated to be the total marketable surplus of which the government has set the target of procuring 8 mn tonnes. However, till the middle of May—by when the peak threshing season in most areas is over and there is little hope of substantial further supplies in the pipe-line—actual procurement had been less than 2 mn tonnes. This has created great anxiety within the government and now a close hour-by-hour watch is being kept on country-wide market arrivals and procurement through the newly set-up 'control-room' in Krishi Bhavan. Outwardly, the government is trying to present a bold face by comparing the current procurement figures with the low figures of the corresponding period of last year, though the circumstances—in terms of total production, total requirement and weather conditions affecting harvesting dates—are not at all comparable. If the actual procurement is compared with the procurement target for the season, it will be clear that the procurement effort is falling behind schedule. Except in Punjab, procurement in all the major wheat producing states is lagging far behind the target. The situation is particularly alarming in states like Rajas-

than, Bihar and Madhya Pradesh where the governments are finding it difficult to achieve even a respectable part of the targets fixed for them.

NOT THE ONLY VILLAIN

The government is blaming foodgrain traders and the opposition parties supporting them for the farmers' lukewarm response to the take-over of wholesale trade. However, to single out the trader as the villain of the piece is to ignore the many operational deficiencies of the take-over scheme and to underrate the farmers' keen understanding of the objective circumstances of our grain marketing system.

Let us take first the mechanics of the take-over scheme. In its method of initiation and implementation, the scheme shows remarkable similarities with a number of other programmes intended to bring about institutional changes in agriculture, such as that famous non-starter, the scheme for co-operative farming, or the different components of land reforms. In brief, the whole process follows a set pattern: A resolution of the Congress party, followed by press statements by leaders of the party about the proposed change, enactment of legislation or issue of gazette notification or government press note setting out fragmentary details of the scheme and giving the time-table for enforcement; issue of directives to the concerned bureaucracy at different levels; and follow-up action consisting largely of almost similarly-worded public statements by Ministers and other party leaders emphasising the positive features of the scheme, criticising and blaming vested interests for obstructing the proposed changes and, finally, calling for public co-operation for the success of the "people's programme".

History, however, is yet to provide instances of structural changes being brought about by pseudo-activities of the above type. In the case of the take-over of wholesale trade in wheat, for instance, precious little has been done to prepare the farmer, the consumer and all those whose active co-operation is a prerequisite for the success of the programme. Even in a country like China, the unified procurement and marketing scheme did not deliver the goods till

the political cadres entered the operation, classified the producers into poor, middle and rich categories and resorted to different strategies for the three categories to elicit their support for the new scheme. In a country where 'party cadres' constitutes only a talking point at party meetings and the vested interests which are said to be blocking the proposed change are the ruling party's patrons, the means for gathering mass support are very much more restricted and the need for careful spadework, taking realistic account of the institutional limitations, is all the greater.

Further, even if one did not question the possibility of bringing about structural change through official declarations and through the working of a mercenary bureaucracy, the grain trade take-over scheme still leaves too much to be described in terms of clear direction and operational details. The official wavering over many issues such as a compulsory levy, the procurement price, the retail traders' issue price, statutory rationing, non-price incentives to the farmer, the restrictions to be imposed on farmers and traders, etc, are clearly evident from the contradictory statements of central as well as state ministers daily reported in the newspapers. In the absence of a clearly-cut framework, even the best and the most willing administrators will find it difficult to implement the scheme.

Let us examine some of the circumstances which have shaped the farmers' response to the take-over scheme. Firstly, given the scope, the Indian farmer is rather more rational and return-conscious than the most optimistic 'acreage response' studies would indicate. When the partial take-over of wholesale foodgrains trade, covering wheat and leaving out other crops, together with the overall scarcity created a hitherto unknown situation of coarse grains gaining a price lead over wheat, the farmer was placed in a peculiar situation. For example, in the Punjab and Haryana markets, where gram and barley prices during early May ranged between Rs 130 and Rs 140 and Rs 100 and Rs 110 per quintal, respectively, compared to the corresponding levels of Rs 80 and Rs 50 last year, wheat was demanded from the farmers at Rs 76 per quintal by the procurement authorities. Only a simpleton could expect the farmers to willingly sell wheat to the government at such a low rate. This anomaly in prices, a by-product of the partial take-over of foodgrains trade, has not only helped to bring the farmers and traders together, and thus create

additional complications for the procurement scheme, but opened highly rewarding opportunities for traders. During early May, the wholesale price of bajra in the Hapur market was Rs 105 per quintal, while the price quoted in the Bombay market ranged between Rs 185 and Rs 190 per quintal. The corresponding price of maize was Rs 74 per quintal in Hapur and Rs 155 to Rs 160 in Bombay. In the case of barley the prices were Rs 88 in Hapur and Rs 105 to Rs 110 in Bombay. The margin was thus too attractive for the wholesale traders to carry out their threatened boycott of trading in coarse grains from May 7. The traders' federation, therefore, decided not to stop the trade in coarse grains—"in the interest of the consumers"! Besides, the trader could not overlook the convenient cover provided by coarse grains for clandestine trading in wheat.

The completely disturbed price parities are also largely responsible for the farmers' demand for a higher procurement price for wheat, which some of the state governments have marginally conceded. True, the farmer knew of the procurement prices fixed in advance while sowing wheat, but even so he simply cannot reconcile himself to selling wheat at a price substantially lower than that of coarse grains, which are not only considered inferior products but whose cost of production is also low compared to that of wheat. So the farmer is busy making the most of the Godsend (or shall we say government-send?) opportunity provided by the high prices of coarse grains. Even the quota of coarse grains normally retained for feeding animals and making payment in kind to labourers is being diverted to the market. Thus the poor—the consumers of coarse, but now costly, grain—have been hit from one more direction.

HOARDING BY FARMER?

The question to ask, it may appear, is how long and with what expectation would the farmer withhold his wheat stocks? The government and its experts feel that the farmer's hoarding capacity is not unlimited and that sooner or later he will have to sell wheat to the procurement authorities at fixed prices. However, the actual situation in the villages suggests the contrary. From his experience of his own locality the farmer knows better than the experts in Krishi Bhavan about the shortfall in production; he is also better aware of the traders' ability not only to operate despite the take-over but also to successfully evade the zonal restrictions and smuggle wheat for high margins; finally,

he knows about the flourishing clandestine markets outside the traditional markets and is, therefore, fairly sure of the gains to be made by withholding the surplus wheat from the government. In fact, his own participation in the new informal clandestine marketing arrangements (under which traders act as 'brokers' and the farmers make direct supplies to consumers at high prices) has convinced him more than anything else that he has nothing to lose by not selling his wheat to the government. Further, what could be more reassuring to the farmer than the fact that the very officials who visit the villages to persuade the farmer to co-operate with the procurement machinery, while returning purchase bagfuls of wheat at the 'open' market price for themselves and their colleagues. The scare created by the propaganda carried on by the trader and the government (for opposite reasons, of course) has at least in some areas encouraged hoarding of wheat by those consumers who have the means to do so. Thus till the overall scarcity persists, neither the farmer nor the trader can be a loser. All evidence suggests that traders are able to make such larger margins today, even after meeting the 'cost of restrictions', than during the regime of private wholesale trade. Thus the farmer is not really

MAHARASHTRA

The Bandh—and After

D N

THE widespread agitations in rural Maharashtra on May 16 have shaken the Naik government. Not that there is any immediate threat to its existence. But the success of the Maharashtra Bandh points to the possibility of a mass movement among the peasantry. Such a mass movement, organised to secure not some separatist demand, but the democratic demands of the peasantry is something the government must fear.

From having been a backward area in the political map of India, Maharashtra has been pushed by the famine into a leading place in the mass movement in the country. Years of working on relief sites have led to some important changes in the peasants' mentality. While earlier they laboured on their own pieces of land or for a particular landlord/rich peasant, now they are all working for one employer, the government. The peasants who lived off the direct product of their own labour are now wage-labourers. This is, of course, temporary. But the period of

hoarding wheat but marketing it through new informal channels. The trader too has successfully adjusted himself to the new circumstances.

How long the farmer will be able to withhold stocks is thus largely an academic question. The assumption that the resource requirements of kharif sowing would make him yield to government pressure also makes no sense if even a part of what we know about the improvement in the economic condition of the kulkas during the plan periods in general and since the inception of the 'green revolution' in particular, is true. Moreover, the traders' active partnership and the flow of public funds for the proposed kharif production drive will come to the rescue of the farmer in case his hoarding capacity proves insufficient.

The burden of the above story, then, is that not only the trader but the government, the farmer and the consumer are jointly responsible for the poor performance of the wheat trade take-over scheme. But all these elements taken together constitute the total system whose likely behaviour should have been taken into account while framing the take-over scheme. As things are, the relative failure of the take-over, while it is certainly a matter for concern, should certainly not come as a surprise to anyone.

ideologically closer to the rich peasants, and aspired to their position, the famine has shattered this aspiration and forced them closer to the poor peasants and landless labourers. The distinction of owning a little more land is insignificant when compared to the identity of being temporary wage-workers on relief sites. Even the women in the middle peasant families are now working with everybody else.

Students, who are particularly susceptible to the petty-bourgeois ideology of getting ahead on one's own, have also been forced to come closer to the other sections of the rural working population. From the beginning of the academic year itself many students were abandoning their studies and going off to the relief works. Now, in the vacations, even those who managed to continue their studies are on the relief works. Not just university students but also high school students are working, to earn the money with which to pay fees and buy books. Finally, seasonally employed industrial workers (for instance, those in sugar factories) and unemployed workers have also been forced onto the relief works.

This coming together of so many sections of the rural population, the fact of being employed by one employer, viz. the government, and the desperate living conditions have led to the now familiar pattern of frequent agitations in the countryside. The peasants are militant, but they do not seem to have the experience and knowledge to be the initial leaders. In Ahmednagar district students and workers have played the most important role in organising the peasants. In Srirampur, for instance, it is the workers of the Potable Liquor Plant who, under the guidance of the Lal Nishan Party, have played a leading role. These workers are educated and young. Recently they were all dismissed from employment, because they broke away from the recognised Socialist Party union and formed a Lal Nishan union. Now they are working on relief works.

Over the past year or so many struggles have been waged in Ahmednagar district. The nature of the demands has been the same everywhere—the starting of works, the taking up of irrigation projects, prompt payment of wages, and so on. But although all the struggles were similar, they were conducted separately—at the level usually of a single village, rarely of a group of villages that had a common relief work.

The May 16 Bandh made a significant difference to the situation, not all over Maharashtra but at least in some areas like Ahmednagar district. For the

first time there was a common agitation on general demands, like the provision of adequate foodgrains, increase in wage rates, cancellation of new debts, etc. The success of the Bandh in some areas is a testimony to the heightened consciousness of the people. In the earlier struggles there had been a direct connection between the realisation of the demands and the action taken—for instance, gheraoing the overseer to force a payment of wages. Now, the connection between the action (a one-day token strike) and the realisation of the demands (adequate wages, grain, etc) was not so direct.

To come out for such a struggle, as the one of May 16, definitely requires a higher level of consciousness—an ability to think in general class terms that extend beyond a village, and to identify the common enemy. The common enemy must not have been difficult to identify. It was not one landlord here and another landlord there, but the same government everywhere which was obviously seen to be responsible. It was the government that set and paid wages and the government that promised rations.

The necessity of struggle on a general class level, however, was not so easily recognised. In some places, for instance, the peasants did raise objections to participating in the strike—that they would lose a day's wages, that the strike would not achieve anything, etc. But when it was pointed out to them that this strike was not itself going to achieve the demands, and that this

strike was only the beginning in demonstrating to the government that the people were not going to take things lying down, they quite readily accepted it.

This organising of the struggle on a general class basis is an important contribution of the Bandh. The famine and the fight for adequate relief measures have helped to organise the peasants and landless labourers and increase their class consciousness. But it is necessary that the movement not be just one for more and different relief measures. If it continues to be just that, we would get something similar to the trade unionism in the cities and the endless morchas that emasculate the working class. The way ahead is to fight for the eradication of famines. This, however, is not a question of demanding more irrigation projects. As a letter to this journal ("Productive Relief Works for the Rich", April 28, p 773) pointed out, the increase in irrigation will only help those (landlords and rich peasants) who in any case do not face the problem of famine. Famine is essentially due to the precarious economic condition of peasant farming. This is the result of the peasants' insufficient holdings of land, and the amounts they pay as rent and usurious interest. The only way forward for the peasant movement that has been building is through tackling the land question—through taking up the demand for breaking up large landholdings and the redistribution of land among the peasants and landless labourers.

relief works have been the targets, as also grain shops since foodgrains have not been available in sufficient quantities or at fair prices. The last three months, particularly, saw tens of thousands of relief workers all over the taluk coming forward to demand more projects, higher wages, more and cheaper foodgrains, and better working conditions. The Shramik Sanghatana, an organisation of agricultural labour and small peasants, spearheaded this mobilisation. On an average there was one morcha every week, several meetings, distribution of leaflets, and study and propaganda classes. Last month, in protest against official inaction, relief workers even boycotted relief works. At the same time, over the past two months, organised morchas along the Gujarat border had marched on grain shops and confiscated hoarded grain; hoarding in the

region has been serious enough to treble the prices of grain over the past six months even though the drought has not been so severe.

The Bandh in Shahada on May 16 was in a sense a culmination of this organised activity. It was preceded by a study camp of women activists last month, a series of small and large meetings informing the people of their rights under the drought laws and regulations, consolidation of the Tarun Mandals (youth cells) of the Shramik Sanghatana, a 5,000-strong morcha on the police station to protest against police repression, and distribution of leaflets. The Bandh, organised to coincide with the all-Maharashtra Bandh, focused on the Lal Nishan Party's Maharashtra Charter of Demands. These include: starting of more relief works, continuing these for some time after the onset of the monsoons, infrastructure-creating relief works in place of metal-breaking works, equal wages for men and women, increase in daily pay from Rs 3 to Rs 4, compliance with drought relief regulations such as shelter at works sites, and grain supply of 35 kg per week per family of 5 members. There were special local demands too, such as extension of particular relief works and opening up of more ration shops (today there are only a handful of them as a concession to the earlier agitations).

The 3,000-strong procession on May 16 grew to twice its original size as it passed through the streets of Shahada. It shouted anti-government, anti-kulak slogans, demanded full work and full pay for work done. The relief workers had gone on a total strike on the morning of May 16. They marched to Shahada town from villages 10 to 15 miles away; their morchas were led by the Farm Mandal and by women activists. Shopkeepers had put their shutters down, fearing looting of grain. But the morcha was completely disciplined. It culminated in a meeting and a dharna at the Tehsildar's office and at the police station.

A deputation of about 30 workers, including two full-time Shramik Sanghatana activists, submitted the charter of demands to the Tehsildar. A discussion followed, conducted mainly by the labourers themselves. They argued each of their demands, substantiating with ample evidence the corruption, inefficiency and callousness of government officials. The Tehsildar seemed taken aback. He acknowledged the correctness and fairness of their demands, but pleaded inability to make promises which involved decisions by the Collector and other higher authorities. Meanwhile the progress of the discussion within was continually reported to the gathering outside, and the opinion of the general

body was fed back to the negotiators in the Tehsildar's office. The officer was unable to refute, in the face of the overwhelming evidence, the charges of frequent breaches of government regulations and assurances. He tried to reassure the people that he would commend their demands to the appropriate authority. But that failed to satisfy anyone, least of all the women delegates. The mood was: "we want a guarantee, here and now". After some three hours of such exchange, the Collector and the Pranth Officer (next in the hierarchy) arrived in town. The delegates led the morcha to the government dak bungalow, dragging with them the Tehsildar who was by now quite panicky. The Collector was visibly shaken at hearing himself called an agent of the kulaks and the blackmarketeers. The Pranth Officer pleaded to be allowed to speak and to explain the government stand. He made out that all government servants, in particular he himself and the Tehsildar, were 'social workers' and 'humane people with concern for the poor'. The crowd grew restless. The more militant interrupted him and made fiery speeches. The dharna turned into a gherao. Rank and file workers attacked the government. The people began, with the women in the lead, to attempt storming the suite into which the officers had withdrawn. Finally, a delegation entered the suite while the gathering in the courtyard chanted militant slogans and sang revolutionary songs.

Meanwhile, the special police force from Dhulia had arrived and stood watching helplessly—until a few people noticed them and began to order them about to keep the crowd calm. The policemen complied sheepishly. The crowd was getting more and more restive, determined now to stay put until they got hard promises. At last, after about an hour, the Pranth Officer came out again and gave various assurances: commencement of construction of percolation tanks from May 17, more relief works to follow within a week to create employment for 5,000 to 10,000 persons, adequate food rations, and implements and tools which were till then not given to relief workers to be supplied within two days.

That seemed concrete enough for many, but not for all. As the crowd became more restive, the Pranth Officer announced that five more road projects would start on May 18. That quietened the majority. The activists explained to the gathering the significance of their organised action, their partial victory, the need for more struggles and greater mobilisation, the larger context of the Bandh and the large support to it. It resolved to intensify the agitation and to make sure through militant action

that the promises were not broken. Then the gathering dispersed, after a good eight hours of dharna and gherao.

The significance of the Bandh can be seen only against the background of the movement organising the peasants and landless labourers that has been under way in Shahada for well over a year now. As a result of it, what was a backward, literate fragmented peasantry not so long ago has been undergoing an important metamorphosis. Poor peasants and to a lesser extent landless labourers, who work as individuals, essentially in isolation from one another, have been thrown together by the drought relief works. They have acquired in the process of working together some sort of a collective identity based on their collective work and interest. This is the first time that they have been organised for large-scale non-agricultural operations involving disciplined labour and norms of work seldom to be found in pure peasant occupations. This has made the peasantry more organisable and more capable of effective group action. They have also been exposed to new concepts, ideas, techniques, standards and methods—a development which has important implications for the future. And finally, they have become more able to perceive a relation between themselves and workers elsewhere. Another interesting development is the growing numbers of upper-caste (Gujar, Rajput, etc) small and lower and middle peasants, who have been pauperised by the three seasons of drought and are working shoulder to shoulder with the lower-caste and Adivasi poor, and who have come within the ambit of the movement.

An observation that needs to be made concerns the self-confidence that seems to have arisen from the organised militancy and that has now replaced the earlier servility of the poor. They no longer want to petition, beg, or plead to the government. They make demands upon it. There is a new consciousness of their rights to live, to work, etc. They perceive the agitation as a fight for their rights against the state which they increasingly see as a hostile instrument in the hands of the rich rather than as a paternalistic institution designed for their benefit.

Bandhs and partial struggles of this kind are significant and effective in the long run only to the extent that they are followed up and utilised for organisational consolidation and cadre-building. As this is being done in Shahada already, it is likely that the intensification of the struggle of the drought relief workers will be dovetailed into longer-term programmes of action of the peasants and labourers in the area.

BIHAR

Murder to Order

N K Singh

THE Naxalite movement is in disarray in Bihar. So there should have been an end to violence and murder in the state. After all, this is what official propaganda had always led one to believe. However, nothing of the kind has happened. In fact, violence has been at a peak in Bihar recently. Not communal violence of which there is usually so much in the state; nor dacoity and highway robbery; nor petty land feuds, in which Bihar tops the list. The violence one has in mind is class violence, plain and simple. It is the violence of the landlords against the peasants, the upper castes against the untouchables, the capitalists against the workers and the state machinery against the people. It is significant that the violence of the ruling classes has mounted ever since the decline of the Naxalite movement.

Two Socialist workers of Shahabad were beaten to death in broad daylight on February 26. In Selibeli in Madhubani district, seven CPI workers and peasants were shot dead. There have been numerous murders of Harijans and adivasis. In Rupaspur Chandwa in Purnea 14 Santhal sharecroppers, most of them women and children, were shot dead or burnt alive. A prominent Congress leader of Bihar and a former speaker of the Assembly, who is also a big zamindar of the area, is standing trial in the courts.

The Naxalites too are being taught a 'good lesson' on the defensive though they are. 'Encounters', inevitably culminating in the death of 'extremists', are taking place, not only in the jungles of Chottanagpur but also in the populous villages of north Bihar. On May 6, for instance, four Harijan agricultural labourers were shot dead by the police in Chouri village in Bhojpur district. Later it was given out that these were Naxalites who had been killed in an 'encounter'. Many village-level activists of the CPI(ML) are untraceable. They are suspected to have been murdered by zamindars. The daily incidents of loot, rape and beating of agricultural workers and sharecroppers are, of course, too commonplace to even deserve notice.

Gangsterism has been induced into the trade union movement in a big way, especially in the industrial belt of Chottanagpur. The entire coalbelt of Chottanagpur looks like a setting from

some Mexican gangster movie. There were brutal mass murders of workers in the Kumardhubi and Wasuria collieries last month. Trade union activists live under constant threat to their lives.

The brutal murder of Suraj Narain Singh, the Socialist leader and veteran freedom fighter, has drawn pointed attention to this state of affairs. The 65-year old leader, who had been working for unity among socialists, and was in fact an applicant member of CPM, died on April 21 as a result of merciless beating by the police and goondas hired by a Birla factory and its pro-management INTUC union. Suraj Narain Singh, known as Suraj Babu, was the President of the Engineering Mazdoor Sabha (EMS), the recognised HMS-affiliated union of Usha Martin Black (Wire Ropes) factory at Tatisilwa, near Ranchi. To create a rift among the workers, the management of the factory helped to set up a rival trade union affiliated to the INTUC. The recognition of the EMS was withdrawn and the INTUC-affiliated union was recog-

nised by the management.

This led to discontent among the workers. The Labour Department of the state government fixed February 24 for holding a ballot to ascertain the representative character of the INTUC union. However, the ballot was thwarted as a result of collusion between the management and the INTUC. This led to a hunger-strike by workers on April 13-14 in support of the demand for continuation of recognition of the EMS and revision of wages and service conditions. On April 14 Suraj Babu commenced an indefinite hunger strike.

Next day there was an unprovoked lathi-charge by the factory watchmen and police, which also fired seven rounds to "disperse the violent workers". Three workers were seriously injured. The police, the hoodlums of the INTUC and the factory watchmen attacked the EMS office where Suraj Babu was on fast. He was dragged out of the office and was beaten with lathis by the police and the others in the presence of the magistrate and police officers. He was then taken to the time-office of the factory and was again beaten by the police with rifle butts. He was then tied with a rope and thrown in the scorching sun without even drinking water. The police finally left him only when he became unconscious. There is

hardly any parallel for such brutality on an unarmed and fasting leader of Suraj Babu's prominence even during the British raj. There were at least 60 injuries on his person. The Deputy Commissioner and the SP arrived on the scene after two hours and the unconscious leader was taken to hospital.

The political hand in the murder of Suraj Babu was obvious enough. The INTUC-affiliated union in the company is led by one Ramnika Gupta, a close associate of Chief Minister Kedar Pande. Ramnika Gupta has played a very prominent pro-management role in the trade union movement in Hazaribagh and other places. It is said that the police were emboldened to beat up Suraj Babu by Ramnika Gupta's "good relations with the Chief Minister". In fact, the Chief Minister along with Ramnika Gupta had had discussions at lunch at the guest house of the factory just before the fatal assault on Suraj Babu. At a press conference the next day Kedar Pande dismissed the entire incident in an offhand manner and delivered a brief lecture on the 'goondagardi' of trade union workers in the industrial belt of Chottanagpur. During his two-day stay at Ranchi he did not show the courtesy of visiting Suraj Babu in the hospital, though later he expressed his "deep sorrow" at his death.

The local officials tried to suppress the facts about Suraj Babu's condition and insisted that he was "all right". It was only when a group of newsmen visited the hospital that they came to know that he was in a critical condition. When the news was splashed in the

newspapers the Chief Minister announced in Patna on April 17 that a team of doctors was being sent to Ranchi. But the team did not turn up till the death of the old revolutionary at 3.15 p.m. on April 21.

Leaders of all political parties described the gruesome killing as a "cold-blooded murder". The Sarvodaya leader, Jayaprakash Narain, who had been a close associate of Suraj Babu and with whose help he had escaped from the Hazaribagh Central Jail in November 1942, declared that it was a shame beyond words that one of our front ranking freedom fighter should be beaten to death in this manner in free India. An angry Parliament discussed the matter. The Socialist Party demanded the resignation of the Pande Ministry. In a memorandum to the President, the party pointed out that "though the Bihar government has instituted a judicial inquiry, the terms of reference are not adequate".

A large number of grief-stricken trade union workers, students and political workers brought out a big procession at Ranchi with the body of Suraj Babu. Thousands attended the funeral procession at Patna. There were protest strikes, bandhs and condolence meetings all over Bihar. The students of Patna University observed a one-day hartal. In Madhubani, the home district of Suraj Babu, rail transport was disrupted by angry crowds. May 1 was observed as "martyrdom day" at several places. All the opposition parties except the CPI have given a call for a Bihar Bandh on June 7.

TAMIL NADU

Towards a Left Democratic Front?

THE landslide in favour of the ADMK, which polled 52 per cent of the votes cast in the Dindigul by-election, has not come as much of a surprise, although its lead over the Congress (O) of 1,40,000 votes compared to the DMK's lead of 97,635 in 1971, has certainly shaken many who had anticipated a close contest between the two. Karunanidhi's prediction that the only alternative to the DMK would be Kamaraj's party, and his open call to the Tamils never to accept the leadership of an 'alien'—M G Ramachandran is a Malayalee—have come to naught. In 1971, as a united party, the DMK had polled 2,48,000 votes. In last month's by-election, it lost 1,55,000 of its votes to its splinter. The large chunk of votes lost to the ADMK testifies to the long, and widely, held belief that, after the

split, the DMK's rank and file had flocked to the ADMK while its official echelons—MLAs, district and lower level functionaries—had stayed put, linked to the party and to each other by the umbilical cord of corruption.

Karunanidhi has shrugged off his rival's victory by attributing it to the wrong sub-caste of his party's candidate. MGR's statement, when asked before the election why he thought his candidate was sure to win, that it was because the candidate belonged to the majority caste of the constituency, seemed to substantiate this. But then so did all the candidates belong to the majority caste, excepting the original candidate of the CPI(M) who had later withdrawn in favour of the ADMK candidate. All the candidates belonged to the Makkalathore caste, though it may

be said that Maya Thevar, the ADMK candidate, had the added advantage of belonging to its most populous sub-caste, the Piramalaikkallar. It would, of course, be an oversimplification to attribute Maya Thevar's triumph to this factor alone. Were it that crucial all the other parties too would certainly have chosen their candidates from the same sub-caste. Even assuming that all the 1,20,000 Piramalaikkallars voted for Maya Thevar—an absurd supposition even in this caste-conscious country—he has certainly managed to get 1,40,000 non-Piramalaikkallar votes as well. For all the DMK leaders' insistence that this was purely a caste and cinema vote, the widespread discontent of the people with the soaring prices and the power crisis, together with the 'iron hand' regime of Karunanidhi, have had a large role to play in the Dindigul election.

Almost every leading political personality has been cut to size in Dindigul. The Congress whose candidate—polled 2 per cent of the votes ranked the lowest. The party's two Central Ministers from Tamil Nadu, C Subramaniam and Mohan Kumaramangalam, however close they may be to the Prime Minister, seem to be far removed from the Tamil people. The party's lack of roots among the masses was shown up most aptly in a chat this writer had with a Jutkawallah in Dindigul two days before the election. "This Congress is sure to win", he said. "Which one? You know, there are two of them". "What do you mean?", he asked genuinely shocked and added more to reassure himself. "There is only one Congress here. That's Kamaraj's party." And this, despite any number of Central Ministers who invaded Dindigul, making hair-raising speeches about the "bloody revolution that no power on earth could prevent" if Indira Gandhi's "revolutionary plans" were thwarted by the right reactionaries! The great Indira wave of 1971, already gradually receding in the face of the mounting national crisis, had become a droplet by the time it hit Dindigul.

The people, who had wondered all along why the enquiry commission from Delhi to investigate charges of corruption against the DMK Ministry was not forthcoming, were told brazenly by the two Central Ministers from Tamil Nadu that, if they wanted a commission, they should vote for Indira's party. Mohan Kumaramangalam asked, "What's the use of voting for the ADMK candidate when all that he could do is to send yet another petition to Indira. If you vote for our candidate he would personally approach her and see that a

TRAIN YOUR TRAINING EXECUTIVE AND PLANNERS AT CENTRAL STAFF TRAINING & RESEARCH INSTITUTE, CALCUTTA, DASNAGAR, HOWRAH-5.

The Central Staff Training & Research Institute, Calcutta, Dasnagar, Howrah has been established by the Govt. of India in collaboration with the Federal Republic of Germany. This Institute runs regularly the staff training courses for developing training officers from industrial establishments as effective training executives for planning, organising, executing and evaluating skills and supervisory training programme in the establishments.

Duration of the Course: 3 Months.
Courses during the year 1973: (a) Period from 2-7-1973 to 29-9-1973
(b) Period from 1-11-1973 to 31-1-1974.

Eligibility: Persons already serving or proposed to serve as Training Officers in industrial establishments having degree or diploma in engineering, are eligible for the course. Private individuals having requisite qualification and experience may be accepted on individual merits.

Course Fees: (a) The tuition fees of Rs. 20/- per month is charged from the participants nominated by private organisation. (b) Private individuals have to pay a tuition fee of Rs. 25/- per month. (c) Nominees of Government organisation are not required to pay any tuition fees. Tuition fees are to be deposited lump sum in advance for the full duration of the course.

Accommodation: Hostel facilities consisting of modestly furnished single room accommodation are available at a nominal rent of Rs. 2.50 p.m.

N.B.: Application forms or any other particulars related to the course can be had directly from the Director, CST & RI, Calcutta, Dasnagar, Howrah-5.

DIRECTORATE GENERAL OF EMPLOYMENT & TRAINING
MINISTRY OF LABOUR & REHABILITATION,
GOVERNMENT OF INDIA

davp-391(9)/73

commission is formed". This, plus the thinly-veiled boast that only the Indira Congress had the power to topple the DMK, regardless of who got elected, were the themes harped on by the ministers. Thus without the slightest hesitation our high-level corrupters went around openly bargaining for a price for appointing a commission.

Kamaraj, the strongman of Tamil Nadu, who, rarely bothering to attend Parliament, has spent the last few years touring every nook and corner of Tamil Nadu, seems to have sweated it out all for nothing. Although the Dindigul election cannot be said to have sealed his political future, it has taught him the lesson that he had his party had refused to learn in 1971—that the old style law-and-order rhetoric as much as Indira's new wave rhetoric, has ceased to pay in Indian politics; people are fed up of old parties, old faces and old-style politics. ADMK has had a generous bite of Kamaraj's base in Dindigul while the latter has made no inroads into virgin territory and no new conquests. Even maintaining the traditional base has proved too big a task.

The people of Dindigul have told the state's rulers that they are no longer in a mood to indulge their party in its soda bottle throwing and cycle-chain wielding pranks. The DMK thugs, well-trained in these antics as the frontliners in breaking the many working class struggles in the last few years, roamed the constituency, liberally practising their sanguinary skills. Karunanidhi's followers in Dindigul attempted to create a mini, but third-rate, imitation of West Bengal at the time of the 1972 elections. Hundreds of ADMK followers were arrested even while they were on their way to Dindigul. The party's election offices were attacked. Rickshaw-wallahs, the traditional supporters of MGR, were beaten up if found flying ADMK flags and their rickshaws smashed up. Muthu, the flamboyant DMK mayor of Madurai—who is now blamed by Karunanidhi for the election debacle—and chief of the DMK's army, 'seerani padai', toured the area in an open jeep with his men brandishing swords in a live demonstration of how political power grows out of the blade of a sword. This was the man who had, during the year-long Simpson struggle, vowed publicly that for every single DMK worker killed ten heads will roll. Another DMK stalwart, Quader Pasha, a high party functionary and a star of the celluloid world, the newspapers reported, pulled a gun on a crowd which became restive when he began to address a meeting scheduled for Kamaraj. He was over-powered and

his gun seized when he threatened to use the ADMK office for target shooting. The gun seized was actually handed over to the district sub-collector, who was on the spot but who had remained strangely paralysed. In all these incidents, as in many others, when DMK men began to disperse opposition party meetings or indulge in any sort of hooliganism, the police stood watching, bored and Buddha-like. Police inaction at DMK's rowdism and police brutality against the DMK victims, have by now become the established pattern of behaviour of the law and order machinery in Tamil Nadu. The initial shock and disbelief at such open partiality have gone. Perhaps it was DMK's blind faith in its invincibility that allowed to election day pass without any untoward incidents. The bitter irony of Central ministers warning the state official against misuse of authority in the elections, their repeated calls to the people to vote without fear, and their assurance that the Centre would guarantee a fair and free election was lost on the people of Dindigul who—excepting for a fraction of a minority—had never heard of the story of West-Bengal 1972.

Karunanidhi had charged that the Communist parties, which even the great Anna could not unite, had been brought together by MGR's black money. Though sharing the same platform, the tenor of the two parties' speeches were totally dissimilar. For the CPI(M), which had agreed to support the ADMK only after MGR had announced his readiness to fight Indira Congress—however vaguely and belatedly the intention was expressed—it was a valuable occasion to carry its anti-DMK and anti-Centre policies to the hundreds of thousands whom it could not have otherwise reached. It was a rare opportunity to politicise the ADMK masses, hitherto untouched by class politics. Dindigul is one of the strongholds of the CPI(M) which commands the allegiance of the thousands of tannery and municipal workers. The significance of the coming together, even temporarily, of the organised working class followers of CPI(M) and the unorganised and lumpen supporters of ADMK cannot be overlooked.

The CPI's dilemma was heart-rending. Anguished at its mentor's decision to go it along and yet realising that it was MGR who had the masses behind him, it managed to remain Her Majesty's most loyal opposition by reserving its sound and fury wholly for the DMK and the "Right, reactionary alliance". Rarely ever did a word, even in response to the Central Minister's

taunts, escape the CPI campaigners. Still, vehement criticisms of Indira Congress from the joint platforms are bound to have had an impact on the CPI's rank and file and accentuated the contradictions between the pro- and the anti-Indira factions within the party in favour of the latter.

Is Dindigul an indicator of the future trend in Tamil Nadu politics, or is it a chance move in a mindless game? Whatever its future implications, it has for the time being registered the Tamil people's stark rejection of the policies of the Central and state governments. However unsophisticated this rejection might be, and despite the undeniable element of charisma in the ADMK's victory (the DMK and now its offshoot, more than any other party, have demonstrated what a powerful medium of political mobilisation the cinema could be), it has pushed to the fore the bitterness and disgust of the people with the existing order of things.

Can the alliance between the three parties develop into a democratic front, an alternative to the existing political forces in Tamil Nadu? The fate of the anti-Congress electoral alliance of 1967 is a little too obvious to call for any elaboration. The ADMK leaders have said they want a further consolidation of the alliance. One of their top leaders said in an interview that the present alliance between the ADMK and the Marxists was not comparable to that of 1967 as the present alliance, unlike the former, marked a clear polarisation of political forces in Tamil Nadu. The CPI, also desiring a similar development, would and the predictable proviso that the Indira Congress should be included in any such front. The CPI(M) had backed the ADMK precisely in the hope of developing a Left democratic third front. The task of forming it is fraught with many a contradiction, in the resolution of which the fragile alliance might well break. A lot would depend on the ability of the CPI(M) to sustain the anti-Congress posture of the ADMK—just now a mere electoral necessity—long enough to be able to transform it into a policy desired and demanded by its followers. And it would be a marathon task to re-orientate the anarchic and frenzied politics centred around a matinee idol.

What does Dindigul portend for the future? Almost every opposition leader in Tamil Nadu has demanded the resignation of Karunanidhi's ministry. And the chief minister, a consummate politician, has pointed out that if one were to resign for every by-election lost, Indira Gandhi should have already resigned four times and Achutha

Menon twice. Nor does any large-scale defection from the DMK's legislators seem likely. Even though a mid-term poll is widely talked of, it seems quite unlikely at the present moment. After Dindigul, Indira Gandhi will be the last person to force the pace.

The ADMK is certainly the most popular political party in Tamil Nadu. Centred primarily on a single hero, drawing sustenance largely from his fans, and lacking a serious political approach, the ADMK lacks stability.

Industrial Relations in the Public Sector

A Critique of the National Seminars

Baldev R Sharma

THE Action Committee on Public Enterprises, set up in January 1972, has been examining, among other things, the problem of industrial relations in the public sector. One of the members of the Action Committee prepared a draft Action Plan document in September 1972 which was circulated among 30 or so critics drawn from diverse fields. These critics made their comments and observations on the document in the course of a special Seminar organised for the purpose at the India International Centre, New Delhi on October 19, 1972. In the light of the comments and observations of the critics, the earlier draft was revised by a drafting committee consisting of five members.

The revised Action Plan document was submitted to a cross section of national and industry-based trade union leaders and to a select group of chief executives from the public sector for their comments. On December 15 and 16, 1972, as many as 56 persons met at the India International Centre to discuss the revised Action Plan document. Almost three-fourths of the participants in this Seminar (41 out of 56) were trade union leaders. Therefore this first Seminar will be referred to as the Seminar of trade union leaders.

A day after the first Seminar ended, another Seminar was held at Vigyan Bhavan, New Delhi, on December 18 and 19, 1972. The second Seminar was attended by 37 participants, 28 of whom (75 per cent) were senior management personnel of public sector enterprises. This second gathering will be referred to as the Seminar of the management group. The participants of the second Seminar concentrated on some of the issues dealt with earlier by the trade union leaders. This was possible because a draft summary of the issues covered in the first Seminar had been circulated to the par-

Consolidation of its alliance with Left forces would depend largely on the mass base and strength of the Left parties themselves—especially the CPI(M). In a fit of impotent rage, Karunanidhi vowed at the peak of the election campaign that the wiping out of the two Communist parties from Tamil Nadu will receive the highest priority in the work of his ministry and party. This suggests that he is well aware of the potential danger to his own party from a Left Democratic front in Tamil Nadu.

The three Seminars failed to produce agreement on any of the following issues which have for long taxed the minds of those concerned with the question of industrial relations in India:

(1) *Registration of a Trade Union*: The management group favoured a change in the existing laws regarding registration. To discourage the mushrooming growth of unions, they suggested that the government should register only those unions which have the support of at least 10-15 per cent of the employees. However, the trade union leaders and the management personnel failed to agree over what should be the minimum qualifying membership for registration of a trade union.

(2) *Recognition of a Trade Union*: The trade union leaders could not agree among themselves over how to determine the recognised union. Some favoured the existing "verification" method while others were in favour of the "secret ballot". The management group left the matter entirely to the trade union leaders. They felt that the unions should resolve their own differences and that whichever proposal they agreed on would be acceptable to the management group. Thus the recognition issue still remains unresolved.

(3) *Third Party Intervention*: The trade union leaders favoured bipartite relations and, if necessary, voluntary arbitration. But the union leaders advocated that when both these steps failed, the two parties should be free to take "appropriate action" without any third party intervention. The management group, on the other hand, strongly favoured third party intervention in some form or the other. Each party stuck to its already well known position and so there was no agreement.

(4) *Workers on the Board*: The trade union leaders could not agree among themselves over workers' participation at the level of Board of Directors. The management group did not agree to the suggestion of union nominees to the Board. Thus the two parties failed to resolve the question of workers' representation on the Board, each for its own reasons.

(5) *Participative System*: Although both trade union leaders and management personnel accepted the idea of substantive participation, they seriously disagreed over how to operate the participative system. The trade union leaders favoured "co-control" and "determinative status" and not just "consultative status". They also cautioned that the participative system will not work unless all the parties were properly educated and unless the managers changed their present attitudes towards workers. The

Also, the revised Action Plan document was kept in the background for occasional reference when necessary.

Finally, a joint Seminar of the trade union leaders and the heads of public sector units was organised at Vigyan Bhavan on February 6 and 7, 1973. Also present at this third (joint) Seminar were officials from different Ministries of the Government of India, representatives of the Action Committee on public sector enterprises, and some specialists. In all 78 persons participated in the joint Seminar of whom 27 (34 per cent) were trade union leaders, 23 (29 per cent) public sector heads, 20 (25 per cent) government officials, 4 Ministers, and the remaining 4 academicians. The participants were supplied with the following documents: (a) the revised Action Plan document, (b) a summary of the issues covered in the first Seminar of trade union leaders and (c) a summary of the issues covered in the second Seminar of the management group. The Table gives a breakdown of participants in the three Seminars.

The organisers of the Seminars have prepared summaries of conclusions reached at each of the three Seminars. Based on these three summaries I have prepared a master summary of the outcome of this whole effort on the part of the Action Committee on Public Enterprises. To facilitate discussion, all the materials have been classified into a few broad topics and then for each topic I have tried to present in one place the substance of the deliberations of the three Seminars. Toward the end of the summary, I will present my critique of the outcome of the series of Seminars. It may be pointed out that, as the title suggests, this is a critique of the three Seminars and not of the draft Action Plan per se.

management group, while basically accepting the idea of participation, felt that the suggestions made by trade union leaders regarding "co-control" and "determinative status" needed further exploration and deliberation. Thus the question of participation too remained unresolved.

(6) *The Role of the Recognised Union:* The trade union leaders maintained that the "recognised" union should have a charter of rights while the "unrecognised" unions should deal with individual grievances and disputes in relation to their respective membership. Whereas the management group accepted the role of the "unrecognised" unions, as suggested by the trade union leaders, they wanted that a document be prepared laying down the norms governing the role of the "recognised" union.

(7) *Officers/Supervisory Associations:* There were two contradictory views which remained unresolved. According to one view, officers/supervisory associations should continue existing as independent bodies, but according to the other view these associations should be entitled to join the workmen's unions.

(8) *Welfare Measures:* The two parties generally agreed that social policy for the public sector can become a useful instrument in mitigating the consequences of inflationary pressures. When faced with operational details, however, the trade union leaders and the management personnel failed to agree over who should undertake the distribution of subsidised essential commodities.

ACHIEVEMENTS

On the positive side, the trade union leaders and the management personnel readily agreed over the following issues:

(1) *Personnel Function:* The two parties agreed that (a) the bureaucratic culture should be discounted; (b) to ensure continuity the deputationists should be allowed to continue for a considerable period; (c) the deputationists should be asked to make up their minds within a period of six months; (d) the government officials should not be barred from moving into the higher ranks in public sector units; and (e) the personnel function should gradually shift to a performance-based reward system at least for the managerial group.

(2) *The Role of Ministry Officials:* It was agreed that the Ministry officials on the Boards of public sector enterprises should play a facilitating role in dealings between the Board and the government.

(3) *Craft Unions:* The two parties agreed that the general trade unions should try to gradually integrate the craft unions within their fold.

(4) *Shop Councils:* There was agreement over the functions of the proposed

Shop Councils.

(5) *Unit Level Enterprise Council:* There was broad agreement over the structure and functions of the proposed unit level Enterprise Council.

(6) *Communication System:* To develop an effective communication system it was agreed (a) to demarcate issues in terms of bargainable and non-bargainable, (b) to have direct and fast communication between managers and the top management, and (c) to evolve an upward communication system through joint union-management efforts.

(7) *Social Policy:* It was generally agreed that as far as possible welfare measures in the public sector should be uniform and that social policy for the public sector should be evolved in the context of the basic objectives of the Fifth Plan.

(8) *Appropriate Government:* The general view was that the Central Gov-

ernment should become the "appropriate government" for the public sector enterprises controlled by the Central Government, as is the current practice with regard to Railways, Ports and Docks, Banking, Insurance, etc.

DISCUSSION

The preceding summary of conclusions shows that in half of the cases it was possible for the trade union leaders and the management personnel to reach an agreement, while in the case of the other half of the two parties continued to be divided and, therefore, failed to resolve the issues. On the surface at least this record of achievement appears to be quite impressive. However, a closer look at the preceding summary shows that the so-called gains are deceptive and that there is no cause for jubilation.

It goes without saying that the topics on which agreement was reached between

the parties were all non-controversial to begin with. For example, few will disagree with the view that the bureaucratic culture should be discounted; that the reward system should be performance-based; that the deputationists should make up their minds within a specified period; that the Ministry officials should help rather than hinder the relationship between the public sector units and the government; that there should be direct and fast communication between different levels of management; that there is a need to have a system of upward communication; that as far as possible there should be uniform welfare measures in the public sector; and that social policy for the public sector should be consistent with the basic objectives of the Fifth Plan.

Few are likely to disagree with the views just mentioned because these have become more or less clichés. While it is certainly useful to have an occasional public affirmation of even the well-accepted views, the crux of the problem lies in their implementation. None of the three Seminars went into the operational details showing how to discount the bureaucratic culture in a public sector unit, or how to switch to the performance-based reward system, and so on. In view of these considerations, many of the so-called achievements shown on the "credit" side are misleading.

On the "debit" side, the trade union leaders and the management personnel could not agree on any of the critical issues that directly influence the climate of industrial relations in the country. Questions like registration and recognition of a trade union, intervention by the third party, and workers' participation in management could be considered the nuts-and-bolts of industrial relations, not only in the public sector but also in the private sector. These issues have for long defied easy solutions and we are no nearer a solution as a result of the Seminars reported here.

The organisers of the various Seminars had planned that after the draft Action Plan document had been discussed by (a) a cross section of the national and industry-based trade union leaders and (b) a select group of chief executives from the public sector, it would be finalised for the consideration of the government. It was also decided in the third (joint) Seminar that the basic ideas that emerged out of the three Seminars should be presented to the Ministry of Labour for appropriate action. This decision was based on the hope that some of the ideas emerging from the Seminars would provide a useful guide to the proposed industrial relations legislation.

Looking at the record of achievements

TABLE				
Seminars	1st Seminar (Dec 15-16)	2nd Seminar (Dec 18-19)	3rd Seminar (Feb 6-7)	All 3 Seminars Together*
	Union	Mgt	Union + Mgt	
Participants				
Ministers	5	3	4	12
Govt Officials	4	3	20	27
Mgt Personnel	5	28	23	56
Union Leaders	41	1	27	69
Academicians	1	2	4	7
Total	56	37	78	171

* It may be pointed out that many of the participants attended more than one Seminar and some attended all the three. Therefore, the total number of participants shown in this column is naturally higher than that actually involved with the three seminars.

and failures of the Seminars, one wonders whether we have a learned anything new that was not known already or whether we are any nearer solving the difficult problems of industrial relations in this country. Both the agreements as well as disagreements between labour and management, as highlighted by the series of Seminars reported here, have been well known to those connected with the subject of industrial relations. In view of this, the knotty problems of industrial relations remain just as complex today as they were before the Seminars were held.

Even if one considers the agreements reached between the parties to be significant, their relevance to the impending industrial relations legislation seems questionable. Things like rational personnel policies, better communication systems, attitudes and behaviours of Ministry officials, and integration of craft unions with industry unions do not require and need not wait for legislation by the government. At the grass-roots level, where implementation of such innovations is to take place, what is required is not public pronouncements and declarations at the national level but education of the concerned personnel at the unit level.

Of all the unresolved issues listed on the "debit" side, the most fundamental is the question of "recognition" of a union. The three Seminars reported here as well as several other such seminars and conferences held during the last many years have all pinpointed the area of disagreement. Whereas most of the major trade unions in India today are in favour of using "secret ballot" as the method of determining union recognition, a few of them (especially INTUC and its affiliates as well as the recently formed National Labour Organisation) have consistently opposed this method and have favoured the continuation of the existing "verification" method.

The pros and cons of using one method as against the other are too well known to require elaboration here. If therefore, the recognition question has not been resolved so far it is not because we do not know what is the right course of action to take. Rather, it is because certain vested interests are being protected through prolongation of the controversy. Meanwhile, the nation is paying a terrible price through inter-union rivalry and its manifestation in many ugly forms. While it is true that settling the question of "recognition" will not remove inter-union rivalry altogether, it will certainly reduce much of the industrial relations conflict both in the public and the private sectors.

It will be naive to imagine that given proper atmosphere for a dialogue and sufficient time, the parties concerned will be able to resolve their differences over matters like union recognition. This has not happened in the last 25 years and may not happen in another 25 years. This is the time, therefore, to stop going for soft options and start making some hard choices. If the government as the third party really wants to play the role of an unbiased mediator between labour and management, then the only rational choice it can make is to allow the workers to "elect" the union of their own choice.

When the workers are granted the right to choose their own union as suggested above, many of the secondary problems of industrial relations (e.g., registration of a union, multiplicity of unions, inter-union rivalry, litigation, third party intervention, and the like) will be considerably reduced. The responsibility to take immediate action, therefore, lies squarely on the shoulders of the government and not on the parties involved in the conflict.

[The author wishes to thank his many colleagues who made valuable comments on the first draft of this paper.]

Institute for Social and Economic Change

BANGALORE

Applications are invited for the following posts in the Institute in its education unit.

1. Fellow (Corresponding to University Reader)
2. Technical Assistant

Pay Scale: (1) 700-50-1250. (2) 210-10-290-15-320/EB-15-425.

Allowances: Same as admissible in Bangalore University.

Qualifications: (1) Ph.D. in Education/M.Ed. First/high second class, minimum ten years' teaching experience of B.Ed./M.Ed. classes/experience of educational administration/extension education. Preference will be given to candidates with doctorate and with experience of conducting and guiding research.

(2) M.Ed. first/high second class plus experience of not less than three years in teaching and/or research.

The selection committee may relax qualifications in exceptional circumstances and can also consider suitable candidates from outside the list of applicants.

Candidates from the Scheduled Castes and Tribes are requested to mention the fact in their applications.

Candidates should give their bio-data stating age, qualifications and publications and names of two academic referees. Applications should reach the Registrar, ISEC, Carlton House, Palace Road, Bangalore-560 001 not later than 14th June, 1973.

Notes forming part of the Accounts :-

- (1) The actual amount of liability arising from future gratuities payable to staff has not been ascertained but is greater than the amount provided.
- (2) As returns in respect of Pakistan (including areas now comprised in Bangladesh) Branches have not been received for the period after 30th June, 1965, unaudited returns as at that date only have been incorporated in the Bank's Balance Sheet as at 31st December, 1972. As no further information is available, the assets and liabilities in Pakistan have not been shown in the Balance Sheet under the individual heads but only the net book value thereof has been incorporated.
- (3) The figures for the previous year have been regrouped where necessary and possible.
- (4) Certain old items in the branch reconciliations remain to be cleared. The balancing of general ledger with subsidiary ledgers/schedules remains to be completed at a few branches. The schedules supporting general ledger balances and reconciliation statements for accounts with other banks were not ready at a few branches. Necessary steps are being taken in this regard.
- (5) Bills of exchange amounting to DM. 10.5 millions reported to have been discounted with some German/Swiss Banks were purported to have been endorsed/guaranteed by the Bank's London Branch and in respect of claims relating to these bills legal proceedings had been instituted against the Bank. These claims have been settled by the date of signing the Balance Sheet at amount as advised by Bank's counsel. Provision, net of tax, in respect of claims settled after the date of the Balance Sheet has been made.
- (6) For the years 1970 and 1971 the provision for bonus disclosed as an appropriation of profits after transfer to the Statutory Reserve. For the current year, the said provision has been charged to the Profit and Loss Account.
- (7) There is a pending demand from the employees for payment of bonus for the year 1972 in excess of the amount provided. The provision made in the accounts is on the basis of the offer made by the management to the employees.

Bombay, 14th May, 1973

Auditors' Report to the President of India

1. We have audited the attached Balance Sheet of Central Bank of India as at 31st December 1972 and also the Profit and Loss Account of the Bank for the year ended on that date annexed thereto, in which are incorporated the returns of 168 Branches audited by us, 422 Branches audited by other auditors, 5 Branches in Pakistan (including areas now comprised in Bangla Desh) for which unaudited returns as at 30th June, 1965 have been incorporated and the unaudited returns in respect of 509 Branches not visited by us. The Branches to be audited by us and the Branches to be audited by other auditors have been selected by the Bank, in accordance with the guidelines issued to the Bank by the Reserve Bank of India.
2. The Balance Sheet and the Profit and Loss Account have been drawn up in Forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that—
 - (a) In our opinion and to the best of our information and the explanations given to us and as shown by the books of the Bank:—
 - (i) the Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1972 and
 - (ii) the Profit and Loss Account read with the notes thereon shows a true balance of profit for the period covered by the Account;
 - (b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;
 - (c) The transactions of the Bank which have come to our notice have been within the powers of the Bank;
 - (d) The returns (except for Pakistan including areas now comprised in Bangla Desh Branches—See Note (2)) received from the Branches of the Bank have been found adequate for the purposes of our audit.

LAOS

At Pathet Lao Headquarters

Harish Chandola

A VAST valley ringed with towering mountains opens up. It is not cultivated, but is free of the dense forests that cover the higher reaches of the mountains. The earth is dark, burnt brown.

Within the valley are several smaller limestone hills, living under the shadow of the towering ones. In them there are hundreds of caves, and while driving as you turn a corner, you can see, here and there, small bamboo-mat platforms nestling under cliff overhangs. The people living in the dark caverns use these platforms for enjoying the natural light and sunshine for a few hours when the US planes are not overhead.

One does not see much activity at the cave mouths. The road winds between the smaller hills and then leads up to the entrance of a cave. There is a tall Laotian in a blue jacket there to welcome us. We are led into a fabulous man-made cave. A stone and cement-concrete wall eight feet thick and twenty feet high protects the entrance of the cave from splinters of bombs falling in the neighbourhood. We wind our way around more cement-concrete walls inside, measures of protection against bomb-blasts. This is the guest house or guest cave of the headquarters of the Lao Patriotic Front (LPF), popularly known as the Pathet Lao.

The space within the cave is divided with wooden partitions. A door in a partition is opened and we are led into a large hall, lit with two kerosene lanterns. Otherwise, it would be pitch dark inside. In the hall there are several sofas, well-upholstered, a settee, a coffee table and small side tables. The coffee table is covered with a hand-woven intricately-patterned cloth the Laotian women weave on their looms. There are flowers in a vase made out of the metal from shot-down US planes.

A light floats through the darkness and when it comes near we see a Laotian woman in her traditional sarong, lantern in hand, bringing us a pot of hot tea. The tea is in a delicate China pot and the cups into which it is poured are equally delicate.

In brighter light, I see electric wires running along wooden beams and a large electric lamp on the ceiling. There are switches on the wooden walls. Over wooden beams a canopy of white cloth is stretched to create the impression of a ceiling. Beyond the point where the canopy ends, one can see the corrugated

galvanised iron sheets providing a proper roof under the rock. They prevent the rock from dripping water on you and help in keeping the living and working quarters a little less damp.

After tea, I am shown to my room which is further into the cave, along a cemented, plank-walled passage. There are curtains on the door and on the wooden frames, cut like windows, of the room given to me. The plank-walls of the room do not reach up to the tin roof and end eight feet above the floor. In this cave-room there are three beds, one with a clean, white mattress, sheets, pillows, a quilt and a mosquito net. There is nothing on the other two beds. In a corner, there is a coat and hat stand and there are two kerosene lamps aglow on two tables, one near the bed. The writing table has a neat table-cloth and two chairs near it. In an enamel tray there are two light-blue enamel mugs, an ash-tray and on a plate a packet of 20 Chinese cigarettes and a "Double Happiness" matchbox, also from China. Also there is a thermos flask full of hot water and a bottle of cold, boiled water.

DREAM CAVE

It is frightfully cold inside the cave. There is no wind, but the cold just gets into your bones. Being here is like returning to one's childhood dreams of living in a cave. The wonder of being in a cave does come back even to grown-ups when they enter one for the first time.

I go out. It is bright daylight, though clouds still cling to the cliffs. Flowers are planted at the entrance. A little beyond, there are small squares of onions and lettuce on soil brought up from elsewhere and piled on top of chipped rock. A little below, on the valley floor, there are cabbage patches, tended by the keepers of this cave, and in and around the patches are bomb-craters showing that the cave-mouths had been severely bombed.

Higher on the hill, under a overhang, there is a water-tank. Pipes lead from it into washrooms. The toilets in the cave are of glazed China with a flushing system. Almost everything in this cave has been brought from places thousands of miles away, part of the way on human backs and then over very bumpy motor roads. I marvel at the care taken in bringing these very

fragile things to this remote area.

As I sit down to write this, electric lights overhead begin to glimmer. An electric generator is being switched on. After flickering a couple of times, the lights become steady.

After a while lunch is served. Again elaborate care. Cut-glass from Czechoslovakia laid out. The dining-room is brightly lit with tube lights. In a corner, a cupboard full of cut-glass. Lunch is relatively a simple fare. Carrot soup, chicken curry and rice and tinned pear-halves in syrup from China. We greatly relish the food. It is our first meal after the bowl of noodles in Mac Chou.

Among the hundreds of caves around, some are so large that over 500 people, or the population of two villages, lives in them. Sam Neua province, where we are, was the first to be completely liberated during the first Indochina war. The Geneva Conference of 1954 had asked the Pathet Lao forces to regroup in Sam Neua, so that the French could withdraw their forces from precarious and untenable positions and take them home.

When US planes began bombing every village and hamlet in Sam Neua in 1964 and destroyed every single house, the survivors simply moved into the natural caves, because they were the safest places to live in.

The LPF (Pathet Lao) leaders including Souphanouvong, its Chairman, also moved into the caves. Soon they found that there were not enough caves to accommodate the entire population of Sam Neua province. And so the LPF began building new caves by blasting mountainsides with dynamite. It was in this process that the Central Zone (the term used for the headquarters) came into being. In the area where the leadership lived, new caves had to be created to accommodate members of the Central Committee of the LPF, its offices, cadre training schools, workshops to maintain and repair arms and motor vehicles and later safe parking places for armoured cars and tanks.

From the Central Zone I made several visits to various areas where the villagers lived and to institutions created by the LPF. This enabled me to see and understand that a new civilisation was being developed by these people who had been forced to live in caves.

At dawn a loud bell rang for a while. In a few minutes people appeared at cave mouths and in that dim light began their exercises. Then they disappeared into the caves again. Since this was the Central Zone, the people I saw exercising were the leaders, their families and cadres working at the headquarters. But later I was to see

similar exercises at the twilight hour at the mouth of other caves where the villagers of Sam Neua province lived.

How did it feel to live in the twentieth century in mountain caves like prehistoric man? Before I tell you what the villagers told me, I would like to record by own experience. Though the cave in which I was housed was one of the very best, it was extremely inconvenient and uncomfortable to stay inside. It was pitch dark all the time. The nights I spent there were very cold. Living and working areas smelt of kerosene fumes all the time. In my cave there was electric supply, but it was switched on only thrice daily, mornings from 6 to 7 for breakfast, from 11 to 12.30 for lunch and from 6 to 9 in the evening.

The first two nights I had nightmares. I dreamt I was in a tomb. In the morning after my first night in the cave, I woke up with a fever. That evening a medical assistant, a girl of the Meo tribe, who looked after the health of villagers in one of the liberated zones, called at the guest cave. She was very charming and began by saying that it was the first time that they had an Indian guest in their Central Zone and that the Lao people were very thankful to the Indian people and government for their support to the Lao struggle. After such pleasant talk, she asked: "And how is the health of our guest?" I said I was well, but the interpreter interrupted and told her that I had woken up with a fever, though I was able to go around visiting places during the day without difficulty.

HEALTH FACILITIES

She said I need not worry about that, because the entire people of Sam Neua, when they first moved into the caves, had fever, some for a few days and others for a week. The fever had something to do with getting used to living in a cave. "If you move into a cave in Laos, you cannot escape this fever", she said. Then she opened her big brown leather bag, on which a red cross was painted prominently, took out two bottles from it, handed them to me and prescribed that I must swallow four pills from one bottle and also four from another, daily. One contained capsules and the other some white tablets which I thought were some sort of sulphur preparations, both made in China. After telling me something about the health facilities the Central Committee of the LPF had created and adding that there were medical assistants like her in all parts of the liberated area, she said goodbye and left.

INDIAN INSTITUTE OF MANAGEMENT

AHMEDABAD

announces

THE ELEVENTH 3-TIER PROGRAMME FOR MANAGEMENT DEVELOPMENT AUGUST 5-SEPTEMBER 29, 1973

The 3-Tier Programme aims at improving the managerial competence of participant executives. The basic approach will be to broaden the management point of view to encompass the concept of the total enterprise. The focus in the subject areas discussed in all the three tiers, therefore, will be that of a general manager rather than that of a specialist.

SCHEDULE

Tier I	Middle Management Course	August 5-September 1, 1973
Tier II	Senior Executives Course	September 2-15, 1973
Tier III	Top Management Seminar	September 16-29, 1973

PARTICIPANTS

Tier I: For executives in late 20s or early 30s with a minimum of five years experience in positions of responsibility within functional departments.

Tier II: For executives around the age of 40, with at least 10 years experience and currently heading functional departments.

Tier III: For executives over 40 years, with about 15 years or more experience, and currently in top management positions such as general manager, executive director, and managing director.

IIMA FACULTY

Professors Praful Anubhai, J. C. Camillus, B. K. Hegde, Akkanad M. Isaac, S. C. Kuchhal, Subhash C. Mehta, V. L. Mote, C. N. S. Nambudiri, Keshav Prasad, C. Rangarajan, Suresh A. Seshan, Baldev R. Sharma, N. R. Sheth, K. L. Varshneya, and Pramod Verma—all of IIMA. Dr. Kamla Chowdhury, Ford Foundation, New Delhi; Prof. G. R. Kul-karni, Director General, Indian Institute of Foreign Trade, Delhi.

FEES

	Single Occupancy	Double Occupancy
Tier I	Rs. 5,000	Rs. 4,000
Tier II	Rs. 3,000	Rs. 2,500
Tier III	Rs. 3,000	Rs. 2,500

LOCATION

Hotel Clarks-Shiraz, Agra.

APPLICATION & ENQUIRIES

Last date for applications: June 30, 1973.

Please write to Manager (Publications), Indian Institute of Management, Vastrapur, Ahmedabad 380 015.

Parliament, the Executive and Public Sector Enterprises

B L Maheshwari

Politics, Finance and the Role of Economics: An Essay on the Control of Public Enterprises, by C D Foster, London, George Allen and Unwin; p 232.

THE triangular relationship between the Parliament, the Executive and the Boards of the Public Sector enterprises has attracted considerable attention of those involved in formulation and implementation of public sector policy as well as those who are engaged in interpreting and understanding this sector. The book under review attempts an examination of this complex relationship essentially in the context of the political and administrative system of Britain. The author of this book brings the perspective of an economist to this task and the bias of one looking at the problem from the civil service end. The discussion in the book is based on the author's experience with transport and utility corporations where interaction between business and social considerations is very close.

OTHER SIDE OF THE FENCE

Since the author has known the public sector enterprises essentially from the other side of the fence, he seems to be in favour of more intervention by the Minister—naturally, assisted by the civil servants like himself. This preference is not explicitly stated in the book but has been laboriously worked out in many places. For example, after a long discussion on powers of appointment, he turns down the position, "choose the right man and then let him get on with the job", by saying that it is, "an impossible ideal as things now stand" (p 76). Besides the personal preferences of the author, the weak empirical base for discussion is a prominent feature of this book. The author's approach is based on the analysis of statutes, White Papers and other similar documents. This fails to bring out the dynamics of this triangular relationship.

In the first two parts of the book, the author discusses the existing pattern in government-enterprise relationship in Britain and finds it less than

satisfactory. Then he examines the "alternative developments" including politicisation of administration, subordination of nationalised industry, competition, discipline of the finance market, etc, and highlights the inadequacies of these. Finally, as expected by now, he suggests methods of strengthening Ministerial control. The main thesis of the book is that the absence of effective financial control over nationalised industry is the main source of most of the problems. The entire book reflects an obsession with this concern. His argument is that, "the financial discipline that can be exerted by the finance market can, and indeed should, be exercised by the government in relation to nationalised industries" (p 159).

"STRATEGIC CONTROL"

As everyone knows, the important issue in the triangular relationship relates to the marking of the dividing line between autonomy of the enterprise on the one hand and the control by the government on the other. In this context, the author refers to the report of the Select Committee on Nationalised Industries on "Ministerial Control of the Nationalised Industries" (1968), which concluded that the Ministers' function should be confined to "strategic control" and the Boards of the enterprises should have "tactical command". However, he argues that a dividing line between policy making and implementation is not workable because lack of clarity about objectives is the prime cause of much of the confusion. He suggests that policies of public sector enterprises are not defined precisely in the statutes because of the desire to maintain flexibility in interpretation. The author also points out that the Boards in Britain are held responsible to Parliament for the financial position of the enterprises and thus the system operates to ensure less effective control by the

Minister. He asserts

The powers of a Minister, and by delegation of his department, are greater than those of a minority shareholder but less than those of a majority shareholder or holding company. The metaphor of the Minister or government as a shareholder or holding company, though often used in seriously misleading. The assets of nationalised industries are not vested in the Minister or in the Crown. They are their own proprietors (p 57).

This is rather an interesting statement making out public sector managements to be self-perpetuating managements, without intervention of the invisible owners.

POWER OF PERSUASION

Foster also refers to the "practical independence" of the Boards of public sector enterprises and argues that the power of the Minister is essentially that of persuasion and that "the opportunity and the right to persuade is not a power to command obedience" (p 86). It seems that this assertion misses a very important point of relationship in the administrative system. It may be useful here to remind Foster that President Harry Truman perceived the power of the American president essentially as one of persuading people to do things they ought to be doing themselves. Thus, if one takes the dynamic view of reality, one can appreciate that people located at high points in the decision-making process, such as Ministers, have considerable power to persuade others to their way of thinking.

This book has a message. It argues a case which boils down to a repeated plea to allow the civil servants in the ministries to intervene more frequently in the matters of expenditure incurred by the public sector enterprises. The author uses the concept of strategic financial control (chapter 16) as part of the strategy for strengthening ministerial control but he has not tried to develop his general ideas into actionable recommendations. On the whole, the author has given rather a mediocre treatment to an important subject and therefore the book fails to hold the interest of even an interested reader. Nevertheless, the book succeeds in raising some pertinent questions about the nature of government-enterprise relationships. Even if one finds oneself in disagreement with some of the views expressed in this book, the discussion raised here has relevance for all situations where public sector enterprises have come to occupy important position in the national economy.

Unfair Balance

A G Noorani

Libel and Slander by Peter F Carter-Ruck; Faber and Faber, 1972; agents: Oxford University Press; £ 10.

"LIBEL and Slander. The very words themselves conjure up a daunting vision of menacing muddle, not only in the minds of laymen but, regrettably, also in the minds of practitioners, even those who enjoy the reputation of being experts in this branch of the law." This is quite a confession, coming as it does from a QC who is acknowledged to be one of the ablest in libel cases, Colin Duncan.

In his Foreword to the book he commends it particularly to the layman and to the Judge who tries such cases, a testimony to the erudition and the readability of the work. "He has produced a book that is not just a work of reference but a book that can be read—read and understood—yes—read and enjoyed!"

It is a well-deserved testimonial. Not only is it a comprehensive work on the law of libel and slander in England today after the enactment of the Defamation Act, 1952, but is also a good guide to the essentials of the law on the subject in most of the principal countries of the world; over fifty countries, in fact. This is quite a feat. It makes the work useful to those whose activities take them into the international field and who may be concerned in defamation proceedings abroad, whether as complainants or as the aggrieved.

Thanks to the lucidity of the style, those who derive their livelihood from literature, the arts, television, radio, advertising, in industry and the professions will be able to consult it.

The law must strike a fair balance between the individual's right to secure redress if he is unfairly attacked and the right of the press to investigate and comment freely on matters of public interest. Does the law attain this balance?

"If any one wishes to be certain that he will not render himself liable to pay damages for libel the advice which he must be given is simple though drastic. He would have to refrain from writing, printing or publishing or distributing, any written matter of whatsoever nature. Until 1952 certainly any relaxation of this stringent standard of conduct would have involved at least some element of risk. Since, however, the Defamation Act, 1952, came into force the balance between the complainant and writer has been more equitably balanced by the introduction of the defence of Unintentional Defamation which in effect provides a defence, for the writer, publisher and printer whensoever the publication is

'innocent' as defined by the Act and an 'offer of amends' has been made in the form prescribed by the Act."

Unfortunately, in our country no comparable provisions have been introduced and the law is substantially the same as in England without the ameliorating effect of the Defamation Act, 1952. In India, defamation as a tort is based almost entirely on case-law. As a crime it is defined in Section 499 of the Indian Penal Code.

As well as being a thorough survey of case-law the work contains the texts of all the pertinent Statutes, including the Act of 1952. This statute treats the broadcasting of words "as publication in permanent form", and dispenses with the necessity to prove special damage in an action for slander. But it relaxes the law

in other and more important respects.

The defence of justification or fair comment will not fail by reason only that the truth of every allegation is not proved if what is proved is substantial enough so that what is unproved does not materially affect the plaintiff's reputation. Or, if in a similar circumstance, the comment is fair on the whole.

Publication in newspapers of reports of proceedings of legislatures, courts, inquiries, other public bodies, private associations and even public meetings is privileged unless the publication is proved to be made with malice. In the last mentioned case, the aggrieved person is obliged, first, to ask the newspaper to publish "a reasonable letter" by way of explanation or contradiction. He can sue only if the newspaper fails to comply. Finally, there is the new category of defence introduced by the Act, namely, unintentional defamation for which a new procedure "offer of amends" is also devised.

A similar reformatory Act in our country is clearly overdue.

Centre for Development Studies

Ullloor, Trivandrum-695 011

The Centre for Development Studies invites applications for posts of Research Associates from economists/statisticians adequately qualified for research in problems of applied economics. Appointments may be made on the scale of Rs. 310-20-350-25-400 or of Rs. 400-40-800-50-950. Appointments on the lower scale will be initially for a period of two years; they may be extended subject to a maximum period of five years when all such appointments will be terminated. Appointments on the higher scale will be on a permanent basis, subject to a probation period of one year.

Research Associates will be given opportunity to devote part of their time to own professional work, including dissertations for research degrees. Applicants should send details of academic qualifications, copies of written work (if any), and a statement (not exceeding 1000 words) indicating a problem that interests them and the method of analysis they would employ for studying it. Those called for interview will be paid return third class fare by rail.

Applications should reach the Director not later than July 15, 1973.

SPECIAL ARTICLES

Marginalist Explanation for More Intense Labour Input in Smaller Farms

Empirical Verification

Ashok Rudra

with the statistical assistance of

Bela Bandopadhyaya

As farm size increases, labour gets employed with increasing quantities of land and capital, but capital increases at a slower rate than does land. This results in increase in the average productivity of labour, but at a very low rate—at a much lower rate than the rate of decrease of labour input per acre.

If this increase in labour productivity gets more than counterbalanced by the increase in labour input per acre that goes with it, the net result would be diminishing yield per acre—as has allegedly been observed to hold quite generally.

This paper seeks to show that the marginalist model which has been used to explain this phenomenon in terms of the composition of labour consisting of family labour and hired labour does not seem to work.

WE present in the following some quantitative results pertaining to the interrelations between (i) the composition of farm labour in terms of hired labour and family labour; (ii) the intensity of application of human labour to cultivation; (iii) the productivity of the human labour input into cultivation; (iv) the productivity of land; and (v) the size of farm in terms of acreage of net cultivated area. Our results reject certain hypotheses which are quite widely held and which have been assumed by certain research workers in deriving certain far-reaching conclusions. Certain other hypotheses get confirmed by our data. No generality is claimed either for the rejections or for the confirmations. Our data consist of 149 sample farms, drawn

randomly from the Hooghly district of West Bengal; the time reference is the agricultural year 1970-71. One can think of any generalisation on a countrywide basis only after the hypotheses tested here have been tested—similarly or otherwise—with reference to other data drawn from other regions. It should be kept in mind, however, that most of the generally held ideas examined here have been so held purely on a *a priori* common sense or theoretical grounds; there has been hardly any empirical verification of any of them with Indian data.

We shall first of all take up the marginalist reasoning about the varying intensity of labour use, between farms based on family labour and farms based on hired labour. The late 19th century

Russian economist, Cheyanov, argued that under *ceteris paribus* conditions the family-labour based farm would use labour more intensely than the hired-labour based farm, because the latter would not use labour beyond the point at which the marginal productivity of labour starts to go down below the market wage rate, whereas no such consideration would generally apply to the family-labour based farm in labour-surplus economies. A similar argument was used by A K Sen [2] to explain the alleged superiority of small farms over big farms in respect of value of yield per acre of land cultivated. Small farms are largely family-labour based farms and bigger farms largely hired-labour based, and this according to Sen results

TABLE 1: DEPENDENCE ON SIZE OF FARMS

Size Groups (acres)	Number of Farms	Average Farm (acres)	Labour Input per Farm (hrs)	Labour Input per Acre (hrs)	Proportion of Family Labour to Total Labour	Average Productivity of Labour (Rs)
	n	A/n	L/n	L/A	$\frac{L_f}{L_f + L_h}$	O/L
0.01- 1.25	53	0.75	701.70	932.55	0.5989	1.2258
1.25- 2.50	40	1.96	1485.19	758.52	0.5411	1.3872
2.50- 3.50	16	3.04	2162.91	712.21	0.5545	1.5359
3.50- 5.00	9	4.24	3273.17	772.17	0.2653	1.5940
5.00- 7.50	19	6.19	3948.50	637.61	0.4296	1.4903
7.50-10.00	9	8.59	6176.44	718.75	0.3251	2.0284
10.00 and above	3	15.53	9135.33	588.11	0.1409	2.1185
All groups	149	3.00	2138.78	713.69	0.4296	1.6022

DIAGRAM 1: GRAPH SHOWING LABOUR INPUT PER ACRE AGAINST FARM SIZE

Hypothesis H_7 : Higher the proportion of family labour to hired labour, lower the productivity of labour.

Hypothesis H_8 : Higher the proportion of family labour to hired labour, higher the productivity of land (that is, yield per acre).

The marginalist argument can be represented in the form of the following network:

in higher intensity of labour application on small farms—which in turn gives rise to a higher level of output per unit of land.

The above reasoning can be broken down into the following hypotheses:

Hypothesis H_1 : Larger farms have a higher proportion of hired labour to family labour.

Hypothesis H_2 : All other factors are applied with equal intensity (that is equal per acre rate) on all sizes of farms.

Hypothesis H_3 : Higher the proportion of family labour to hired labour, higher the intensity of application of labour.

Combining H_1 , H_2 and H_3 we can obtain

Hypothesis H_4 : intensity of labour input (that is per acre labour input) goes up as farm size becomes smaller.

Hypothesis H_5 : Higher the intensity of application (that is,

per acre input) of labour, higher the yield per acre.

Hypothesis H_6 : Higher the intensity of application of labour, lower the productivity of labour (that is, output per unit of labour input).

We find that our data confirm hypotheses H_1 , H_4 and H_5 , reject H_3 and H_8 , and lend rather weak and questionable support to the hypotheses H_6 and H_7 . But the marginalist position is centred precisely on H_3 and H_8 . The idea is precisely that family labour is used more

DIAGRAM 2: GRAPH SHOWING PROPORTION OF FAMILY TO TOTAL LABOUR AGAINST FARM SIZE

TABLE 2: DEPENDENCE ON COMPOSITION OF LABOUR

Proportion of Family Labour to Hired Labour $\frac{L_f}{L_f + L_h}$	Number of Farms n	Labour Input per Farm (hrs) L/n	Labour Input per Acre (hrs) L/A	Productivity of Labour (Rs) O/L	Output per Acre (Rs) O/A
0	9	1279.33	500.61	2.1445	1073.58
0-0.20	32	1945.06	548.44	1.6804	959.30
0.20-0.40	17	4104.50	1021.02	1.9130	1546.60
0.40-0.60	24	2873.58	907.33	1.3692	1242.37
0.60-0.80	22	2134.98	800.30	1.6254	1300.07
0.80-0.99	28	1577.73	743.96	1.2575	935.56
1.00	17	846.00	539.46	1.3911	711.52
All proportions	149	2134.41	713.69	1.6010	1140.29

DIAGRAM 3: GRAPH SHOWING LABOUR INPUT PER ACRE AGAINST PROPORTION OF FAMILY LABOUR TO TOTAL LABOUR

in quantity and, therefore, has less productivity. These two hypotheses getting rejected, the hypotheses H_1 , H_4 and H_5 get de-linked.

For the confirmation of the hypotheses H_1 , H_4 and H_5 reference may be made to the Diagrams 2, 1 and 4. Diagram 2 shows that the proportion of family labour to total labour declines from about 60 per cent to about 10 per cent as one moves from the smallest size group (0 to 1.25 acres) to the biggest (about 10 acres). (For further details about the nature of association between these two variables see Appendix, note 1.) Diagram 1 shows that labour input per acre falls from about 900 manhours to less than 600 manhours when one makes the same movement over size groups. Diagram 4 shows that output per acre goes on increasing as labour input per acre increases until it reaches a ceiling of about Rs.2,500, corresponding to about 1,400 manhours of labour per acre and that this does not increase any more with further additions to labour input. Of course, the graphs show only group averages and our raw data reveal a very high margin of error associated with each such average. Nevertheless, the patterns revealed can be taken to be statistically significant without carrying out any tests. Rejection of hypotheses H_3 and H_8 is indicated by the graphs in Diagrams 3, 5 and 6. They belie any systematic, meaningful pattern of dependence on the composition of labour by any one of the variables concerned. Thus the total labour input into cultivation is on the average less for purely family-based farms than for purely hired-labour based ones (Diagram 6). This

may be partly due to purely family-based farms being smaller farms than purely hired-labour based farms. The pattern, however, does not change very much even when one takes account of this factor by considering labour input per acre rather than total labour input (Diagram 3). Labour input per acre is higher for the purely family-labour based farms, but only very slightly. Diagram 5 shows that per acre output of purely family labour based farms is actually lower than that for the purely hired-labour based farms.

Neither in the case of total labour input into cultivation nor in the case of output per acre is there any need to subject the data to any kind of test: for, surely, if observed average

values for the purely family-based group of farms be less than those observed for the purely hired-labour based ones, there cannot be any question of any tests showing that the former is significantly higher than the latter! Of course, our data provide information not only about the two pure classes—the entirely family-labour based ones and the entirely hired labour based ones—but also about all the mixed classes with varying proportions of family labour and hired labour. The graphs, however, are not such as to suggest any meaningful pattern of dependence. Incidentally, all these three graphs show somewhat similar shapes each, with a peak at the point corresponding to a mixture of 30 per cent of family labour and 70 per cent of hired labour. It is, of course, quite plausible that the more dynamic farms are neither purely family-labour based nor purely hired-labour based; but this hypothesis cannot be confirmed by these odd-shaped graphs. It is to be emphasised that the graphs have for ordinates weighted averages and for abscissae group mid-points; and the averages do not give any idea whatsoever of the tremendously large within-group variations that the individual farmwise data reveal.

To clinch the issue, we have carried out some tests of significance for the case of total labour input per acre—the only case where the dependent variable is at all higher for purely family-labour based farms than for purely hired-labour based farms. The test results (for details see Appendix note 2) show that:

- the labour input per acre by purely family-labour based farms is not higher than that by purely hired-labour based ones;
- in general, there is no statistically

DIAGRAM 4: GRAPH SHOWING OUTPUT PER ACRE AGAINST LABOUR INPUT PER ACRE

significant variation in labour input per acre as between the different groups corresponding to the different values of the ratio of family labour to total labour, $\frac{L_f}{L_f + L_h}$. (In other words, the correlation ratio of labour input per acre, L/A , on the composition of labour, $\frac{L_f}{L_f + L_h}$, is not significantly different from 0).

If there is no systematic dependence of labour input per acre on the composition of labour or of output per acre on the same, then the implication is that the average productivity of labour is the same whatever be the composition of labour. Diagram 7 is in apparent conflict with this conclusion; for, the group weighted averages of the productivity of labour do show a mild tendency to decrease. But on testing, we find that the group means are not significantly different from each other (see Appendix note 3).

The marginalist explanation of the declining tendency of yield per acre over increasing size is also in contradiction with labour productivity trend revealed in Diagram 8—if there is any trend at all. The 'if' is a big 'if'—for all these graphs of group averages we are dealing with are subject to very high degrees of within group variations. However, we can proceed without testing for significance as follows. If there is any systematic dependence patterns in Diagram 8 at all, it is of labour productivity *increasing* as quantity of labour input increases. So it can be said that the average productivity of labour *does not* decrease as quantity of labour input increases. Now, that surely contradicts the idea that farms that put in comparatively more labour (small farms, farms based on more family labour than hired labour) do so at the cost of having a lower average productivity of labour.

As a matter of fact, the marginalist position, to be verified with cross-section data, requires hypotheses H_2 to hold: but there is enough evidence that this does not; that material input per acre, irrigation facilities per acre, etc., decline as farm size increases. Thus, as farm size increases, labour gets employed with increasing quantities of land and capital, but capital increases at a slower rate than does land. This results in increase in the average productivity of labour, but at a very low rate—a much lower rate than the rate of decrease of labour input per acre. Diagram 9 shows the way average labour productivity increases with size. Once again the increase may not be statisti-

DIAGRAM 5: GRAPH SHOWING OUTPUT PER ACRE AGAINST PROPORTION OF FAMILY LABOUR TO TOTAL LABOUR

DIAGRAM 6: GRAPH SHOWING LABOUR INPUT PER FARM AGAINST PROPORTION OF FAMILY LABOUR TO TOTAL LABOUR

cally significant, but if there is any trend at all that is one of increase. If this increase in labour productivity gets more than counterbalanced by the increase in labour input per acre that goes with it, the net result would of course be diminishing yield per acre—as has allegedly been observed to hold quite generally. The generality of this variation pattern of land productivity has been challenged by us earlier [1]. In the present paper, we have tried to show that the marginalist model that has been used to explain the phenomenon in terms of the composition of labour consisting of family labour and hired labour does not seem to work—at least with our data.

Appendix Notes

1 The association between farm size and the composition of labour in terms

of family labour and hired labour is not very strong. Some idea of the variability in the composition of labour *unexplained* by the pattern of dependence represented by the curve of Diagram 2 can be formed from the following Table.

Size Group (acres)	Proportion of Proportion of	
	Purely Family-Labour Based Farms (per cent)	Purely Hired Labour Based Farms (per cent)
0 - 2.50	14	8
2.50- 5.00	12	0
5.00-10.00	3.5	7
10.00 and above	0	0

Thus the bigger farms have a smaller proportion of purely family-labour based farms than the smaller ones; but the distribution of purely hired-labour based farms among the different size groups do not follow any systematic pattern.

DIAGRAM 7: GRAPH SHOWING PRODUCTIVITY OF LABOUR AGAINST PROPORTION OF FAMILY LABOUR TO TOTAL LABOUR

DIAGRAM 8: GRAPH SHOWING PRODUCTIVITY OF LABOUR AGAINST TOTAL INPUT OF LABOUR

DIAGRAM 9: GRAPH SHOWING PRODUCTIVITY OF LABOUR AGAINST FARM SIZE

TABLE 3: DEPENDENCE OF OUTPUT PER ACRE ON LABOUR INPUT PER ACRE

Labour Input per Acre (hrs)	Number of Farms	Output per Acre (Rs)	A/O
0-250	5	85.15	
250-500	47	641.17	
500-750	38	907.09	
750-1000	15	1267.75	
1000-1250	12	1841.18	
1250-1500	10	2635.60	
1500-1750	9	1864.64	
1750-2000	4	2274.54	
2000-2500	5	2532.64	
2500 and above	4	2527.16	
	149	1140.29	

2 Two tests can be conducted with respect to these data:

(a) A t-test (Fisher's two sample t-test) to test the significance of the difference between the arithmetic means of the variables $\frac{L}{A}$ for the two groups defined by $\frac{L_f}{L_f + L_h} = 0$ and $\frac{L_f}{L_f + L_h} = 1$. The t-value with 23 d f was found to be 0.38 and, therefore, insignificant.

(b) A simple analysis of variance for one-way classification of data to test if the group averages of the labour input per acre values for the farms grouped according to the proportion of family labour to total labour input varied as between the groups. The F value was $F_{6, 142} = 1.21$

which is not significant at the 5 per cent point.

3 Just as in the case explained in (2) above, two tests were carried out.

(a) A Fisher's t-test for testing the

TABLE 4: DEPENDENCE OF PRODUCTIVITY OF LABOUR ON TOTAL LABOUR INPUT

Total Labour Input (hrs) L	Number of Farms n	Productivity of Labour O/L
0-200	8	1.0721
200-400	13	0.9720
400-600	14	1.3210
600-800	13	1.4363
800-1000	13	1.5626
1000-2000	33	1.3352
2000-3000	25	1.6728
3000-4000	11	1.2914
4000-5000	7	1.6873
5000-6000	4	1.4979
6000 and above	8	1.9235
All groups	149	1.6010

difference between the arithmetic means of the values of the variable $\frac{O}{L}$, value of output per unit of labour, for the two groups defined by $\frac{L_t}{L_t + L_n} = 0$ and $\frac{L_t}{L_t + L_n} = 1$. The t value with 23 degrees of freedom is 0.53 and therefore not significant.

(b) An analysis of variance for one-

way classification to test if the arithmetic means of the values of $\frac{O}{L}$ for individual farms, grouped by the variable value of $\frac{L_t}{L_t + L_n}$, differ significantly. The value of F with degrees of freedom 6 and 142 was found to be 1.59 which is not significant at the 95 per cent point.

From Reformist Princes to 'Co-operative Kings'

III—Trends Toward Routinisation in Kolhapur Politics

Donald B Rosenthal

This paper examines how the character of political relationships in Kolhapur state/district has changed during the past century and what the present pattern of political leadership in that district looks like. While the part that social structure has played in these matters is notable, the roles played by particular men and, equally important, the contingent nature of those roles, needed to be emphasised.

For, contrary to that school of political analysis which attributes much stability to the past, the political history of Kolhapur embodies the search for additional bases of power, conditioned, no doubt, by the social structures and technological possibilities of an era but significantly independent of them. The result is that those men of ambition who are able and willing to enter into political life can influence the actions of others and direct the course of events of their times, if only on the small stage provided by local political activity.

What should be stressed here is that by 1962 to speak of the bases of political power in Kolhapur district, meant not only to refer to those with formal power in state or local legislative bodies, or to men with a voice in the district party, but also to those most active in the new economic institutions of the district—institutions which drew upon governmental financing organised under the guise of co-operative economic activity. Indeed, so important have the major co-operative institutions become as political arenas in their own right—for they have control of important financial resources which can be manipulated to the advantage of individuals or political groups—that contests for control of bodies like the district board, do not seem to raise as basic or potential a threat to the positions of major political leaders as do challenges to their control of taluka and district co-operative institutions.

Part III looks at trends towards bureaucratisation and institutionalisation of Kolhapur politics during the past few years. Part II dealt with the highly personalised and factional style of politics between 1947 and 1967. Part I examined the political process in Kolhapur state prior to its merger with independent India.

The 1967 Elections

INTO this cauldron of personal quarrels and fights for individual economic dominance a 'traditional' issue was injected in the mid-1960s. The government of India rekindled the wrath of the people of Kolhapur against itself and the Maharashtra government by authorising Shahji, who had faded from public sight since the merger of Kolhapur, to adopt an heir (his own grandson). This was contrary to the understanding that allegedly had been made with the widow of Rajaram at the time of Shahji's succession. Agitations were organised in 1965 when the matter came to public attention and Chavan made a critical mistake when he remarked from his position in New Delhi that the dispute over a "torn gadi" was irrelevant. In his view, princes were no longer important. With privy purses likely to be abolished in the future, he argued, the question of succession was of little moment.

The opposition, led by the PWP, skillfully seized upon Chavan's comments and organised a campaign that focused on the demand that "justice be done"

to Padmaraje, the daughter of Rajaram. The women of Kolhapur city, in particular, were drawn to the cause and the embers of Maratha populism seemingly dormant in Kolhapur were rekindled. Chavan's remarks were blown out of proportion by the opposition and held to constitute a slur on the history of Kolhapur state and particularly on the memory of Shahu Maharaj. Chavan's personal popularity—which had never been high because of the local feeling that Kolhapur had been inadequately recognised in state politics as compared to neighbouring districts like Sangli and, particularly, Chavan's own Satara⁵³—fell even further and along with it fell the fortunes of the Congress. The opposition skillfully capitalised on the issue by making Vijyamala (Rajaram's second wife) its candidate for parliament in 1967. The Congress countered by choosing as its candidate a previously non-political general whose family came from the district. (It was hoped that a martial figure of national stature would counteract the appeal of the opposition's major issue.) The contest was made into a prestige fight by the national Con-

gress' choice of a candidate, but the Congress was not able to overcome its defensive posture. (Exploitation of the Padmaraje issue by the PWP was ironical, at least at one level, because the PWP has always visualised itself as standing to the left of the Congress on issues of social justice and the economic organisation of Indian society. In practice, however, the PWP continues to express essentially regionalist and Maratha-oriented attitudes in Kolhapur.)

At the same time, though Kumbhar had lost control of the district Congress and was reduced by now to a non-entity in the local party, the MPCC was cautious about entirely ending its association with him (particularly in light of the popular agitations in Kolhapur).⁵⁴ As a sop to Kumbhar, therefore, MLA tickets were extended to him and to one of his supporters (for a seat reserved for the Scheduled Castes) and one of Kumbhar's top men was given the city ticket for parliament. Otherwise, the remaining seats went to persons favoured by the anti-Kumbhar group in the Congress.

The Vijayamala factor, the equivocal position of the Kumbhar group, the other personal conflicts within the Congress, as well as rising prices and general dissatisfaction with the prevailing economic situation, all contributed to the Congress loss of the MP seat from the rural area (to Vijayamala) and four MLA seats to PWP candidates. In addition to Kolhapur city, two seats were lost in rural areas where Kumbhar's group had little following. One of these was the seat of Udaisingh Gaikwad (won in 1962). Gaikwad's defeat was blamed, in part, on the intervention of leaders of the Warna sugar factory who allegedly opposed Gaikwad's efforts to gain political influence in that factory.⁵⁵

In the zilla parishad elections which followed, few Kumbhar supporters received tickets and Kumbhar men did not even run on a common basis, but among the 54 men elected were 22 non-Congressmen—11 'independents' (not all of whom were Kumbhar men) and 11 from a PWP-dominated electoral front. When the election for president was held in August, Yadav was re-elected but only by a margin of 28 to 24 over a man closely associated with Kumbhar.⁵⁶ The men selected for Vice-President and committee Chairman were all from the anti-Kumbhar group and several were selected with the intention of further weakening Kumbhar in those talukas where he still had some following. None, however, were especially prominent figures at the district level in either the Congress or the co-operative movement.

Politics Since 1967

Even with Kumbhar's men inactive in the local party organisation, conflicts continued in the DCC. This was apparent in 1970 in a contest for a seat to the Vidhan Parishad from a special local bodies constituency consisting of members of the zilla parishad and of the municipalities in the district. The incumbent, whose origins were in Satara district, had established a good personal reputation in Kolhapur since his first election in 1964, but his candidacy blocked the ambitions of others, some of whom employed the claim that he was an "outsider" as a means of enhancing their own opportunities for office and as a way of stirring feeling against the manner in which non-Kolhapuris (and particularly persons from neighbouring Satara and Sangli districts) regularly intervened in the politics of the district from positions they held in the state government and in the higher echelons of the Maharashtra Congress.

This particular contest illustrates how much Kolhapur politics has been linked into the political quarrels of the larger political arenas of the state, since many of the manoeuvres that led to the incumbent's renomination and to his close victory involved contests for domination in state politics among prominent Maharashtra Congressmen in which Kolhapur was only one of several pieces in an elaborate political chess game.

Thus, in a bargain allegedly struck between Balasaheb Desai of Satara (Minister for Revenue in the Maharashtra government) and Vasantao Patil of Sangli (MPCC President), Desai supported the Kolhapur incumbent, whom Patil favoured, in return for an agreement by Patil that he would back Desai's man for a similar post in Poona district. However, men friendly to Desai at the local level in Kolhapur did not accept this arrangement easily. Some Congressmen apparently encouraged the Vice-President (a member of the tiny SSP unit) of the Kolhapur municipality to defect from his party and enter the contest with their support as well as the backing of the PWP.⁵⁷ In addition to these two candidates there were others: the SSP's own official candidate, a Kumbhar-inclined candidate (a former MLA) and a dissident PWP candidate.

Since no candidate received a majority of the first preference votes, the second preferences of persons choosing the lesser candidates were counted and the official Congress nominee scraped through by a margin of 118 to 109 for the Desai-inclined candidate. Thus, to the already intricate set of conflicting among local politicians in Kolhapur arising out of contests for control over areas of local power and access to higher levels of government and politics were added a series of cleavages due to expedient associations with ambitious politicians at the state level. At this time, while the Kumbhar group was outside the local Congress, its leader continued to have contacts with important figures in the Congress party and, despite numerous provocations and inducements, he refused to make a definite break with either the state or national Congress organisation.⁵⁸ For a time, the Balasaheb Desai group locally included the President of the zilla parishad, the leader of the relatively ineffectual Congress organisation in Kolhapur city and, somewhat less clearly, Udaisingh Gaikwad. But when Desai fell into disfavour with Y B Chavan in 1970, these and other local Congressmen quickly moved away from Desai⁵⁹ and toward figures like Vasantao Patil who seemed to be ascending powers in the state Congress organisation. In addition

to his position as MPCC President, Patil was a major figure in the co-operative institutions of Maharashtra as well as in his own district, Sangli.

Like a giant amoeba making only those minimum alterations necessary to survive, the state and national leadership of the Congress moved in the period after 1967 to neutralise the effect of the Padmaraje movement in Kolhapur. Its key action was to choose the son of the leader of the Padmaraje movement as one of the two candidates for parliamentary seats from Kolhapur in 1971. This nominee had spent a decade out of India (mainly in Germany) prior to returning to Kolhapur in 1964 and had no previous political credentials. In selecting this relatively young man (42), the MPCC (and Chavan at the Centre) passed over the incumbent MP, a Kumbhar group leader. Not only was the choice of candidate seen as a way of removing the Padmaraje issue and thereby defusing the strength of the PWP which had surfaced in 1967, but it was also likely to assure the strong Maharashtra group in parliament a potential supporter with few local political commitments or even much of a political base of his own.

If the choice in this case was a man with little political history, the nominee for the other seat, Dattajirao Kadam, was of a very different character. His emergence may have signalled the start of a major change in the style of Kolhapur politics. Operating essentially from the prosperous weaving-based municipality of Ichalkaranji in Hatkanangale taluka (where his co-operative institutions literally face those of Ratnappa Kumbhar), Kadam had become a major force in the city's co-operative movement in the previous decade. Where Kumbhar drew his strength from his rural activities—his sugar factory, his rural co-operative bodies and the rural governmental institutions particularly in Hatkanangale and Shirol talukas which his men ran—Kadam's influence was based on urban institutions that he and his associates had established in Ichalkaranji. They had initiated large-scale co-operative weaving and spinning mills as well as an urban co-operative bank during the preceding fifteen years. As a result, Kadam's group had come to play a major role in the economic life of a rapidly expanding city of well over 75,000 people.

Equally significant, however, was the political style of the municipal group with which Kadam was associated. It included a Brahman member of the Rajya Sabha, who was from Sangli district, but also had an economic interest

in the prosperity of Ichalkaranji, and B B Khanjire, the Jain MLA from the city who functioned as an important intermediary between the group and the state government. Furthermore, in a manner that is a model of systematic organisation, Kadam and his associates had put together an economic and political 'power structure' in Ichalkaranji that nicely duplicates power concentrations in some American communities. This power structure has been institutionalised, in fact, in a body which local people call "the civic board". The board allocates positions in urban co-operative institutions, in the local unit of the Congress party and in the municipality on a rotational basis which has tended to reduce conflict and moderate ambition.⁶⁰ The board remained relatively aloof from the internal quarrels of the district Congress until 1970. Clearly, they protected their own economic interests when such interests lay with the DCCB (District Central Co-operative Bank), but because of the financial and industrial nature of those interests, their activities were directed principally at exercising influence in state and national politics (concerning policies affecting matters like licensing procedures) rather than in district politics.

However, in the late 1960s, Kadam began to expand his personal activities into the rural sphere by helping to organise a sugar factory in Shirol taluka and by investing heavily in the development of lands that he himself had acquired. In the acquisition of rights to develop his new sugar factory, he received the help of the key leaders at the state and national levels who were against Kumbhar, who had been trying to organise a co-operative factory in the same area for a number of years—a factory which presumably would have got its membership from persons more sympathetic politically and communally to Kumbhar. Kadam's selection in 1971 as a parliamentary candidate by the MPCC, at a time when Indira Gandhi was publicly avowing commitment to a greater equalisation of wealth, actually served to recognise the growing strength of economic interests concentrated in a few hands in the region. At the same time, however, it was a direct slap at Kumbhar by the state Congress leadership, which passed over the incumbent MP in Kolhapur city—who was a Kumbhar man—in making its choice.⁶¹

It is not surprising that Kumbhar worked against these official Congress candidates. What may be surprising is that the MPCC was so slow to act against his behaviour. Leaders of the DCC brought complaints to the MPCC leadership, which took considerable time

to go through the formal motions of requesting an explanation from Kumbhar. Rather than dissimulating, Kumbhar clearly held that the quality of the candidates offered by the Congress was not worthy of his support. Final action was still pending against him at the time of MLA nomination in early 1972 and by that time events had again conspired to continue, and actually improve, Kumbhar's political standing in Kolhapur.

If Indira Gandhi had been too weak in 1971 to force her choices upon the MPCC, her national stature was so great by early 1972 that it was rather difficult for the MPCC leadership to resist her determined support for particular candidates. By 1972, a degree of division previously unknown in the MPCC had also surfaced, with Shankarrao Chavan of Marathwada putting forward a tentative bid to displace the long-established Vasantao Naik ministry. In Kolhapur, the state factions made themselves felt only indirectly, but they did provide an opening which permitted a number of decisions about tickets to be left to the parliamentary board of the AICC. In the case of Kumbhar and a second ticket from a constituency adjoining his, the MPCC left the seats open, pending a decision about Kumbhar's opposition to the MP candidates. With the help of some of Gandhi's closest associates and with the intervention of Mane, Kumbhar and a long-time colleague were given the tickets for these seats.⁶²

Once the tickets were allotted, a strange new harmony—possibly only of a temporary nature—entered the Congress. Though three Congress nominees were defeated by dissidents (including a man backed by Kaulaukar-Patil, who had been denied a ticket), a new spirit of compromise seemed to arise among leaders like Udaisingh Gaikwad, Kumbhar and Kadam. In that spirit and also possibly as an effort to wield greater power on his part, Vasantao Patil created an *ad hoc* Congress Committee in Kolhapur and appointed as President, Anantao Bhide, Chairman of the Decan Spinning and Weaving Mills in Ichalkaranji, a co-operative institution with which Kadam has been closely associated and toward which Patil has shown particular friendliness over the years. Bhide, it must be noted, is a Chitpavan Brahman.

In preparation for the zilla parishad elections, a district parliamentary board was created which gave substantial weightage to the Kumbhar forces. If anything, some of the anti-Kumbhar activists have expressed dismay at the extent of favour Bhide has shown to Kumbhar and his followers. Thus, Kumbhar

received a substantial bloc of nominations for the zilla parishad and when the time came to select office bearers, his associate was made Vice-President of the body. One committee Chairmanship (out of three) was also given to a man inclined to the Kumbhar group.

In organisational elections late in 1972, the spirit of compromise was carried forward by setting a rule that no one who was an office-bearer in other major institutions should hold posts in the DCC. Some controversy arose when Bhide, himself, continued as President and also as representative to the MPCC and AICC. By March, 1973, resentment against Bhide for evading this informal understanding was mounting and some possibility of a voluntary withdrawal by Bhide existed.

However, it was significant that faced with other controversies in the power structure of Kolhapur, there has recently been a further reaching out for compromise. Thus, in the elections for the DCCB held in March 1973, a compromise candidate, Dadasaheb Nimbalkar—a man long associated with the Padmaraje movement but sympathetic to the Congress since the election of his son as MP in 1971—was chosen without opposition. This was in contrast to the situation in the years from 1971 to 1973. In 1971, for example, the incumbent, Udaisingh Gaikwad, was not only backed by local actors but by Vasantao Patil. The President of the Satara DCCB, who is a leading Chavan lieutenant in that district, was on hand to rally support on Gaikwad's behalf. Yet, from within the ranks of the majority group in the Congress came a challenge to Gaikwad that was supported by the Kumbhar men and the single Communist member of the Bank. As a result, Gaikwad was defeated by a vote of 10 to 9. In that election, the Vice-President of the district Congress, who had ambitions to become President of the DCC, voted against Gaikwad.⁶³

Decisions about office-bearers for the zilla parishad, as we have already noted, involved some compromise by the dominant groups in the DCC with the Kumbhar group. At the time those decisions were taken, Bhide promised members that a review would be made of their decisions after January. For various reasons, including possible opening of old wounds, the matter was not raised again until March and even as this is written no definite action has been taken. Involved were essentially two sets of compromises. At one level—that of the selection of candidates for president and vice-president—was involved a compromise between the Kumbhar and anti-Kumbhar groups with the former receiving the

Vice-Presidential position and the latter the position of President. The post of President went to a man who had served previously as Vice-President under Yadav. While the two choices resolved one problem, they created others because both men were from the same taluka, Hatkanangale. In a sense, too, they represented on the anti-Kumbhar side more of a success for the Kadam group within the section of non-Kumbhar Congressmen than for other groups. Gaikwad was conciliated by making a man from his taluka one of the three committee Chairmen. However, other Congressmen remained unhappy that their talukas were unrepresented in major posts in the zilla parishad and they continue to press for reopening the question. They demand recognition particularly for talukas where no one has held a major post in the previous zilla parishads.

This question of representation at the state level has been one of the sources of recent unity in the Kolhapur Congress organisation. Almost every Congressman from Kolhapur interviewed in 1973 commented bitterly upon the fact that the district has never been represented either in a major governmental or party post since the integration of the Kolhapur state 25 years ago. Since the elections of 1972, delegations of local leaders have met with the Chief Minister to seek some assurances on this point and vague promises of opportunities at the time of a future expansion of the ministry have been made, but this question of representation (and ultimately of fair treatment of the district in the distribution of resources by the state) rankles local leaders. It has provided an incentive, at least temporarily, toward local unity—unity which might well disappear, as one state leader pointed out, if a post were actually given to a Kolhapur man. For then a new imbalance would arise between the man given the position and those not benefited.

For the moment, however, there seems to be some attempt on the part of local Congress leaders in Kolhapur to extend to the district level some of the behaviour patterns associated with the working of the civic board in Ichalkaranji, where a kind of bureaucratic system has been introduced into the allocation of offices and provision has been made for their rotation among leading figures in the city. It remains to be seen whether this movement from an uncontrolled individualistic self-aggrandisement in local politics to a new phase of more 'businesslike' or bureaucratised power distributions in governmental, party and co-operative posts will actually be completed.

Kolhapur in Perspective

To review the outlines of the previous story: Prior to independence, the Maratha ruling house of Kolhapur encouraged social reforms and educational opportunities for non-Brahmans in the state but resisted pressures for greater political participation by the 'new class' that it had created. This gave rise in the 1930s to a minor movement for greater political participation, the Praja Parishad. But this was suppressed through firm action taken against its leaders. Conflicts between the Maratha nobility and the popular movement for responsible government were complicated in the period after 1946 by the ascension to the *gadi* of a ruler unpopular with the Maratha elite and by the emergence within the Parishad of divisions between one group that might be called the 'populist' Marathas—those who appealed to moderately urbanised group-conscious Marathas—and a second group of Congress-oriented non-Marathas (principally, Lingayats and Jains). Much of the conflict within the Parishad was conditioned, however, by the character of its leaders and the nature of their personal ambitions.

The result of these conflicts was the existence for a time after 1947 of three major groupings in Kolhapur politics: 1) a Congress organisation led by non-Marathas with strong orientations to ward the national Congress leadership of persons like Vallabhbhai Patel; 2) a 'populist' Maratha element with more localised orientations which emerged out of the Parishad and eventually became the nucleus of the Peasants and Workers Party in the district; and 3) a small group of high-status Marathas who had previously been close to the princely regime but were now alienated from the new prince and were prepared to seek a place for themselves in the opportunity structures being created by the national and state leaderships of independent India.

Among the new opportunities were positions in the state assembly, in elected local bodies and in the Congress party itself. With a segment of the 'populist' Marathas based (at least temporarily) in a political party of their own, the Maratha element in the leadership of the Congress organisation in the Maharashtra region of Bombay state turned for help to members of the Maratha elite in Kolhapur. In the process of attempting to mobilise the rural Marathas behind the Congress, the state party leadership downgraded the non-Marathas who were holding positions of influence in the party and in the governmental institutions. The large-scale in-

troduction of co-operative institutions functioning under government auspices in the mid-1950s, at the same time, provided an alternative set of arenas in which conflicts among the various political groups might be worked out. Thus, on the one hand, the introduction of co-operative bodies promoted the extension of inter-individual conflicts into new territories, but at the same time, it had the effect of cushioning the process of decline in governmental and party affairs of the non-Marathas. Indeed, for those like Ratnappa Kumbhar, who were perceptive enough to see the importance of these new arenas, early entry provided an opportunity for continued political participation from a secure personal base.

With the extension of invitations to all Marathas after the creation of Maharashtra in 1960, the 'populist' Marathas increasingly entered the Congress and came into conflict with the older elite Maratha group. These locally-grown conflicts were exacerbated by conflicts among state political actors for influence in Kolhapur politics. Balasaheb Desai, a high-status Maratha educated in Kolhapur district who employed a highly 'populist' style in state politics, was especially influential in worsening relations between local rivals for office, and particularly between the Marathas and non-Marathas in the Congress, but other state leaders pursued their own ambitions through occasional interventions in Kolhapur politics as well, with the result that the nature of the political conflicts became increasingly individualised and earlier group distinctions less significant.

In this period of individualised politics, each political actor sought to become the premier political figure in his taluka, whether this meant undercutting some of his colleagues in the Congress or not. A few like Chavan-Patil, Kumbhar, and Udaisingh Gaikwad managed to become the apex figures in a pyramid of political and economic power within their home talukas. Major arenas for their control included not only governmental bodies but such co-operative institutions as local credit societies and sugar and textile factories. In the course of accumulating the power necessary to be a source of influence in the district, such men have had to dominate not only the choice of persons to fill responsible positions in the state assembly (often a post the leader reserved for himself), in the zilla parishad and in taluka governmental bodies from their home areas, but also, in an array of co-operative institutions and ancillary local organisations like educational societies.

In this situation, a man might be able to dominate one taluka by holding the

major power positions himself or giving some of those positions to a few highly trusted lieutenants. However, if he has personal aspirations in district or state politics this could well raise a set of dangers to himself. First, there is the 'span-of-control' issue. How far can a single man really dominate a taluka without either antagonising persons in the taluka or closing himself off from vital information about pretenders to his position? If he has aspirations for higher office or for a major role in district politics, he may either have to hive off some of his activities to lieutenants who may lie in wait for errors on his part or he may have to spread himself too thin in overseeing every relevant activity in the district. With the emergence of a new set of politically relevant institutions in the 1960s—new co-operative institutions, revitalised local governmental bodies, an array of educational societies conducting schools for a rapidly expanding secondary school population, in addition to existing party and governmental opportunities—the possibilities for one-man domination in a single taluka become more remote and the voices for a sharing of the plums of power more persistent.

If the organisation of power on a personal basis was difficult in a single taluka, the possibilities for ascendancy in the district as a whole decreased geometrically unless one could somehow rise above the immediate battles—something impossible in Kolhapur though not unheard of elsewhere.⁶⁴ Normally as a man pursues his aspirations upwards, those who play a major role in other talukas may well reach out to create or support local rivals in order to undercut any reach for power which might occur at the district level.

What needs to be seen most clearly about the nature of contemporary politics when examining a district like Kolhapur, therefore, is that there have occurred significant changes over time in political relations—changes which are as marked at the elite level as at the level of relations between elites and the wider public. Given a certain perspective, one might well argue that the number of men who play a leading part in Kolhapur and reap the major rewards of the political and economic systems are only marginally greater than in the days of Shahu. The number of persons oriented to active and autonomous participation in political life at any level may still be very small. Yet the terms on which access to the political process are based are quite different from Shahu's day.

More important than the breadth of formal participation may be the charac-

ter of the kinds of politics and policy concerns generated by contending political elites. By almost any standards, the politics of Kolhapur appears to be endlessly manipulative and exceedingly narrow in its focus on personal advancement. However, there are a number of policy 'spillovers' which benefit those in the public able to take advantage of them. Leaders of co-operative societies do distribute economic resources while collecting political benefits in return; sugar factories have jobs and dividends (underwritten by government subsidies) which they can distribute to cane growers in exchange for political support; educational society managers and local government office-holders may also win political support for their distribution of social benefits or jobs. Despite the fact that very few of the resources we have just mentioned reach the vast majority of the landless and the impoverished in Maharashtra society, there has been very little evidence of a potential for organised expression of discontent on the part of the public. If anything, the government of Maharashtra has been particularly skilful in heading off radical challenges to the dominant landed interests of the state by taking those minor steps necessary to lend the operations of the political system an aura of concern for social justice.

Still, as we have noted, the past hundred years in Kolhapur have witnessed a transition in elites from a situation in which a princely family benignly ruled the people of the state to a situation in which contending elites (visualised either as unsteady political groupings or as individual claimants for political authority) have vied for control over a growing number of governmental, party and co-operative institutions. In these recent contests, participants have had occasion to mobilise electoral support ranging from the general voting public of parliamentary and state elections to the narrower electoral bases of sugar factory and other co-operative society elections. In exchange for that support, political actors have also had to feed out benefits to their followers, though most such benefits have been of a severely restricted character.

Occasionally, an issue like the *gadi* dispute may stir 'traditional' sentiments, though, curiously enough, it is principally the reformist 'tradition' of Shahu that inspired particular respect for the Kolhapur *gadi*. Whatever the nature of the sentiments associated with such an issue, the most significant aspect of its political use was the way in which it was incorporated into the otherwise 'contentless' politics of Kolhapur by opposition parties, parties (including the

PWP and SSP) which otherwise pride themselves on a leftist orientation. Because they lack the leverage on the resources of the political system which would allow them to emulate the Congress, such parties are forced to seize upon occasional issues like the *gadi* or Samyukta Maharashtra to provide largely intangible (symbolic) collective benefits to their supporters.

For the most part, at least until recently, politics in Kolhapur has been a conflict of individual wills to gain control of existing opportunity structures. That style of politics has operated in a context of *laissez-faire* assumptions about the propriety of personal ambition and the acceptability of fluid personal alliances for the achievement of immediate economic and political benefits. It may be too early to predict, but recent events seem to suggest that this condition may be changing both in Kolhapur and elsewhere in Maharashtra. On the one hand, some members of the older generation of 'co-operative kings' which emerged with the expansion of the co-operative sector have become so openly vulgar in the display of their new affluence that they have brought public condemnation upon themselves and elicited both fear and contempt from the more sober elements within the leadership of the state Congress organisation. Equally important, the political rivalries of the co-operative kings and the challenges of those who aspired to emulate them may have proven destabilising economically and politically to the point where forces may be at work to assert order upon the situation. What we may be seeing both through the enunciation of recent state policy and through the working of powerful local economic interests in a district like Kolhapur is an effort to 'depersonalise' or, more familiarly, to 'bureaucratise' the co-operative movement and political life more generally by redefining the terms on which participants in the political order can benefit directly and personally from their participation in co-operatives. In Kolhapur, the recent willingness and ability to discard previously dominant leaders like V K Chavan-Patil when some of the economic activities of these men became too unsavoury may point in the direction indicated. In contrast, Kumbhar has presided over his personalised co-operative empire in a style that has kept both himself and his organisations free of public condemnation. The model for the future, however, may be not that of the individual 'co-operative king' but of the Ichalkaranji civic board with its collective leadership and corporate structure in which men like Kadam, Bhide and Khanjire participate

with others in the setting of limits to personal ambition through the use of schemes of rotation in office and rewards based on bureaucratic skills. For, systems of politics based purely on personal ambition are essentially unstable in character and, as history has shown, tend in many cases to be replaced by regimes which either pursue militant ideological ends or develop a bureaucratic orderliness which channels ambition through formally constituted institutional structures in a manner which reduces the uncertainties attendant on a politics of pure personal conflict.

(Concluded)

Notes

- 53 Indeed, some Kolhapur respondents rather heatedly attacked what they called "Sataraj"—rule of Maharashtra politics in imperial style from Satara. In addition to Chavan at the Centre, Satara district had strong representation in the state government in 1970 with three men holding ministerial or sub-Cabinet portfolios and another holding a ministry in the Central government. The phrase "Sataraj", with its feudal overtones, also served to arouse memories, because conflicts between Satara and Kolhapur went back in Maharashtra history to the period of the Maratha Empire.
- 54 Before the 1969 split in the Congress, Kumbhar was helped by his ties with Morarji Desai and Congress President Nijalingappa at the national level.
- 55 This opposition was allegedly encouraged by Kumbhar. It is charged that Gaikwad as a leading member of the DCCB tried to exert pressure on the factory to gain personal influence in its operations and that this was resented by the Chairman of the factory.
- 57 Few Kumbhar men even tried to get Congress tickets. Indeed, the man defeated by Yadav for President simply wrote directly to the MPCC and was rather surprised when the ticket was given to him, even though he was a long-time party worker and had held important positions in the district.
- 57 In this effort they allegedly received the help of both the 'Desai group' and of an MLA who was personally friendly with a state-level figure from Sangli district who might have had an interest in seeing the MPCC President suffer a setback.
- 58 Though Kumbhar ceased to be a member of the Kolhapur DCC executive as early as 1964, he continued to be a 'special invitee' to meetings of the MPCC.

- 59 Desai was forced to resign from his ministry in 1970 because of his activities against the Chief Minister of Maharashtra, Vasantao Naik, and because of his part in levelling accusations against others. Members of his group in Kolhapur organised meetings to hail Desai on his next visit to the city. When it became evident, however, that Desai was clearly out of favour and not simply bargaining with Y B Chavan and Naik for a return to the ministry, the group dropped his 'cause' rather peremptorily.
- 60 That moderating effect may be a function of the thriving economic situation of the city, for it allows many of the leaders to benefit from the economic expansion which the city is experiencing. It is not clear that such a political strategy would be as successful in a less expansionary situation.
- 61 The incumbent Congress MP, Shankarrao Mane, voted for Giri in the Presidential election which split the Congress in 1969. For this breach of discipline, the MPCC (which supported Reddy), denied him the nomination. Mrs Gandhi's position was too uncertain at the time to allow her to intervene successfully on Mane's behalf, but she subsequently rewarded him by bringing him back to New Delhi as Commissioner for Scheduled Castes and Scheduled Tribes.
- 62 In the process of accommodating Kumbhar, however, the incumbent President of the zilla parishad, Dinkarrao Yadav, was denied the ticket he sought from Kumbhar's taluka. V K Chavan-Patil was dropped as

the MLA from Chandgad. In large measure this action was taken against him because of pending charges about his mismanagement of several co-operative societies and a bitter dispute over the organisation of the sugar factory proposed for his constituency. Chavan-Patil, Kaulaukar-Patil and others encouraged a rebel Congress formation during the MLA and zilla parishad elections, but they met with only minor successes.

- 63 Gaikwad remained President of the DCC until the assembly elections in 1972. In keeping with national rules, he resigned from the post when he was given a ticket. The Vice-President then became acting President during the election campaign. In part, the decision to create an *ad hoc* Congress Committee after the elections arose from Vasantao Patil's unhappiness with the Vice-President's behaviour in the DCCB elections.
- 64 Where a single person is said to 'dominate' the politics of a district, as in Poona district, it is because so much actual authority is subdivided among supporters that the chief leader assumes the role of conciliator among those subordinates. Thus, the style of leadership that is adopted has much to do with the span of control that a leader can maintain. A conciliatory style with declaratory interventions resorted to only as a last resort, which seems a common leadership approach, is also one adopted in Maharashtra politics by Y B Chavan during the dozen years that he has been the pre-eminent figure in the state.

Maharashtra Steels

MAHARASHTRA STEELS, a new company, is establishing a mini-steel plant in a notified 'backward' area of Bulandshahr in UP, some 15 miles from Delhi. The annual installed capacity of the steel ingot casting plant on a 10-tonne arc melting furnace will be 18,000 tonnes. Manufacture is planned presently of mild steel ingots in billet size by conventional bottom-pouring method. The plant and utilities are planned to permit diversification and expansion in the future, without stoppage of production. Total cost of the project, estimated at Rs 120 lakhs, is proposed to be met by share capital (Rs 48 lakhs) and term loan from IFCI and UPFC (Rs 72 lakhs). Installation is planned to be completed

in September next, and the project would be commissioned in the following month. The company is offering to the public for subscription at par 2.30 lakh equity shares of Rs 10 each and 8,000 cumulative redeemable preference shares of Rs 100 each carrying right to fixed dividend at 9.5 per cent per annum. The subscription list will open on May 30 and closed on June 9 or earlier, but not earlier than June 2. V C Patel, ex-Custodian of Central Bank of India, who is the chairman, expects the company to pay a maiden dividend of 10 per cent out of the earnings of the first year. Mukul Jain, a young entrepreneur, is the managing director.

NEWS! Fixed Deposit Scheme UBI now offers higher rates of interest

From 1st April, 1973 you get more for your savings with UBI under the Fixed Deposit Scheme. You can deposit your money for a period of 15 days to over 5 years and earn handsome interest. Rates of interest range from 2½ per cent to 7½ per cent depending on the term.

OLD RATES	PERIOD	NEW RATES
2%	15 days to 45 days	2½%
3%	46 days to 90 days	3½%
4½%	91 days & above but less than 6 months	4½%
4¾% 5½%	6 months and above but less than 9 months. 9 months and above but less than 1 year.	5½% 6 months and above but less than 1 year
6%	1 year and above but less than 2 years	6%
6½% 7%	2 years and above but up to & inclusive of 3 years. Above 3 years but up to & inclusive of 5 years.	7% 2 years & above but up to & inclusive of 5 years.
7½%	Above 5 years	7½%

GOVERNMENT PROPOSES, FARMER DISPOSES

FRUITLESS NEGOTIATIONS WITH EEC

TELENGANA STRUGGLE IN RETROSPECT

VIEW OF MANAGEMENT

The widest, most modern range of contactors today—built in the dimensions you prefer

After studying the needs of original equipment manufacturers and control panel builders, L&T proudly announces the widest, most modern range of contactors.

WIDE RANGE

Now L&T offers you: MV-1 (10 amps), ML-0 (10 amps), MK-1 (15 amps), ML-1 (16 amps), ML-2 (32 amps), ML-3 (40 amps), MK-3 (63 amps), ML-8 (125 amps), ML-12 (300 amps).

QUICK INSPECTION

Contacts in any contactor need periodic inspection. In L&T contactors they are accessible from front. Just lift the contact carrier with pliers—both moving and fixed contacts can be taken out easily.

TROPICALISED, DAMAGE RESISTANT COIL

An L&T exclusive. Soon you'll be seeing more potted coils in L&T contactors. Moulded in hard resin, the coil is fully protected from accidental damage to insulation. The potted coil is tropicalised—you can even leave it in water overnight. It is not affected!

Coil terminals accessible from front—easy to connect or disconnect. Just remove front housing for access to the coil in ML contactors. In MLO/ML1 contactors, the coil is plugged in: the leads need not be disturbed at all.

AMPLE TERMINALS

L&T's new contactors have ample terminals. Reason: they are designed to take aluminium wires. We do keep pace with your requirements.

EASY CONTACT REPLACEMENT

In the large rated L&T contactors, you do not have to disconnect the terminal connections to change the contacts. You would not want to tamper with the cable connections more than absolutely necessary, would you?

COMPACT DIMENSIONS

ML contactors are designed to occupy very little panel space—made possible by building the auxiliary contacts in between the main contacts. Saves on cost of panel.

VARIETY

Our contactors range from 10A to 300A. ML contactors come with 2 NO and 2 NC auxiliary contacts as standard. In addition, MV1 contactors are in 5 different contact combinations fitted with both AC and DC coils. That is some variety.

LONG, LONG LIFE

All contactors have silver cadmium oxide contacts with anti-weld properties—designed for long life. The double-break bounce-free contact system helps this further. The ML contactors have been tested for long life at a high frequency of operation. Our test is your guarantee.

The new range of L&T contactors is better. Much better. Study them at your dealer. Or ask our engineers to show them to you. We are confident you will go for them at the first chance: because we studied your needs before building this new generation of contactors.

L&T Switchgear better...much better

Panic in Food

SINCE the availability and distribution of foodgrains could, in the current year, make or break the economy and presumably the polity too, there need be no awkwardness felt about returning time and time again to a discussion of the underlying issues. For, quite extraordinary things have continued to happen. The Minister for Agriculture, it is tacitly assumed by all, will not function. The effective leadership in matters concerning his ministry was initially assigned to the Minister for Planning. Now, the Minister for Heavy Industry has taken charge. At the same time, Krishi Bhavan has begun to play footsie with the estimates of both the output and the procurement of wheat. The emergency rabi programme, on which Rs 150 crores were dissipated, and which at one point of time was to yield as much as 15 million tonnes of additional wheat, was credited till about a fortnight ago with having been instrumental in lifting the output of grain by at least a modest 3.5 million tonnes in the current agricultural year. Since then, a further evaporation in output has taken place. Production of wheat in the country in 1972-73 — according to the latest pronouncement from the Minister of Heavy Industry—Chairman of the Task Force for Agriculture — will be just about what it was last year, viz, around 26 million tonnes. It is thus official that the sum of Rs 150 crores on the emergency rabi programme has totally gone down the drain. The production of wheat remains invariant, irrespective of the outlay of resources; and you run the risk of being considered unpatriotic if you look too closely into the end-use of the funds appropriated from the Central exchequer for the 'crash programme' of the rabi season.

Be that as it may, this scaling down of the estimate of wheat output can be causally linked to the government's own abysmal failure in procurement operations. The flamboyance with which, during the early weeks of the season, communiqués were being issued daily regarding the progress in procurement, has now been replaced with an uneasy silence. At the current level of performance, actual procurement of wheat is unlikely even to equal the quantity procured last year, viz, 5.6 million tonnes. Thus all that the government would have to show against the much-vaunted take-over of wholesale trade of wheat and the emergency production programme in the rabi season, is a decline in both the output as well as the availability of grain through the public distribution system.

But exercises in make-believe continue, however. The current toil is over determining the size of the kharif emergency production programme and the nature and magnitude of the bounties to be offered to the rich farmers in order that they might condescend to produce more. In a sharp reversal of the practice since 1969, fertilisers and other essential inputs are to be supplied at subsidised rates to those farmers who would agree to hand over an agreed proportion of the harvest to government agencies. It needs to be remembered that a limited experiment on these lines was carried out five or six years ago in one or two districts in Andhra Pradesh under the auspices of the Food Corporation of India. The farmers there had gleefully accepted the fertilisers supplied at subsidised prices, but at the time of the harvest had somehow forgotten to surrender to the Corporation the stipulated quantity of the grain. There is no assurance at all that that experience will not be replicated all over the country if the 'innovations' currently being touted by the Minister for Heavy Industry are pressed with.

It is thus once more the American model of the middle 1960s at work: subsidise the inputs, but do not press too hard on the affluent farmers in case they refuse to hand over a substantial portion of the grains raised; if you desire a somewhat larger order of procurement, ensure that the procurement prices are generously hitched up. Taking his cue from this, the Union Minister of State for Agriculture could not wait for the report of the Agricultural Prices Commission in the matter. In unseemly haste, he confided to a press conference that, irrespective of what the Commission might or might not recommend, the government is determined to raise by a significant amount the level of procurement prices for kharif foodgrains. The Commission was thus put on notice: from now on, procurement prices are going to be politically determined, and that is that; if the Commission refuses to go along, it is welcome to get out.

A kind of panic has taken over. The rise in purchase prices — overtly, as is being proposed for the procurement of kharif grains, or covertly, through subsidy of inputs as in the case of wheat — has certain implications for the issue prices and for the size of the fiscal deficit. But evidently, no one is worrying about that at this moment. Quite to the contrary, the proposal

to take over the wholesale trade in rice is being quietly shelved. Since the government does not have the gumption to come down on the rich farmers, a reversal of policy all along the line is on the anvil. Till the next crisis arrives on the scene, therefore, it is the rich farmers who will hold complete sway. They will not pay any taxes, the prices for their products will be jacked up, and the inputs they purchase will be supplied generously at subsidised rates. Despite all this, food for the poor is likely to remain short, for, even were the government's stock to swell once more, the poor will not have the wherewithal to purchase the expensively-priced grains. And, if the starving ones have the temerity to rise in protest against their circumstances, the forces of law and order will no doubt be at hand to take care of that.

India and EEC

Fruitless Negotiations

OUR trade negotiations with the European Economic Community do not appear to have yielded the results expected of them by the government. In the last two years or so, hectic activity has been going on both in the Indian embassy at Brussels and in higher policy-making circles in New Delhi to prepare a forceful trade negotiations plan so that Indian exports gain greater access to the EEC. Britain's entry into the EEC apparently strengthened our resolve, just as Article 24 of GATT, which entitles GATT members to compensation for loss of markets resulting from the enlargement of a restrictive trading area, strengthened our bargaining position. It was felt that India's position, along with that of other Commonwealth countries, was particularly strong in seeking concessions from the EEC since it was not only losing normal access to the British market but was also losing the preferential treatment received by it for a few decades.

The main objective India has been pursuing is a commercial co-operation agreement which would ensure greater access to Indian exports through both reduction of tariff barriers, in some cases to nil, and removal or reduction of quota barriers against a number of important export products like jute manufactures, coir products, handicrafts, processed goods and some simple manufactures.

Viewed in this context, what India has been able to obtain in the negotia-

tions with the EEC is disappointing. The EEC has offered to reduce its tariffs to one-half of their present levels on costlier varieties of jute manufactures on condition that India would limit their exports to EEC at 8,000 tonnes annually (which could be increased by 10 per cent per annum over the next three years), and removal of quantitative restrictions on the exports of cheaper varieties of jute manufactures, except in respect of France. The reduction of duties would be spread over the next two years or so with the first 20 per cent cut coming in July 1973 and the final reduction of 20 per cent taking effect by January 1975. With all these concessions the EEC market for jute will remain relatively an insignificant one compared with that of the UK. And what would happen to India's exports of jute goods to UK is still not known. The Indian official position is that at least the *status quo* will be maintained in respect of UK. But this hope is based on the assumption that even if UK is willing to permit Indian exports into the country as before, the other members of the EEC will permit it to do so. The British have been stressing time and again that they cannot afford to ignore their obligations under the Treaty of Accession, implying that they will have to erect by the year-end the EEC's common external tariff barriers against non-EEC imports.

In respect of the other demands put forth by India the EEC commission is adopting time-consuming procedures. Though Indian officials are still unwilling to admit the fact, it has become abundantly clear by now that the EEC's interest in India is at best marginal. The majority of the members of the EEC do not have the sort of political or economic stake in India that they have in the Associated African member countries under the Rome Treaty's reciprocal arrangements. Nor do they have any strong political interests in view, as indeed they have in respect of Yugoslavia to which they have offered a number of concessions, including liberal import of labour. India cannot offer much to the EEC countries in terms of a potentially fast expanding market. All the same, the EEC has made a suggestion to India in the form of a clause in the proposed agreement asking India to offer to the EEC countries access on a most-favoured-nation basis to India's natural resources. The government's first reaction to the suggestion has been rather cool. Since trade treaties are by definition reciprocal, the EEC coun-

tries are unlikely to offer anything to India which does not have much to give in return.

Exports

Misuse of Incentives

THE Report of the Comptroller and Auditor General (CAG) of India for 1971-72, in its discussion of the erstwhile Ministry of Foreign Trade now redesignated Ministry of Commerce, lends support to the view that the Ministry's export promotion policies lack objectivity and rationality. Among the various export promotion measures, cash subsidy and import replenishment are the most important, especially for exporters of non-traditional products. Yet the Ministry has not adopted any rational criteria for the administration of these two major export incentives. What is worse, there is evidence to show that these incentives have been sometimes misused to grant special favours to particular persons and firms.

Take, for instance, the case of cash subsidy granted in respect of exports of dehydrated onions. At the request of firm 'A' (a misplaced sense of delicacy apparently prevents the Comptroller and Auditor General from naming the firms in question) in early 1970, the Ministry offered cash assistance of 20 per cent of f o b value of exports of dehydrated onions with effect from July 1970 — on the assumption that the firm's exports would amount to Rs 25 lakhs in the first year. As against this the firm's exports of dehydrated onions were only Rs 4.76 lakhs in the initial year and it altogether stopped exporting onions after December 1971. The Ministry of Foreign Trade made a general announcement in April 1972, after firm 'A' had stopped its exports, that a 20 per cent cash subsidy would be available on exports of dehydrated onions from July 1970. Why did the Ministry not disclose to other units manufacturing dehydrated onions until as late as April 1972, by when firm 'A' was no longer interested in exports, that a cash subsidy was available.

The CAG's Report draws attention to another case in which a firm from Madras exported silver oxide worth Rs 52.5 lakhs to an East European country and was granted 20 per cent cash subsidy and 20 per cent import replenishment. Over two decades ago silver oxide was used as a drug for treating

hysteria patients and so found entry into the British Pharmaceutical Codex, 1934. The item did not find any mention in subsequent editions of this publication; nor does it feature in the Indian pharmacopoeia, as it is no longer used as a medicine. Yet the government gave its decision in 1972 that silver oxide was a drug, export of which was entitled to 20 per cent import replenishment and 20 per cent cash subsidy. This was done by pointing out that the item had been classified as a drug in the 1934 edition of the British Pharmaceutical Codex. It should be remembered that prices of silver in India were lower than those abroad at that time. Secondly, in the case under consideration silver oxide had been exported to a rupee payment country. Despite all these obvious considerations, the exporting firm was given a cash subsidy of Rs 10.5 lakhs and an import replenishment licence for Rs 10.5 lakhs in free foreign exchange in May 1972.

Yet one more case is that of another company 'A' which exported copper conductors through a foreign company B, acting as its sales agent on commission basis. At the time of the negotiation of the deal a director of the foreign company 'B' ceased to be its director and became a director of the Indian company. Company A had negotiated a deal to export 3,000 tonnes of copper conductors at stipulated prices based on the prices of copper on the London Metal Exchange. The company approached the government for cash subsidy on its exports at the rate of 10 per cent of the f o b price to cover its estimated loss on the deal. The government agreed to cover the actual loss on the assurance that the company would make available to the government cost accountant such production data and other information as might be required by him. The government cost accountant submitted his estimate of the loss before all the goods had been finally exported and suggested that the company should be asked later, after the completion of the order, to submit details of actual expenses duly certified by the company's auditors. Though subsequently the company did not submit any details about the expenses relating to this particular contract, the government paid the agreed cash subsidy to the firm and also gave it 70 per cent import replenishment licences. According to the CAG's office, the actual loss incurred by company A was only Rs 16.08 lakhs as against the government cost accountant's preliminary estimate of Rs 68.03 lakhs and the

actual subsidy paid by the government of Rs 41.91 lakhs. The CAG's Report also notes that the additional sales commission of Rs 6.45 lakhs paid by firm A to firm B on account of the price escalation clause in the contract was not in order and that this involved additional outgo of foreign exchange and also boosted the loss incurred by company A.

The economics of encouraging such exports is far from convincing. The domestic value added component in company A's export deal was only 5.5 per cent of the f o b value of exports of about Rs 5 crores, or Rs 23 lakhs, and the labour content was a mere 1.8 per cent of the f o b value. The subsidy of Rs 41.91 lakhs granted by the government gives a ridiculously high rate of subsidy of 182 per cent of the domestic value added. The CAG's Report aptly notes that "our country does not enjoy comparative advantage in manufacturing and exporting such a product, the import content of which is very high and labour content so low" (p 51).

The manner in which the government interprets export obligations imposed on firms is also strange. Firm X producing dehydrated onions had accepted export obligation to the tune of 80 per cent of its production and had on that basis secured the needed imports of capital goods from abroad. Though the export obligation had been given without any assurance of a cash subsidy, the company was given 20 per cent cash subsidy on its exports of Rs 21.7 lakhs during the period July 1970 to March 1972. What is more interesting is that though the announcement granting cash subsidy was made in April 1972, it was made effective retrospectively to all the units from July 1970. It is difficult thus to understand whether the cash subsidy is an incentive meant to induce people and firms to export or a *post facto* windfall for its recipients.

Agricultural Wealth Tax

To Save Farmer's Wealth?

NO one with even the slightest acquaintance with the efficiency of the Indian fiscal system will be surprised by the official revelation that out of the Rs 22 crores of expected revenue from the agricultural wealth tax only a paltry Rs 1 crore could be scraped together over the last three years. The excuse given

for this by the Ministry, that this is the result of land being owned by companies and institutions which are exempt from tax, should take in nobody. Information on land holdings and the condition of land records in this country is notorious for its inaccuracy and poor coverage. Even so, there are enough data to refute this latest official excuse. A number of studies conducted by the Reserve Bank and the NSS indicate that the aggregate value of rural assets held by cultivators is about Rs 33,000 crore and of assets held by non-cultivating households about Rs 3,000 crores; this means that about 91 per cent of rural assets belong to cultivating families. What is more, about 37 per cent of these assets are concentrated in the hands of the top five per cent of the rural rich — a fact which further undermines the veracity of the official plea. Land reforms have not materially altered this skewed wealth distribution in the villages, though they may have inspired formal land transfers within the households. In fact, since wealth tax is on individuals, to the extent that such intra-household transfers have been effected, they will have diminished the wealth tax liability on the same quantum of wealth.

This dismal performance of the agricultural wealth tax may be traced directly to fiscal mismanagement which has become endemic. New Delhi has always dithered while dealing with the rural rich on whose political support its survival depends. As in land ceilings, in the wealth tax imposed in 1970-71 too the individual, rather than the family, was made the leviable unit. Consequently notional transfers of land title within the same family have robbed the exchequer of possible revenues. At the same time, the exemption limit has been set so high, at Rs 1.5 lakhs, that as one source has estimated, all except a few at the top — 0.9 per cent to be precise — are left out. In reality, even fewer than those liable under the law proper pay the tax. For the law allows a long list of assets which a rich farmer can exclude from the purview of the tax. The Raj Committee has gauged that, after all the exemptions, the effective non-leviable minimum works out to 4 lakhs — which diminishes the number of households paying the tax to an insignificant number.

Clearly, if the government wants the agricultural wealth tax to yield revenues, the exemption limit will have to be lowered, the privileged exemptions beyond this limit to be removed, and the

family made the leviable unit. Such have already been the recommendations of the Raj Committee on Agricultural Wealth and Income Tax. Also, the Raj Committee has suggested tax levy on the shares of companies, co-operatives or trusts in land, so as to prevent the rural rich from dodging tax. Implementation of such suggestions, however, would again mean tampering with the same social group that the men in New Delhi rely on for their political sustenance.

Indo-Bangladesh Ties

Time for a Low Profile

THE discussions the Foreign Secretary of Bangladesh had in New Delhi have ended on a mute note. For the present, or so it would appear, we have little alternative but to wait for the Godot of Pindi's response, which may never arrive. Pakistan having decided in favour of other gambits, last year's Simla Agreement can now almost be taken to be obsolete. P N Haksar's carefully got together package too can be set aside, at least in its present form. As Indira Gandhi's internal problems have mounted, President Bhutto's difficulties have seemingly lessened, especially since the beginning of the current calendar year.

This is discouraging enough. What is even worse, New Delhi's perception of the domestic developments in Bangladesh too remains imprecise. The week during which Maulana Bhashani was fasting in support of, among other things, the demand for the abrogation of the Indo-Bangladesh Treaty was hardly appropriate for D P Dhar to lead a trade delegation to Dacca; on the day he arrived, the Bangladesh capital was shut down by a hartal ostensibly in support of Bhashani's demands. It was also the week when the results of the four by-elections to the Bangladesh Parliament were announced, confirming the fact of a substantial erosion in the popularity of Sheikh Mujibur Rahman's party since the general elections in March.

D P Dhar and his delegation were not the only irritant; to complicate matters further, there was also an Asian Peace Conference meeting in Dacca later in the week. Since this was an appendage of the World Peace Council, the combination of circumstances was bound to provide the impression of a pincer of a joint Moscow-New Delhi political offensive. Not unexpectedly, the largest contingent of foreign delegates to the Conference

was from India. The Ministry of External Affairs in New Delhi, it is fairly well known, is in the habit of covering the finances of at least some of the Indian delegates to such conferences. The practice started in the 1960s when the Government of India was anxious to use forums of this kind for strengthening the lobby against China. The original objective proved infructuous in no time, but paying of homage to inertia has continued. The practice is now integrated with a certain mindlessness, or, as some cynics suspect, is a fall-out of the developing Indo-Soviet camaraderie at the official level.

To many in Bangladesh, and even among those who are not pathologically biased against India, all this was unnecessarily provocative. A meaningful conclusion of the trade talks, leading to arrangements which could turn out to be mutually beneficial, was out of the question in the vitiated atmosphere; the joint statement issued at the termination of the Indian delegation's visit contains hardly any reference to the problems of trade and is a bland listing of the unilateral credits — or, if you will, hush money — offered by India. A large part of Bangladesh's current woes are linked to the fact that, having hitched its political — and, by implication, economic — stars to India's, it had to take the rough along with the smooth; the price level there had to come up somewhere around the level of India's. As the process involved a very steep climb within a relatively short stretch of time, while the corresponding adjustments in the levels of incomes have been neither quick nor equitable, the hardships experienced by the people could not but be widespread. In terms of supply-demand complementarities too, India has proved to be a singularly mismatched partner. It does not have an excess availability of either cotton or oilseeds, and its stock of foodgrains has run dry. It has little use for Bangladesh's inferior tea, but has given every indication of maintaining its role as price leader in the matter of the export of jute and jute manufactures. If, on top of all this, unscrupulous elements within the Awami League have used the opportunity provided by the difficult economic circumstances to feather their private egg-nests, the stigma for that too, via some not at all complicated psychological device, has been transferred to India.

Like it or not, we are now stuck with Bangladesh; despite epithet-mongering and developing recriminations, we have, for the present, no option but to turn the other cheek. However, in

view of the current mood, a policy of low profile would seem to be the right one to pursue; with minor emendations, one ought not even to mind period of what has come to be known as 'benign neglect': this might facilitate the quietening of some passion across the border. But a D P Dhar is constitutionally incapable of not cutting a swarth, and the kind of junk-teering Congressmen who found themselves in Dacca on the pretext of the Peace Conference are prone to shoot their mouth. It would therefore be scarcely surprising if the wages of the week turn out to be a spell of repentance at leisure.

Foreign Companies

Cloak over Remittances

THE Reserve Bank has published the latest in its series of studies on the finances of branches of foreign companies and foreign-controlled rupee companies (RBI Bulletin, March 1973). The study relates to 1969-70, so that its results are of little more than historical value. Further, the presentation of the results is such as to render them largely valueless even from a historical viewpoint.

A crucial piece of information which any study of the finance of foreign firms, branches or subsidiaries should be expected to disclose is about their remittances abroad by way of dividends and other payments. There is no information on this subject in the RBI study. The omission is totally inexplicable considering the mass of data on the subject which is in the RBI's possession. Given the rigid exchange control regulations, every remittance, under whatever head, has to be cleared by the Reserve Bank. So all that the Reserve Bank has to do is to ensure that the information in the possession of one of its departments is collected and analysed by another.

Yet another department of the Reserve Bank has been conducting regular studies of the country's international investments position, covering detail of profits earned, distributed and retained by foreign companies. The latest study in this series relates to 1967-68 and its results were published in the March 1971 issue of the Bulletin. The Reserve Bank had also conducted a comprehensive survey of 'Foreign Collaboration in Indian Industry' giving details of remittances, though the data were as old as for 1964-65.

Actually, the details of remittance

by foreign companies under various heads are readily available with the RBI even for 1971-72. This is evident from the information furnished by the government in reply to questions in Parliament from time to time. The RBI claims to have widened the scope of its study of foreign companies "by giving statistics for a larger number of industry groups, sub-groups, and for additional countries". But all this effort is largely wasted without the crucial information on remittances.

If the Reserve Bank's objective is to present information about other aspects of the working of the foreign companies — such as trends in costs, profits, assets formation, etc — its other studies of public and private limited companies (non-government, non-financial) are comprehensive enough. As many as 276 of the 407 foreign-controlled rupee companies have been included in these studies. At best, comparative ratios of profitability and asset growth, of the type presented in the study of foreign companies, could be given as part of the other studies. This would be sufficient to show that companies with foreign capital have shown better performance than the Indian companies in all respects.

Again, information about the 'stock' variables are given in the study for the two years 1968-69 and 1969-70 whereas that about the 'flow' variables are given for only 1969-70. Any attempt to compare the results of the latest study with those for earlier years is also defeated by the differences in the number of companies included in different studies. In the study for 1968-69, 223 branches of foreign companies were studied, whereas in the present study the number has come down to 216; out of these, 203 were common to both studies. The number of foreign-controlled rupee companies has gone up from 378 to 407, with 369 common to the two studies. To the extent the samples are different, the growth rates worked out in stock variables are not quite valid. The reason for such frequent changes in samples and their sizes is not clear. If it be suggested that the relative proportions, if not the absolute figures, would still be comparable for different years, the tinkering with the samples and their sizes would appear to be all the more redundant.

The raw data presented in the study do nevertheless suggest certain relatively minor but interesting features. One such concerns wage cost as a propor-

tion of the value of production. Another study by the Reserve Bank had indicated that the proportion was 13.4 per cent in respect of 290 large public limited companies (RBI Bulletin, July 1972). The corresponding ratio for the 407 foreign-controlled rupee companies covered in the present study is 11.8 per cent. The difference appears even more significant if it is remembered that salaries of senior managers and executives, which are known to be higher in foreign companies than in Indian ones are included under 'wages'. The difference is not explainable in terms of differential capital intensities; for, interest and depreciation costs of the two sets of companies are almost identical. Thus while the general impression that labour in foreign-controlled companies is well paid may be true, yet in relation to the contribution they make to the profits earned by these companies, labour's share is seen to be actually smaller than in other companies.

Lucknow University

Militancy without Ideology

A Correspondent writes:

AT Lucknow University the theory of student participation in University management has begun to signify dictation by students in all matters. Generally, it is the SSP-wing of students, specialising in militancy without ideology, and the RSS-affiliated students who manage to get elected to the Lucknow University Union — thanks to their 'attractive' promises, in the form of demands on the University authorities. Last year, a militant SSP student, with the help of toughs imported from Gorakhpur in east UP, was elected Union President. He was even given a several-gun salute.

The new Union President tried to project the following slogans: (1) 'Open Admission' (i.e., all those who apply should be admitted); (2) 'Open Examination' (i.e., all those who want to appear for an examination should be allowed to appear); 'Open Pass' (i.e., all those who appear at the examinations should pass).

In August-September 1972 the Dean of the Faculty of Arts resisted the first demand. He was gheraoed on several occasions, for hours each time. The academic community, represented by the Teachers' Association, did not support the Dean. The President of the Association, who was also the Dean of the Faculty of Science, was leader of

a disgruntled group that was not friendly with the Arts Dean. The District authorities too were unwilling to intervene on the ground that such intervention would merely spread the student agitation. All this gave strength to the SSP-RSS coalition in the Lucknow University Students Union.

At the time of the examinations, the students asserted their 'right' to be admitted to the examination halls, even when they had put in no attendance, whereas under the University Ordinances the minimum required attendance is 75 per cent. Student instigators pressed for mass copying to be allowed. This time, for a variety of reasons, the teachers took objection. Taking the position that invigilation had degenerated into a law-and-order problem, they said they would not invigilate unless the police came to their assistance. The Students' Union stuck to its guns. It declared that, if the police entered the campus, the students would tear the question papers and writing books. On May 10, they did so. The mass of examinees who had no share in this, their parents and guardians, were perturbed. The examinations had to be postponed by a few days and the Provincial Armed Constabulary (PAC) had to be called in to help the invigilators conduct the examinations.

But the PAC itself had been in a turbulent mood for some months. Several newspapers had reported that there were cells of the RSS in the PAC. They have been demanding that their trade unions be allowed to function under the united banner of a 'Parishad'. The Vidyarthi Parishad, the students' wing of the Jan Sangh, is dominated by the RSS. A meeting of the two 'Parishads' took place on the night of May 20, at about 9 o'clock. They decided to revolt together. The Vice-Chancellor, having got news of this, ran from pillar to post but could not move the District authorities to act promptly. The Army was ready to enter the university campus any moment but seems to have avoided doing so during the night as an armed confrontation with the PAC would have also involved the students. The PAC men and the students were together shouting: "Chhatra-Police Bhai-Bhai" ('Students and Police are Brothers'). The PAC men refused to listen to their officers and declined to quit the campus. They supplied petrol from their trucks to students who had a free time setting on fire the offices of the Registrar and the Proctor, the Faculties of Science, Arts, Commerce and Law, and the Examination Centre. The once beautiful Burma-teak stair-

case in the main building exists no more. The teachers' rooms marked with swastikas were burnt — except for the office of the Editor of the *Indian Journal of Labour Economics* which is protected by a wall. The watch-and-ward staff stood helplessly by. The fire brigade was chased back. Hundreds of non-participant students stood in front of the University Library and, with folded hands, prayed that the Library be spared. The incendiaries evidently responded. By 9 o'clock in the morning, on May, 21, the PAC had withdrawn and the army had entered the campus. Fire-extinguishing work was begun. A common remark was that what Bakhtiar Khilji had done to Nalanda, the self-styled devotees of *Bharatiya Sahitya* had now done to Lucknow University.

Lucknow University politics is a microcosm of the national scene. The opposition parties, mainly the Congress (O), that dominate the University Executive Council and other similar bodies, combine to use any kind of mercenary struggle in their campaign against the ruling party. What is even more unfortunate is that the Teachers' Association itself is riven by factions so that it has given top-most priority to removal of the Vice-Chancellor rather than to the general rehabilitation of the University. It has also failed to try and identify the teacher-patrons of the student hooligans and protect the University as a centre of learning and academic values.

Accidents

Distribution of Commiseration

ON the night the Indian Airlines jet was destroyed in New Delhi last week and 48 people lost their lives, including the Union Minister for Steel and Mines, two local trains collided in Bombay resulting in the loss of another 16 lives. But evidently some deaths are more important than other deaths. It is the rich who habitually travel by air and who become victims when a plane meets with an accident. In contrast, trains, particularly local trains, are used by faceless non-entities; when there is a train accident, it is usually those who do not matter who die. Understandably, therefore, the air-crash hogged all the attention of the news media. During the two days following the accident at Palam, in one or two New Delhi newspapers nearly 60 per cent of the total space not taken up by advertisements was earmarked for stories and reports concerning the loss of the plane and

the loss of famous lives. The tragedy near Bombay was consigned to an insignificant corner. The radio and the television did likewise.

Technically, in our kind of democracy, every adult has a vote and is, therefore, supposed to exercise equal political weightage. At the level of reality, a few at the top are always more equal than the rest. If they die, there is an additional element of tragedy and pathos. The relatives of the persons killed in the air-crash will receive compensation at the rate of Rs 100,000. Even the injured would be handsomely compensated. On the other hand, the relatives of the persons who lost their lives in the train crash are to be offered *ex gratia* payments of Rs 500; the injured

will be paid at the rate of Rs 400. The poor, it is assumed, do not deserve more.

Such instances of double standards evidently disturb no one. To be eligible for ascription as tragedy, an event must be one concerning the nobility of the country. The poor and the rustic may die through accidents, but theirs are mute deaths. No judicial commissions of enquiry into such commonplace deaths, no special high-level committees to recommend greater measures of safety. The distribution of incomes and assets determines just about everything, including even the distribution of commiseration at the time of death. The rich are bidden tearful farewell, the poor merely die.

Calcutta Diary

A M

PRAY, will insertions in newspapers help? Of late, has anybody seen the country's economists anywhere? With each week, the country sinks into a deeper morass. Charlatans, in government as well as outside, are on the loose and do havoc to this or that sector of economic activity. Astoundingly ridiculous explanations are furnished about why economic growth is near zero and why prices are rising and why procurement is not proceeding according to expectations and why income inequalities are getting aggravated. The credulity of the people have been exploited beyond endurance. Even so in the short run, the political alternatives are few and far between. This being the case, the fools and the bounders are being put up with.

One can nonetheless persist with the query: where are the country's economists? Have you seen any of them in the neighbourhood? What precisely are their current preoccupations? What do they think of the present state of the economy? Have they any comments to offer on the quasi-stagnation of output, on the government's inability to maintain the procurement and distribution system, on the awkwardness of the fiscal and monetary mechanisms, on the consequences of unbridled price inflation, and all that? On any crucial issue affecting contemporary realities, has one heard even one economist make a single significant statement in recent weeks? Banalities of course continue to be uttered in plenty, for example, that a reduction in the inequalities in con-

sumption expenditure would lead to a reduction in the aggregate demand for imports, or that in order that indirect taxation may not affect the absolute level of prices, measures have to be taken to reduce the unit cost of production. But beyond the parading of such transparent innocences, it is almost impossible to track down the minds of the economists. Where are they?

THE CORE AND THE PERIPHERY

They are either abroad, or possibly busy developing esoteric models about growth in some abstracted economy under some weirdest assumption or other about the nature of the production function, the time-path of growth, and people's time-preference. We have to pay the price of being a generally equilibrated world. And in the generally equilibrated world, our economists do what economists in the cosy Western countries do: the science of economics has become a plaything, and our good economists, along with those elsewhere, love to while away their time in playing at models which are purely abstract entities, and whose resemblance to the realities of life could never be even approximately established by even the most astute of prosecutors. At a certain point of recent history, economics ceased to be political economy. From the fairly sensible fact that analytical coherence in demonstrating economic principles could gain from mathematical rigour, far-reaching consequences followed. Gradually, the core and the periphery

interchanged places. Frustrated mathematicians discovered that nothing has been lost, they could still make a career out of economics; economics in due course was made the peg on which to hang their mathematical abstractions. Establishing or refuting economic laws became the feeble apology; skill fetishism took over. In any decadent society, the involvement with live, real issues is supplanted by the exhibition of empty skills as the major activity of an artist or a technologist. In this exercise of decadence, the United States inevitably assumes the role of the pace-setter. At a level of per capita income of \$5,000 dollars annually, you can afford to allow economists indulge in idle games. Of each additional dollar of national income produced in that country, roughly sixty-seven cents, or two-thirds, consist of income from services. It does not really matter whether a part of this service income takes the form of remunerations offered to a decadent group of economists lolling on mathematical fantasies, or of earnings from, say, the exploitation of sexual proclivities of the idle rich. Between what gets branded as mathematical model-building in economics and what finds its way on the pages of the *Playboy* magazine, one need not make any distinction at all. Both are illustrations of indulgence: in one case, the indulgence of the flesh, in the other instance, that of the abstract intellect. Neither leads to an increase in material output, not even indirectly. But, for the United States, it could hardly matter: that country has enough assets and incomes to play around with. The bottom deciles of the population even in that lush land may perhaps hold a somewhat different view about these goings-on, but neither the model-building economists nor *Playboy* could care less.

The problem is however transferred to hapless countries such as India, which spend a disproportionate share of their resources in rearing economists, pampering them and offering them all the facilities in the way of computers, equipment and suchlike, in the hope that they, in their turn, would teach the nation the secrets of economic growth. The economists in no time belie the hope. Perfect mobility is perfect mobility; our economists become aware in no time that the country's basic problems can wait, it is hypothesis-mongering which must receive priority. Moreover, model-

building exercises are not terribly satisfying unless conducted in the open forum of an international clientele. To be fair, it is perhaps not the steady demand emanating from foreign markets alone, there is also the latent inferiority complex in our economists — as in others —, who would like to be applauded by a non-native crowd. Their native land merely offers them some sets of raw data on which they apply their sophisticated skills for abstraction, which in any case are considerable for an average high-caste Indian. The models that are formulated and the equations that are fitted usually fall into two patterns. They are either on the basis of assumptions which are so remote that the conclusions following from them have not the least relevance to the country's problems; alternatively, after much huffing and puffing, much airing of obscure mathematical conditions and application of far-fetched statistical tests, the conclusions arrived at are about as trivial as the garden variety of observations on the weather made by your charwoman. Economists say either totally abstract things which have no relevance for contemporary or even long-range issues, or the most obvious things through a modality of obfuscations one could as well dispense with. Meanwhile, though, prices rise, income continues to be distributed more and more unevenly, the rate of growth slides down to zero, agricultural output marks time, the industrial structure is reduced to an absurdity, politicians trot out alibis for economic failures which would not meet the test of even fifth-rate intellects, and which would never be dared to be trotted out if only economists were around. But economists are not around; they are either permanently abroad, or they have gone out on their summer junkets. And those who have been left behind in the country will not come out in the open.

THE NEW OBFUSCATORS

They will not open for a number of reasons. Even those of the economists who stay back in the country — and they of course constitute the majority — have done reasonably well by the system. Among all so-called social scientists, economists as a tribe have registered the most material advance since Independence, for somehow politicians found them to be the most useful of the lot. Economics became the talisman of the prosperity that was

a-coming; the practitioners of the subject have exploited this role to the hilt. But a crisis was bound to overtake them sooner or later. An economist of even moderate competence will need little time to reach the conclusion that the factors underlying India's economic stagnation are almost entirely institutional; given the conglomeration of class forces, inequalities will aggravate and growth will be negligible. If savings fail to pick up, if a disproportionate part of aggregate investments are diverted to unproductive channels, if procurement is frustrated, if regional inequalities are intensified, if direct taxes on agriculture cannot be raised, if the unit cost of industrial output cannot be lowered, the reason in each case is extra-economic; if prices rise and government seemingly does not succeed in lowering them, it is because it wants the prices to rise, and abets in the process. A perceptive economist has to admit that he has little residual role left in the circumstances and that his profession has been played out. As a group, economists will not however prefer to utter such home truths; such a step would imply their going against the system which has propped them up; it may involve their bread and butter; it may involve a certain drying up of funds which provide the accountrements of comfortable living.

No, the economists know which side their bread is buttered. If the emperor has no clothes, they will be the last persons to proclaim that fact. They love their present role, which in many respects is parallel to that played by the Brahmin in ancient and medieval Hindu society. The Brahmins were the traditional obfuscators; they were the buffers between the masses and the Hindu kings. They would manufacture alibis explaining why the kingdom was not prospering and why the poor must remain condemned to their state of servitude. In the structure assiduously built in this country over the past two and a half decades, the economists have blossomed forth as the new obfuscators. Politicians could not do without them; no dearth of opportunity for them, there is saturation money for this or that project and for umpteen meaningless model-building exercises. The masses must be provided with ample diversions so that they would not come to know the essential facts about their current plight; economists are providing these diversions, that is, those amongst them who have condescended to remain behind in this poor, hot country.

Challenge and Response

Romesh Thapar

THE terrible air disaster on the outskirts of Palam once again in a flash uncovered the rotten state of work and performance in our country. Instruments are not working, equipment is not maintained, communications are primitive, norms of every description are broken, standards are not maintained, duty is shirked and there is looting. Whenever there is an emergency, in whatever area, the same story of a sick system is repeated. On this occasion, the very centre of power is affected — and something may result from the probes that have been launched.

There's a lot of heart-searching going on. We are in a situation where everyone has devastating comments to make about someone else, but few, very few, do their own job at a competence expected of them. We have quietly, over the years, persuaded ourselves into believing that we possess all manner of remarkable qualities, and the sorry part of our degradation, moral and otherwise, eludes us. The air disaster will soon be forgotten, or left to committees of enquiry to ponder on but the crises which surround us can no longer be willed away. They demand remedial action by a leadership which knows its mind.

The strange handling of the Bihar situation where governments are made and unmade without thought of relevance of leadership, and the inexplicable reluctance to crack down on Uttar Pradesh and order its cleaning, now gets pitchforked into a central ministerial reorganisation following the death of a dedicated colleague. Procrastination could gather more problems. As one piles up on the other, political house-keeping becomes more and more forbidding. Politics has been reduced to a game of chess. Its time programmatic action was restored. All else is illusory.

Observers in Delhi cannot but note the ready response to decisive leadership. The spreading railway strike, an expression of the cynical opportunism of inter-union rivalry, was broken with the order banning strikes. To have permitted this strike at this moment would have caused a vast dislocation. Yet, there are certain colleagues of Indira Gandhi who continue to make known their opposition to the banning. The Prime Minister tolerates these elements at her peril —

for, the need to impose discipline on other key services and production points is urgent. No ministry can evade responsibility.

As disciplines are imposed on powerful and organised sections of the working force, it is equally necessary to correct the causes of genuine discontent. Disgruntled over the banning of strikes, Indira Gandhi's colleagues are unlikely to function positively on discontent. There is grave danger here, danger that is not adequately seen in the bureaucracy-encrusted system we have built up for ourselves. Only when the genuine discontent has been uncovered will it be possible to move to purposeful trade unionism in contrast to the present gang war by political parties, including the ruling Congress.

The breakdown of marketing and supplies, following on the railway disruption and the failure of the grain trade take-over, has pushed the emergency into new dimensions. Already speculation has begun on the fixation of wheat and rice prices. There is serious questioning about the capacities of those who fixed these prices which have angered not just the rich farmers. Calculations are being revised. Excuses are being trotted out about earlier estimates of agricultural costs. It is a situation loaded with confusion. And the only beneficiaries seem to be the "kulaks" (sic!) in the USA and Canada; they should raise a memorial to radical colonial economics, said a nasty joker the other day!

The breakdown in grain distribution is paralleled by the failure to get coal to points where it is needed. Consumer products, in short supply or in

excess, are just not getting to sales outlets. In the Capital, for example, the conviction is widespread that a major marketing collapse is on the way because price control mechanisms have got into a tangle and it is no longer profitable to produce. Goods, it is said, will disappear into various black-markets, with their own price mechanisms, compelling a frightening increase in living costs.

While all this may be exaggeration, there is little doubt that marketing and distribution are likely to become a major headache. May be, we need to launch a number of professionally manned and competing trading companies. May be, we need to build around the existing private networks. May be, we have tampered rather carelessly with existing mechanisms, when we have no adequate substitutes. May be our permit-licence raj has finally demoralised the producers of goods and they need solid reassurance that they are not going to be kicked around. May be, we have to free the economy until we get over our cynicism about work and performance. May be, we will remain corrupt and useless for some time to come.

Although politicians of various hues prattle incessantly in public, they are in private without even tentative answers. They are probably resorting to that old stand-by — astrology. The initiative can still very firmly be wielded by the Centre. But the Prime Minister and her senior colleagues have to decide categorically on the priorities. As this level of power, the old animosities and suspicions must not vitiate meaningful action. Probably this is asking for too much. But let's hope the nature of the crisis qualitatively changes responses.

Hansavivek

RAIPUR MANUFACTURING has decided not to implement its ceramics project, as government suggested certain changes in the foreign collaboration agreement which were not acceptable to the collaborators. Besides, the estimated project cost has gone up substantially rendering the project less profitable. The installed capacity of the mills is 45,512 ring spindles, 6,760 doubling spindles and 800 looms (including 264 automatic ones) with complete dyeing, bleaching, roller printing plants and physical and chemical testing laboratory. As a part of the reorganisation and renovation programme, the company incurred last year a capital expenditure of Rs 30 lakhs. Im-

proved market conditions helped the company to produce better results for 1972, although it had to contend with intermittent shortage of power and allround rise in costs. The prices of Indian cotton had gone down considerably because of a record crop, but the company had to spend more on cotton as it consumed a higher proportion of foreign cotton, the prices of which ruled higher. The import duty of 40 per cent on imported cotton, imposed in the last budget, in place of the effective rate of about 3.5 per cent heretofore, is likely to affect the current year's profit. The excise duty on 50:50 polyester-cotton blended fabrics has been changed to 15 per cent ad

valorem, which, it is felt, may not be absorbed by the market. The company's exports declined last year from Rs 18 lakhs to Rs 10 lakhs. The further levy imposed by the Indian Cotton Mills' Federation as export promotion fees has been of the order of Rs 3 lakhs. The government has fixed compulsory exports for 1973 at 16 per cent of the packed production of 1971. The management is hopeful that the company will be able to discharge the obligation fully. The ICMF decided in March last to raise the rate of contribution to a rupee per square metre of shortfall in manufacturing controlled cloth in respect of the period July to December 1972. This liability is estimated at about Rs 9 lakhs and will arise in June 1973 in the event the company fails to fulfil the obligation by that time. The directors say that the sophisticated and modern machinery in the mills is not

suit for manufacturing controlled fabrics of coarse and lower medium counts. The incidence of the burden to be borne by the company in the current year will be of the order of about Rs 21 lakhs, the consequences of which are going to be severely felt by the company. The directors are seriously considering as to what "course of action" they should follow. The 1972 results were better than the previous year's with higher sales. Owing to a provision of Rs 17 lakhs for gratuity, however, the gross profit turned out to be lower. The inventories/sales ratio showed a sizeable increase over the year.

BRITISH PAINTS (INDIA) has had a difficult year to December last, with slightly lower sales and sharp deterioration of margins. There was a nine-week shut-down of the factory in the earlier part of the year, but actually the company could not operate at full capacity almost throughout the whole year. The situation was aggravated by the occasional but serious break-downs in supply of some of the raw materials and packaging materials. Rutile, one of the major raw materials, was chronically in short supply during the last 4 months of the year, which happened to be the peak season. Also, during the middle of the year the company experienced non-availability of printed metal containers. Paint production declined by about 25 per cent over 1971, and the unit cost of production rose steeply. The physical volume of goods sold was about 11 per cent lower than in 1971, but the rupee sales were down by only 4 per cent on account of improved product-mix and higher unit revenues. The measures taken in the area of credit stock control yielded good results. Long-term debts were reduced by 40 per cent, and the average length of credit extended to customers shrank considerably. Likewise, stocks were kept under better control and stores inventory and year ending finished goods showed a marked improvement. A settlement with the employees' union was signed in January and operations largely normalised after that. During the year, the company incurred capital expenditure of Rs 16 lakhs.

BOMBAY OXYGEN has installed two oxygen plants out of the three received from GDR in the premises of Mukand. Iron with whom a long-term agreement has been entered into for supply of oxygen through pipelines. The third plant has been installed at the company's own works at Mulund near

Bombay. The company has received Rs 3 lakhs as compensation from Invest Export of GDR against an old claim. Although the amended Income-tax rules provide for full depreciation on gas cylinders, permission of the Company Law Board has been obtained to declare dividend out of the profits by providing depreciation on straight-line method. The company has made a representation to the tax authorities for claiming relief under Section 80 J of the Income-tax Rules and also for unabridged development rebate. Provision for tax has been made assuming that this claim will be allowed by the Income-tax department. Bombay Oxygen has invested about Rs 123 lakhs in the shares of Raptakos, Brett, a pharmaceutical manufacturing concern. Over 92 per cent of the equity capital and 50 per cent of the preference capital are held by the company. Last year, the company received a net dividend of Rs 5,47,648 from the subsidiary for 1971. The yield on investment works out at barely 4.4 per cent. The amount has been surrendered to the vendors, since as per the agreement the shares were purchased on an ex-dividend basis. An amount of Rs 1,80,000 is due to the company from parties with whom the agreement to purchase land has been terminated. On account of the default in payment, a suit has been filed against the parties.

KOHINOOR MILLS has, in line with the textile industry as a whole, shown improved results for 1972 and is paying a dividend of 8 per cent, although the entire surplus together with the write-backs from unclaimed dividends, excess provision for taxation and from general reserve, together aggregating Rs 28 lakhs, has been utilised to wipe off the loss brought forward from the previous year. The directors say that the decision to pay a dividend has been influenced by improved working in the first quarter of the current year, and the continuing favourable trend in cloth prices. The company has given a guarantee on behalf of the subsidiary, Navjivan Mills, to the tune of Rs 178 lakhs. As at the end of 1972, the subsidiary's accounts disclosed an accumulated loss of Rs 104 lakhs, besides arrears of depreciation amounting to Rs 24 lakhs, and doubtful debts and advances not provided for to the tune of Rs 7 lakhs. Kohinoor's directors say that in view of the improved working of Navjivan, the outcome of the guarantee given on its behalf and the ultimate realisation of the investment in and advances to

that company are "unlikely to be adverse".

SUPERIOR AIR PRODUCTS, a new company, is establishing a project at Faridabad for the annual production of 1.5 million cubic metres of oxygen, one lakh cubic metres of dissolved acetylene gas, 50,000 cubic metres each of argon and nitrogen and 100 tonnes of nitrous oxide. The capital cost of the project, estimated at Rs 95 lakhs, is proposed to be met by share capital (Rs 35 lakhs), borrowings (Rs 31.50 lakhs) and deferred payments (Rs 28.50 lakhs). The company is entering the market on June 20 with an offer of equity capital of Rs 22 lakhs in shares of Rs 10 each at par. The subscription list will close on June 29 or earlier, but not earlier than June 23. The entire machinery and cylinders will be obtained from manufacturers in Italy, Germany and Japan, for which necessary import licences have been secured. An in-built provision is being made in the design of the plant to leave considerable scope for expansion at a minimum cost. Almost all the raw materials are readily available from indigenous sources. Efforts are being made to start production as early as possible to take advantage of the grant of development rebate. On completion, the project will be the biggest of its kind in northern India. It will also be the only unit manufacturing nitrous oxide in northern India and will be the third largest argon-producing unit in the country as a whole. The Board is headed by Dharma Vira, ex-Governor of Punjab, West Bengal and Mysore. The other members of the board are: Bansi Dhar of DCM Group, Kuldeep Chandra, A K Roy, retired Comptroller General of India, Ashok Chandra and Abinash Chandra. The management expects the company to pay a maiden dividend of not less than 10 per cent from the second year of its working and to step it up in subsequent years. Being a 'priority' industry, the company and its shareholders will be entitled to tax concessions prescribed under the Income-tax Act.

DAMANI DYE-CHEM is introducing, for the first time in India, a synthetic plaster manufactured in collaboration with Hermann Thone KG of West Germany. Suitable for plastering any surface such as concrete, wood, glass etc, the plaster is based on synthetic fibres, chemicals, minerals and special type of colour pigments. It does not burn. The product has been modified to suit the climatic conditions in India.

NEW DELHI

Is the Procurement Price Too Low?

WHILE the government is succumbing to the pressure for higher procurement prices for the marketed surpluses in foodgrains controlled by the big farmers, it may not be amiss to look at the facts regarding the cost of production of principal foodgrains on which the case for higher procurement prices is sought to be based. The Food and Agricultural Ministry initiated in 1968 a Comprehensive Scheme for studying the cost of cultivation of principal crops. The technical details of the scheme were worked out by the Institute of Agricultural Research Statistics on the basis of the recommendations of a Standing Technical Committee. The study has been carried out in collaboration with agricultural universities, the agro-economic research centres and other competent institutions. Its first reports under the comprehensive schemes are available and cover: the cost of production of wheat in Haryana and Punjab during the 1970-71 season and the cost of production of wheat during the 1971-72 season in respect of selected holdings in Uttar Pradesh. A great deal of more work has yet to be done under this scheme. But the data for wheat already give a fairly reliable picture of the cost situation for this crop. The conclusions of the study completely demolish the argument that the cost of production of wheat is not covered by the procurement price fixed by the government and that higher price and additional incentives are required to make wheat farming remunerative and profitable.

The overall results of the studies may be summarised as follows: The cost of production of wheat was found to be only Rs 27.07 per quintal in Punjab, Rs 23.57 in Haryana and Rs 19.48 in Western UP if the cost was taken to cover only paid-out costs. Paid-out costs in the study include hired human and bullock labour, seed, manures, fertilisers, pesticides, irrigation, depreciation on implements and farm buildings, interest on crop loans, land revenue and other taxes. In the conditions of our farming paid-out costs represent the most relevant basis for working out the cost and returns for an overwhelming majority of the farmers. On this basis of reckoning cost, it is clear that a procurement

price of Rs 76 per quintal and assured sale to government agencies of whatever the farmer may want to sell at that price gives a very fair margin to the farmer and an attractive incentive for raising production and productivity.

The studies, however, take into account other concepts of cost also. They show that if to the paid-out costs are added the rent that may have to be paid on leased-in land, in the case of those farmers who take some land on lease to make their farms more viable the cost of production will go up marginally, to Rs 28.44 in Punjab, Rs 24.07 in Haryana and Rs 19.64 in Western UP. If to this are further added the rental value of owned land and interest on owned fixed capital, the cost will go up to Rs 54.34 in Punjab, Rs 41.39 in Haryana and Rs 42.34 in UP. And if, finally, the imputed value of family labour is also added, the comprehensive cost will go up to Rs 61.04 in Punjab, Rs 48.10 in Haryana and Rs 49.68 in Western UP. Even on the basis of the comprehensive costs so worked out, the present procurement price gives a fair profit for the farmer.

INTERESTING DATA

Now take some of the more detailed aspects of the study which provide interesting information. First, as regards the structural characteristics of the selected farms which are relevant for working out the cost of production, it is seen that the average size of the holding is larger in Haryana than in Punjab. But the average size of the farm family is also larger in Haryana than in Punjab, so that the average size of farm family per hectare is only slightly larger in Haryana than in Punjab. The proportion of leased-in land to the total cultivated area is very small in both states, but it is smaller in Haryana than in Punjab. Further, most of the holdings in Haryana and Punjab have irrigation facilities and the intensity of cropping is therefore high. But the average value of owned and self-cultivated land per hectare as well as of other assets is lower in Haryana than in Punjab. This last factor is the principal reason why the cost of production in Punjab comes to be very much higher than in Haryana when the comprehensive cost concept,

rather than paid-out costs, is used.

The study shows that paid-out costs of cultivation per hectare is Rs 707.45 in Haryana and Rs 815.54 in Punjab while the yield per hectare is 22.74 quintals in Haryana and 24.40 quintals in Punjab. While Punjab has higher yield per hectare, its comprehensive cost of production is higher than that for Haryana, being Rs 1654.59 and Rs 1265.12 per hectare, respectively.

An important finding of the study is that if comprehensive costs are taken into account, the cost of production per quintal declines substantially for larger holdings in Haryana — from Rs 59.44 for farms upto 2 hectares and around to Rs 40 for farms of 18 hectares and above. A similar decline is not to be seen in Punjab. Another interesting finding is that tubewell irrigation is the largest single source of irrigation in both states. Further, in Haryana the cost of cultivation per hectare as well as the cost of production per quintal is the highest in the case of holdings irrigated by tubewells and the lowest for canal irrigated holdings. The position of Punjab is quite the reverse of this. Though comparative figures of cost of production for irrigated and unirrigated land are not sufficiently reliable, it is found that the costs per quintal are nearly 25 per cent higher for unirrigated land compared to irrigated land. In both states the cost of production per quintal for bullock operated and tractor operated holdings is not very different, tractors giving only a marginal advantage.

There are, of course, wide variations between maximum, minimum, and average cost of cultivation and cost of production. The yield per hectare ranges between 58.57 quintals in Haryana and 53.94 in Punjab at the maximum and 9.27 and 8.23, respectively, at minimum; the average being 22.74 quintals for Haryana and 24.40 quintals for Punjab. The cost per quintal in the two states ranges between Rs 150 and Rs 17. This is on the basis of comprehensive costs and not paid-out costs.

The rate of return, according to the study, works out for Haryana at 48 per cent over total comprehensive cost and 161 per cent over paid-out costs. The corresponding figures for Punjab are 20 per cent and 131 per cent.

The break-up of the cost of cultivation per hectare shows that operational costs account for 62.66 per cent of the

total comprehensive cost while fixed costs account for the rest. Operational costs include human labour, bullock and machine labour, seed, fertilisers, insecticides and irrigation charges. Fixed costs include rental value of owned land, rent for leased-in land, land revenue and other taxes, depreciation and interest on fixed assets.

Seed constitutes 7.65 per cent of the total comprehensive cost while fertilisers and manure constitute 9.13 per cent. Irrigation charges account for

8.66 per cent. It would appear that input costs, the alleged rise in which is being made the ground for an increase in procurement prices, constitute a relatively minor fraction of total cost.

The study of costs in UP gives similar results as for Haryana and Punjab. It is on the basis of these studies that the Agricultural Prices Commission came to the conclusion that the procurement price for wheat was fair to the farmer.

More Moonshine on Employment

(From a Special Correspondent)

THE Committee of Experts on Unemployment, which submitted its report recently, was set up as early as in December 1970 "for assessing the extent of unemployment and underemployment in all its aspects and for suggesting suitable remedial measures". Despite its labours spread over two years, the Committee has hardly enlightened anyone on the subjects of unemployment and underemployment. It may be recalled that when the Fourth Plan was under preparation serious doubts were raised regarding the statistics of backlog of unemployment mentioned in the Plan documents. That was how the Dantwala Committee on Unemployment Estimates came to be appointed in August 1968 to advise the Planning Commission on methodological issues concerning estimates of unemployment. The Committee, which submitted its report in April 1970, had deprecated the existing practice of estimating labour force, additional employment generated and backlog of unemployment, at the beginning or end of a Plan period, in "one-dimensional magnitudes". It emphasised the need for studying what M. L. Dantwala subsequently described in this journal as the anatomy of unemployment and underemployment ("Approaches to Growth and Employment", December 16, 1972). This called for "estimation of different segments of labour force, taking into account such important characteristics as region (state), sex, age, rural-urban residence, status or class of worker and educational attainment". The Committee had suggested a series of measures for the collection and presentation of unemployment data to be procured through the Census, the National Sample Survey, Employment Market Information and the Employ-

ment Exchanges.

The Bhagavati Committee has paid lip service to the need for "disaggregation of estimates relating to different aspects of the labour force on the basis of social, cultural and economic factors affecting population as also of the aspirations and job preferences of the unemployed and the underemployed". But its own discussion of the subject is based on the very procedures adopted in the past which the Dantwala Committee had rejected as useless. The number of the unemployed is placed by the committee at 18.7 mn in 1972, of which 16.1 mn persons are estimated to be in rural areas and only 2.6 mn persons in the urban areas. The Planning Commission had placed the backlog of unemployment at the start of the Fourth Plan (April 1969) at "9 to 10 million, of whom about three-fourths are in the rural areas". The Bhagavati Committee has thus sharply revised upward the estimate of unemployment, but without any reliable empirical basis for doing so. Not that the Committee had no worthwhile data to go by. There was, for instance, the 25th Round of the NSS (July 1970-June 1971) which was designed specially to collect comprehensive information about the weaker sections of the rural population. The unconventional results of the NSS do not dispute the existence of vast unemployment and underemployment in the country, but it brings out that a significant proportion of it in the rural areas is not in the conventional form of a factor of production eagerly waiting to be transported, body and soul, to the place of employment. People are not prepared to take up jobs in public works even if such works be near their villages. Caste and other social factors are another bar to taking up employment

on public works. The Bhagavati Committee, however, is completely innocent of all such sophistications.

It was inevitable therefore that the Committee would perform the second part of its job — suggesting suitable remedial measures — in an equally perfunctory manner. According to Ashok Mitra, a dissenting member, the Committee's various recommendations, "are by and large a compendium of conventional wisdom". The Committee has enumerated as part of the "strategies for employment generation" every conceivable programme except perhaps one for a moon landing! It has also deemed it necessary to dwell on the importance of restricting the growth of population through family planning and has even gone into discussion of family planning devices — it has advocated more liberal abortions; provision of hospitals and health centres with medical and para-medical staff; basic research into reproductive biology and demography; and postponement of the age of marriage.

In industry, the Committee's suggestions include better capacity utilisation, adequate supply of raw materials, discouraging highly sophisticated or automated machinery, wider dispersal of industries, building up of infrastructural facilities in backward areas, development of ancillary units, improving the functioning of existing traditional village and small industries and harmonious industrial relations. There are also certain 'radical' measures: a strategy for utilising the financial and managerial resources of the larger industrial houses; full utilisation of industrial capacity once created, "whether authorised or unauthorised"; and encouragement of industries to maximise production by working two or three shifts. In other words, the existing industrial controls should be ignored, except in 'critical areas'. What the Committee has not bothered to ponder on is whether this liberal approach to industrial growth will produce the goods needed for satisfying the consumption needs of the poor for whom employment opportunities are being created. If it does not, rise in the prices of consumption goods would nullify the benefits of employment to the poorer households.

Likewise, a series of programmes have been proposed for agriculture and construction. In agriculture, the Committee suggests a massive programme of rural works for irrigation, soil conservation, land reclamation and rural

roads; special programmes for low-rainfall areas such as conservation and economic use of available water and soil moisture and evolution of suitable cropping patterns; dairying, poultry farming, piggy and sheep breeding, fishing and cultivation of vegetables and fruits; increasing the area under all plantation crops, cashew and edible oilseeds, including soyabean and sunflower; and better exploitation of forest resources.

This still leaves the major field of road and house construction. And here the Committee really spreads itself: it suggests construction of main roads with an outlay of Rs 2,400 crores upto 1980-81 and of about 2.92 mn rural houses involving a total cost of Rs 875 crores. Of this outlay, about Rs 700 crore "could be provided by the persons constructing houses" and the balance is to come by way of loans from the LIC, etc. In the urban areas, the present rate of house construction could be stepped up by 40 per cent, i.e., an additional outlay of Rs 2,000 crores for 1.35 mn additional houses. Of these 0.6 mn units with an outlay of Rs 1,200 crores are set aside for the private sector.

The Committee has also complained of the lack of foresight and care in the selection of Plan projects, which have hindered the proper implementation of Plan programmes. In the manner of presenting a great discovery, it also points out that the benefits of the Plan programmes have not accrued to the weaker sections of the community.

BASIC QUESTIONS

On the whole, therefore, the Report is a graduate level essay on a pattern of development of the economy which would generate additional employment. The more fundamental questions that arise from a reading of the report are: (i) can there be a significant employment programme independent of the overall programme for development?; (ii) how far are the current development programmes oriented towards maximising employment, even as the capital base of the economy is being strengthened? More specifically, is there a trend towards displacement of labour by capital in areas where technological considerations do not call for such substitution? and (iii) in the complex socio-economic situation such as the one obtaining in India, what is the role of programmes designed primarily to create employment.

As for the first of the above questions, there is no gainsaying that em-

ployment generation is primarily a function of investment in different directions. Thus construction of houses on a massive scale, for instance, needs steel, cement, asbestos, bricks and other construction materials, which are all in short supply. Again, a massive programme of employment would generate additional demand for a wide variety of consumer goods which, again, are in short supply. It is thus essentially a question of the right mix of policies with regard to investment and the impact of it on sectoral distribution, employment and income generation — all along an integrated time-path of growth.

It is in this context that the second question above becomes relevant. Despite the lip service paid by government to the need to prevent the introduction of labour-displacing techniques where technological considerations do not call for such substitution, there has already taken place, and there continues to take place, considerable avoidable substitution. In all the Plan periods, the actual capital-output ratios have

KERALA

After the Feast...

THE food situation in Kerala has become grave and the government is really in a panic. A fortnight back, the state Food Minister and MPs from Kerala saw the Prime Minister and pleaded with her to restore the cut in the allotment of rice to the state. All the same, the government was compelled to reduce the quantum of ration from 160 gms a day to 80 gms. Immediately the free market price of rice shot up from Rs 1.30 per kg to Rs 2.50 per kg. Similar increase in the prices of tapioca, pulses, sugar, cooking oil and other food articles followed. A ministerial delegation, headed by the Chief Minister, and another high-powered delegation led by the President of the Kerala Pradesh Congress Committee rushed to Delhi, paid obeisance to the Prime Minister and impressed on her the hunger that haunts the people of Kerala and its political consequences. They returned with an assurance that a monthly allotment of 90,000 tonnes of food-grains would be made available to Kerala from June to September. The state government wants to increase the ration to 100 gms of rice and in addition give 80 gms of wheat a day from June 4. It is also expecting some mar-

turned out to be considerably higher than what were originally postulated. Even the Approach to the Fifth Plan assumes a higher incremental capital-output ratio of 3.14 as against the comparable estimated ratio of 2.33 for the Fourth Plan period. The Bhagavati Committee has, however, missed the opportunity to make a detailed industry-wise study of developments in this regard and make concrete suggestions regarding the employment potential of investment and production in different sectors of the economy.

Once these considerations are borne in mind, the role of special employment schemes is seen to be peripheral in tackling the overall problem of unemployment and underemployment. These schemes should be designed to tackle immediate and specific problems which do not come within the purview of the regular developmental programmes. The overall employment policy has to be a part of the strategy for investment, development, income generation and better distribution of income and wealth.

ginal help from the neighbouring states, particularly from Tamil Nadu, in exchange for the surplus power available in Kerala. But what the Tamil Nadu Chief Minister is really interested in is whether M. N. Govindan Nair, the Kerala Electricity Minister, would be able to persuade the Tamil Nadu unit of the CPI to break away from Anna DMK, which has started to lean on the CPM.

Let us look at the present food crisis a little closely. Rice is the staple food of the people of Kerala. The state produces only 40 per cent of its rice requirements. Local procurement has been hardly sufficient to give rations at the rate of 160 gms a day for about three weeks. After the breaking up of the southern food zone consisting of Andhra Pradesh, Tamil Nadu, Mysore and Kerala into separate state zones in 1964, Kerala has been under statutory rationing, the ration quota being 160-gms of rice, with slight variations now and then, and with an option of getting an additional 160 gms of wheat. The Central government knows perfectly well that Kerala's huge food deficit is due to its concentration on commercial crops, which earn valuable foreign exchange for the country. There

was, therefore, no dispute about the responsibility of the Centre to meet the food requirements of the state.

LEAN MONTHS AHEAD

However, the Centre has to frame its policy on the basis of the availability of foodgrains. Last year's monsoon failure brought down domestic production and created scarcity conditions in large parts of the country. Further, there is a world shortage of foodgrains and rice is simply not available for import. Even under the worst scarcity conditions, Kerala can somehow manage with tapioca, fish and other food articles available locally — except for the monsoon months. During June-August, even such substitutes become scarce. This is the time when people look to rice the most. The government has miserably failed to take these facts into consideration in formulating its food policy. The Food Minister has been unable to size up the problem in the correct perspective and in time. He really helped to give a false sense of abundance by allowing people to violate the guest control order with impunity and instances were not rare of Ministers and enforcement officers partaking of grand feasts when in other parts of the country people were on the verge of starvation. Would it not have been better had the government enforced a little austerity during the festive season and tried to build up stocks even by reducing the quantum of ration so as to be able to increase it during the lean months? However, after his return from Delhi, the President of the KPCC seems to be once again optimistic about the food situation. The Centre may be able to allot 90,000 tonnes of foodgrains a month to Kerala; but the question is whether the administrative machinery and the transportation system would be capable of moving such a large quantity so as to reach the ration shops regularly and avoid frequent breakdowns in rationing during the lean months ahead. After all, Kerala is not the only state which requires foodgrains on a priority basis.

The food crisis has once again revived talk of food self-sufficiency in Kerala. A conference of the various interests hurriedly called by the Chief Minister has repeated the measures necessary for augmenting food production. There is hardly any uncultivated land which could be brought under the plough. The only way to step up rice production is

through higher productivity. For that, high yielding varieties of seed, adequate water, nitrogenous fertilisers, pesticides and at least partial mechanisation may be necessary. But the key factor will be the farmer. In the existing economic order, the farmer's response would depend on the price which he is able to get. In Kerala, particularly, where a large section of the agricultural community depends on

POONA

The Worst Casualties

A T

ALTHOUGH it may be too much to read into the particular context of Poona, the various factors which have caused Hindu-Muslim animus in other parts of India, some of these at least have been at work locally for some time. There has been a spurt in the endowments of sacred cloth at various Muslim *darghas*, and the recent Paigumbardin celebrations saw Muslim youth coming out dressed, for the first time since perhaps 1947, in the typical Muslim skull-cap, green neck-scarf and goatee-beard. At the same time considerable money seems to have been spent recently in setting up new schools and colleges where while the ideology is still separation from the majority community's institutions, the curriculum is definitely more modern than that in the traditional Urdu schools. The newly established Poona College is a case in point. The Shiv Sena in attempting to 'enter' Poona politics has been equally demonstrative. Simultaneously, there has been pressure building up among the second-level Congress workers that the party take a more 'positive' stand against minorities. Certain Congress Corporators have even admitted in private that they had a directive from the state authorities to celebrate Shiv Jayanti on a grand scale and so pre-empt likely Shiv Sena inroads into the Congress's mass support.

The actual chain of events that followed from this trend is by now well known. Trouble began about a month ago when Muslims objected to a Neo-Buddhist wedding procession playing music in front of masjids. Stone throwing ensued and there were some injuries. Tension ran so high that the Poona Peace Committee met with the Commissioner of Police to consider arrangements for the next day's Paigumbardin celebrations. That day, April 16, there

more remunerative commercial crops with the freedom to market its produce and with a support price, if necessary, the expectations of the rice-cultivator are naturally high. This is a conflict between economic realities and the social philosophy of the government which the government would have to reconcile if it wants to bring about any substantial increase in the rice production.

was another incident at the Satranjiwala chowk in which 14 people were injured. On April 20, the Shiv Sena led a counter-demonstration stressing that the citizens had the right to play music on public roads even in front of mosques. On April 22, Bal Thackeray addressed a meeting in Poona and on May 4, the Shiv Sena celebrated Shiv Jayanti with communal slogans and offensive floats.

Trouble was, therefore, expected and it erupted on May 16 at a time when the police force was deployed mainly at the Collector's office in view of the Leftist bandh in protest against the food shortage and the price rise. Some of the Muslim leaders interviewed seemed quite clear that the police had been warned and had failed to take adequate preventive measures. Others hinted that in taking their time to control the situation the police probably had some political backing as well.

In any case, once violence erupted at Chand Tara Masjid in Nanachowdi Chowk, it quickly spread through the predominantly Muslim wards of the city — Nanapeth, Ganjpath, Islamura, etc. Hindu and Muslim leaders who toured the affected areas maintain that, for the next two or three days, these areas were virtually under mob rule. Both sides further agree that the main participants were young people between the ages of 12 and 20; they set fire to and looted houses and shops and fought in the streets with stones and knives. The Hindu youth were organised in the Hind Mata and Azad Mandals, which usually organise the Ganesh festival.

The real casualty figures will probably never be known. It is possible that, in the general confusion, some also saw an opportunity to settle personal scores. However, the net impact on

the city can be gauged less by the count of eight dead or several injured by bullet and stab wounds than by the number, around 1,200, of uprooted Muslim families who sought refuge in the three relief centres set up at the Moledina, Anglo-Urdu, and Badria high schools. Of these, even today there are some 40 families who have nowhere to return to. Both the Hindu and Muslim leaders interviewed appeared to have little faith in the all-party Peace Committee which is reportedly too rent by mutual suspicion and conflicting views to be able to resolve the situation.

It seems evident that to some extent, such trouble may be endemic — recall 1965 — to conditions in Poona. The wards of the city in which the riots took place are areas where the Muslim and neo-Buddhist dwellings are interspersed. The neo-Buddhists — former Hindu untouchables — have their own reasons for being rather aggressive in asserting themselves. Traditionally,

STEEL

Where Has the Money Gone?

(From a Special Correspondent)

THE heavy losses run up by Hindustan Steel (HSL) are only partly due to the inadequacies of production; the major reason for the losses is the investment and profit and loss pattern set for HSL when it was formed in the heydays of Nehru and T T Krishnamachari. It is the impossibility of achieving the profit targets set for it, even had it been able to work to cent per cent rated capacity as fixed for the three steel plants by its designers, which is the compelling reason for the wrong use of funds by HSL.

In the 14 accounting years from 1953 to 1972, HSL set apart around Rs 547 crores as depreciation, according to the balance-sheet and annual report of the company for 1971-72, the latest available. The gross fixed assets are stated to be Rs 1,174 crores. Before depreciation is provided and interest paid, HSL shows a cumulative gross surplus over the years of Rs 542 crores. Once depreciation is provided, there is a marginal loss and after adding interest on long-term government loans the cumulative losses go up to Rs 223 crores at the end of 1971-72.

A lay Member of Parliament reading

both communities were settled on the periphery of the Hindu city; under colonial rule, British and upper class households employed a muslim *khan-sama* (cook) and a Mahar cleaning woman and this proximity of work continues today as the two communities are engaged in the same tin-making, cycle-repairing, tanning and other semi-skilled in artisan jobs. Within this depressed economy the Muslims have a slight edge and enjoy a slightly higher status, being owners of small hotels, panshops, handcars, etc. The neo-Buddhists are more often their employees. There is continuous cause for friction and rivalry. Indeed, one of the neo-Buddhist leaders was reported to have said that, although the general opinion held that the Hindus had 'won' in the riots, in fact it was the neo-Buddhists who now stood to suffer at the hands of their Muslim employers.

Poona reaffirms thus that the worst casualties of any communal riots are the poorest sections of the city.

between Rs 30 and Rs 40 crores, or much less than 10 per cent of the cumulative depreciation amount shown in the balance-sheet.

A defensive explanation by those who are in charge of HSL's affairs is that the value of fixed assets has been "written down" but the assets have not been "run down". The truth, however, is that the HSL plants may be said to have been run down even without going into full production. To illustrate this point, those operating the Rourkela plant, including the present General Manager and his predecessor, who had to go after the steel melting shop roof collapsed in the middle of 1971, have said that the real capacity of the plant after expansion is only 1.4 mn tonnes and not 1.8 mn tonnes as designed by the Central Engineering and Design Bureau. The former General Manager used to head the CEDB and was known at that time to have pressed his colleagues' case that the expansion had been to 1.8 mn tonnes. But after becoming General Manager of Durgapur he changed his tune! And, mind you, in those days both the Rourkela plant and CEDB were part and parcel of HSL. It is only more recently that CEDB has become a separate company under HSL.

In Durgapur, the situation is even worse. For the last seven years the plant has come nowhere near the production capacity of one million tonnes achieved for two consecutive years when it was at the one-million tonnes stage. The Durgapur expansion, also the work of CEDB, was said to be 1.6 mn tonnes, but executives and workers join together in declaring that the capacity after expansion is probably in the range of 1.2 mn tonnes! These two instances make it impossible for this writer, among others, to accept any claims by HSL about the present worth of the plants.

The directive to HSL had been to set apart 5 per cent for depreciation and provide 8 per cent profit on equity. For this purpose, a gross surplus margin was provided amounting to slightly over Rs 150 per tonne of saleable steel on the basis of projected 100 per cent utilisation of capacity. These basic steel prices were fixed in 1962, to be effective retrospectively from the beginning of the financial year 1960.

HSL showed some profit in two financial years. In 1964-65 it showed a profit of Rs 18.5 crores when the production was 3.116 mn tonnes of ingot steel against a total rated capacity of

3 mn tonnes. But even with production in excess capacity, the profit was a rigged up one. More than Rs 40 crores each were provided for depreciation in the years preceding and following, but in 1964-65 the depreciation provision was only about Rs 20 crores. In 1965-66 with production at 3.437 mn tonnes; the profit came down to Rs 1.7 crores. Though depreciation was fully accounted for in the year, there was no increase in payment of interest. The highest surplus before depreciation earned by HSL was about Rs 88 crores in 1970-71. The gross margin came down to Rs 47 crores in 1971-72 and the losses reached a record of Rs 45 crores. The 1972-73 losses are placed around Rs 25 crores.

The Rs 150 per tonne gross margin was, again, on the basis of an imaginary investment of Rs 1,176 per tonne of saleable steel capacity. This block investment figure was mid-way between the investment per tonne of the Indian Iron and Steel Company and that of the Tata Iron and Steel Company. At the one-million-tonne stage, HSL's investment was around Rs 2,800 per tonne of saleable steel; now it has come down to a little less than Rs 2,500 per tonne.

To provide adequately for depreciation and to pay proper returns, the HSL plants should have earned 13 per cent on the capital invested whereas, because of the huge investment, the Rs 150 per tonne surplus represented in reality less than 6 per cent. Setting aside 5 per cent for depreciation, this would have meant a return of 1 per cent, and that too if the plants were working to full capacity. To meet the targets of return set by the government, HSL would have had to earn a gross surplus of nearly Rs 140 crores in 1971-72 on a total trading of around Rs 450 crores! Actually it earned less than Rs 50 crores.

Private sector companies prefer to have a higher ratio of loan capital, while the public sector has a standard one-to-one debt-equity ratio. HSL and other public sector companies which have been losing have been asking for more equity and less of loans. As one of TTK's former colleagues remarked to this writer, the provision of loans meant that the government could be certain of at least the interest. But in the end the government has cheated itself because the interest has been paid out of what should have been retained for proper depreciation and reinvestment.

One of the main problems in planning for steel capacity expansion, which the government cannot afford to ignore, is the fundamental question of the basic prices for steel to be paid to the plants. Jawaharlal Nehru may have talked of the strategic value of steel and the role steel plays in promoting general economic growth and all that. However, his idea of cheap steel has remained an academic concept since the benefit of the low ex-factory price of steel has not been extended to the consumer. It is the middle-men and fabricators who have reaped enormous profits.

New investment on steel plants in this decade is estimated at about Rs 400 crores for 1 mn tonnes of ingot steel or 750,000 tonnes of saleable steel. This price will have to be paid whether the plants are at Visakhapatnam or Vijayanagar or Bhilai or Jamshedpur. The rate works out to some Rs 5,000 per tonne of saleable steel

capacity. The estimates for the Vijayanagar and Visakhapatnam plants expect a loss of Rs 20 crores per million tonnes of ingot steel per year. An addition of 10 mn tonnes of ingot capacity will thus mean an annual loss of Rs 200 crores. Budgetary subsidy to meet these losses is, of course, out of the question and accounting manipulations, like in the HSL, will only mean that the capital invested would gradually be eaten up by losses. One solution would be to make steel products expensive; another, which will fail to work in our mixed-up economy, is not to expect any reasonable return at all from capital invested in steel. The present emphasis on production of high-priced flat products is short-sighted. Already, there is an acute shortage of billets and sections. As already pointed out in these columns ("Thinking Big in Steel", May 10), too much concentration on increasing the production of flats is also socially wasteful in the long run.

FARMERS' CONVENTION

Government May Propose, But...

(From a Special Correspondent)

PERTURBED over the non-availability of power during the electricity workers' strike in the state, a Haryana farmer angrily remarked that every section of the working population, from engineers to sweepers, can go on strike, but the farmers are one section which cannot afford this luxury. Not only will no one compensate the farmer for the lost time, but as nature knows no waiting, the stoppage of work may, depending on the time, mean large losses and in some cases even starvation for the farmer for rest of the year. Almost similar views were expressed by a Ganganagar farmer speaking at the Farmers' Convention organised by the National Tonnage Club of farmers in Delhi from May 13 to 15, which was inaugurated by President Giri. This speaker further said that as farmers do not have any union and they cannot go on strike, they have always received a rough deal at the hands of the government. In his printed welcome address, the secretary of the Tonnage Club also expressed similar feelings when he said: "the sleeping rural giant has awakened from his age-old slumber. The days of government proposing and farmers disposing as obedient children have gone. He [the farmer] is no more

a docile, dumb and obedient child to accept whatever the government says... He has exercised his franchise in four parliamentary and four assembly elections, has used his discretion and has thrown big guns into the dustbin. Government can plan and propose... but they themselves cannot perform. The performance has to come from the farmers... which could not come without experience, conviction and identification." Such identification, he added, could not be achieved unless "the farmer himself is associated with the planning and policy formulation process".

This gathering of farmers, described as "the 3rd All-India Higher Agricultural Production Convention and Seminar on Economic and Social Growth of the Rural Millions", was to discuss issues as wide-ranging as recent developments in agricultural research and their operational aspects for higher farm production; problems of small and marginal farmers and of farmers in tribal and dry areas; rural unemployment and means of gainful employment; social justice and farm productivity; and problems relating to agricultural input supplies pricing and taxation, etc. In fact, however, except for a few short speeches

ECONOMIC AND POLITICAL WEEKLY

on recent research by some invited agricultural scientists on the second day, the deliberations of the seminar were largely confined to issues directly and immediately affecting farmers, such as procurement prices and the food-grain trade take-over, shortages of and irregularities in input supplies, land ceiling and agricultural taxation. Speakers from practically all the major states participated in the discussion. Attendance on the first day was said to be around 3,000 which rapidly declined from the next day, partly because of the disruption caused by heavy dust-storms for two days in Delhi. The biggest contingent, of around 700, came from Maharashtra, a severely drought-affected state. One of the sessions was presided over by the Maharashtra Agriculture Minister, who frequently but vainly tried to tone down successive speakers' allegations against the government.

CENTRAL THEMES

Most of the speeches converged on issues relating to the trade take-over and procurement prices fixed by the government. Here is a small sample of the type of arguments advanced: Some government policies pertaining to farmers, emanating from advisers who know little about the real farming situation, have been very unsympathetic to the farming community; while fixing Rs 76 per quintal as the procurement price for wheat, the government has failed to realise that the HYV, which created an impression of impending self-sufficiency, is highly capital intensive and the high-cost technology, despite high yields, yields very small net margins which get further attenuated once the additional cost of getting the requisite input supplies through the corrupt government machinery is considered; input costs during the last three years have been constantly on the increase, but procurement prices have remained unchanged; even on the university farms in Punjab and Haryana, where expertise and inputs are available in plenty, the cost of wheat cultivation is Rs 110-120 per quintal; the consumer pays Rs 1.50 or more per kilogram of wheat in the open market, whereas the government could have ensured supplies at rates much lower than this even after paying upto Rs 110 per quintal (or Rs 1.10 per kg) as procurement price to the farmers; the government seems to prefer import of foodgrain to paying a slightly higher

price to its own producers on the strange argument that the latter course is against distributive justice; does the government really think that it can "purchase social justice or socialism" with scarce foreign exchange?; why does the government, which is thinking of paying Rs 180 p m or so to its peons, who sit in comfortable office corridors, feel so reluctant to give the toiling farmers their legitimate dues?; the government is free to impose all conceivable taxes and ceiling on land holdings, but let it also undertake that it will ensure timely input supplies and in the event of its failure to do so let it fully compensate the farmers for the consequent losses.

The Agricultural Prices Commission was one of the main targets of criticism at the seminar. The editorial in the March-April issue of the Tonnage Club's *Farm News*, which was distributed to the participants, summarised the farmers' views. A few extracts from it may be of interest: "We feel that the so-called Agricultural Prices Commission is working in a vacuum. It has no directive as to which cost of production and whose cost of production it is to consider. Its decision on pricing is... a political one. The methodology adopted for calculating the cost of production is erroneous and is likely to be misleading." Several factors — among them, the drought, irregular input supplies and diversion of the crash rabi programme funds to non-users — have contributed to low production and raised the cost of cultivation; therefore, "farmers are reasonably justified in demanding Rs 110 per quintal for parting with their wheat". "The administrative stubbornness over its [the APC's] arbitrary fads to deny increase in the purchase price of wheat is a game of the worst kind of blackmail. The threat of... imposition of a levy [on the producer] would be an exercise in systematic harassment of the proverbial 'anna-dada' and would alienate the faith of the toiling masses who have always co-operated with the government efforts."

The convocation ended with a decision to take up the various issues with government efforts."

COST OF PRODUCTION

One may agree or disagree with the above views, some of which may even be dismissed as the stock arguments of the farm lobby. But the whole debate does raise at least a few im-

portant issues. Take, for instance, the much debated issue of consideration of the cost of cultivation while fixing procurement prices. There is probably hardly any product whose cost of production has been so casually treated in price fixation as it has been in the case of foodgrains. For the industries referred to it, the Tariff Commission finds it difficult to ignore even the non-functional or unproductive components of costs while fixing prices. Examples of manufacturers going right up to the Supreme Court over the "cost-price" issue are also known. However, in the case of agricultural products, particularly wheat, practically no one outside Krishi Bhavan knows anything about the manner and measure of weightage given to production costs while fixing procurement prices. The issue is not whether sale of wheat at the rate of Rs 76 per quintal is profitable; it is a much more basic one relating to the whole mechanism of prices fixation and the relative importance to be attached to different ingredients. Unless satisfactory answers are provided to these questions, whatever prices the APC or the government fixes will be suspect in the eyes of the farmers.

WRONG IMAGE

On the question of the weightage assigned to the cost of cultivation in price fixation, both ministers and spokesmen of the APC have generally been found to be evasive or apologetic in discussions. This has created a wrong image of the APC in the farmers' mind. Perhaps the APC is helpless. In the matter of cost of cultivation, it is still to find a reliable and respectable data base. The series of Farm Management Studies, which earned job promotions for many PhDs for some and professional breakthroughs for a few and also yielded vast raw material for prolonged and inconclusive debate, including in the pages of this journal, on farm size and efficiency in Indian agriculture proved miserably inadequate when attempts were made to use them for formulating price policies. To fill this major data gap, a comprehensive cost of cultivation study (using cost accounting methods of data collection for all the major crops for a period of five years) was initiated about three years back in different crop zones. It is said that the project, which has the blessings of the APC, received a setback in the initial stage because of the controversy between the Institute of

Agricultural Research and Statistics (LARS) and the Directorate of Economics and Statistics over its operational command. Now the Directorate is operating the scheme through the Agricultural Universities and a few Agro-Economic Research Centres. Though the scheme is at present in operation in all the states, in terms of output nothing is publicly known. After what interval the data will ultimately be available and how useful they will be are anybody's guess. Hence a long life for the cost-price controversy seems to be ensured.

NO REPRESENTATIVE BODY

The absence of a representative organisation to put forward the problems and viewpoints of genuine farmers is another matter which deserves attention. There have been a few instances in the past of farmers' organisations being formed to look after their interests as farmers. There was the Marwar Kisan Sabha under the leadership of the late Baldev Ram Mirdha in the former was dissolved to provide mass the Gujarat Khedut Mandal led by the late Bhailal Bhai Patel. However, the former was dissolved to provide mass membership for the Congress party which had been non-existent in Rajasthan before Independence. The Gujarat Khedut Mandal too got liquidated when Bhaikaka was persuaded to form the Swatantra party in the state. Kisan forums or labour forums as wings of different political parties may still be found but their objectives are different and they cannot serve as protectors of the exclusive interests of particular occupational groups. Organisations like the Tonnage Club of Farmers or Bharat Krishak Samaj, etc, have tried to fill this vacuum, but they too fall far short of the requirement largely because they tend to become in practice organisations of rich farmers. Central and state ministers, MPs, MLAs, retired Civil and Military Officers and a few neo-rich at village level grace their executives. These organisations are basically clubs of gentlemen or absentee farmers, most of whom have probably never touched a plough in their lives. At best one could consider them as organisations for the farmers but not of the farmers. They cannot claim to know much about the problems of the common farmer. In certain cases, members of these organisations, in their individual capacities, could be the very source of difficulties and problems for the common farmer. Understandably, there-

fore, these organisations cannot speak on behalf of the toiling peasant. But the latter himself is too poor, ignorant and unorganised to be able to effectively present his viewpoint. Thus the political parties or the organisations of the rich are left absolutely free to exploit any issue or situation involving the interests of the farmer without intending to help him in any meaningful way.

Research workers working on rural problems could prove useful instruments in informed policy-making on problems affecting farmers. However, that again is not happening. One reason for this is the lack of clear understanding of the actual situation facing the farmer on the part of our researchers, particularly economists. Some of them are so obsessed with the 'first derivative' and 'second derivative' that realities easily escape their sophisticated models. In fact, nothing has failed more miserably

EXCHANGE RATES

Float in Hindsight

Michael B Cohn

FEBRUARY was chaotic for the monetary situation. The key interest rate for six-month Eurodollars was 9.25 per cent — up 2.50 per cent — while that for the Euromark fluctuated between — 1 per cent and — 3 per cent. That is, speculators were paying interest to obtain the stronger West German currency. In order to maintain fixed exchange rates against the twice-devalued dollar, European governments faced waves of dollar selling and were forced to close their money markets.

PREVENT TRADING FROM BECOMING TOO ERRATIC

To prevent trading from becoming too erratic, the Federal Reserve Board of the US had sold approximately \$320 million German marks in February and the end of January. This was done in an effort to slow down the spiralling value of the mark. In spite of this action, the mark rose from 31.25 ¢ to 36.50 ¢ from the first of the year until the beginning of March.

The nine members of the European Community (France, Italy, Luxembourg, Netherlands, Belgium, Britain, Ireland, Denmark, and West Germany) had agreed to close their money markets to

than mathematical models in Indian planning. Yet another set of economists who do not play with tools but with phrases and jargon are equally ineffective. Describing the agricultural situation in terms of kulaks versus the rest is one example which betrays their imperfect understanding. The Indian big farmer is certainly not a parallel of the Russian kulak. Other differences apart, the relationship of this class with the ruling party and the government in the two situations make them qualitatively the opposite of each other. The Bolsheviks coerced and crushed the kulaks, whereas the Indian establishment has always nursed and pampered them. Any why not? After all, they cover the largest number of pages in the "Who Is Who in Parliament". That, of course, does not prevent our social scientists from making facile comparisons and using misleading categories.

avoid another monetary crisis. American, Japanese, Swedish, Swiss, Canadian, and Norwegian economists were invited to a meeting in Paris March 9. Prior to the meeting, the only foreign currency transactions that took place were those in which banks traded among themselves in order to satisfy customer demands.

IRONICAL

United States' Secretary of the Treasury, George P. Schultz, Arthur Burns, Chairman of the Federal Reserve Board, and Paul Volcker, Under Secretary of the Treasury for Monetary Affairs, attended the conference in Paris. Pierre-Paul Schweitzer, Managing Director of the International Money Fund, was a key man in setting up the Paris meeting which was to negate the fixed rate system. The irony of fate is that the International Monetary Fund represents the orthodoxy of a fixed exchange rate system. But the need for reform had become acute when, on the first day in March, \$2.7 billion flowed into Germany. Chances were that the Common Market Countries would link their nine currencies and float them against the dollar; it was hoped this

would prevent the inflow of inflationary dollars.

Wide fluctuations in the foreign exchange markets were considered a factor in the decline of world trade during the depression years of the 'thirties. In order to prevent such circumstances from recurring, in 1944 a system of fixed exchange rates was initiated at Bretton Woods, New Hampshire. When the dollar was devalued, the Bretton Woods system ended.

The participating countries of the March 9 meeting were expected to use the meeting as an opportunity to persuade the United States to support the dollar in the world's financial markets. In order to aid the United States, the Common Market seemed ready to lend funds to the US. If the US would bow to pressure from the Common Market, it would provide massive intervention to absorb the excess dollars, and there might not be the need for a joint European float. It was expected that the United States would be requested to cut back on the flow of dollars into Europe whether or not there would be a float.

In the interim, the price of gold had been high. In the week before the dollar flow into Germany, the price of gold passed \$90.00 an ounce, and then went back to the \$80.00 range; on March 6, it was \$83.00 an ounce. It was speculated that the United States had been consulting with Japan and various European countries about the possibility of instituting an international reserve to be used to keep down the price of gold. Perhaps this would be a prerequisite for US support of the dollar. The reserve could be made up of the profits that various countries had gained by the dollar devaluation, which increased the value of their gold stock by raising the gold price to \$42.22 an ounce. The United States could benefit from the proposed system, as the US wishes to see the role of gold diminished in future monetary systems.

OWN INTEREST

Each participating country had its own interests to consider as the finance ministers convened. Before the meeting, Paul Volcker indicated to Congress that the United States would resist demands to defend the dollar exchange rate by intervening in foreign markets. But he did not rule out such possibilities.

The French approach to the meeting was to try to protect against future trade losses; thus France would oppose any increased value of the franc vis-à-vis the

dollar. France feels the dollar's woes are a purely American problem which America alone should solve.

West Germany was determined not to accept any more dollars which would aggravate its inflation problem. West Germany was willing to float the mark in an effort to stem the constant dollar inflow, but, in order to preserve unity, wanted this move tied to other Common Market currencies. Germany was not inclined to request much from the United States, for it is to Germany's advantage that the United States maintains troops within her borders.

Great Britain wanted the freedom to set a new rate for the pound; at the present time Britain is satisfied that the pound floats independently. Its domestic, social and economic problems make it apprehensive about joining in unified action.

Japan hoped there would be a Common Market float, since it would relieve the pressure on the yen. Japan did not want the yen to appreciate too much against the European currencies, for Japan views Europe as a major competitor in world trade.

Basically, the Europeans were trying to keep out waves of dollars and simultaneously to maintain their exports by restricting the rise in their currencies. Various solutions had been offered — one of them that US capital outflow should be taxed. This would help curb the dollar flow, and in the process add to foreign revenue. A tax could also be placed on goods exported by America.

JOINT FLOAT

On March 12, 1973, France, Netherlands, Belgium, Luxembourg, Denmark, and West Germany, agreed on a joint float. These currencies were allowed to float against others, but would maintain a fixed relation among themselves, allowing for a 2.25 per cent margin. The national central banks of the various countries would maintain the system by intervention when necessary. Within a year, the system would be institutionalised further by establishing a central pool of reserves for currency intervention. Such a pool could be conducive to pulling together the economic policies of Europe so as to form a more united monetary union.

Germany also revalued the mark — up 3 per cent. For Germany, the float and upward revaluation will be a much wanted damper on the inflationary boom. Its export-oriented industry will now be at a disadvantage on the world

market; It is these industries which have contributed to Germany's inflation.

Britain (with Ireland) and Italy are continuing their independent float; they are staying out of the combined float because of their financial weakness. It would be senseless to have the flow of dollars replaced by a flow of English pounds or of Italian liras. Britain, Italy and Ireland hope to join the float at some later date.

It is anticipated that those countries not in the Common Market — viz, Switzerland, Austria, Sweden, and Norway — would associate with the float.

In the joint float, all six currencies would move up or down against the dollar. Since the dollar had been so weak, it would probably fall against the combined six. After two devaluations in less than 18 months, a further fall of the dollar is an unpleasant prospect; it could lead to an increased loss of confidence in the dollar, provoking Europeans to raise barriers against US goods. Although the lower priced dollar would make American exports more attractive price-wise, the detriment might outweigh the benefit.

On March 13, 1973, the dollar was strong and gold prices fell. A report, which was later denied, claimed that the price of gold dropped to \$75.50 per ounce, and later rose to \$80.50. The dollar was quoted at 2.81 marks — up from 2.80 the day before. Speculators were now buying dollars to replace those they had lent to invest in more secure currencies. The increased dollar value is merely technical, and it is too early to give any clear indication as to whether a successful monetary reform had been reached. However, if this was an indication of what would follow, things may be said to be looking up for the Americans.

The three Benelux countries—Belgium, Netherlands, and Luxembourg—have agreed to keep the parities of their currencies. Austria, on the other hand, followed West Germany, choosing to up-value the shilling by 2.25 per cent. This meant that the dollar would now be traded for 20.30 shillings, rather than at the old rate of 20.97 shillings.

ALONG THE LINES OF THE CANADIAN DOLLAR

It was hoped by analysts that the floating monetary situation would relieve the vast fluctuations and that the currencies would show a slow increase or decrease in value, reflecting their respective economics — hopefully along

the lines of the Canadian dollar. Canada has floated her dollar for almost 25 years, and has achieved stability by necessary intervention in the money market by the Canadian central bank. By locking their exchange rates together, the six European countries are attempting to keep fixed rates for internal trade among themselves, although other factors, such as the rate of inflation, can differ from country to country.

On March 16, 1973, the financial ministers had their second financial meeting. Their plans were to let the flows of currency fluctuate together, although there would be intervention to keep up their values.

It was said that George Schultz, US Treasury Secretary, had committed the United States to use existing 'swap' arrangements to keep up the dollar prices. This means that more than \$11 billion worth of foreign currency would be available for loan by the Federal Reserve of the US to be used in the money market. It is not known when the present US administration would deem it necessary to take such action. The announcement that the United States was willing to try supporting the dollar was contained in a vague four-and-a-half-page communique. It stated that the United States Government was considering removing inhibitions of the flow of capital into the country. One possibility was to lower reserve requirements on funds borrowed from abroad, in order to check capital outflows, the Federal Reserve, requires its member banks to have 20 per cent reserve for such funds.

When the exchange markets first opened with the new float, the German mark took a drop, while a weaker currency — the Swedish kröner — took the mark's place as being on the top of the band of European currencies. To counter this trend, the German central bank began to buy marks for Swedish kroner. The action was temporary, but it illustrated the operations involved in maintaining the float. The weakness of the system lies in its vulnerability to internal pressures; if too large a flow of funds among the involved countries were to take place in one direction, it could create serious problems.

Now that the float is in effect, West Germany is the monetary leader in Europe. It had \$23.4 billion in reserves before the dollar inflows; since then, it is likely it has more than \$30 billion. A new monetary system in Europe would most likely be based on the mark. Great Britain, on the other hand, is

the weakest of those in Europe. The government is struggling to control inflation and has only \$5.6 billion in reserves.

Japan is the leading monetary power of the East. It has monetary reserves of approximately \$20 billion, and had a current account surplus of \$6.3 billion in 1972. Chances are that it will have another surplus this year, though smaller than in 1972.

The Paris conference was primarily a meeting of minds between the Americans and the Europeans, with Japan's Finance Minister Aichi and Governor Sasaki of the Bank of Japan sitting on the sidelines; but this will not diminish the effect on the Japanese economy.

The float will be one factor that will rob the Japanese economy of some of its growth. Japan's real GNP is predicted to have an 8 per cent or 9 per cent growth rate for 1973 — far below the 15 per cent annual increase enjoyed in the fourth quarter of 1972. The damper is, of course, in the export demand sector, but the internal economy is expected to continue to have strong growth.

A major part of Japan's imports are raw materials, so that some sectors of the economy will gain from the float; for, imports will now be cheaper. Industries such as oil refining stand to gain. The shipping industry, however, may be especially hard-hit — freight rates being in dollars; the higher rates would force shippers to other vessels. Some officers in the Economic Planning Agency are concerned about a possible revaluation of the yen in 1974. They are considering programmes, such as granting the Prime Minister the power to levy selective taxes on exports, to lower or raise tariff charges, and to remove controls on imports and capital movements. The task ahead for the Japanese is to direct their economic growth into less export-oriented sectors, to reduce the trade surplus, to raise welfare and internal social-economic levels, and to expand the domestic market.

POTENTIAL THIRD MARKET

The international monetary situation has split the international money markets — into the dollar area and the European bloc; the yen is a potential third market.

The Paris meeting changed the United States' position from that of a strong nation with a strong currency to a national power trying to defend its currency. The United States had reserves of \$13.2 billion at the begin-

ning of the year. In 1972 it had a deficit of \$8.5 billion (on current account), and it faces another deficit in 1973 unless drastic steps are taken to keep a bad situation from getting worse.

But the United States has to realise that it is not as independent as it once was. The dollar is as mutable as other currencies; when the dollar liquidity is in excess of its demand, the exchange rate becomes unstable.

The United States will have to make every effort to form a tight monetary policy in order to restrict any increase in the rate of inflation. The stress has to be on expanding export-oriented industry and improving the balance of trade. Efforts will have to be made to control the dollar outflow and the US's foreign expenses — such as maintaining troops in Europe. If co-operation with the European community can be successfully conducted to help control monetary crises, surely enough political co-operation could be achieved so that the United States can withdraw its troops from Europe. If appropriate steps are taken, a united American-European community could contribute not only to monetary but also to political stability.

Although on May 16 the price of gold rose about \$110 an ounce in London, generally since the float the international monetary scene has been relatively quiet; but the problem of avoiding another crisis persists. The job at hand is to design a new monetary system; this job has been assigned to the Committee of Twenty — a group made up of the major nations along with some smaller countries, in the International Monetary Fund. To do this properly, the Committee will have to find a successful solution to the problems of:

- (1) Correcting future external disequilibrium without long delays. This could be done if a proper and flexible exchange rate system is established.
- (2) Maintaining growth in the international liquidity pool to allow for the growing volume of trade.
- (3) Determining what should be the role of floating exchange rates, reserve currencies, special drawing rights, and composition of reserve assets.
- (4) Reducing the effects of speculators in the international money market without hindering the legitimate capital flows of international commercial transactions.
- (5) Securing the co-operation of many nations working toward various individual goals.

LAOS

Life in Sam Neua Province

Harish Chandola

SAM Neua province has been the base of the Laotian revolution for over 20 years. It was completely liberated from French colonial rule in 1953. At the Geneva Conference on Indochina in 1954, it was decided that the Laotian patriotic forces should regroup themselves in one area and the French troops in Laos in another, to disentangle the two sides. The Lao forces fighting all over in their country against the French were asked to regroup in Sam Neua, because it was completely free of French control. Since then Sam Neua has been the headquarters of the Lao Patriotic Front, whose Central Committee members spend much time in this province to meet each other and confer and plan strategies both for winning the war and developing the country.

The province has high mountains and thick forests and many streams. Three-fourths of it borders Vietnam: in the east lies Thanh Hoa, north Son La and south-east Nge An, all provinces of North Vietnam. To its south is the Laotian province of Xieng Khouang and to the west Luang Prabang, in both of which war was raging till the end of February this year. It is inhabited by three nationalities: Lao Lung (the majority Lao people), the Lao Sung (Meo) and the Lao Thung, (Kha). Its area is 1,500 square kilometres and population 154,331, who used to live in 117 villages and 1,193 hamlets (at present all of them live in caves).

After the Geneva Agreement was sabotaged by Lao rightists in 1960, and the Lao Patriotic Front leaders in the coalition Government detained in Vientiane, it was again Sam Neua province which launched the struggle against the US backed rightists. The US began bombing Sam Neua province on May 18, 1964 and continued to do so until February 22, this year. The first to be hit by US bombs were Xala Ban hamlet and Xhaloi village in Sam Neua district. In that first bombing raid 39 villagers were killed and wounded and 35 houses, 19 tons of rice, 72 buffaloes and cows and 12 hectares of cultivated land were destroyed. From May 18, 1964 to July 29, 1970 (the figures after this date have not been compiled yet), the US launched 19,611 sorties consisting of 44,151 planes over this province, which dropped 425,850 bombs, equal to 84,251 tons. Each square kilometre of Sam Neua received on the average six tons of bombs or 500 kilograms of bombs per

head of Sam Neua's population. Casualties were fairly high: 542 persons killed, mostly women, children and old people, 667 wounded, 9,382 dwelling houses destroyed, 8,282 buffaloes, cows and horses dead, 472 hectares of cultivated land laid waste, 998 warehouses containing 1,506,230 kilograms of rice burnt, 295 hamlets, with 47 pagodas, 1,864 Buddha images and 2,441 Buddhist texts destroyed.

The purpose of such barbarous bombing of villages was to turn the people into refugees and force them to seek shelter in camps set up by the US under the flag of the Vientiane Government. The attempt was to put into reverse action the Mao dictum about the relationship between the guerillas and the people: that the guerillas are the fish and the people the water, their life-giving environment. By bombing the villages, the US wanted to "draw the water out and let the fish die". But the US did not succeed in drawing the water out. Most people went to live in caves after their homes were bombed.

I visited a group of caves where hundreds of villagers were living, and talked to them. The villagers said: "Not content with the bombing, the US sent bandits and spies [by bandits they meant Meo and Thai mercenaries] into our province to create disorder. They killed and captured many villagers and tried to create division among us on the basis of nationalities and religion. But we successfully defended our province and the spies and bandits could not set up even a single post in it."

"From May 18, 1964 to July 29, 1970, we put out of action 3,563 enemy troops, out of which 1,651 were killed, 700 wounded and 1,217 captured. We in this province also shot down 258 US planes. On July 16, 1970, the 1,500th US plane was shot down over Laos, and it was brought down by the people of Sam Neua. We also captured 1,723 guns."

"All our people here cherish peace and want a peaceful settlement of the Laos problem. Nobody wants to prolong the war. But the US and its Vientiane puppets do not abandon their aggressive schemes."

"While fighting, we continued to reconstruct our country, consolidate our economy and raise the living standard of our people. We constructed new irri-

gation channels and now in many districts of Sam Neua province two crops of rice are raised yearly and production has been increased. Of the variety of rice harvested in October, in the past from one kilogram of seed we used to get 40 to 45 kilograms of rice, but now we get 50 to 60 kilograms of rice. The five-month rice was not grown in Laos before, but now, after it was introduced, one kilogram of seed gives us 18 to 20 kilograms of rice."

"We have established several industrial units during this period in our province. We now have a textile mill, a foundry which turns out agricultural implements and a biscuit factory."

"Trade between the people and the government has also developed. We now have 24 state shops, 15 of them in villages (in caves)."

"The province now has 1,155 primary schools, with 20,216 pupils, 26 secondary schools with 820 pupils and one high school with 88 students. Besides, there are five schools for minorities with 181 students and four spare-time schools for cadres. Every hamlet has a night school."

"Attention has been paid to providing medical facilities to the people. There are now 13 hospitals in the province with 255 beds and 62 clinics with 220 beds."

"The province has six mobile teams to stage cinema shows. It has one team of full-time actors and actresses which travels and stages plays and other shows. There are other teams of artistes, made up of peasants, which stage shows in their own areas."

I then went into a cave where the people of an entire village were living. An open platform had been built on a ledge at the entrance for the villagers to take in the natural light. Children and the old were sitting on that platform on stone benches hewn out of large rocks and enjoying the last rays of the day's light. A rock path led one inside the cave, where it became a sunken passage between two elevated platforms on either side of it. On the platform on the left a number of fires were lit, over which the villagers were cooking their evening meal. There were soot-blackened pots bubbling over iron tripods placed over the fires. On the platform on the right, bedding had been spread on flat stone-slabs, but nobody was asleep. From the roof, from stone pegs, hung cloth hampers containing the belongings of the inhabitants. There was no electricity here, but the log fires did their best to dispel the darkness. Smoke filled the entrance at that hour and the rock walls were black.

I was offered a stone stool and somebody offered to take his bubbling pot

June 9, 1973

off the fire to boil some tea for me. I had to decline the kind offer because I had a long way to go to the Central Zone where I was staying and it was getting late.

"Do you find the caves gloomy?" I asked the villager who had offered me the stone stool. "Yes", he said, "when we think of our villages in the open. But here we are safe. We do, however, have an accident or two inside. Recently, the US planes dropped bombs on this mountain. They loosened a large rock inside the cave, which fell on a 65-year-old woman, sitting just where you are, and killed her on the spot."

I was then led further inside the cave. It was absolutely dark there. Some villagers had flashlights and in their beams I could see the cave divid-

ed into two tunnels, at a 60 degree angle from one another. Inside the tunnels there was only bedding and some belongings in hampers.

I followed a tunnel and after a stretch of laid out bedding it degenerated into a narrow cove which one could enter only by crouching. There, too, a few rags were spread for someone to sleep on. It was hard to imagine that children grew up in these miserable, confined and suffocating spaces. Did they ever play, I wondered? These people forced to live here, came from very open and vast spaces on the mountains. In Laos there are only three million people in an area of 91,000 square miles. But in these caves the population density was, perhaps, the highest in the world.

ECONOMIC AND POLITICAL WEEKLY

explanations, in terms of gross returns or weather factors affecting performance of the crops, which are more in the nature of hunches. It is further shown that Tamil Nadu's contribution to the all-India production of the five crops under consideration has declined during the last 15 to 18 years. The reason given for this decline is the slow growth of area under these crops (p 20). As the scope for increasing the acreage under these crops is limited, the output according to the authors can be increased by raising the yield through use of the high-yielding varieties of these crops. This would raise the yield per hectare by 100 to 200 per cent (p 20). This is greatly encouraging. Those who care about the dry farming areas would be further pleased (only to be disappointed later) to read the relative economics of the traditional and high-yielding varieties of the five dry crops in Tamil Nadu. The per hectare yields of traditional and HYVs of the five crops are as follows. Sorghum 550 and 1500 kg, Pearl millet 600 and 2000 kg; ragi 800 and 1500 kg; groundnut 620 and 950 kg; cotton 450 and 1000 kg.

The cost of production per hectare is higher in the case of the HYVs of dry crops, but owing to higher yields, the cost per kg of the products is lower. The net returns per hectare from the five dry crops under HYV are much higher than those from the traditional varieties. They are 6.8 times, 4.1 times, 4.7 times, 2.2 times and 4.6 times the return from the traditional varieties in the case of sorghum, pearl millet, ragi, groundnut and cotton, respectively (p 67).

However, disappointment follows once one looks into the details of the cost-return calculations. For the traditional varieties, cost details — which not only exclude the family labour but also all owner-supplied materials, interest charges, depreciation and rental value of land, etc, from the cost calculations — have been taken from the cost of cultivation survey conducted in all the districts by the state Directorate of Economics and Statistics during 1966-67. The returns are also calculated on the basis of yield and price data received from the Directorate. The aggregate state averages are presented for comparison with the corresponding details of HYVs of dry crops. But there is no meaningful base for the comparison. Cost calculations of HYVs relate to no farming situation. Instead, they are based on the "package of practices" recommended by the Directorate of Agriculture. Regarding the yields, no source of data is clearly mentioned (p 66), yet

they seem to be based on the results of experimental or demonstration farms. It is well known that, owing to the uncomparable situations (in terms of availability of expertise and supply of inputs etc), the experimental results can hardly indicate the actual performance of new crops on the farmer's field. The authors compare the performance of the ideal situation of HYVs on experimental farms with the state average of the performance of traditional varieties. This comparison is not very appropriate. The gap between the performance of two varieties thus gets inflated in the process. This is a crucial limitation of the results presented by the authors, and it reduces the utility of the study to both the policy-makers and the farmers.

The authors would have done a big service had they attempted a critical economic evaluation of the performance of HYVs for dry areas. In fact, the economic evaluation of results from biological researches is one of the neglected aspects in our whole research system pertaining to agriculture. With the help of a proper accounting system, it should probably be possible to work out the implications of the new varieties even before their commercial release. The number of so-called 'first generation' and 'second generation' problems of changes caused by new crops could also be anticipated well in advance.

However, the authors, unmindful of the limitations of their results, go ahead with their recommendations for covering all the 37,95,000 hectares of dry land in the state with HYVs of dry crops in a 15-year perspective plan; for creation of the Tamil Nadu Dry Farming Authority to plan, promote, and execute the programme — a body similar to the several other 'authorities', 'commissions', 'corporations' or 'agencies' currently proliferating in the country for all conceivable purposes; and for revitalising the co-operatives to help the programme.

The proposed dry farming programme, according to the authors, has two "major pre-requisites", viz, adequate credit and proper marketing arrangements. On an average, the HYV crops would require an additional Rs 200 as cost of cultivation per hectare; but institutional credit is not readily available to dry farmers (of course, no evidence to that effect is mentioned). Similarly, increased production of dry crops would create problems of marketing.

The authors devote considerable space to both credit and marketing problems of agriculture in the state. A number of tables have been reproduced from RBI surveys and other studies to

make their point. But throughout, the discussion pertains to the credit and marketing problems *vis-a-vis* agriculture in general. There is practically no discussion of the institutional problems which are specific to dry farming. No doubt, the co-operative or collective approach is inevitable once conservation measures on catchment or watershed basis, as integral parts of dry farming, are undertaken. However, the authors do not even mention such problems.

Further, as the experience of HYVs in well-watered areas have shown, once high returns are assured, the farmers would seldom wait for the creation of official institutions. The major problems which have hindered the progress of HYV crops in irrigated areas are the scarcities of crucial inputs such as fertilisers. Till the shortage of basic inputs persists, it is doubtful whether widespread adoption of HYVs (for dry or wet areas) would be possible. The persistent scarcity of crucial inputs tends to inject an element of inter-crop (or inter-area) competition for scarce resources which, in turn, affects both the farmers' and the nation's priorities *vis-a-vis* dry crops or dry areas. The diversion of the nation's scarce resources to regions with better production potential the diversion of regional resources to more productive areas, and the diversion of farm-level resources to more paying crops, have been important features of the resource allocation in

the country. Appropriateness of the institutions for credit or marketing (discussed at length by the authors) is of secondary importance. In fact, these institutions only subserve the pre-determined allocation pattern.

Thus the major problem relating to the success of the HYVs of dry crops, which involve higher input cost and greater dependence on scarce and purchased inputs, is their relative economics *vis-a-vis* other high-value crops rather than their own traditional varieties. This is more so where the 'non-dry crops' constitute the major portion of the total crop enterprise. Not only farmers' priorities but also effective public support for allocation of scarce resources to dry areas or crops, would be determined by the comparative advantages which enterprises in dry regions can command. But this is yet to be established. May be, a real breakthrough in dry farming technology could ensure this. The limited evidence there is suggests that new crops like sunflower would probably fill the gap. In the immediate future, the continuation of the price anomaly — coarse grains commanding much higher prices than superior cereals like wheat — created by the partial takeover of foodgrain trade may probably tilt the balance at the farm level, in the favour of some of the major crops of the dry areas, like Pearl millet and sorghum.

REVIEW

A Matter of Allocation

N S Jodha

Economics of Dry Farming in Tamil Nadu by R K Sampath and Jayalakshmi Ganesan; Sangam Publishers (for Madras Institute of Development Studies); Madras, 1972; pp viii + 123; Rs 12.

"DRY farming and co-operatives in Tamil Nadu" would have been a more appropriate title of the book under review, as credit and marketing co-operatives (and other institutions) not only account for nearly half of the effective text of the book but constitute the major part of the discussion pertaining to policy prescriptions given by the authors. This could be partly because of the not wholly tenable assumption of the study that "the breakthrough in dry farming is currently being held up by economic and institutional factors and not by the level and availability of its technology" (p 1).

By dry farming technology one would understand a two-way adaptation process for raising production from low rainfed agriculture, where, on the one hand, the crop species are made to adapt to the adverse climatic conditions (through injecting drought resistance or high-yielding characteristics under moisture strain) and, on the other, the climatic factors (particularly the effective moisture-availability) are adapted to the plant species (through several conservation measures) so that the severity of climatic conditions are moderated to permit proper plant growth.

However, the focus of the present study is partially on the former aspect of the adaptation process.

The study deals with five major dry crops in Tamil Nadu viz, Chulam (Sorghum vulgare), Cumbu (Pearl millet) ragi, groundnut and cotton. They are considered dry crops because the extent of unirrigated area constituted between 72 to 90 per cent of total acreage under these crops (except ragi) in the state. These crops jointly accounted for 38.4 per cent of the total cropped area in the state. Of course, this proportion varied from district to district. A detailed discussion of the growth of these dry crops (their acreage, production, and yield) during 1950-1970 for the state as a whole has been attempted in chapter 2, supplemented by 30 pages of graphs and tables. While Chulam has shown very marginal growth in area, production, and productivity, the ragi crop's acreage and production (despite increase in yield) has declined in the state. The area and production of groundnut has increased, but its yield has declined. This feature of the groundnut crop is observed in other areas, too, such as Gujarat. Cotton, despite fluctuations, has shown growth in area, production, and yield. The authors seek

UNIVERSITY OF DELHI DEPARTMENT OF SOCIOLOGY (Centre for Advanced Study in Sociology)

Applications are invited for four Teacher-Fellowships in the Centre for the academic year 1973-74. The object of the fellowships is to provide opportunities to young college teachers to spend an academic year at the Centre to refresh their subject knowledge and to get acquainted with new techniques of teaching and research. The selected teachers will normally not be encumbered with teaching duties but may be expected to participate in seminars and research activities, and will have to submit a report on the work done by them during their tenure as Teacher Fellows.

Eligibility—The Teacher Fellow should be a lecturer in Sociology/Social Anthropology holding a permanent position in a college and should have an aptitude for research.

Emoluments—The Teacher Fellow shall be paid a monthly stipend equal to the monthly salary (including allowances) that he would normally get in his parent college. In addition the fellowship has a provision for a book allowance (Rs. 100 p.a.) an allowance for covering incidental expenditure (Rs. 100 p.m.) and a travel grant to cover the actual Railway/Bus fare from the parent college to the Centre and back, as per Delhi University rules.

The candidates may be called for an interview for which they will be paid fare according to Delhi University rules. Application should be sponsored by the Principal/Management of the college concerned who should be prepared to consider the period of the teacher's stay at the Centre as study leave without pay and to give an undertaking that the teacher concerned will be entitled to return to his position without any loss to his seniority, increments, etc.

Application forms and further information may be had from the office of the Department of Sociology, Delhi School of Economics, University of Delhi, Delhi-110007. The last date for receipt of applications is 25th June 1973.

(The University reserves the right to consider the names of teachers who have not applied).

Total Engineering for the Steel Industry

To us "Total Engineering" means the complete technical services from picking a site, selecting processes, writing specifications and placing orders, systems designing, preparing construction drawings and site supervision, right through commissioning and management advice on the project.

We started steel plant consultancy services in India and continue to be in the forefront—of new technologies like sponge iron, electric furnace steel-making and continuous casting; also, net-work planning for expediting construction.

We are independent, which means you get objective advice on processes and equipment best suited to your needs, without being tied-down to any particular process or equipment.

We are international, which means you get the most modern technology, adapted to your requirements.

Paper Plans

THE Ministry of Commerce is reported to be busy preparing a ten-year perspective plan for the export sector so as to reach an export target of Rs 8,000 crores by 1980. The Ministry's efforts in this direction appear to have been spurred by the supposedly phenomenal growth in exports of over 20 per cent in 1972-73. The projected perspective plan is evidently based on the assumption that this achievement will be capable of being duplicated every year between now and the end of the decade. The cabinet sub-committee on industry and trade has decided to set up an expert group not only to suggest an overall export promotion strategy but also to identify the specific constraints hindering rapid growth of exports and to recommend measures to remove them. The sub-committee is said to have gone into issues of industrial licensing, supply of raw materials and creation of the necessary infrastructure for export industries. According to the sub-committee, if Japan could raise its exports from \$5 billion in 1963 to nearly \$28 billion by 1972, there was no reason why India could not achieve an export growth rate of 20 per cent over the next seven years.

Against the background of the actual performance of the export sector in the last two decades, the first reaction to the Ministry of Commerce's perspective plan is one of incredulity. The supposed 21 per cent growth of exports last year, it has been pointed out in these columns, was the result of a number of special and non-repetitive factors and that the real growth of exports in the year was perhaps around 5 per cent ("Exports: Illusion and Reality", May 5, pp 814-5). After all, the Third Plan's modest export target of 5 per cent per annum could not be achieved and in the Fourth Plan again the annual rate of growth of exports is likely to be below 5 per cent, against the target of 7 per cent.

Even if one were determined not to allow oneself to be unduly influenced by past trends in exports, the specific measures being contemplated by the government to achieve its ambitious export programme are not such as to encourage an excess of enthusiasm. First, an attempt is proposed to be made to identify items of high export potential so that their production and export could be increased. A reading of the annual reports of the Ministry of Commerce for the last few years would be instructive in this context. Year after year these reports have been repeating, in almost identical phrases and sentences, that the Ministries of Commerce and Industrial Development are engaged in drawing up concrete export production plans and that, to begin with, some 20 product lines had been identified. We have also been told year after year that working groups were being set up to identify further products with export potential, to estimate demand, to identify gaps in existing capacity, and so on. Yet for three years or so little progress has been made in translating all this preparatory work into actual export growth. We are also told that the views of exporters would be sought by the government in formulating export plans. This, again, the government has been doing for long through the board of trade, the various export promotion councils, commodity boards, etc. But the primary interest of these bodies has been quite often in things other than expansion of exports. Export promotion councils, for instance, spend most of their time in lobbying for more and more export incentives rather in promoting exports.

Above all, what needs to be realised, however, is that the scale and boldness of the export plans cannot be very independent of the scale and boldness of the overall development plan. Yet the tendency is gaining ground to aim at achieving sectoral objectives — for instance, enlargement of employment opportunities or expansion of exports — through tinkering with the pattern of investment irrespective of its overall level. Thus to create more employment it is recommended that more investment should go to housing or road-building or other activities which are deemed to have a high employment potential. Similarly, for more exports it is considered sufficient that more investment be made in activities which supposedly have a high export potential. Apart from all their other infirmities, such partial approaches to employment creation or export promotion evade altogether the question whether the desirable reallocation of investment is at all feasible given the overall level of investment in the economy. How relevant Japan's experience in the field of exports is to a country like India may be a moot question, but one lesson is readily available to be learnt from Japan: No economy with an investment level of around 10 per cent of national income and an average growth rate of national income of 3 per cent or thereabouts per annum is likely to be blessed with a sustained export growth of 20 per cent per year or anything even remotely approaching it.

Problems and Possibilities of Project Appraisal

Cost Benefit Analysis in Fifth Plan Approach

J N Tewari

An attempt is made in this note to give a broad review of the type of problems which have to be faced if appraisal of projects for inclusion in the Plan is to be done by scientific benefit/cost analysis. The intention is to bring out how the methodological problems become more acute with the present focus and orientation of the Fifth Plan Approach.

There is brief discussion on the social discount rate, on the assumptions behind the NPV and the IRR method; on the two manuals — OECD and UNIDO — from practical angle on presentation of data in the detailed project reports; and on identification of common biases in the DPRs. A study of divergences in the benefits/costs from projects which are in the production stage against what was envisaged in the project reports, is recommended to help feedback from Appraisal Wing to Plan Formulation Wing.

THE approach document to the Fifth Plan emphasises certain directional changes in the objectives of planning; the emphasis on minimum consumption needs, the distinction of 'below the poverty line' and 'above the poverty line', the stress on redistribution, the employment orientation, the regional balance consideration, and finally the zero net foreign aid — each objective, significant in itself, has to be enmeshed in the fabric of the Plan from the angle of consistency, efficiency, and equity not only at the aggregate macro level but at the multi-levels of region, state, districts, with conscious spatial analysis. The implication of this approach for project appraisal work in the Planning Commission and on the techniques to be adopted deserve consideration. It highlights the need of objective function with multiple objectives — aggregate consumption (or growth), regional balance, sectional distribution (poor, non-poor), self-reliance. The 'weights' to be assigned to the different objectives will have to be determined and quantified; this is a difficult task and very often left attempted in the 'social cost benefit' exercises. The task is made more difficult by the subtle but very real problem that some at the top in decision-making deem it better not to reveal the objectives and their relative priorities, and prefer to leave them vague. Even if this problem were to be solved, the question of differences in the 'national' objective function and the 'state' objective functions remains as also of how they are made uniform in the planning exercise through the iterative process. The further question is how acceptability by the state governments is achieved.

The current practice usually is to confine the exercise to the first objective and go from 'private' costs/benefits to 'social' costs/benefits, using accounting prices which are thought to measure better the so-called true scarcities — in

the case of labour, foreign exchange, capital. The premium on benefits — because of regional balance considerations and because of employment objective — are really not measured. A project in a 'backward' area may be given financial subsidy or incentive to enable its start, but in the calculations the degree of backwardness is not taken into account (neither by the income per capita criterion nor by the consumer expenditure per capita criterion data for which could be available through the NSS). Under the heading of 'indirect benefits' one may find a qualitative description but no precise allowance made in the calculations to help decision-making. The gap in the 'appraisal practice' and the 'proclaimed Plan objectives' needs to be bridged, and this step becomes increasingly important with the present emphasis in the approach paper.

SUITABLE LOCATIONS NECESSARY

One of the increasingly important functions of cost/benefit analysis in multi-level planning is to decide the most suitable locations for the projects; this has become necessary in order to reduce, if not eliminate, political pulls and pressures for 'grabbing' projects. Alternative sites, say A, B, C, for a specific project X will have to be evaluated on the social cost/benefit criterion as competing projects. And in this exercise one has to take cognisance of the linked projects, which often are not fully brought into the analytical framework. For illustration, a fisheries co-operative project (consisting of larger mechanised trawlers to catch prawns for export and a chilling plant) at Ratnagiri without harbour facilities, has to be evaluated in terms of the incremental benefit from the fisheries project ('with' minus 'without' the fisheries project); but if a harbour project is simultaneously, though independently,

visualised, and if in the course of development the catches per year per fisherman are expected to rise faster with larger trawlers than with smaller boats because of harbour facilities, then it would be desirable to get a 'with' and 'without' fisheries project picture for the two situations: 'with' and 'without' fishing harbour — thus giving data classification under four cells. The fisheries project also serves as an illustration for another category of linked projects. The size of a chilling plant at Ratnagiri can be thought of from the angle of catches in this project at Ratnagiri only, or alternatively, to serve the purpose of another fisheries project also, say, 100 km down in the same coast at Malwan. Here the sites for the chilling plant and its size has to be determined by cost benefit analysis taking into account the two alternatives (one chilling plant at Malwan and one at Ratnagiri against a larger chilling plant at Ratnagiri).

The emphasis on multi-level planning and spatial analysis brings to the fore another type of problem in project appraisal, viz, should the benefit/cost analysis be applied at the individual project level or at the level of bunch of projects for the lowest area unit of planning (say district). The same bunching approach may be relevant where there is vertical integration of projects, in the sense that, the output of one project is the input of another. A forestry project (say bamboo plantation in South East UP) may provide raw materials for the paper and pulp plant located within the project area. In this case should the whole complex of projects be considered as the unit for analysis or the two components taken as separate projects? The bamboo plantation itself may not be acceptable on the net present value (NPV) criterion (using say rate of discount as 10 per cent), or alternatively on the internal rate of return (IRR) criterion where

ECONOMIC AND POLITICAL WEEKLY

for a project to be acceptable the minimum IRR has to be 10 per cent, but considering the complex of projects it may be acceptable by the same criterion. Of course, the complexity does not arise if the two component projects are severally acceptable by the same criterion.

The logical corollary of the idea of bunching of projects for the benefit/cost analysis is that the decision criterion should be so defined that the scale or size of the project does not affect the decision; the trouble about

the benefit/cost ratio $\frac{B}{C}$ criterion is

that it is biased in favour of smaller projects whereas the B-C criterion is biased in favour of larger projects.

Sometimes one talks of $\frac{B-C}{C}$ criterion

but this reduces itself to $\frac{B-1}{C}$ and

therefore gives the same ranking as

the $\frac{B}{C}$ criterion.

The emphasis on minimum consumption needs gives new weightage to the quick-yielding projects and the so-called 'social consumption' (like education, health, drinking water supply). The first brings up the basic element in the analytical situation, viz, different projects have different life time and also differing gestation period. The steps crucial in any project appraisal are, therefore, identification of the time of the project; the time profile of the benefit/cost stream and the discounting rate for estimating net present value.

Identification of the life time of the project is from the angle of identifying the period for which the year-wise data on projects' cost/benefit are to be built up. While this is relatively easy when a purely 'project' approach is adopted, it becomes more difficult when the idea in the Planning exercise is to integrate the 'area' approach with 'project' approach. To take a simple illustration. In a bamboo plantation project of 3 lakh hectares the time required for covering the entire area at the rate of new plantation of 15,000 hectares per year would be 20 years and if the life-time of a bamboo is taken to be 30 years (i.e. till it flowers and dies), then if the first plantation starts in 1972 the entire area will be covered by plantations only in 1992 and the bamboos planted in the last year will have their life-time upto the year 2022. Thus, for this area-based project, the relevant life-time is from 1972 to 2022.

The above example of bamboo plantation can be made slightly more

difficult but realistic, by supposing that the plantation programme is started by an agency in say 1963 (against 1972, the current year). In that case, while the future benefit/cost stream would be discounted to the present value (as in 1972) the past benefits/costs would be compounded to 1972. The other alternative could be thought of in terms of compounding the stream to the terminal value, i.e. as in the year 2022. The terminal value approach will have the practical disadvantage of the common terminal year being dependent on the life-time of the most durable project on the shelf under consideration or, to be more precise, what Mishan calls 'terminal period of the project having the longest re-investment opportunity' in the case of projects which have wholly re-investible returns. It is usual to adopt the first alternative which is also simpler.

SIGNIFICANT FEATURE

There is also another basic question in this illustration. When does the life of a bamboo end? After 30 years — it flowers and dies; but more important is that it regenerates by itself; the natural regeneration is without any significant cost and yield stream and will be more or less the same as before. The usual approach in the project appraisal exercise, of adding 'scrap value' of the project after the last year of its life-time, can take care of the situation; but then one has to be careful not to miss in the 'yield' calculations this item and, while capitalising its value, to take full account of the above significant feature.

Linked with the period of analysis is the precaution about the 'yield rate constant' assumption. The purpose of building year-wise output or benefit data is to avoid such assumption. Output rate may not remain constant over time, and the variables which might introduce change should be critically looked into. In this task, care must be taken to distinguish variables which are integrally related to 'output' contribution as such, and to other factors which are external in that sense. To illustrate from the case of an irrigation project. Output per acre may not remain constant over time because of changes in cropping pattern, in seed variety (high yielding variety from ordinary improved) or in fertiliser input. But factors like recurrence of drought or flood, which do affect output of the individual years but are external, should be taken care of separately in the analysis, and not through the 'yield rate' estimates. Probabilities of occurrence of drought

Review of Management June 1973

or flood could be explicitly thought of and taken into account in building the time profile of the output. In fact, the entire calculations could be done making different probability assumptions.

Even for the integral factors, like cropping pattern, there is an element of uncertainty in the forecasting for long periods. One may visualise different likelihoods (probabilities) for the emergence of different cropping patterns and could use these probability tags for the emerging 'net benefits' or net present values to get the expected value of net benefit from the project. Estimation of differing possibilities in cropping patterns for the command area of the irrigation project and their probability tags will mean collection of additional information involving costs. The question will crop up whether all this is worthwhile.

The current emphasis on social consumption implies that projects/programmes in this sphere too should be appraised by the uniform criterion. But the methodology for appraisal in sectors such as education or health, still remains to be crystallised in a form that could be applied as a part of the drill before inclusion of the schemes in the Plan. The problem is more of quantifying the benefits; in the sector of education, the incremental production approach implies measurement of incremental earnings because of education; allowance has to be made for the level of unemployment. A further complication may be that education can be conceived both from the production and the consumption end; it results in multiplicative interaction through better utilisation of other inputs. Among the benefits of education, there is 'allocative benefit that is determined by the ability to respond to the opportunities afforded by growth. This particular benefit increases as the level of education increases'.¹ This benefit has to be accounted for. In the health sector, besides the problem of isolating incremental earnings attributed to a specific health programme for those who are living, the benefits of lower death rate, vigorous living, etc, have to be identified and measured.

Then, there are basic questions such as, how social discount rate is determined; what will be the value of this parameter for India for the Fifth Plan period; whether it should be kept uniform for all the sectors in project appraisal work; or whether the technique of benefit/cost analysis should be thought of essentially as a tool for ranking projects for selection within a sector. While a detailed exercise on India's social rate of

Health sprouts from fresh ideas daily at Alembic

Fresh ideas bloom daily at Alembic, Baroda. Here, ceaseless research, fundamental and applied, yields new weapons to fight disease, reveals fresh ways to promote health and growth. An investment in your health! Alembic's countrywide distribution makes

Get	(viii) Social rate of discount in real terms.	8%	13.2%

discount remains to be done, the author is inclined to agree with the operational suggestion made by J A Seagreaves³ for determining the social rate by the procedure shown above in Table A. The illustrative figures given by him (lower limit and upper limit) are also indicated above. For the Indian economy a rough guess is that the social rate may be taken to be around 10 per cent.

Once the social discount rate is determined, the Net Present Value (NPV) method "gives the same acceptor-reject criterion as a minimum standard of rate-of-return, and it is in terms of rate of return that it appears easiest to justify. The constant discount rate, once established, provides a method of choice between incompatible alternatives: that is, alternatives which require the same specialised resource-input, and alternatives which exploit, in part or in whole, the same consumer demand." But what about the situation when "alternatives are not identical in their calls on consumer demand or specialised resources?" The conclusion drawn by H P Brown is that "the present values of two incompatible alternatives are completely comparable only if the alternatives make exactly the same calls on specialised resources or consumer demand. Something less than this exact equality may be sufficient in particular cases, where a difference occurs which is not material to the investing agency. But this immateriality has to be checked, and cannot be assumed to be generally the case; and, where in fact one alternative leaves open investment possibilities not permitted by the other, the present value of the further investment must be taken into account." The inference is that, while evaluating say a nuclear power station with life-time of 20 years *vis-a-vis* a conventional power station (life-time 40 years), NPV will give correct accept/reject criterion only if present value from a second nuclear power station (assumed to be installed sequentially) is added to the first nuclear station when comparing it to that

of the conventional power station with twice that life-time. But will this assumption of second nuclear station be always realistic in planning exercise?

The above illustration of choice brings to the fore the problem of the project appraisal analyst: for ranking the two projects he has to choose out of four procedures:

- NPV₁: when NPV of one nuclear compared to that of one conventional station.
- NPV₂: when NPV of two nuclear (sequentially) compared to that of conventional station.
- NVT: net value compounded to the terminal year (year 40 against the current year)
- IRR: Internal rate of return of the nuclear against the conventional station.

In this context, it should be noted that the basic difference in the NPV and the IRR method is the assumption that the cash generated from the project is reinvested at the project IRR rate in the IRR method and at the social discount rate in the NPV method. As the IRR rate will vary from project to project the adoption of the IRR method will imply assuming that the net output from different projects can be invested with different returns in the same society; this may be true for the private sector but not desirable for 'social' calculations. Further, the IRR method cannot handle adequately cases like coal mining industry where later-stage investments are involved (for filling the coal pits after mining is completed), unless another condition is added to the usual one in determining the internal rate of return — *viz.* that the net present value of any final section of the income stream should be non-negative. This really implies applying what Hawkins and Pearce call 'extended IRR method',⁴ as against the usual procedure where the IRR gives that rate of return which makes net benefit discounted at that rate equal to zero.

On the methodology issue there is another basic point. There are really two manuals on *ex ante* project evaluation methodology, the OECD manual (IMD Little) and the UNIDO manual; the question often raised is about their synthesis with a view to having an agreed operational procedure which can be adopted as a part of the drill by the Planning Commission. This will mean a brief, down-to-earth guideline for work which the appraisal division can take up as its first assignment. But briefly, I may mention that the basic differences are two: (i) emphasis on multiple objectives which occurs in the UNIDO but not in the OECD; (ii) use of overall foreign exchange accounting price in the UNIDO as against the use of many exchange rates in the OECD manual, which is implied in the pricing by the use of 'border' prices for the tradeables (traded internationally as well as those which could be traded); (iii) relative under-valuation of project benefits in the OECD approach because of border pricing in situations where, because of import restrictions, total availability of the project output is less than what would have been without import restrictions and where domestic costs are higher than border prices. Similarly, there will be relative over-valuation of project benefits if the project is using some input on which there are import restrictions and where the above situation applies.

On the issue of accounting prices of foreign exchange, there is an excellent critical review⁵ by Edmar Bacha and Lance Taylor. The determination of accounting prices is beyond the scope of this limited article, but a practical suggestion about presentation of the data in the detailed project report (DPR) on the foreign exchange aspect may be relevant. The DPR should indicate domestic costs of the project per unit of net foreign exchange earned/saved. This information, when pooled from different projects, will also throw some light on the direction in which the accounting price estimate of foreign exchange goes. At present, while the DPRs do give the foreign exchange component of costs, data on the above indicator are not readily available.

The question of pricing of strictly non-tradeables, such as electricity and transport remains. In respect of electricity, while generation cost is to figure in economic analysis, there is wide disparity in the electricity tariffs as charged at present by the different State Electricity Boards. Even the industrial rates are quite divergent and, for heavily electric-intensive industries, rates of

return are very sensitive to electricity rates. The disparity is still more conspicuous if a project like a nuclear-agricultural-industrial complex is being considered, where tubewell irrigation is the main agricultural component. Should not a uniform electricity price be assumed for all project appraisal exercises?

In the context of the Fifth Plan, there is growing awareness on the part of the Planning Commission about the lack of a shelf of projects in the past from which the Commission could make a scientific choice for inclusion in the Plan, but what needs better recognition is that a project appraisal exercise itself results in modification of the project as originally formulated and, therefore, it has to be done sufficiently in advance so that after appraisal the re-formulated projects are available for inclusion in the Fifth Plan. Further, the project appraisal work in the Commission has to recognise that appraisal is done at different levels (the state technical department; the state planning department; the Ministry; and the Commission) and the Detailed Project Report (DPR) including its section on economic justification has to provide the data and information base towards this end. The precaution to be taken in the DPR from this angle is that it should present the technical alternatives considered at the different stages or in respect of the different components of the project, and the basis for the choice of the alternative. This is important, particularly for sites, output mixes, technology, including employment intensive alternatives, input combinations, scales/sizes of plant/equipment and finally output prices. The DPRs, in their present shape, are inadequately documented in respect of output-mix and output-price alternatives as in the case of the Salem steel plant or the Kudremukh iron ore project.

If the DPRs are adequately documented on the above lines, the project appraisal analyst here could effectively carry out sensitivity analysis to identify the crucial variables to which the internal rate of return is more sensitive and examine in respect of those variables the extent of manoeuvrability open at that stage and suggest the direction in which the projects as formulated could be modified for improving the return in case the project does not fall in the acceptance zone. The variables for analysis may be picked out of the technical alternative variables discussed in para 19. Further, a sensitivity analysis may also be made to

find out if the accounting price of foreign exchange or labour makes substantial difference to the net present value of the project.

Another aspect to which the project appraisal analyst has to contribute is the identification through the appraisal exercise of the common biases in the DPRs as formulated relating to quantum of output, pricing, cost estimates, time-scheduling, etc. and suggestion to project authorities of adjustment factors or corrective actions so that future DPRs are better prepared. In this task, certain case studies of projects already on the ground vis-a-vis their DPRs as approved to identify the divergences and their causes will be helpful — along with suggestions regarding the line division concerned and the monitoring unit. Adequate feedback from the appraisal analysis to the Plan Formula-

tion Wing has also to be insured.

[The views expressed in this article are of the writer and not of the Planning Commission.]

Maintenance Engineering as an Independent Discipline

B V Chitnis

Maintenance Engineering is a sophisticated, multidisciplinary technology that must combine the highest skills, judiciously and intelligently applied past experience, the deductive techniques of a Sherlock Holmes, and the entire spectrum of analytical engineering, process knowledge and fabrication technology. Engineers must perceive the true nature of maintenance technology and wholeheartedly participate in it.

Industrial management must recognise the true importance of the profession and create an environment that will attract talented engineers to it.

Educational institutions must promote its development through the introduction of an integrated course of studies on Maintenance Engineering and also by encouraging the necessary research activity in the area.

Even consulting engineers should find this a fertile field.

ONE of the major causes of the current country-wide power crisis is inadequate maintenance. In fact, the level of maintenance in most industrial plants is extremely poor. The reasons given for this are many, but the one that recurs is that the industry is unable to attract the proper talents into the profession of maintenance engineering, as engineers find this field intellectually uninteresting, economically unrewarding and mentally unsatisfying. It is rather unfortunate that this is so; it is not that the profession is inherently unattractive but that the engineers fail to see the challenging side of it.

About 25 years ago, maintenance was in the hands of technicians and depended upon their manual skills. Investigation of failures was more intuitive than analytical. Graduate engineers saw the profession as it was practised then, and since manual skill was not their strong point they stayed away from the profession.

The situation, however, soon changed. Graduate engineers found their way first into construction activity and then, when the plants were commissioned, into operation and maintenance. But with the continuously growing construction activity, graduate engineers found it more attractive to change from one construction job to another than to remain as maintenance engineers. It is difficult to blame them. If the plant was operated and maintained well, the work became uneventful and uninteresting. If the plant gave trouble, the work was a thankless task, to be carried out day and night under tremendous pressure from the management. Yet, there were no financial rewards, no pats on the back no mental satisfaction. You just went from one crisis to another. On the other hand, in construction, you got special site or construction allowances, transport facilities and, finally,

mental satisfaction when the plant was commissioned. You got your promotions when you jumped from job to job.

It is the thesis of this article that Maintenance Engineering is a sophisticated, multidisciplinary technology that must combine the highest skills, judiciously and intelligently applied past experience, the deductive techniques of a Sherlock Holmes, and the entire spectrum of analytical engineering, process knowledge and fabrication technology. Engineers must perceive the true nature of maintenance technology and wholeheartedly participate in it. Industrial management must recognise the true importance of the profession and create an environment that will attract talented engineers to it. Educational institutions must promote its development through the introduction of an integrated course of studies on Maintenance Engineering and also by encouraging the necessary research activity in the area. Even consulting engineers should find a fertile field.

SCOPE OF MAINTENANCE ENGINEERING

What is Maintenance Engineering? What is its scope and what are the new ideas and areas of development? Maintenance Engineering in an integrated system of techniques aimed at ensuring optimal operation of process and production plants. The objectives of any maintenance strategy are assumed to be an optimal balance between capacity, efficiency, availability, reliability (assured availability) and maintenance costs appropriate to the industrial and economical environment in which the plant operates. Maintenance Engineering techniques can be classified as follows:

- (a) Techniques of 'observation' of plant and equipment performance and status;

- (b) Techniques of 'Estimation' on the basis of observed data so as to decide the maintenance work strategy;
- (c) Techniques of maintenance work 'Planning and Execution';
- (d) Techniques of operation and maintenance 'Information Storage and Retrieval';
- (e) Techniques of 'Cost Accounting';
- (f) Techniques of 'Evaluation' of the effectiveness of the maintenance system.

OBSERVATION AND ESTIMATION TECHNIQUES

Maintenance essentially begins with a well co-ordinated systems design that takes into account the operation, maintenance and safety requirements, appropriately selected equipment, components and materials capable of operation within the expected region of performance, and operated carefully with the help of a properly designed instrumentation, control and protection system by technical personnel who are knowledgeable in plant performance limitations, are sensitive to abnormal performance deviations, and correctly respond to plant emergencies. Observation and Estimation techniques therefore form the base of a sound maintenance strategy. The observational techniques can be classified as follows:

- (a) 'On line' observations:

- (i) From logged data from permanent plant instrumentation. Measurement of appropriate plant parameters through strategically placed instrumentation of the appropriate sensitivity and accuracy and indicating/recording/warning capability. Logging techniques Manual/automatic.

everes/151/DMCC

Current / historical / trend / processed or derived. As is/ deviations/out of limits.

(ii) From special tests
Tests to establish overall plant, system, subsystem and equipment capability and efficiency, as original bench-mark performance for newly installed plant, intermediate benchmark performance after major overhauls and in connection with any special plant events.

Tests to monitor, investigate and relate internal equipment component behaviour or status to parameters observed from outside on running equipment.

Tests to induce or simulate normal/abnormal behaviour and study equipment or system behaviour in connection with investigation of abnormal occurrences.

(b) 'Off line' observations:

(i) Visual inspections — component conditions, alignments etc.

(ii) Non-destructive testing — Ultrasonic tests; Dye penetrant checks; X-raying; Microscopic examination; Chemical analysis of deposits; Insulation testing.

(iii) Destructive tests on failed components: Besides above tests Physical testing; Metallurgical examination; Chemical examination.

The recent interest in observational techniques, particularly in on-line observations, is on account of the heavy financial penalties associated with taking a process plant out for maintenance too early or too late. The fired charge on a 200 MW thermal power generating unit, costing nearly Rs 40 crores, is nearly Rs 1.5 lakhs per day and another Rs ½ lakh per day for making up the lost generation in the next inefficient unit(s) at an assumed incremental cost of 1 p per KW hr. With a 500 MW unit, the above figures will be correspondingly higher.

It is, therefore, essential to devise observational techniques in such a manner that they permit an accurate estimation of the internal status of a running plant/equipment, detect minute incipient faults, and predict end of reliable or economically useful performance through analytical techniques, empirical relationships or experience.

Ideally, estimation techniques should

establish the most optimum maintenance strategy such that corrective action is possible just before the point beyond which continued operation is positively unsafe or uneconomical and the necessary operation and maintenance preplanning has been possible.

The plant performance data must be so analysed that every deviation from the ideal operating environment and condition is unambiguously related to a specific component deviation in operating efficiency. It is only then that the maintenance strategy can be directed towards the more important contributory causes.

There has been considerable recent research activity in the area of detection of internal incipient malfunctions from externally observed phenomena. This area is generally identified as "Secondary Effect Signature Analysis". The performance or the status of an internal component, when suitably communicated outside through natural or seeded communication paths or coupling modes, can be observed through their secondary effects. The coupling modes can be electro-magnetic, acoustical or chemical in nature. The side-effects are not usually uniquely characterised but may be described as signatures. To overcome some of the disadvantages of signature recognition in the presence of widely varying environmental conditions, a synthetic or artificially induced (seeded) side-effect may be introduced to give a unique side response. Oil analysis of IC engines, or vibration analysis of ball and roller bearings are simple examples.

Careful analysis of an occurrence of abnormal behaviour is a powerful analytical tool to analyse the adequacy of existing plant protection systems, and to make the necessary design modifications in them. Occurrence analyses requires considerable ingenuity. In some cases, particularly large thermal and nuclear power plants, an elaborate computerised alarm analysis has been found to be justifiable. Similarly, chemical and metallurgical examination of failed specimens can reveal the true nature of the environment, operating conditions material properties, design deficiencies, etc, not clearly understood or envisaged at the time of sign.

WORK PLANNING AND EXECUTION TECHNIQUES

Techniques of "Planning and Execution" can be categorised as follows:

(a) Planning covers:

Manpower scheduling;
Activity scheduling;

Replacement material scheduling;
Maintenance equipment scheduling.

(b) Execution covers:

Cleaning techniques;
Rebuilding of wasted material;
Restoring deformation or original material properties;
Restoring original alignments or clearances;
Redesign of components/systems for better performance.

Work planning of the maintenance activity is as complex as project planning; perhaps more so because of the limited manpower, time, access and tools generally possible in a maintenance activity. Work progress must be watched and reviewed very frequently, strategies redecided as new elements are discovered and work executed with almost split-second timing. The working environment is far more difficult than during initial shop fabrication and site construction. In some cases it is extremely hot, cramped and, as in the case of a nuclear plant, even dangerous. The work techniques also require considerable ingenuity since none of the factory facilities and conveniences and often even design data are usually available. Rebuilding wasted material, restoring deformation, etc, often require a different approach from what was used during initial manufacture.

INFORMATION STORAGE AND RETRIEVAL

Maintenance information storage is essentially a method of accumulating operation and maintenance experience in such a manner that it can be intelligently employed in a wider variety of operation and maintenance situations than it was gathered from. To facilitate this, the experience must be analysed into its essential basic elements—the equipment/component involved, the operating environment and history, the current equipment/component status and the future trend, the nature of maintenance work performed, the mechanism of deterioration/failure, the sequence of events in a complex occurrence—identified and described in terms that will permit comprehensive retrieval from elementary clues and statistical data accumulation on a wide basis.

The techniques of "Information Storage and Retrieval", as currently applied to maintenance work, therefore need considerable reorientation, rethinking and widening of its scope. Each

process plant today has its own method of keeping and utilising its maintenance records. While a large organisation may collate or combine its maintenance experience either through frequent internal meetings or through centralised maintenance, the entire process and production industry has never found it practicable to join hands in a nation-wide effort. There are some advantages in developing an information storage and retrieval system that is universally applicable to all process plants.

A process plant can be envisaged as a set of systems and subsystems, each subsystem comprising of more or less very similar equipment such as prime movers, steam generators, reaction vessels, heat exchangers, agitators, filters, dryers, evaporators pumps piping, instrumentation, electrical motors switchgear, cables, etc. The performance of each equipment, when compared with that of other similar equipment in any other plant, on the basis of similar internal and external operating environment, can permit development of better statistical records than each plant can individually do. This however is possible only if we develop a common or universal language for identifying equipment and describing the operating history, the status of internal components from on-line and off-line observations and the description of maintenance work carried out. A cue can be taken from the languages computer engineers have developed for various specific applications. It should be possible to develop a language suitable for computer storage and retrieval maintenance records and then utilise it on the same basis as the Edison Electric Institute has done it for the compilation of operational performance of the generating units in USA. In this case, the data are maintained on confidential basis; generalised data are available to all but specific plant data to owners only.

COST ACCOUNTING AND EVALUATION TECHNIQUES

The cost accounting efforts are directed towards establishing the cost of maintaining, at near original level, the performance of each component/equipment/system/plant so as to determine the financial strategy for replacement or design/material modifications and the effectiveness of the maintenance effort. The first problem is solved by a well-designed system component/equipment/system/plant identifications and cost heads. The main problem, however, is how to establish a suitable index for the effectiveness of maintenance. For

TABLE	
$= \frac{\text{operating performance index}}{\text{maintenance cost index}}$	where any = $\frac{\text{actual}}{\text{ideal}}$
The same index can be expressed as	
$= \frac{\text{Actual operating performance}}{\text{Ideal operating performance}} \div \frac{\text{Actual maintenance cost}}{\text{Ideal Maintenance cost}}$	
$= \frac{\text{Actual operating performance}}{\text{Actual maintenance cost}} \div \frac{\text{Ideal operating performance}}{\text{Ideal maintenance cost}}$	
$= \frac{\text{Actual maintenance index}}{\text{Ideal maintenance index}}$	

such an index to be developed, we need to know, besides maintenance costs, idealised maintenance costs, actual operating performance and ideal operating performance. We might then envisage a maintenance performance index as shown in the Table.

From the performance of each equipment in terms of capacity, availability and reliability (assured availability) it should be possible to develop a composite performance index for a system — a configuration of equipments — using reliability theory. Idealised performance data would be calculated from equipment and component guarantees, material and component behaviour pattern data from laboratory or factory tests or from the recorded operating history of the most well run equipment obtained from the Information Storage and Retrieval System described earlier.

Maintenance cost accounting can present some challenging problems when one tries to apportion actual costs to individual components and equipments, particularly the common costs such as of opening and closing a large piece of equipment. Consequential loss of production is not usually a charge against maintenance but in a maintenance performance index, such cost items would have to be taken care of. One would then also have to take into account these maintenance items that derive the benefit of an outage due to some other defect. Determining ideal maintenance costs is even more difficult. Can we somehow establish the maintenance expenditure justified on a process plant going purely by the economic and financial environment in which a plant operates, such as tax laws, depreciation methods, process obsolescence, market conditions, etc?

CONCLUSIONS

In conclusion, two points need emphasis. Firstly, Maintenance Engineering is a neatly definable discipline, with clear-cut objectives, multidisciplinary tools and techniques and capable of being professionalised. The basic skills of Maintenance Engineering can be

identified as follows:

- Process thermodynamic theory;
- Mechanical/electrical/chemical system design theory;
- Instrumentation — sensors, data analysis and pattern recognition techniques;
- Industrial engineering — work study methods, project management techniques;
- Material technology — properties of materials;
- Fabrication technology covering welding, joining, shaping, forming techniques;
- Metallurgy — material behaviour, heat treatment, metallurgical examination theory;
- Reliability theory;
- Operations research, econometrics and mathematical modelling techniques;
- Cost accounting theory and techniques;
- Information, storage and retrieval techniques;
- Computer programming techniques.

There are many areas in which excellent opportunities for individual as well as multidisciplinary research activities are possible. Therefore, educational institutions should find it justifiable to develop Maintenance Engineering as an integrated discipline at the M Tech level. Similarly, industry should find it to its advantage to offer attractive career opportunities to these post-graduates.

The second point is the concept of developing and utilising performance indices for objective monitoring of the effectiveness of an organised effort. This concept is utilisable in many other fields and could become a subject by itself. These indices should be used in conjunction with data collection by national bodies vide standardised procedures on industry-wise or even nation-wide basis and the processed data made available on confidential basis to individual organisations in respect of their performance and to all in respect of group performance. In respect of public utilities, the data should be made available for public review.

THERE'S SO MUCH MORE TO M & M

Not just the famous 'JEEP' vehicles. M & M are equally active in

STEEL- M & M make available to the country a wide range of steel and alloy steels.

MACHINE TOOLS- M & M bring you a choice of machine tools from U.K, West Germany, Canada and India

INSTRUMENTATION- M & M provide Industrial Instruments, Process Controls and Automation Equipment.

ELECTRONICS- M & M manufacture Industrial Controls, Professional Grade Components, Electro-Medical Instruments and Military Equipment.

AGRO-AVIATION- M & M undertake aerial agricultural and anti-malarial spraying.

For technical progress with a social purpose.

FIRST INDIA-MADE OXYGEN PLANT Delivered by INDIAN OXYGEN LIMITED

Pledge to continue struggle for Self-Reliance

K HARTLEY, Managing Director Indian Oxygen Limited

A momentous event

A few days ago the first Indian made oxygen plant was delivered by IOL to Bhagwati Steel Pvt Ltd, Howrah, West Bengal. The plant is now in the process of installation and is expected to be commissioned within a short while. This is indeed a momentous event in the life of Indian Oxygen Ltd (IOL). It is also an event of importance for the country as a whole because it registers another step forward in the country's march towards self-reliance — the indigenous manufacture of air separation units and other plants for the manufacture of industrial gases and cryogenic equipment. This is a field where until recently India was entirely dependent on imports. It is a matter of satisfaction that with the development of plant manufacturing activities in India another important technological gap in our national industrial structure has been closed and it is even more gratifying to be able to record that this plant and others which will be following shortly are being manufactured entirely with IOL's own know-how and technology. Apart from oxygen plants, the range of plants and equipment in this field manufactured by IOL includes plants for the manufacture of Acetylene and Nitrous oxide Argon Purification systems, High Pressure Compressors for various gases as well as Vacuum Insulated Vessels for storage, transport and distribution of cryogenic liquids. The plant that IOL has recently delivered is only the first in a series of plants which are now being manufactured at our Plant Manufacturing Shop in Calcutta. Another two plants will be delivered by September this year and thereafter we plan to deliver a plant every two months or so.

Marching in step

This is I feel, a fitting occasion for us to take a look back at the growth and development of our organisation especially in the years since the planned economic development of our country started. It has throughout been IOL's endeavour to march in step with the country's economic development, to achieve progressively import substitution and to act as a vehicle for the dissemination of advanced technology in fields with which we are connected. By doing so we felt we could on the one hand, conserve valuable foreign exchange and on the other make available to industry sufficient quantities of gases, welding equipment, and consumables so that the nation could cope with the gigantic task of national development that was taken in hand from the moment of the launching of

Mr K Hartley

the First Five Year Plan. Thus, long before the slogan of self-reliance became popular in political circles, we in our own humble way had begun the march towards self-reliance.

Pioneering role

In pursuit of this ideal IOL pioneered the manufacture of welding electrodes — the first Indian factory which was established by us as early as 1947. Familiarising the country with various applications of industrial gases including the use of oxygen in steel-making, the use of nitrogen for annealing metals the use of argon for welding aluminium and other non-ferrous metals were among other steps that we took to keep Indian industry abreast of the latest technological developments. Simultaneously we set up production facilities to make available the gases and equipment required for this, IOL also played an important role in developing distribution systems for gases through pipelines so that large users of these gases for industrial as well as medical purposes could have supplies on tap. Today IOL is in a position to undertake the installation of pipeline systems on a turnkey basis not only for gases but also for petroleum products where specialised know-how is required. We are also proud that we have been able to play a role in India's defence effort by supplying specialised equipment and electrodes for the fabrication of armoured vehicles and naval vessels and making available high altitude oxygen to the Air Force.

Early next month we shall be launching another new product for the first

time in the Indian market — MIG Welding Equipment. The story of the various products that we have developed to meet the requirements of the Indian market is a long one and I do not propose to dwell on it further. It has been referred to here to indicate that these developments would not have been possible if from the beginning IOL did not have the outlook of identifying itself with the aspirations of the nation and dedicating itself to the task of rapid industrial development.

Self-reliance through Research and Development

It is obvious also that it has been possible for IOL to render this service to industry and to achieve import substitution in such a systematic manner only because in consonance with its general outlook of identifying itself with the national interest it had established its own R and D facilities which have been strengthened from time to time in keeping with its operational needs. Several products developed by IOL are based on technical know-how originating within IOL. Even today our R and D establishments and our planning cells are looking ahead into the future and trying to develop products which will satisfy the needs of future years and will take the country nearer towards the national goal of self-reliance.

Gas Compressor

Creating export markets

It is in keeping with the same outlook that IOL has made special efforts on the export front. Although gases and many of IOL's major products are essentially unexportable it has been able to find markets abroad for a number of its products.

As employer

As an employer, IOL has constantly striven to maintain cordial relations with its employees and their unions and to keep its wage levels and other benefits ahead of the national norm. It has planned and made conscious efforts to develop its human resources and the large majority of those holding positions of responsibility in the organisation today have risen from the ranks. Aware of the importance of productivity in ensuring the progress of the Company and the resultant well-being of its employees, emphasis on productivity has been a main theme of our negotiations with the employees over the years. IOL was among the first in India to negotiate and sign settlements with employees unions linking wages with productivity.

Identity with national objectives

Our close identification with national objectives throughout the period is reflected in several other spheres. In times of natural calamities and national crises IOL has responded promptly and liberally to the call for special efforts. On the declaration of the national emergencies in 1962, 1965 and 1971 we made substantial contributions to the National Defence Fund and other defence-oriented funds. We have also lent support to worthwhile projects to honour the memory of several national leaders. Our participation in the activities of and contributions to well-known organisation and institutions — both Government and public — engaged in scientific, economic and industrial activities has been recognised to be significant in many cases. In our public relations activities especially with the issue of several publications we have sought to give expression to our feeling of identity with the country's needs and ideals. We have thus dealt with occasions, events and information of great national import and tried to present the past and project the future in proper perspective. The recent IOL Publication — 25 Years of Indian Independence — released in August 1972 falls in this pattern.

Towards import substitution and diversification

Technology in the fields of industrial gases and welding is developing fast. For instance, many new uses of nitrogen have been found in the sphere of food preservation and oxygen is being increasingly used in the treatment of effluents. In advanced countries sophisticated techniques of welding and cutting have been developed such as laser welding, ultrasonic welding, computer controlled cutting and so on. IOL

would have welcomed the opportunity of making available to the country its knowledge and expertise in these fields. However we have taken note of the desire of our Government that companies such as ours should try to diversify into new lines and should harness their financial and human resources for filling important gaps that are present in the industrial structure of the country today or are likely to emerge in the near future. These gaps have been identified by Government recently in its list of 19 industries. We are also aware that there is an acute scarcity of foreign exchange today and that it is necessary to conserve foreign exchange by even more vigorous measures for import substitution and that it is necessary to make efforts to earn foreign exchange by promoting exports. We have also taken note of the national aspirations which expect that foreign controlled companies should progressively reduce the proportion of foreign equity in the total share capital and associate the Indian public in larger numbers in the ownership of IOL.

Our intent

I would like to take this opportunity of declaring that in keeping with our tradition of identifying ourselves with the interest of the nation we wish to expand and diversify the Company's activities within the policy guidelines laid down by the Government of India for foreign controlled companies. I am sure the Indian public will be pleased to learn that in this task we have been assured of the full support of The British Oxygen Co. Ltd.(BOC) which

has promised to make its world-wide expertise available to us in our search for diversification projects in the fields recently specified by Government. BOC is an international Group operating in twenty-eight countries in fields as diverse as welding advanced engineering, metallurgy, chemicals, food services besides medical and industrial gases. In many of these fields BOC is an acknowledged leader. Needless to say any further expansion or diversification project that secures the approval of the Government of India would, in accordance with the formula laid down, automatically reduce the foreign equity holding of this Company.

As a Company we have faith in the future of this country. We have never allowed ourselves to be overwhelmed by adverse factors which may have temporarily obscured the horizon. It is on record that even in the midst of the recession which affected most of all the engineering industry, with which we are directly connected, we did not allow ourselves to be dismayed but went through with the plans of development that we had drawn up prior to the recession. We are glad to note that this confidence was not belied and that when the economy started picking up after the recession we were ready to serve industry with our improved facilities in various parts of the country. We have every hope that in the future too we shall have opportunities of playing a role in the exciting drama of national development. The current year which happens to mark the Silver Jubilee of Indian Independence is perhaps opportune for reiterating our pledge to dedicate ourselves to the continuing national struggle for self-reliance and faster industrial growth.

Heat-Exchanger unit under manufacture

The Indian Industrial Worker

His Origin, Experience and Destiny

Baldev R Sharma

This paper presents some research findings on the background, experience and aspirations of the Indian industrial worker and discusses their implications for the climate of industrial relations in the country today. It goes on the hypothesis that a given state of industrial relations, whether at the plant or the national level, is the end product of a multiplicity of interacting forces which include, among others, economic considerations, political processes, legal framework, technological environment, socio-cultural factors, and psychological forces.

ONE of the parties actively involved in a situation of industrial relations conflict or harmony is, of course, the industrial worker. While it is customary to trace back industrial relations conflict and co-operation to the so-called nuts-and-bolts of the situation (e.g. wages, dearness allowance, bonus and the like), we seem to forget the basic fact that conflict and co-operation between people and groups begin and end with human beings. Therefore, to talk of industrial relations in terms of the so-called substantive issues without looking at the human beings who are involved in the situation will at best be a partial approach. Let me hasten to add that, by the same logic, to talk of industrial relations in terms of the social-psychological factors (as I promise to do in this paper), without looking at the substantive issues, would be equally partial!

About two years ago, I published an article, 'The Industrial Worker: Some Myths and Realities'.¹ As argued in that paper, popular beliefs about the Indian industrial worker are in sharp contrast to the reality of their situation. Consciously or unconsciously, certain 'myths' are being perpetuated about him. An attempt was made there to highlight some of the reasons for the continued belief in the 'myths' described in the paper. The paper ended with the suggestion that, instead of blaming the socio-cultural background of the industrial worker, the Indian managers should try to satisfy some of his social and psychological needs which appear to be largely neglected. Some concrete steps were outlined for managerial action. For the last two years, I have been engaged in a major research project on the subject of labour commitment in India.² In this paper, I would like to present some further evidence on the subject based on my recent study. Before presenting the new data it would be useful to say a few words

about the nature and scope of my recent study.

The study was concerned with only blue-collar workers and, within that category, only direct production workers. Eight companies were chosen on the basis of their production technology, so as to obtain a sufficiently diverse sample. The eight companies represented the following four technology groups: (1) jobbing, (2) machine-tending, (3) mass production and (4) continuous process. Four of the eight companies were from the West (Maharashtra and Gujarat) and the other four from North (Rajasthan and Punjab). One of the eight companies was in the public sector, one in the joint sector, and the remaining six were in the private sector.

All the eight firms were in the manufacturing business. The jobbing firms manufactured machinery in one case and control instruments in the other — both on unit production basis. The machine-tending firms were both textile mills. The two mass-production firms manufactured consumer items mostly for domestic use. And, finally, the continuous-process firms included one fertiliser plant and one synthetic fibre plant. A total of 1971 blue-collar workers were interviewed for the purposes of the study. The names were selected from the company payrolls on a simple random basis.

BACKGROUND AND CHARACTERISTICS

Of the 1971 workers interviewed, 56 per cent were found to be rural, while the remaining 44 per cent came from urban areas. Eighty-two per cent of the workers were Hindus and, among them, 46 per cent belonged to upper castes. The average worker had had about eight years of formal education. As many as 40 per cent of them had completed high school education, including some (14 per cent) who had even gone to college. Only 11 per cent of the workers were found to be illiterate. The educa-

tional background of the worker was, quite understandably, in sharp contrast to that of his father.

The educational background of the worker's father showed that he had had on an average four years of formal education. Only 11 per cent of the fathers had completed high school, and 40 per cent of them were illiterate. Thus, in just two generations, the educational levels of the fathers and sons have been completely reversed as shown below:

	Father (per cent)	Son (per cent)
(a) Completed high school	11	40
(b) Illiterate	40	11

The occupational background of the worker's father showed that only 35 per cent of the fathers had worked primarily in agriculture. As against this, 30 per cent of the fathers had worked mainly in white-collar occupations — like clerical, business or professional — and 19 per cent in the blue-collar occupations. The remaining fathers either held some menial jobs (9 per cent) or their occupational background could not be ascertained (7 per cent). Thus, neither educational background nor occupational experience of the worker's father showed him to be overwhelmingly rural in origin.

The occupational background of the workers themselves revealed that 45 per cent of them had had some work experience before joining the present firms. The average length of previous work experience for the sample as a whole came to over four years. Less than one per cent of the workers had earlier worked mainly in agriculture whereas one-third of them had worked at factory jobs. The average seniority of the workers in the present firms was a little over six years. One-third of the workers belonged to states other than the one in which they worked at present. The average age of the workers was about 29 years; 79 per

ECONOMIC AND POLITICAL WEEKLY

cent of them were married; and each worker had on an average four dependents. Finally, the average worker was earning a sum of Rs 276 per month as emolument. A summary of the background and other characteristics of the industrial worker is given in Table 1.

ORGANISATIONAL EXPERIENCE

Less than one-fourth of the workers interviewed (23.4 per cent) had seen a newspaper advertisement for the first job that brought them to the present firms. A little over two-fifths of them (42 per cent) had sent in a written application. One-fourth of the workers were registered with an employment exchange but only 10 per cent of them reported that their names were recommended to the firms by the employment exchange. Less than one per cent of the workers said that they were helped by a trade union in getting their first jobs.

As many as 60 per cent of the work-

Average monthly emoluments	Rs 276

ers reported that they knew someone already working in the firm when they were looking for a job. More than half of them (52 per cent) said that their 'contacts' helped them in obtaining the job. In answer to a direct question, three-fourths of the workers reported that 'influence' was most important or fairly important for securing employment in their firms.

Commenting on the management culture prevailing in their respective companies, almost half of the workers (49 per cent) reported that "company officers think only of themselves". Over two-fifths of the respondents (42.3 per cent) are of the view that their companies "exploit workers every chance they get". And, finally, over half of the workers (53 per cent) charged that their companies show "favouritism in their promotion policies". These being the perceptions of the workers about their employers, it is little wonder that as many as 42.4 per cent of the industrial workers are reported to be "generally unhappy".

A number of questions sought to ascertain the nature of work technology. The picture that emerged from the workers' responses highlights 'positive' as well as 'negative' aspects of the jobs held by the workers. On the positive side, almost all workers (97.7 per cent) consider their jobs essential to the success of their firms. More than nine out of every 10 workers (92.6 per cent) report that their jobs require much mental concentration. A large proportion of the workers (88.7 per cent) feel that their jobs require much responsibility. Three-fourths of them (74.7 per cent) are of the view that quantity of work they have to do does not interfere with their quality of performance.

On the negative side, there are several ways in which the jobs of factory workers leave something to be desired. To begin with, only about two-thirds of the workers (65.4 per cent) are of the view that their present jobs provide them with an opportunity to fully utilise their capabilities. Similarly, only about two-thirds of them (63.4 per cent) feel that they get a chance to try out their own ideas. Thus, as many as one-third of the workers interviewed are holding jobs which fail to give them a chance to use fully their own ideas and abilities.

Less than three-fifths of the workers (58.8 per cent) report that their jobs involve variety, i.e., doing different operations or things most of the time.

Review of Management June 1973

workers feel that their jobs often provide *challenging situations*. Less than half of the workers (46.7 per cent) are of the view that their jobs do not leave them *too tired* at the end of the day. And even fewer of them (42.7 per cent) report that their jobs do not make them work *too fast* most of the time.

Answers to the next three questions are even more revealing. At least two-fifths of the workers (39.5 per cent) describe their work as *monotonous* as a result of which they feel that they are unable to use all of their talents. Less than two-fifths of the workers (38.9 per cent) feel that they can change

TABLE 2: ORGANISATIONAL EXPERIENCE OF 1971 INDUSTRIAL WORKERS

Particulars	Per Cent
(a) Organisational Culture	
Saw a newspaper advertisement for the job	23.4

A dream today, a reality tomorrow

Today at Mithapur, young India, conscious of the past, urged on by the present, confidently dreams of a glorious tomorrow.

Their immediate dream is of a new complex—massive, self-sustaining, long-range and innovative—harnessing the sea, the sun and ultimately the atom to banish hunger from their land and to generate greater economic self-sufficiency, more and more independence.

There is a beginning but there is no end to the work of bringing purposeful prosperity to the people of India. Harness the sea, the sun, the atom and from Okhamandal—the land of salt—fertility will flow to the entire country.

TATA CHEMICALS LIMITED

their work methods if they desired to do so. In other words, more than three out of every five workers are assigned jobs which allow little freedom on discretion insofar as methods of work are concerned. And, finally, less than one-fourth (22.6 per cent) of the workers are allowed to leave their place of work for half an hour without a reliever even when they could finish their assigned task during the allotted time. Table 2 summarises the organisational experience of the industrial worker.

OCCUPATIONAL ASPIRATIONS

Each worker was asked to indicate the highest job that he thought he could get in his present company. The responses to this question were supposed to give us an idea about the level of aspirations of the workers. In addition, we can also judge from these responses as to what occupational future awaits the industrial worker after he has worked in industry for a number of years. Of the 1971 workers interviewed, only 449 (22.8 per cent) hoped that they could some day rise to the supervisory level or above.

Over three-fourths of the industrial workers, therefore, are pursuing more-or-less dead-end careers. Almost one-fourth of them (24.7 per cent) think that they will retire as workers, rising no higher than where they are at present. Another 30.3 per cent hope to advance to some senior grade as a worker, while only 12.8 per cent think that they can become jobbers or mukadams. The remaining 9.4 per cent of the workers could not respond to this question. The workers estimated that they would hit the ceiling in about six years on an average. The next question sought to determine the monetary level of the job that the worker hoped to reach at the height of his career. The average monthly emoluments aspired to by the industrial worker came to Rs 390, which represents an increase of 41 per cent over the present average emoluments of Rs 276 per month.

Through several projective questions, the workers were asked to compare factory work with the work of an office employee and that of a small independent farmer. The respondents were asked to assume the monthly income in all three types of work to be the same. In this comparison, agricultural work was considered by the workers to be most respectable, most necessary, least monotonous, and most satisfying. In all these cases, the small independent farmer scored the highest rank, followed by factory work and office work, in that

order, with just one exception. The exception was over 'monotony', in which case factory work was considered the most monotonous and office work the next most monotonous.

Next, the workers were asked the following hypothetical question: "When you have accumulated enough money, would you like to quit the factory and go to live in a village?". Over three-fifths of the workers (61.8 per cent) replied this question in the affirmative, which shows that the 'heart' of the industrial worker is not in his present job but somewhere else. Similarly, in answer to another hypothetical question, 59.1 per cent of the workers said that if they could go back to the age of 15 and could start life over again, they would choose an occupation other than factory work. It seems, therefore, that for the majority of industrial workers their jobs fail to have a strong 'pull' for getting them involved in their work.

SUMMARY AND DISCUSSION

Background: The data on the background and other characteristics of the Indian industrial worker presented in Table 1 generally support the conclusions already drawn in my earlier paper. We may conclude, therefore, that (1) the Indian industrial worker is not predominantly rural; (2) very few of them are illiterate; (3) only a small proportion have previously worked mainly in agriculture; (4) among the ones with previous experience, those with industrial experience are in the majority; and (5) most of them are Hindus generally coming from upper-caste families. The new data further reveal that the worker is 29 years old, has continuously worked in the present firm for six years, at least one-third of them are from out-of-state, and his average monthly emoluments are Rs 276.

As argued in my earlier paper, both physiological and safety needs of the workers are more or less satisfied. In view of this (and as the psychologist Abraham Maslow would have us believe), the workers are increasingly concerned about their social and ego needs. The research findings reported in this paper clearly show that the social-psychological needs of the industrial worker remain largely unsatisfied. Given the background and other characteristics of the worker, as shown above, it seems all the more important that his latter needs are attended to. More on this point will follow.

Experience: The organisational experience of the industrial worker reveals that right from the beginning of his industrial employment he is subjected to an organisational culture which he does not see as altogether rational or just. Workers are recruited not through open competition (using agencies like the newspaper and the employment exchange) but through influence and contacts. Moreover, as viewed by about half of the workers, the company officers think only of themselves, the companies exploit workers every chance they get, and promotions are based on favouritism. Such a state of affairs is likely to demoralise the worker and, as shown later, make him feel alienated. Here, then, we have the first major source of tension which must influence the industrial relations climate.

The workers consider their jobs essential to the success of their companies. They feel that their jobs require much mental concentration and responsibility and that quantity does not affect the quality of their performance. However, despite these positive aspects of industrial work, the workers do not appear to be very satisfied with their work experience. One of the reasons for dissatisfaction appears to be the lack of sufficient opportunities for employees to use their own abilities and skills in the execution of the tasks assigned to them. The several questions on work technology included in Table 2 bring out the negative aspects of industrial work quite clearly.

Further analysis of data showed that the 13 dimensions of work technology mentioned in Table 2 were not equally important in influencing workers' attitudes and feelings. In fact, only the following six factors were significantly related to whether the worker felt happy or unhappy about his work experience:

- (1) Job gives a chance to use fully own abilities.
- (2) Job gives a chance to try out own ideas.
- (3) Job does not leave too tired at the end of the day.
- (4) Job does not make work too fast most of the time.
- (5) Work here is monotonous; it does not use all of my talents.
- (6) If so desired, can change methods of work.

Each of the six conditions of work mentioned above seemed to promote or inhibit satisfaction not only with the job but also with the firm. This finding

dom, autonomy, discretion and control in relation to work experience. The presence of these factors seems to promote positive feelings toward the job as well as the company, while their absence is likely to produce negative feelings.

Jobs in modern industry are designed in terms of the principle of specialisation. The principle of specialisation, as applied to industrial work, is expressed through the processes of rationalisation and mechanisation. In a mechanical factory, jobs are broken down into minute parts and skill is transferred from the operator and is built into the machine. In such a plant, therefore, machine plays the dominant role in the production process while the worker is generally reduced to the status of a machine tender or an assembler. As industrialisation advances, there is a progressive increase in the degree of mechanisation which, in turn, results in the loss of freedom and control for the operator. We have here, then, the second major source of tension which is bound to influence the industrial relations situation.

Aspirations: The industrial worker by and large does not see his future career as a "rosy" one. The typical worker hopes to remain an industrial worker all his life and the occupational advancement envisaged by him is quite limited in scope, both in terms of status as well as emoluments. Although he would like to accumulate sufficient money so as to start a new life someday, perhaps in a rural setting, it seems highly unlikely that more than a handful of the workers can ever realise this dream. Here is a situation involving large numbers of industrial workers who feel quite dissatisfied with their current work experience and, in addition, suffer disillusion by the future that awaits them. Since there are few alternatives to the present life, the industrial worker cannot help but feel 'trapped'. This feeling of helplessness is the third major source of tension from which the Indian industrial worker suffers and which is certain to make the climate of industrial relations turbulent.

Alienation: At this point I would like to introduce the concept of 'alienation' which seems to explain the feelings, attitudes and behaviour of the industrial worker reported here. My discussion follows Melvin Seeman's who has identified the following five dimensions of alienation: powerlessness, meaninglessness, normlessness, isolation, and self-estrangement.³ Robert

Blauner has tried to apply Seeman's classification to analyse the situation of the modern industrial worker.⁴ According to Blauner, work which permits autonomy, responsibility, social connection, and self-actualisation furthers the dignity of the human individual, whereas work without these characteristics limits the development of personal potential and is, therefore, negatively valued. Work of the latter type, in other words, leads to alienation of the worker.

We have seen in the data section of this paper how large numbers of industrial workers view the personnel policies followed by their respective managements in matters like recruitment and promotion. When such policies and practices are perceived as irrational and not quite above-board, the workers are sure to suffer from a feeling of 'normlessness'. Similarly, the discussion of work technology has also shown that work tasks by and large fail to provide sufficient discretion and control to industrial workers. This is likely to create a feeling of 'powerlessness' among the workers. Moreover, jobs which are routine and repetitive, requiring little or no judgment of the worker, will be viewed as meaningless. When the worker has to perform such meaningless tasks day-in and day-out, he is likely to suffer from a feeling of 'meaninglessness'.

Seeman's fourth dimension of alienation is isolation. One of the several consequences of rationalisation of work technology is to break down the task into many parts and then assign just one simple part to one worker. Under this method of job design, each worker is made responsible for his own individual segment of the task, which he can handle more or less independently. The worker in such a situation is deprived of any meaningful interaction with his fellow workers and is, therefore, likely to suffer from a feeling of 'social isolation'.

Any one of the four feelings described above is likely to reduce the motivation and commitment of the worker. But when a person experiences all the four feelings simultaneously, their combined effect is sure to lead to self-estrangement, which is the fifth dimension of alienation. In each of the first four cases, the person becomes an 'alien' (or, a foreigner) to the activity which is the source of that feeling. But when all the four negative feelings are combined — that is, when the worker feels powerless, when he sees his activity as meaningless, when he

ECONOMIC AND POLITICAL WEEKLY

perceives the policies and practices of the management as normless, and when he feels socially isolated —, the individual is likely to become an 'alien' even to himself. In such a situation, the worker suffers from the fifth dimension of alienation called 'self estrangement'.⁵

I submit, then, that at the heart of much of the tensions and strife which pervade the industrial relations scene today lies the alienation of the modern industrial worker. I am sure none of us will find this factor listed as one of the items on the list of grievances or the charter of demands. But this in no way lessens the importance of the explanation offered here. In fact, I would like to argue that in many cases the substantive issues that are supposed to be the basis of industrial relations conflict are merely the vehicles for the expression of hostility which is essentially psychological in nature and is rooted in the alienation of the worker.

With the attainment of political freedom, the industrial worker has increased his participation in the democratic processes operating all around him. His level of education is progressively rising. Almost half of the workers grew up in cities and have been exposed to the urban way of life. The combined effect of all these forces has been a gradual rise in the level of aspirations of the worker. The industrial worker today, compared to his counterpart of an earlier day, is much more aware of his freedoms and rights and is even more anxious to protect them when they are threatened.

It would be naive to imagine that industrial workers are the only ones who are influenced by the social changes just described. The fact is that all citizens, be they students, teachers, business managers, government officials, or even family members, are affected by these global processes in varying degrees. Viewed in this light, the phenomenon of alienation among the industrial workers and the resultant tensions in the sphere of industrial relations, can find many parallels in other institutions of society. In every sphere of institutional life, men and women, young or old, seem to be engaged in an undeclared war to gain freedom and control, or to preserve it.

To someone responsible for management of industrial relations it will be no consolation to know that other spheres of society also face similar

problems. Yet, this knowledge, I believe, is essential for proper diagnosis of their own problems. One of the lessons that can be drawn by defining the problem of alienation at the macro-level is to recognise the need to bridge the 'gap' between rising expectations of people and the institutional mechanisms that frustrate those expectations.

CONCLUSION

If those connected with management of industrial relations accept the thesis advanced in this paper, there are essentially two ways in which they can respond to the situation. They may treat work alienation as the necessary concomitant of industrialisation and, therefore, consider it a 'necessary evil' or a 'price' to be paid for modernisation and growth. Or, they may treat it as an avoidable human cost to be reduced, if not completely eliminated, through imaginative programmes. Far too many people around the world — including managements and unions — seem to have gone for the first option than for the second.

Employer-employee relations around the world have worsened rather than improved over the years. There is no guarantee that with technological advances industrial relations conflicts will diminish. Technological progress has undoubtedly improved the material wellbeing of the worker; but, as we all know, material gains and affluence have not reduced the conflict between labour and management. This is because the roots of these tensions are to be found in the day-to-day experiences of the worker which, as I have tried to argue, leave much to be desired.

Management circles in some of the advanced countries have gradually begun to realise that it is no longer possible to ignore one of the basic causes of labour-management conflict — viz, work alienation. Some of them have started experimenting with newer methods of job design through such innovations as job enlargement, job enrichment, job rotation, team work, participatory democracy, and the like.⁶ But in all these experiments, managements as well as consultants have been at pains to look for increases in productivity or some other tangible results. While nobody should grudge such material benefits, I feel the real gain from these innovations is the reduction of tensions between employers and employees. It is high time we in India also make a beginning in this direction.

[This paper was presented at the Eighth Alumni Conference of IIMA on 'Management of Industrial Relations' held at Bombay on March 9 and 10.]

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS
ANNOUNCEMENT REGARDING ISSUE OF 6,30,000 EQUITY SHARES OF RS 10/- EACH FOR CASH AT PAR.

Persons interested in full details may obtain copies of Prospectus and Application Forms from the Underwriters, Brokers and Bankers to the Issue or any of the Offices of the Bankers to the Issue mentioned below and also from the Registered Office of the Company.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 19TH JUNE, 1973 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON 29TH JUNE, 1973 OR EARLIER AT THE DISCRETION OF THE BOARD OF DIRECTORS OF THE COMPANY BUT NOT EARLIER THAN THE CLOSE OF BANKING HOURS ON 21ST JUNE, 1973.

TRIVENI SHEET GLASS WORKS LIMITED

HISTORY AND OBJECTS OF THE COMPANY :

The Company, promoted by Sri D.N. Agrawal, was incorporated on the 15th December, 1971, in the State of Uttar Pradesh under the Companies Act, 1956, and obtained the Certificates of entitlement to commence business from the Registrar of Companies, Uttar Pradesh on the 3rd February, 1972. The main objects of the Company, inter alia, are to manufacture, produce, export, import, trade and deal in, distribute, stock, buy and sell sheet and safety glasses toughened, plate, flat looking, window, decorative and other type or types of glass required in or used for industrial, domestic, household, building, furniture, electric fittings, transport vehicles and other purposes.

PROPOSED ACTIVITIES :

The Company proposes to set up a plant for the manufacture of sheet glass from 3 mm. to 6 mm. thickness through P.P. G. process with an installed capacity of 5 million square metres per annum. In this respect, the Government of India has granted an Industrial Licence to the Company bearing No. L/33(2)/9/NU/72-LI(II) dated 7.12.1972.

The Company will import plant, machinery, equipment including spares of an approximate value of Rs. 35.77 lacs from West Germany and U.K. In this respect the Company has obtained an Import Licence bearing No. P/C/2065022/S/IB/46/H/35-36/CGIV dated 27th January, 1973, for the C.I.F. value of Rs. 35.77 lacs.

Hugo Knoblauch of West Germany will supply drawings for pits, balconies and general layout plan of the whole melting furnace. Subject to the approval of Central Government and Reserve Bank of India, they have also undertaken in their letter dated 26.11.71 addressed to Sri D. N. Agrawal, the Promoter, to send their technical specialist to supervise the erection of three P.P.G. machines and another specialist for the P.P.G. process as adviser to start the production.

It is expected that about 60% of the total production of the company will be purchased by Companies including Hindusthan Safety Glass Works Private Ltd., and firms which are now controlled by Sri D.N. Agrawal. In view of this, the Directors do not anticipate any difficulty in marketing the products of the Company and are of the opinion, in the absence of any unforeseen circumstances, the company should be able to pay a maiden dividend to the holders of Equity Shares within a reasonable time.

LOCATION OF THE INDUSTRY :

The Company's factory will be located at Iradatganj, Dist. Allahabad, Uttar Pradesh. The Company has already purchased more than 4.14 Hectares land adjoining Iradatganj Railway Station. The location selected is considered to be very suitable for the Sheet Glass Industry.

APPLICATION TO THE STOCK EXCHANGE :

Applications have been made to the Calcutta Stock Exchange and Bombay Stock Exchange for permission to deal in and for

quotation for the Equity Shares of the Company.

Copies of the Prospectus and Application Forms may be obtained from the Underwriters, Brokers and Bankers to the Issue or from any of the main offices of the Bankers to the Issue mentioned hereinabove, or from the Registered Office of the Company.

APPLICANTS ARE ADVISED IN THEIR OWN INTEREST NOT TO MAKE MULTIPLE APPLICATIONS. EVERY APPLICANT SHOULD SUBMIT ONLY ONE APPLICATION FOR THE NUMBER OF SHARES REQUIRED. MULTIPLE APPLICATIONS AND APPLICATIONS IN JOINT NAMES ARE LIABLE TO BE REJECTED.

PRESSMAN

World Bank's Experience with Development Finance Companies

William Diamond
Ravi Gulhati

It is much easier to evaluate the performance of an individual development finance company (DFC) than that of the entire group of DFCs associated with the World Bank. The heterogeneity of this group of DFCs and the diversity of their environmental and institutional characteristics makes generalisations about their performance very difficult. So also does the shifting posture of the World Bank, whose own basis of evaluation has changed.

This paper makes the effort to reflect on some facts which seem unquestionable, and to make some generalisations from them.

THE interest of the World Bank Group (WBG) in development finance companies (DFCs) began in 1950. The network of DFCs associated with the WBG increased gradually to 45 at the end of December 1972. Roughly two-thirds of WBG lending to the industrial sector during the sixties was channelled through these intermediate credit institutions. Altogether, the Bank, IDA and IFC committed, till December 31, 1972, the equivalent of \$1.7 billion in the form of loans, credits, and equity.

The Bank's relationship with DFCs is not confined to the provision of finance. The Bank also extends technical assistance, helps recruit managerial and senior staff, trains DFC personnel and supplies selected categories of information on a continuing basis to the development banks associated with it. More fundamentally, the Bank has played a key role in the initial establishment of some DFCs and in the reorganisation of others. In at least 16 cases, the WBG can be said to have influenced significantly the basic structure of the institution.

Why is the Bank so profoundly interested in DFCs? There are essentially two reasons. First, these intermediaries are convenient retail outlets through which the Bank can assist a broader cross-section of industrial enterprise in the developing world than would be feasible through a direct financing of projects. Direct financing works well in the case of very large steel, fertiliser, or pulp and paper plants. But direct financing by the WBG would be prohibitively expensive — in financial terms and in terms of staff time — for projects whose total cost is below, say, \$5 million. And yet, the cost of the bulk of manufacturing investment in most developing countries is well below this level. Without recourse to intermedia-

ries, the WBGs activity in the industrial field would be clearly biased in favour of very large-sized projects. Closely related to its wish to penetrate more deeply and more broadly into the industrial sector has been the Bank's wish (attenuated with the passage of time, but not eliminated) to promote private investment and private enterprise. As it happens, large-scale enterprise in developing countries is generally public in ownership and control; small- and medium-sized enterprise is overwhelmingly private.

The second reason for the Bank's interest in DFCs goes beyond the matter of administrative convenience. It concerns the basic concept of the development process and how it can be stimulated. Methodologies change in identifying the key to accelerating economic progress in underdeveloped countries. Once it was (and among some, it still is) considered that the injection of external capital is the key. At other times (and among other groups) emphasis has been placed on the inflow of technical assistance. Clearly, both are important elements in the picture. However, there is more to development than capital accumulation and knowhow. Economic development involves basic changes in society and in its institutional framework. DFCs are one element in the complex of institutions and mechanisms through which a society mobilises itself to achieve modernity. It is in the context of such institutions that professional staffs are built, decision-making skills are acquired and qualities of leadership are identified. It is only when expansion in investment, output, and employment, proceeds side by side with institutional and entrepreneurial growth that the development process is likely to become firmly rooted in a society.

Thus, the Bank considers DFCs not only instruments for transferring capital and knowhow to a large number of small and medium entrepreneurs, but also as permanent institutions capable of adapting to, and modifying, the environment and of devising indigenous solutions to local problems. How to tap household savings in the context of prevailing family mores? How to influence corporate savings decisions in the light of business practices, ownership patterns and the tax situation? How to win the confidence of government authorities and thereby obtain public funds for development purposes? How to influence insurance companies, commercial banks, and other financial entities to expand the volume of industrial finance? How to persuade potential investors to examine their projects critically? How to protect them from the skilful salesmanship of foreign suppliers of machinery anxious to sell their wares? How to find suitable foreign partners for local businessmen, and how to support local businessmen when they negotiate with large, experienced multinational corporations? These and many other questions need to be answered. To answer them well requires detailed knowledge of the local scene and good judgment distilled from long experience. A good DFC should provide that knowledge and judgment.

BASES FOR EVALUATION

The group of DFCs associated with the Bank is heterogeneous. Some have barely started; others are in their teens and four have celebrated their twentieth anniversaries. Some are operating in economies which are still non-industrial in character; others are in semi-industrial countries. Some are wholly government-owned while others are entirely

Reaching petroleum products wherever needed

With a nation-wide storage and distribution network, Indianoil maintains an uninterrupted flow of petroleum products to serve the nation.

With more than 200 installations, bulk depots and aviation fuel stations, and over

3000 petrol/diesel stations, Indianoil ensures that products are delivered wherever needed. All modes of transportation are pressed into service—coastal tankers, pipelines, rail tank wagons, tank trucks and tank carts. Indianoil marketed about 14

million kilolitres of products during 1971-72 thus meeting nearly 55 per cent of petroleum product requirements of the country—serving the nation in its development plans as well as in defence efforts.

Delivered 1972-73

private in ownership and control. Their diversity is the result of not only structural differences related to their age and ownership patterns and to the stage of development of the economies in which they operate, but also of differences in management style and policy orientation.

By what standard should they be evaluated? The performance of DFCs may be assessed by several standards.

- First, there are the objectives and policies of the DFC itself, as laid out in its Articles of Association (or charter of organic law), in its formal policy statement (if there is one) and in periodic Board decisions. In this category should be included the objectives of the shareholders, if the DFC is privately owned. The first approach to an evaluation of performance involves a comparison between those objectives and what the DFC has in fact done in a particular period of time.
- Performance may also be assessed against the policy objectives of the government of the country in which the DFC is located. The objectives and policies of DFCs associated with the WBG are always congenial to the government at the time the DFC is established and at the time the WBG begins to deal with it. But governments and their policies change, and divergences (and hence strains) may develop between a DFC and the government, unless the DFC is able to adjust to the changing situation.
- A third standard against which performance may be assessed, is the WBG's own policy aims, i.e. the expectations about a DFC held by the WBG. The WBG makes decisions as to whether to support the establishment of a DFC and whether to continue to provide it with financial resources in the light of the WBG's priorities and lending programme in the country. It can be expected to do so only if the DFC's performance conforms to the Bank's general objectives and policies.

The three viewpoints, though distinct, are inter-related. Nevertheless, this paper is concerned primarily with the third: conformity with the WBG's objectives and policies. Discussion of the performance of DFCs from this viewpoint is not easy. For the Bank's expectations and policies with respect to DFCs have shifted during the past two decades. One example is the Bank's policy regarding the ownership of DFCs. Throughout the fifties and most of the sixties, the Bank insisted on financing only privately-owned development banks which financed productive enterprises in the private sector.

This posture reflected a strong belief in the effectiveness both of private management of DFCs and of the desirability of supporting private entrepreneurship and mobilising private technical and financial resources for industrial development. In 1968, the Bank's policy changed with regard to insisting on private DFCs; it decided that government-owned or controlled DFCs might be necessary and that they might play a valuable role under certain conditions. In 1971, the Bank decided that, because government policy and objective circumstances in some countries made private enterprise unlikely, it would not insist that the bulk of a DFC's business be with private enterprises. Bank policies will no doubt continue to change — not only in the light of its operational experience with DFCs and with its member countries, but also in the light of the Bank's changing conception of its own role in economic development.

It is much easier to evaluate the performance of an individual DFC than of the group of DFCs associated with the WBG. The heterogeneity of the group of DFCs associated with the WBG — the diversity of their environmental and institutional characteristics — makes generalisations about their performance very difficult. So also does the shifting posture of the Bank, whose own basis of evaluation has changed. This paper makes the effort to reflect on some facts which seem unquestionable, and to make some generalisations from them.

Some Accomplishments

SURVIVAL AGAINST ADVERSITY

To carry out their missions effectively, DFCs must survive the turbulence in their environment and at the same time keep in step with the basic thrust of national change. By 'turbulence' we mean instability in the political, social or economic realm which reflects temporary aberrations or erratic movements as distinct from the more enduring elements in the process of national development. Conditions in many countries in the developing world have been unstable in this sense. International war, civil war, constitutional breakdown, changes in government, traumatic changes in exchange rates or other policies have figured in their history. These crises have added greatly to the normal problems of DFCs and in some cases have endangered their viability. It is therefore significant that, practically without exception, the DFCs associated with the WBG have managed to

weather economic and political storms. Perhaps this resilience was the result of their basically sound financial structure or perhaps it reflected the general acceptance of their objectives; it must certainly have been in part the result of the political and managerial skills of their chief executives.

It is notable that most of the DFCs associated with the WBG have not merely survived. They have also enjoyed continuity of management, or have learned to change management in an orderly fashion; i.e. policies and procedures have become sufficiently well-established to assure institutional stability despite changes in management. In its 21 years of life, management of TSKB (Turkey) has remained essentially the same, although two different men have from time to time held the key position. The style and quality of management of ICICI (India) have also remained essentially the same, despite a crucial change, a few years ago, in the composition of ownership. Only untimely death has forced changes in management in CDC (Taiwan), but so far these have not infringed upon policy or management method. Many of the DFCs still have their original chief executive officers; most of the DFCs older than five years have had the same chief executives for at least five years. This notable stability may be attributed to the development of an understanding among shareholders and of an *esprit de corps* among board members about the nature of the DFCs. It also demonstrates the resilience, leadership and effectiveness of DFC managers.

Survival is, of course, an accomplishment. However, while it is a necessary condition for a DFC to fulfil its mission, it is hardly a sufficient one. Similarly, stability of management is generally associated with good institutional performance but there is no necessary causal link between the two. It is quite possible for a DFC to survive and to have the same executive head for a decade or more without creating a distinguished operational record. Matters other than survival and stability are also important.

STAFF DEVELOPMENT

DFCs must recruit, train, and deploy a staff of engineers, financial analysts and other professional. A competent and well-organised staff with good morale is a critical resource for carrying out the normal tasks and the innovative functions of these institutions. It has not been easy for DFCs to acquire this resource in the context of

the acute scarcity of high-level manpower characteristic of many developing countries. What complicates the situation is that people who have the required skills and outlook are precisely the kind of people who are sought by private firms and government agencies for important positions. Many DFCs have had to recruit fresh graduates from the university and to groom them for the job. They have made use of national and international training facilities and at least one (PDCP in the Philippines) has established an institute for training its own staff. In some DFCs, foreign advisers have played an important role in upgrading the quality of local staff. Some of the older institutions have managed to acquire a team of professionals who are more than a match for their counterparts in government ministries, planning offices and the like. In fact, on a number of occasions an experienced staff member of a development bank has left the institution at the request of the government to undertake an important official assignment. A number of DFCs have helped train staff members of other younger development banks, in the spirit of common endeavour. It is a mark of the success of some DFCs that they have become sources of skilled manpower for the public as well as private sectors. Professional teams, assembled in these senior DFCs, are a strategic asset which have yielded, and should continue to yield, an important pay-off both to the DFCs themselves and to the community.

EXPANSION OF ACTIVITY

DFC accomplishment can also be seen in the growth of their portfolios. Many DFCs have rapidly expanded the volume of their commitments. The rate of growth during 1966-70 in 17 DFCs exceeded 20 per cent per annum. In some instances, this growth represented the initial burst of operations starting from a very small base. In other DFCs there was a longer history of very rapid growth going back to the early sixties. Seven institutions had crossed the \$200 million mark in terms of cumulative commitments. Altogether, the total financial commitments made by DFCs associated with the Bank amounted to the equivalent of \$729 million in 1970. About 150 commitments were for amounts exceeding \$1 million each, and nearly 3,000 were for amounts smaller than this sum. Unfortunately, the data needed to compare growth in DFC commitments, systematically with expansion of total manufacturing investment in the same countries, are not readily available. There is reason to believe,

however, that many of the DFCs were not cashing in on a rapidly expanding manufacturing sector but were taking over the financing function from other institutions and providing funds on more appropriate terms.

Yet, despite the record of growth in the sixties, most of the DFCs remained relatively small in terms of the proportion of total industrial investment financed by their disbursements. Generally speaking, DFC disbursements made up somewhere between 5 per cent and 25 per cent of industrial investment; most of the DFCs were at the lower end of the range. This small quantitative role was a reflection of the fact that capital formation in industry is financed to a large extent by plough-back of profits within the firm. On the other hand, some DFCs were making an appreciable contribution to the flow of institutional industrial finance on a medium-or long-term basis. This was particularly true of IDBI (Israel), BNDE (Morocco) and SNI (Tunisia). Also, these and other DFCs occupied a prominent place in the financing of the import component of investment. ICICI was an important supplier of foreign exchange for private sector industry in India, as was TSKB in Turkey. A growing role is not to be expected in all cases; a declining role is not necessarily a sign of weakness. Indeed it may be argued that there is merit in creating competitive institutions, or in spinning off specialised institutions, when a DFC begins to have a very large quantitative role in the economy.

INNOVATION AND PROMOTION

The record of DFCs should be judged not by their financial contribution but also by their impact on the thinking, working habits, and attitudes of their clients and of the business community generally. The major innovation development banks have tried to introduce is the technique of project formulation and appraisal. The idea that investment proposals should be spelled out in considerable detail (engineering blueprints, production schedules, financial projections) was a new one in many business communities. Many industrialists had never before been exposed to questions of this kind and DFCs faced considerable resistance when they tried to obtain answers. In some cases, industrialists did not have the answers, simply because they had not thought about the proposed investment systematically or because they were unfamiliar with modern accounting methods. In other cases, industrialists felt that, by asking all these

questions, the DFC was casting doubt on their projects, undermining their credibility, and threatening their standing in the business community. Still other industrialists feared that, by passing on detailed information to the DFC, they would be revealing business secrets to potential competitors and financial information to the tax collector. Despite these difficulties, many DFCs have succeeded in bringing home to their clients the virtues of careful project formulation and appraisal. In doing so, they have helped industrialists to overhaul accounting systems, to analyse systematically the implications of proposed business decisions and to apply modern forecasting techniques. They have managed to win the confidence of their customers and to establish a relationship of mutual respect.

These innovations in business behaviour cannot be attributed solely to the efforts of the DFCs. On the contrary, they were in any event being brought on by the increasing technical complexity of modern industry and by the associated demand for more sophisticated management. Moreover from every country young men were going abroad for study of the various disciplines that make up business management, and schools of business management were being set up in many developing countries. Nevertheless, DFCs were in a good position to give a push to these new trends; for, having command of often scarce financial resources, they were able to tie adoption of new techniques to the provision of finance.

Some of the DFCs, but regrettably very few, have played an entrepreneurial role by promoting new enterprises. Some, too, reacting to the demands of economies growing more complex and sophisticated, have begun to promote the establishment of new financial institutions and mechanisms.

FINANCIAL VIABILITY OF DFC CLIENTS AND DFCs

Through the application of project analysis, DFCs and their clients were able to ascertain whether or not proposed investments made sense from the standpoint of technical feasibility, business risks, and financial profitability. This systematic screening partly explains why the bulk of industrial and other investment associated with Bank-supported DFC operations has proved to be financially viable. (Another factor, which must not be forgotten, is that governments often established conditions in which failure was difficult: low

interest rates, other grants and concessions, little or no external competition, little internal competition.) The record shows that most DFC clients were profitable and that there were relatively few cases of structural failure. This means that at least gross errors in investment were avoided. Money was spent, as planned, on construction and equipment. Factories did not collapse; machinery was found to be suitable for the planned operation; there was enough money to install the fixed assets, to purchase materials and to pay wages; once production started, the goods could be marketed. These happy sequences should be compared with many cases of infructuous investment resulting from the attempt to implement half-baked projects in a haphazard manner.

The financial profitability of firms which borrowed from DFCs associated with the WBG is borne out by the satisfactory collection experience of these intermediaries. By and large, they have succeeded in rolling over their loan portfolio and serious arrears have seldom assumed dangerous proportions. If it is agreed that the large expansion in the financing provided by these DFCs is a considerable achievement, then the good collection record should be viewed as an even bigger accomplishment. It means that these DFCs have conducted business in the framework of financial discipline.

A satisfactory collection experience is only one element in the generally strong financial position of most DFCs associated with the WBG. This is not the place to survey the mix of financial policies followed by DFCs. Suffice it to say that the DFCs associated with the WBG have behaved prudently. They have avoided overextending their borrowing capacity, have satisfactorily managed their protective reserves, and have followed well-considered dividend policies. In some cases, the DFCs enjoyed enough financial success, or gave sufficient promise of adequate returns, to enable them to obtain additional funds from private sources.

Weaknesses in the Record

The strong financial showing of DFCs and the financial success of their clients are comforting. But this is only a limited demonstration of good performance. At least three important questions might be raised about the performance of DFCs. First, profitability may be a misleading index; for the profitability of DFCs might be based as much on the incentives extended

to them by their governments and on the fact that they were dispensing a severely rationed commodity (i.e. foreign exchange loans on a medium-or long-term basis) as on managerial and technical acumen. Second, in the case of their clients, the financial returns earned by DFCs might reflect the hot-house atmosphere in which industrialisation sometimes takes place, masking inefficiency in production through high protection and other subsidies. Thirdly, the question can be raised whether the activity of DFCs has resulted in accentuating the inequalities of income and wealth which are characteristic of many of the economies in which they operate.

DEPENDENCE ON OFFICIAL FUNDS

The list of incentives extended by governments to DFCs is a long one: contributions to share capital, sometimes subordinated to other equity, tax holidays or exemptions, interest subsidies. However, perhaps the most important incentive is loans at interest rates well below the market price of capital. Such loans constituted more than 20 per cent of total resources deployed by 23 DFCs upto 1970; in five cases, the proportion was nearly 50 per cent or more. Most DFCs associated with the Bank Group in Asia and in Africa were given, when they came into existence, an injection of free or cheap, and subordinated, loan capital. The WBG recommended this (indeed, it was often a *sine qua non*) as a one-shot stimulus, comparable to temporary protection or tax-relief given to infant industries.

In addition, governments have facilitated greatly the DFCs' task of raising capital from official international and bilateral sources, by guaranteeing these loans and sometimes by providing protection against foreign exchange risk. In more than a dozen cases, cumulative borrowing from the WBG constituted more than 20 per cent of the total resources available. Other official sources — the US AID, the German KfW, the French Caisse Central, the regional development banks (IDB, ADB, EIB) — occupy a prominent position in the overall resource picture of other DFCs.

Altogether, the vast majority of DFCs associated with the WBG remain heavily dependent on official funds, both national and international. Such funds account for 80 per cent or more of total resources available to 16 DFCs. Some of the institutions with this resource pattern have just got started, and the picture is, therefore, not surprising and need not cause concern.

But the group also includes some of the largest, the most experienced and the most influential DFCs associated with the Bank. The fact that these well-established institutions have been either unwilling or unable to reduce their reliance on official finance by mobilising funds on market terms is disappointing. A device which the WBG had proposed as a temporary stimulus has tended to become a way of life.

Many DFCs were operating within a government policy framework which closely circumscribed the opportunities for tapping private savings at home and abroad. Many governments remain wedded to a policy of raising savings through the budget, through government borrowing at relatively low interest rates, and through a system of credit control as well as statutory requirements. Rightly or wrongly, these governments believed that development programme ought to be financed on the basis of low interest rates, that the adverse impact of these low rates on allocation decisions could be avoided through administrative controls, and that voluntary savings were not responsive to interest rates. The foregoing notwithstanding, the policy climate in several countries was sufficiently permissive to allow DFCs some room for manoeuvre. Arrangements might have been worked out in some cases to raise funds on market terms. DFCs as a group have not lived upto expectations on this score: they have not showed significant capacity to devise resource mobilisation schemes and they have made little attempt to influence government policy. DFCs have naturally accepted the flow of concessional government finance. They have taken the easy route which, to be sure, was at least in their short-run interest, rather than face the pressure of living in the market.

EFFICIENCY OF DFC PROJECTS

The second point, that the financial success of DFC clients is no assurance that these enterprises have yielded adequate developmental benefits, reflects a growing concern about the industrial policies of many developing countries. Even the ardent advocates of the policy of protection and import substitution have expressed dismay at the results achieved during the past 20 years. For example, Raul Prebisch — the former Secretary-General of ECLA and the first Secretary General of UNCTAD — wrote in 1951 that an import substitution strategy was necessary to assure the development of primary exporting countries operating on the periphery of

the world economy. By contrast, his recent writings tend to be much more circumspect and much more conscious of the limitations of protectionist strategy. Our associate, Bela Balassa, has spelled out the imperfections and the costs of pursuing such policies through an examination of the situation in seven countries. [The structure of Protection in Developing Countries, Baltimore, 1971 page 72.] His point is not so much that import replacement is a bad idea or that a policy of protection is objectionable. He is emphasising, rather, that in reality the measures taken correspond to no rational design and that the structure of effective protection tends to be arbitrary. Frequently the magnitude of incentives enjoyed by a firm is unintended, and reflects simply the piecemeal and chaotic character of the decision-making process.

Given these distortions in the cost-price-profit mechanism in many developing countries, financial calculations are not a reliable guide for assessing the merits of projects from the standpoint of society. High profits may be the result of the fact that a ban on imports of the goods produced by the project results in an abnormally high domestic price. The project may be grossly inefficient in design, the management may be slack, the raw materials used in the project may be inexpensive—and yet, the enterprise may earn attractive profits. On the other hand, a project which is financially weak may turn out to have considerable developmental merit, if the sale price of its output is close to the international price, while the raw materials it must purchase have to bear high tariff and/or excise duties.

Little is known at present about the economic characteristics of investment financed by DFCs. We do know that the great majority of these institutions do not, or at least did not, analyse the social costs and benefits of projects before deciding to finance them. Therefore, we cannot dismiss the fear that DFCs may be supporting projects which are financially attractive but which contribute to wasteful import substitution. Even projects which are export-oriented are not wholly immune to the criticism. Few projects cater exclusively to foreign markets; exports can be made at a loss, provided this is a condition for operating in a highly lucrative home-market. Some governments have balanced the incentives on the side of import replacement by a set of subsidies for exports.

It would be instructive to carry out a systematic cost-benefit analysis of projects that constitute the portfolios of

DFCs. We can only speculate about the results of such an analysis. It will, no doubt, identify projects of questionable merit which depend heavily on the government's policy framework for their financial viability. However, we would be very surprised if the analysis demonstrated that economic returns on DFC projects were negative or low all across the board. What we expect to find is a scatter of developmental returns—some high and others low. This is in fact the preliminary result of the first of a series of intensive examinations which the WBG is making of the portfolios of some of the DFCs associated with it. In that first case, we concluded that the large majority of projects financed by that DFC have economic rates of return in excess of 30 per cent. Even when account is taken of the minority of projects with unattractive economic returns, it seems most unlikely that the aggregate rate of return for the portfolio as a whole is lower than about 25 per cent and it may well be considerably higher.

An ex-post analysis of the economic pay-off of DFC financed projects will be valuable. The question arises whether such analysis should also be performed before DFCs take operational decisions on specific loan requests. If the effort is made to evaluate projects in this manner and if there is a wide divergence between financial and economic returns, how should DFCs react? They can hardly be expected to support economically attractive projects which are financially untenable; indeed the likelihood is that they will receive few applications of this kind. The real dilemma will arise in cases where financial returns are unsatisfactory. On this more later.

IMPACT ON INCOME DISTRIBUTION

Thirdly, there is the question whether DFC investments have enhanced, or at least have not counteracted, the skewed income distribution generally prevailing in developing countries. Again, it is important to appreciate that this concern reflects a recent change in thinking about development policy. Not so long ago the emphasis was on building a momentum in investment and production and on doing this as efficiently as possible. It did not matter whether the primary participants in this process were big or small industrialists, whether they were located in the relatively developed capital city or in the hinterland. It was expected that there would take place in due course a diffusion of income throughout the economy. This automatic "spill-over" could be strength-

ened through the fiscal mechanism; taxes and public expenditures could redistribute incomes as desired by government. The experience of the past 20 years has not borne out this view of the political and economic process in many developing countries. Inequality of income and wealth seems to have increased both in terms of personal and regional distribution. Therefore, according to the new view, "efficiency" should be the only criterion for planning investment and production; considerations of income distribution must be introduced at the investment planning stage.

How does this new perspective relate to DFCs and their operations? These financial intermediaries are active in the modern industrial sector consisting of relatively large and relatively capital intensive units. DFCs were structured and encouraged by governments and by the WBG to deal with such enterprises. Inevitably, their operations have had immediate and direct benefit for, at best, the upper quarter of the population in the income pyramid. In this sense, the operations of these DFCs may have accentuated the dualism characteristic of many under-developed societies. DFCs associated with the WBG are not equipped to grapple directly with the problems of the rural poor or the destitute in urban areas; a very different kind of institutional mechanism would be necessary to deal with these groups.

Nevertheless, even within the relatively narrow sphere of DFC operations, the distribution question does arise. It may take the following forms:

- to what extent do DFCs facilitate social mobility by helping new entrants into the entrepreneurial class?
- to what extent do they help small industrialists to expand their operations and to rise in the social hierarchy?
- to what extent do they promote economic activity in the relatively under-developed regions of the country?
- to what extent do they assist local industrialists in negotiating with foreign parties and thus increase the chances of securing equitable arrangements?
- to what extent do they influence the factor proportions incorporated in project design so as to raise the share of wage income in total value-added?

On the basis of available information, it is not possible to assess with assur-

ance the performance of DFCs in respect of these five questions. New analysis is required to sharpen our appreciation of DFC performance in this area; the intensive examination of the activities of some of the DFCs associated with the Bank, referred to earlier, should in due course help provide answers. Nevertheless, it is probably fair to say that with respect to these questions the majority of DFCs have played a relatively passive role. They have "responded" to loan applications, and most of these came from well established business houses in big industrial centres rather than from the ranks of potential entrepreneurs or small-scale industrialists or sponsors in backward regions. DFC policy orientation and management style, both much influenced by WBG thinking, have not encouraged dealings with new or small businessmen, located outside the main centres and have no doubt discouraged such businessmen from approaching the DFCs. For example, a number of DFCs do not lend for amounts smaller than a stated sum, which is generally much larger than is relevant to small-scale enterprise. Many DFCs are reluctant to extend term loans in local currency. Such a posture has a special significance for borrowers who may need to purchase locally manufactured capital goods rather than imported items. DFCs naturally attach much importance to the financial strength of a borrowing firm, for a healthy cash flow from the firm's present operation reduces substantially the risk undertaken by the DFC in financing an expansion. This is a sound business reason for DFCs to prefer lending to well-established and already profitable concerns rather than to small or new ones.

DFCs have not done much in the way of "promoting" projects, particularly projects involving small or new entrepreneurs. One reason is that such promotional work involves high administrative costs for the DFC per unit of asset creation. It is also likely that DFC assets in the form of loans to such groups will be much more risky than the rest of the portfolio. There is no financial compensation for these extra costs and risks, as most DFCs associated with the WBG charge a standard interest rate to all borrowers. Consequently, the search by the DFC for borrowers in this category would be unrewarding financially. This has been a crucial consideration underlying both the attitude of the WBG and that of the DFCs associated with it. Their premise has been that DFCs should aim at becoming "financially sound" institu-

tions with access to private capital markets and that governments ought to find other mechanisms for dealing with less well-established or small-scale business enterprise and with the development of the more backward regions of the country.

This premise has some validity. Nevertheless, DFCs are going to have to pursue policies designed to counteract the maldistribution of income and wealth, if they are to retain credibility as national development-oriented institutions. If DFCs were entirely private institutions whose operations were not influenced by subsidies or government privileges of any kind, this might not be necessary. But very few fall into that category. As mentioned previously, governments have subsidised and supported DFCs in a variety of ways. In turn, lending rates charged by DFCs are heavily influenced by the low-interest rate structure established by governments. New and small entrepreneurs which lack access to DFC finance must raise funds at very high interest rates from the unorganised money market, whenever official programmes for dealing with such groups are inadequate. These groups cannot therefore share in the privileges granted to the established industrialists through DFCs. Furthermore, lack of access to DFC finance frequently means that new or small entrepreneurs cannot share in the subsidy to procedures of industrial goods provided through the system of protection against imports.

Suggestions for Improving Future Performance

One point which stands out in the preceding discussion is the sheer impossibility of evaluating the developmental performance of a DFC without discussing the government's policy framework. This is true whether one is concerned with raising resources, using them for sound projects or improving the distribution of income and wealth. No doubt financial intermediaries can improve their developmental impact somewhat by carrying out internal reforms but really big leaps forward will not be possible except in the context of major changes in government policy. What constitutes appropriate government policy towards a DFC is also a large question. Much depends on a government's perception of its objectives, and how best they can be achieved. Governments which are disenchanted with the functioning of the market mechanism may decide to expand the network of physical controls and to rely

heavily on both productive enterprises and financial intermediaries in the public sector. Other governments may wish to substitute price signals for licences or quotas and to tap the initiative of private enterprise for achieving national objectives. In principle, it should be possible to devise taxes and subsidies so that, when a DFC maximises profit, it is also maximising social surplus. In practice, very little research has been done in this field and even less experimentation. Subsidies extended to DFCs by governments have been rather general in character; they have failed to bridge the gap between private and social welfare. Designing a more purposive set of penalties and incentives should be high on the agenda of development research.

In the rest of this paper, we shall focus on three aspects of the policy and procedures of DFC themselves: the role of economic analysis, an approach to administrative costs, and the need for continuing critical self evaluation.

ECONOMIC ANALYSIS

Few DFCs have had the capacity to conduct economic analysis during the past two decades. The great majority did not have a very clear idea of either the techniques or the meaning of economic analysis. No wonder then, that the appraisal reports of DFCs seldom devoted much space to this subject; usually one found the statement that a project fell within a branch of industry assigned priority in the national five-year plan, or projects were justified by saying that they would generate x new jobs or would expand exports by y . There was little appreciation that such absolute measures of economic benefits were too crude to be useful and that it was necessary to compare benefits with costs to obtain meaningful results. Only relatively recently have a few of the DFCs associated with the WBG acquired some of the basic tools necessary for evaluating the economics of projects.

The backwardness of many DFCs in economic analysis is scarcely surprising. The technical expertise required for such work is difficult to find. The position is no different in other financial intermediaries, most of the private business sector, or the vast majority of government ministries and planning departments. Indeed, even in the WBG debate continues on how best to determine the economic merit of industrial projects. It is seldom appreciated how small is the world-wide stock of professionals able to evaluate projects from

an economic standpoint in the context of developing countries. Moreover, DFCs have rarely felt the need for economic analysis. For, whether privately or publicly owned and controlled, they have felt obliged to accept the economic decisions of governments. The common view is that it is for the government to decide whether a project has priority from an economic standpoint; indeed, as a practical matter, many DFCs cannot finance projects unless they have obtained a licence or a permit or a certificate from some government agency. Why, then, should DFCs acquire capability in economic analysis?

Our view is that DFCs need a capability in economic analysis in order to play their double role as financial institutions and development agencies. In the former capacity, they are interested in building a balanced portfolio which avoids excessive exposure to various kinds of risk. One such category of risk, which has not received much attention despite its importance, is the risk of reversal in government policy which jeopardises the financial viability of certain projects. Devaluations and dismantling of quota restrictions take place swiftly, with dramatic repercussions on the liquidity, profitability and debt-servicing capacity of industrial firms. It is important, therefore, for DFCs to recognise explicitly and precisely the link between the financial condition of their clients and specific government policy instruments. This knowledge can be acquired through economic analysis of projects — during both appraisal and supervision — and should enable DFCs to avoid excessive exposure of their portfolios to the risks arising from the instability of government policy. This knowledge will also allow DFCs to devise contingency plans to facilitate the adjustment of their clients to changes in government policy. Sophisticated economic analysis might even produce a model to facilitate systematic study of the impact of alternative government policies on the cash flow of different categories of projects in the DFC portfolio.

DFCs associated with the WBG are not simply financial entities geared to the objective of profit maximisation, subject to a risk constraint. They are also committed to the goal of economic development. Their policy statements and Articles of Association voice this concern explicitly, although this general commitment has not always been translated into working procedures. In fact, they are not likely to be able to do so till they strengthen considerably their

economic staff. Once this happens, DFCs are in a position to perform three developmental functions: (a) help clients improve the economic design of projects; (b) reject projects with unacceptably low economic returns; and (c) contribute to the process of reviewing and reformulating government economic policy.

DFCs are already advising clients on the engineering and financial aspects of project design. If they have the necessary professional skills, DFCs can extend their advisory function to the economic sphere. The task of the DFCs in this context is to review the main features of the proposed project—capacity, product-mix, choice of technology, factor proportions — and to identify modifications which would increase efficiency. Some of these modifications will enhance the financial attractiveness of the project and should be acceptable to the client. For example, analysis may reveal that the sponsor will improve his financial prospect by reducing the diversity of the product-mix, increasing production runs for the remaining items and devising plans to sell a part of his output in foreign markets, taking advantage of government incentives. However, other modifications may make sense from the national economic standpoint but, owing to serious distortions in the cost-price structure, result in lower profitability for the firm. These changes in project design will encounter resistance from the client and DFCs will not wish to insist on these modifications. But they may take up these aspects with government in the context of a review of national economic policies.

No one will question a DFC's assisting its clients to improve project design from the economic standpoint. However, rejection of projects with low economic returns may leave a DFC with an insufficient volume of business, where there is such a sharp conflict between the interest of the institution and that of society, it is clear that fundamental changes are required in the government policy frame and possibly in the structure as well as orientation of the DFC. For example, instead of going ahead with projects submitted to it but which have questionable economic merit, the DFC can go through the painful and financially expensive process of identifying, formulating and promoting projects with acceptable economic and financial features. To do this may require a significant change in DFC policy and even this may prove insufficient in certain situations. However, we believe that the

constraints will not be so binding in economies where investment and income are expanding rapidly and where there is a sizeable entrepreneurial class. In these cases, rejecting an occasional project when there are clear economic grounds for doing so is not likely to jeopardise the financial viability of DFCs. The rejected projects will before long be replaced by other candidates for DFC support.

There is another aspect to be considered. Generally, governments have not questioned that right of financial intermediaries to reject applications on technical or business grounds. But governments may not take to the notion of DFCs rejecting projects exclusively on economic grounds, particularly if these projects have received government sanctions (and privileges) at an earlier stage. A confident government will not see a DFC's interest in the economic aspects of project selection as a challenge, but rather as a worthwhile initiative on which to build a collaborative relationship. Most governments recognise that, at the early stage in the project cycle at which they must decide to extend or withhold approval (in the form of licences or certificates), it is not possible to analyse fully the economic implications of the proposed investment. While certain strategic aspects (ownership, rough location, approximate cost, main inputs and outputs) will be known, government decisions cannot be based on detailed and specific estimates of the kind necessary for conducting social cost-benefit analysis. It is, therefore in the government's interest to encourage the DFC to carry out such an analysis at a later point in the project cycle and to reject investments which fail to qualify despite earlier government approval. Obviously, this kind of relationship cannot be established unless the government has confidence in the integrity of the criteria for economic appraisal of projects.

In conducting economic analysis at the project level, DFCs will acquire a detailed comprehension of selected aspects of government economic policy and of the difference it makes to business decisions. Such an understanding is seldom available in government ministries. Indeed, one of the aspects of policy-making which has impressed us is the extent to which it is a shot in the dark. Quite frequently decisions are made by people who have little first-hand knowledge of traditional business mores or the specifics of institutional arrangements in the market place. That is why it is easy for businessmen to make subtle adjustments

response to new policies which make their actual impact very different from what is intended. DFCs have an important advantage in the review of economic policy, precisely because of their intimate relationships with the business community. If, at the same time, they learn to communicate with planners and policy-makers, they should be able to play a distinctive role in evaluating policy proposals and in preparing public opinion for them.

ADMINISTRATIVE COST

To upgrade the quality of economic work, DFCs will have to incur additional administrative costs. The corresponding benefits will accrue largely to clients, government and society at large. Similarly, to finance projects involving new or small entrepreneurs and backward regions, DFCs will have to incur additional administrative costs in the form of staff salaries, consultants' fees, travel, establishment of branch offices and general overheads. It will seldom be possible to recover these outlays to any significant extent, even though benefits to society might be significant.

Most DFCs, even government-owned institutions, think in terms of profitability. An object of their policy is to minimise administrative costs per unit of output or to maximise the return on assets and on capital invested. It is difficult to fault this policy. For the financial integrity of a DFC is generally judged by, and its access to new resources is generally related to, its capacity to service debt and its ability to pay a return on its capital. This is certainly true of most of the DFCs associated with the WBG. Moreover, the steady diminution of administrative outlays per unit of output is generally considered to be one of the tests of efficiency of management.

And yet, this policy towards cost of operation greatly oversimplifies the situation of a DFC. For one thing there is no easy way of measuring the "output" of an intermediary institution. The usual practice of equating this "output" with the amount or number of commitments made by a DFC during a year can be quite misleading. At one end of the spectrum may be a loan which involves the bare minimum of intermediation. This will be the case when the DFC is simply responding to a fully worked out request from a well established, reputable, industrial firm which needs little technical assistance at any stage of the project. At the opposite end of the spectrum may be a case in which the DFC conceives the invest-

ment idea, formulates the project design, promotes the venture and plays an important part in its execution. The point is that DFC "output" can be a mixture of pure finance, technical guidance and entrepreneurial activity in different proportions. A DFC which has a large measure of technical assistance (and/or entrepreneurial activity) in its total operation is likely to show high administrative costs per unit of finance extended. And yet this is not necessarily bad so long as the operation is conducted efficiently in terms of the performance of individual tasks. We need to develop better ways of judging institutional efficiency than just looking at administrative costs per unit of finance extended. This co-efficient confuses the question of efficiency in the technical sense — the avoidance of waste, the building of optimum organisational forms, the establishment of proper incentives and penalties — with the much larger strategic issue of what kind of intermediation is required in a particular socio-economic setting.

If the profit of a DFC diminishes as a result of a decision to develop economic analysis and to finance smaller entrepreneurs or underdeveloped regions, its creditworthiness and its capacity to raise resources may be affected adversely. If, on the other hand, a DFC's staff and activities are limited to those needed to carry out a banking function strictly conceived, real questions arise about its capacity to achieve its developmental objectives. In this perspective, higher administrative costs are not necessarily bad and lower costs are not necessarily praiseworthy. Much depends on what the DFC is trying to accomplish and how efficiently it is going about its task.

There is thus a close relationship between these very different facets of DFC performance, between administrative costs and achievement of underlying objectives. Owners (government or private shareholders), boards and managements, need to consider carefully whether expectations about these facets of performance are internally consistent. Thus, for instance, the simultaneous goals of reducing DFC dependence on concessional official borrowing and the social desirability of expanding finance to new or smaller entrepreneurs might be untenable if government imposes a low-interest rate regime. However, there might be less tension between these two objectives if higher financial charges for attracting private savings and higher costs of intermediation for high risk borrowers

could be passed on to DFC clients in the form of higher lending rates. Alternatively, government might offset these increased costs through a system of selective, carefully calculated subsidies.

SELF EVALUATION

It was noted at the outset that DFCs are institutions which should be capable both of affecting and of being influenced by society, and of devising indigenous solutions to local problems. The perception of these problems and the importance assigned to each varies from time to time. DFCs learn from experience, and experience colours the way in which they define their problems and try to deal with them. Indeed, to be effective, DFCs must periodically re-define their tasks in the light both of their experience and of changing national values.

Of course, adaptation as a result of experience is a natural process. It is also a slow, osmotic process, more akin to the process of absorption than to the process of active learning. The latter calls for an explicit decision and deliberate effort. It is, moreover, much more characteristic of individuals than of institutions.

A DFC learns from its daily activity. Its profits decline one year; and it asks itself why this has happened and it tries to take steps to prevent recurrence of the experience. It has a follow-up system which monitors the performance of its clients. If it is a good system, the information acquired is not simply used to keep its finger on the pulse of its clients; it is also fed back into the appraisal and decision-making process, so that the experience of yesterday's investments is made available for tomorrow's appraisals. A DFC learns to adapt to the expectations (even shifting expectations) of its creditors. Whether it is well or poorly managed, any financial intermediary inevitably learns from its experience in these and other ways; such learning stems from the daily struggle to survive. Certainly the DFCs associated with the WBG have done so.

But this is not enough. What is also needed is a continuing testing and evaluation of performance against the underlying objectives and policies of the DFC, and a periodic reconsideration of those objectives and policies in the light of changing national objectives. Even a purely private enterprise — if it is a dynamic one — will try to judge the drift of society and to adapt its operations accordingly. The more so a DFC, whose objectives are funda-

mentally developmental. Yet few, if any of the DFCs associated with the Bank have instituted mechanisms for continuing and systematic critical self evaluation; neither their Boards nor their managements seem yet to have appreciated the significance of the pro-

Self evaluation is an important instrument of management. Costs and conformity to objectives are the twin standards by which a manager can evaluate his company's performance. They will certainly be the standard by which creditors, governments, and, in most cases, shareholders will evaluate the performance of the manager and the institution. If self evaluation is to be effective, it cannot be simply the activity however regular, of an "external auditor", whose report is periodically submitted for management or Board inspection. It must be built into the procedures and decision-making processes of the DFC, at all levels. Staff as well as management should participate in this re-examination. DFCs start with an innovative purpose but there is the danger that the sheer struggle to survive will dilute initial enthusiasm. Unless management is vigilant and staff is highly motivated, there will be the temptation to fall in with traditional ways of doing things. A systematic examination of past activity will provide the opportunity for reflection and institutional renewal.

Self evaluation should involve, not simply the testing of performance against original objectives and policies, but also the reconsideration of those objectives and policies with respect to their appropriateness to the future. There is merit in stability, but risk also. An institution that looks only to the past, that considers only justification of its historical record, is not likely to have much of a future. Its future will depend as well on reorientation, when circumstances call for it, to a changing environment. Thus a DFC established in the Fifties, before tourism was found to be the dynamic sector it has become in many countries, and which deliberately excluded hotel financing from activities, might in the Seventies find good reason to change its policy. Or, a DFC which deliberately focused on financing import substitution has reason to reconsider its emphasis as the economic structure changes, new trading opportunities emerge and government policy evolves.

In short a DFC should periodically ask itself:

- What has been its developmental impact?
- What have been the internal institutional constraints which have limited its developmental impact, either in mobilising or in allocating resources? Have the

critical factors been DFC policy, quality of leadership, organisational structure, quality of staff, access to information, or what?

- What have been the environmental constraints which have limited the DFC's developmental impact?
- What can be done to ease the internal and external constraints?
- Does the changing environment call for change in the institu-

tion's objectives or policies? Asking and answering these questions and acting appropriately, will help assure a dynamic institution. Yet, neither the answers nor the action can be allowed to undermine the financial integrity of the DFC. Finding out and pursuing the right line between developmental dynamism and financial integrity is the delicate, yet crucial task which gives development bank management its peculiar challenge.

ADMINISTRATIVE STAFF COLLEGE OF INDIA

announces

The Tenth Seminar on MANAGEMENT BY OBJECTIVES

at Bella Vista, Hyderabad,
from September 3-8, 1973.

OBJECTIVE. Management by Objectives is a top management planning and control approach to improve performance of both the individual executive and the enterprise. The primary objective of this brief and intensive seminar is to provide deep understanding of this approach and to help the top executives develop commitment for Management by Objectives based on proper understanding.

CONTENTS: The Seminar will cover all the elements of Management by Objectives, including the setting of corporate and unit objectives, strategic planning, action planning, improvement of managerial performance, management job description, performance review, management development, problems of implementation and role of management adviser.

ELIGIBILITY: This is a top management seminar designed for the executives of the private and public sector enterprises as well as the Government. Only chief executives and top executives directly reporting to the chief executives will participate in this seminar.

PROGRAMME DIRECTOR Dr. B. L. Maheshwari.

FEE: Rs. 2000/- per participant. This will cover tuition, boarding and lodging, and educational material for the seminar.

LAST DATE: Completed nomination forms along with fees should reach the College by July, 23, 1973.

For brochure and nomination forms, please write to or contact:

The Programmes Officer,
Administrative Staff College of India,
Bella Vista, Hyderabad-500004.

Telex: Hyd. 015-390

Industrial Concentration by the Managing Agency System in India, 1948-1968

Arabinda Ghosh

This article examines the extent of control by firms under managing agencies since India's independence in 1947. By taking this long sweep of years, it hopes to shed some light on the direction of structural change that occurred in India's 22 major industries during 1948-68.

Also, the division of these industries into the traditional and the relatively newer engineering and chemical groups would enable us to examine the role played by firms under managing agencies in the context of economic growth.

THE managing agency system dominated the industrial scene of India for more than a century. With the establishment of the 'agency houses' in the early days of the East India Company and then later development into full-fledged managing agencies, the system worked to the overall benefit of India — when capital was shy and risky, when issue houses and finance companies were generally absent, and when indigenous entrepreneurship was virtually non-existent. It was the managing agencies which floated new firms, undertook the initial risk, raised the necessary capital, brought efficiency into production, and exercised firm and stable control over management.¹ In short, the managing agency system served a unique and historic role in the industrialisation process of India.

With the passage of time it has been found that the system, due to its inherent conditions, has become an anachronism, the main source of abuses, and a major stumbling block in the speedy industrial development of India. After much discussion and inquiry spanning the last two decades, the law was eventually promulgated for phased abolition of the managing agency system. Today the large industrial houses, either through managing directors or through a chairman on the board of directors or simply by putting family representatives on the board, nevertheless maintain control over the large firms in India. With the abolition of mostly small one-firm managing agencies, today it is the erstwhile large managing agencies that remain conglomerate in nature and dominating the major industries in the private sector.²

In this article we examine the extent of control by firms under the managing agencies since India's independence in 1947. By taking this long sweep of years we hope to shed some light on the direction of structural change that occurred in India's 22 major industries during 1948-68. It is our belief that this study, encompassing the entire

two decades, could assist in future policy discussions. Also, the division of these industries into the traditional and the relatively newer engineering and chemical groups, would enable us to examine the role played by firms under the managing agencies in the context of economic growth.

EXTENT OF CONTROL BY FIRMS UNDER MANAGING AGENCIES, 1948-68

In Table 1 we have calculated the percentage changes in both the number and asset-size of firms under the managing agencies during 1948-1968. We find that the percentage of numbers and assets of firms administered by managing agencies had decreased in the majority of industries. In 15 of the 22 industries under study, the percentage of firms under the control of managing agencies had decreased significantly — i.e., by more than 5 percentage points — whereas in 12 industries, the percentage of industry assets under the managing agency firms had decreased by more than 5 percentage points. In 8 industries the decrease in firms was 20 per cent and over, while the decrease of assets at 20 per cent or more occurred in 7 industries.

Increases in numbers and assets of firms controlled by managing agencies took place only in three industries, namely, rubber, organic chemicals, and dyes. In both organic chemicals and dyes, there had been no firm under the managing agency system — these industries being virtually non-existent in 1948, and growing significantly only after the launching of the Five-Year Plans. In dyes, about half of the total assets came under the control of the managing agencies in 1968; by contrast, in organic chemicals, it was insignificant. In the rubber industry alone during 1948-1968, the percentage increase in the number of firms controlled by managing agencies was quite high (27 percentage points) while in asset-size, the percentage increase was less steep (14 percentage points).

In 7 of the 22 industries, the per-

centage of assets of firms under the managing agencies remained virtually unchanged between 1948 and 1968 while the percentage of firms under the managing agencies changed little in industries only. Drugs and pharmaceuticals and synthetic textiles industries showed slight percentage changes. The role of managing agencies, measured both in numbers and asset-sizes, in a majority of the engineering industries (4 out of 6) the firms under managing agencies showed little change in the percentage of assets, while in number the change was over 20 percentage points during 1948-1968. In cotton textiles, the drop was about 20 points in assets whereas in numbers the percentage had increased slightly.

Finally, in all the 5 'traditional' industries (i.e., industries which had been developed before India's independence in 1947 and where the hold of managing agencies was the strongest), namely cotton, jute, paper, cement, and sugar, firms under managing agencies, there was a significant decline both in industry shares of number of firms and asset size. With the exception of cotton textiles, the decrease was more than 1 percentage points in number, while in asset size the decrease was more than 5 points in all five industries — for cotton and sugar it was near 20 per cent. For the industries which were developed after 1948, namely, the engineering and chemical groups, in 4 out of 6 engineering industries, and 3 out of 6 chemical industries the percentage of firms under the managing agency system dropped significantly.

Table 1 does not reveal the fact that most of the large managing agencies held a number of firms in the same industry, thus seriously undermining chances of competition among them. In Table 2, we have computed the multi-firm holdings of a single managing agency in each industry during 1948-1968. Thus, in 1948, 1 out of 22 industries had this multi-firm control by large managing agencies, while in 1968 the number rose to

man.
magnetic,

MAFATLAL GROUP

MAFATLAL GROUP

19 — or about 86 per cent of total industries covered. The maximum concentration of multi-firm holdings by large managing agents was in three traditional industries in India, namely, cotton, jute and sugar for both 1948 and 1968. In the cotton textile and sugar industries, more than 30 per cent of total firms were held in 1948 by 24 and 8 managing agencies, respectively, while in 1968 the percentage decreased to 25 per cent with virtually no change in the number of managing agents controlling these firms. But the percentage of assets held by these agencies in these two industries changed differently during 1948-68. While in cotton textile industry it rose from 41.19 per cent in 1948 to 48.48 per cent in 1968, in sugar it fell from 39.92 per cent in 1948 to 27.28 per cent in 1968.

For the jute textile industry, the percentage both in number and assets controlled by the multi-firm managing agencies remained virtually unchanged during 1948-68 — about 70 per cent of total assets and 66 per cent of number of firms. There was a slight decrease in total number of managing agencies in this industry in the 1948-68 period. In the other two traditional industries — paper and cement — the change was different. While in paper there was no multi-firm managing agency in 1948, there arose three such agencies in 1968, controlling 16.2 per cent of the number of firms with 51.34

TABLE 1 : HOLDINGS OF MANAGING AGENCIES IN 22 INDIAN INDUSTRIES, 1948-1968

Industries	1948		1968

per cent of total assets. In the cement industry, only one managing agency with two firms controlled 53.56 per cent of total assets in 1948, while in 1968 two agencies with five firms controlled 18.86 per cent of total assets — a fall of about 35 per cent in assets.

The engineering industries were relatively new and growing parts of the economy in India. Tools and instru-

ments and electrical engineering industries had no multi-firm managing agency in 1948; in 1968 an average of 23 per cent of assets were found to be controlled by such managing agent. In automobile and ancillaries, mechanical engineering and metallurgical industries, the percentage of number of firms and assets controlled by managing agencies increased significantly.

between 1948 and 1968. In industrial machinery, the number of multi-firm agencies increased by one but the percentage of assets held fell sharply from 33.34 per cent to 21.27 per cent. For the chemical industries, none had a multi-firm managing agency in 1948, but in 1968, 4 out of the 6 industries were so controlled. Thus in 6 out of the 22 industries, the percentage share of assets held by multi-firm managing agencies rose significantly during 1948-68; in 4 industries it fell off, with the share remaining constant in only one industry. The multi-firm control by managing agencies spread to 7 industries in 1968, whereas in 1948 it was non-existent in these industries.

In Table 3, we have listed the largest firms in 22 industries under the control of managing agencies for both 1948 and 1968. In 14 industries, the largest firm belonged to a managing agency in 1948; the number rose to 15 in 1968. In 4 industries, all 8 of the largest firms were under managing agencies in 1948. This went down to 3 industries in 1968. In total, in 8 industries in 1948, 7 of the 8 largest firms were controlled by managing agencies; this declined to 6 industries in 1968. In the traditional industries, like cement and vegetable oil, all the largest 8 firms were controlled by managing agencies in 1948; in sugar and paper the largest 7 were so controlled. By 1968, the role of managing agencies had declined in jute, cement vegetable oil and sugar. In paper and cotton textile 7 of the 8

largest firms were controlled by managing agencies in both 1948 and 1968.

Thus, as shown in Table 3, the role played by the managing agencies is of paramount importance because of their control of the largest firms in most industries. In every industry, other than rubber, fertiliser, and plastic chemicals, the managing agencies held more than 4 of the 8 largest firms in 1948; in 1968, in only 4 industries did they hold less than 4 of the largest 8 firms. In 6 industries the number of largest firms belonging to managing agencies remained constant throughout this period. Only in glass and drugs and pharmaceuticals did the number decrease significantly in 1968. In rubber, fertiliser and dyes, the number of largest firms held by managing agencies rose considerably during 1948-68.

DYNAMIC CHANGES IN MANAGING AGENCY FIRMS, 1948-68

In order to examine the structural changes in firms controlled by managing agencies during 1948-68, we have computed Table 4 to describe shifts in these managing agency firms. Only in the cotton and vegetable oil industries were the governmental and other internal pressures successful in substantially lessening the managing agency control. In cotton textiles, 57 firms or 42.53 per cent of total firms controlled by managing agencies went out of the system, while in vegetable oil it was 9 firms, or 47.36 per cent of total firms existing

in 1948, that had abolished such control. In 6 industries, like jute, cement, industrial machinery, electrical engineering, alkalies and allied chemicals, and fertilisers, decontrol policies met with moderate success as more than 20 per cent of managing agency firms terminated this kind of management by 1968. In 5 other industries, like paper, sugar, tools and instruments, mechanical engineering and metallurgical industries, the success was much less pronounced as seen in the small percentage of firms going out of the managing agency system by 1968.

But to assume that the vigour and ability of the managing agencies had diminished significantly during 1948-68 would be mistaken. As seen in the last two columns of Table 4, a considerable proportion of new firms (i.e. firms coming into existence after 1948) came under the control of managing agencies. This was largely a development for new firms, as the number of firms that existed without a managing agent in 1948 but had one in 1968 were insignificant. In 4 industries, the percentage of new firms under managing agency control were 50 per cent or over, while in 5 industries it was 40 per cent or over in 1968. In 9 industries, the percentage stood at more than 20 per cent, while in 2 industries it was over 10 per cent in 1968. Thus, in almost all industries, a significant number of new firms came under the control of the managing agency system, with the exception of the cotton and jute textile industries. In synthetic textiles and rubber industries, the percentage of new firms under managing agencies was highest, being 75 and 77 per cent, respectively, in 1968. In cement, metallurgical, alkalies and fertiliser it was around 50 per cent of new firms. Thus, the hold of the managing agencies shifted somewhat from old established firms to new firms launched after 1948, and established, initially financed, and managed by mostly old managing agencies.

The strength of the hold of managing agents on the firms they controlled could be seen by the small number of firms where the managing agencies had changed. In each of 5 industries, only one firm changed hands, and there was no change at all in 11 industries during these two decades. Only in cotton, jute and sugar were there numerous changes of managing agencies, and this was in part due to the fact that old British managing agency houses had left India in the aftermath of India's Independence.³ The industries where the number of managing agency firms had decreased

TABLE 4 : INTER-TEMPORAL CHANCES IN MANAGING AGENCY FIRMS IN 22 INDUSTRIES, 1948-1968

significantly were typically old industries, and reflected the fact that old British managing agents had left India, the control of managing agency being terminated thereafter. It is apparent, therefore, that in most industries once a managing agency acquired the control of a firm, it was able to maintain it successfully throughout the period of our study (1948-68).

Although there were many managing agencies, and of these most were one-firm family-held agencies, it was the large multi-firm managing agencies which played the dominant part in most industries. If we examine the frequency distribution of firms controlled by managing agencies, it is seen that a handful of large managing agencies actually dominate the industries in which they operate. In Table 5, we have divided firms controlled by managing agencies into 6 size-classes, size being determined by assets of firms in terms of rupees. The first thing that strikes us is that the distribution of assets among firms under managing agencies is highly skewed. While the lowest size-class had only 0.39 per cent of total assets of all firms under managing agencies in 1948 with over 11 per cent of firms falling in this class, the largest size-class with 1.26 per cent of total firms possessed 25.88 per cent of total assets in the same period. The largest percentage of firms belonged to second

lowest size-class (45.43 per cent), but again had controlled only 6.90 per cent of total assets of managing agency firms. The largest two size-classes actually controlled more than 75 per cent of assets while consisting of only 16.72 per cent of the total managing agency firms in 1948.

This pattern of skewed distribution is more pronounced when we compare it with that of 1968. The largest size-class in 1968 had more than doubled its share of assets controlling about a third of total assets of firms under managing agencies. In the lowest size-class, there was a sharp decrease in the percentage of firms, commanding an insignificant proportion of total assets. That the average firm sizes had increased during this period is quite evident, in that, in all four larger firm-sizes the percentage of firms belonging to these groups increased from 16.40 per cent to 36.26 per cent during 1948-68, controlling about 85 per cent of total assets under managing agencies in 1968. It is thus clear that the operation of a large number of managing agencies did conceal an extremely unequal distribution of assets of firms under these agencies and that it was only 96 large firms, controlled by a few managing agencies, that held more than four-fifths of total assets of all firms under managing agencies operating in 22 Indian industries in 1968.

CONCLUSIONS

Our study has shown that the percentage of firms and their asset sizes under the control of managing agencies had declined in 15 of the 22 industries covered during 1948-68. In traditional industries, like cotton, jute, paper and sugar, the shares held by firms under managing agencies declined significantly in this period. When we take multi-firm managing agencies into account, we find that 11 or half of the industries covered were subject to this multi-firm holding by one or more managing agencies in 1948, while the number rose to 19 industries by 1968. The percentage share of assets held by multi-firm managing agencies rose significantly in 6 industries, fell off in 4, and remained constant in one; by 1968 an additional 7 industries were characterised by multi-firm holdings by managing agencies.

With the exception of cotton and jute industries — the traditional bases of the managing agency system — a significant number of new firms came under the control of managing agencies. It seems that the hold of the managing agencies had shifted from old established firms to the new entrants, launched after 1948 and managed by the managing agencies. Also, the managing agencies had changed hands among themselves in a very small number of cases. It is thus apparent that in most industries, once a managing

TABLE 5 : FREQUENCY DISTRIBUTION OF FIRMS UNDER THE CONTROL OF MANAGING AGENCIES ACCORDING TO ASSET SIZE, 1948-1968

Size Class*	1948			1968		
	No of Firms under Managing Agencies	Per Cent	Per Cent of Assets	No of Firms under Managing Agencies	Per Cent	Per Cent of Assets

agency acquired the control of a firm, it was able to maintain the hold through the period of our study. As to the size-distribution of firms under the control of the managing agencies, we find that the distribution was extremely skewed — less than 17 per cent of total managing agency firms in the 22 industries controlled more than 75 per cent of the total assets in 1968.

Appendix A

DATA SOURCE

The principal source of data used in this study is Kothari's "Economic Guide and Investors' Handbook of India", published since 1945 under various names like "Investors' Encyclopaedia", etc.⁴ It contains data on paid-up capital, reserves, and other information for all joint-stock companies as compulsorily registered with the Ministry of Industries, Government of India. This main source of data was supplemented by various stock exchange manuals, like the Madras, Calcutta and Bombay Stock Exchange year books, in order to obtain the necessary additional information for each public-limited company in the industries covered. Except for agricultural processing and cottage industries like rice milling, wheat flour milling, biscuit-making, fruit-processing, soap, matches, and starch manufacture, we have taken all other industries in the Indian Census of Manufacturing Industries (CMI), which had a total of 29 industries. Together, the 22 industries we have covered constitute over 80 per cent of the total manufacturing activity in India.

The dependence of our study on Kothari's "Handbook" will not bias it unduly as the data are quite comprehensive and the coverage in most of the industries is more than 90 per cent. This is also not the first time that Kothari's "Handbook" is used for empirical

investigation in India. Andrew Brimmer in his 1955 study on the role of the managing agency system in India used Kothari's "Handbook" where 1,064 companies were classified under 17 industries.⁵ Brimmer also noted that the publicly registered joint stock companies are responsible for the bulk of the output in these industries. The National Council of Applied Economic Research in its study on the managing agency system compiled data from Kothari's "Handbook" and divided companies into 'traditional' Indian industries like cotton, jute, sugar, paper, and cement.⁶ L C Gupta, in his discussion on the ownership of stocks in Indian industries, also used Kothari's "Handbook".⁷ It is thus apparent that many important studies on Indian industrial structure had relied on data collected by Kothari. This is mainly because Kothari's is the only source available in India where data on individual firms in the organised private sector is given.

We have taken the joint-stock companies in our industry totals. This is

mainly because balance sheets of joint-stock companies are the only data on industries which are available on continuous basis. Almost all major studies on Indian industries have used this source. Hazari, Mehta, Lokanathan, Nigam and Chaudhuri, Bain, etc had to use these data on joint-stock companies.⁸ Reliance on Kothari does not inhibit our study seriously. Of the 22 industries we have selected, all fall in the organised sector where floating of a firm as a joint-stock company has been the usual practice. For example, the coverage by joint-stock companies in cotton, jute, sugar, paper, and cement was 83 per cent, 85 per cent, 92 per cent, 80 per cent, and 90 per cent, respectively, during 1963-64.⁹ In engineering and chemical industries, the percentage of firms outside joint-stock companies was quite low, as pointed out by the Industrial Licensing Policy Inquiry Commission.

The size of a firm is measured here in terms of 'net assets' or 'capital assets' (i.e., paid-up capital plus general

reserves), and are the basis for the measures of concentration. Its use is justified by its being the only available source, and probably not the least useable of the several measures of size. Among its limitations, as Adelman had pointed out, are difficulties in using assets as a measure during periods of appreciable price changes.¹⁰ However, all other measures possess limitations of greater or lesser degree. Moreover, some comforts can be drawn from the fact that all the measures show very high correlations among themselves, as Rosenbluth has demonstrated.¹¹ Since we are mainly concerned with the relative change in firm size, any general change in price level will not unduly affect the relative position of firms.

We believe that by taking 'net assets' we will avoid the pitfalls of taking paid-up-capital alone, or physical assets. Taking both paid-up capital and reserves as net assets or capital assets give us a better yardstick of a firm's net worth which shows changes with the economic condition of the firm.¹² Our position may be summed up best by the words of Collins and Preston: "...assets have been used in most of this kind because of their availability, and because of their significance as an index of ability to engage in economic activity."¹³

Bulk packaging for pharmaceuticals?

And they render traditional pharmaceutical packaging methods obsolete! For STYRON offers you advantages that are hard to beat:
It's cheaper than tin and doesn't dent or corrode. It's as hygienic as glass but is unbreakable and weighs only a quarter as much. So though it is a little more expensive, the amount you save on breakages and transport costs, more than makes up for the initial investment in the long run. You can mould it, colour it and print it any way you want and adapt it to your

current filling methods. It's versatile. So apart from bulk containers for powders and pills, it's good for medicine spoons, measuring cups, droppers, a wide variety of caps and closures, ampule boxes with perforated trays to transport injection ampules safely, and for practically anything else you care to mention. So whatever your packaging problem, the chances are STYRON can solve it. Just get in touch with our Polychem Technical Service for FREE advice and technical literature.

The Telengana Peasant Armed Struggle, 1946-51

Mohan Ram

Over 20 years ago, Acharya Vinoba Bhave launched his bhoodan movement at Pochampalli, a village in Telengana where communists had carried on an armed struggle for five years around an agrarian programme. Bhoodan was to be the sarvodaya answer to the communist challenge on the land problem and was meant to achieve what legislative action was not expected to do.

The minuscule peasant revolt in Naxalbari (1957) was a reminder that neither the sarvodaya approach nor the legislative process (in which communists had begun participating after abandoning the tactic of armed struggle) had solved the agrarian problem in India. There have been many Naxalbaris since.

The Maoist perspective in the Indian communist movement, which began with the Telengana struggle, has resulted in an extra-spectrum trend which rejects the parliamentary system and seeks to achieve the people's democratic revolution through people's war linked to an agrarian programme. The re-emergence of the Maoist trend in the Indian communist movement marks the return of the "Telengana line".

The 25th anniversary of the Telengana armed struggle last year found the Indian communist movement indulging in polemics on the nature and significance of the struggle. The main controversy was over the circumstances attending the withdrawal of the struggle in 1951. This article seeks to place the 'Telengana line' in perspective with particular reference to its relevance to the split in the Indian communist movement in 1964 and again in 1968.

THE Telengana peasant armed struggle was the first independent trend in the Indian communist movement. Communists of the Telugu-speaking tracts of south-central India, now Andhra Pradesh, organised and led it, often in defiance of the central leadership of the Communist Party of India and of the international communist movement.

Until 1953, the Telugu-speaking people lived in a contiguous area, a part of which was in the erstwhile Hyderabad state, a multilingual entity, and another in the erstwhile Madras Presidency (later Madras state), also a multilingual entity. The Telugu districts of Madras state were constituted into the Andhra state in 1953. The Andhra state, together with the Telengana region (as the Telugu districts of Hyderabad state were known) were grouped together to create the present Andhra Pradesh in 1956, breaking up the Hyderabad state.

The first communist groups came into being in Telengana in 1939-40. They were illegal and functioned through the Andhra Mahasabha, a mass organisation to promote the cultural and political interests of the Telugu-speaking people of the Hyderabad state. In 1943, the leadership of the Andhra Mahasabha passed into communist hands. From 1944 on, communists were organising militant struggles against landlordism and feudal exploitation.¹

The Communist Party of India's zig-zags during the Second World War (the switch from the imperialist war to the people's war slogan in 1942 and the consequent support to the British war effort and the reluctance to support the demand for transfer of power) did not permit its Hyderabad unit to demand the end of Nizam's rule, the abolition of landlordism in the state and the implementation of a radical agrarian programme. A change in the CPI's policy, coinciding with the post-war upsurge in the country, enabled the local unit to plan more radical and more militant struggles.

In Telengana, the contradiction between the mass of the peasants and feudalism was most advanced in 1945-46. The peasant movement was initially organised around simple demands against eviction and oppressive feudal exactions but it quickly escalated when it met with the combined repression of the landlords and the Nizam's governmental machinery. Peasant resistance to the attacks of organised hoodlums, police and the Nizam's military took the form of armed clashes which eventually were to swell into a movement for the overthrow of Nizam's rule.

STRUGGLE AGAINST NIZAM

By mid-1946, the movement had acquired the characteristics of a national liberation struggle to free the people from the rule of the Nizam and the

feudal order. In the adjoining Andhra area (i.e., the Telugu districts of Madras Presidency) the CPI had an efficient organisation and a well-trained cadre but in Telengana it was not so well established and the people of Telengana had no tradition of political participation. Yet the CPI found itself leading an armed struggle in Telengana that was to last five years.²

The Telengana region had been under a medieval feudal monarchy while the Andhra area was directly under British rule and had the ryotwari land tenure system. The contradiction between the peasants and the landlords had become very sharp in Telengana while it had been blunted in the Andhra area. Secondly, the nationalist movement in British India had been led by the national bourgeoisie, whereas in Telengana the communists were in effective control of the small nationalist movement.

Finally, the decision of the Nizam to refuse accession to India after Independence (1947) placed him in direct contradiction to the new Indian government. This factor made it possible for the communist-led movement in Hyderabad state to take on the character of a national liberation struggle, with the support of the national bourgeois leadership of the rest of the country, until Indian forces marched into the state to force its merger with the Indian Union.

In 1946, the Hyderabad state unit of the CPI began campaigning for an interim government in the state as the intermediate step towards breaking up the multilingual unit and merger of the various linguistic areas comprising it with the respective linguistic areas outside. This was the genesis of the Andhra communists' slogan of 'Visalandhra' (an extended Andhra) to unify the Telugu-speaking people into a single, unilingual state. In the Andhra region, the CPI campaigned for an anti-feudal, democratic programme around the slogan of "People's Rule in Visalandhra" at the 1946 general elections³ and launched a limited struggle in the area to link up with the upsurge in Telengana where the Andhra Mahasabha had become a united mass organisation of all the anti-Nizam forces.

When the British formally announced in June 1947 their decision to abdicate power in the subcontinent, the CPI found itself confused about the meaning of the transfer of power to take place on August 15. It settled for a non-class approach to the Congress leadership that was to take power from the British as a result of a compromise. At the inaugural meeting of the Cominform in September, Zhdanov made his famous speech characterising the world as being divided into two hostile camps and calling on communists to lead movements to oppose the imperialist plans for expansion and aggression.⁴ Indian communists misread this to mean that in every non-socialist country the bourgeoisie had gone over to the camp of Anglo-United States imperialism and this new alignment of forces had created two camps in irreconcilable conflict in everyone of these countries. So India's independence was branded fake. Indian communists went further than Zhdanov and embraced the views of Eduard Kardelj, a Yugoslav participant at the Cominform meeting. Kardelj had argued that democratic and socialist revolutions must "intertwine" and communists must attack not only the big bourgeoisie but the bourgeoisie as a whole. Adopting this Titoite line, the CPI concluded that India was already a capitalist country (and not a semi-feudal, semi-capitalist one) and that the party should intertwine the two stages of revolution into a single stage through an attack on the entire Indian capitalist class. This was the essence of the party's thesis at its second congress in February-March 1948. It was a swing from right opportunism to left sectarianism.⁵

The Andhra communists had already taken the Telengana peasant movement

to the level of partisan armed struggle. "Telengana means communists and communists mean Telengana" thundered B T Ranadive, the party's General Secretary-to-be at the second congress which deposed the reformist P C Joshi. The Telengana armed struggle was a few months old and it was not until the Telengana delegates had attacked the failure of the new political thesis to realise the "revolutionary significance" of the struggle to the "present epoch of maturing democratic revolution in India" that the new leadership appeared to support the struggle seriously. The second congress called for similar struggles in other parts of the country and for working class movements in support of Telengana, all ultimately leading to armed insurrection. The new albeit formally, because it might hasten the working class general-strike-cum-armed-insurrection which it had banked upon in the post-war revolutionary situation.

ANDHRA THESIS

In May 1948, Andhra communists challenged the second congress thesis and its reliance on the general-strike-cum-insurrection weapon. The Andhra thesis said that the Indian revolution, in many respects, differed from the classical Russian Revolution and that it was to a great extent similar to the Chinese Revolution. The perspective should therefore be that of a dogged resistance and prolonged civil war in the form of an agrarian revolution culminating in the capture of political power by the democratic front rather than a general strike and an armed uprising. Therefore, where a good proportion of the masses were with the party (in Andhra, Kerala and Bengal) it was time to think in terms of guerilla warfare (the "Chinese way") against the military onslaughts of the Nehru government bent on liquidating the party. Armed guerilla resistance had to be developed in several parts of the country and these areas were to be converted into liberated areas with their own armed forces and state apparatus; later, towns were to be liberated by the armed forces from the liberated areas.

The Andhra thesis also advocated a united front, which included the rich peasantry and the middle bourgeoisie as the allies of the proletariat in the people's democratic revolution, and asserted that such a wide front of armed struggle could take shape under the leadership of the party and that the objective conditions for realising

these were fast maturing. Only prolonged armed resistance as in Telengana would bring about the needed situation.⁶

Andhra communists had invoked Mao Tse-tung's "New Democracy" to justify their strategy of a two-stage revolution in India. The new leadership of the CPI rejected the Andhra thesis but the significance of this episode has not been adequately realised in India or outside. The first recorded debate on the legitimacy of Mao Tse-tung's theories as part of Marxism-Leninism took place between the Andhra communists and the new CPI leadership. The ultra-revolutionary Ranadive, in his polemic against his country-cousins leading the Telengana armed struggle, suggestively bracketed Mao with Tito and Browder and denounced him as a charlatan ("some of Mao's formulations are such that no communist party can accept them; they are in contradiction of the world understanding of the communist parties," he said).⁷

While the CPI's understanding was based on a wrong interpretation of the Europe-centred Zhdanov line, the Cominform did not seem to have clear line yet for former colonies like India when Ranadive embarked on his anti-Mao polemic. The Chinese Revolution had not been brought to a end. It was not until 1950 that the Cominform endorsed the formulation of Mao's "New Democracy".

A Soviet academician, E M Zhukov advocated a four-class alliance in colonies and semi-colonies.⁸ A little later Academician V Balabushevich hailed the Telengana struggle as the "first attempt at creating people's democracy in India and the harbinger of agrarian revolution".⁹ This was vindication of the Andhra leadership's "Telengana line".

SUPPORT FROM CHINA

Support to the Andhra leadership came also from the Communist Party of China within weeks of the formal proclamation of the People's Republic of China (October 1, 1949). Li Shao-chi declared in Peking in November 1949 that "the road of Mao Tse-tung" was the path for other colonial countries and armed action was the main form of struggle whenever and wherever possible.¹⁰

A few days thereafter, an editorial in the Cominform journal endorsed the most crucial of formulations of Liu's declaration:

The experience of the victorious national liberation struggle of the

Chinese people teaches that the working class must unite with all classes, parties and groups, and organisations willing to fight the imperialists and their hirelings to form a broad nation-wide united front, headed by the working class and its vanguard... the Communist Party.¹¹

But when it came to the form of struggle, the Cominform mentioned China, Vietnam, Malaya and "other countries" as examples of how armed struggle was becoming the "main form of struggle" of the national liberation movement in many colonies and dependent countries. Then it listed Vietnam, South Korea, Malaya, the Philippines, Indonesia and Burma as countries engaged in armed struggle, but not India which was mentioned merely as a country with "sham independence".¹²

With the Cominform debunking Ranadive, the Andhra leadership found itself heading the party. Rajeswara Rao took over as General Secretary in May-June 1950. The Telengana line of peasant partisan warfare triumphed inside the CPI, but Moscow's intervention was to suppress this trend later.

The new CPI leadership worked out a political line which briefly meant:

(1) Rejection of the programmatic understanding of the second congress, subsequently elaborated in what was called the "Tactical Line" by the leadership;

(2) Rejection of the thesis of the single stage revolution, i.e., the intertwining of the two stages of the Indian revolution into one;

(3) Rejection of the idea that the entire bourgeoisie, including the rich peasantry, had become enemies of the people's democratic revolution;

(4) Upholding of the concept of the Chinese path for the Indian revolution which meant developing Telengana-type agrarian struggle extensively wherever possible.¹³

The new Central Committee, on June 1, 1950 highlighted the role of armed struggle for securing national liberation and claimed that preconditions for starting such struggles were already there. But this did not mean that armed struggle could be launched immediately anywhere and under any conditions. The accent was on armed guerilla warfare linked to an agrarian programme wherever the party's strength permitted it. The Central Committee pledged to extend the Telengana struggle to other parts of India. It wanted to put the party on the rails of armed struggle in the countryside and rebuild the movement

in the cities and working class centres on the basis of the new line and tactics.

ENTRY OF INDIAN ARMY

In the meantime, the entry of Indian armed forces into Hyderabad and the accession of the state to the Indian Union had created a new situation in the Telengana struggle areas. The Nizam's forces and the private army known as the Razakars had failed to suppress the armed struggle. But after the surrender of the Nizam, it was a military campaign (with 50,000 to 60,000 Indian troops thrown in) against the communists who had developed contiguous liberated zones covering 3,000 villages, complete with village soviets, people's courts and people's militia. A formidable modern army was fighting the ill-equipped squads. The guerilla squads retreated to the forests, leaving small groups behind to operate in the plains. The government tried a strategic hamlets plan similar to the famous Briggs plan in Malaya. They destroyed about 2,000 tribal hamlets in the forests and herded the people into concentration camps. This was part of the plan to isolate the guerilla squads from the tribal people inhabiting the forests. The guerillas moved to newer forest areas.

The correlation of political forces in Hyderabad state changed significantly with the accession of the state to India. Though the state Congress party and some other non-communist forces were not part of all-in front against the Nizam, each had fought his autonomy and there was sympathy for armed struggle even from the masses of the people. But with end of the Nizam's rule, this support was thinning.

The all-India leadership of the CPI was divided about continuing the armed struggle after the Nizam's accession to the Indian Union late in 1948. A section of the local party unit was also for withdrawal of the struggle.¹⁴ In fact, the present day CPI owns up the Telengana struggle only upto this point and regards the rest of it sectarian and dogmatic and little more than a terror campaign. It thinks the struggle should have been called off when the Nizam's rule ended.¹⁵

But the Visalandhra communist committee as a whole for continuing the struggle. The big gains of the Telengana peasantry, especially the one million acres of land distributed among them, had to be defended and not allowed to be snatched away. Secondly, the national and international situation

was favourable for armed partisan struggle. The Telengana struggle, the committee thought, was the beginning of the liberation struggle and it was demonstrating that the Indian revolution was more like the Chinese revolution than the Russian revolution. So the Telengana armed struggle continued.¹⁶

OPPOSITION WITHIN CPI

Opposition to the Andhra leadership and its new political line came not only from a group operating from the party headquarters in Bombay which included S A Dange, Ajoy Ghosh and S V Ghate, who had been released from prison, but also from the Communist Party of Great Britain. A letter from its Political Committee late in 1950 traced the CPI crisis to a perverse understanding of the Cominform journal's editorial (January 27, 1950). Armed struggle was not ruled out for India but the situation in the CPI and the country did not hold immediate prospects for such a struggle. The CPI could utilise all opportunities for legal activities and prepare for general elections (a whole year and more away!). The letter also called for a change in the CPI leadership because the Rajeswara Rao leadership had not been "democratically" elected (a veiled call for revolt against the leadership determined to continue the Telengana armed struggle). The solution to the party crisis lay in "full and unfettered discussion" (which meant armed struggle as a tactic should be abandoned formally). The most important references in the letter were to the CPI's failure to work out a policy on Korea, where the war was raging, and on the peace movement.¹⁷ This amounted to directing the CPI to step up pressure against Nehru's foreign policy.

This letter could not have been sent to the CPI without Moscow's clearance, if not a directive from Moscow. It was addressed to the Central Committee and was therefore not circulated to the ranks. But the Party Headquarters faction made it a point to circulate it three months after its receipt to exert pressure on the Rajeswara Rao leadership on the eve of the December 1950 Central Committee meeting, which reorganised itself as well as the Politbureau to provide representation to all the trends. The new leadership decided to seek the Soviet party's help in establishing political-ideological-organisational unity in the party.

According to P Sundarayya, one of the leaders of the Telengana struggle, differences in the CPI related to two

sets of issues. One concerned the programme — the class assessment of the transfer of power in 1947, the exact stage of the Indian revolution and the class strategy or alliance for it — and another to tactics the possible path of the Indian revolution — Russian or Chinese, the nature of the Telengana armed struggle, the different phases of partisan peasant struggle and the problem of equating these peasant partisan struggles with the armed struggle for political power, etc.¹⁸

Meanwhile the pressure from the British party continued. The directives were now explicit and positive, indicating a clear shift in the Cominform line and the Soviet foreign policy requirements. The directives came in the form of answers by R Palme Dutt to five questions on the Indian situation. The peace movement had to be stepped up against Anglo-United States imperialism and for the liberation of Asia. Nehru's foreign policy, it was not a "consistent peace policy" yet and Nehru's opposition to imperialism was "hesitant and limited", should be reappraised in the light of his attitude to the Korean war and to China's admission to the United Nations. Peace and freedom went together and India needed a "broad democratic front" from above on the basis of a common action programme for peace and independence. Finally, armed struggle was not the correct path for India for the present.¹⁹

Dutt elaborated this in an interview to visiting Indian communists. He said that as stated in his party's letter to the CPI, "ultimately the revolution in India will and must take the form of armed struggle. It is hardly to be debated". He had no idea of the exact situation in Andhra and could not say what would be the proper form of struggle there. But if the Andhra unit had adopted correct forms of struggle during the post-second congress period, the party should not have suffered any disruption there. "But from the reports we possess, this does not seem to be true. When on the top of it, the so-called experience of Andhra is applied mechanically to all over India where the conditions of peasant organisation and the strength of the party were both weaker than in Andhra, the result cannot but be disastrous", he said. Elaborating the concept of armed struggle, Dutt was insinuating that the Telengana struggle was little more than individual or squad terror. (Thereby he was endorsing the faction demanding its suspension.) Armed struggle, he said, was "the higher

form of struggle" and "must bear a mass character", as distinct from the terrorism of individuals or small groups. Again, armed struggle was a "higher state of mass movement, which therefore becomes the pre-requisite". Dutt's concern was with the peace movement because the cold war had replaced class struggle on the Cominform agenda to suit Soviet foreign policy interests. The peace movement presented the CPI with "one of the most important weapons for building a front of all sections of Indian people... If we recognise that the building of the National Democratic Front is the key task for the national liberation struggle, then it should be obvious that the broad front that will emerge out of the peace movement may lay the basis for the National Front for national liberation".²⁰

In sum, Dutt's advice aimed at persuading the CPI to give up the tactic of armed struggle at least for the moment and to seek the broadest possible united front for peace, while the task of building a national democratic front could wait.

SOVIET INTERVENTION

The British advice strengthened the faction opposed to the Telengana armed struggle, but the CPI crisis continued until a top-level delegation clandestinely visited Moscow early in 1951 for consultations with the Soviet party leadership. The CPI team comprised two Andhra leaders (C Rajeswara Rao and M Basavapunniah) who were directly leading the Telengana struggle and two leaders opposed to it (S A Dange and Ajoy Ghosh). The Soviet party commission comprised Stalin, Malenkov, Molotov and Suslov. The main conclusion on the issues concerning the programme were incorporated in the Draft Programme published in 1951.²¹

The draft said the state that came into being with the transfer of power was the same old imperialist state and the Congress government installed with the consent of imperialism had pledged to protect the British interests in India. It rejected the second congress understanding that the entire bourgeoisie including the rich peasantry were outside the pale of the people's democratic front. It recognised the possibility of winning over all the Indian bourgeoisie, barring some individuals and groups of big bourgeoisie. It rejected the theory of the intertwining of the two stages of revolution.

As for tactics, an accompanying document, "Statement of Policy".²²

said "neither only the Russian path nor the Chinese path but a path of Leninism applied to Indian conditions was the answer". Partisan warfare of the peasantry had to be combined with the other major weapon, that of working class strikes, the general strike and uprising in cities led by detachments of the working class. The statement stressed the leading role of the working class in the worker-peasant alliance.

The "Statement of Policy" was the legal or open version of a larger unpublished document prepared by the CPI team to Moscow. It was entitled "Tactical Line".²³ Parts of it were not included in the "Statement of Policy" and the omitted passages dealt with the elaboration of some of the theoretical issues and principles which provided the theoretical-ideological basis for the "Statement of Policy" and included details of the discussions between the CPI team and the Soviet party commission headed by Stalin.

Neither of the documents referred to armed revolution as part of the immediate programme. The "Tactical Line" cautioned the party against "premature uprisings and adventurist actions" and yet thought it wrong to lay down that armed struggle in the form of partisan warfare should be resorted to in every specific area only when the movement in all parts of the country rose to the level of an uprising. This was because the uneven levels of mass consciousness in a vast country like India would not permit peasant movements of the same tempo everywhere. On the contrary situations demanding armed partisan warfare might arise in several areas. For instance, when in a big and topographically suitable area the peasant movement rose to the level of seizure of land, the question of effective seizure and defending the land seized would become a burning one and "partisan warfare in such a situation, undertaken on the basis of a genuine mass movement and firm unity... if correctly constructed and led, can have a rousing and galvanising effect on the peasant masses in all areas and raise their own struggle to a higher level".

SWITCH TO PARLIAMENTARISM

The proximity of the general elections seems to have made it expedient for the new CPI leadership to withhold publication of the "Tactical Line". Through the "Statement of Policy" the CPI was trying to project the image of a party that had virtually abjured violence and was settling for

mentarism. The leadership feared that some of the formulations in the "Tactical Line" might prevent the party regaining its legality in states where it had been banned (Travancore-Cochin and Hyderabad). Another reason could be that a more explicit reference to the tactic of combining peasant partisan warfare with urban insurrection might provide the extremist elements in the party arguments for opposing the switch to parliamentarism.

The "Draft Programme" and the "Statement of Policy" formalised Moscow's decrees on strategy and tactics for India. The "Draft Programme" was published by the Cominform journal immediately after it was released in India and the "Statement of Policy" within a fortnight of its adoption.

Rajeswara Rao had already resigned as General Secretary and Ajoy Ghosh had replaced him when the Central Committee met in May 1951 to hear about the Moscow discussions. The May 1951 Central Committee meeting decided to call off the Telengana struggle and asked its Andhra members to ascertain from the partisan leaders whether they could hold on until the party negotiated with the government on the terms for withdrawal, which included the following: land in possession of the tenants should not be taken away to be handed over to landlords; all warrants against the struggle leaders should be withdrawn; all prisoners released; and the ban on the CPI lifted. The resolution made clear that the Telengana struggle was not started and was not being continued to overthrow the Nehru government, but to end feudal exploitation. It directed the newly-constituted Politbureau to review the Telengana problem and adopt all ways and measures to make the struggle successful.²⁴

Taking advantage of this resolution, the Ravi Narayan Reddy faction in Telengana and the party Headquarters faction at the all-India level launched a campaign for withdrawal of the struggle even before the terms of withdrawal could be secured, and to eliminate the fighting cadre from all levels of leadership. It began claiming that the Central Committee had already called off the struggle and that what was going on in Telengana was mere individual or squad terror. The open campaign by this faction forced the Politbureau to appoint a three-member negotiating committee. Ajoy Ghosh, the new General Secretary, even threatened to disown the struggle

Maddukuri Chandrasekhara Rao, an Andhra leader, retorted that in that case the struggle leadership would be forced to disown him and his leadership.

The struggle leaders were still talking to the partisan leaders in the forest bases when the government told the negotiating committee that declarations favouring withdrawal of the struggle were of no avail unless the leaders in charge of the struggle announced its withdrawal.

At the May 1951 Central Committee meeting, the Andhra members agreed that the struggle could not last long even as a partial partisan struggle in defence of land and should be withdrawn after securing the most favourable terms. They had supported the Central Committee resolution in this spirit. As Sundarayya rightly records, the dissensions that had plagued the party during the last two years caused "irreparable harm to the Telengana armed struggle". There was the vicious propaganda that the movement in Telengana was nothing but individual terrorism or squad actions and that there was no mass participation. The Central Committee's resolution was based on the new programme and a new tactical line, but in complete contradiction to it the Politbureau issued a public statement condemning individual terror and squad actions and this helped the slander campaign against the Telengana struggle.²⁵ Also, the releasing to the Press of the part of the Central Committee resolution expressing readiness for a negotiated settlement led the government to believe that the movement was about to collapse and the party was about to surrender. This hardened the government's position.

WITHDRAWAL OF STRUGGLE

Late in October 1951, A K Gopalan, on behalf of the Central Committee and the Andhra Committee, announced the withdrawal of the struggle. Though the government had rebuffed the negotiators, the CPI leadership was obliged to "advise the Telengana peasantry and the fighting partisans to stop all partisan actions" and to mobilise the entire people to rout the Congress at the general elections.²⁶

It was tame surrender because the party gave the peasantry no guarantee about protecting their hard-won gains. The withdrawal of the struggle meant surrender of all the guerilla zones and liberated villages to the Indian army,

was settling for parliamentarism.

The following agreed conclusions were drawn by the party about Telengana at the end of the struggle, according to Basavapunniah who was among its leaders:

(1) It is a crime to characterise the struggle as individual terrorism or squad terrorism.

(2) It was correct to have continued the Telengana armed struggle and guerilla struggle even after the Indian troops entered Hyderabad, and to defend land and other democratic gains, but it was not correct to have had as the aim "a people's liberation war for capturing political power and overthrowing the Central Congress Government".

(3) It was wrong to confuse or characterise every struggle of the peasantry or other exploited masses, whenever they are forced to use weapons, and especially peasant guerilla struggles, as the final revolutionary struggle or as the beginning of the final revolutionary struggle or as an intermediate part of such struggles.

(4) There was the danger of the movement degenerating into terroristic actions by squads and getting isolated from the masses. How long the armed peasant guerilla struggle should be continued, and when it should be withdrawn, depended on the ebb and flow of the movement;

(5) Stalin and the Soviet party leaders had said that it seemed difficult to continue the Telengana struggle further, that is, during the first part of 1951 and it was unfortunate that the Indian communist movement was not in a position to continue it. But they had left it entirely to the CPI to decide whether it should be continued or withdrawn;

(6) It was not possible to mechanically choose between the Chinese path and the Russian path and it was necessary to learn from the experience of both.²⁷

The struggle was called off late in October 1951, but the struggle leaders could explain what was virtually a *fait accompli* to the partisans in the forests only later. A conference of party leaders and guerilla fighters of the Amarabad forest region was held in the third week of November and it approved the decision to withdraw the struggle.

The underground leadership announced a reconstituted committee for Telengana with about 25 members drawn from the underground cadre as well as those released or still in prison. But General

ting the underground leadership, constituted an "Election Committee" and authorised it to function as the *de facto* State Committee. The underground committee asked the cadre to ignore this body except for election purposes. While the underground committee continued to guide the underground cadre, the Election Committee got the support of the open cadre. However, the underground cadre worked for the success of the People's Democratic Front through which the illegal party contested the elections.

LESSON OF THE ELECTIONS

Over 2,000 CPI cadres were still in jail when the elections took place. Over 1,000 were underground. The People's Democratic Front could run candidates in only 42 of the 98 constituencies in Telengana. The extent of the CPI victory is underlined by the fact 36 of the 45 candidates running under the PDF banner were elected. In addition 10 Socialist candidates that had the PDF's support also won. The Congress won 41 seats but 25 of these were located in Mahboobnagar and Hyderabad districts, where the PDF did not put up candidates. In the 'Red' district of Nalgonda, the PDF made a clean sweep of all the 14 seats; in Warangal, another 'Red' district, the PDF won 11 of the 14 seats; in Karimnagar it won 10 of the 15 seats. Thus 35 of the 45 seats the PDF won were located in those three districts where the CPI had conducted the Telengana armed struggle. Of the 2.5 million votes polled, the PDF got approximately a third, while the Congress, which had contested everyone of the seats, could only poll about the same proportion of votes. It was unmistakable that communist gains in Telengana were most spectacular precisely in those areas where the CPI had led the peasant partisan warfare or guerilla squad actions, inviting massive police and military repression. If the vote meant anything at all, it was a vindication of the Andhra communist line of Maoist armed struggle. It was convincing refutation of the vicious campaign that the Telengana armed struggle was isolated from the masses and was sectarian, anarchist and terrorist in character.

Even after the elections in January 1952, the cadre in Telengana continued to be divided. About 25 leaders, from the fighting areas as well as those in the open, met in February 1952 for a week to discuss the differences. Ajoy Ghosh, who attended the meeting

summed up the agreed conclusions and a united Telengana committee was formed to lead the movement.²⁸

The government's hunt against the underground squads did not stop even after the elections and arrests and prosecutions continued. The government's argument was that arms had not been surrendered and therefore the hunt could not be relaxed. As the logical step to the withdrawal of the struggle, the CPI decided to surrender arms.

The question here is: did the 1951 documents (on programme and tactics) warrant the withdrawal of the Telengana struggle? The present-day Maoist contention is that they did not and that the withdrawal was an act of betrayal by "revisionists" who wanted to take the party into the vortex of parliamentary politics by entering the 1952 general elections.²⁹ In their view, the Telengana armed struggle could have continued as a struggle to protect the gains of the peasantry, though not as a struggle for state power.

What followed the withdrawal was the quiet abandonment of the perspective of armed struggle because the party settled for peaceful constitutionalism, and eventually opted for peaceful transition to socialism.

One of the issues of controversy on the Telengana struggle is the Soviet attitude to its withdrawal. Rajeswara Rao, now General Secretary of the CPI, contends that the Soviet party and Stalin did not support the struggle until it was withdrawn.³⁰ But Sundarayya, the CPI(M)'s General Secretary, contends that the CPSU and Stalin thought that it was unfortunate that the struggle could not be defended or continued and that, therefore, the time had come for its withdrawal. It was, however, for the CPI leadership to decide when exactly and on what terms it should be withdrawn and how long it had to be continued to secure suitable terms.³¹

Whether the Soviet leadership supported the struggle till the end or not, its withdrawal had more than its tacit support.

CHINA'S ATTITUDE

Though the Communist Party of China now charges "Indian revisionists with betraying Telengana", it is silent on the Soviet and Cominform roles. An NCNA commentary on August 2, 1967 noted that for a long time the Indian communist movement had witnessed an intense struggle between two lines. The revolutionaries had

resolutely urged the seizure of power through armed struggle, that is, the path of the Chinese people, who were guided in their victories by Mao's Thought. "Some revisionist chieftains, however, feverishly pushed ahead with the revisionist parliamentary road resulting in doing tremendous harm to the Indian revolution." In 1946-51, base areas of armed struggle were established in Telengana where landless and poor peasants were aroused to seize land by armed struggle "and become the banner of the Indian people's revolutionary struggle of the time". The commentary said though the Indian revisionists described peasant armed struggles as adventurism and individual terrorism, the Telengana struggle grew under the radiance of Mao Tse-tung's Thought. In a party document in September 1950 and an open document in 1951, they villified the Chinese people's revolutionary war led by Chairman Mao and had put forward the theory of India's exceptionalism, hysterically preventing the Indian people from taking the road of Chinese revolution. Long after the Telengana "sell out" and after many setbacks the Indian peasants had realised the "futility of the parliamentary path and the need for armed struggle", it said.

It might be well to record here that there was even a veiled Chinese suggestion in June 1950 that the Telengana armed struggle might have been ill-timed. The timing of this suggestion (June 1950) is significant. The Andhra leadership had just taken over from B T Ranadive, but the Chinese party seemed to have some reservations about the Andhra leadership's line of peasant armed struggle. The suggestion came in the form of a reply to a reader from the editor of the *People's Daily*, the CPC's chief organ. After referring to communist peasant warfare in China, the editor declared that characteristics of the Chinese revolution "can under certain historical conditions become the common characteristics of all revolutionaries of other colonial and semi-colonial countries". He quoted from Liu Shao-chi's opening address to the Peking World Federation of Trade Unions conference on the desirability of armed struggle on the part of "many colonial and semi-colonial peoples" and from the Cominform journal's editorial of January 27. Quoting a statement by B T Ranadive (when he was the General Secretary of the CPI) fully endorsing the conclusions of this editorial and the lessons of the Chinese revolution as the infallible guide for

the CPI, the editor underlined the limited applicability of the Chinese example. It was in the nature of a warning to the CPI, against an unreserved acceptance of the Chinese model.

Armed struggle against imperialist aggression is essential for the liberation of many colonies and semi-colonies. But the time and place for conducting this kind of revolutionary armed struggle must be decided according to concrete conditions. It can by no means be conducted in any colony or semi-colony at any time without the necessary pre-conditions and preparations.³²

This, coupled with the absence of any critical comment on the withdrawal of the Telengana armed struggle later, suggests that the CPC had no objection to the withdrawal. According to Sundarayya, at no time between 1951 and 1967 did the Chinese say that the withdrawal was wrong "though they could have conveyed it on innumerable occasions when we had the opportunity to meet them personally. Once when we said in a mood of self-criticism that if we had had the correct understanding we could have retreated with much less losses and with greater gains, they told us not to stress that aspect but to bring forth the revolutionary significance of the fact that the Nehru government could not suppress a peasant partisan struggle even in a small part of the country."³³

GAINS OF THE STRUGGLE

The more important fact here is that the struggle was withdrawn and not defeated. It was the first armed struggle of the Indian communist movement over a wide area, resulting in a liberated zone of about 16,000 square miles covering 3,000 villages. For 12 to 18 months the entire administration in these areas was in the hands of village peasant committees. About 4,000 party and peasant militants were killed and over 10,000 communist cadres and others were thrown into prisons or detention camps for three to four years.

It was a revolutionary agrarian armed struggle to end the feudal order. The village committees in the liberated zones implemented the agrarian programme. Though this task could not be achieved completely, over 3 million acres of land was redistributed, forced labour was abolished, illegal extractions and feudal oppression of various types were ended. Evictions were stopped and a minimum wage ensured to agricultural labour. The struggle pushed the question of agrarian revolution to the forefront, compelling the

Congress to undertake land reforms.

It was a struggle for ending the autocratic rule of the Nizam and it contributed to achieving this objective. It was also a struggle for reorganising the states on the basis of language and it not only resulted in the eventual formation of a unified Telugu-speaking state but in the break-up of the Hyderabad state and the creation of other linguistic states (Maharashtra and Karnataka).

The Telengana struggle, as Sundarayya says, brought to the fore "almost all the questions concerning the strategy and tactics of the Indian people's democratic revolution for correct and scientific answers and realistic solutions".³⁴

Telengana divided the CPI until the armed struggle there was called off on the basis of the 1951 documents. But the origins of the 1962-63 Indian communist split can be traced to the difference over the Telengana line during its last two years. Sundarayya rightly observes that these differences crystallised into two hostile trends and those who opposed the struggle are by and large with the present day CPI while those favouring it went to the CPI(M). Though the CPI split synchronised with the international schism and was hastened by it, it did not represent a straight Moscow-Peking polarisation. The real ideological split in the Indian communist movement came after Naxalbari, in 1968.

Immediately after the 1952 selections, the CPI found itself divided in its attitude to the Congress party and its government headed by Jawaharlal Nehru. Should it fight the Congress all out or should it forge a united front with "progressive" sections to fight the "right reaction" which was growing inside the Congress and outside, was the issue. A united front would require support to Nehru's foreign and domestic policies against his critics both inside and outside the Congress party.

Soviet policies of the period had much to do with the CPI's dilemma. When, in the early 1950s, Nehru showed an anti-West orientation and sought closer ties, including economic aid, with the socialist camp, the Soviet Union supported India as a non-aligned ally in the peace front. The CPI backed Nehru's non-alignment policy without reservation because it served Soviet foreign policy interests. But the party remained divided on Nehru's domestic policies. Amidst the continuing CPI controversy, the Soviet leadership began seeing progressive features

not only in Nehru's foreign policies but also in his domestic policies. With this shift in the Soviet attitude, India became the pivot of Soviet policy for Asia.

SEEDS OF THE SPLIT

The CPI's 1951 programme had assumed that India was a semi-colonial and dependent country ruled by a big bourgeois-landlord government which was collaborating with British imperialism. This formulation now came under attack from a pro-Soviet section of the CPI which insisted that Nehru had abandoned collaboration with imperialism and had taken to peaceful co-operation and co-existence with the socialist camp. This group argued that India needed a national united front as the prelude to a government of democratic unity. Such a policy would require an emergency alliance with the Congress to resist the rightist offensive.

This line of thinking was to be developed later into a slogan for a "national democratic government". In December 1955, a few months before the 20th CPSU congress, the CPI General Secretary, Ajoy Ghosh, outlined a programme for "uniting with and struggling against the Congress" to build a national democratic front. This programme implied not only peaceful transition to socialism (a concept which was to be proclaimed at the 20th congress in February 1956) but also the concept of national democracy (proclaimed formally through the Moscow Statement of 81 communist parties in 1960). The CPI had thus anticipated two of the most controversial formulations which were later to be commended to the international communist movement by the Soviet leadership.³⁵ The same concepts became the major issues in the Sino-Soviet ideological dispute.

The Moscow declaration of 1960 described the national democratic state as a form of transition to socialism, especially in the non-aligned countries of the peace zone, in which the national bourgeoisie played an objectively progressive role and deserved socialist economic and diplomatic support. The national democratic state was one that had achieved complete economic independence from imperialism and was ruled by a broad anti-imperialist front that included the national bourgeoisie. The working class was to evolve as its leader only gradually. The concept of national democracy was a corollary to the concept of peaceful transition, and India was one of the countries of the peace zone where peaceful transition via the

Companies Legislation in India

Plea for a Rational View

Madan Gopal Jajoo

Legislation governing companies in India has possibly no parallel anywhere in respect of the frequency of amendments. The statement of objects of the latest Companies Act Amendment Bill refers to changes incorporated in the Companies Act of 1956 by the amending Acts of 1960, 1965 and 1969. There have been other amending Acts in 1956, 1963, 1964, 1966, 1967 and 1968. And even before the present amending legislation could complete the legislative circuit, proposals have been mooted for yet another amendment of the Companies Act. Company law administration in India evidently does not have much respect for the basic approach of the Jenkins Committee in UK which had pointed out that it was advisable "not to disturb longstanding provisions unless they have outlived their usefulness" and that "those who claim that the law should be altered should make out their case".

The statement of objects and reasons attached to the Bill cites as reason for bringing forward the Bill: "Cases of abuse or distortion of the system have of late assumed comparatively serious proportions." How far is this allegation in the statement of objects warranted by facts?

What is the precise nature of the alleged serious abuses? Why is there little significant public discussion of these abuses? In which respects are the existing powers (enlarged from 1956 to 1970) not sufficient to prevent these abuses or to take appropriate penal action against the offenders?

THE Companies (Amendment) Bill, introduced in Lok Sabha in August 1972, has been under consideration of the Joint Select Committee. It is rare for Parliamentary committees to come to the conclusion that the legislation under their scrutiny would not really serve a useful purpose. It is this writer's humble opinion that the Companies (Amendment) Bill, 1972, merits this dubious distinction.

The statement of objects and reasons of the Bill draws on the Report of the Jenkins Committee in the UK for a *prima facie* justification of frequent amendments to the Companies legislation. The Jenkins Committee was appointed in 1959 to review the experience of the working of the UK Companies Act 1948, i.e., about 12 years after the Act came into force. It presented its Report in 1962. Though its terms of reference were wide, it found it advisable to make 'selective' recommendations. Legislation to implement Jenkins Committee Report followed in 1967.

The Jenkins Committee observed in para 6 of its report:

"This elaboration of the law can generally speaking be fairly justified as having been found necessary in order to keep effective control over the growing and changing uses of the company system as an instrument of business and finance and the possibilities of abuse inherent in that system. It would be wrong in principle to disturb in any important respect longstanding provisions designed to serve these ends unless they have clearly outlived their usefulness or are demonstrably objectionable on other grounds."

The statement of objects of the Bill

conveniently cites a part of the above quotation: "growing and changing uses of the company system as an instrument of business and the possibilities of abuse inherent in the system" and overlooks the Committee's considered opinion in favour of not making frequent changes. Incidentally, it should be noted that the Jenkins Committee made this comment in the context of elaboration of law and not in relation to its frequent amendments.

FREQUENT AMENDMENTS

Evidently, company law administration in India does not have much respect for the basic approach of the Jenkins Committee, namely that it was advisable "not to disturb longstanding provisions unless they have outlived their usefulness" and that "those who claim that the law should be altered should make out their case". Legislation governing companies in India has possibly no parallel anywhere in respect of frequent amendments. The statement of objects of the Bill refers to changes incorporated in the Companies Act of 1956 by the amending Acts of 1960, 1965 and 1969. There have been other amending Acts in 1956, 1963, 1964, 1966, 1967 and 1968. Even before the present amending legislation could complete the legislative circuit, proposals have been mooted for yet another amendment of the Companies Act.

The statement of objects and reasons attached to the Bill cites as reason for bringing forward the Bill: "cases of abuse or distortion of the system have of late assumed comparatively serious proportions". This statement possibly takes a cue from the remark quoted

earlier from Jenkins Committee Report, viz., "possibilities of abuse inherent in the system". How far is this allegation in the statement of objects warranted by facts? What is the precise nature of the alleged serious abuses? Why is there little significant public discussion of these abuses? In which respects are the existing powers (enlarged from 1956 to 1970), not sufficient to prevent these abuses or to take appropriate penal action against the offenders?

Section 638 of the Companies Act 1956 has placed a statutory responsibility on the Company Law Board to lay before the Parliament every year a report on the working and administration of the Act. The last report (for the year ended March 31, 1971) was submitted in February 1972. Its perusal does not disclose any developments which may justify the statement that "cases of abuse have of late serious proportions". Nor does the latest Report (nor any of the earlier ones) make any mention of absence of adequate legislative powers which hamper the administration. The Report for 1970-71 says, apropos the inspections carried out under section 209(4) of the Act:

"These inspections enabled the Government to have an insight into the working of the companies belonging to big groups especially with regard to intercorporate investments and loans and advances, sole selling agency arrangements, distribution of managerial remuneration and payment of salaries for holding offices or places of profit to the directors and their relatives." "In conclusion, it may be pointed out that in as much as there was only a limited number of officers and staff available to the Directorate of Inspection and Investigation it was not pos-

national democratic state was possible.

The "national democracy" concept added a new dimension to the CPI's continuing struggle for a new programme to replace the 1951 document. As Nehru's domestic policies shifted to the right and tension grew on the Sino-Indian border, the attitude to the Indian bourgeoisie continued to be the central issue in the CPI debate which took a predictable form: national democracy versus people's democracy. The right-wing of the CPI, which had the Soviet backing contended that India's bourgeois democracy could metamorphose into a national democracy. It placed heavy reliance on Soviet aid as the instrument to secure national democracy. The left wing countered this by arguing that the bourgeoisie was compromising with domestic reaction and imperialism. Soviet aid, although necessary, was being used by the bourgeoisie to bargain for more aid from the West. Rival programme drafts were presented at the CPI's sixth congress and the split was averted only by the intervention of Mikhail Suslov, who headed the high level CPSU delegation to the CPI congress. Suslov, anxious to preserve CPI unity, managed to salvage the rightist line and to manoeuvre the congress into shelving the issue of a new CPI programme. The conflict continued behind the scenes until the CPI split in 1964, after which the CPI as well as what later came to be known as the CPI (M) adopted their own programmes.

Thus the factors underlying the 1962-63 split date back to the Telengana armed struggle and the differences over it.

The real significance of Telengana however lies elsewhere: it was the first application of the Maoist revolutionary model outside China even before the Chinese revolution had triumphed fully and China had proclaimed itself a people's republic. Over 20 years later, Naxalbari brought to the fore once again all the theoretical and ideological questions concerning the strategy and tactics of the Indian revolution but in a changed context: the international communist movement had split on issues of ideology and Moscow had ceased to be the sole centre of the international communist movement.

Bihar Alloy Steels

BIHAR ALLOY STEELS, which is setting up a project in Hazaribagh district of Bihar for the manufacture of alloy constructional steels, alloy tool steels and high speed tool steels, expects to commence operations of the plant before the end of May next. Construction of various factory buildings is in progress and machinery is expected to start arriving from July. The directors urged the government to declare Hazaribagh as a 'backward' district on the plea that the employment problem is very acute there. If it is declared a 'backward' area, its development would be expedited and the people would have more employment opportunities. Meanwhile, the company's project cost has gone up owing to virtual devaluation of the rupee twice *vis-a-vis* the various European currencies. Also, increases in import duties on machinery and various other levies on steel, etc, imposed in the last two budgets have added to the cost. The directors say that the exchange rates of various foreign currencies are still in a fluid state and that as soon as the exchange rates are stabilised, the revised project cost would be worked out and arrangements made to meet the shortfall.

TABLE 1: NON-GOVERNMENT COMPANIES AT WORK

	31-3-1959	31-3-1969	31-3-1971
I Companies Limited by shares			
Public Limited Companies	7723	6164	6443
Private Limited Companies	19653	21543	23655
II Companies Limited by Guarantee	1323	1188	1220
III Foreign Companies (section 591 of the Act).	572	564	543
	29371	29459	31861

sible to take up more companies for inspection, although a larger coverage was the target aimed at. Since the inspections are undertaken in the interest of better administration of the law, it is necessary that all the important companies in the corporate sector are inspected in the shortest possible time. To achieve this objective appropriate action to strengthen the Directorate of Inspection and Investigation by augmenting its strength at all levels especially in the Regional offices, was initiated."

There is no gainsaying that if it is administrative deficiency which accounts for ineffective action against abuses, then no amount of additional legislative sanctions will meet the stated objective.

It may be worthwhile to examine the available data to ascertain the nature and extent of 'cases of abuse'. The annual Reports referred to above contain statistics regards (1) complaints received by Registrars of Companies, (2) nature of defaults in respect of which prosecutions were launched against companies and/or their officers (3) cases where action was taken for investigation, inspection, protection of minority rights, etc, and (4) applications for approval of Government in respect of appointment and remuneration of managerial personnel and other discretionary powers vested in the Government. In considering this data it will be useful to note the number of companies at relevant periods (Table 1). Over a period of 10 years there was little increase in the number of companies; though, in the last 2 years there has been a small improvement.

The 1958-59 Report states that during the period of 3 years (April 1956 to March 1959) the Registrars of Companies received nearly 4,000 complaints from Company shareholders,

TABLE 2: COMPLAINTS RECEIVED BY THE REGISTRARS OF COMPANIES

	1968-69	1970-71
Mismanagement	194	231
Misappropriation	52	32
Fraud	24	20
Misappropriation of the funds of the Company	12	15
Technical offences (non-receipt of balance sheet, dividend warrant, notice transfer of shares, etc)	533	475
Other complaints	345	303
	1160	1076

employees and creditors. The allegations concerned mismanagement, misappropriation of funds, fraudulent dealings, manipulation and falsification of accounts, delay (or failure) in holding annual general meetings, non-publication of accounts, refusal to grant inspection of registers, etc. Recent reports furnish a breakup of the complaints as shown in Table 2. It will be seen that over the years, there has been a decline in the number of complaints. Moreover, a substantial number of complaints concerns defaults of a technical nature. This is corroborated by analysis of the nature of defaults in cases in which prosecution was launched (Table 3).

The number of prosecutions show a marked increase over the period 1958-59 to 1968-69; however, the increase in the number of prosecutions in the last two years is about proportionate to the increase in the number of companies at work. In any event, the larger number of prosecutions bespeaks of greater administrative vigilance and action rather than increase in dereliction of duty on the part of companies. One has also to take account of the elaborate procedural burden cast by the Companies Act 1956 and its numerous amendments which the smaller companies are not in a position to discharge properly. Lest this increase in the number of prosecutions evokes the usual complaint of failings of private sector, it will be instructive to read the following observations in the Report for 1970-71:

"The Company Law Board has also been impressing upon the management of the Government companies the responsibilities cast on them by the provisions of the Companies Act 1956, and the fact that in regard to compliance with these provisions the companies in the Public Sector stand on the same footing as companies in the Private Sector."

TABLE 3: NATURE OF DEFAULTS IN CASES OF PROSECUTIONS

	1958-59	1968-69	1970-71
Submission of Annual Returns	843	1264	1513
Convening Annual General Meeting	574	251	363
Submission of Annual Accounts	408	653	794
Filing of Balance Sheet with the Registrar	362	1858	2264
Filing of Statements pertaining to pending liquidations	201	112	140
Other requirements	107	450	451
	2495	4588	5525

"Consequent on the recommendation of the Administrative Reforms Commission the proposal to exempt the Government companies from the applicability of some of the provisions of the Companies Act 1956, which are considered to be superfluous and irksome formalities in their application to the wholly owned Central or State Government companies is still under the consideration of the Department."

Like the Government companies, most of the smaller private companies can lay equally justifiable claim to exemption from the same 'superfluous and irksome provisions'. It is non-compliance with these provisions which accounts for most of the prosecutions.

Mention has been made earlier of inspections of companies carried out under Section 209(4) of the Companies Act. There are other provisions of the Act which authorise the Government to carry out investigation into the affairs of a company. The Reports furnish data of investigations carried out under Sections 235 and 237, special audit of companies ordered under Section 233A, and investigation of cases of mismanagement or oppression of minority shareholders under Sections 397 and 398. The number of cases covered every year under all these heads for several years past has been less than 50; there has been no change in this to justify the statement that cases of abuse have assumed comparatively serious proportions.

DISCRETIONARY POWERS

Approval of the Central Government is also required in many other matters: e.g, presentation of the Balance Sheet in a form different from that set out in Schedule VI, exemption of branch offices from the provision of compulsory audit, etc. Other important provisions which require approval of the Central Government are appointment of managing directors or managers, remuneration of managing director, other directors or manager, making of loans to directors or other bodies corporate, amendment of provisions in the Articles of Association pertaining to directors, etc. The total number of such applications in 1970-71 was about 2,000. Though figures for earlier years are not comparable because of the abolition of

the Managing Agency system in 1970, it can well be said that there has been no significant increase in these applications.

Available data does not show how many of these applications were approved *in toto* or approved with modifications or rejected. However, assuming that a large number of the applications being received by Government for approval are either sanctioned with modification or are rejected, would this not bear out the contention that the companies making these applications are guilty of practices which are undesirable or result in distortion of the system? One can say without hesitation that such a conclusion would be far from correct. Take, for example, the case of a company making an application for approval of remuneration to its Managing Director. The Company Law Board may not wholly approve the remuneration proposed and advise reduced payment in some item of perquisite or remuneration. May be the company makes out a case for higher remuneration than that suggested by the Company Law Board and the latter relents; or the company accepts the Board's views. The relative provision in the Companies Act has been in force for 17 years; the Company Law Board (or its predecessor) has had different criteria to guide its decision in this matter. At all times, the administration has consistently held that for remuneration to be paid to managerial personnel each company's case has to be judged on merit and that it is not possible to reduce it to an abstract formula of universal application. Many of the other discretionary powers vested in the Government are decided by similar subjective judgments. None of these cases would support the charge of abuse of serious proportion.

Another reason mentioned in the statement of objects is the "distortion of the system". This phrase, though widely used in pseudo-economic discussions in India, has no precise meaning in the present context (and was probably used for this very reason). What is the nature of the system and how are distortions being caused to it? In the widest sense, the system would cover the whole economy. However, the corporate sector in India has no role in the agricultural sector (excluding the plantations), transport and public utilities or other infrastructure activities. With the nationalisation of major banks and general insurance, the private corporate sector's role in the financial field has also become insignificant. The private corporate sector's role is thus limited to the fields of industry and commerce, which are covered by a

host of statutory regulations: Industries (Development and Regulation) Act, Exchange Control, Import and Export Controls, Prices and Distribution Controls, Industrial Relations and Wages Regulations, etc. The Companies Act has but a limited function in this broad spectrum of regulatory devices.

NO ROLE FOR SHAREHOLDERS

The Jenkins Committee Report contains the following comments which are pertinent to the issues under study:

"The business corporation is a device for enabling an expert body of Directors to manage other peoples' property for them. Since these managers are looking after other peoples' money, it is thought that they should not be totally free from any control and supervision and the obvious persons who exercise some control are the persons whose property is being managed. Hence the basic principle adopted by British Company Law (and, indeed, by the laws of most countries) is that ultimate control over the Directors should be exercised by the shareholders."

"... [successive ... Committees have ...] made it their major concern to find means of making it easier for shareholders to exercise a more effective general control over the management of their companies."

"Another instance of conflicting considerations is to be found in proposals for giving shareholders closer control over their Directors. It may be theoretically desirable that shareholders should have a more effective voice in the management of their company's business of which they are ultimate proprietors. As against this no company's affairs can be managed properly, or indeed managed at all, otherwise than through a Board of Directors with a reasonably free hand to do what they think best in the interests of the Company. The risk (which must not be exaggerated) that dishonest directors may abuse the trust reposed in them must be accepted if business is to go on."

These are weighty considerations but, unfortunately in India, they have not found favour with the Government. On the basis of the historical experience upto early 1950s, the Government concluded that shareholders are not aware of their rights, or even if they are aware, may not exercise those rights effectively. Instead of educating the shareholders as to their rights and ways of exercising them effectively, the Government chose the alternative of vesting control over directors in the Government.

The inevitable result has been that the shareholders' role in the management of their companies is of no great consequence. In free enterprise econo-

mies, specialist financial institutions, securities (share-broker) firms and the financial press keep a vigilant watch on the working of companies. The bigger securities firms in the US (and Japan, UK, etc) have a sizeable staff of analysts who devote the whole of their time to study 25/30 companies each and keep abreast of the developments of the companies and the industries in which the companies operate. This in-depth study is an essential ingredient of correct appraisal of a company's past performance, current working and future prospects. The approach leads to knowledgeable discussion of various matters affecting the companies; this is in turn facilitated by the willingness of company managements to readily provide better information. It is an important factor in the dynamism of these economies.

By vesting authority in Government in many important matters affecting companies, we seem to have turned our back on shareholders' education and vigilance. In the USA or Japan a research analyst, a fairly capable executive, works continuously to acquire the necessary knowledge of the industry and the 25/30 companies he studies. Judgment of operational, management or investment policies of a company is based on this knowledge. It is not possible for the bureaucracy entrusted with the regulation of companies and having a bias towards procedural compliance rather than appraisal of performance to meet this purpose. If we are thinking of the proper functioning of companies in the economic system, in a broad sense, it is this aspect that should merit our consideration.

In the light of the earlier discussion one may well conclude that the *raison d'être* of the Companies (Amendment) Bill 1972 is not apparent from the statement of objects and reasons. A brief analysis of the proposed amendments attempted below, may throw better light on the objective behind the changes.

There are 39 clauses in the Bill. However, amendments of a substantive nature are 12. Clause 2 proposes *inter alia* new definitions to cover (a) the procedural requirements for acceptance of deposits from the public; (b) a 'group'; and (c) the nature of duties the Secretary of a company is to perform. The 'group' is the center-piece for amendment of the term 'same management' proposed by clause 3. This clause also proposes a definition of 'public financial institutions'. Pursuant to the policy that these public financial institutions will have a pre-

emptive right to convert a part of their loans into equity share capital, changes are being proposed in Section 94 of the Act (*vide* clause 9 of the Amendment Bill). Clause 5 of the Bill proposes amendment of the existing Section 43A of the Act which redefines the concept of a deemed public company on the bases of structure of shareholdings in both public and private limited companies, the paid-up capital and the turnover. Clause 6 provides that a company which wishes to accept deposits shall issue an advertisement which shall conform to the provisions of the Act in relation to the issue of a prospectus. Clause 10 of the Bill makes approval of Central Government necessary for acquisition of shares in public limited companies with paid-up capital exceeding Rs 25 lakhs if the shareholding proposed to be acquired exceeds 25 per cent of the paid-up capital. Similar approval will be necessary for transfer of equity shareholding if the existing shareholdings of the companies under the same management exceeds ten per cent of the paid-up share capital; and if the shares to be transferred are of a company engaged in an industry specified under the Industries (Development and Regulation) Act, the Government shall have a pre-emptive right to those shares. Under clause 13 every person who holds shares beneficially and every registered holder who does not have beneficial interest in the shares will have to make a declaration in respect of such shares.

PAYMENT OF DIVIDEND

Clause 16 stipulates mode of payment of dividend through a special dividend account; payment of dividends out of accumulated reserve shall be subject to compliance with such rules as may be framed for this purpose and vests in the Government dividends unpaid for three years. Clause 20 makes it obligatory for a company to obtain approval of the Central Government for re-appointment of auditors after their having held the appointment for a period of 3 years and for approval of government to the appointment of auditors in companies in which public financial institutions, nationalised banks or insurance companies or Central or State Governments or Government companies hold not less than 25 per cent of subscribed share capital. Similarly, under clause 23 reappointment of Managing Director has to be approved by Government even though there are no changes proposed in respect of remuneration, etc. Clause 24

provides that the Government may, if the demand for any goods is in excess of supply or production thereof, decide that appointment of sole selling agents will not be necessary; and that appointments of sole selling agent by a company having paid-up capital of Rs 50 lakhs or more may be made after approval by general meeting by a special resolution and the approval of the Central Government. Clauses 25 and 26 make approval of Government necessary respectively, (a) in cases of contracts entered into by a company with paid-up capital exceeding Rs 25 lakhs in which any Director is interested, and (b) appointment of Directors as legal or technical advisers or appointment of relatives of directors to offices of profit if the salary proposed to be paid exceeds Rs 3,000 per month. Lastly Clause 30 proposes amendment of section 408 so that Government may nominate more than 2 directors on the Board of Directors of a company in circumstances specified in the clause and further empowers the Government to issue such directions to the Board of Directors as it may consider necessary or appropriate in regard to its affairs. The Joint Select Committee surely has received many representations from the interests directly affected making detailed suggestions in regard to the amendments. This paper purports an examination of some of the changes from the viewpoint of an economist.

Firstly, two rather minor issues. One relates to the proposal for opening of a separate dividend account and regulation of payment of dividend out of accumulated reserves, etc. The avowed purpose is to prevent companies from "declaring dividends when no profits in the shape of liquid funds are readily available". The Companies Amendment Bill 1959 had a similar proposal for depositing the amount of dividend in Bank and the Joint Select Committee which scrutinised the 1959 Bill had rejected it. The proposal has been revived with a suggestion that profits can only accrue in the shape of "liquid funds". Why should only the profits being distributed as dividend be in the shape of liquid funds? All profits, whether current or past accumulated ones accrue not wholly or mainly in the shape of liquid funds but as additions to the various assets employed in the company's business. Conversion of the various assets into cash for expenditure (for materials or wages or dividend) is a function of the management. Within the constraints imposed by production facilities, market conditions and available financial resources, managements have to meet the

various liabilities including payment of dividend. Rather unusually, a company may not be able to pay dividend by the stipulated date. But there are instances of companies being unable to make wages or other payments also by stipulated date. If profits accrue in the shape of liquid funds, in which form do wages or payments for materials or taxes accrue? The suggestion that payment of dividend out of accumulated reserves is improper runs counter to the whole concept of equity share capital. Managements consider many factors before deciding on payment of dividend; one is the liquidity position of the company; another is the necessity of maintaining steady dividend. Most big companies have thousands of small shareholders who have an expectation of normal dividend return from their holdings. Apart from putting handicaps on effective functioning of managements, the amendment will not serve any useful purpose.

PROTECTION FOR THE MINORITY

The other amendment in this category is of section 408. The heading of the section reads: Powers of Government to Prevent Oppression or Mismanagement. It defies all logic that protection of the minority is not found feasible except by turning the majority into a minority. Irrespective of how the appointment is made, every director of a company is *inter alia*, entitled to full information on the affairs of a company; he has a right to inspect books of account and other documents. A nominee director, even if he and his colleague are in a minority, would be able to become fully familiar with the company's affairs and offer useful suggestions to the Board of Directors. The other directors can hardly afford to ignore suggestions made by the nominee directors if these are sound and in the interests of the company. Difficulties probably arise because the nominee directors are not happy about a restricted role and wish to enforce their views. It will be interesting to know the specific cases in which directors have proved ineffective. Even in these difficult cases relief is available through the court. It is in the interests of all parties that adjudication of the issues should be through the judicial process. Assuming there are some intractable cases the other amendment empowering the Government to issue directives should be sufficient.

Long-term deposits from the public (i.e., persons other than directors and their relatives) have been a special feature and an important source of

industrial finance in India. The Reserve Bank commenced regulating deposits by non-banking companies after 1964. The first notification in May 1964 asked for returns to be submitted periodically; then followed in January 1966 a stipulation regarding minimum period of deposit and after December 1966 another restricting the total quantum of deposits. The Reserve Bank has been thus well placed to deal with the problem; based on this knowledge, the Bank has made changes in the regulations from time to time. This regulation by Reserve Bank has been found satisfactory by all the interests concerned. It did not purport to provide complete protection to the depositors. The Companies Amendment Bill proposes to make acceptance of deposits more expensive; but it would not provide any better security for the depositors. The amendment stipulates that companies may accept deposits pursuant to an advertisement and that the advertisement shall comply with the requirements of a prospectus. The prospectus for inviting subscription to share capital is such a hoary institution in Company Law that it will be blasphemy to question its usefulness. However, it may easily be verified that in cases of a large number of new companies which have proved financially unsuccessful, the prognosis could not have been known by a study of the prospectus. There are many factors which account for success of an enterprise; in India these factors are more complex than elsewhere. A prospectus would be helpful only if malafide action of managements is the cause of the financial woes of a company. This is not the usual cause. If the objective is prevention of excessive borrowings it is effectively achieved by the Reserve Bank's existing directives. In any event, preparation of a prospectus, its printing and circulation would involve considerable expense which may be disproportionate to the amount of finance it may help to raise. A prospectus is related in point of time to the issue of share capital. In case of deposits it is likely to be impossible to achieve this correlation. In all these matters, small companies will be put to great hardships.

As noted earlier, the growth in the number of companies in the past 15 years has been slow. However the number of chartered accountants qualifying has been increasing rapidly. Possibly a few of the chartered accountants who pass may not find employment or work. As compared to chartered accountants, graduates of

engineering, social sciences or, recently, other technical faculties are having greater difficulties in finding jobs. The legal profession has always been overcrowded. Yet the suggestion that the older people in the auditing profession have a monopoly has not found an echo in other fields. On the analogy that a chartered accountant should not continue as auditor for more than 3 years, it might well be said that there should be similar changes in doctor or lawyer or architect, etc. Perhaps the Central Government might decree that all the Government contractors or suppliers should cease to do business with the Government after a period of 3 years! More seriously, what objective standards are proposed to be applied by Government in giving consent to reappointment of the same auditors after 3 years? Perhaps, the number of companies of which the firm acts as auditor, the size of the firm (numbers of partners or employees or both?) and the sizes of the companies audited may be thought to be relevant. Eventually, it might be a matter of subjective judgment. Or again, it may prove to be yet another case of applying an administrative ceiling, this time to the fees that an auditor's firm may earn. The obvious solution to the problem posed by the ever-increasing number of job seekers, be they chartered accountants or chartered secretaries, is that the corporate sector should grow at a faster pace. Unfortunately the proposed amendments, which would make the task of company managements very difficult, would have the opposite effect.

SELLING AGENTS

The proposed amendment regarding selling agents shows how a government immersed in coping with scarcities finds itself unable to take a rational or pragmatic view. Capitalist economies are normally faced with the problem of supply of goods, in most cases, being in excess of demand. That "the demand for goods of any category ... is substantially in excess of the production or supply" will be a passing phase. It cannot be treated as a permanent feature. In India, on other hand, public policy appears to think of excess of demand in relation to supply as the normal state of affairs.

The amendment says that the Government may assess the demand and supply for any type of goods. Our experience of planning shows how difficult it is to forecast either the demand or supply even of major product groups. Obviously the Company Law Adminis-

tration is not equipped to undertake this job. Yojana Bhavan should be chary of making estimates of demand for goods that are not matched by increases in supply. Whoever undertakes the job, it is well to remember that such estimates, even when based on better data than available in India, often prove wrong because human behaviour is unpredictable and defies all rational calculation. The basic reason for the proposed amendment lies in the desire to avoid the selling agents' commission, if it is a device for distributing income. Under the existing provisions CLB does, if it is found justifiable, reduce the commission that a company may pay its selling agents. These decisions have been upheld in legal action. It will be eminently reasonable for the administration to maintain the *status quo*.

By another amendment it is proposed that appointment of selling agents by companies with paid-up capital in excess of Rs 50 lakhs will require approval of the government. This has no justification other than the desire to put additional fetters on managements.

The Amendment Bill has adopted, interestingly, different bases for selection of companies which deserve greater control by Government. In the case of selling agents, it is paid-up capital of Rs 50 lakhs; for restrictions on transfer of shares it is paid-up capital of Rs 25 lakhs; and for a private company to become a deemed public limited company it is paid-up capital of Rs 25 lakhs and turnover of Rs 50 lakhs. Does this purport to show that a company with a paid-up capital of Rs 25 lakhs is a big company? In terms of real resources paid-up capital of Rs 25 lakhs today is equivalent to paid-up capital of Rs 10 lakhs 20 years back, and in another 10 years' time, Rs 25 lakhs will be perhaps equivalent to Rs 5 lakhs in terms of 1950 prices. Perhaps the administration suffers from the complex of thinking in terms of the past. A lakh of rupees was a big sum when most of the senior bureaucrats were young. Unfortunately, the value of money has eroded fast and the future does not hold a prospect of respite. It will be in the national interest to shed the illusion of treating a company with Rs 25 lakhs capital or Rs 50 lakhs turnover as big and hence deserving special regimentation.

TAKE-OVER BIDS

An outstanding feature of the Amendment Bill is the concerted attempt to freeze the existing ownership and management of companies *vide* the proposed section 108A (acquisition of more than

25 per cent equity share capital); 108B (transfer of more than 10 per cent equity share capital not to be made except with prior approval of the Government), 108D (in case of change of controlling interest which may be considered prejudicial to the public interest, the Central Government may issue directions not to give effect to the transfers), etc. In a society 'committed' to change, the dice is being loaded against persons seeking change. One hears daily outbursts against "vested interests", and here is another attempt to protect the same "vested interests".

Firstly, a point of minor detail. To describe any change in the controlling interest of a company as a 'take-over bid' is a misnomer. In all major industrial societies attempts, successful or otherwise, are made to acquire either controlling interest in, or the whole of the share capital of, another company. One of the methods of acquisition is buying the shares on a stock exchange; another is by public announcement of readiness to buy shares of the company proposed to be acquired for cash or for shares of the acquiring company or both. Such attempts at acquisition which are opposed by the shareholders having controlling interest in the first company may lead to a situation which is described as a 'take-over bid'. The objects of a take-over bid may be either to rationalise the business or to use the assets more efficiently or even to diversify the interests of the acquiring company. In late 1950s, takeover bids became sufficiently significant for the UK Government to include in the terms of reference of the Jenkins Committee consideration of this specific item. The Jenkins Committee was of the opinion that take-over bids are an essential feature of economic growth and development. There is no odium attached to take-over bids or any changes in controlling interest in other countries.

Such changes in controlling interest in respect of old established companies in India have not been very numerous. In some of them, the controlling block of shares had changed hand by negotiation between the parties and hence by mutual consent. In some other cases sufficiently large number of shares were acquired in the open market which were sufficient to dislodge the then existing management. It is a specious argument that those who acquire control of a company must treat all shareholders alike; this means that one who proposes to acquire the controlling interest in a company must acquire 100 per cent of its shares even though those from whom control is being acquired may have had only, say, 30 per cent. This is what leads one to describe it as load-

ing the dice against change.

Another facet of this is the suggestion that the proposed new management should be considered satisfactory. How does one have satisfactory antecedents unless one has managed a company? There could be just two ways of acquiring control: by inheritance and through acquisition of sufficient shareholding. If the second alternative is frowned upon, a government committed to change will be fostering continuance of management by inheritance. The amendment contained in the proposed section 108B is also likely to lead to the same result. According to it any person who holds either by himself or with other persons in the same group more than 10 per cent of the equity share capital in companies engaged in specified industries may continue to hold it at his pleasure; but should he desire to sell any part of it, he has to face the risk of Government exercising the pre-emptive right to purchase those shares.

The real purpose of the Amendment Bill is to ensure that in all important matters changes are made with the approval of Government. Of course, the statement of objects and reasons does not say so. The Bill does not have a redeeming feature unless one believes that greater control by government is *per se* good. It will, of course, not be practical politics to expect the Select Committee to decide against reporting the Bill. It has also to work within the framework of the legislation submitted to its scrutiny. Keeping in view these limitations, it is suggested that the Committee may adopt a useful

feature of the Commercial Code of Japan in substitution of approval of government for diverse matters. According to the Japanese Law, in specified matters ordinary resolution means approval by not less than 50 per cent of shareholding; in matters considered more important, approval by special more important, approval by special resolution means approval by three-fifths majority. Under our Companies Act, Ordinary or Special Resolution requires approval of majority or ¾th majority respectively of shareholders present at the meeting but not the proportion of total shareholding. The Japanese Law ensures that in important matters the decision of the actual majority of share capital (in some cases a three-fifths majority) shall prevail. This is another facet of the consensus method which governs the Japanese way of life.

It may be said that the provision for a sufficiently large majority of total share capital may not meet the purpose of ensuring compliance with the ideas of government. This fear is unreal in case of the bigger public limited companies because of substantial shareholdings in these companies of Life Insurance Corporation of India, Unit Trust of India, the nationalised banks, General Insurance Corporation and the other public financial institutions. Adoptions of this proposal will be a step in the direction of better education of shareholders. Greater knowledgeability and vigilance on the part of shareholders will ensure better performance of the companies; the constraints proposed by the Amendment Bill will not meet this objective.

Zuari Agro Chemicals

ZUARI AGRO CHEMICALS achieved mechanical completion of its project in July 1972 as per schedule, but the start-up operations continued much beyond expectations owing to a set of adverse factors — a delay of some five months in the commissioning of the public water supply scheme, power interruptions, and a serious defect noticed in the syngas compressor, which necessitated dismantling and reinstallation of the compressor, besides changing a substantial portion of the high pressure piping of the synthesis loop. Having crossed these hurdles, the company now expects to commence urea production soon. The company has been served with a notice of termination of the supply of phosphoric acid, the main feedstock for production of compound fertilisers, by the Mexican firm of Fertilizantes Fosfatados Mexicanos. It is intended to take legal action in the matter, if necessary. In the mean-

time, alternate sources of acid supply are being located. Till such time as acid supplies become available, it is proposed to convert the whole of the ammonia produced into urea, for which the plant has built-in capacity. This may cause delay in the production and distribution of compound fertilisers, but the management says that its financial impact on the company's working will be only "marginal". As a result of the change in the Union government's policy of direct allocation of seeding materials, the company had to restrict purchase and sale of fertilisers to the limited quantities made available by the state governments. Therefore, turnover was only Rs 4.19 crores against Rs 9.02 crores in 1971 and the loss under this head increased to Rs 37 lakhs from Rs 30 lakhs of last year. At the year-end, the expenditure charged to capital assets stood at Rs 51.02 crores.

Vande Mataram: A Historical Lesson

A G Noorani

The controversy over the singing of Vande Mataram in Bombay's municipal schools has all but died down. But the consequences of the bigoted propaganda of the communal forces of the Muslim League, the Shiv Sena and the Jan Sangh, as well as the hamhanded treatment of the issue by the Maharashtra government, will be with us for some time to come. Fortunately, the controversy did not spread much beyond the city or become a national issue.

The subject is inherently an explosive one, nevertheless. Vande Mataram aroused popular emotions for decades before Independence. All the greater reason, then, why the issues in the controversy, which has been associated with the song almost since its inception, should be calmly and objectively appraised. These issues affected the national movement in the past and they are relevant today in the process of nation-building.

THE controversy over the singing of 'Vande Mataram' in Bombay's municipal schools has all but died down. But the consequences of the bigoted propaganda of the communal forces of the Muslim League, the Shiv Sena, and the Jan Sangh, as well as the hamhanded treatment of the issue by Sharad Pawar will be with us for some time to come. Fortunately, however, the controversy did not spread much beyond the city or become a national issue.

The subject is inherently an explosive one. A national song is by definition one which arouses the people's emotion. 'Vande Mataram' did so for decades and still continues to do so. All the greater reason, then, why the issues in the controversy, which have been associated with the song almost since its inception, should be calmly and objectively appraised. They are issues of the utmost importance. They affected the national movement in the past, and they are relevant today in the process of nation-building.

A Government of India publication¹ states the desiderata of a national song accurately enough. "A Constitution, a Flag and an Anthem: these three sum up a nation ... Not every song can be a national anthem, whatever its literary qualities. In fact, there are very few national anthems whose merit is exclusively literary. What is it, then, that distinguishes a national anthem? Its 'singability', experts say, among other things; that is, people should be able to sing it in chorus. How can the whole nation sing it, unless it is accessible to everybody? ... A national anthem, besides its 'singability', has, of course, other features also. For instance, it should be distinctly national in sentiment. ... Two of India's national songs have vied with each other for the status of the national anthem. They are: Bankimchandra Chatterjee's 'Vande Mataram' and Rabindranath Tagore's 'Jana Gana Mana'."

The official publication's account of

the origin of the song and the reasons underlying the Muslim objection to it is another matter. It adds: "Of the two songs, 'Vande Mataram' is the older. It occurs in Bankimchandra's novel 'Anand Math'—published in 1882. Its origin, however, dates much earlier, perhaps as early as the seventies of the last century. The first political occasion on which it was sung was at the 1896 session of the Indian National Congress. It was set to music by Rabindranath Tagore. Later, during the stormy days of the anti-Partition movement in Bengal, its appeal was instantaneous. It was sung during the Bengal Provincial Conference held at Barisal in April 1906 under the presidency of a Muslim. Later in the year, Rabindranath Tagore himself sang the song on the opening day of the Congress session. Gradually the first two words of the song became the slogan of the nationalist movement, despite sporadic protests from some Muslims who read a communal meaning into the song. These two words have inspired some of the greatest sacrifices in human history."

"In 1937, the Congress Working Committee appointed a sub-committee consisting of Maulana Abul Kalam Azad, Jawaharlal Nehru, Subhash Chandra Bose and Acharya Narendra Deva who were required to examine, in consultation with Rabindranath Tagore, the suitability of the song as a national anthem. Earlier it had adopted this resolution: 'Taking all things into consideration, therefore, the Committee recommends that whenever the 'Vande Mataram' is sung at national gatherings, only the first two stanzas should be sung, with perfect freedom to the organisers to sing any other song of an unobjectionable character, in addition to, or in place of, the 'Vande Mataram' song?'"

Some Muslims, some meaning. The slurring over of this aspect — i.e., of the Muslims' reasons for the objection

over the years — only reflects a gap in understanding, a gap which, sad to say, few have tried to bridge. As will be underscored later, the failure is on both sides.

First of all it is surely misleading to say that a communal meaning was "read... into the song". In his "Autobiography of an Unknown Indian", Nirad C Chaudhuri has aptly described the atmosphere of the times in which the song was written.² "The historical romances of Bankim Chatterjee and Ramesh Chandra Dutt glorified Hindu rebellion against Muslim rule and showed the Muslims in a correspondingly poor light. Chatterjee was positively and fiercely anti-Muslim. We were eager readers of these romances and we readily absorbed their spirit."

"Ananda Math", the novel in which the song occurs, had a seminal effect. It is, therefore, very necessary to consider its theme — all the more so because it has been misunderstood to this day. R C Majumdar, the veteran historian, has written a very objective account of it.³ "During the long and arduous struggle for freedom from 1905 to 1947 'Bande Mataram' was the rallying cry of the patriotic sons of India, and thousands of them succumbed to the lathi blow of the British police or mounted the scaffold with 'Bande Mataram' on their lips. The main theme of the novel inspired the Bengali youths to supreme self-sacrifice during the hectic days of the Swadeshi movement. The central plot moves round a band of sanyasis, called *santanans* or children, who left their hearth and home and dedicated their lives to the cause of their motherland. They worshipped their motherland as the Goddess Kali; they knew no other deity save the land of their birth, and no other religion except the service of their motherland. That is why they called themselves *santanans* or children (of the mother). In their temple they

Government of India
DEPARTMENT OF SUPPLY
Directorate General of Supplies and Disposals
 (Registration Branch)

NEW DELHI

Procedure for registration with the D.G.S. & D., New Delhi

OBJECT OF REGISTRATION :

The main object of registration of firms as approved suppliers is to facilitate the location of reliable sources of supplies as and when demands are received from the various Indenting Departments of the Government of India including Defence, Railways and Posts & Telegraphs. It also undertakes purchases on behalf of the State Governments and the expanding Public Sector Undertakings. Purchases embrace practically all types of stores excluding food-stuffs and live-stock. The annual purchases made through D.G.S.&D. extend over quite a few hundred crores of rupees.

BENEFITS OF REGISTRATION :

Firms registered with DGS&D enjoy the following benefits:—

- i) Demands which are not advertised are met from registered firms.
- ii) In case of advertised demands, copies of the notice are sent to registered firms, giving them advance information of the demands.
- iii) Rate Contracts and Running Contracts are normally reserved for registered firms.
- iv) Operational demands are normally reserved for supply by registered firms.
- v) Normally 80% of the quantity against Express and Urgent demands is reserved for supply by registered firms. Even ordinary demands are mostly covered from registered suppliers.
- vi) The State Governments and Public Undertakings may at their discretion waive the requirements of Security Deposit from firms registered with D.G.S.&D.
- vii) Registration with D.G.S.&D. raises the firms' status in business, not only with Government Departments but also with foreign firms and establishments.

APPLICATION FORM :

All firms in India and in foreign countries are eligible for registration. The application must be made to DGS&D, New Delhi, in the prescribed application form. Firms in USA and Canada may purchase the form at \$ 5/- from India Supply Mission, Washington. Foreign firms in other countries are supplied forms free of cost by DGS&D, New Delhi. Indian firms may purchase application form from DGS&D, New Delhi or Director of Supplies & Disposals, Bombay/Calcutta/Madras/Kanpur on payment of Re. 1/- either at the counter or by Money Order. Application for registration in the prescribed form should be submitted along with a Treasury Challan for Rs 10/- indicating the Revenue Head of Account "XX-Supplies & Disposals". Form of application for renewal of registration will be issued free of any initial charge on request. Application for renewal of registration should, however, be accompanied by a Treasury Challan for Rs 10/- as mentioned above. Application forms are issued free of cost for initial registration as well as for renewal to Small Scale/Cottage Industry Units on production of certificates by the firms from the State Director of Industries or the NSIC authorities to the effect that the Units are registered with them as bonafide Small Scale/Cottage Industry Units. Such Units are also not required to forward necessary Challans for Rs 10/-.

CATEGORIES OF REGISTRATION :

- (1) Manufacturers.
- (2) Sole Selling Agents/Sole Distributors of Manufacturers registered.
- (3) Stockists (a) of imported stores
 (b) of indigenous stores such as Timber, Hides & Skins and Cotton Waste.
- (4) (i) Foreign firms who are Manufacturers;
 and
 (ii) Accredited Agents in India of foreign firms registered. It pays to get registered as approved supplier with the Directorate General of Supplies and Disposals.

davp 731129

placed three images of the Goddess Kali representing the motherland — Mother that was, great and glorious in her majestic grandeur; Mother that is, wretched and grovelling in the dust; and Mother that will be, in her pristine glory. No other Bengali book — or, for the matter of that, no book written in any language — so profoundly moved the Bengali youths save perhaps Saratchandra's "Pather Dabi", written half a century later. The later novel was an emotional protest against the British rule, as the earlier one was, at least ostensibly, against the Muslim rule. This aspect of the "Ananda Math" and the imagery of Goddess Kali leave no doubt that *Bankimchandra's nationalism was Hindu rather than Indian*. This is made crystal clear from his other writings which contain passionate outbursts against the subjugation of India by the Muslims. From that day set the sun of our glory — that is the refrain of his essays and novels which not unoften contain adverse, and sometimes even irreverent, remarks against the Muslims" (italics added). As Majumdar pithily puts it, "Bankimchandra converted patriotism into religion and religion into patriotism".

Needless to add, this religious concept of patriotism is not one which all Indians could accept. It is pointless in view of this and Chatterjee's "fiercely anti-Muslim" outlook, to make much of the fact that the song was written prior to the novel; also, it is sheer sophistry to argue that he had "chosen Muslim rulers as the target of the fury of the *sanyasis*, apparently because if the British had been made the target, the novel would have been suppressed and the author's intent frustrated."

Anti-Muslim as he was, Chatterjee needed no such excuse. The novel was not anti-British, either. In the last chapter, we find a supernatural figure persuading the leader of the *sanyasis*, Satyananda, to stop fighting. The dialogue that follows is interesting:

"He: Your task is accomplished. The Muslim power is destroyed. There is nothing else for you to do. No good can come of needless slaughter.

"S: The Muslim power has indeed been destroyed, but the dominion of the Hindu has not yet been established. The British still hold Calcutta.

"He: Hindu dominion will not be established now. If you remain at your work, men will be killed to no purpose. Therefore come.

"S: (greatly pained) My lord, if Hindu dominion is not going to be established, who will rule? Will the

Muslim kings return?

"He: No. The English will rule."

Satyananda protests, but is persuaded to lay down the sword.

"He: Your vow is fulfilled. You have brought fortune to your Mother. You have set up a British government. Give up your fighting. Let the people take to their plows. Let the earth be rich with harvest and the people rich with wealth.

"S: (weeping hot tears) I will make my Mother rich with harvest in the blood of her foes.

"He: Who is the foe? There are no foes now. The English are friends as well as rulers. And no one can defeat them in battle. (Italics added.)

"S: If that is so, I will kill myself before the image of my Mother.

"He: In ignorance? Come and know. There is a temple of the Mother in the Himalayas. I will show you her image there.

"So saying, He took Satyananda by the hand."

Anti-Muslim references are spread all over the work since the central theme was anti-Muslim. But, alas, they are the references of a most intemperate and, indeed, vituperative character. Jivananda with sword in hand, at the gate of the temple, exhorts the children of Kali: "We have often thought to break up this bird's nest of Muslim rule, to pull down the city of the renegades and throw it into the river — to turn this pig-sty to ashes and make Mother earth free from evil again. Friends, that day has come."

The use of the song 'Vande Mataram' in the novel is not adventitious, and it is not only communal-minded Muslims who resent it because of its context and content. M R A Baig was a nationalist Muslim before Independence and is an ardent advocate of Muslim modernisation today. The Muslim Progressive Group of which he is chairman has worked splendidly in the cause of reform of Muslim personal law. Baig's analysis of the novel and the song deserve attention. "Written as a story set in the period of the dissolution of the Moghul Empire, the hero of the novel, Bhavananda, is planning an armed rising against the Muslims of Bengal. While busy recruiting, he meets Mahendra and sings the song 'Bande Mataram' or 'Hail Mother'. The latter asks him the meaning of the words and Bhavananda, making a spirited answer, concludes with: 'our religion is gone, our caste is gone, our honour is gone. Can the Hindus preserve their Hinduism unless these drunken Nereys (a term of contempt for Muslims) are

driven away?' ... Mahendra, however, not convinced, expresses reluctance to join the rebellion. He is, therefore, taken to the temple of Ananda Math and shown a huge image of four-armed Vishnu, with two decapitated and bloody heads in front. 'Do you know who she is?' asks the priest in charge, pointing to an image on the lap of Vishnu, 'She is the Mother. We are her children, Say 'Bande Mataram'." He is taken to the image of Kali and then to that of Durga. On each occasion he is asked to recite 'Bande Mataram'. In another scene in the novel some shouted 'kill, kill the Nereys'. Others shouted 'Bande Mataram', 'will the day come when we shall break mosques and build temples on their sites?'

The song has five stanzas. Of these, only the first two are the 'approved ones'. Jawaharlal Nehru was 'opposed to the last two stanzas'. The approved stanzas read:

"I bow to thee, Mother,
 richly watered, richly fruited,
 cool with the winds of the south,
 dark with the crops of the harvests,
 the Mother!

Her nights rejoicing in the glory of
 the moonlight, her hands clothed
 beautifully with her trees in flowering
 bloom, sweet of laughter, sweet of
 speech, the Mother, giver of boons,
 giver of bliss!

The third stanza refers to "Thy dreadful name", evidently, a reference to the Goddess Kali. The fourth is in the same vein. 'Thou art Durga, Lady and Queen, with her hands that strike and her swords of sheen'.

Ram Gopal avers a common view: "In any case, the song itself was innocuous, and only paid homage to the motherland". It escapes him that this particular form of homage is not 'innocuous' or acceptable to those who do not subscribe to the creed — however much they respect the creed and those who believe in it. It is essentially a religious homage to the country conceived as a deity. 'A form of worship' as Majumdar aptly called it. The motherland is "conceived as the Goddess Kali, the source of all power and glory".

This, in the song itself. The context only makes it worse. "The land of Bengal, and by extension all of India, became identified with the female aspect of Hindu deity, and the result was a concept of divine Motherland". (Italics added.) How secular is such a song?

It is not the mere gesture of bowing but the bowing to this form of divinity which Muslims have found objectionable. Nor was the protest voiced "half a century too late" as Ram Gopal thinks. It was voiced fairly early in the

day and on the unexceptionable ground that it was sectarian and not national.

The view was expressed with such cogency and restraint that it bears recalling *in extenso*. In his presidential address to the Second Session of the All-India Muslim League held at Amritsar on December 30, 1908, Syed Ali Imam said: "I cannot say what you think, but when I find the most advanced province of India put forward the sectarian cry of 'Bande Mataram' as the national cry, and the sectarian Rakhibandhan as a national observance, my heart is filled with despair and disappointment; and the suspicion that, under the cloak of nationalism, Hindu nationalism is preached in India becomes a conviction. Has the experiment tried by Akbar and Aurangzeb failed again? Has 50 years of the peaceful spread of English education given the country only a revival of denominationalism? Gentlemen, do not misunderstand me. I believe that the establishment of conferences, associations and corporate bodies in different communities on denominational lines are necessary to give expression to denominational views, so that the builders of a truly national life in the country may have before them the crystallised needs and aspirations of all sects. In this connection, every lover of India will welcome such institutions as Kayastha Conference, the Bhuinder Conference, the Rajput Conference, Mohammedan anjumans and conferences, the associations of the domiciled community, and all such denominational institutions. Such activities help to bring into focus the thoughts of all sections of the population of India. Regard for the feelings and sentiments, needs and requirements of all is the key-note to true Indian nationalism. It is more imperative where the susceptibilities of the two great communities, Hindus and Muslims, are involved. Unreconciled, one will be as great a drag on the wheel of national progress as the other. I ask the architects of Indian nationalism, both in Calcutta and Poona, do they expect the Muslims of India to accept 'Bande Mataram' and the Sivaji Celebration? The Mohammedans may be weak in anything you please, but they are not weak in cherishing their traditions of their glorious past. I pray the Congress leaders to put before the country such a programme of political advancement as does not demand the sacrifice of the feelings of the Hindu or the Mohammedan, the Parsee or the Christian." (italics added.)

The protest went unheeded, and *Vande Mataram* became 'the battle-hymn of the national-movement'. Con-

trovery arose in an acute form three decades later, in 1937, when Congress ministries came into being in many Provinces and 'Vande Mataram' began to be sung in the legislatures. The Muslim League strongly objected to it. A resolution adopted by the 25th Session of the League at Lucknow, in October 1937, dubbed it as "not merely positively anti-Islamic and idolatrous in its inspiration and ideas, but definitely subversive of the growth of genuine nationalism in India." The League still believed in Indian nationalism. Before long it was to discard belief in Indian nationalism and all restraint in its opposition to 'Vande Mataram'.

The Congress took note of the League's objection and tried to meet it half-way. The Congress Working Committee, which met at Calcutta on October 26, 1937, under the presidency of Nehru, adopted a long statement on the subject.⁸ It asked that the song should "be considered apart from the book". Recalling its use in the past 30 years, the resolution said: "The song and the words thus became symbols of national resistance to British Imperialism in Bengal especially, and generally in other parts of India. The words 'Bande Mataram' became a slogan of power which inspired our people and a greeting which ever reminds us of our struggle for national freedom.

"Gradually the use of the first two stanzas of the song spread to other provinces and a certain national significance began to attach to them. The rest of the song was very seldom used, and is even now known by few persons. These two stanzas described, in tender language, the beauty of motherland and the abundance of her gifts. There was absolutely nothing in them to which objection could be from the religious or any other point of view. ... The other stanzas of the song are little known and hardly ever sung. They contain certain allusions and a religious ideology which may not be in keeping with the ideology of other religious groups in India.

"The Committee recognise the validity of the objection raised by Muslim friends to certain parts of the song. While the Committee have taken note of such objection insofar as it has intrinsic value, the Committee wish to point out that the modern evolution of the use of the song as part of national life is of infinitely greater importance than its setting in a historical novel before the national movement had taken shape. Taking all things into consideration, therefore, the Committee recommend that, wherever *Bande Mataram* is

sung at national gatherings, only the first two stanzas should be sung, with perfect freedom to the organisers to sing any other song of an unobjectionable character, in addition to, or in the place of, the *Bande Mataram* song." (italics added.)

'National' songs do not need political surgery; the songs which do, do not win national acceptance. Against this was the fact of history that, however ill-advised, the song had come to be associated with the struggle for freedom. "... No matter what its source was, and how and when it was composed, it had become a most powerful battle cry among Hindus and Muslims of Bengal during the Partition days. It was an anti-imperialist cry. As a lad, when I knew nothing of 'Anand Math' or even Bankim, its immortal author, 'Vande Mataram' had gripped me, and when I first heard it sung it had enthralled me. I associated the purest national spirit with it. It never occurred to me that it was a Hindu song or meant only for Hindus. Unfortunately now we have fallen on evil days. All that was pure gold before has become base metal today. In such times it is wisdom not to market pure gold and let it be sold as base metal. I would not risk a single quarrel over singing 'Vande Mataram' at a mixed gathering. It will never suffer from disuse. It is enthroned in the hearts of millions. It stirs to its depth the patriotism of millions in and outside Bengal. Its chosen stanzas are Bengal's gift among many others to the whole nation. ...". This was Gandhiji in *Hartian* on July 1, 1939.

Till the last he spoke in the same refrain, asking Muslims to appreciate its historic association but counselling against any imposition. "No doubt, every act ... must be purely voluntary on the part of either partner", he said at Alipore on August 23, 1947.

The Government of India acquired this emotion-charged legacy. Its stand was defined in a statement by Prime Minister Nehru to the Constituent Assembly (Legislative) on August 25, 1948:⁹

"The question of having a national anthem tune to be played by orchestras and bands became an urgent one for us immediately after the 15th August 1947. It was as important as that of having a national flag. The 'Jana Gana Mana' tune, slightly varied, had been adopted as a national anthem by the Indian National Army in South-East Asia, and had subsequently attained a degree of popularity in India also. ... The matter came to a head on the occasion of the General Assembly of the

United Nations in 1947 in New York. Our delegation was asked for our national anthem for the orchestra to play on a particular occasion. The delegation possessed a record of 'Jana Gana Mana' and they gave this to the orchestra who practised it. When they played it before a large gathering it was very greatly appreciated, and representatives of many nations asked for a musical score of this new tune which struck them as distinctive and dignified. The orchestral rendering of 'Jana Gana Mana' was recorded and sent to India. ... Apart from the general appreciation with which this tune was received, there was at the time not much choice for us, as there was no proper musical rendering available to us of any other national song which we could send abroad. At that stage, I wrote to all the provincial Governors and asked their views about our adopting 'Jana Gana Mana', or any other song as the national anthem. I asked them to consult their premiers before replying ... Every one of these Governors, except one, (the Governor of the Central Provinces), signified their approval of 'Jana Gana Mana'. Thereupon the Cabinet considered the matter and came to the decision that provisionally 'Jana Gana Mana' should be used as the tune for the national anthem, till such time as the Constituent Assembly came to a final decision. Instructions were issued accordingly to the provincial governments. It was very clear that the wording of 'Jana Gana Mana' was not wholly appropriate and some change would be necessary. What was important was the tune to be played by bands and orchestras, and not wording. Subsequently, the new Premier of West Bengal informed us that he and his Government preferred 'Vande Mataram'.

"That is the position at present. It is unfortunate that some kind of argument has arisen as between 'Vande Mataram' and 'Jana Gana Mana'. 'Vande Mataram' is obviously and indisputably the premier national song of India, with a great historical tradition, and intimately connected with our struggle for freedom. That position it is bound to retain and no other song can displace it. It represents the position and poignancy of that struggle, but perhaps not so much the culmination of it. In regard to the national anthem tune, it was felt that the tune was more important than the words. ... It seemed therefore that while 'Vande Mataram' should continue to be the national song *par excellence* in India, the national anthem tune should be that of 'Jana Gana Mana', the wording of 'Jana Gana Mana' to be

suitably altered to fit in with the existing circumstances.

"The question has to be considered by the Constituent Assembly, and it is open to that Assembly to decide as it chooses. It may decide on a completely new song or tune, if such is available."

A more definitive statement was made by the President of the Constituent Assembly, Rajendra Prasad, on January 24, 1950. He said:¹⁰ "There is one matter which has been pending for discussion, namely, the question of the national anthem. At one time it was thought that the matter might be brought up before the House and a decision taken by the House by way of a resolution. But it has been felt that, instead of taking a formal decision by means of a resolution, it is better if I make a statement with regard to the national anthem. Accordingly, I make this statement. ... The composition consisting of the words and music known as 'Jana Gana Mana' is the national anthem of India, subject to such alterations in the words as the Government may authorise as occasion arises; and the song 'Vande Mataram', which has played a historic part in the struggle for Indian freedom, shall be honoured equally with *Jana Gana Mana* and shall have equal status with it. (Applause.) I hope this will satisfy the Members."

These matters stand so far as the State and the law are concerned. But none of them by itself guarantees unity in national sentiment. The recent controversy in Bombay is only one more reminder that we have yet a long way to go to achieve that unity.

That consummation calls for understanding and tolerance with which we are not too generously endowed. No attempt whatever has been made to appreciate the reasons for the Muslims' objection. It was by no means confined to the communal-minded Muslims. In his book, "Distant Neighbours", Kuldip Nayar records that the late Humayan Kabir would often tell him, "It was very unfair of a secular India to have adopted (sic) 'Vande Mataram'."¹¹

This, however, is only one side of the picture. No effort, likewise, has been made to make the Muslims appreciate the historical association of the song. How close the association was, emerges very clearly from the following account by Gandhiji in *Young India* of September 8, 1920. "During the Madras tour, at Bezvada I had occasion to remark upon the national crisis and suggested that it would be better to have cries

about the ideals than men. I asked the audience to replace 'Mahatma Gandhi ki jai' and 'Mohammed Ali Shoukat Ali ki jai' by 'Hindu-Muslim ki jai'. Brother Shaukat Ali, who followed, positively laid down the law. In spite of the Hindu-Muslim unity, he had observed that Hindus shouted 'Bande Mataram' the Muslims rang out with 'Allaho Akbar', and *vice versa*. This, he rightly said, jarred on the ear and still showed that the people did not act with one mind. There should be therefore only three cries recognised: 'Allaho Akbar', to be joyously sung out by Hindus and Muslims, showing that God alone was great and no other; the second should be 'Bande Mataram' (Hail Motherland) or 'Bharat Mata, ki jai' (Victory to Mother Hind). The third should be 'Hindu-Muslim ki jai', without which there was no victory for India and no true demonstration of the greatness of God. I do wish that the newspapers and public men would take up the Maulana's suggestion and lead the people only to use the three cries."

Mutual understanding will lead to the Gandhian formula — respect for the song but no imposition. But even more than that, if the problem were understood in depth, what would emerge is a far better appreciation of the reasons why the Muslims and the Congress drifted away from each other. Those reasons have many a lesson for us today as we build a secular India.

Union Bank of India

Report of the Board of Directors

1972 WAS a year of set-backs in the country's economy as a whole. Among other things, drought conditions in several parts of the country and the consequent loss of kharif crop, shortage of power in many States and the resultant deceleration of the otherwise improving trend in industrial production, created shortages and spiralling prices. In this environment, the banking industry was also affected, with its pace of growth slackening, compared to 1971. The scheduled commercial banks opened lesser number of branches, 1,763 against 1,805 in 1971, and registered a lower deposit growth rate of 17.4 per cent, as against 22.0 per cent. Even this comparatively lower deposit growth far outstripped the expansion in credit, which dipped to barely 7 per cent from the already low rate of 13.5 per cent witnessed in 1971. Consequently, the credit-deposit ratio throughout the year was, on an average, 6 percentage points below the level of 1971.

In the context of this none-too-happy state of affairs, both of the economy in general and of the banking industry in particular, Union Bank's performance during the year under review, considered from all angles, was quite heartening. In all spheres—in branch expansion, deposit mobilisation and disbursal of credit—the Bank achieved substantially higher growth rates than the industry's average. (See Table "A")

As against 59 branches opened in 1971, the Bank set up 73 new branches in 1972, taking the total to 506. Of the 73 new branches, 34 were located in rural centres, 16 in semi-urban, 14 in urban and 9 in metropolitan. Since nationalisation, the Bank had, as at 31st December, 1972, opened 266 branches, of which 180 were in the rural and semi-urban areas.

The total deposits of the Bank, as at the end of 1972, expanded by 28.4 per cent from Rs 197.34 crores to

Rs 253.42 crores. In line with the trend in the banking system, the time deposits of the Bank also increased faster (37.4 per cent) than the demand deposits (21.6 per cent). Consequently, there was further increase in the share of time deposits in the deposit-mix of the Bank — from 43.3 per cent as of 1971 to 46.3 per cent as of 1972. The deposit mobilisation by the Bank's rural and semi-urban branches continued to be encouraging, insofar as these branches achieved a much faster growth rate of 39.0 per cent as compared to 26.2 per cent achieved by the urban/metropolitan branches.

As a result of the very poor credit expansion, largely due to lower demand for credit for food procurement, the banking industry was afflicted with excess liquidity. In the case of Union Bank, however, the growth of credit outstripped even its comparatively high growth in deposits. Over the year, the total advances of the Bank increased from Rs 135.34 crores to Rs 174.44 crores (including Rs 2.50 crores for food procurement), registering a growth of 28.9 per cent as against growth of only 6.9 per cent in the banking industry. Consequently, the credit-deposit ratio of about 71.0 per cent as at the end of 1971 was well maintained as at end 1972. This was quite contrary to the drop of more than 6 percentage points, from 72.8 to 66.3, in the case of scheduled commercial banks. The Bank's credit disbursement was consistently at a high level during the year under review, as can be evidenced from the credit-deposit ratio which averaged at 72.0 per cent for the year.

Of the total accretion of Rs 56.08 crores in deposits, as much as Rs 39.10 crores, i.e., 69.7 per cent were deployed in advances. This incremental credit-deposit ratio of 69.7 per cent stood out in sharp contrast to the ratio of only 28.7 per cent registered by scheduled commercial banks, with credit ex-

pansion of Rs 346.00 crores out of deposit accretion of Rs 1,209.00 crores.

As a matter of deliberate policy, the Bank continued to divert credit to priority and neglected sectors in an increasing measure. Of the total credit expansion of Rs 39.10 crores, funds deployed in priority and neglected sectors aggregated to as much as Rs 16.76 crores excluding exports and Rs 26.62 crores including exports. As a result, the incremental shares of priority sector advances to increase in total advances stood at over 42.0 per cent, excluding exports and almost 68.0 per cent including exports. Whereas, over the year the total advances of the Bank increased by 28.9 per cent, advances to priority and neglected sectors, excluding exports, increased by 45.5 per cent — from Rs 36.87 crores to Rs 53.63 crores. On the whole, credit to priority and neglected sectors (excluding exports) accounted for 30.8 per cent of the total advances, as against 27.2 per cent at the end of 1971. Including exports, this ratio improved over the year from 41.6 per cent to 47.6 per cent.

(See Table "B")

The magnitude of credit apart, even the number of persons benefiting through the Bank's assistance to the priority sector grew sizably.

The agricultural advances portfolio of the Bank recorded satisfactory progress during the year despite acute drought in many parts of the country. These advances which stood at Rs 13.60 crores (21,442 accounts) as at December 1971, increased to Rs 20.47 crores (32,922 accounts) as at December 1972, registering a growth of 50.5 per cent during the year. These advances formed 12.0 per cent of the total advances of the Bank as compared to 10.0 per cent the previous year. The number of branches engaged in agricultural advances rose from 234 to 334 during the year, improving the percentage to total branches from

54 to 66. The continued stress on production finance resulted in the increase in crop loan accounts from 9,776 in 1971 to 17,611 in 1972.

In line with the Bank's policy of extending increased assistance to weaker sections of the community, concerted steps were taken to grant credit to small and marginal farmers. Advances amounting to Rs 1.44 crores were granted to 10,558 farmers with holdings upto 5 acres. Thus, the number of such accounts constituted over one-third of the total agricultural accounts. This progress is partly attributed to the adoption of a three-tier structure of rates of interest on agricultural advances which provides for lower rates on advances to the small and marginal farmers. The Bank selected 24 Districts for participation under the Scheme of Small Farmers Development Agencies and Marginal Farmers and Agricultural Labourers Agencies and commenced financing in 10 of them. As at December 1972, advances amounting to Rs 0.08 crore had been granted to identified small and marginal farmers.

The Bank continued its participation in the Reserve Bank's Scheme of financing of primary Co-operative Societies by Commercial Banks. During the year, advances amounting to Rs 0.21 crore were granted, through 5 branches in 4 States, to 67 primary Societies, covering 3,643 members. The Bank also actively participated in almost all the Agricultural Credit Projects in various States being financed with the credits made available by the World Bank.

In intensifying assistance to the hitherto neglected sectors, a number of new schemes were devised and the existing schemes were reviewed and modified to make them more workable. Schemes for assisting handloom and powerloom weavers in the Lead Districts of Varanasi and Azamgarh in UP were liberalised during the year and about 800 weavers were financed under these schemes. Similarly, in the Lead District of Ernakulam a scheme for financing bamboo-mat weavers was

introduced with the co-operation and collaboration of the Kerala State Bamboo Corporation. This scheme evoked great enthusiasm and the Bank assisted about 200 persons in getting self-employed. Other schemes of assisting small borrowers and retailers continued to be operated through all the branches.

In mid 1972 the district of Idikki, carved out from the existing districts of Ernakulam and Kottayam in Kerala, was allotted to the Bank as its Lead District and a preliminary survey of the district was completed by the Bank by the end of the year.

In all the 6 Lead Districts assigned to the Bank — 4 in UP and 2 in Kerala — Bank's progress in all directions was quite satisfactory. Out of 18 branches opened in UP during the year under review, 10 were opened in Lead Districts taking the total number of branches in Lead Districts to 36. In Kerala, 7 branches were added in the 2 Lead Districts — 4 in Ernakulam and 3 in Idikki.

Branch expansion apart, attention was focused on accelerating the process of development already initiated. To intensify developmental efforts, an additional 'Lead Office' was opened at Azamgarh, with jurisdiction over two districts, of Azamgarh and Jaunpur. The Lead Office at Varanasi continued to look after the development work in Varanasi and Ghazipur. In all the Lead Districts the targets for all important parameters were realised and even exceeded and the credit-deposit ratios were considerably stepped up. The overall business performance of the Bank's Lead Districts truly matched the impressive performance of the Bank on all-India level as can be seen from Table "C" on the next page.

As reported earlier, by the end of 1971 the Bank had completed surveys of all the districts allotted to it. These preliminary surveys were necessarily impressionistic and were primarily aimed at identifying areas requiring banking facilities. It was at that time noted that a survey of the districts would have to be a continuous process

and that a periodic review would be necessary in planning the Bank's operational strategy in the area. In the latter part of 1972, therefore, a fresh study-cum-survey of all the 6 Lead Districts was undertaken with the three-fold purpose of (a) evaluation of results of the Bank's activities in the area so far (b) further identification of growth areas and credit gaps and (c) preparation of a concrete programme of action in such areas. The findings of the survey are now under study.

The novel and unorthodox scheme of Differential Interest Rates announced by the Finance Minister in Parliament in March 1972 aimed at providing finance to financially very weak sectors in backward districts at concessional rate of 4 per cent was earnestly pursued by the Bank. To begin with, for implementation of the Scheme the Bank selected all its branches in all the backward districts where the Bank was represented. At the time of introduction of the Scheme, the Bank had 106 branches in 43 of the backward districts. As and when new branches were opened in the backward districts, they were also identified for the purpose of the Scheme. As at 31st December, 1972, the Bank operated the Scheme in 44 backward districts through all its 119 branches. This coverage worked out to 2 out of every 9 branches of the Bank, as against 1 out of 9 suggested by the Reserve Bank.

Considering that the Scheme would have to be operated through smaller branches manned by relatively inexperienced staff, arrangements were made to monitor continuously to the branches all such information as would be of use in their initial efforts. State-wise and district-wise population data on pockets of scheduled caste and scheduled tribes were furnished to enable identification of borrowers and information on employment generation schemes envisaged in the Plan documents was also provided to assist the branch personnel in drawing up viable schemes. To encourage implementation of the Scheme in letter and spirit

			1972	% 45.34	80.89	85.44	87.02	44.73	48.75

and to make its coverage wide and effective, the norms and rules therefor were kept as flexible as possible. All sections of society and categories of borrowers, as primarily intended by the Government, were covered. At the same time, care was taken to ensure that finance under the Scheme was made available for only productive endeavours. Borrowers who benefited under the Scheme included variegated category of individuals self-employed in small vocations, from shoe-makers, shoe-repairers and skinners of dead animals to small farmers, blacksmiths and glassmiths. In the space of hardly 6 months of the operation of the Scheme, the Bank had disbursed Rs 18.72 lakhs among about 5,000 borrowers — the average loan per account being a little over Rs 375. Though this performance fell short of the target of one-half of one per cent of the total advances intended to be achieved, it represented over 20 per cent of the total effort of the public sector banks, which added upto Rs 83 lakhs disbursed to about 19,000 borrowers.

If may well be said that Union Bank had introduced a system of multi-tier rates of interest, albeit in a small way, quite some time before the present Differential Interest Rates Scheme came into operation. Since 1971, the Bank has introduced a three-tier structure of interest rates, ranging from 8½-10 per cent for agricultural finance, depending upon the size of the landholding of the borrower. Similarly, a three-tier structure of interest rates was introduced also for the small industrial units, linked with the unit's age and capital investments.

To ensure orderly and systematic expansion of the Bank's activities in conformity with the national objectives, the Bank formulated its maiden Business Plan or Performance Budget

for the year 1972-73. Though an element of planning was introduced in the Bank a few years ago, in the shape of fixation of branch-wise deposit targets, it was in 1971 that the first-ever effort was made in drawing up, at the instance of Reserve Bank of India, a Credit Plan. These exercises were, however, very elementary. In early 1972 it was for the first time that the Bank drew up a comprehensive Performance Budget, as a first step towards integrated planning. It involved simultaneous exercises in budgeting branch expansion, deposit mobilisation, deployment of resources including assistance to priority sectors and manpower planning including training. Though in subserving socio-economic goals of the nation, profit cannot be the dominant motive for a bank, it is still a very important criterion with which to measure efficiency. Hence, the Business Plan also covered a branch-wise profit plan which necessarily included control over expenditure.

A separate Business Plan was formulated for each of the Bank's Lead Districts. To ensure commitment of those who had to implement the Plan, a Conference was held early in the year when all the key officials participated in formulating the various targets and evolving appropriate strategies to achieve them. To avoid any time-lag in between the plan for the first financial year and the next, the first Plan was drawn up for a 15-month period January 1972-December 1972-March 1973. The performance under the Plan was reviewed periodically, through a Monthly Report System as well as through two mid-year conferences where the performance was reviewed Zone by Zone separately.

To facilitate successful implementation of the Business Plan, three new levels of management were introduced

in the shape of Group Managers, Development Managers and Regional Managers in most of the States. The role assigned to them was primarily developmental, with little supervisory and control functions, these being the responsibility of the Zonal Officers headed by Assistant/Deputy General Managers.

The Business Plan, supported by the reorganisation of the developmental machinery, indeed gave a great impetus to the Bank's efforts, as would be evident from the all-round impressive growth in the Bank's business reported above. Correspondingly, the working results for the year were also very satisfactory. The net profit of the Bank, after allowing for all usual and necessary provisions, improved from Rs 74.05 lakhs the previous year to Rs 92.65 lakhs from which after deducting the amount of Rs 1.53 lakhs paid to staff as bonus for 1971 in excess of the appropriation made therefor, a balance of Rs 91.12 lakhs is left, which amount has been appropriated as in Table D:

The directors are conscious that, notwithstanding the encouraging results reported above, what is achieved so far has touched only the fringe of the problem facing the banking industry and falls far short of the aspirations of the common man. The Management is not oblivious to the several deficiencies and shortcomings. Constant efforts are being made to improve and streamline the organisational structure, staffing pattern, man-power development, operational procedures, decentralised decision-making machinery etc. and above all, to reorient the thinking at all levels.

To meet the ever-growing needs of training in line with the quantitative and qualitative expansion of the Bank's activities, one more Training Centre was set up at Lucknow (U.P.) during

TABLE D

74,05,467.18		91,12,394.87

the year under review. One or more centres are proposed to be added in 1973, according to the emerging needs.

In conformity with the decision of the Official Languages Implementation Committee of the Department of Banking, Ministry of Finance, Government of India, the Bank has initiated steps for ensuring progressive use of Hindi in its day-to-day business in Hindi speaking areas. The standard forms and stationery like the account opening forms, rules relating to various types of accounts, pass books, cheque books, pay-in-slips, loan application forms, security documents and other publicity literature, are printed in Hindi for use of the Bank's customers and the public at the branches located in Hindi speaking areas. A Hindi Cell is being established in the Bank for promoting use of Hindi in the office circulars, administrative orders and

reports, press reports etc. issued by the Bank. It is also proposed to organise in-service training programmes for teaching Hindi to the Bank's employees. During the year under review, the Bank was deprived of the services of two members of its first Board of Directors. Shri H. M. Trivedi resigned in April 1972, upon his election as a Member of the Council of States (Rajya Sabha) in Parliament. In August 1972, Shri P. K. Kaul, Joint Secretary, Department of Expenditure, Ministry of Finance, also ceased to be a member of the first Board and in his place Shri M. Dandapani, Director, Department of Banking, Ministry of Finance, Government of India, joined the Board with effect from 1st September, 1972. The Board recorded its sincere appreciation of the very valuable services rendered by Shri H. M. Trivedi and Shri P. K. Kaul as mem-

bers of the Bank's first Board of Directors during the first formative post-nationalisation years.

In December 1972, in terms of the provisions of the Nationalised Banks (Management and Miscellaneous Provisions) Scheme, 1970, the Central Government constituted the new Board of Directors as well as the Management Committee of the Bank. All the five members then serving on the first Board were re-appointed as members of the new Board along with four other new Directors, Shri S. Bardhan, Shri S. B. Godiwala, Shri R. R. Upasani and Shri M. Jeelani. Shri P. F. Gutta ceased to hold the office of Custodian on his appointment as Managing Director and Chairman of the new Board. With the reconstitution of the new Board and the appointment thereon of Shri S. Bardhan and Shri S. B. Godiwala as Directors representing the workmen and supervisory staff of the Bank respectively, a new chapter in participative management was opened in the history of Indian banking.

The Board feel considerably gratified with and hereby record their appreciation for, the spirit of devotion and co-operation displayed by all the employees of the Bank, which ensured, in great measure, the results reported above.

For and on behalf of the Board,
Bombay,

P. F. GUTTA
Chairman
28th April, 1973

FROM THE CHAIR

Devidayal Electronics and Wires Limited

(Formerly Devidayal Cable Industries Limited)

Review by the Chairman, Mr Harikishandas T Aggarwal

THE following is the Review of Mr Harikishandas T Aggarwal, Chairman, Devidayal Electronics and Wires Limited, circulated to the Shareholders along with the Annual Report 1972:

OPERATIONS

During the year under review the sales and profits have recorded a further growth. The sales during 1972 were 629 lakhs, which is 19.6 per cent higher than the sales of 526 lakhs in 1971. If this rise in sales is viewed in the light of the loss of production in 1971 owing to a strike in our works, the sales appear stagnant. This can be attributed to the difficult market conditions prevailing in 1972. Owing to the slackness in implementation of plans by The State Electricity Boards, the Transformer industry registered meagre growth. Fan and Meter industries faced a slump. There was a slump in the

afftake of ACSR Core wires by the Conductor manufacturers. Due to the uneconomic export prices, we had also to curtail exports.

The profit before tax amounts to 38.37 lakhs compared to Rs 35.56 lakhs of last year. As a percentage of sales, the gross profits has declined from 6.8 per cent to 6.1 per cent. After the canalization of Copper through MMTC, the price of Copper has been on the increase. The price of Steel has also gone up, during the year. Considering the market conditions, we had to absorb the increases in the cost of these critical raw materials. This has affected the profitability.

STEEL WIRE DIVISION

This division is playing an increasingly important role in the sales and profits of your company. In 1972, the sales of this Division were 174 lakhs accounting

for 27.7 per cent of the total turnover. The sales in 1972 was 20 per cent higher than the sales in 1971, which was 145 lakhs.

The higher profitability and long term demand prospects has prompted us to expand activity in this Division. As you are aware, we had received a letter of registration to enhance the capacity of Steel and Alloy Steel wires to 20,000 tons per annum. We have also completed negotiations with ICICI for a term loan of Rs 20 lakhs to finance the expansion in this division. We hope to complete the expansion project by the end of 1973.

UNION BUDGET

The reaction of the stock market to the budget was one of jubilation, as indicated by the bullish trend in share prices. However, we have good reasons to feel concerned. As you know, Copper

and Steel are the two most critical raw materials used by your company. Both of these have been earmarked for bearing additional burden. The import duty on Copper has been increased from 32½ per cent to 45 per cent. The MMTG has raised the price of Copper from Rs 14.25 Kg. to Rs 16.78 Kg. for the month of March. Due to this price hike, electrical equipment prices would go up by 10 per cent. The State Electricity Boards, which receive fixed quantum of funds, would buy less of equipment. This would affect the demand for the products of your company.

The auxiliary levies on imports would also affect your company. It would be difficult for your company to bear this additional burden and we will be forced to pass on the burden to our customers.

Government proposes to introduce accelerated rates of initial depreciation in place of development rebate. However this concession, is to be extended to a few selected industries, and is a cause of much speculation. I am happy to note that our major expansion projects would be completed before 1st April 1974, and we would draw full advantage of the provision of development rebate.

DEMAND — SHORT TERM AND LONG TERM PROSPECTS

By now, the Corporate sector has come to accept power scarcity as a fact of life. According to Dr K L Rao, the short fall in generating capacity is estimated at 3 million KW for the year. With the states progressively imposing power cuts, industrial production is severely affected, estimated losses running into several crores of rupees.

Located in Maharashtra, we are only marginally affected by the power cut. But we cannot say the same of our customers. The deplorable power situation is likely to impede the demand for our products. Paucity of funds seems to be a perennial problem with the State Electricity Boards. With the drought demanding diversion of resources, we cannot expect any improvement in the status of the power projects.

We hope an early monsoon would put an end to our tribulations. 1973 would be a difficult year for your company. We are however taking steps to maintain the profitability of your Company.

Government has embarked upon a very ambitious power development plan, envisaging an addition of 21 million KW of generating capacity by the end of the Vth plan. Since 1966, the additions during any year have not exceeded 2 million KW. The public sector plants manufacturing power gene-

ration equipment are working at less than 50 per cent capacity and are also postponing deliveries. Unless suitable steps are taken, any acceleration in the rate of addition to generating capacity seems difficult.

Besides, power projects have long lead periods of 6 to 8 years. Hence, emergency measures taken now are not likely to fructify before the end of the Vth plan period.

Government is considering the prospects of importing gigantic thermal power plants. It is doubtful whether the country would have the resources to do so. Considering these factors, I do not foresee any significant growth in the power development projects. And so the demand for your company's products would not grow rapidly.

As an added factor, Government has considerably enhanced the licensed capacity in the Winding wire and Steel wire industries. In the years to come, competition is likely to intensify.

However, we are fully prepared to meet the situation. We propose to diversify into special purpose Steel and Alloy Steel wires. Our Sole Selling Agents are making efforts to tap new markets for steel wires. We have also diversified into the field of electronics, which is a far more profitable field, compared to the existing ones. With these steps, we hope to improve the profitability of your Company.

ELECTRONICS

We have received the letter of intent for the manufacture of 3000 desk top calculators per annum. The prototype was developed by Messrs. Vidyut Research Company Pvt. Ltd. We exhibited our calculator at Asia 72 and it was well received. We hope to introduce the calculator in the market by December 1973. We are confident of selling 100 sets this year and hope to raise the sales to 2000 sets by 1974.

As you are aware, we had also received a letter of intent for the manufacture of 30,000 tape recorder sets per annum. The prototype is under development. We hope to introduce our tape recorder in 1974.

The construction of the factory building at Bangalore, is in progress. It is expected to be ready by September. Meanwhile we have started a training school to train the assembly girls.

The entire project for Calculators and Tape recorders will cost Rs 47 lakhs.

Our Capital Goods application is pending with the government. As soon as it is cleared, we propose to approach the financial institutions for a term loan of Rs 30 lakhs (including Rs 10 lakhs in foreign currency).

Under our letter of intent we have

an export commitment. We have started exploring export markets, especially in USA, UK and Germany. I am happy to note that the response has been favourable. We are confident of meeting our export obligations.

We have plans to enter into a wide range of markets including business machines, entertainment, process equipment, electronic components, etc.

The field of electronics is a virgin field, offering immense potential for growth. The profitability of this division would be much higher than that of the existing divisions. Through our diversification plans, we hope to increase the profits of the Company substantially.

RESEARCH AND DEVELOPMENT

Manned by a team of able technicians, this cell continues to do good work. In the face of a 100 per cent increase in the prices of the chemicals over the last 7 years, R & D department has maintained the costs of varnish, through constant endeavours at import substitution and process development.

During the year, we have successfully manufactured Polyvinyl Formal Resin and Polyvinyl Alcohol Resin, on a laboratory scale. Other accomplishments of the department have been

i) Commercial production of Phenolic Resin.

ii) Development of coloured enamelled wires, with indigenous raw materials.

iii) Thermo bonding enamelled wires.

With constant efforts at development of Enamels, we are now confident of manufacturing quality products. We now have plans to expand the capacity of Enamel department and export Varnish.

We have been fabricating sophisticated machines in our workshop. This year, we built a fine wire drawing machine which can draw Copper wire at 6000 ft./minute. We have successfully modified an imported straight line machine with electronic drive into a double deck block machine.

PERSONNEL

In an economy fraught with industrial strife, we fully recognise the contribution of industrial harmony to higher productivity and economic growth. We are taking steps to put our personnel policies on a strong footing. As a result, we experienced a year of cordial relations between the labour and the management.

I take this opportunity to thank all the employees for their co-operation and sustained efforts which have significantly contributed towards the prosperity and growth of the Company.

H T AGGARWA

The Chemical and Pharmaceutical Industries provide sinews to the growth of the economy.

KNOW ASHOK LEYLAND BETTER—3

Ashok Leyland is developing today

the vehicles you'll need tomorrow!

Ever since its inception, Ashok Leyland has anticipated the country's needs in transport, developed new ideas, and translated them into new vehicles.

That's why Ashok Leyland's contributions to the Transport industry and technology are numerous—and substantial. The Ashok Leyland range—developed from vehicles of 12.156 tonnes GVW up to those

of 45.72 tonnes GTW—includes versatile Haulage and Passenger vehicles; Tipplers; Dumpers; special vehicles for Defence... and also Power-Plus 370 and 680 Diesel Engines for mobile air compressors, generating sets, drilling rigs, fishing trawlers etc.

Ashok Leyland also means a tremendous help to industries, multi-purpose projects and, through them, to the National Economy.

BIG NEWS FOR THE WELDING INDUSTRY

In step with the country's vigorous drive towards self-reliance, Indian Oxygen are indeed proud to maintain their pioneering role in the welding industry by introducing an entirely indigenous MIG welding set. It's guaranteed to be the best, because it has been built with the finest materials. And put together by experts who know welding technology better than others.

The advantages that this Mig 200 can offer :

- ★ Semi-automatic—therefore faster welding, more production.
- ★ Metallurgically sounder welds.
- ★ Big saving over gas welding mild steel sheet metal.
- ★ Considerable saving over electric welding mild steel plates up to 6.3 mm thickness.
- ★ Can weld mild steel in higher thickness in all positions.

MIG 200 for faster and better welds and greater economy.

Doing without Parties

THE rest of India may not catch a cold every time UP sneezes, but when developments in this largest state of the Federal Republic of India lead to its governance being taken over by New Delhi, the matter deserves attention. Ostensibly the reason for imposing President's Rule in UP is last month's revolt of the Provincial Armed Constabulary there. But it is not a very convincing reason, serious as the PAC revolt was from the point of view of the establishment. What seems more plausible is that, seizing upon the PAC episode, Kamalapati Tripathi's opponents in the faction-ridden UP Congress threatened to raise a revolt of their own. Whether or not his opponents would have succeeded in toppling the Chief Minister, they appear to have been able to persuade the party's central leadership, and the Prime Minister particularly, that if the faction fighting was allowed to continue it would effectively impair the party's chances in the Assembly elections early next year. And the Assembly elections in UP, as everyone knows, have for quite some time occupied a very high place in the Prime Minister's scheme of priorities. To put it briefly, then, UP had to be taken under the Centre's wing to make the state safe for the Congress in the elections.

Andhra and Orissa had preceded UP in going under President's rule and it is very likely that some others like Gujarat, Bihar, Madhya Pradesh and Rajasthan may follow it in due course. Of course, many of these states have been under President's rule in the past. But past practice in the matter has been generally for the Centre to step in either when a state was ruled by a non-Congress government or when there was imminent danger of a non-Congress government displacing a Congress one. In this respect things have evidently changed. All the states under President's rule at present had Congress governments, as have all the others who appear likely to end up by being ruled from Delhi; nor was, or is, any of them threatened by a take-over by a non-Congress government. Why has it become necessary for New Delhi to step in even where the Congress party — if not the particular Congress government in office at the moment — is to all appearance firmly in the saddle?

The answer has to be sought in the failure of the Congress party organisation to resolve conflicts which arise within it. As a result, situations which would normally be tackled by the party organisation in the states concerned have to be resolved by the use of the powers available to the Central government under the Constitution. As our correspondent writes elsewhere in this issue, even in West Bengal it required the threat of imposition of President's Rule to bring the warring factions in the state Congress party together for their peace talks earlier this month. The declining ability of the Congress organisation in the states to resolve internal conflicts may be traced to numerous factors. Perhaps the most important of these is the damage done to the party organisation at the time of the split in the party in 1969. In some of the states, like Gujarat and Mysore, the present ruling Congress was unable to take over the established party structure; in many others — Andhra Pradesh and Rajasthan, for instance — the existing party organisation was systematically dismantled as part of the Prime Minister's strategy to consolidate her hold over the party. The further tactic, after the 1972 Assembly elections, of imposing on the states chief ministers hand-picked by the Prime Minister, and with little or no political support of their own, effectively ruled out the possibility of reconstruction of the party organisation. The Barkatullah Khans came to their Chief Ministerships by Indira Gandhi's grace and by it they have been content to rule ever since.

In this general situation making for neglect of the organisational aspects of the party, the economic difficulties of the last year or two have made conflict resolution even more difficult within the party, first, by cutting into the quantum of the spoils available for distribution among the party factions and, second, by sharpening the conflict of interests among certain sections of society — e.g., between the farmers with surplus foodgrains to sell and the urban middle class or between the big farmers who have hogged most of the agricultural inputs in short supply and the middle ones who have to make do with whatever is left — which inevitably got reflected in sharpened conflict within the Congress. Also, the economic difficulties and the Central government's helplessness in their face have dimmed the political halo around the Prime Minister and this has weakened the last restraining influence on factional squabbles in the Congress in the states.

The 1971 elections to the Lok Sabha and those to the state Assemblies last year demonstrated that superlative electoral performance could be built

the Prime Minister. However, in today's situation, these electoral episodes are only of historical interest. Clearly, the consequences of organisational weightlessness are beginning to be felt acutely by the Congress.

What gives these developments a larger significance is that the decline of the Congress as a party does not seem to be accompanied by an uptrend in the fortunes of any of the other parties. The country's parliamentary system thus appears to be headed in the direction of having to function in many parts of the country virtually without political parties. The government's growing reliance on the forces of law and order to keep mass discontent under control is manifest. Together with the role that is devolving on the bureaucracy as a result of the decline of political parties and the proliferation of President's Rule, the prospect therefore is one of the rump of the Congress party that is in power at the Centre ruling much of the country with the help of the bureaucracy, the police, and, as and when necessary in an emergency, the army. None of the established parties has the mass base, except in limited areas, to be in a position to significantly alter this course of events. The more significant political developments may, therefore, have to be increasingly sought outside the framework of the parliamentary system and the established parties.

Food Economy

Chronology of Mismanagement

THE government's hypocrisy in the management of the food economy in the past year and a half will turn even the most ardent optimist into a cynic. A year ago, the government had stocks of nearly 10 mn tonnes of foodgrains, mostly wheat. The Agricultural Prices Commission had recommended in March 1972 a reduction in the procurement price of wheat on many weighty considerations, the most important of which were the cost of production and the large budgetary subsidy involved in government operations in foodgrains. However, the government maintained the procurement price for the 1972-73 season. In the meantime, reports of unsatisfactory weather conditions raised the open market prices of wheat. The Food Corporation unloaded some of its stocks at the subsidised prices and traders gratefully snapped up a large part of it. Panic prevailed in

the government. A programme to import foodgrains was announced, but actual purchases were so delayed that anywhere between one-third to one-half more had to be paid out of the country's scarce foreign resources. As a result of the high open market prices, procurement of kharif grains, planned at 4.6 mn tonnes, aggregated just 2.2 mn tonnes. This was despite the system of monopoly procurement of paddy in Assam, Maharashtra and Orissa, of levy on producers in Kerala, Mysore, Andhra Pradesh, West Bengal and Gujarat, and of levy on millers/dealers in nine rice-growing states. These states had procured 3.2 mn tonnes out of a total output of 42.2 mn tonnes in 1970-71 and 3.1 mn tonnes out of 42.7 mn tonnes in 1971-72. In 1972-73, they could procure only 2 mn tonnes out of an output of 40 mn tonnes, despite the raising of procurement prices by Rs 2 per quintal.

Then came the now-famous emergency production programme which to begin with promised 15 mn tonnes of additional grains at a cost of Rs 150 crores. Now the government is talking of a wheat output of 26.5 mn tonnes — which is to say that the money spent on the crash programme has virtually gone down the drain. On the procurement front, despite the take-over of wholesale trade in wheat, government purchases to date total a little over 3 mn tonnes, considerably lower than even last year's procurement, leave alone the target for this year of 8 mn tonnes. Ministers have talked of imports ranging all the way from 2 mn to 7 mn tonnes. The Finance Minister held out the threat to farmers the other day that if they didn't sell enough grain to the government, it would simply go in for large-scale imports. The "task force" under the Minister for Heavy Industry had a different solution which was to offer Rs 10 worth of inputs for every quintal of grains sold to the government. With the government thus bending over backwards to please the larger farmers, foodgrain traders could be forgiven for offering to help the government procure 7 mn to 10 mn tonnes of wheat if only it raised the procurement price from Rs 76 to Rs 85 per quintal — and, of course, in effect rescinded the trade take-over decision. The government, which once appeared inclined to accept the offer, has on second thoughts preferred to distribute its bounty among state politicians who, after all, know the benefactors of the ruling party better.

To what extent the policy-making machinery at the Centre is in the grip of the rich farmers' lobby is evident from the Food and Agriculture Ministry's proposals, gratefully accepted at Thursday's conference of state chief ministers, for payment of a bonus to state governments for procuring wheat and for higher support price for rice. About 90 per cent of the wheat procurement in the 1972-73 rabi has been done by the FCI, a Central government agency. It is difficult to understand, then, why any incentive should be given to the state governments or how it will help FCI to attract more foodgrains — unless this is to be taken as public acknowledgement of the fact that there is a direct link between the state governments and the holders of surplus grains. The Centre evidently expects the state governments to make use of the funds — about Rs 32 crores if procurement is 8.1 million tonnes and Rs 15 crores if it is 5 million tonnes — for offering incentives to farmers as they think fit. Procurement of 8 mn tonnes is an impossible achievement. Of the less unlikely figure of 5 mn tonnes, about 3 mn tonnes would be from Punjab whose politicians and farmers will thus get about Rs 15 crores. Most of this quantity has already been procured. The total requirement of wheat for public distribution for the next eleven months, at the rate of a million tonnes or so a month, would amount to about 10 mn tonnes. The population nominally covered under statutory and informal rationing now works out to about 420 mn, the highest on record. Wheat being scarce in the international markets and such imports as can be arranged being prohibitively expensive, the poor need have no hope of getting foodgrains from the public distribution system.

The government's decision to treat the higher procurement price recommended by APC as support prices is really incomprehensible. The distinction between procurement prices and support prices is well known to the government. The minimum support prices are "in the nature of a long-term guarantee to the producers that in the event of a glut in the market consequent on excessive increase in production, prices will not be allowed to fall below the minimum economic levels"; procurement prices, on the other hand, are "essentially for the purchase of quantities needed by the government public distribution and include reasonable incentives to the producers" (Annual Report of the Ministry of Agri-

culture, Department of Food, 1971-72, pp 15 and 17). On this basis, the procurement price for paddy had in the past exceeded the minimum support price by about Rs 10 per quintal. In 1971-72, the minimum support price was Rs 46 per quintal whereas the procurement price was about Rs 56 to Rs 58 per quintal. This year, the APC has recommended a higher procurement price of Rs 63 per quintal for paddy — an increase of Rs 5 to 7 per quintal. Now this is sought to be converted into the support price. And, of course, the subject of a levy or monopoly purchases, to get the required quantities of paddy and other grains, was not even mentioned at the Chief Ministers' meeting. The fate of the decision to take over the wholesale trade in rice and paddy from the next harvest was another subject which was apparently taboo.

West Bengal

Outmoded Mores

BY all reckonings, it was an extraordinary event. Throughout the first half of this month, the Writers' Building at Calcutta, which is where the secretariat of the state government is located, was taken over at zero rent by the Congress party. The Chief Minister and the President of the state Congress Committee appropriated the official facilities in the Building to meet the MLAs and other important functionaries of the party hailing from different districts. Factional squabbles within the party had reached their zenith, the daggers and the sten-guns were all out, at least one MLA had lost his life, and there were countless instances of violent confrontations between opposing groups of near-criminals who now constitute the mainstream of the party. These intra-mural affairs of the party badly needed to be looked into, and a venue was necessary where the warring groups could be met by turns. The Chief Minister thought nothing of using the government premises for the purpose. Even the Chief Secretary, supposed to be the principal civil servant in charge of the secretariat and the administration, either did not think that anything was wrong in permitting the Congress the free use of public property and facilities or was too tremulous to protest.

So there it was; a complete identification of the party and the government: Ask not what the party can do for the government, rather ask what

the government can do for the party. It can do, and has been doing, a whole lot. Established procedures for recruitment to government jobs have been suspended in the state, the Public Service Commission has been by-passed, the employment exchanges have been admonished to mind their own business; vacancies in government departments and in public sector undertakings under the control of the state government, such as the State Electricity Board, have been filled up on the basis of lists of names supplied by party hacks. Thus the provisions of the Constitution have been summarily given the go-by; Article 16 pertaining to equality of opportunity in matters of public employment has been despatched to oblivion. The fundamental right of one citizen to be treated on par with other citizens in the matter of employment in government — provided the other conditions have been satisfied — has been brushed aside.

The constitutionalists, in their goodness of heart, would suggest a reference to the courts so that outrages of this nature could be prevented. But one cannot at all be sure that the judiciary would think it fit to interfere. To strike down the appointment of a Congressman on grounds of discriminatory practice may in no time be described as a 'backward-looking' decision. With their prior knowledge about which side their bread is buttered, the judges may therefore decide to turn a blind eye to goings-on, such as currently in West Bengal.

There is also an anachronistic service rule that no government servant may be a formal member of any political party. Following the progressive developments in recent months, that rule too is in the process of being eroded beyond recognition. From now on, it would seem, one could simultaneously be both a government servant and an active functionary of the Congress party; this would no longer be considered as ill manners, nor would it invite administrative retribution. It is, of course, a different matter if you choose your political party wrongly; the government's weaponry will then be out in full regalia to mete out the deserved punishment. Democracy, after all, is defined in terms of who lords it over whom. Even the Greek military oligarchy would feel genuinely hurt if you were to call it by any name other than 'democracy'. So be it here.

Newsprint

NEPA's Lonely Failures

THE National Newsprint and Paper Mills (NEPA) in Madhya Pradesh is the country's only newsprint unit. Set up as a private enterprise in 1947, the company was taken over by the state government in 1949 and by the Central government in 1958. The first machines were put into operation in 1954-55; commercial operations started in 1956-57 at a total cost of Rs 5.41 crores; and the rated capacity of the mill, of 30,000 tonnes per year, was achieved only in 1963-64 — 17 years after incorporation and seven years after the start of commercial production. At present, about 52 per cent of the shares are held by the Centre, 34 per cent by the Madhya Pradesh government, and about 14 per cent by private investors.

In 1963, it was decided to expand the capacity of the mills to 75,000 tonnes per year; a part of the increased output — about 7,500 tonnes — was to come from the renovation of one of the paper machines. The preliminary project report, prepared in August 1963, estimated the cost of expansion at Rs 7.32 crores. The detailed project report, prepared in July 1965, revised the estimates to Rs 9.50 crores. The seventh revision of cost estimates, made in July 1968, placed the cost at Rs 11.71 crores but did not include interest charges amounting to Rs 98 lakhs. Yet another estimate, made in May 1972, placed the expansion cost at Rs 11.95 crores, excluding expenditure on the township of Rs 34.35 lakhs sanctioned *ex post facto* by the Centre. A further sum of Rs 76 lakhs is to be spent on the expansion of the captive caustic soda chlorine and calcium hypochlorite plants.

At the same time, the renovation of the old paper plant, which was scheduled to be completed in 1968, has yet to come about for want of matching pulping capacity and due to other difficulties. It is now expected to be carried out this year. NEPA's new paper machine went into production in March 1969, about a year behind schedule. And this unit too is expected to attain its rated capacity of 125 tonnes per day only after the new pulp unit is commissioned in 1973-74 — after a delay of more than five years.

It is not unusual to find an integrated

paper mill first commissioning its paper machine and operating it on purchased pulp till its pulp unit is erected. However, for NEPA, imported pulp or even domestically available pulp proved to be far too expensive. In part at least this was due to rise in costs, but in the main it was due to the price control on newsprint. In fact, newsprint prices remained stagnant for almost a decade, till mid-1968. An *ad hoc* increase of Rs 50 was granted in 1968 which brought the selling price of NEPA's newsprint to Rs 1,100 per tonne, even as the cost of imported newsprint at that time was Rs 1,243 per tonne. In September 1971, government raised the selling price to Rs 1,362 per tonne, bringing it on par with imported newsprint prices. By then even this increase could not neutralise the rise in costs. NEPA incurred operating losses of Rs 92 lakhs in 1969-70 and Rs 52 lakhs in 1970-71; 1971-72 witnessed considerable improvement and NEPA showed a marginal profit of Rs 4 lakhs.

Government's pricing policy with regard to newsprint not only goes contrary to its general practice of price determination on a cost-plus basis but also inhibits the growth of an industry for whose product the country relies heavily on imports. India imports about 82 per cent of its requirements of newsprint, and the total annual import bill on this account was on an average about Rs 16 crores during 1967-68 to

1969-70. Value of imports increased further to Rs 18 crores in 1970-71, and again to Rs 23 crores in 1971-72.

Apart from NEPA's expansion programme, four newsprint projects are at present under consideration. These include Hindustan Paper Corporation's unit at Kerala with an annual capacity of 80,000 tonnes and three other units in the private sector. Among the private sector schemes, the oldest is that of Ballarpur which has remained at the project outline stage for almost a decade. Considering the progress made in these schemes, it is unlikely that any of them will be commissioned before the end of the decade.

It may be said that, looking at the way NEPA has been functioning, the promise of an efficient indigenous newsprint industry is not all that bright. But the moral of the NEPA story must not be lost sight of. Having taken the initiative to set up the first newsprint mill in the country and despite knowing fully well that demand for newsprint would grow at a fast rate, government has dragged its feet on creating further capacity. At the same time, the fact that the established business houses, which own the major dailies in the country, have not thought it necessary to come forward to set up newsprint units speaks for the absurdity of government's strict pricing and easy import policies.

Calcutta Diary

A M

THIS is a murky story which goes back twenty-eight months. The mid-term elections were barely a fortnight away, the Lok Sabha had been dissolved in the last week of the preceding December, the Prime Minister had asked for a fresh mandate for herself and her Government at the Centre. The halo sparked by the nationalisation of the fourteen commercial banks one-and-a-half years ago was still burning bright. Alongside the elections to the Lok Sabha, a fresh poll had also been ordered for West Bengal, which was under President's rule since March 1970, when the second United Front collapsed. The Assembly poll was touch and go. The CPM was riding high despite the fact that, apart from the support a few non-descript

groups, it was almost going it alone, it was confident about winning a comfortable majority in the state assembly. The two Congress parties, R and O, had their separate lists of candidates; so too was the case with the Bangla Congress, The CPI, the Forward Bloc, the Socialist Unity Centre and a few other of West Bengal's unending sprout of Left parties, who were all mortally afraid of the CPM's growing strength and yet bashful enough to stay away from Indira Gandhi's enticement, were banded together, and had their agreed list of candidates. Distinct from the parties enmeshed in the electoral game were the Naxalites, very much on the rampage at that time. There were, however, Naxalites and Naxalites; already one set amongst them

had begun spitting invectives against another. Polemics, open and under cover, were going on over the advisability of urban terrorism and over the criteria of identification of class enemies in the countryside. The prevalent confusion was being made use of by mysterious elements to infiltrate themselves into the ranks of the Naxalites and perhaps also of some of the other Left parties. West Bengal — particularly Calcutta — was, really and truly, no man's land.

As the best organised party in the state, and with a large following among the organised working class, the poorer peasants and the urban lower middle class, the CPM had continued to press home its advantage ever since Ajoy Mukherjee walked out of Writers' Building in the previous spring. The party was clamouring for a mid-term poll; now that the date of the poll had been announced, it could not see how its prognostications of a smashing electoral victory could go astray. Even when you talked in confidence with representatives of the Congress or the CPI, you could discern an undercurrent of pessimism and nervousness. Civil servants and police officials would wager private bets about the size of the majority the Marxists would be able to chalk up in the Assembly. Some of them had begun making discreet enquiries whether they would be bailed out and provided berths in New Delhi once the CPM marched back to power in the state and made their lives miserable.

NIGHT OF THE JACKALS

Going by external manifestations, it was almost the night of the jackals. Thanks to the Naxalites, and others whom it was impossible to identify with any clarity, greater Calcutta presented an eerie scenario. Battalions of the CRP and the army were all over, on the ostensible ground of maintaining and restoring law and order. Stray knifings and pitched battles between different political, and not-so-political, factions were taking place with a weary regularity. The affluent, and the only-moderately-so, middle class was increasingly worrying over what they believed to be the fast-descending darkness at noon. The newspapers were having a field day apportioning all the blame for what was happening on the Marxists; even the Naxalites, they would argue,

who can deny, were the offspring of the CPM; latter therefore must not be allowed to disown the outrages committed by its progeny. This, however, did not prevent either the Congress or the CPI from entering into temporary, even if clandestine, understandings with this or that shade of Naxalites for shutting off the CPM from this or that electoral area. However dissimilar their motives, there was a broad spectrum of agreement amongst nearly all the other political groups that, never mind the means, the CPM must somehow be stopped.

POLITICAL WAR VETERAN

But none of them was apparently feeling very hopeful. In the face of the organised prowess the CPM was demonstrating, it was almost taken for granted that, short of a miracle, that party was going to win the Assembly elections. Then something happened a bare fortnight before the polls on the misty morning of February 20, 1971 in a desolate north Calcutta lane. Hemanta Kumar Basu was a bachelor and an old political war horse. A respected uncle figure, about everybody in the political world had good words for him. He had been an associate of both C R Das and Subhas Bose, and was President of the All-India Forward Bloc for umpteen number of years. He had ups and downs; immediately following Independence, he had even left the Forward Bloc to join the Congress. That interlude did not last long. Soon he migrated back to the left movement, where he had remained a permanent fixture. It was difficult to think of any Leftist concourse in this state without the presence of Hemanta Kumar Basu, with his drooping moustache, mild manners, and inane, good-natured observations. He was a minister in both the United Front governments, and was a candidate in the 1971 election on behalf of the CPI-Forward Bloc front from the Shyampur constituency. In 1969, he had won from the same constituency, although he had then received the support of the CPM. Nobody knew for sure what the outcome in the ensuing election was going to be.

Around 9.30 on the morning of February 20, 1971, Basu stepped out of his house located in a by-lane in the Shyampur area, walked a few paces up to the intersection of a bigger lane, and was looking out for a taxi. Suddenly, an unnamed of young men converged and pounced on him; the daggers and knives were out; in a couple of dozen seconds or less, Basu's emaciated body was slashed beyond recognition. A few dazed

shrieks, and life ebbed out of the body, almost instantaneously. Their task accomplished, the young assassins disappeared along the deserted lanes and by-lanes. The present Chief Minister of West Bengal, who was campaigning out of town, immediately flew back to Calcutta and confided to the waiting pressmen that he had authentic information that the cadres of the CPM had murdered Hemanta Kumar Basu. The police, while maintaining a facade of impassiveness, arranged with care to let go of a few innuendoes which seemed to confirm the view.

The particular spot where Basu was set upon was supposed to have been a Naxalite belt for the preceding six months or thereabouts; supporters of the CPM could not, for dear life, approach anywhere near it. But this minor aspect of the matter got obliterated by the cacophony raised by the Calcutta newspapers and the collective outrageousness given expression to by the leaders of the Congress, the CPI, the Forward Bloc and others. Simulated or otherwise, it was a massive display of well-targeted revulsion. The long funeral procession with Basu's body the following day was converted into a mammoth demonstration of anti-CPM emotions. A condolence meeting was organised in the *maidan*, and a resolution explicitly accusing the CPM for the cold-blooded murder was passed amid self-righteous frenzy.

CAMPAIGN AGAINST CPM

The CPM was taken totally unawares. The leaders of the party tried to refute the allegation, but their enfeebled voice died in the wilderness of suddenly-acquired untouchability. It was a saturation campaign against the party for a cramped fortnight before the elections. The urban middle class was in particular sought to be aroused against the CPM as it had never been aroused. The All-India Radio chimed in: every quarter of an hour, it would call upon the good citizens to come out on election day and fulfil their noble obligation by voting against the cult of violence. As that day dawned, the scandalised housewives in towns and cities, who had never bothered to bestir themselves in any previous elections, emerged in their thousands; they, the jury, were casting their votes against the murderers of Hemanta Kumar Basu. When the results of the poll were announced, the CPM, it was seen, had lost heavily in several of their erstwhile strongholds in urban and semi-urban belts. On a conservative reckoning,

the murder of Hemanta Kumar Basu cost the party as many as thirty-five seats, each of which it lost by a margin of less than 2,000 votes. In a house of 280, the CPM front could capture only 127 seats, thirteen short of a majority. If only that particular murder had not occurred when it occurred, there cannot be the least doubt, Jyoti Basu would now be the Chief Minister of West Bengal and the political developments in the state in the recent period would have been altogether different.

ENTHUSIASM COOLED OFF

Those who sharpened the tooth of the dog, meaning Death, had the ecstasy of their contentment. What followed was dreary anti-climax. Some arrests took place initially in the wake of the murder. One or two Marxist supporters on the eve of the election, presumably to bolster the impression that the party was in fact responsible for the dastardly crime. Once the election was over, the enthusiasm of the police noticeably cooled off. A few further arrests did indeed follow, but this time from among elements belonging to the Forward Bloc, the party of which Hemanta Kumar Basu himself happened to be the leader; a number of Naxalites were also taken in for questioning. But the salt obviously had lost its savour; the investigation into the murder, stretching over the past two years, has been carried out in a listless manner. The CPM sympathisers who had been picked up were released in no time; not the slightest evidence could be brought together against them. The supporters of the Forward Bloc and the alleged Naxalites, who were subsequently arrested, were also let off. A case was limply proceeded with for several months against a single suspect; a few weeks ago, the police moved a prayer before the examining magistrate that the case against this individual too may be quashed as no evidence could be gathered.

Persons along these shores, who have their vicarious catharsis every morning from generous helpings of Watergate, would perhaps not find the unsolved murder of Hemanta Kumar Basu meaty enough. It is not merely a matter of Naipaul's 'craze for foreign'; there is something more to it — an uncertain compost of fear and guilt complex. A prominent political leader is murdered in open daylight in an open thoroughfare; the maximum political mileage is squeezed out of this murder, accusations are openly hurled by seemingly

responsible political leaders, with covert encouragement from those in charge of law and order, against a particular party; but once the political purpose has been served, there is a great conspiracy of hush-hush: nobody could be bothered to bring to justice the actual murderers. The police could be not more lackadaisical; those leaders who had been bubbling over with enthusiasm in pointing accusing fingers at the CPM have suddenly become tongue-tied. If you visit the spot where the crime was committed and engage the neighbours in discreet conversation, you would come away with quite extraordinary theories about why the government is so desperately anxious to bury the episode of Hemanta Kumar Basu's murder. There would be any number who, with a knowing wink in their eye, would whisper into your ear that Basu's murder was plotted — and executed — by this or that branch of

the police. They would remain vague if pressed about whether the conspiracy was hatched here in this city itself or somewhere else. You would however find it most difficult to shake their belief that there was, and is, much more than meets the eye. If national security would be in jeopardy if the CPM were to come to power in West Bengal, cloak-and-dagger operations to forestall this possibility, they would argue, might be considered as belonging to the genre of patriotic tasks. And if, in order to have the maximum impact, such cloak-and-dagger operations would call for setting up the assassination of a doddering, but widely loved, septuagenarian, why should those who master-mind these things at all balk at it? Those who derive their pleasure from Watergate should have little ground for discovering traces of *lese majeste* in such thought processes.

heartlands. At the same time, the known to enjoy her support would soon build the muscle to cope with these situations, is no longer considered relevant. Sethi in Madhya Pradesh and Barkatullah in Rajasthan are also unable to develop the responses that those situations require. One can hear whispered regrets about the shelving of the Brahmananda Reddys and the Sukhadias. This is acknowledgement that leadership in the state must be based on stable support for this or that leader. In other words, the satrap era is ending — or, so it seems.

EMERGENT PATTERN

We are likely to see many changes in the heartlands. Maybe, in the course of the search for leadership which has a base in these areas, the Centre will begin to realise the fundamental truth which it has so far refused to accept: that the newly awakened political consciousness in the heartlands and elsewhere can only be handled by the recognition that new states will have to be formed out of these old monoliths. Uttar Pradesh and Bihar could yield half-a-dozen states, and half-a-dozen leaderships quite relevant and stable for these states. Put them together, and you have trouble, constant trouble.

Of course, the power elite in the ruling party is reluctant to even discuss the possibility of a reorganisation of our federation at a time when so many other critical problems are unresolved, particularly those affecting economic health. Here and there voices are being raised for the first time in support of smaller states, despite the hysterical opposition of, surprisingly enough, the old protagonists of the idea — the communists. It could be that the political currents of today compel thinking in these neglected directions.

The problem of the flabby heartlands will not yield to a push there and a pull here. A very much more incisive review of the reality of politics and development in these areas will have to be undertaken. Interestingly enough, confidential reports reaching the national newspapers, and those wanting information, suggest that what has been going on in Uttar Pradesh is common to the heartlands — and that goes for PAC discontent and indiscipline. One only hopes that, unlike as in the case of Uttar Pradesh, the GOI's Intelligence network keeps working.

June 11

CAPITAL VIEW

Flabby Heartlands

Romesh Thapar

SLOWLY, with the usual subterfuge and double-talk, it is becoming fairly clear that the heartlands of the sub-continent — those backward areas which wield tremendous political power in our democratic arrangements — will have to pass under President's rule. The political manipulations, the corrosive pressures of powerful lobbies of caste and class, the erosion of morale caused by large-scale corruption, have so shattered the framework of administration and development that there seems to be no other corrective.

Uttar Pradesh and Bihar are at the moment under treatment. I use the word 'treatment' deliberately, because what we see as unnecessary delay in tackling the problem is really the Prime Minister's complex style of persuading the political factions within the ruling or dominant Congress parties in the states to demand Presidential rule. The betting is that both Kamalapati Tripathi and Kedar Pande will unseat themselves, and probably before the Prime Minister leaves for her Yugoslav and Canadian tour.

EXPENSIVE GAME

What an expensive game this is, at least for the wretched states which

come under the malignancy of Congress factions. Of course, President's rule if properly administered is like a shot in the arm. Even Andhra is convinced of its profound benefits, and so will Orissa be despite the love-hate tangles there. Now, the demoralised millions in Uttar Pradesh and Bihar await the benediction. Here, too, the forecast is that President's rule will continue well beyond six months — and that can mean anything.

CANNOT BE WISHED AWAY

The Congress High Command faces a problem in the heartlands which cannot be wished away by appointing this or that factotum. The Congress factions, powerfully based on caste and regional loyalties, have destroyed the elan of the party almost totally. To add to the confusion, the Muslim population is disgusted with the treatment it is receiving, particularly in the matter of jobs at lower levels. For the heartlands to become politically disoriented at this juncture would only complicate the task of managing the politics of the subcontinent in these critical times.

The Congress leadership knows that it cannot tolerate flabbiness in the Prime Minister's notion, that satraps

COMPANIES

Where Smaller Margins Don't Hurt

Hansavivek

SOUTH INDIA VISCOSE expects to complete expansion of its staple fibre plant, from 10 tonnes to 30 tonnes per day, and to begin production using the expanded capacity in October or November next. The company has also got 'letters of intent' for setting up a polynosic plant with a capacity of 20 tonnes per day and for expansion of the pulp plant from 60 tonnes to 120 tonnes per day. The expansion is to be financed entirely by internal resources and borrowings, and no fresh capital is intended to be raised. Last year, the company's production of rayon yarn was less by 423 tonnes and that of wood pulp less by 910 tonnes, compared to the preceding year, owing to a 40-day strike by workers and the power-cut. The

workers resorted to a stay-in strike in November/December on the question of bonus. The matter was settled by payment of 12.5 per cent of the total earnings as bonus and another 15 per cent as *ex-gratia*. The 25 per cent power-cut, imposed in October last, was raised to 40 per cent from February 1 and further to 75 per cent from February 15. Although the company has been using a generator, production has been affected to a great extent. Staple fibre production has been stopped completely and rayon production has been reduced by 50 per cent. The pulp plant, however, is being worked to full capacity. The management complains that STC has not only not accepted the company's claim towards

reimbursement of loss and interest under the export promotion scheme, but has claimed about Rs 28 lakhs as excess reimbursement made by it in prior years. The matter is in court. Meanwhile, the appeal to the High Court, against the levy of fees by the Textile Committee, has been decided in favour of the company. Despite slightly lower profit, dividend has been again stepped up by 4 points to 20 per cent and is shorted with the cover at 0.83.

ALEMBIC GLASS experienced marked contraction of margins last year on account of loss of production consequent to the power-cut and the reduction in prices of some important items due to "stiff competition" in the market. The company could produce 46,125 tonnes — against 50,262 tonnes produced in 1971 and against the installed capacity of 89,000 tonnes. The com-

pany's licensed capacity is 71,040 tonnes. Net sales were Rs 20 lakhs higher, at Rs 661 lakhs, but with contraction of margins, gross profit was Rs 30 lakhs lower at Rs 151 lakhs. Even so, the reduced earnings covered the unchanged 12 per cent distribution 1.96 times. Number of employees entitled to receive emoluments, including benefits aggregating Rs 2,000 or more per mensem, increased by 4 to 25 over the year. The company's investments at book value amounted to over Rs 65 lakhs, including about Rs 51 lakhs in Alembic Chemical. Borrowings amounted to Rs 186 lakhs against Rs 143 lakhs a year ago.

WIDIA (INDIA) has complied with all the conditions imposed by Government for issue of industrial licence for doubling capacity to 48 tonnes per annum, and expects a licence shortly. Last year, the company increased its production from 30 tonnes to 35 tonnes, following increase in the installed capacity from 30 tonnes to 36 tonnes. The company's gross profit increased by Rs 3 lakhs to Rs 47 lakhs. The share capital is only Rs 40 lakhs. Dividend was stepped up by 5 points to 15 per cent, which was covered 5.33 times — against 3.25 times previously. The company has not been able to proceed with further issue of share capital on the terms proposed, as there were restrictions imposed by Government in the context of its application for substantial expansion.

DEVIDAYAL ELECTRONICS AND WIRES, formerly Devidayal Cable Industries, is diversifying into the field of electronics. It has got 'letters of intent' for manufacture of 3,000 desk-top calculators and 30,000 tape recorders per annum. These projects, estimated to cost Rs 47 lakhs, will be financed partly by term loans of Rs 30 lakhs (including Rs 10 lakhs in foreign exchange) from the financial institutions. The factory, being built at Bangalore, is expected to be ready by September. The calculator will be in the market by December and the tape recorder during next year. The company also intends to produce, among other things, business machines and electronic components. In the existing steel wire division, the capacity of steel and alloy steel wires is being stepped up to 20,000 tonnes per annum. Negotiations have been completed with ICICI for a term loan of Rs 20 lakhs for the project, which is expected to be completed by the end of this year. During 1972, the company's sales show-

ed a marked rise over the previous year; but viewed in the light of loss of production in 1971 on account of a strike, sales of the latest completed year have actually stagnated. This is attributed to slow implementation of plans by SEBs, meagre growth of transformer industry, slump in the fan and meter industries, and low offtake of ACSR core wires by conductor manufacturers. Contraction of margins, it is claimed, was the result of rise in cost of raw materials such as copper and steel. The company paid over Rs 18 lakhs by way of commission to sole selling agency firm, in which one of the directors is a partner. The chairman, Harikishandas T Aggarwal, envisages improved profitability for the company.

TRIMURTI AGROCHEMICALS, which is putting up, at Mangrol in Saurashtra, a complex fertiliser plant to manufacture various ratios of NPK to suit different types of crops and soils, is offering to the public equity shares of Rs 15 lakhs to raise a part of the finance required for the project. The installed capacity of the plant will be 50,000 tonnes per annum. The design of the plant is based on technical knowhow and consultancy obtained from Tennessee Valley Authority of the US. Total cost of the project, estimated at Rs 75 lakhs, is proposed to be met by equity share capital, term loans, and bank borrowings, of Rs 25 lakhs each. Orders have been placed for fabrication of the plant on a turnkey basis, and the plant is expected to be commissioned by the end of the current year. Located in a 'backward' area, the project will be entitled to tax concessions and other benefits allowed by Government. The management envisages that the company should be in a position to pay a maiden dividend of 12 per cent, wholly exempt from tax, out of the profits of the first year of production. The subscription list will open on July 2.

KOTHARI (MADRAS), in spite of the increased power-cut, expects to fulfil its earlier forecast of a profit of about Rs one crore — sufficient to pay a dividend of 10 per cent for the year ending August next. The company owns three textile mills in Tamil Nadu and AP, and tea and coffee estates in TN, Mysore and Coorg, which produce about 25 lakh kg of tea and 1,500 to 2,000 tonnes of coffee annually. It also has a coffee curing unit in Mysore state and a phosphatic fertiliser plant. It is proposed to set up a caustic soda plant in Madras at a cost of about Rs

8 crores. The company will also make ammonium chloride by fully utilising chlorine from the caustic soda plant and ammonia from Madras Fertilisers. It is also intended to establish a watch manufacturing unit with Swiss collaboration with a capacity of 5 lakh watches per annum. The company intends to issue 'rights' shares to secure part of the finance required for these projects, which would need a capital outlay of Rs 10-11 crores. According to H C Kothari, managing director, both the new units should be in operation by about 1975-76. With the existing plant and equipment, the company should be able to make a profit of Rs 1.25-1.50 crores in a normal year and pay a dividend of 15 per cent on equity capital.

TRIVENI SHEET GLASS, which is setting up a PPG sheet glass manufacturing unit at Iradatganj near Allahabad, is offering 6,30,000 equity shares of Rs 10 each at par to raise part of the finance required for the project. The installed capacity of the plant will be 5 million square metres per annum of sheet glass on the basis of 2 mm thickness. Estimated to cost Rs 247 lakhs, including about Rs 37 lakhs for land and buildings and Rs 119 lakhs for plant and machinery, the project will be financed by share capital (Rs 100 lakhs) and loans from financial institutions (Rs 147 lakhs). The company has obtained licences to import plant and equipment worth about Rs 45 lakhs from West Germany, France and UK. Hugo Knoblauch of West Germany, a pioneer in the PPG process, is providing technical assistance. The main raw materials — soda ash and sodium sulphate — are available within 10 to 20 miles of the factory site. The plant is expected to go into production in September or October 1974. The company has been promoted by D N Agrawal, who established 18 years ago Hindusthan Safety Glass engaged in the manufacture of glass and mirror glass. About 60 per cent of TSG's production is expected to be taken up by HSG. Agrawal expects TSG's sales to gradually rise from Rs 262 lakhs in the first year to Rs 363 lakhs in the fifth, when the plant will achieve full production. Beginning with a 6 per cent distribution out of the first year's profits, he believes the company should be in a position progressively to enhance it to 15 per cent in the fifth year. The subscription list is opening on June 19 and will close on June 29 or earlier, but not earlier than June 21.

FROM OUR CORRESPONDENTS

Now That Slogans Will Work No More

(From a Special Correspondent)

THIS must already be the season for the Prime Minister to begin a cautious stock-taking. The flood of populist emotions which she found surging to her side in the wake of the nationalisation of the 14 leading commercial banks has sustained her as long as it could. Following the victorious war over Bangladesh culminating in Pakistan's humiliating defeat, admiration for the Prime Minister reached its zenith by December 1971; the elections to the state assemblies in March 1972 proved to be an even greater walk-over for her than the Lok Sabha elections the previous year.

Nobody in the Congress would dare to suggest that the glory for these electoral triumphs belonged anywhere else than the Prime Minister's quarters. As a party, the Congress remains as unreconstructed as ever; it is still a portmanteau of conflicting ideologies and motives. The feather-bedders and the crooks continue to inhabit the party as much as the saints and the dyed-in-the-wool socialists. Given its inherent contradictions, it would be impossible to forge the party into an effective vehicle for political mobilisation at the grassroots. Even when it moves forward, it does so only because the motive power has been provided by exogenous factors. When it triumphs, it is often because of an accidental bequest bestowed on someone at the top; the fallout reaches down to all layers of the party. Similarly, if things go wrong at the top, if the leaders commit a *faux pas* or are embroiled in scandals or tear one another apart in internecine factional quarrels, the consequence too becomes pervasive. From time to time, perfunctory talks take place on the theme of converting the party into cadre-based one; such talks have now entered their umpteenth year. By its very nature, the Congress seems destined to remain condemned to inchoateness; the heritage of the spoils system has a tyranny of its own.

DISAPPEARING HALO

Which means that once the Prime Minister's halo disappears, the party is in danger. Sooner or later it was bound to happen that the stock of goodwill

which Indira Gandhi had accumulated for herself would start to dwindle. Till as long as her charisma was at work, the masses at large had willingly put up with the daily — and interminable — inconveniences of living. Besides, even when the rate of economic growth was just moderate, the pinch of these inconveniences was somewhat less acutely felt despite the acute skewness in the structure of distribution. But as the rate of income growth has petered out and there has been a widening of the temporal distance from the days of Indira Gandhi's glorious coups, the economic distress of the people is finding its sublimation through various manifestations of as yet admittedly minor rebellions. Indira Gandhi is progressively losing grip over events and circumstances. The very fact that she has begun to lose grip in turn ensures that economic administration will henceforth become that much more wobbly, leading to a further slackening of the rate of economic growth.

The Prime Minister is here a prisoner of her own dilemma. The dilemma stems from the gathering of economic forces which she has assembled under the umbrella of the Congress, and whose short-term avarice cuts into the prospects of the nation's economic progress. Each of these forces wants to be subsidised at the expense of the State; none wants to pay any additional tithe to the State. Each of them has got used to being a beneficiary of an unrequited system of spoils. With Indira Gandhi's diminished political prowess, it would now be most difficult to introduce a different behavioural pattern. The nationalisation of the banks, it was once naively thought in certain quarters, represented a watershed in political-economic arrangements in the country, since it heralded the break of the Congress party with monopoly capital entrenched in industry and trade and a purposive shift in monetary policy in favour of the poorer sections of the community, including small cultivators and artisans. In reality, however, following the act of nationalisation, industry and trade have barely experienced any diminution in the flow of bank credit in their direction. The

only thing of significance that has happened is that, at the margin, the affluent farmers are now able to appropriate a higher proportion of bank advances than they were able to do in the past. In terms of rough and ready class alignments, Indira Gandhi's political infrastructure continues to be based on the support of the upper peasantry and the bulk of the urban bourgeoisie. These classes, in their turn, have made use of her populist image to swing in their favour a sizeable segment of the electorate. Her strategy of leaning on radical slogans succeeded in offering opiates to large groups of rural masses, industrial workers and the urban middle class; at the same time her pragmatism ensured that the gravy continued to flow to the kulaks and the urban industrialists.

The growing practice of canalising domestic and foreign trade in the public sector might have provided a basis for the hypothesis that perhaps the government was interested in withdrawing support from at least one clearly demarcated economic class, namely, the trading community. The modality adopted however made it obvious that the illusion was intended to be greater than the reality. Certainly in foreign trade, nationalisation has not implied any erosion of the interests of private trade. In domestic trade too, protective devices have been set to work: erstwhile traders, whose activities have been nominally taken over, have learned camouflage operations, so that the adverse impact of the government's measures has been minimal.

MASS DISSATISFACTION

As dissatisfaction with economic conditions swells among the masses, purely formal gestures would increasingly lose their relevance. The implicit political model tried out during the past few years would then stop yielding any sizeable dividends. One can humour along the people only provided a margin is available somewhere in the economy to be distributed as peripheral bounty. Even where this margin is not available, the largely good-natured electorate can still be nourished on political exhortations and on hope of a blooming arcadia in the future. In view of the extremely short time-preference of the people, however, the latter becomes a rather unreliable instrument. There is a point beyond

which the discounted marginal utility of a prospective heaven fails to counteract the marginal disutility of the heli-lush present bereft of even minimum economic dividends. This cut-off point, seems, has almost been reached.

Given the particular constellation of economic forces hemming her in, there is no obvious way, by which the Prime Minister can extricate herself from the present mess. The slack in agricultural output and the lack of supplies in the international market have made her further vulnerable to the blackmailing of the kulaks. Unless political alliances are completely reshaped, it would therefore continue to be difficult to extract investible surplus of any worthwhile magnitude from agriculture. What is worse, resources raised elsewhere might have to be increasingly deployed to propitiate the elements who control the surplus in agriculture. This would make it impossible also to push ahead with land reforms, which could have been one means of raising the purchasing power of the rural masses and at the same time eliminating the institutional rigidities hampering production, particularly in the kharif belt. All this may slow down the rate of growth in the industrial sector as well, since the latter would be increasingly burdened by rising raw material cost, rising wage cost and a constricted market. The limitations on policy-making set by the compulsions of oral radicalism would make it equally difficult for the government to release industry from some of the administrative fetters placed upon it. The kind of theoretical construct that has often been proposed as a way out of the current stagnation, namely, a gradual relaxation of physical controls on industry to be combined with a larger order of fiscal levies on the gains from the consequential expansion of output, would also therefore not seem to be practicable in the existing circumstances.

THE CHOICE

If there is to be an economic breakthrough, Indira Gandhi will therefore have to exercise a clear choice in her political modalities. Either she has to discard one important element in her present package, namely, the carefully articulated predilection of populist slogans, and categorically declare a moratorium on measures of nationalisation, take-overs, and similar other acts. This will have to be accompanied by

a progressive dismantling of industrial controls and a selective discarding of the commitment to reduce income inequalities through fiscal and monetary devices. In other words, she has to come out openly in favour of an all-out policy of economic *laissez faire*, gladdening the hearts of the Swatantra Party, the Congress (O) and those in her own party leaning in these directions, in the hope that this would have a miraculous effect on the rate of growth of national output. Or, she would have to dare to decide that a tinkering with the existing system is neither here or there, that what is called for is an out-and-out conversion to socialist economic practices. This would involve a switching of her present political alignments, a further period of confusion in the economic sphere, and a

thorough overhaul of the apparatus of the government. The temptation to opt for the first alternative is overwhelming; for this calls for the least alteration from the existing arrangement. It is for the Prime Minister to judge whether the political risk attendant upon such a total alignment with the right is something she can entertain; if, despite the fundamental shifts in policy, the industrialists and the kulaks are unable to lift the economy from its present depths, the resulting backlash could indeed be severe. On the other hand, the alternative of going the whole hog and making a conscious choice in favour of socialist policies all along the line would necessitate a complete alienation from the big bourgeoisie and the kulaks.

BIHAR

To Fight for Yourself Is 'Naxalite'!

(From a Special Correspondent)

ON May 6, four Harijan farm labourers were killed and 31 others injured when the police opened fire in Chouri, a small village 30 km from the district headquarters at Arrah. According to district officials and the police, those killed and injured were Naxalites. Chouri had allegedly become a hotbed of Naxalites who had created a reign of terror in the area. As the police have made out, almost every house in the village was a miniature ordnance factory. Two landlords were killed last year and, naturally, only the landless could be held responsible for the killing. On April 26, 40 maunds of rice which a trader had purchased from a landlord of Chouri were looted just outside the village. On May 6, when a police party went to search the village for the looted rice, it was allegedly attacked by armed Naxalite guerillas. The encounter lasted eight hours, during which the four deaths occurred and the 31 others injured. The extremists had even built a bunker on the outskirts of the village — obviously as part of their plan to give pitched battle to the forces of law and order.

The battle over, the District Magistrate visited the scene of the foiled crime and that evening proceeded to ring up the Patna dailies and the correspondents of news agencies to brief them with the story the police had

furnished. The newspapers and the new agencies faithfully published the official version of the story. On May 15 *Searchlight* carried a 'special report' with photographs of the impressive 'armoury' — two crackers, one or two home-made pipeguns, and some lathi spears and wood-cutting implements — and the famed 'bunker' with the 'brave District Superintendent of Police, who fought the 'eight-hour battle', standing next to it.

However, leaders of political parties, MPs, MLAs and journalists who visited the village had a totally different story to tell. According to them, what was carried out at Chouri was no less than the gruesome murder of four young men at the instance of the landlord to suppress the workers' agitation for higher wages. The suggestion that the workers were Naxalites was intended to shield the real culprits.

The following is an account of the tragedy as it was reported by a group which included Minister Ramjayappa Singh, Socialist leader Ramanand Tiwary, Congress MPs Baliram Bhagat S D Singh and Sadhu Ram, CPI MP Yogendra Sharma, Suraj Prasad, Ram avatar Shastri, Kamala Mishra Madhu kar and Bhola Prasad, CPI MLAs Sant Prasad, Ambika Prasad, Raj Kishor Singh, Nareish Das and Chaturman Mishra, Congress MLA Rajdeo Singh, SSI

leader Karpoori Thakur, opposition Congress MLA Mahavir Paswan, and Chandra Mohan Mishra, special correspondent of *Patriot*.

BACKGROUND OF TROUBLE

Chouri village has about 200 families. Of these, about 25 Bhumi-har families own more than 500 acres of well-irrigated and fertile land. The remaining 175 Harijan and backward-class families have less than 100 acres of land.

Economic disparities in the village have become more marked due to the improved farming methods adopted by the landlords. While the landlords have become richer over the past few years, the wages of the farm workers have remained low and unchanged. Thirty years ago, agricultural labourers used to get two kg of paddy for a 10-hour work-day, and they get the same today. They used to be given 17 'kathas' of land for cultivation for themselves — which of course, also bound them to the particular landlords; now, when productivity has increased, they are given only 12 'kathas'. Loans have always been made on hard terms: the rate of interest charged by landlords was 60 per cent per annum and for every maund of rice loaned to them, the landless had to return two and a half maunds of paddy within four months.

Resentment against such exploitation was growing. During this year's rabi harvest, the landlords wanted the farm workers to harvest the crop during the nights. Night harvesting of rabi is known to reduce wastage to a great extent. The workers wanted higher wages, but this was unacceptable to the landlords who started to threaten the workers. The workers were firm and the harvest was delayed by a few days. Ultimately, the landlords, with the help of some outside labour and some of the less firm among the farm workers, completed the harvesting and threshing. But the tension persisted.

On May 6, a police party of 17 — nine armed policemen and eight policemen with lathis —, headed by an inspector, reached Chouri in the early morning, purportedly to search the houses of the Harijan labourers for looted grain. Accompanied by the landlords, the police party entered the houses of the landless. They allegedly began to beat up and terrorise the workers. According to the police, the villagers put up resistance and forced the police

party to the main road about 200 yards away. No one attacked them there. The police sent for reinforcements from Arrah. Reinforcements — comprising two deputy superintendents of police, heading a party of 17 armed and nine lathi-wielding policemen — arrived at about 10.45 a.m. The reinforced police force entered the village.

Raghubans Sao, a teacher in the local primary school, was beaten up and arrested. Three others — Bhimal, Ganesh, and Lal Mohar — who had taken shelter in Sao's house were attacked by bomb-carrying landlords who were accompanying the police party. Splinters of these bombs hit a police officer too. The three men, though injured, tried to escape but were mowed down by police bullets. As they fell, according to some of the women who were eye-witnesses, the landlords ran up and dragged them by their feet, jumped on their chests, and killed them. Twenty-year old Lal Mohar, who had been working as a driver in Assam and who had returned home last March after three or four years away, was dragged to the house of a landlord. He is alleged to have been killed while his mother's cries rent the air. Dinanath's mother stated that the landlords broke open the front door of her house, dragged out her son and killed him on the spot.

WANTON FABRICATION

That the story of a 'police-Naxalite encounter' is a fabricated version of what actually happened becomes clear from the following.

According to the police, the Naxalites had murdered two landlords — Ramnath Rai on November 29 last year and 70-year-old Karu Rai on April 9. Both murders, however, seem to have been the results of family feuds which are common in Bihar. What is intriguing is that Ramnath's murder was not reported to the police, but was hushed up by the landlords themselves. Karu's murder may have benefited his relatives; even the police did not register it as a murder by Naxalites. Nevertheless, all of a sudden, on May 6, it was claimed that these murders were committed by the village people — allegedly Naxalites.

The two landlords were killed while sleeping in their *khaliha* (place for grain threshing). If there really was a

reign of terror by Naxalites, how did the landlords dare to sleep in the open all alone?

Even the rice-looting incident was not originally registered by the police as an act of the Naxalites. And, though the incident took place on April 26, the police did not go to 'recover' the rice till May — i.e., a gap of eleven days!

It must be remembered, too, that while the police party waited for some 2-3 hours for the arrival of reinforcements from Arrah, no Naxalite 'guerillas' attacked them. Is that credible if the villagers were so organised for violence? The police version, that the workers hurled bombs at the police party, is challenged by the womenfolk of the victims. Anaro Devi told a correspondent of *Conscience*, an Arrah weekly, that "bombs are made in the house of Raghubans *malik*, Ganesh was the victim of bombs thrown by someone from the house of that Bhumi-har *malik*".

APPROPRIATE EXPLANATION

As for the 'bunker', Ramanand Tiwary reported: "I saw the so-called bunker. I don't think that it can be called a bunker of any sort. When I saw it [the very next day of the incident] its mud-roof was still wet. It was a mud structure in which not even one person could stand or lie down properly, not to speak of using it as a bunker. It was such a weak structure that even a child could smash it easily. The more appropriate explanation seems to be that it was a toy-hut built by the village children. It is a common practice among village boys to build small mud structures in mango gardens — where the 'bunker' was found — especially during the summer season".

True to form, the Bihar government has asked the Patna Divisional Commissioner to enquire into the incident, though the officer had been all praise for the police without having himself visited the site. New Delhi is sending some senior Home Ministry officers "to assist the state government in conducting the enquiry". But it will not take over the investigation as "that would amount to interference in a state matter". Indeed it is becoming evident that killing of landless workers — and there has been a wave of such incidents in Bihar — has truly become a "state matter" in the region.

LABOUR

Railway Workers Begin to Organise Themselves

D N

THE rash of partial strikes by various categories of employees and in various divisions of the Railways has its origin in the events immediately following the 1960 strike of Central Government employees. The strikes are also an indication that the Railway employees are recovering from the heavy blows they suffered from the government and from their own leadership.

At least from 1960 onwards the government and the leadership of the two recognised unions (AIRF affiliated to HMS and NFIR affiliated to INTUC) have worked hand-in-hand to keep down the Railway employees. With the territorially far-flung operations of the Railways, the government is in a good position to use one of the classic anti-labour instruments, transfer of workers, in order to break up a strong centre which shows signs of being able to rally and lead workers. In the 1960 strike, the Western Railway Employees' Union (affiliated to AIRF) was one of the strongest units; within the zone, the Bombay division had served as an organising centre. So the leading activists of the union were transferred out of Bombay to remote places. The President of the WREU, Maniben Kara, did nothing to prevent the transfers.

RECOGNISED UNIONS: MAJOR BLOCKS

Since the time of the 1960 strike (except for the brief period in September 1968) the recognised unions have done nothing to organise the railway employees and lead their struggle for tolerable living conditions. They only take personal cases — including those relating to disciplinary action. The membership of the unions has steadily fallen and might now be hardly 10 per cent of the total number of railway workers. However, their position as the 'recognised' union allows them to have a hold over the workers. In all matters the workers have to go through one of the official unions as the Railway authorities continuously refuse to talk with other representatives of workers. The government has been doing everything to help the recognised unions. Union officers are not transferred without union consent. Members of

the managing committees are given passes and special casual leave to attend meetings. Leaders of unions are given air conditioned coach and first-class passes, not only for themselves but for their families as well.

The result of this relationship between the recognised unions and the Railway workers has been a rapid deterioration in the absolute and relative living standards of the workers. Workers in other industries have waged many successful struggles for DA, bonus, etc. These have not led to an improvement in the conditions of workers, but at least it is better than it would have been without their struggles. The result is that while, on the eve of Independence, industrial workers were barely able to match the wage-level of the railwaymen and other government employees, now the wages of railwaymen are very much below those of workers in industry, even of those in government-owned industry. Class IV employees get an average of Rs 263 per month in Mazagon Docks, as against an average of Rs 180 per month in the Railways. The basic wage for railwaymen is higher but the DA is much lower. Similarly, Class III employees of the Railways get much less than junior clerks in industrial establishments.

While their pay is less, the responsibilities of and the risks taken by some Class IV Railway employees like firemen, levermen, keymen, etc., are much greater compared to employees in industries. Firemen have to work long hours, as much as 12 to 14 hours, and their weekly offday is at the discretion of the administration. Station-masters are posted to small wayside stations, where even the most elementary facilities are lacking. In Gandhidham the staff had to wait for the train to come in every day to get water.

REWARD FOR STRIKE-BREAKERS

The deteriorating living standards and oppressive working conditions have increased the militancy of Railway employees. The numerous strikes that have been taking place testify to this. In carrying forward the strike move-

ment, however, the established unions are one of the main blocks. Not only do they work to break strikes, but they are so organised as to prevent the workers from taking control of the unions. The WREU, for example, has a fool-proof system. The President appoints the divisional secretaries who choose the delegates to the meeting which elects the President. Thus, though there have been strikes in every division of the Western Railway and though the WREU has opposed them, Maniben Kara remains the WREU president. The government has, of course, adequately recognised the services of the main strike-breakers. After the 1960 strike, which the INTUC had opposed, Vasavda was given a Padma Bhushan. Maniben Kara was similarly rewarded when she withdrew Western Railway from the 1968 strike, giving floods in Gujarat as the excuse.

To oppose the recognised unions, some general unions, for instance the Western Railway Labour Union and the Southern Railway Employees' Union, have been formed. However, not being recognised unions makes it difficult for them to function.

Faced with the problems of organising all the employees, a possible way to break the recognised unions is to organise category-wise unions. However, such unions can also be quite dangerous, since government could use the unions to spilt the workers and make one section of the workers attack another. It was perhaps realising this, that the Congress also went into organising category-wise unions. Raghunath Singh and Shashi Bhushan have had a hand in some of these unions. In Bombay Congress MLAs and Councillors like H N Trivedi, Jagesh Desai and F M Pinto have played a role. Besides the Congress, the Jan Sangh has also organised category-wise unions. A B Vajpayee was President of one of the Associations.

CATEGORY-WISE UNIONS

These category-wise unions can serve either of two purposes — they can help to break the organisational hold of the recognised unions and release the initiative of the workers, or they can be an instrument for setting one section of workers against another. Which of the two purposes they serve has depended upon the leadership of the associations. All the same, the associations have given some strength to the workers and in places the workers

have thrown off the original leaders and forged their own leadership. A B Vajpayee, for instance, was removed from the presidency of the SMs Association.

The results of these developments have been the numerous partial strikes in many units of the Railways. In September last year the Locomen's Association in Southern Railways went on strike. Their demands were recognition of the union, implementation of the scales recommended by Justice Miyabhoy and an 8-hour working day.

The government replied to this strike by using the Defence of India Rules, which was justified on the basis of drought conditions and the urgent need for moving foodgrains to Kerala. The Railway Minister declared that there was no question of recognition of the Locomen's Association. The strike was called off after a few days.

"MASS ABSENTEEISM"

In April this year, three railway employees from the Ratlam Division (Western Railway) were arrested when they went to present a memorandum to the General Manager. This had been preceded by a strike in the Ratlam diesel workshop. In response to the arrests there was a strike of SMs and ASMs in various divisions. There was also a threat of a strike by SMs and ASMs all over the country.

Since then there has been a 'work to designation' in Eastern Railway, a 'work to rule' in the Godra shed of Western Railway and a strike by Loco Running Staff in Northern and Western Railway. In the last instance there has been no formal strike but "mass absenteeism".

The government immediately invoked the DIR and banned all strikes in the railways for six months. The Railway Minister complained that no notice of the strike been given, nor even any demands submitted. The demands about working hours, etc., however, had been submitted to the Minister, but no appointment for discussing them had been given to the representatives of the All-India Loco Running Staff Association. The demands of the strikers were for a change in working hours and working conditions and for the government to begin talks on these issues.

When the DIR was invoked and strikes banned, the leaders of the strike went underground to avoid arrest. The special strike-breaking force, the Territorial Army, was called in to keep the

trains running. After six days the strike was called off following assurances that there would be no victimisation, that all arrested persons would be released when work was resumed, and that discussions on grievances would be held. The workers thus achieved their main aim of getting the government to talk with them.

GOVERNMENT'S METHODS

The various railway strikes are illustrative of the methods used by government to control the labour movement, which is as yet nowhere near being a revolutionary movement but only a very simple movement for economic demands. In the first place, leaders of recognised unions are the main allies of the government. The recognised unions are being used to break the strike — but so far all their calls have gone unheeded. Peter Alvares of the AIRF has announced a strike from August 27, but no preparations are being made, and it seems unlikely that the strike will come off. Both when leading struggles and when sitting quiet, the methods of the main leaders and the undemocratic structure of the unions gives little room for the workers to express their initiative and establish their control. Further, corruption is normal and union leaders charge money for cases to be taken up.

When these unions refuse to take up any general demands, and the workers take them up through other channels the standard response has been to refuse to discuss them. Thus, even legitimate demands of the workers are completely denied. And workers have to strike in order to force a discussion.

The resulting strike is met by invoking a piece of legislation supposedly meant for the Defence of India. Strikes are banned and the leading workers arrested. There are those who would say that this is a misuse of the DIR, and perhaps even recommend movements inside and outside Parliament to prevent this misuse. The plain truth, however, is that the DIR is not meant for the defence of the people of India but for the defence of the ruling classes of India — both in their relations with neighbouring ruling classes and in their relations with the ruled people of India.

The press and the other instruments of communication mould public opinion against the strike. The plight of the workers is rarely mentioned. All that appear are government handouts, saying that the movement of grains is being affected and that the strikers are

holding the country to ransom. In reality it is the government which, by not acceding to the reasonable demands of the workers, holds them to ransom and forces them to strike.

A part of what is called the Territorial Army has been specially organised in order to break railway strikes. Railwaymen have been induced to join the Territorial Army. Then when a strike breaks out, the military discipline of the TA is invoked to make the railwaymen break their own strikes. As if this is not enough, T A Pai, when he was Railway Minister, envisaged a programme for training unemployed engineering graduates in operating trains — using the reserve army of unemployed against the employed.

POTENTIALLY POWERFUL WEAPONS

The categorywise associations, initially formed by members of the Congress and other such parties, have turned into a powerful instrument in the hands of the workers. In many places the original leaders have been thrown out and workers have taken their place. These associations have by now led a number of strikes. The issues taken up (like working conditions, even recognition) can only be solved at the level of the railways as a whole. The strikes that have taken place should be seen as steps leading to united action. This requires strong regional and divisional units.

There have been attempts to bring all the Associations together. A Confederation of Associations was formed in 1970. But as yet it has little power. Many meetings have taken place, but the unity moves have been sabotaged by the political parties, including the CPI and the CPM. CITU declared that it would not work with AITUC. Even as late as October 1972 the two obstructed a meeting to work out united action. Perhaps, these parties only want unity when it is under their own hegemony. Any other unity is not to their liking.

The strike called for August 27 has given the railway workers a great opportunity. The AIRF has given the call in order to demonstrate that it too is doing something. But this call can be used by the Associations. In the name of supporting the call by the AIRF they can virtually organise the strike on their own. It is then very likely that such a strike will unite all the railwaymen's associations.

Land Grabbers

THE official committee of eight Punjab MLAs, presided over by Harchand Singh (Congress) has listed dozens of "influential persons" who have acquired land through dubious transactions with the connivance of key officials. The Committee, comprising six Congressmen, a CPI legislator and an Akali, submitted its report to the state government early this month. Many of the "land grabbers" have already disposed of the property, netting tidy sums in the process. Among the politicians exposed by the committee are present and former Ministers, ruling party legislators, IAS, PCS and Police officers, including members of Scheduled Castes, two sub-judges and some non-Congress politicians, notably a senior CPM leader. According to the committee's 200-page report, many of the land grabbers have acquired large farms by exploiting their positions and deceiving others. The Committee has also pointed out that some influential persons had bought land in open auctions "because the law was defective"; their responsibility, in the committees' view, was only moral because they had misused their political influence.

Of the scores of instances quoted, some are indeed glaring. Land worth Rs 10,000 at market rates had been bought for Rs 100. The father of a Congress member of the Lok Sabha is stated to have bought 300 acres of surplus evacuee land for Rs 25,000. The subsequent sale of one-third of this land brought him Rs 3 lakhs. Then there is the case of a member of the present Congress Ministry who some years ago bought about 90 acres of land at the reserve price in the names of his wife, a sister-in-law and an employee. Another politician acquired 72 acres of *banjar* (barren) land very cheaply in his wife's name. Another influential person has built up a 275-acre farm which is the envy of many.

Several civil servants have followed the example of their scheming bosses and are in unauthorised occupation of evacuee land. What is more, some have not made any payment at all to the state government and not paid even the penal rent which formerly was eight times the land revenue and is now 20 times. There are greedy police officers, too. A Deputy Superintendent of Police is stated to have illegally established a 300-acre farm.

Another DSP has likewise set up a 100-acre farm. A senior office-bearer of the state Congress bought evacuee land for Rs 4,000, although he was not entitled to it. Soon after he sold it for Rs 40,000, well before the expiry of the prescribed 10-year period. A PCS officer has a 123-acre farm, another a 125-acre one; and yet another bought a 55-acre farm for barely Rs 8,000. A magistrate has set up a 190-acre farm which he bought at a rigged auction for Rs 21,000; a colleague of his purchased a 61-acre farm at a similar auction for Rs 6,000.

Several political parties have demanded speedy action to reverse these shady land deals. The Deputy Leader of the Assembly Akali Party has sought a high-powered, all-party body of MLAs to ensure implementation of the committee's recommendations so that the grabbed land may be recovered and distributed among members of the Scheduled Castes. At a press conference on June 8, Chief Minister Zail Singh assured "proper action in the matter, irrespective of the status of the people involved". But the indications are that, despite all the loud talk of socialism and economic justice, most of the culprits will not be proceeded against on one ground or another.

Another issue that has gripped public attention in recent weeks concerns the share of Harijans and other backward classes in the Punjab government services. Harijans and backward classes form about 27 per cent of the states' population and their goodwill is vital to the ruling party. To counter the campaign recently launched by some Harijan leaders against the Congress ministry for failing to give them their due, the Chief Minister announced on June 3 the revival of the scheme to reserve a quota of Class I and Class II posts for Scheduled Caste employees. The proposal was originally accepted in 1963-64, but was shelved in 1966. The unstable ministries which were formed in the succeeding years made no effort to implement it.

Preferential treatment of Scheduled Castes in appointments and promotions not only involves sacrifice of merit but also leads to anomalous situations that cause considerable heart-

burning among employees whose claims are bypassed. The existing practice has led to an interesting controversy. Punjab's high-powered Committee on Scheduled Castes' Welfare has unanimously urged the government to reserve for Harijans 10 per cent of the posts in promotions in Class I and II services. The Committee, headed by the Chief Minister himself, has also sought reservations in semi-government bodies, aided schools, colleges, universities and local bodies. To counteract this partiality, the Punjab Non-Scheduled Castes Welfare Association has demanded the appointment of another committee to examine its plea for reservations in government services on the basis of "economic backwardness" rather than on caste considerations. Many Harijans now belong to the higher income group but continue to enjoy the concessions designed for the poorest category.

"If the privileges of the princes can be abolished," the Association has pointed out, "then why not remove the well-to-do people among the Harijans from lists of people who are at present entitled to concessions and reservations?" The Association intends to submit a memorandum, to be signed by one lakh government servants, urging abolition of reservations for Scheduled Castes. Members of the Association are especially critical of the system of promotion on a caste basis. If any preferences and concessions have to be given, the Association president has said, they should be available to anyone earning less than Rs 300 per month.

Himachal Pradesh has also taken up the question of accommodating more members of the Scheduled Castes and other backward classes in government services to keep them contented. A special cell has been created in the Personnel Department to ensure adequate representation to these classes. No vacancies reserved for them are to be "de-reserved" without the Chief Minister's permission. The reservations have not been confined to initial recruitment but have been extended to promotions for non-selection posts. To give a fair opportunity to all backward classes, their candidates are being assessed by different standards. Performance at the university level, an official spokesman said in Simla the other day, could not be made the sole criterion; otherwise the appointment of selection bodies and boards would become irrelevant.

The Peace Protocol

AFTER the recent spurt of sanguinary clashes claiming more than a dozen lives, including that of a sitting MLA (a former Minister), a 22-point protocol for inner-party peace has been signed by 31 faction-chiefs of the Congress and their mediators. The apparently smooth passage of the protocol's formidable list *dos* and *don'ts*, through the motley crowd of state Congress bosses, senior ministers, and their young henchmen, was obviously clinched by New Delhi's firm threat that President's rule would be imposed if there was continued deterioration in the intra-Congress situation. At the same time, the ground for a partial defusing of the tension had been prepared by some subtle manoeuvre — such as the Chief Minister's cultivation of his cabinet colleague, Tarun Kanti Ghosh.

It is no secret that the patronage and resources of Ghosh, who has been nursing aspirations for the top position in the West Bengal government and has grievances against Ray for being cold-shouldered by him, were the mainstay of the principal line-up of challengers to the Priya Das Munshi-Subrata Mukherji axis. Ghosh's recent softening towards Subrata Mukherji and a corresponding public posture of partial disinvolvement with the rival faction of Lakshmi Kanta Bose, Somen Mitra etc, considerably cramped the style of the latter. As a result, the dissidents, unable to press home their hard-won advantage at the critical moment, had to climb down from their demand of ousting Subrata Mukherji from the Home (Police) Department and to agree to the compromise.

NO MORE THAN A RESPITE

While the omnibus agreement may lead to an immediate easing of intra-Congress tensions, long-term prospects do not appear to be at all bright. As admitted officially by the Chief Minister and the state Congress chief, the recent flare-up of violence in the party was inspired not by ideological or political differences, but by considerations of personal profit and career. This inevitably means a constant struggle for changing the inner-party power equation and its reflection at the government level — in defiance of all codes of conduct, however nobly worded.

What immensely complicates the

situation in West Bengal is the proliferation of the armed gangs, pampered and encouraged by the tallest of the Congress leaders in the course of their struggles against the militant Left. The same dark forces of the underworld, courted by the various Congress contestants for power and position, have acquired a certain autonomy of their own and the tail is threatening to wag the dog. In the present context, "anti-social elements", as a leading Calcutta newspaper sharply pointed out, "have had and will continue to have a political role to play. They have become almost an inseparable part of the system and cannot be got rid of without the party getting seriously hurt in the process" (*The Statesman*, June 9, 1973).

NO AMNESTY

Only a few days ago, the Commerce and Industry Minister, Tarun Kanti Ghosh, had publicly mooted the suggestion that Congressmen should surrender their (unlicensed) arms. Not only did the suggestion fail to evoke a favourable response from any Congress quarters, but the Minister of State in the Home (Police) Department, Subrata Mukherji, virtually scotched the suggestion by declaring that there would be no amnesty for those surrendering their arms!

A further factor that has a bearing on the law and order situation in the state, is the involvement of a section of the higher levels of the police in the Congress party's faction-fights. As the *Hindustan Standard*, which cannot be accused of harbouring anti-Congress sentiments, recently wrote editorially: "The police become inactive when the administration stops being impartial. If the police in this state are behaving like passive onlookers, the fault lies not with policemen but with those leaders of the ruling party who are trying to bend them to the will of one warring faction or another... There cannot be any rule of law in a situation in which even the police are under pressure not to abide by the law but to act as dictated by the faction leaders."

It would be naive in the circumstances to expect anything more than a temporary lull in the wave of violence that had engulfed the ruling party in the past few weeks.

The 'political' dimensions of the law and order situation in West Bengal were recently highlighted by the stricture, passed by a Presidency Magistrate in Calcutta, on the conduct of the official prosecution. When the aged Forward Bloc leader, Hemmanta Kumar Basu, was murdered in broad daylight in North Calcutta in February 1971, Siddhartha Shankar Ray and the present Inspector-General of Police (then Police Commissioner of Calcutta) had instantly ascribed the crime to the CPI(M). The young man who was subsequently arrested and sent up for trial for the crime could not be associated with the CPI(M) by any means. The Left Press, in fact, identified the accused with the Congress. After months of procrastination, the Director of Public Prosecution, West Bengal, submitted to the trying magistrate that "there was no witness to identify the accused and no useful purpose would be served by proceeding with the case". After this had led to a considerable hue and cry in the Left Press, the Director of Public Prosecution sought to withdraw the application.

"EXTREME INDECISION"

The magistrate criticised the "extreme indecision" displayed by the prosecution and observed:

"I have carefully gone through the case diary and as a result I am of the definite opinion that, for the interest of the prosecution as well as of the accused, the committal enquiry should, be disposed of by examining the witnesses of the occurrence and not otherwise. I, therefore, reject both the petitions filed by the prosecution."

At the subsequent hearing of the case, an application was moved on behalf of the Forward Bloc Secretary for permission to allow the party to appoint an advocate to assist the prosecution. The Forward Bloc leader's arguments were that "the case was not properly investigated by the police. He apprehended that the case would not be properly conducted and that for the fair conduct of the case, he was praying for permission of the court to engage a lawyer to conduct the prosecution case as per provision of law under Section 495 of the Criminal Procedure Code."

No Time to Play It Cool

Magnus

THE Department of Mines, under the Ministry of Steel and Mines, has been in the news quite often during the past two years for its 'takeover' activities. Its Report for 1972-73 is however a dull document compared to its predecessor. The Department of Mines, like All India Radio, seems to believe firmly that what is due to happen in future (particularly in government agencies) is much more newsworthy than what has happened in the recent past. Its Report thus serves up a curious mixture of facts, fallacies and predictions. Data on actual performance are presented along with figures abstracted from reports of the Fuel Policy Committee, various Task Forces and the Plans; to these is added some plain wishful thinking. To take the example of coal; output is reported to have increased from 72 mn to 75 mn tonnes, and the target for the current year is given as 80 mn tonnes. The Task Force set up by the Planning Commission estimates the demand for 1978-79 as 143 mn tonnes. Ergo, the Ministry comes up with a quick breakdown of how the four public sector companies would boost their production (not merely capacity) from 72 mn to 143 mn tonnes in the next four years. It would be a miracle, and one wishes them the best of luck.

While on the subject of coal, it would appear opportune to wind up both the Coal Board and the Coal controller's office. The former deals with safety and conservation measures and provided subsidies to the many coal mines which used sand-stowing. The Coal Controller was meant to ensure equitable distribution of coking and blendable coal, and to subsidise rail-cum-sea despatches of coal. Now that all coal mines are owned by the government, the subsidies granted to, and special cesses collected from, various producers can both be withdrawn. Bharat Coking Coal in particular was formed to ensure conservation and proper extraction of coking coal reserves, and may be expected to carry out the two organisations' tasks jointly with NCDC. If this reduces the number of cushy jobs going, so much the better.

Iron-ore too has a lot of headway to make in the next five years. Its production has to go up from the present 34 mn tonnes (exports 21 mn tonnes) to 65 mn tonnes (exports 35 mn tonnes).

The National Mineral Development Corporation has shown a slight drop in production for the third successive year, to 4.3 mn tonnes. At Bailadilla, its producing mine as well as a newly-developing mine are reported to be in difficulties which are admittedly the result of faulty planning. Throughout the section on NMDC, there is again no mention of such matters as income, expenditure or profits: either these do not matter, or the NMDC is modifying its accounts procedures for over two years. An Iron Ore Board with a full-time Chairman and five full-time Members was formed in January 1973 to act as the "policy planning and developmental agency, draw up perspective plans... etc". This must intrigue people in the Steel Authority of India who were gearing up to do the same job.

The section on copper, lead and zinc is mostly routine. Hindustan Copper reactivated the old reverberatory furnace of Indian Copper Corporation so as to increase the available smelting capacity to 26,000 tonnes per year. At Khetri, the new smelter may be commissioned by December 1973, thus adding 31,000 tons smelting capacity. Nobody seems to be talking of how to feed this massive copper capacity of 57,000 tons per year, and how long it will take to build up the necessary ore output of nearly 18,000 tons per day. Hindustan Zinc's zinc smelter produced nearly 25 per cent less metal than in the previous year, and this year has also started badly due to frequent power failures. The Company has entered into technical consultancy agreements with French, West German, Polish, British and US Companies. Don't they know that Sweden and

Canada also have flourishing zinc mines?

The Gold mines in Kolar were reinstated as a Company in April 1972, and placed under charge of a former Professor of Mining. The terms are that KGF will supply gold to the Centre at IMF prices, and would receive central assistance not exceeding Rs 4 crores per year. The production cost is a little in excess of Rs 310 per 10 gm, which means that the mines are economically viable at today's market gold price. The effect on smuggling operations of selling in the market about 20 lakh gm gold per year is worth examining, apart from savings of Rs 4 crores per year to the Centre. There is no mention of the Hutti Gold Mines, which also produce substantial quantities of gold for sale in the open market.

The Department itself has undergone some changes; NMDC, BCCL and Manganese Ore India now function as subsidiaries of the Steel Authority under the Department of Steel. In spite of losing these major subsidiaries, only three out of 17 senior officers were transferred to the Department of Steel. The Ministry's Chief Technical Adviser, Chari, recently took over as Secretary to government in the same Ministry. His two former assistants comprise the Technical Cell, which "advises on all technical matters relating to mining and metallurgical projects, scrutinises and evaluates feasibility and project reports, monitors progress... and assists in planning and programming of projects". Sounds like an awful lot of work for two persons. There is indeed an awful lot of work to be done in the minerals field in the next decade, particularly in the matter of raw materials to feed the steel and cement industries. (The little-mentioned limestone quarries will have to deliver a staggering 53 mn tonnes by 1978.) The Department seems to be playing it cool when it is really time to do the opposite.

Journey from Dindigul

WHEN the Anna DMK was formed there were many political commentators who sneered at it all. They could not even imagine that shifts in political loyalty do not always manifest themselves in a clear-cut manner in a country where political articulation is still in a medium state of development.

The resounding success of the ADMK candidate in Dindigul indicates that a decisive shift has taken place in Tamil Nadu's politics. The DMK mass has moved over and moved over to more radical positions. It is not mainly a negative vote and it is certainly not a vote for a personality, though M G Ramachandran certainly exercises a tremendous pull. But had the same MGR stuck on in the DMK he would not have become the symbol of the desire for a thrust to the Left as he now has. His personal popularity has become an important political factor because of the political stand that he has taken and the constellation of political forces that he has brought into being by his challenge to Karunanidhi.

The vote against the DMK was a vote against all that the DMK had been doing in the past few years. The failure to implement its programme, the attack on organised labour, the letting loose of a private-army of hired hoodlums, the discovery of the 'vices' of the USA, etc — all this was a definite departure from the earlier radical promise of that party. And yet the radical protest against this deviation had its limitations. The mass through its experience had not learnt to trust any alternative. They wanted change, as so often happens, by a return to the past. This had happened with the Congress in 1969-72. It has happened again with the DMK in 1972.

The whole point was to understand this process in order to be able to intervene and influence it; to take the new thrust to radicalism as it was and not as it ought to have been. Anybody who has taken the trouble to go to the mass meetings organised by the ADMK or to talk to the young men and women who followed MGR would have realised the vitality and the potential of this new phenomenon. After all, if it was only a vote against whoever happened to be in power, there was Kamaraj to turn to. Quite the opposite, however, happened. Some who had been following the rather unusual Syndicate leader turned to the ADMK. Thus, not only

was the DMK severely punished but the Right also received a sharp setback.

The Congress debacle was totally deserved, though it is doubtful if the proper lessons are being drawn by the state Congress leaders as well as some of their mentors in the High Command. The Congress does have a place in the politics of Tamil Nadu and, because of the all-India picture, quite an important place but it is not the most important or dominant place. It will have to be content to play second or third fiddle in this state. That is all it can play. That is what it should play if it has any concern for the survival and forward movement of the country. There are some in the Congress who are of the view that it would be possible to inveigle Kamaraj back and that then the Congress would be able to stand on its own feet. But such a rapprochement could only take place on the basis of a significant turn of the Congress itself to the Right, a continuation or resumption of the strategy that was tried on an all-India scale in 1972 with quite disastrous results for the Congress.

A most encouraging development has been the decision of the CPM to join the ADMK-CPI alliance. It is all to the good that Ramamurti and some of the state leaders of the CPM were able to overcome the resistance of some of the more sectarian and opportunist sections in their own party and decide to go in for the alliance. There was a trend in the CPM which was of the view that the Congress being the main enemy and the ADMK-CPI alliance not being anti-Congress the best course would be to try for some kind of understanding, if not alliance, with the DMK and the Congress(O). This, it was felt, would represent a force that would be able to effectively challenge Indira Gandhi from Tamil Nadu and become a part of the "gherao Centre" movement which both the Grand Alliance and the CPM envisage as the best means of ending Congress rule. That this tactical line has been rejected at least for the time being is all to the good. After all, the CPM does have a mass base among sections of the working class and agricultural labourers and its swinging into the ADMK-CPI alliance would help to bring a better class content into the alliance. Of course, Ramamurti and some other CPM leaders try to explain their present tactical line on the basis that since the ADMK did not have an under-

standing with the Congress there was no difficulty in working with it. But this is a far from satisfactory explanation. After all, it was not as if the ADMK had rejected the overtures of the Congress. Exactly the opposite happened — the Congress decided to go it alone. Further, immediately after the election results were announced MGR declared that he did not consider the result to be a verdict against the Prime Minister and that he wished to seek her co-operation as also that of her party. Neither anti-Congress nor anti-Centre tones were to be discerned in this most politic statement.

It would be all to the good if the CPM threw its whole weight behind the demand for the removal of Karunanidhi and sat down with the ADMK, CPI as well as the Congress (if the latter is wise enough to shed its utopian hopes) to work out a programme for Left and democratic advance in Tamil Nadu. This would provide it with fresh experience and facilitate its return to the mainstream of the Left and democratic movement in the country.

Dindigul has opened up fresh prospects in Tamil Nadu. The journey that has begun there can lead to the consummation of the process that began with the DMK victory in 1967 and which continued with that party opposing the plans of Right reaction to take over the Congress in 1969-71. The deviation from that course effected by Karunanidhi has led to his isolation and then the Dindigul debacle. Tamil Nadu is Kerala's neighbour. It has begun or rather resumed the journey to becoming its comrade with, of course, its own very specific identity.

Kothari Sugars

KOTHARI Sugar and Chemicals expects to crush about two lakh tonnes of sugarcane with an average recovery of about 9 per cent during the year ending August 1973. On this basis, the company should be able to earn a profit of Rs 40-50 lakhs and pay a dividend of 10 per cent on the increased capital of Rs 160 lakhs. The new factory being put up at Siruguppa, with a crushing capacity of 2,000 tonnes per day at a cost of Rs 3.9 crores, is expected to be commissioned in December next. According to H C Kothari, a director, the company should be able to step up dividend to 15 per cent for 1974-75. Steps have been taken to enlarge the crushing capacity of the Kattur factory to 2,200 tonnes. In addition, it is intended to set up a distillery at Kattur or Siruguppa and also a milk powder plant at Kattur.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

Announcement regarding the issue of 5,00,000 Equity Shares of Rs. 10 each and offer for sale of 1,00,000 fully paid up Equity Shares of Rs. 10 each, both at a premium of Rs. 20 per share. Persons interested in full details may obtain copies of the Prospectus and Application Forms from the Managing Brokers, Brokers, Underwriters and Bankers to the Issue mentioned hereunder. The subscription list will open at the commencement of banking hours on Monday, June 25, 1973 and close at the close of banking hours on Wednesday, July 4, 1973 or earlier at the discretion of the Directors, but not before the close of banking hours on Wednesday, June 27, 1973.

An application has been made to the Calcutta Stock Exchange for permission to deal in and for an official quotation for the Equity Shares of the Company.

Bata India Limited

(Incorporated on December 23, 1931 under the Indian Companies Act, 1913)
Registered Office : 30 Shakespeare Sarani, Calcutta-700017.

HISTORY, ACTIVITIES AND OBJECTS OF THE ISSUE :

The Company was incorporated under the name of Bata Shoe Company Limited on December 23, 1931. Pursuant to the requirements of the Companies Act, 1956, the Company's name became Bata Shoe Company Private Limited in April 1956. The Company became a Public Company on April 7, 1973 and its name was changed to BATA INDIA LIMITED. The objects of the Company are fully set out in the Memorandum of Association and in particular to carry on business as boots and shoes manufacturers, dealers in hides and skins, manufacturers of and dealers in rubber goods, footwear machinery and carry on business as tanners.

Starting the first production of Rubber and Canvas shoes in India in its rented premises in Konnagar, near Calcutta, in 1931, BATA-INDIA set up its factory in Batanagar—the "TOWN OF GOOD SHOES" (near Calcutta)—where production of Leather Footwear started in 1936. Tanning was introduced in Batanagar in 1937 and a Rubber Collecting Station established in Kottayam, Kerala in 1939. A Machinery Department (now a full-fledged Engineering Division) was established in Batanagar, which produced the first India-made major shoe machine in 1942. Simultaneously—Chemical, Research and Auxiliary Departments were set up to cover operational needs and to meet deficiencies arising out of import restrictions and non-availability of materials and equipment. The growing demand for the Company's products called for substantial increase in its output and the Company embarked on its expansion programme. A Leather production unit was established in Bataganj, near Patna in 1942; a Rubber and Textile production unit was started in Faridabad, Haryana in 1951; and the country's most up-to-date Tannery was set up in Mokamehghat, Bihar in 1952.

BATA-INDIA thus grew to be a great industrial complex, which it is today—employing over 22,000 people in its factories and sales network and still aspiring to meet the evergrowing demand for a very wide range of products. Today the Bata plants produce 4.5 crore pairs of footwear annually. The Company assists the footwear manufacturers in the small-scale sector by providing them training facilities, technical know-how and marketing. The Company is a major supplier of footwear to the Armed Forces and is also the leading exporter of footwear in India—earning over 4 crores of rupees annually in hard currency foreign exchange. With rapid industrialisation of the country and self-sufficiency in food, shoe wearing habits are bound to grow both in the urban and rural areas. The Company also expects to make steady progress in its exports as heretofore.

With a view to introducing Indian participation in the Company's shareholding, negotiations were started with the Government of India and the Government has given its approval to an issue of 5 lacs new shares as well as a sale by the existing shareholders of 4 lacs shares to the Life Insurance Corporation of India and the Unit Trust of India and a further one lac shares for sale to the public, all at a premium of Rs. 20 per share of Rs. 10 each.

The object of the issue of new equity shares and offer for sale of five lacs existing shares is to implement the scheme approved by the Controller of Capital Issues for Indian participation in the Share Capital of the Company. The issue of the new equity shares will also result in augmenting the financial resources of the Company.

APPLICATION FOR SHARES

Applications for shares shall be made only by Indians resident in India and must be for a minimum of 50 shares or multiples thereof. Application Forms duly completed together with the amount payable on application i.e. at the rate of Rs. 15 per share must be lodged before the close of the Subscription List with any of the above two Bankers to the Issue at the places mentioned against them. Applications must be made in single names only and not in joint names. Transfer to joint names will, however, be permissible subject to the approval of the Board of Directors after allotment is made. An applicant should submit only one application (and not more than one) for the total number of shares required. The Board of Directors reserves the right to reject in its absolute discretion applications in joint names and multiple applications by the same applicant.

The Political Change in Australia

R F I Smith

THE change of national government in Australia in December 1972 signified the beginning of a new stage in Australia's development as a small, wealthy, ethnically European country on the fringes of South-East Asia. For the first time since 1949 the Australian Labour Party (ALP), led by Gough Whitlam, outdistanced the Liberal-Country Party coalition. Even before the final settlement of the results in individual constituencies Prime Minister Whitlam and his deputy Lance Barnard took a series of administrative initiatives which changed the direction of national policy at home and abroad. With the swearing in of the full cabinet of 27, and the summoning of parliament for its first session under Labour, the pace has been fully kept up. In the process there have been an acceleration of trends apparent in the closing years of the Liberal regime as well as new departures in proposed public policy. The effect has been to revive faith in the efficacy of the electoral process as an instrument of purposive change; to win the interest and commitment of many of the intelligentsia alienated from the previous drab and unjust governments; to raise new interest in other countries in Australia's international potential; and to dismay the faint-hearted who are rather flabbergasted to find Australia's long-lapsed reputation for radicalism getting a new lease of life.

The Liberal Party is still in a state of shock and although it has replaced as leader the luckless former Prime Minister William McMahon with the younger Billy Snedden, it has a long way to go before becoming a credible opposition. Its current re-appraisal of its policies and organisation will be prolonged and uncomfortable. Its coalition partner, the Country Party, came out of the election in better shape but, faced with a declining rural base and the possibility of a redistribution of seats which eliminates preferential treatment for country areas, is looking for ways of broadening its appeal. The Democratic Labour Party, which split from the ALP in 1955, made an issue of the ALP's alleged penetration by communists, and yoked tirelessly to keep the ALP out of office, has had to review its whole strategy and reason for existence. When by directing its preferences (under the Australian pre-

ferential system of voting) to the Liberals it manifestly contributed to their electoral success, it had a clear role in the political system. Now that it has failed in its job as nark and roadblock to the ALP it too is looking for a wider base. Thus it is having merger talks with the Country Party and a union of the two parties is a distinct possibility.

Although the vigour and intensity of Labour's approach to government caused surprise the result of the election itself was not a shock. Indeed some had expected the old government to have been defeated by a wider margin. Quite simply the old government was worn out. Its central policies had eroded and it had neither the imagination nor the will to construct new ones. Much of the success of the old government had rested on two foundations — contentment at home and fear of the 'red peril' abroad. In 1949 the Liberals took over from the Chifley Labour government an orientation to domestic politics which included federal government management of the economy, full employment and federal predominance in significant areas constitutionally the responsibility of the states. Innovations made by the government were limited; to a large extent the Liberals presided over the working out and running down of the policies they had inherited. In foreign affairs their approach was similar. They accepted the alliance with the United States made during the 1939-45 war and stuck to it without imagination. At the same time they strengthened their electoral position by dramatising perceived external threats to Australia and exploiting the feelings of racialism, xenophobia and anti-communism that run close to the surface in sections of the Australian electorate. This mixture had its most spectacular effect in 1966 when Harold Holt led the coalition to a crushing win over Labour on the issue of Australia's involvement on the side of the United States in Vietnam. It was a 'khaki election' and whatever the facts might have been many Australian voters saw Australian troops as fighting in the front line against an Asian communist aggression (in which China was centrally involved) and in defence of Australian domestic prosperity and 'way of life'.

But by the end of the 1960s the frame of politics was beginning to change. Successive Liberal leaders did not know how to handle the new challenges facing their government; the seriousness of the position was shown by the large gains made by Labour at the federal elections in 1969. The use of foreign threats for domestic purposes was undermined as a strategy by event in Vietnam. As the Americans got bogged down, the Liberal crusade against the red and yellow peril lost its force. Moreover in 1971 President Nixon's visit to China kicked the bottom out of the Liberal's case that China was an international leper. At the time of the announcement of Nixon's visit, Prime Minister McMahon was excoriating the Labour Party for Gough Whitlam's pioneering trip to Peking. He was left without an argument. If, of all people, Richard Nixon could treat with the Chinese, the China bogey could no longer be used in Australian domestic politics.

Stripped of the ability to divert attention to foreign threats the coalition also had to face a rising tide of domestic issues. In the period before the 1972 election the economy was exhibiting contradictory symptoms — the problems of inflation and unemployment were marching together. By world standards the problem of unemployment was minuscule but in Australia if the proportion of the work force unemployed approaches two per cent the federal government is in for trouble. For a time Australia's primary industries, especially wool, were also in economic trouble which added to the government's burdens. It was in this context that the Labour Party raised domestic demands which could not be dismissed and which the leadership of the Liberal Party was not adroit enough to take over.

Following the departure from federal politics in 1965 of Robert Menzies, creator of the Liberal Party and magisterial Prime Minister since 1949, the Liberals had had severe problems in finding a leader who could re-define and up-date the party's symbols. Harold Holt, despite his victory in 1966, failed to put his stamp on the party. John Gorton who followed him from 1967 to 1971 proved more adept in raising expectations and knocking over accepted policy predispositions than in building a new party consensus. William McMahon (1971-1972) had a reputation for technical efficiency in politics and administration which vanished as soon as he had responsibility for running the whole government. Following Gorton's

demolition of a number of Liberal myths McMahon tried foolishly not only to resurrect them but to move back to raking over old issues and scares from the 1950s, 1940s and earlier. The inadequacies of the party as a whole were symbolised in this aging, out-of-touch man whose personal ambition had driven him to take on a task that was too big for him.

The Labour revival was founded on hard-won party unity and the systematic evolution and propagation of policies with appeal to the predominantly urban Australian electorate. Following its defeat in 1949 the ALP had lost its sense of focus. Different groups within the party had disagreed violently about the course it should take. Out of this came the disastrous split of 1955 which created the Democratic Labour Party. In this period, except in 1961 when the Menzies government mismanaged the economy by suddenly imposing restraints on credit and thus creating unemployment, Labour did not seriously threaten the government. The rebuilding of the party's capacity involved the widening of representation on the party's federal policy-making and administrative bodies to include parliamentary leaders, the re-organisation of its state branches in the two largest states, Victoria and New South Wales, and the use of the bi-annual federal conference to re-write the party's platform. In addition the federal leader of the party, Gough Whitlam, developed a flair for communicating new policies to the people and in the immediate years before the 1972 election the party's federal officers were political operators of exceptional skill.

Whitlam succeeded to the leadership in 1967 following the retirement of Arthur Calwell, a tub-thumping, working class-oriented leader of the old Labour kind. Calwell was suspicious of members of the party with intellectual training and was vehemently opposed to non-European immigration. In contrast Whitlam is proud to be a middle-class radical and has never worked with his hands or been a trade unionist. A lawyer by training, he is unabashedly erudite and delights in classical allusions and references to the finer points of European history. He is physically huge and his impressive presence is linked with compelling oratorical ability. On questions of personal liberty his views are tolerant and liberal; he was one of the leaders in the movement which forced the party to drop its support of 'White Australia'. Despite his considerable experience in the Labour Party he first entered parliament in 1952)

Whitlam has had difficulty convincing sections used to leaders with trade union backgrounds that he is genuine. His impetuosity, quick temper, desire to rid the party of backward looking policies and structures, and indiscreetly proclaimed sense of personal destiny, have landed him in difficult situations that could have been avoided. Moreover his interests have not led him to acquire the skills of the 'numbers game', and in backroom scheming and bargaining, that are vital to the mobilisation of majorities within the party. This weakness has been overcome to some extent by gaining allies who are good at power broking — notably C R Cameron, now Minister for Labour, who learned the art in one of the toughest unions, the Australian Workers' Union. When Cameron took over the job of looking after the leader's intra-party housekeeping and headknocking, Whitlam was able to concentrate on the things he is good at.

What Whitlam excels at is the development of pragmatic policies which will enable the federal government to take firm action in the cause of social reform. For all his middle class ways, his ability on this point is highly congruent with the Labour Party's usual way of promoting social change. The party is pledged to a policy of socialisation but its actual objectives in this direction are vague; demands for the creation of a socialist society, when they are made within the party, are more notable for their symbolic than for their substantive content. The party's contributions to social reform have been incremental and episodic. What Whitlam has done is to assemble a package of policy initiatives in areas the Liberals hesitated to come to grips with and which are highly relevant to the needs of ordinary citizens. These areas include hospital and medical services, urban planning, local government, and education. Most Australians live in cities and in the last decade the problems of city living have become depressingly obvious. Whitlam proposes federal government action to take the pressure off existing cities by building new ones, to stabilise the price of land for home-building, to give local authorities the finance they need to provide an adequate range of local services, to increase the resources applied to education, and to introduce a comprehensive national health scheme.

Proposals in these areas were not developed in a hurry just for an election. Whitlam is himself a suburban man and has been concerned with the problems that bother his fellow subur-

banites for as long as he has been in Parliament. When he became leader he sought the advice of experts in various policy fields, assembled a competent personal and research staff, encouraged promising members of the parliamentary party who shared his interests to work out their views, and presented the results to the electorate in fully researched and well-timed speeches. In this way he structured the issues to be debated in the pre-election period in his favour. By the time the elections were due his contributions were well known. His judgment in emphasising these issues was shown by the support given to Labour in the outer suburban areas of Australia's two largest cities, Sydney and Melbourne. The shift to Labour in these areas was one of the most notable features of the results.

The transition from opposition to government is something in which Whitlam has revelled. He has had the support of a parliamentary party with high morale and a cabinet elected by the party caucus, containing well-qualified men. Of the 27 members of cabinet 14 have academic qualifications; ten come from trade union or traditional Labour backgrounds and these include some of the most effective ministers. Old departments have been restructured and new ones created to give emphasis to the government's areas of priority. A Department of Urban and Regional Development has been established; education has been made the sole responsibility of a senior minister; responsibility for aboriginal affairs has also been made a full-time job; portfolios have been established with responsibility for minerals and energy, the environment and the media; the Department of Social Security has been given a young and capable minister.

A list of the government's activities and achievements would take up much space. In the initial period when Whitlam and Barnard ran the country as a duumvirate, decisions flowed out at a strikingly fast rate. Some of the most significant actions include the reversal of Australian policy on Vietnam and strong criticism of the US bombing of North Vietnam prior to the cease-fire agreement; the abolition of conscription for military service and the release of all young men gaoled for refusal to comply with call-up notices; the encouragement of a new sense of independence and national identity; steps towards an independent foreign policy, oriented away from military pacts, and attuned towards an area of neutrality in South-East Asia; recognition of China and the exchange of ambassadors; a

firm stand against racialism either at home or abroad; opposition to French nuclear tests in the South Pacific; revaluation of the Australian dollar; the making of plans for the early independence of Papua-New Guinea; and consultation with the state governments on building new cities. Moreover a veritable squadron of committees and commissions has been established to inquire into and refine plans for changes in domestic policy. The Minister for Social Security had two academics working to a three month deadline on a health benefits scheme; a Protection Commission, headed by John Crawford, is examining entrenched systems of subsidisation and tariff protection; a joint parliamentary committee on prices has been set up to inquire into price rises in critical commodities. It is too early to judge the effects of many of these actions. Many proposals have the force only of ministerial announcements and await legislative and administrative backing. The important thing is that ministers are in deadly earnest about getting the necessary backing and that the government's actions in its first few months of office have established the basis for a continuing and creative wave of reform.

Despite the government's ascendancy it is not having it all its own way. Australian society and institutions, and their place as an antipodean segment of Western capitalism, place limits on what can be achieved in a hurry. For a start, at the legislative level the government does not have a majority in both houses of the federal parliament. In the Senate it can be outvoted by the Liberals in concert with the Country Party, Democratic Labour Party and independents.

The Liberals senators include some of the more conservative and backward looking members of the parliamentary Liberal Party, who feel no compulsion to compete with Labour by offering their own programme of change, as do significant sections of the Liberal Party in the House of Representatives. They have shown their determination to take control of business away from the government and to block legislation. A Senate election must be held between the end of 1973 and the middle of 1974, and the government can if frustrated in its legislative programme, seek the dissolution of both houses and try for a majority in both at the ensuing election. However because of the proportional representation system of voting used for Senate elections the government would have no assurance of gaining a better position. It therefore

has to mount a campaign of bluff based on the calculation that if pushed to the point of final decision some sections of the opposition, especially the Democratic Labour Party, may back down first.

The government's relations with the civil service are also crucial. In Labour's last period of government, during and after the 1939-45 war, it was fortunate to be able to recruit large numbers of sympathetic officers as part of the war effort. But one of the important structural changes of the Menzies period was the continued growth and professionalisation of the Commonwealth Public Service. Thus Labour now has to deal with a much expanded public service oriented by 23 years of non-Labour rule. The Public Service Commission is jealously guarding its prerogatives in the allocation of staff to the newly established departments. Important positions have not been filled. The Defence Department figured in a controversy over the role of the Minister for Defence's personal staff in which the Minister ended up losing some of his staff and becoming more dependent on the department.

FEDERAL-STATE RELATIONS

Of equal importance are the government's relations with the states. Constitutionally many of the areas in which Whitlam is most interested are the responsibility of state governments. During electioneering he used to cover himself by using phrases about consultation and co-operation with the states. In government however he has found that even state Labour governments are not going to agree meekly to the writ from Canberra. State governments have protested at the strategy of trying to influence state policy by the manipulation of federal grants — a strategy which Whitlam has proclaimed on many occasions to be central to his conception of the federal government's capacity for exercising initiatives. One of the government's attempts to assert Australia's national independence has also drawn protest from the states. The government wants to stop the practice of allowing certain legal appeals to be taken to the Privy Council in the United Kingdom. The states oppose the government's proposal and have added insult to injury by combining to seek, if necessary, the Privy Council's opinion on the extent to which the federal government can control offshore areas around the Australian coast. The issue is important because of the existence of offshore oil reserves which the federal government wishes to control.

The government was fortunate to take

over at a time when the national economy was in good shape. With the sharp rise in wool prices in 1972 the recession in the rural sector disappeared, and under the influence of the previous government's attempts to stimulate the economy, unemployment dropped. Economic management is not something at which Whitlam excels and the government is fortunate that its Treasurer, a mild and self-effacing accountant, Frank Crean, has established an unexpectedly firm hold on his portfolio. With inflation running at a record level, conservative and business forces are pressing for wage restraint as a necessary corollary to any move to control prices. The government has responded with a determination to attack prices first. The potential for conflict is high and a false step could prejudice the government's whole position. The government also has to contend with the inflow of foreign capital which under the Liberals was warmly welcomed. Crean has told foreign businesses quite bluntly that Australia does not want their money and has acted to stop proposals for foreign takeovers of Australian firms. But a substantial portion of Australian commerce and industry is already in foreign hands and the flow of foreign investment has been significant in maintaining the buoyancy of the economy. This situation limits the extent to which the government can act without risking an upset in the economy, and any upset, for whatever reason, will be strongly resented by the electorate.

In foreign affairs, the government's determination to strike an independent posture is long overdue, but the price of independent-mindedness and the changes in relations it will involve, have not been determined. Whitlam's statements on policy and his series of overseas visits, past and proposed, have removed the guidelines of former policies without replacing them with clear alternatives. For the moment it is enough that Australia is viewing the world through a lens with a wider angle but soon the government will be forced to make choices and commitments. Hence it will become relevant that the electorate has been used to assurances of protection from "great and powerful friends"; that Whitlam has not moved to sever the alliance with the United States; and that sections of the Labour Party are keen to press for the cutting of all ties with the US. In this configuration of forces lies the possibility of protracted conflict.

Of even greater importance will be the capacity of the government to respond to new challenges and to move

beyond the issues with which it is currently preoccupied. The force of much of its domestic programme is founded on an extension of government intervention and of bureaucratic controls. This is inevitable since the structure of society is such that needed adjustments will happen by themselves. But attention will have to be given to making sure bureaucratic methods do not crush the life out of the people they are supposed to help. Moreover there is growing dissatisfaction with the whole notion of state action as practised by social democratic governments. Of importance, too, is the question of limits to economic growth. The cost of paying for much of Labour's programme is to be recouped from growth in the economy. As yet it is only the radicals on the left who are questioning the propriety of burning up resources in increasing quantities for the exclusive enjoyment of Australians. But this, too, is a question that will have to be faced.

A further question is the issue of Australian investment abroad. For the most part, Australians have been rather proud that they have companies with the enterprise to set up shop in South-East Asia, Fiji and New Guinea. In recent years investment in Indonesia has proceeded apace. What the Indonesians and others think has been scarcely considered. The list of similar problems, both domestic and international, could be extended indefinitely. If the Labour Party can identify and confront some of them while in office it will do much to see that Australia does not lapse back into a state of suspended animation once the excitement of having a change of government wears off. In the meantime the change has refocused the objectives in Australian politics and only the most backward of Liberals will be able to deny for long that Labour has taken the initiative and that a successful challenge will have to be made largely on terms that Labour has made its own.

A New Era in Soviet-American Relations

The Soviet View

R G Gidadhubi

ABOUT a year after Nixon made his historic trip to Moscow, the First Secretary of the Communist Party of the Soviet Union, Leonid Brezhnev, is now making his return visit to Washington. How far have these two countries succeeded in translating the various agreements reached a year ago into reality? Are the Soviets and the Americans happy about the developments in their relations? Why are these two super powers, after a quarter century of confrontation, now trying to come closer? On the eve of Brezhnev's visit to the United States, it would be interesting to know the Soviet view on some of these questions.

In brief, the Soviets appear to be largely satisfied with the progress made so far in the normalisation of Soviet-American relations on the basis of the summit talks between Brezhnev and Nixon held in May 1972. Many Soviet academicians consider that Nixon's visit to Moscow has been a turning point in the history of Soviet-American relations in the post-war period. An aspect of great political and military importance is the signing of the treaty by the two countries on the limitation of anti-ballistic missile systems and also the interim agreement that has been recently concluded on measures to limit strategic

offensive arms (SALT-1). The agreements on scientific and technical co-operation, public health and space research are being implemented. For instance, the USSR-USA joint committee on co-operation in the field of environmental protection has worked out 30 specific projects in which scientists and specialists of both countries will be involved.

One field in which both countries have evinced great interest is trade and economic relations. For speedy expansion of trade and economic relations between the two countries, the Joint Soviet-American Commercial Commission set up in the course of the summit talks has already prepared the ground for the opening up of a US commercial bureau in Moscow and a USSR trade mission in Washington. In addition, the Soviet government is building a commercial centre in Moscow with the purpose of meeting to a fuller extent the requirements of the representatives of foreign firms, including many American ones, in the USSR. This is one more clear sign of the earnest desire of the Soviet Union to promote trade and economic relations with the United States.

Soviet economists view with satisfaction the threefold increase in the trade

turn-over between the Soviet Union and the United States over the past year. In contrast to the earlier pattern of commodity composition, wheat purchases exceeding 11 million tons figure as one of the most important items in Soviet imports from the United States in 1972-73. The interest in expanding trade is not confined to government circles only. Removal of trade restrictions and extension of credit facilities by the US government on the one hand and the large and steady Soviet market for a wide range of engineering and consumer goods on the other has encouraged American businessmen to turn to the Soviet Union in large numbers. In the first ten months of 1972, more than 2,500 representatives of American firms visited Moscow.

In the same way, stable East European governments and smooth labour relations in industry have even attracted private investors to many of the socialist countries, including the Soviet Union. The Soviets are particularly appreciative of the agreement that has recently been concluded with the American Occidental Petroleum Corporation for the construction in the USSR of a large industrial complex for the extraction and processing of oil and gas and the production of mineral fertilisers. The American side is to make available to the Soviet Union an advanced production process, machinery and equipment on credit terms with subsequent repayment through supplying the United States with part of the products to be produced by the new complex. This project involving mutual deliveries valued at 8,000 million dollars is to be effected over a period of 20 years. V Spandaryan, staff member of Gosplan (the State Planning Committee) of the USSR in his *Pravda* article of May 8, 1973, admits that this multi-billion dollar deal will make a considerable contribution to boosting the production of valuable mineral fertilisers in the USSR and thus facilitate the further development of Soviet agriculture. Mention may also be made here of the agreements concluded by the Soviet Union with the Swindell-Dressler Company for the delivery of equipment and technical co-operation in the construction of a foundry for the KAMAZ plant and with the Caterpillar Company for the delivery of equipment for laying a large diameter gas pipeline.

Why is it that after a quarter century of confrontation the two super powers are now trying to come closer? For the change in the stand of the American side towards socialist countries in general and the Soviet Union in particular,

V Aikimov and two others in an article in *Izvestia* (May 4, 1973), entitled "Time for Decisions on Soviet-American Trade and Economic Relations", attribute three basic causes, namely "World socialism, the international working class movement and the national liberation struggle of peoples". The authors explain that the increased military and economic might of the socialist countries, the abolition of colonial regimes and the onslaught of the working class movement have compelled the capitalist countries to change their attitude towards the socialist bloc.

FUTILITY OF CONFRONTATION

In the opinion of many Soviet scholars the general easing of political tensions in the international sphere has greatly contributed to the normalisation of Soviet-American relations. It is pointed out by Yuri Kanin in his article, "A New Stage in Co-operation between the USSR and the West", that the Soviet policy of peaceful co-existence had won wide recognition and that a policy of trade embargo on the USSR was not in the interest of the Western countries. On this point, G Arbatov writes in *Kommunist*, No 3, 1973, that "... there is good cause to state that the main trend of changes in international relations is towards *detente* and stronger peace, towards the affirmation of the principles of peaceful co-existence of states with different social systems". Hence it is generally contended that the Western countries, including the US, have now realised the futility of following a policy of confrontation with the USSR. One Soviet scholar reminds us that in 1958, the Soviet Union had suggested to the US that co-ordinated measures to normalise trade on the principles of mutual benefit and equality should be undertaken. This offer was then regarded as a sign of Soviet weakness and as a sign of the success of the 'Cold War' policy followed by the US at that time. He opines that time has dispelled these illusions.

In the coming together of the two super powers the economic interests of both the countries are no less important. The Soviets are aware that the Americans have an eye on their large market and abundant natural resources (natural gas in particular). But they also know that close economic relations and expansion of trade with the US will help them to narrow down the technological gap, boost the production of important industrial and agricultural commodities and improve the quality of their consumer goods. In addition to these benefits, the Soviets can tide over their foreign exchange difficulties and the problem of the large investments required for the

exploration of the natural resources of their eastern regions by allowing foreign capital to flow into the country. After all, the Soviets will repay the long-term loan in the form of goods produced in the new enterprises and there too, not the whole output be given away to the US. Hence the Soviet Union will stand to gain. Although large inflow of foreign capital is in sharp contrast to the situation prevailing till recently, Soviet political scientists see no contradiction in this with the country's professed philosophy. In fact, it is claimed by one scholar that "in co-operating with foreign firms, Soviet organisations proceed from the Leninist principles on the need to use foreign economic relations with capitalist countries in the interests of socialist construction".

In the opinion of some Soviet scholars, the US was virtually forced to seek the co-operation of the USSR in the trade and economic fields. In contrast to the majority of advanced capitalist countries which, despite American resistance, had developed normal economic links with the Soviet Union and had benefited from these links in the sixties, the United States had isolated itself from the markets of the USSR and other socialist countries. It appears that in order to overtake the West European countries in the Soviet market, Nixon agreed in October 1972 to offer most favoured nation (MFN) treatment in trade to the Soviet Union.

Although considerable progress has been made in a short period to normalise relations between the USSR and the US, certain problems still remain to be solved. One such problem relates to port and shipping facilities. Soviet ships face problems from the American side in entering Cuban ports and also in fulfilling various formalities required for visiting American ports. It is felt that the 'Cold War' aftermath continues to determine the American attitude in this regard.

The Soviets also feel that certain business circles in the United States are against the normalisation of relations between the USSR and the US and that there are forces actively opposing the expansion of trade and economic relations between the two countries. This, they fear, might complicate the situation. Moreover, the two sides have differences of opinion on many complicated trade policy issues. Whether or not Nixon and Brezhnev find solutions to all the outstanding issues during the latter's visit to Washington, there is no denying the fact that both the leaders have opened a new chapter in Soviet-American relations which is of great international significance.

Education and Politics in India

Studies in Organization, Society, and Policy

Edited by SUSANNE and LLOYD RUDOLPH

By exploring the relationship between educational and political systems, this study focuses on policy problem of vital importance, opens up new fields and methods of inquiry, and contributes to our knowledge of education, politics and sociology. Rs 30

Urban Leadership in Western India

Politics and Communities in Bombay City 1840-1885

CHRISTINE DOBBIN

Bombay City provides an exciting case study in one of the main themes of modern Indian history: the manifold ways in which different communities in the Indian sub-continent espoused the new opportunities and ideas which followed foreign rule. Talented individuals rose to prominence and also certain castes and communities and Bombay's 'urban leadership' was felt throughout Western India. Oxford Historical Monographs £6.0

Population, Economy, and Society in Pre-Industrial England

J. D. CHAMBERS

This is a lively, general discussion of the historical rather than purely technical and statistical problems involved in population studies. As the first synthesis of the results of recent research, it will serve as an introduction for students of historical demography, but it also makes a number of fresh contributions to the subject. Economic Development: Chicago View

Bhabatosh Datta

Chicago Essays in Economic Development edited (with an Introduction) by David Wall; the University of Chicago Press, Chicago, 1972; pp 370, price not stated.

WHAT happens when the methods of the Chicago School of Economics are applied to development problems? This is the question with which the editor David Wall starts his introduction to the valuable collection of essays by members of the Department of Economics at the University of Chicago. The essays relate to different aspects of development problems and are all bound together by an academic presumption in favour of the operation of the market mechanism in a competitive system. What is likely to trouble many readers is that there is also a presumption that the competitive system exists in real life, or that it can be brought into existence very easily. The essays taken together provide a very thorough inventory of the gaps and inadequacies in the generally accepted development economics of today. One can only ask what the Chicago analysis will look like, if there is a searching examination of the assumptions not often made explicit and of the quick moves to policy conclusions from extremely limited data. We may very justifiably criticise any given set of assumptions and bring the hidden ones out into the open; but that does not build a case for a new set of assumptions, or a set far removed from real life.

The editor has started by putting clearly what he considers to be the "three beliefs" behind the common intellectual framework of the Chicago School. These are, first, that "theory is of fundamental importance"; secondly, that "theory is irrelevant unless set in a definite empirical context"; and, thirdly, that "in the absence of evidence to the contrary, the market works". The first belief is basically simple, but one feels that the implicit emphasis is on that particular brand of theory which rests on private profit-maximising behaviour in a perfectly competitive set-up. The second belief is easily acceptable to all, if relevance means relevance to policy prescription. The real difficulty is in regard to the presumption in favour of the market. One can start with a question about the type of the market and another about the

meaning of the term 'working'. There is nothing that does not work in some way or the other. It is not much to say that the market works, unless one clearly indicates what sort of markets work for what sort of objectives. The editor is careful to state that the market does not work always and that some of the papers do point out the conflicts between policy objectives and market solutions. Nevertheless, there is a strong belief in the allocative efficiency of the price-mechanism running through all the essays.

While the editor has tried to moderate to some extent the extreme forms of the Chicago 'beliefs', he has been less than fair to the non-Chicago development economists. These economists have all been lumped together. According to David Wall, they all assume that development is an automatic process, which is occasionally impeded by identifiable constraints; they also pretend that the development process can be simulated by mechanistic models which can be used as a basis for policy prescription. The first of the two charges certainly goes too far; there have been romantics among development economists, but there have been many others who have started from the position that, in the absence of specially designed impressed forces, it is non-development, which is generally an automatic self-perpetuating state. There is a world of difference between the abstraction that goes by the name of the theory of growth and the theoretical basis of the economics of development.

There is some truth in the charge that policy conclusions have sometimes been sought to be drawn from simulated mechanistic models of undeveloped economies. Here also there has been no dearth of hard-headed economists who have been fully aware of the limits and limitations of simplified models. These models have often helped to bring out the fundamental inter-relations. There is no reason why one should not appreciate the value of the work done through these analytical instruments, even when one wholeheartedly accepts the recurrent Chicago theme about the

importance of the human element in the development process. The technique of creating a paper opponent providing a rebuttable anti-thesis is common one in economic polemic. Aristotle created a Plato of his own; two thousand years later Keynes created his own brand of classical economics.

Happily, the individual essays do not all go all the way along the David Wall line. There are fifteen essays; the volume and the main contributors are A C Harberger, who has written five essays, and H G Johnson, who has written four. There are two each from Theodore Schultz and Bert Hoselitz and one each from Larry Sjaastad and D Gale Johnson. Three of the essays deal specifically with Latin American countries. Harberger's "Some Notes on Inflation" starts with an interesting general analysis, but it then goes to a study of the situation in Chile. The other essays cover 'underdeveloped', 'less-developed' or 'developing' economies (are they all the same?) and are generally relevant to the problems of India. It is interesting to note that Indian data have been used in many of the essays; Harberger's study of the comparative rates of return on capital formation and skill formation is based entirely on an Indian case study. It should be pointed out that most of the essays were written in around 1964-65; only two essays, by Harberger, were written in the last two years, while the oldest is Hoselitz study of urban growth written in 19

AGRICULTURAL DEVELOPMENT

It is not necessary to accept the social philosophy and the methodological technique of the Chicago School in order to appreciate the broad validity of Schultz's proposition ("Economic Growth from Traditional Agriculture") that the agricultural programme in the underdeveloped countries have often failed because "no profitable, rewarding agricultural inputs have been available to farmers which they could adopt and use". Whatever evidence one has indicates that cultivators learn quickly to use new inputs, if they are at all highly productive, abundant and cheap. Such high-pay-off agricultural inputs have to be "discovered, developed, tested" and then supplied liberally at a cheap price. Schultz's preference for the production of these inputs by private firms operating for profit.

is in line with Chicago thinking, but it is not necessarily linked with the main proposition about the requirements of the situation. There have been other forces that have impeded agricultural development, but Schultz has certainly indicated a vital area in which there is a wide scope for research and implementation.

Schultz's other essay ("Value of US Farm Surpluses to Underdeveloped Countries") similarly contains a main theme which would find general acceptance — that the direct benefit to the recipient country of PL 480 supplies is considerably less than is indicated by the money value of the aid. There may be, besides, indirect ill-effects through a relaxed policy in agricultural development. There are interesting estimates of the costs of PL 480 exports as borne by the US economy and also of the very low redemption value, which may be between 10 and 15 per cent of the CCC costs. These costs and losses are, however, willingly borne for reasons which may be partly economic and partly political. Schultz's estimate of the value of the PL 480 supplies to the recipient countries at 37 per cent of the CCC costs may be open to question and the implicit foreign exchange rate relevant to the deal may easily vary from country to country and also from situation to situation. The danger of a wrong turn to agricultural incentives is in fact more important.

Schultz has not considered the uncertainties that the recipient countries face when large balances are held in their banks by a foreign government, however restricted the withdrawals may be. Amounts which are small for the United States are large for India: the stabilising effects of which Schultz speaks may be outbalanced by the destabilising effects of the existence of semi-fluid foreign-owned funds. One has to note, of course, that this particular essay was written in 1960; at that time there was some need for moderating the optimism evinced in the FAO papers of 1955 and 1958 on the use of the agricultural surpluses of the rich countries to finance economic development in the poorer countries.

ECONOMIC POLICY

The most interesting papers in the volume are those written by Harry Johnson. In the first of his essays ("The Ideology of Economic Policy in the New States"), he has given a good account of the way in which the De-

pression of 1930, the growth of Keynesian economics and the example of Russian planning all combined to create an active interest in the problems of economic development. This is followed by an examination of the non-economic forces behind the industrialisation thesis, with its bias in favour of economic planning and against large international corporations. The case for economic planning in India and in many similarly placed countries, one may point out, is no longer a matter of any *a priori* ideology, but is solidly based on the recognition of the failure of the market mechanism. One recognises that there can be strong arguments in favour of large multi-national units operating in the developing countries, if one confines one's attention to an ideal situation. Such a situation does not exist. A poor country seeking economic progress has to balance the advantages of the system against the large financial and political powers which multi-national corporations can easily come to acquire. Harrison's essay was written in 1966: one notes in 1973 how the multi-national corporations have almost been operating their own international monetary system, powerful enough to defeat not only national policies, but also policies of international financial institutions.

In his essay on "Fiscal Policy and Balance of Payments in a Growing Economy", Johnson is critical of fiscal policy measures as correctives of balance-of-payments difficulties in the developing countries. After a lucid analysis of the balance-of-payments pressures generated by the process of planned development and of reluctance of policy-makers to initiate corrective changes in prices and income-distribution, he develops a case for explicit adjustments in the exchange rate, which in effect will mean a serial process of devaluation. There is much truth in what he says about the often-misplaced emphasis on import substitution and the concealed subsidy to particular groups of producers or consumers resulting from the continuance of an over-valued exchange rate. What is not clear is what the correct and distribution-neutral exchange rate will be in a given set of circumstances and what exactly should be the time-path of the changing exchange rates in a changing set of conditions. And one can ask whether one should derive from the arguments of Johnson a case for multiple exchange rates, which certainly are a closer approximation to an unimpeded free

ECONOMIC AND POLITICAL WEEKLY

market than a uniform rate for all types of sub-markets in foreign exchange.

This is the recurrent difficulty that the reader faces. He can agree with the critique of the actual policies — both in their design and in their implementation — but cannot evade the feeling that there is an element of *non sequitur* when alternative positive recommendations are made. He can accept the proposition that a protectionist policy may create an oligopolistic structure within the sheltered market; he cannot necessarily accept the argument that alternative policies will keep oligopoly at bay.

Harry Johnson's essay on "Tariffs and Economic Development" again gives an excellent account of the state of the debate as it was in 1964 — examining the economic arguments for protection (tariffs as a means to increasing the real output), the non-economic arguments (industrialisation for pre-determined objectives like national self-sufficiency or military strength) and the 'non-arguments' (improvement in the terms of trade for primary producers). The arguments follow well known tracks, and to one who started reading economics in the good old days, it is interesting to find so much dependence on the Marshallian triangles representing losses of consumers' surplus or gains to producers. One does not have the heart to ask whose losses (however aggregated) are being compared with whose gains (however aggregated).

There would of course be cases where a subsidy to producers will be better than a protectionist tariff — a subsidy, depending on the circumstances, on training and research, on the use of labour in industry or of other specified factors in agriculture, and on interest rates in appropriate cases. The usual financial argument against subsidies is easily dismissed. The rest of the argument is based on static demand and supply curves. The inferences follow easily as first approximations; there are the same dangers here in reaching facile policy conclusions as there are in the opposite case which the Chicago School will regard as the anti-thesis.

Perhaps a little too much is made of 'cascading'. It is arithmetically correct that if duty-free imported materials constitute, say, 50 per cent of the value of the final output and if the final output is protected by a tariff rate of 30 per cent, the effective rate of protection to the value added by domestic manufacture will be 60 per cent. What

ECONOMIC AND POLITICAL WEEKLY

matters is not the percentage, but objectives and feasibilities in particular cases. The advantage that the domestic producer is given may be an indicator of his current inefficiency, but protective tariffs are based on the expectation that the comparative disadvantage will decline within a limited period. This expectation is not always realised, but that does not create a case for the opposite type of policy.

Johnson has put the correct emphasis on the need for reducing tariff burdens on imports by the developed countries. He has also argued in his fourth essay ("Trade preference and Developing Countries") in favour of preferences by developed countries to imports from poorer countries. All this brings one back to the position that the conclusions and policy-prescriptions which are appropriate to a system of free and full competition — without obstacles to movement, both domestically and internationally — are not valid in a world of competing national policies, competing monopolistic activities and all the types of imperfections in the domestic markets. It is true that the actual implementation of policies by any single country faced with these difficulties has sometimes created further difficulties. But it does not follow that a country in these conditions should adopt policies on the blind assumption that everything else is copy-book style in the rest of the world.

INVESTMENT IN EDUCATION

Among the other articles, one has to take note of A C Harberger's essay on "Investment in Men versus Investment in Machines". On the basis of an Indian study in Hyderabad in 1957, aided by some data from C S Sahota's paper on "Returns on Education in India" (1962), Harberger concludes that the return on investment in machines is greater than an equivalent investment in education. This does not take into account the indirect social benefits of education; nor does it go into a detailed examination of the rates of return on specialised training in particular fields. There are also the questions of interdependence and time-lags. The basic limitation is however the attempt to put side by side an estimate of returns obtained from a single case study on education and an estimate derived from all-India data for company finances. There can be doubts about the justification for the way in which assumptions have been loaded on to the Reserve Bank studies of the finances of

joint stock companies, but even when these are ignored, one has to be cautious in calculating the rates of return on investment in education in different categories and different regions. And one can raise the basic question about the inclusion of the investment in primary education in calculating rates of return. Primary education should be taken as an essential consumer service which every state has to offer its people as readily as food and drinking water.

ACTION MEASURES

Coming back to what was said at the beginning, one has to repeat that if there are inadequacies in the economics of development, as understood, say, by economists in India, there are difficulties in the alternative formulations also. Besides, there is the fact that criticism is often piecemeal; it will be an interesting exercise to combine together the explicit and implicit action measures recommended in the fifteen essays collected in the volume and to see what emerges as the resultant picture. According to the editor, the Chicago credo that "in the absence of evidence to the contrary, the market works" means that "in specified situations, unimpeded competitive forces will lead to the most efficient and potentially most equitable allocation of the world's scarce resources". Ignoring the fact that there is enough gap through which all non-Chicago policies can escape, one notes that the argument begs the question about unimpeded competitive forces about the conversion of a *potentially* equitable income distribution into an *actual* distribution achievement. If competitive forces are to be unimpeded, they have to be unimpeded everywhere — in every factor market (including labour), in every commodity market (including, for example, armaments) and in every trading, domestic and international. It does not follow from the arguments developed in the book that it is easier to convert the realities of the market into the ideal conditions over the whole range than to improve the planning mechanism. There does not seem to be any possibility of bringing in a situation which corresponds to unimpeded competitive forces everywhere and in everything. There are 'market solutions' for all problems, but the market in which the solutions work themselves out is not what Chicago takes as its model.

Further, the potentially equitable income distribution can be converted into an actually equitable distribution

mainly by methods which may themselves impede the operation of the so-called competitive forces. The profit motive which is expected to increase the real income available for more equitable distribution may itself be damped down when it experiences the income transfers that follow production. And the initial state of unequal distribution will itself impede competition and thereby prevent the realisation of the potential for a larger real output for better distribution. The difficulties are magnified when one notes that the discussion is in terms of the allocative efficiency of the "world's scarce resources". It is no satisfaction to a poor people to know that the world output has become larger and has therefore become arithmetically more suitable for a better distribution all over the world.

Despite all this, there is a wealth of important logical exercises in the collection and students of development economics have to take them seriously. Perhaps the most valuable contribution of the essays will be to raise a few doubts about a wide variety of individual policy decisions. This can be immensely useful, even though one does not become convinced of the economic philosophy as delineated by the editor.

Unequal Benefits from Kosi Development

Cost of Bypassed Institutional Reform

P S Appu

Before its taming, the Kosi, Bihar's notorious river of sorrow, inflicted infinite, but indiscriminating, suffering on all the inhabitants of the Kosi Area. The Giant Kosi Project has ushered in a new era of agricultural prosperity for this backward region.

The benefits have, however, been shared unequally, the bulk of the gains accruing to substantial land owners. The Kosi tamed, in the absence of essential structural changes, has turned out to be an instrument of inequity.

The utter neglect of institutional reform has not only resulted in the widening of the disparities in wealth and income, but has also proved to be a formidable deterrent to the fuller utilisation of the irrigation potential. This paper gives an outline of some urgently needed institutional changes.

RIVER OF SORROW

AT its debouch into the plains, at Chatra in Nepal, the Kosi is the third biggest of the Himalayan rivers, next only to the Indus and the Brahmaputra. After entering the alluvial plains, the river wends its way southward through a number of interlacing channels to join the Ganga at Kursela. What makes the Kosi a problem river is the enormous quantity of detritus it brings down from its catchment basin — on an average, over 81,000 acre feet every year. When the river enters the flat plains, the current slows down and the heavy load of sand and silt gets deposited in the river-bed blocking the flow in the channels. The river is thus forced to abandon its old channels and to cut new ones. While forming new channels, over the years, the river had shown a marked tendency to swing to the west, traversing some 70 miles in the course of 125 years.

This relentless process of riverine activity laid waste some 6,000 square miles of territory in the districts of Purnea and Saharsa, by depositing large quantities of sand over once-fertile agricultural lands. The dreaded annual floods brought in their wake death, disease, and devastation. Malaria, kala-azar, cholera, and other diseases were endemic. The Kosi was aptly dubbed "Bihar's River of Sorrow". There was, however, a saving grace: the deadly Kosi, like death itself, was a great leveler. It struck with blind fury and with equal harshness the rich and the poor, the landowners, the land poor and the landless. For several months in the flood season, all had to depend on relief doles. Thus, before its taming, the Kosi inflicted infinite, but indiscriminating,

suffering on all the inhabitants of the Kosi Area.

THE KOSI PROJECT

The Kosi Project comprises levees on both sides of the active channels, a barrage across the river, canal systems, and a hydel station. As flood control was the most pressing need, construction of the embankments was taken up first. The work started in January 1955 and was completed in about four years. The river has been confined within embankments over a length of about 75 miles, the distance between the two embankments varying from 3 to 10 miles. The embankments are estimated to have afforded protection from annual inundation to about 6.5 lakh acres of land in Nepal and North Bihar. The barrage was completed by 1963, and the Eastern Canal was opened for irrigation in a small way in 1964. Work has been completed on the Eastern and Rajpur Canal systems designed to provide irrigation to a gross cropped area of 17.85 lakh acres annually. Work has just started on the Western Canal system. The total investment in the project, at the end of March 1972, stood at Rs 97.53 crores.

AGRARIAN STRUCTURE OF KOSI AREA

The Eastern and the Rajpur canal systems provide irrigation to the districts of Purnea and Saharsa in North Bihar. These two districts, together, constitute what is popularly known as the Kosi Area. The salient features of the agrarian structure of the Kosi Area are: extreme concentration in the ownership of land, absentee landlordism with all its accompanying evils, widespread share-cropping characterised by insecurity of tenure, rack-renting, and other outrageous inequities, as well as a multi-

tudinous population of landless agricultural labourers eking out a precarious livelihood under the extant semi-feudal relations of production in agriculture.

No information regarding the size-class distribution of ownership holdings appears to have been compiled since the Seventeenth round of National Sample Survey (1961-62). Even these data are available only for the state as a whole and not for individual districts. According to the Seventeenth round of the National Sample Survey, in the state of Bihar ownership holdings below 2.5 acres accounting for 68.08 per cent of the total number of holdings and 13.75 per cent of the cultivated area. At the other end, holdings above 15 acres accounted for 2.67 per cent of the holdings and 25.32 per cent of the area. In the districts of Purnea and Saharsa, the concentration in the ownership of land is in all probability greater than in the rest of Bihar. It will, of course, be extremely difficult to ascertain the exact degree of concentration in the ownership of land. For, in the context of the legislative efforts made in recent years to impose a ceiling on agricultural holdings, the landowners have been quite naturally reluctant to disclose the truth. They have made every conceivable efforts to conceal the true extent of land owned by them. During the last 15 years, almost all the big landowners have resorted to large scale transfers of land to avoid and evade the ceiling law. Some of these transfers were permitted under the Bihar Ceiling Law — an interesting piece of legislation riddled with built-in loopholes. Some were downright fraudulent benami transactions. But, in most cases, even after such transfers, the old landlords continue to be the real and effective

owners of vast areas of agricultural land. The village records will, of course, show that their holdings are well within the ceiling area. Hence, no sample survey nor even complete enumeration of holdings can be expected to reveal the true state of affairs. From the discussions I have had with persons who are familiar with field conditions and from the enquiries made in the course of my tours in the Kosi Area, I am left with no doubt that there are still some big landlords who own over a thousand acres each, and a large number who own over a hundred acres. These empirical observations, it is readily conceded, can provide no firm basis for coming to any definite conclusion regarding the degree of concentration in the ownership of land. They do, however, clearly indicate that the ownership of land in the Kosi Area is highly concentrated.

Another feature of the agrarian structure of the region is absentee landlordism. The big landlords of the Kosi Area — particularly of the district of Purnea — own land in several scattered villages. Often, these villages are located at considerable distance from each other. In such a situation, even when the landlord lives in one of the villages in which he owns some land, he is unavoidably an absentee landlord as far as his possessions in the other villages are concerned. As a matter of fact, many of the big landlords of the region live in towns far away from their land. It has been observed that these absentee landowners seldom invest in land development; nor do they bother to put their land to the best possible use. They cling on to their land, partly out of habit and partly to appropriate the unearned increments that accrue from the steady appreciation of land values.

The most significant characteristic of the agrarian set-up of the Kosi Area is widespread share-cropping. Perhaps there is no other region in the country where the incidence of share-cropping is so high. This preponderance of share-cropping is the inevitable concomitant of the features discussed earlier. When holdings are very large but fragmented, widespread share-cropping is unavoidable under conditions of traditional agriculture. On the basis of a 20 per cent sample survey, it was found in the 1961 Census that, in the district of Purnea, 45 per cent of the households cultivated lands which were owned by them, 15 per cent cultivated leased-in lands, and 40 per cent were mixed tenancies. In Saharsa, 43 per cent of the households cultivated lands owned by

them, 17 per cent cultivated leased-in lands, and 40 per cent were mixed tenancies. In the state as a whole, 68 per cent of the households cultivated owned land and only 7 per cent cultivated leased-in lands, while mixed tenancies constituted 25 per cent. A sample survey conducted in 1968 showed that, in Purnea district, 23.36 per cent of the land was cultivated on share-cropping basis and that 43 per cent of the cultivators were sharecroppers. In Saharsa, it was found that sharecroppers constituted 40 per cent of the cultivators and that they cultivated 20.83 per cent of the land. These figures are even more suspect than are data regarding the size-class distribution of holdings. The 1961 Census Report itself says: "The possibility of concealment in furnishing information relating to the extent of share-cropping cannot be ruled out". This is, of course, a classic understatement. Persons familiar with field conditions are inclined to think that not less than 40 per cent of the area is under share-cropping. And, in the Kosi Area, share-cropping is practised on terms very unfavourable to the sharecroppers. Sharecroppers have to meet the entire cost of cultivation and yet give half the produce to the landowner. Though the Bihar Tenancy Act affords a measure of protection to them, the sharecroppers, in practice, continue to be tenants-at-will. As they enjoy no security of tenure, the legal provision, which fixes the landlord's share at 25 per cent of the gross produce, remains a dead-letter. Sharecroppers who try to get their claims established, or insist on giving only one-fourth of the produce to the landowner, face certain ejection.

The Kosi Area is also noted for the preponderance of agricultural labourers among the workers in agriculture. According to the 1971 Census, agricultural labourers constituted 50.62 per cent of the workers in agriculture in the district of Purnea and 53.39 per cent in the district of Saharsa. (The term

'workers in agriculture', as used in the Census report, includes both cultivators and landless agricultural labourers.) The seriousness of the situation is evident from the fact that the relevant percentage for the state of Bihar is 47.31 and for the country as a whole 23.83. Most of the agricultural labourers remain unemployed during the slack season, and the prevailing agricultural wages are among the lowest in the country. Most of the landless labourers remain attached to individual families of landowners for whom they have to work when there is work to be done. In return they get small areas of land to be cultivated on a share-cropping basis. As the landowner is also invariably the moneylender, his stranglehold on the agricultural labourers attached to his household is complete. Thus the agrarian structure of the Kosi Area reveals the survival of semi-feudal characteristics.

BENEFITS OF THE PROJECT

The benefits accruing from the Kosi Project are twofold: first, those resulting from flood protection, and secondly, those from irrigation. The Kosi Project has afforded protection from annual inundation to about 6.5 lakh acres of land in North Bihar. Some of the benefits resulting from the flood protection works, such as freedom from physical discomfort or suffering and improved health conditions, have been shared by all sections of the population. Flood protection has also led to assured returns from agriculture and to spectacular appreciation in land values. The size-class distribution of holdings being very skewed, the new-found agricultural prosperity has been shared unequally.

The Project report envisaged that the Eastern Canal system would, on full development, irrigate 8.11 lakh acres during kharif, 2.49 lakh acres during rabi, and 3.74 lakh acres in summer — making a total of 14.34 lakh acres. For the Rajpur Canal, the figures are 1.90

TABLE 1: AREA IRRIGATED BY THE EASTERN CANAL SYSTEM

Years	Area in Thousand Acres			Total
	Kharif	Rabi	Hot Weather	
1964-65	9.85	0.10	—	9.95
1965-66	60.97	1.44	1.51	64.32
1966-67	165.93	14.95	10.60	178.57
1967-68	265.41	27.28	29.52	322.21
1968-69	240.91	38.94	32.07	311.92
1969-70	285.19	28.45	—	293.64
1970-71	166.65	36.33	—	203.00
1971-72	375.00	—	—	—

Source: Paper on Kosi Project by S G Tiwary, Superintending Engineer, Drainage Circle.

lakh acres during kharif, 0.89 lakh acres during rabi, and 0.72 lakh acres in the summer — making a total of 3.51 lakh acres. Thus the two canal systems together were expected to irrigate 17.85 lakh acres annually. Table 1 shows the area irrigated by the Eastern Kosi canal system annually since 1964-65, when water was first released. The Rajpur Canal system has been in operation for about two years only.

The figures show that utilisation is only about 25 per cent of the potential even 8 years after the commencement of irrigation. A closer look at the figures will show that, while in the kharif season utilisation has reached about 40 per cent of the potential, during the rabi season utilisation has never gone beyond 15 per cent of the estimate. Similarly, utilisation during the summer too has been very low — not exceeding 10 per cent of the estimate.

With the completion of the Kosi Project, the area has experienced considerable agricultural prosperity. Land values have appreciated phenomenally, the range of appreciation being from Rs 50 to Rs 5,000 per acre in some cases. In the result, persons owning large areas of land have benefited greatly. Small holders have also benefited from the flood protection works and the Canal system. However, they have not been able to make full use of the irrigation in the absence of access to the necessary inputs. Furthermore, their dependence on moneylenders and substantial landowners for credit has rendered the position of the small holders extremely vulnerable: The enhanced land values and the increased productivity of land have whetted the appetite of the bigger landowners and moneylenders to acquire more land and expand the size of their holdings; and many a small holder has been obliged to mortgage or sell his land to big landowners. The position of the sharecroppers has become even more precarious. In the past, before the taming of the Kosi, agriculture in this area was a very hazardous occupation. With a wanton river changing its course frequently, and its channels cutting through agricultural land overnight and large tracts being subjected to annual inundation, agriculture in the Kosi Area was a gamble. The region was notoriously unhealthy. In such a situation, it was small wonder that the big and medium landowners preferred to get their land cultivated by sharecroppers, who were mostly members of the Scheduled Castes and Scheduled Tribes. With the completion of the Kosi Project, there

has been marked improvement in health conditions and agricultural productivity. These improvements, along with the steep rise in land values, by themselves would have given enough incentive to the landowners to get rid of the sharecroppers. Unfortunately for the sharecroppers, this period also coincided with the era of half-hearted legislative and administrative efforts to protect them. These halting measures of land reform have had the unfortunate effect of impelling the landowners to hasten the ejection of their sharecroppers. The result has been widespread agrarian disputes in the area, particularly in some parts of Purnea district. The landowners have generally succeeded in ousting sharecroppers belonging to the Scheduled Castes from the land they had been cultivating for generations. As the Scheduled Tribes are a proud people with a degree of social cohesion, they have been able to put up some resistance. In many a case, the landowners resorted to brute force to eject the tribal sharecroppers. The high-water mark of the atrocities committed against the sharecroppers was reached in an incident in Purnea district in November 1971, when 14 Adivasis were murdered in broad daylight. There is ample reason to believe that the Kosi Project is partly responsible for the worsening of the conditions of the sharecroppers, many of whom have been pushed down the social ladder to swell the ranks of landless labourers. The irony of the situation is that, even after the old sharecroppers are evicted, the landowners seldom bother to cultivate the land personally. In most cases, they get the land cultivated by new sharecroppers who are not likely to claim tenancy rights.

The Kosi Project has brought canal irrigation to an area which was already raising more than one crop. The prevailing agrarian structure was not conducive to the development of intensive agriculture. Hence there has been only marginal improvement in the intensity of cropping. On the basis of a sample survey undertaken in 1970, P H Prasad came to the conclusion that there was little evidence of increased intensity of cropping. It was also found that there was no increase in the overall demand for labour. The extremely low level of agricultural wages in the area confirms this conclusion. Even today, the normal daily wage of a male worker is Rs 2, or its equivalent. During the busy season, the wages may go up to about Rs 3 or so. Considering that prices have been steadily rising year after year, the economic conditions of the

agricultural labourers in the Kosi area have perhaps deteriorated in recent years. At any rate, there has been no improvement. Thus, briefly stated, the benefits of the project have been shared in the following manner: substantial landowners have benefited substantially, small landowners have made small gains but their position has become vulnerable, sharecroppers have suffered greatly, and landless labourers survive in more or less the same conditions of abject poverty in which they have always lived.

UNDERUTILISATION OF IRRIGATION POTENTIAL

There are several reasons for the underutilisation of the irrigation potential which has been created. Some of these reasons are common to most river-valley projects in the country, while some are specific to the Kosi Project. The familiar reasons — such as delay in the construction of water courses, absence of field channels, lack of attention to land-levelling, neglect of drainage and water management, failure to evolve suitable cropping patterns, fragmented nature of holdings, inadequacy of agricultural extension, and constraints in the supply of credit, seeds, fertilisers — have all made their contribution to the underutilisation of the available water in the Kosi Area also. Some of these obstacles are, perhaps, of a more serious nature in the Kosi Area than in the command areas of most other river valley projects. For instance, the undulating nature of the land is a very serious problem in the Kosi Area. As mentioned earlier, the river had laid waste large tracts of territory, by depositing huge quantities of sand here and there. A survey has shown that, out of the command area, about 3.37 lakh acres fall above the gravity command, and, therefore, would not in any case get irrigation. The survey has also shown that about 6.48 lakh acres need levelling. The problem of waterlogging also is quite serious. It has been estimated that about 3.68 lakh acres of the command area remain waterlogged. The heavy load of silt and sand brought down by the river gets deposited in the canals obstructing the flow of water. Delay in desilting and failure to keep the canal system in proper trim have also contributed to the underutilisation of the available water. One of the important reasons for the slow progress in the utilisation of irrigation is that the Kosi command area has an average annual rainfall of about 60 to 65 inches. The rainfall is fairly well distributed from April to Septem-

ber, and normally two crops of jute and paddy can be grown without irrigation. In such a situation, an irrigation scheme is more or less an insurance against the occasional failure of rains. This situation has been rendered more difficult by an outmoded and irrational system, under which the farmers have the option to decide every season whether or not they would draw water from the canals. Naturally, the farmers watch the behaviour of the monsoon for some weeks, and, only if rainfall is deficient, do they ask for water. Several years ago, a committee appointed by the state government had recommended that the system should be abolished, and that within the command area where supply of water was assured the farmers should be required to pay water rates irrespective of whether or not they took water in a particular season. The state government has, however, not yet seen its way to abolishing the old system.

The constraints discussed above explain to some extent why kharif irrigation has not extended beyond 40 per cent of the project estimate. But they do not afford the full explanation for the underutilisation. And none of these reasons explains why utilisation of water during the rabi and summer seasons is far below the rate of utilisation during the kharif season. The reasons for the gross underutilisation of water during the rabi and summer seasons are rooted in the agrarian structure of the Kosi Area. The concentration in the ownership of land and the widespread sharecropping on terms grossly unfair to the sharecroppers, are the main reasons for the underutilisation of water during the rabi and summer seasons. The Kosi has a minimum discharge of about 9,000 cusecs even in January, which is the leanest month for the river. The quantity of water in the canals is, therefore, adequate for providing irrigation to about 8 lakh acres. Anyway, there is, without doubt, enough flow in the canals to supply water to every field that gets irrigation during the kharif season.

It has been observed that big land-lords usually grow rabi crops only on a portion of the land owned by them and leave the rest of the holding fallow. They have shown little enthusiasm for full utilisation of the available water to grow rabi and summer crops. Table 2 shows the results of a survey of 11 villages made by P H Prasad in 1970. A glance at Table 2 will show that, while cultivators with kharif irrigation for less than two acres of land fully utilised the available water in the

rabi season, there was a steady fall in the utilisation with an increase in the size of the holdings. Cultivators getting water in the kharif seasons for over 20 acres utilised only 26.50 per cent of the available irrigation in the rabi season. On questioning some large farmers, I gathered that they found it extremely difficult to grow rabi crops, particularly wheat, on more than 15 to 20 acres. In the Kosi Area, the dominant crop is winter paddy, harvested towards the end of November or early December. Immediately after harvesting, the farmers get only two to three weeks to prepare the land and to sow wheat. Under conditions of traditional agriculture, using bullocks for draught power — and emaciated scrub bullocks at that —, the farmers find it extremely difficult to operate a larger area. The fragmented nature of the holdings and the fact that many of the big farmers are absentee landlords, have made the situation more difficult. The large size of the holdings is, without doubt, one of the main reasons for the low utilisation of the irrigation potential.

Share-cropping is an equally important constraint. According to the terms under which share-cropping is practised in the Kosi Area, all the inputs have to be provided by the sharecroppers themselves; yet, sharecropper must give half the produce in each season to the landowner. Experience shows that, in the Kosi Area, an average crop of paddy yielding about 4 to 5 quintals can be grown without applying chemical fertilisers or using improved seeds. But growing wheat is a more costly proposition. According to a rough costing, done after discussions with several farmers and agricultural experts, it appears that on seed alone an additional investment of about Rs 45 per acre has to be made. This is so because an acre needs only 15 kg of paddy seed, as against 40 kg of wheat seed. Yet another reason for higher expenses in growing

wheat is that a reasonable yield cannot be expected unless some investment is made in chemical fertilisers. While an optimum dose of fertilisers will cost about Rs 200 per acre, even for growing an ordinary crop a minimum investment of Rs 50 will be necessary. Thus, even if all the other items are left out, an additional investment of about Rs 100 is necessary for growing wheat. As the sharecropper has to meet the entire expenditure, and particularly as he has to borrow money on usurious terms, it would be entirely foolish on his part to grow wheat. That is why the land under share-cropping usually remains uncultivated during the rabi season.

The question arises, why is it that the landowner does not agree to share the cost or reduce his share of the produce to less than half. After all, he will be a gainer even if he shares the cost of the inputs or agrees to a smaller share of the produce. One of the reasons for the behaviour of the landowner is probably to be found in his apprehension that if a sharecropper cultivates the same plot all the year round, he may successfully claim tenancy rights. After the harvesting of paddy, the land remains fallow for several months, and it is easy for the landowner to throw out the sharecropper when the land is fallow. Another reason appears to be that the landowners look upon their land essentially as a form of wealth, the value of which is appreciating year after year; they are not overly concerned about the annual returns. Furthermore, in the semi-feudal set-up of the Kosi Area, the big landowners are yet to acquire the dynamism of capitalist farmers. Such being the state of affairs, it is obvious that there can be no marked improvement in the utilisation of the irrigation potential in the command area of the Kosi Project — particularly during the rabi and summer seasons — unless the existing agrarian

TABLE 2: DISTRIBUTION OF ECONOMIC BENEFITS OF THE KOSI PROJECT

Kharif Irrigation Class-Size (Acres)	Number of Households	Total Kharif Irrigation (Acres)	Total Rabi Irrigation (Acres)	Percentage of Rabi Irrigation to Kharif Irrigation
0 to 2	259	367.30	376.20	102.43

structure is replaced by a more egalitarian one.

PRESENT PROGRAMME OF AREA DEVELOPMENT

The Government of Bihar is executing a programme for the development of the command area of the Kosi Project. The programme includes construction of watercourses and field channels, periodic desilting of the canals, execution of drainage works, land-levelling including reclamation of waste land, supplementing canal irrigation by exploiting ground water and consolidation of agricultural holdings. It was envisaged in the project report, that government would construct watercourses down to 5 cusecs capacity, and that it would be left to the beneficiaries to construct the watercourses of smaller capacity and the necessary field channels. When it was found that the beneficiaries were reluctant to take up the work, government decided to construct watercourses down to 1 cusec capacity. Accordingly, watercourses down to 1 cusec capacity have been constructed at government cost. Unfortunately, the beneficiaries have been showing much enthusiasm, even in digging field channels. During the recent drought relief operations, funds were provided for construction of field channels and a beginning has been made. However, completion of the work and future maintenance of the field channels will have to be left to the beneficiaries. It remains to be seen how efficiently this will be done.

As the river brings down huge quantities of silt and sand, the canals get choked quickly. It has been found necessary to close down the canals every three years for a few months in the summer to remove the silt and sand. This work is being attended to now. About 3.68 lakh acres of the gross command area remain waterlogged. In order to tackle this problem, a drainage scheme has been sanctioned and is under execution. The need for land-levelling was indicated earlier in this paper. An area of 6.48 lakh acres needs levelling. It is expected that part of the work will be done by the beneficiaries without any assistance from the government. A scheme has been drawn up, with financial assistance from the Agricultural Refinance Corporation, for levelling and reclaiming 3.48 lakh acres at a cost of about Rs 4 crores. The scheme provides for sanction of loans to farmers to buy about 600 tractors. It was hoped that the farmers would utilise the tractors for levelling their own lands and also for doing the work in the lands of small cultivators at a

rate prescribed by the government. Though 383 tractors have been supplied so far, the work of land-levelling has made very little progress. During the last three years, only about 2,000 acres of land have been levelled though the target was to get the work done in over 200,000 acres. It has been found that the big farmers who have purchased tractors generally use them for ploughing, haulage, etc., and not for land-levelling. The agrarian structure of the Kosi Area is to be blamed for the tardy progress in land-levelling as well. The programme for the exploitation of ground water has registered better progress. The original programme was to sink 5,720 tubewells and to energise them with electric motors or diesel engines at an estimated cost of Rs 6.75 crores. The scheme was modified subsequently and the number of tubewells was reduced to 2,000. So far, 19,661 tubewells have been completed. The innovation of the bamboo tubewell, a low-cost device for the exploitation of ground water, has led to a breakthrough in the exploitation of ground water resources.

The state government has just taken up the consolidation of agricultural holdings in Purnea district. Consolidation of holdings, before according effective protection to sharecroppers is bound to lead to their ejection. For one thing, when holdings are scattered, even a resident landowner finds it difficult to cultivate personally all the bits and pieces of land constituting his holding and, therefore, he is obliged to lease out some portions of his holding to sharecroppers. After consolidation, the landowner will find it both feasible and profitable to cultivate personally the entire area; he will, therefore, try his best to oust the sharecroppers. For another, the relationship of share-cropping tenancy subsists in respect of a specific piece of land easily identifiable in the field. Once consolidation is effected, the identity of the particular piece of land that the sharecropper has been cultivating will be lost, and so the landowner will find it easier still to evict him from the land. When it came to my notice that the consolidation of holdings in the district of Purnea would lead to the certain ejection of the sharecroppers, I wrote to the state government fully explaining the situation and suggesting that consolidation operations be stopped forthwith. The matter is probably still under consideration of the state government.

The area development programme has so far been conceived of in isolation from the much-needed institutional re-

forms. As already pointed out, the benefits of the Kosi Project have been shared unequally and the completion of the project has even resulted in a worsening of the position of the weaker sections of the society like sharecroppers. The present area development programme, particularly the completion of consolidation of holdings in the manner in which it is being attempted now, will spell disaster for the share-cropping tenants and will further widen the disparities in wealth and income. We have already put the cart firmly before the horse by providing irrigation and flood protection long before steps were taken for land-levelling, land development, drainage, consolidation of holdings, etc. We shall be persisting in the same folly if we go ahead with the present programme of area development without bringing about the necessary institutional changes.

SOME URGENTLY NEEDED INSTITUTIONAL CHANGES

As we have seen, the main obstacles to the fuller utilisation of the irrigation potential are rooted in the agrarian structure of the Kosi Area. The most important stumbling blocks are the existence of holdings of very large size which the owners do not care — or are unable — to operate efficiently, widespread share-cropping on terms which inhibit the adoption of modern farming practices, and the inability of small cultivators to obtain adequate inputs. These being the hurdles, the needed reforms are obvious.

The first thing to be done is to break up the big holdings and to bring them all down to a manageable size. This objective, no doubt, can be achieved to a certain extent by strictly implementing the amended ceiling law which fixes the ceiling area for a family of five members at 15 acres of Class I land. Under the Bihar law, land with canal irrigation for more than one season is treated as Class I land. Considering that there has been no marked change in the prevailing social and economic conditions or in the political power structure, there is no rational basis for hoping that the amended ceiling law will produce spectacular results. Furthermore, many of the transfers made by the big landowners having been sanctified by the then existing ceiling law, there will be legal difficulties in annulling the bulk of these transactions. The ceiling law alone will not, therefore, be an adequate instrument for bringing down the size of the holdings to a reasonable size. We have to search for other measures over and above mak-

ing every effort to implement the ceiling law efficiently. One such measure is to lay down that a person will be allowed to own land only in the village in which he resides permanently or in an adjacent village. All the other land owned by him should be taken over by government on payment of nominal compensation. The strict enforcement of such a law will not only put an end to extreme concentration in the ownership of land but will also partly cure the evil of absentee landlordism. It will also be more difficult to evade such a law than to evade the ceiling law. Another measure worth considering is the imposition of betterment levy. Instead of imposing a levy to be collected in cash, the beneficiaries may be required to surrender a portion of the land which has benefited from the project. Persons owning less than 5 acres may be exempted from the levy. The levy may be imposed at a progressive rate on those who own more than 5 acres. A third measure that deserves consideration, is the enactment of a law enabling the government or the Area Development Authority to acquire, on payment of nominal compensation, all agricultural land within the command area which has been left uncultivated in any one season. Land taken over under any of the three provisions suggested above should be distributed among the landless labourers and the land-poor peasants.

Equally important is the question of extending full protection to sharecroppers. In the first instance, permanent and heritable rights should be conferred on them and the provisions which fix fair rent at a level not exceeding 25 per cent of the gross produce should be strictly enforced. Later on, ownership rights should be conferred on them. Under the Bihar Tenancy Act, a distinction is made between occupancy and non-occupancy under-tenants. To claim rights of occupancy successfully, one should be able to prove continuous cultivating possession for 12 years. All share-cropping arrangements being oral and informal, and the social and economic position of the sharecroppers being extremely weak, it is seldom that a sharecropper succeeds in getting himself declared as an occupancy under-tenant. It is necessary to amend the law so as to do away with the distinction between occupancy and non-occupancy under-tenants. What is even more important is enactment of a law for the recording of the rights of sharecroppers and according of presumptive evidentiary value to the record of rights prepared under that law. Committees of

landless labourers and sharecroppers should be associated with the work of preparing such a record of rights. If the work is accorded high priority and is entrusted to hand-picked officers, it should be possible to extend the necessary protection to the bulk of the sharecroppers in 12 to 18 months' time.

Lastly, there is need to provide credit and other inputs to the assignees of new land, sharecroppers who acquire permanent rights in the land, and small holders who own less than 5 acres. The nationalised banks, the land development bank, and other co-operative institutions, should be required to revise their lending policies. The bulk of the lending from these institutions, say of the order of 80 per cent or so, should be reserved for the above-mentioned categories. Even if such a policy is adopted, the social and economic set-up of the Kosi Area being what it is, it is very doubtful whether it will be possible to ensure easy access to credit and other inputs to the small holders and beneficiaries of land reform. It may, become necessary, therefore, for government to resort to direct financing to help the weaker sections of the agricultural community.

CONCLUSION

The Kosi Area had always been noted for its inegalitarian social structure and extreme inequality in the ownership of land. The completion of the project, at an expenditure of about Rs 100 crores, has directly led to a widening of the disparities in wealth and income. The outmoded agrarian structure prevailing in the Kosi Area has not only been responsible for the perpetuation of social and economic injustice, but has also proved to be a deterrent to the fuller utilisation of the irrigation potential and the adoption of modern agricultural technology. The area development programme launched by the state government completely ignores the pressing need for institutional changes. The execution of this programme is not likely to lead to any significant improvement in the utilisation of the irrigation potential. On the other hand, it is bound to widen the disparities in wealth and income. The execution of the area development programme should be postponed, therefore, until the much-needed institutional changes aimed at making a frontal attack on the inegalitarian agrarian structure are completed. Certain suggestions for institutional reform have been made in this paper in the hope that the undisguised cynicism with which 'progressive' farmers have been pampered

over the years will yield place to a more enlightened policy.

Indigenous Tyre Curing Systems

TYRE manufacturers in India are now offered indigenous tyre curing systems conforming to the best international standards. The world famous 'Bag-O-Matic' tyre curing presses and related equipment will shortly be manufactured in India by L and T-McNeil Limited. This new company is a joint venture of Larsen and Toubro and McNeil Akron — a Division of McNeil Corporation of Akron, USA.

Construction work has already started on the new manufacturing plant at Madras. Important initial orders have been received and deliveries are scheduled to commence from December 1973. McNeil Akron will extend technical assistance for manufacturing, assembly, commissioning and quality control of the factory's products — which will be backed by L and T's marketing and service facilities.

Since modern tyre curing systems were not manufactured in India up to now, tyre plants were using imported equipment, mostly 'Bag-O-Matic' which ensures high output and quality through sophisticated electrical, pneumatic and hydraulic controls. Now the major tyre companies in India are on the threshold of expanding their manufacturing facilities.

Registered in March 1972, L and T-McNeil Limited has an authorised capital of Rs 1.8 crores, 60 per cent of which has been taken up by L and T and 40 per cent by the American collaborator. The project involves an initial capital outlay of Rs 1.2 crores. The first phase of the project envisages production of Rs 5 crores per annum.

Partial Integration of Agricultural and Non-Agricultural Incomes

A Suggestion

Ahmad Raza

The scheme of partial integration, though well conceived, does not curb the temptation to camouflage non-agricultural income as gains from agriculture. If this temptation is to be curbed, it is necessary to amend the scheme in such a way that what the assessee may gain by way of reduction in income tax liability the loses by way of increased AHT liability. If this is done, it will no longer pay to camouflage non-agricultural income as gains from agriculture.

THE disparate treatment of agricultural and non-agricultural income for the purpose of income-tax creates a strong temptation for the assessee to masquerade their income earned otherwise as gains from agriculture so as to avoid tax liability. It is in realisation of this that the Raj Committee on Taxation of Agricultural Wealth and Income recommended the scheme of partial integration of agricultural and non-agricultural income for determining the rate of tax applicable to non-agricultural income. The scheme has since been accepted by the government. Under the scheme, both the agricultural and the non-agricultural components of income are aggregated and the tax on the non-agricultural component is levied as if it were placed in the top slab of the aggregate income. The scheme is justified on the ground that it will

- (i) ensure that the tax burden on assessee with similar income does not differ sharply merely because of the fact that part of it is derived from agriculture; and
- (ii) curb the temptation to dress up a large chunk of taxable income as income of agricultural origin.

The problems arising out of exclusion of agricultural income from the income-tax base are real. It is, however, doubtful whether the scheme of partial integration, in its present form, can be an effective, or even a partial, solution of these problems. The scheme, as it now stands, will no doubt bring some additional revenue, though how much is an open question. But the assumption that it will ensure even broadly similar treatment of assessee with similar income is unrealistic. And the argument that tax evasion through the device of camouflaging taxable income as gains from agriculture would cease to be paying if the disclosure of agricultural income entails a heavier burden of tax on non-agricultural income is hardly tenable. A little exercise will make these points clear.

As regards the first problem, it is

easy to see that all that the scheme of partial integration ensures is that assessee with similar aggregate incomes are taxed similarly at the margin. The average rate of tax is, however, not even broadly equal. Thus, even under the scheme of partial integration, assessee with similar income will continue to be subjected to disparate treatment, the average rate of tax or the tax burden varying with the size of the non-agricultural component of the aggregate income. The disparity in treatment of assessee with similar incomes, however, is now reduced, particularly at higher levels of non-agricultural income.

As regards the second problem — i.e., curbing the temptation to inflate profits from agriculture in the tax returns — though disclosure of agricultural income does entail a heavier burden of tax on non-agricultural income, this, in itself, does not necessarily make the act of tax avoidance through the device of camouflaging taxable income as gains from agriculture unattractive. It may be emphasised that comparison of the relative tax burden then and now is besides the point — in fact, irrelevant. Whether tax avoidance through this device is a paying proposition or whether tax, in fact, will be avoided through this device will depend on the average and/or the marginal rate of return from camouflaging taxable income as gains from agriculture, the rate of return being defined in terms of the saving in tax liability as percentage of taxable income so camouflaged. The inducement will be there so long as the marginal rate of return is positive. And the assessee will continue to avoid tax through this device so long as the rate of return is sufficiently high to justify it. Thus, the point at issue is not whether the scheme of partial integration reduces the gains from tax evasion — this it definitely does — but whether it brings down the average and the marginal

rate of return from camouflaging non-agricultural income as gains from agriculture to such a low level as to make the act of tax avoidance not worth the risk. If this is accepted, some simple arithmetic will show that though the scheme of partial integration reduces the gains from tax evasion, both the average and the marginal rate of return, by way of savings in tax liability, from passing off non-agricultural income as gains from agriculture remain very high — in fact, in certain income-ranges, even higher than what these would have been in the absence of the scheme of partial integration. Thus, for instance, when the assessee has an income of Rs 150,000, Rs 50,000 from agriculture and Rs 100,000 from non-agricultural sources, camouflaging of the first Rs 10,000 saves him, in tax liability, Rs 8,625 when there is no partial integration and Rs 7,475 after the scheme is introduced. Savings from camouflaging the next Rs 10,000 is Rs 8,625 and Rs 8,050 respectively. Beyond this point, savings are more under the scheme of partial integration (cols 5 and 6, illustration II). Additionally, it may also be noted that, in the absence of the scheme of partial integration, both the marginal and the average rates of return from tax avoidance decrease as more and more non-agricultural income is camouflaged. Under the scheme of partial integration, on the other hand, the rate tends to increase (cols 5 to 8, all three illustrations). In other words, given the level of non-agricultural income, there is now, under the scheme of partial integration, greater incentive to camouflage a larger and larger chunk of non-agricultural income as income from agriculture. This being the case, it will still pay the assessee — and pay handsomely — to avoid tax through this device and the scheme of partial integration will, in no way, affect the assessee's propensity to camouflage non-agricultural income as gains from agriculture.

INCOME TAX LIABILITY, INCLUDING SURCHARGE, WITH AND WITHOUT PARTIAL INTEGRATION—SOME CASES

culture. If anything, the scheme may, in certain income brackets, even provide more temptation for this form of tax avoidance.

The scheme of partial integration is, thus, no solution to the problems arising out of the exclusion of agricultural income from the income-tax base. In fact, so long as agricultural income is given a favourable treatment, there cannot be any solution to these problems. The ideal and the only effective solution lies in complete integration of agricultural and non-agricultural incomes where the assessee is taxed on the basis of his total declared income — agricultural and non-agricultural. The tax liability will, of course, be adjusted for the Agricultural Holdings Tax (AHT) paid. This will not only ensure equal treatment of assessee with equal income but will also completely eliminate all temptation to dress up large chunks of non-agricultural income as gains from agriculture. But as this will amount to taxing agricultural income, and since agriculture is a state subject, the scheme can be implemented only if the state governments empower the Central Government to administer and collect his tax on their behalf. Needless to say, the entire additional tax receipt will be distributed among the state governments in proportion to their respective share in the total agricultural income included in the tax base. As the scheme will ensure additional resources to the state governments without, in any way, abridging their constitutional right to

tax agriculture, there is no reason why they should not agree to this arrangement.

However, if the above suggestion cannot be accepted because of possible constitutional/legal restraints, the least that can be done is to amend the scheme of partial integration in such a way as to minimise the temptation to pass off a part of the non-agricultural income as agricultural income. At least two alternatives suggest themselves for consideration.

First, the rateable value, as recommended by the Committee, is a good measure of the average potential productivity of land; so income declared as gains from agriculture should bear some relationship to the aggregate rateable value of the holdings of the assessee. In other words, there should be some sort of a ceiling on the amount of income that can be declared as gains from agriculture, the ceiling being a function of the aggregate rateable value of the holding. Thus, for instance, it might be provided that income declared as gains from agriculture should not be more than, say 200 per cent of the rateable value of the operational holding of the assessee. Declared agricultural income in excess of the ceiling should be treated like non-agricultural income and taxed accordingly. Thus, suppose the aggregate income of an assessee is Rs 250,000, made up of Rs 200,000 of non-agricultural income and Rs 50,000 of agricultural income, and that the rateable value of his holdings

is Rs 40,000. As per the scheme of partial integration, his total income tax liability will be Rs 177,675. If, however, he declares only Rs 100,000 as income from non-agricultural sources and the balance of Rs 150,000 as gains from agriculture, he will be required to pay only Rs 90,275 as tax — a net saving of Rs 87,400. But if the suggestion is accepted, only Rs 80,000 out of the Rs 150,000 declared as agricultural income will be exempted and the balance of Rs 70,000 will be added to his non-agricultural income. His total tax liability will then be Rs 154,100 — a net saving of only Rs 23,575. Under this suggestion, though the rate of return is still high, assessee are legally prevented from taking advantage of it and there is no way of circumventing it. As the additional tax receipt will be on account of the inclusion of agricultural income in the tax base, and since agricultural taxation is a state subject, the state governments will have to empower the Central Government to collect this tax on their behalf. As the method of working out the rateable value suggested by the Committee is rather conservative, their will be very limited scope of masquerading non-agricultural income as gains from agriculture. This measure may, however, go against the enterprising farmers who are, in fact, getting agricultural income much in excess of what is indicated by the rateable value. Such farmers will get penalised for their enterprise and efficiency. The measure may also appear

arbitrary. Moreover, this measure might be attacked on the ground that it is an attempt to introduce agricultural income-tax through the backdoor.

Alternatively, therefore, it may be provided that if income declared as gains from agriculture is much in excess of what is indicated by the rateable value of the assessee's operational holding, the latter may be suitably enhanced and the assessee may be required to pay AHT on the enhanced rateable value. Thus, for instance, if the income declared as gains from agriculture exceeds, say, 150 per cent of the rateable value of the assessee's operational holding, the latter may be enhanced by, say, three-fourths of the amount by which the declared agricultural income exceeds 150 per cent of the rateable value and the AHT should be payable on the revised rateable value. In this way, a very substantial part of what the assessee may gain by camouflaging non-agricultural income as gains from agriculture, he will lose by way of additional AHT. Thus, suppose that the aggregate income of an assessee is Rs 250,000 made up of Rs 200,000 of non-agricultural income and Rs 50,000 of agricultural income and that the rateable value of his operational holding is Rs 40,000. As per recommendations of the Raj Committee, he will have to pay Rs 177,675 by way of income tax and Rs 8,000 by way of

AHT. If, however, he declares only Rs 100,000 as income from non-agricultural sources and the balance as gains from agriculture, his AHT liability remains the same but his income tax liability is reduced to Rs 90,275 — a net saving of Rs 87,400. If however, the suggestion to enhance the rateable value is accepted, though the assessee still gains Rs 87,400 by way of reduction in income tax liability, his rateable value goes up by Rs 67,500 to Rs 107,500 and consequently his AHT liability is raised by Rs 49,780 to Rs 57,780. In this way, the net gain from passing on Rs 100,000 of non-agricultural income as agricultural income is reduced from Rs 87,400 to only Rs 37,620. The balance is mopped up by way of enhanced AHT liability. Under this suggestion though the assessee may still gain by showing a part of his non-agricultural income as gains from agriculture but, as both the average and the marginal rates of return have been drastically reduced, tax evasion through this device may not be a paying proposition.

By way of added justification for such a procedure, it may be pointed out that the rateable value, as suggested by the Raj Committee, is an index of the average potential productivity of land—average of both good and bad years. As such there is hardly any justification for providing any relief during the years

of crop failure. What the cultivators loses during such years, he makes up during years of good harvest. And yet the Committee has suggested that if, in a given year, the average output of a crop/crops in the whole or part/parts of the district/tract is less than half of the norm gross output established, the rateable value of the land sown under such a crop/crops in that year should be taken to be zero. If the rateable value is to be reduced during the year of crop failure, it is only reasonable to suggest that if, during a given year, the average output of crop/crops in part/parts of the district/tract is more than one-and-a-half times the norms of gross output established, the rateable value of land sown under such a crop/crops in that year should be suitably enhanced.

To recapitulate, it has been pointed out that the scheme of partial integration, though well conceived, does not curb the temptation to camouflage non-agricultural income as gains from agriculture. If this temptation is to be curbed, it is necessary to amend the scheme in such a way that what the assessee may gain by way of reduction in income tax liability he loses by way of increased AHT liability. If this is done, it will no longer be paying to camouflage non-agricultural income as gains from agriculture.

Holidaying in Srinagar

IS this the beginning of the end of the yet-to-be Fifth Five-Year Plan? Two events in quick succession seem to be full of portent. The first was the Planning Minister's admission that the steep rise in prices will, after all, result in a certain trimming of the Plan. To put it in D P Dhar's distinctive prose style, "there will be an element of erosion of the dreams that we had envisaged in the Fifth Plan". Close on the heels of this admission has come the cryptic report that the Planning Commission is considering implementing the Fifth Plan in two phases. The first phase, according to the report, will be concerned with obtaining the maximum results out of investments already made and out of capacities already created; new investment and expansion of capacity during this phase will be largely of the "balancing" type. It is only during the second phase of the Plan that new investment schemes proper will be taken up.

It is true that in his remarks this week to the Consultative Committee of Parliament on Planning — meeting, appropriately enough for the season of the year, in Srinagar — the Planning Minister stoutly denied that there was any move to take up the Fifth Plan in phases. He even went so far as to say that this would only be "a sophisticated version of a plan holiday". Yet only the day before, in an earlier statement to the same meeting, he had dwelt on the importance of phasing projects and programmes, emphasising in that context the growth potential of production capacities already built up. To take his denial too literally would, therefore, be to do less than justice to the Planning Minister's known ability to step lightly away from inconvenient situations. After all, it was only a few weeks ago that he was suavely brushing aside all suggestions that the price rise of 20 per cent or so over the past year would make any difference at all to the Fifth Plan.

Even on the question of the impact of the price rise the Planning Minister remains soothingly vague. True, the size of the Plan might be "somewhat smaller" in real terms than projected earlier; but there was no question of the structure and strategy of the Plan being modified in any "fundamental sense". What is the relationship between the size of the Plan and its structure and strategy? And at what point do cuts in the former begin to affect the latter? Has not the price rise of the last year, the highest ever on record, already taken us beyond that point? It is not merely a question of the rise in prices reducing the real value of the financial investment envisaged for the Plan, but also of the volume of available financial resources being eroded by the proliferation of government expenditures of the patently non-developmental type. For instance, can anyone take seriously any more the Planning Commission's hope that the balance from current revenues of the central and state governments at 1972-73 rates of taxes, available for financing the Fifth Plan will be Rs 7,500 crores (or over ten times the likely figure in the Fourth Plan) over the Plan period?

We have been here before — in the mid-1960s. Not even six months have passed since D P Dhar was pointing accusing fingers at the plan holiday decided upon in 1966 when, conveniently, Morarji Desai was the Finance Minister (though, less conveniently, the Prime Minister and Chairman of the Planning Commission was still Indira Gandhi); it is because the power, steel and heavy industry sectors were then deliberately starved of essential investments that we were now in the throes of economic difficulties; no more Plan holidays; a Rs 50,000 crore Plan for 1974-79. As the author of such brave declarations, the Planning Minister is in a fix. An honest statement to the effect that, in view of the erosion of investible resources as a result of the inflation and given the unwillingness of the government to squeeze the affluent segments of the population, the Fifth Plan will have to be postponed by a couple of years or so is quite out of the question. Hence the recourse to the subterfuge, to be revealed gradually, of a better-ordered Fifth Plan, with the emphasis initially on sprucing up past investments. And, in the meantime, let us have more brave statements — such as that "planning is not an exercise reserved for good years" and that "the imperatives of planned development are greater in the present situation than in an average year". Why, if this were indeed so, has the Planning Commission all but washed its hands of the Fourth Plan? The economic situation could hardly have been worse than it has been in the last two years and yet what has been the Commission's contribution to enforcing "the imperatives of planned development"?

Exercises in evasion and vacuous statements become counter-productive beyond a point. How well the government is succeeding in reducing itself to an object of derision is to be seen from the motions it is going through of formulating a scheme for supplying essential consumer goods, other than food-grains, through the public distribution system. Official bodies have reportedly worked on the scheme for the last 18 months. A committee, presided over by

the Minister of State for Planning is to further discuss the problem on June 27 and 28. No doubt, more such meetings and discussions will follow. Meanwhile, prices of commodities in short supply will go merrily up and up; even such public distribution system for foodgrains as there once was will totter on the verge of collapse; and the scheme to take over wholesale trade in rice will be quietly shelved.

PM Abroad

International Insurance?

THERE is more than an element of comic opera in Indira Gandhi telling an audience of Canadian businessmen about the dangers to the "future of the world" of "exclusive rich men's clubs" at a time when her economic policies at home have made this country ever more dependent on those very rich men's clubs. This allusion to the rapaciousness of the rich countries acting in consort against the poorer segment of the world has been made before by the Prime Minister at several other international gatherings. What is notable, this time, is that both in Yugoslavia and Canada she has emphasised the need for better trade terms rather than for aid. So has the Foreign Minister on his current visits to the Scandinavian capitals. Both have asked the countries they are visiting to import more Indian products.

This ties in with current trends within the Government of India to integrate the country even more firmly into the international capitalist framework. As the economy shows no signs of perking up with the aid of socialist slogans, one of the plausible alternatives — as seen from the government's point of view — is greater foreign investment and collaboration. The requests for better trade terms are a prelude, perhaps, to offering a more attractive investment climate to those very "rich men's clubs" which Indira Gandhi has dubbed "harmful" in her Toronto speech. Behind the Canadian visit there is also, of course, the unstated but nagging fear that the government may need to import many more million tons of wheat than it has so far made provision for. The Canadian Foreign Minister has, however, blandly stated that the international wheat situation is so tight that Canada may have no wheat to spare.

Another likely reason for these visits is the growing realisation that India is being taken for granted — or even ignored — by the two great powers, the US and the Soviet Union, and also by the two other major powers, China

and Japan, in their global jockeying for advantage or understanding. The recent large-scale shipments of American arms to Iran along with the continued US backing given to Pakistan, without bothering about Indian sensibilities, is a case in point. It has also, probably, been noticed in New Delhi that while the Soviet Union continues to provide military and other supplies to India it has not chosen to alienate either Pakistan or Iran. This concern about the manoeuvres of the great powers was made amply clear by Indira Gandhi in her speech at a joint session of the Canadian parliament: "The arming of small nations by big powers... continues in the name of maintaining regional balance. It is a fallacy to believe that the induction of arms from outside can promote stability, for it invariably encourages those militaristic elements who have little use for democratic and peaceful solutions. This is why we protest against the continued arms aid to countries in our neighbourhood and regard it with grave concern."

Faced with the 'unreliability' of the big powers, an attempt to improve relations with as many friendly, second-rate powers as possible could be an important motive for these visits, particularly as Canada and Yugoslavia admirably fit the bill of being cordial, second-string countries. Indira Gandhi expressed this feeling in the same speech by stating that the only safeguard against big power hegemony was for the small nations to stand together and help one another on as wide a scale as possible. She added in a self-righteous tone: "Countries like Canada and India which have no territorial ambitions, no economic empires to protect and no ideologies to export can take a less self-regarding and more far-seeing view of international affairs." What she could not, of course, say is that her visit to Canada is very much part of a self-regarding policy to insure — to however limited an extent — her government against the pressures that have built up at home as a result of her dithering domestic policies.

Banking

Mass without Weight

NEVER perhaps in the history of banking in India has such a mass of printed statistical data been made available as the Reserve Bank has done in the past year or so. Besides the special tables on banking statistics published in every issue of the Bank's monthly *Bulletin*, there have been special supplements, such as the one issued with the October 1972 issue of the *Bulletin*.

There have also been a series of voluminous press handouts based on these statistics. In all of these, the Reserve Bank's major preoccupation appears to have been to satisfy the government's need for publicity regarding the post-nationalisation achievements of banks. As a result, the Reserve Bank and the government have been content with data on mainly three aspects of the banks' operations: spread of bank offices, priority sector advances, and total deposit mobilisation and credit expansion. Every time an impressive array of tables have been compiled covering these three aspects, disaggregating the data centre-wise, region-wise, state-wise and sometimes even district-wise.

The latest issue of the Bank's *Bulletin*, for April 1973, carries a 260-page supplement on banking statistics. This improves upon the Bank's past performance in respect of the volume of data presented; some fresh ground is also broken in regard to the content of the data. Almost for the first time, industry-wise classification of outstanding credit with many break-downs — by regions, states and even districts; by private and public sectors; and by purpose of finance — is presented. These are all based on the now-defunct uniform balance book (UBB) survey for June 1972. The survey was introduced as early as in 1965 and bank branches were expected to furnish the prescribed returns every month. However, what we now have are data on industry-wise distribution of credit for one single period without any comparative figure for earlier periods. According to the Reserve Bank, "a major handicap in compiling banking statistics is the lack of complete response from banks. Could this not owe something to the fact that the Reserve Bank itself has shown lack of seriousness in ensuring the flow of statistical returns from bank branches, in the tabulation of the data thus collected and in using them in a planned manner in the different departments of the Bank? The Banking Commission's observations on the subject confirm this suspicion (see pp 320-3 of the Commission's report). There have indeed been few analytical studies of the Reserve Bank in the last few years of the dimensional and structural changes that are taking place in banking and monetary spheres. A good deal of data used to be obtained from the banks and processed, tabulated and published by the Bank in the past; but not only has the scope of these data not been widened but often their presentation lacks continuity as well. Similarly, the distribution of advances and interest and security pattern have

important implications for policy-making, but hardly any data on these aspects have been published in recent years. Likewise, data on debits to deposits, to indicate the turn-over of deposits — something analogous to the transaction velocity of deposit money — have not been seen since 1966. Is it too much to hope that with a new Committee of Direction and Banking Statistics functioning in the Reserve Bank, things will improve?

Hitherto, the Reserve Bank's data on wider banking problems have been analytically useful, quite a few of them have been so by accident. This is because by and large the data have been compiled in a mechanical manner. Take, for instance, the data on advances against sensitive commodities published in the latest Supplement (Statement 10, p 114). Almost all the commodities considered are seasonal ones and the peak level of credit against them is reached somewhere in the busy season (November-April). The data published, however, relate to the last Friday of June 1972. Not surprisingly, they show that only 11.2 per cent of total bank credit was being accounted for by these commodities. Besides, such important commodities as sugar and sugarcane are missing from the list. Also, since this statement has been compiled from the 'security' code of the UBB proforma, it would have been worthwhile to publish data for other securities such as industrial commodities, gold, shares, unsecured loans, etc.

Likewise, the Supplement claims to present for the first time "a combination of ... regional and sectoral flow of credit", without pointing to a major drawback of the data, viz, that the region-wise, state-wise and district-wise data are based entirely on the location of bank branches and not on the location of the borrowing parties. Thus New Delhi accounts for 58 per cent of the total bank credit going to the 7 states and union territories of the northern region, Bombay for 80 per cent of that in the western region and Calcutta for 84 per cent of that in the eastern region. What is more, Calcutta also accounts for 90 per cent of the credit given for agriculture and allied activities in the state of West Bengal and Bombay city, similarly, for one-third of total agricultural credit in Maharashtra! Here it must be mentioned that in the new system of Basic Statistical Returns (BSR) No 1, a code for 'location' of the borrowing parties has been included.

These issues apart, even taken as they are, the data published by the Reserve Bank leave much to be desired from the viewpoint of reliability and

comparability. Take, for instance, the practice of obtaining a series of special returns for "priority sector advances", including the state-wise break-up of such advances, directly from the banks' head offices. The Banking Commission had warned that while obtaining returns from the head offices did obviate "much of the difficulties and labour inherent in the compilation of branch-wise returns ... the gain is apparent rather than real" (p 325). In some cases at least the head offices' approach to furnishing detailed returns may not have been very different from that of the children's puzzle which goes "think of a number, double it ...". According to the UBB survey for June 1972, direct finance for agriculture granted by all 82 scheduled commercial banks together amounted to Rs 213 crores (pp 50 and 111 of the Supplement) whereas for the same month the public sector banks' special returns on priority sector credit places direct finance for agriculture by only the 22 public sector banks at Rs 232 crores (*ibid*), (p 11). Neither any conceptual differences nor non-reporting by about 15 per cent of the bank offices in the UBB survey can explain this discrepancy. Besides, similar special returns data published in the October 1972 issue of the *Bulletin* had placed the figure of direct agriculture finance at Rs 224 crores at the end of April 1972 in respect of 34 scheduled commercial banks as against Rs 232 crores for only 22 public sector banks at the end of June 1972. In fact the June figures should show a decline in direct lending to agriculture if the over 50 per cent recovery of agricultural credit reported by public sector as well as other banks (statement 13 of Supplement) is true.

The misgivings about collecting special returns data from the head offices of banks apply not only to priority sector advances but also to BSR No 3 in respect of sensitive commodities which will henceforth be furnished entirely by the head offices, especially since the practice of collecting security-wise data has otherwise been completely dispensed with. The practice of collecting special returns on advances to the priority sectors could be dispensed with and instead BSR-1, covering bank advances, could be converted into a quarterly return with the introduction of a 'security' code.

More Branches, but...

AS one has come to expect by now, the most hopeful feature brought out by Reserve Bank's latest Supplement relates to the increase in the number of bank offices. In the first three-and-a-half years after bank nationalisation, 6,477

new bank offices were opened, raising the total number of bank offices from 8,262 in July 1969 to 14,730 in December 1972. There is no doubt that the regional distribution of bank branches has also improved very considerably. However, against this record of branch expansion, the performance in respect of dispensation of credit to the priority sectors is all the more disappointing. In July 1969-June 1970, the first year after nationalisation, about 50 per cent of additional credit went to the priority sectors, but in the subsequent two years, 1970-71 and 1971-72 (July-June), the proportion dwindled to 27 per cent and 29.9 per cent, respectively. As a result, the share of the priority sectors in the total advances of the public sector banks, which had increased from 14.9 per cent in June 1969 to 21.3 per cent in June 1970, stagnated at 22 per cent and 22.9 per cent in June 1971 and June 1972, respectively. Actually, even these averages are misleading, because in both 1970-71 and 1971-72 the growth in total bank credit was very slow on account of the slack demand for credit from the industrial sector. The scheduled commercial banks' credit-deposit ratio declined from 79.9 per cent in June 1970 to 71.5 per cent in June 1972. Had the banks' credit-deposit ratio been maintained at about 80 per cent, the priority sectors' share in total credit would have shown a decline.

The contribution of the new bank offices opened after nationalisation to the growth of deposits and advances needs to be noted. The 4,615 reporting new branches contributed Rs 548 crores or 19 per cent to the growth of Rs 2,878 crores in bank deposits between July 1969 and June 1972; their share of the growth in advances was 15.5 per cent (Rs 278 crores out of Rs 1,778 crores). Of the deposits mobilised and credit granted by the new branches, about 30 per cent in either case was by branches in the northern region which accounted for only 16 per cent of all the new branches opened after nationalisation. In fact, even in the total deposits of all rural bank branches (Rs 459 crores), the northern region accounted for 26 per cent (Rs 120 crores); the proportion of rural branches in the region to the total number of rural branches is about 18 per cent. This does seem to suggest that the agricultural prosperity of the region has not entirely by-passed the commercial banks.

The growth of advances of the rural branches has been slow in relation both to the growth of total advances of banks and to the growth of deposits of the rural branches. The rural branches'

deposits rose by Rs 459 crores and their advances by only Rs 191 crores. The banks are organisation-wise and attitudes-wise ill-suited to be the instruments for meeting the credit needs of the small farmers. As for the large farmers, they are the beneficiaries of official financial bounties in so many forms that their need to rely on commercial bank funds, on commercial bank terms, must necessarily be limited. Those who look at the credit-deposit ratios of the rural branches of commercial banks and rush to charge the banks with siphoning off resources from the countryside to bolster up the prosperity of the metropolitan centres forget that today between Rs 600 and Rs 700 crores (Rs 601 crores in 1971-72 and Rs 690 crores in 1972-73, to be exact) are being pumped into the agricultural sector annually as medium term and short term credit. In addition, land development banks give about Rs 200 crores (Rs 178 crores in 1971-72 and Rs 190 crores in 1972-73) in term loans. And all this is in addition to the pampering of the landed gentry in the form of high prices for farm products and low prices for inputs, including low irrigation rates, and virtual exemption from all direct taxation.

Data presented in Statement 9 of the Supplement brings out that commercial bank credit to the public sector accounts for a significant proportion of total bank credit — 15.7 per cent at the end of June 1972. This proportion was 9.7 per cent in June 1969, according to the Reserve Bank's Annual Report for 1969-70 (p 23). In absolute terms, credit to the public sector increased from Rs 351 crores in June 1969 to Rs 830 crores in June 1973. The public sector's share is likely to have increased further in the last busy season. Though a part of this credit is for the commercial and industrial activities of the public sector, the state governments have been systematically trying to replace budgetary finance by bank finance. In other words, despite the stoppage of overdraft facilities from the Reserve Bank, the expansionary influence of state governments' borrowings, now indirect, on money supply continues. This is openly recognised in the recent decision to extend the scope of the Reserve Bank's credit authorisation scheme to loans to the public sector. However, judging from the ineffectiveness of the credit authorisation scheme in imposing financial discipline on private sector borrowers from the commercial banks, it is a moot point whether its extension to the public sector will serve any purpose.

United States

Constitutional Trap

A Correspondent writes:

INCREASINGLY ugly revelations about the shenanigans the staff of the White House, including those closest to President Nixon, had indulged in, stare Americans in the face. The cumulative evidence may just fall short of linking the President himself with either the illegal acts or the subsequent attempts to cover them up. This, however, would be a mere technicality; the moral responsibility for the outrages committed by his closest confidants cannot escape the President.

A man with a greater scruple for the observance of public morality would perhaps have resigned from office. Broad and thick hints have been thrown in President Nixon's direction, but he has refused to take them and fade away. He, most certainly, does not believe in voluntary abdication. He has decided to 'fight back', as his latest statement phrases it, to fulfil the mandate which the American people so overwhelmingly gave him last year. That this mandate would probably have been altogether otherwise in case some of the things that are known now were known about this time last year is a thought which apparently does not disturb him.

In case President Nixon does not remove himself, the alternative would be to impeach him in the House of Representatives and, if the motion of impeachment is carried there, to have it ratified in the Senate by a two-thirds vote. In their present mood, and particularly in case public opinion polls suddenly indicate a sharp swing against the President, a resolution of impeachment might indeed pass the two wings of the Congress. The real problem would, however, arise right there. Under the American Constitution, whatever the circumstances in which the President is removed, the Vice-President is to succeed him. To vast numbers among the general public as well as to the leaders of the two main parties, the present incumbent, Spiro Agnew, would seem to be an even more undesirable specimen than the debased Nixon. Irrespective of whether the Vice-President too was involved in the shady doings of Watergate and their aftermath, Agnew, it is widely held, would be an even greater disaster as President. Supposing the Congress were to remove both the President and the Vice-President, or supposing both individuals decide to resign following an avalanche of public pressure, the Presidency in

terms of the line of the succession laid down, would then pass on to the Speaker of the House of Representatives. The incumbent in this position, Carl Albert, again according to nearly everybody, is not of presidential timber.

This then is the nature of the crisis confronting the American nation. To tolerate Richard Nixon as President for even another day may be an excruciating thing, but the alternatives may be equally uninviting. There is no provision under the Constitution whereby a particular Presidential election could be declared void and a fresh poll arranged. The Americans, therefore, will have to make do with the present mess. Even were the circumstantial evidence of the President's direct involvement turned out to be overwhelming, there could be a collective urge to turn the other way. This would not diminish the dimension of the tragedy; it would in fact aggravate it. For the majesty of the Presidency would disappear; perhaps it has already disappeared. The Americans would, for the next three and a half years, live with the knowledge that they have as President one who has been incriminated in run-of-the-mill criminal offences, burglary, bribery, cheating, lying and all that. They would live with the knowledge that the rest of the world is mocking at them and at their moral pretensions. They would live with the knowledge that they have to endure a President only because, thanks to the quirks of the Constitution, they have no means of despatching him to the ignominy which he richly deserves. One consequence could be a checkmating of the American initiative in the international sphere, and a setback to the kind of cautious bilateral scaffoldings Henry Kissinger has been persevering with.

Considering that in the post-World War II period, most of the dis-equilibration in international affairs has stemmed from the stirrings of American dogma, Watergate could thus emerge as a blissful outcome for the rest of the world. The possibility of course remains that a Nixon at bay on the domestic front might attempt, as a diversionary manoeuvre, to foment newer Vietnams elsewhere, for example, in Cambodia or Chile. But the probability seems to be meagre: The Americans are providing every indication of being overburdened by the weariness of it all. In their present frame of mind, given another false move on the President's part, they could even come round to getting rid of him however droll the consequences of the action might be.

Parliamentary Process

Growing Irrelevance

A Correspondent writes:

THE long budget session of Parliament has ended: the members have dispersed, glad to get away from New Delhi's merciless summer. Such sessions come and go, but do they really make a difference to the manner of functioning — or non-functioning — of the Indian polity? The Congress has an overwhelming majority in the Lok Sabha, and a comfortable one in the Rajya Sabha. We continue to call ourselves a parliamentary democracy; we therefore go through the formalities of cut motions, call attention notices, finance bills, select committees, public accounts committees and so on; occasional motions of adjournment are supposed to provide the leavening. Each of these is now reduced to a ritual. A Jyotirmoy Bosu or a Madhu Limaye may create sudden flutters; their performance too, however, is soon reduced to a predictability.

It is as if everybody is going through a written, rehearsed script: even the shouting and the epithet-mongering have a canned quality about them. There is a procession of nibbling issues succeeding one another: Maruti, the supersession of Supreme Court judges, the rampant price increase, the failure of the take-over of wholesale trade, the government's decision to hug the emergency for ever, detentions without trial, and so on. But since, in each case, the finale of the debate is pre-ordained, listlessness marks it all. Many Cabinet ministers are found to be away from the House even when discussions concerning their portfolios are going on. Attendance is invariably thin. The question hour is converted into a symbolic occasion: answers are sought not to lay bare the essentials of an issue, but merely because, in their absence, a deeper ennui would spread over everything. Beyond a point, members of the opposition groups cannot succeed in extricating themselves from the pervading cynicism either.

Formally it is still a parliamentary process, but the scaffolding is almost entirely that of a presidential system. A presidential system has its strengths, but also its weaknesses as are being currently demonstrated in the United States. The rules of the game at any rate are different. While at some point of time presidential powers may expand disproportionately and put into shade the other wings of the government, the built-in checks and balances soon res-

tore the equilibrium. No such self-correcting mechanism is however likely to be available if a parliamentary system itself is subverted, surreptitiously or otherwise, into the presidential form. For then, the *de facto* president himself or herself can claim to represent the legislative wing and thus combine in him or her the writ which should accompany the exercise of both executive and legislative wills. In this circumstance, the judiciary could well be reduced to playing a minor, annotative, conformist role, as is being borne out by certain rapidly surfacing symptoms. In terms of formal arrangements, it may continue to appear that parliamentary democracy remains the untrammelled queen, but the corrosion taking place everyday could soon result in a situation where the government could not care less for the susceptibilities of either Parliament or the judiciary. In the process, little local difficulties may arise; but the executive would be armed with enough weaponry to take care of such stray accidents.

This could amount to an almost absent-minded slide to quasi-authoritarianism. Given mass illiteracy, lack of coherently organised political groups, and the advantage which a ruling group possesses of being able to pick and choose and exploit emotion-charged populist slogans, organising a victory at general elections at five-yearly intervals may not involve a great deal of strain. From then on, everything else could be taken for granted. Parliament as a forum for ventilating grievances and mirroring popular aspirations may run the danger of losing its profession. The judiciary too could find itself totally hamstrung. If widespread discontent wells up among the people, there would then be no ready outlet for it. Since parliamentary catharsis would be ruled out, over the long run the inclination for extra-parliamentary stratagems may develop. Some of the happenings currently taking place round the country suggest that the empirical correlates of the forebodings are almost already knocking at our doors.

Powerlooms

Workers, the Worst Hit

Our Maharashtra Correspondent writes:

THE Union Government's Textile Commissioner as well as spokesmen of the Maharashtra government have been claiming that powerlooms in Bhiwandi, 50 km from Bombay, will "soon" get their requirements of yarn. Yet all the yarn that the powerlooms in Bhiwandi

have got in the entire period of the last two-and-a-half months would have been enough to run the looms on a two-shift basis for just two days.

Like Ichalkaranji in Kolhapur district, Bhiwandi is one of Maharashtra's large powerloom centres. According to official estimates, there are 33,000 authorised powerlooms in Bhiwandi and over 10,000 "unauthorised" ones. There are, besides, about 10,000 art silk looms. Nearly 50 per cent of the looms are owned by so-called "master-weavers", who supply yarn, finance and know-how and also look after the marketing of cloth and employ weavers to work the looms. Each of these "master-weavers" owns between 50 and 100 looms. A large number of the remaining looms are owned by a few local "giants", who own as many as 500 to 1,000 looms each, and by millowners from Bombay. Finally, there are the small loom-owners, with two to eight looms each, who themselves operate the looms with the help of their families.

Powerlooms in Bhiwandi work two 12-hour shifts. There is little information about the application of the state government's labour laws to those who work the looms. As for the 12-hour shift, the answer one usually gets is that powerloom workers have been traditionally used to working such long hours. If we take the number of powerlooms at 43,000, including both authorised and unauthorised looms, but excluding the art silk ones, with one worker looking after two looms in his 12-hour shift, the total number of workers employed on the looms would be about 43,000. There are, in addition, thousands of workers employed in ancillary industries dependent on the powerlooms. There are, for instance, over 7,000 workers employed on sizing machines and approximately 10,000 handcraft workers.

At present only 8,000 to 10,000 looms are working in Bhiwandi. These are mostly those which are owned by a few large loomowners and by millowners from Bombay. The latter get their supply of yarn from their affiliated composite mills. The rest of the looms have been practically shut for the last two-and-a-half months. The people who have suffered the most on account of the yarn shortage are the small loom-owners and the workers employed on looms owned by the "master-weavers". Also badly affected are those employed in the sizing units and the handcart drivers and others engaged in the ancillary industries. Over 25,000 weavers are estimated to have lost their employment in the last

two-and-a-half months, not counting the thousands of other workers employed in the ancillary industries. Bhiwandi's powerloom workers come mostly from Uttar Pradesh and Andhra Pradesh and a large number of them have left for their villages.

The yarn crisis in Bhiwandi followed on the heels of the imposition of control on the distribution of yarn by the Union Government in February last. When news of the Union Government's intention to impose control spread, the millowners raised the prices of yarn steeply, even though from August 1972 there was supposed to be in existence a voluntary yarn price control.

Powerlooms in Ichalkaranji have not suffered on account of the yarn shortage because loom-owners there have their own spinning mill, the Deccan Co-operative Spinning Mill, which has enough spindleage not only to cope with the yarn requirements of the local powerlooms but also to supply yarn to other powerloom centres in the state. Besides, in Ichalkaranji co-operatives of weavers own processing units whereas powerlooms in Bhiwandi have to sell grey cloth to merchants in Bombay and in the towns of Saurashtra for processing and printing.

Maharashtra has over 13 co-operative spinning mills, owned by cotton producers. Where has the yarn output of these co-operative mills disappeared? It was known by December last year that a yarn crisis was in the offing following the power shortage in Tamil Nadu. But the government woke up only this April after the handloom weavers of Nagpur and the powerloom weavers of Malegaon had started to agitate about the non-availability of yarn. The state government sought to persuade the Tamil Nadu government to supply yarn in exchange for electric power. The deal was, however, put out of gear by the control on distribution of yarn enforced by the Central government. The state government also froze stocks of yarn with mills in Bombay and imposed restrictions on the sale of yarn by the state's co-operative spinning mills. The steps came too late in the day and were ineffective.

Such supplies of yarn as are trickling through the state government's distribution machinery to the small loom-owners in Bhiwandi are insufficient to enable them to run their looms economically; the yarn is, therefore, being sold to the big weavers, who buy it at a premium. The "master-weavers" are doing the same, since they are not sure that the cloth merchants will lift their output at the high prices which alone will make

it worthwhile for them to buy yarn at a premium in the open market. The other problem the small weavers face is that of credit. Traditionally they used to get their yarn on credit extending from one to two weeks. With the yarn shortage, no yarn is to be had on credit. At the same time, neither the nationalised banks nor the state government has made any alternative arrangements for extending credit to the small weavers.

CENTO

Becoming a Regional Entity

THE kingpin of the Central Treaty Organisation is Iran, and more specifically, the Shah of Iran. Its progenitor was the Baghdad Pact. But then a coup by Brigadier Kassem in 1958 had removed overnight the feudal regime of King Faisal and his mentor, Nuri al-Said. And the name of the Pact had also to be changed overnight. At that time the United States and Britain had regarded Nuri al-Said as their stabilising trump-card in the region. Now Reza Pahlavi fits that role. Times have changed though. The Cold War is over and the Soviet Union is no longer regarded as a direct military threat by the Western powers and after their rude experience of colonial struggles these powers are wary of making commitments which could draw them into local wars or long drawn-out anti-guerilla operations. This partly explains why the Foreign Ministers of the United States and Britain are most reluctant to redefine the role of CENTO as urged to by Iran and Pakistan. The latter two countries would particularly like the redefinition to take into account the 'new threat to security' posed by the Soviet Union's treaties with India and Iraq and by the spread of insurgency movements in the Gulf and Baluchistan. Britain and the United States have shied away from making any definite commitment to counter these threats by their own military presence.

The United States, involved in a wide-ranging *detente* with the Soviet Union, has no reason to build up an atmosphere of big power confrontation. Yet, it is worried about the potential instability of the region, particularly the smaller Gulf states, and the security of its oil supplies. Faced with these constraints and compulsions, Washington has once again resorted to its classic gambit — arming the strongmen of the region, in this case Reza Pahlavi of Iran and King Faisal of Saudi Arabia. The huge arms pur-

chases by Iran and Saudi Arabia also help to keep the US armaments industry in good spirits and to even out Washington's balance of payments. In these calculations, Indian sensitivities matter little as Washington has a fairly shrewd idea that while Delhi may be dependent on Moscow for military supplies and diplomatic support, it is only the United States which can provide substantial economic aid and foodgrains. The Government of India's dithering economic policies which have conspicuously contributed to India remaining bound to the United States are also thus partly responsible for this country's lack of manoeuvrability in foreign relations. China also realises this and sees no reason to improve its ties with India. At the same time Peking has maintained a discreet silence over the Iranian-Pakistani attempt to revamp CENTO as it would not be unhappy to see Moscow discomfited. It would, however, be misreading the situation if it thought that the Iranian-Pakistani initiative is directed against Moscow. The Pakistanis and Iranians have no intention of alienating a neighbouring super power, but they do want Moscow to tone down its support for India and Iraq.

Pakistan is particularly fearful of Soviet military supplies to India and finds that Iran, within the framework of CENTO, is likely to be its only open supporter in the event of another conflict with India as Teheran would not like the further disintegration of the only buffer state which separates it from the formidable military power of India. That is why the renewed interest of Islamabad in CENTO after a break of many years. This is also a clear indication of CENTO becoming much more of a regional entity than it was when the Western powers backed it as a bulwark against Soviet expansionism. It is the regionalisation of CENTO which should cause anxiety in Delhi as it could so easily become an organisation confronting India.

Calcutta Police

Another Big 'Catch'

A Correspondent writes:

THE neurotic state which the police and administration in this part of the country have worked themselves into over the activities of so-called Naxalites and over the possibility of Naxalite groups receiving guidance and help from China gave rise recently to what seems almost certainly to be a farcical incident, though it is not yet seen as

such by those involved in it. The Calcutta police recently let it be known to local journalists that they had nabbed a Calcutta University student who had in his possession what the police thought was a vital, top secret communications from the Chinese Communist Party to the East Pakistani Communist Party (Marxist-Leninist). This document was deemed particularly important because it was thought to represent the CCP's latest thinking on revolutionary movements in the Indian subcontinent. The CCP and the Chinese mass media, it will be recalled, have been rather quiet about the CPI(ML) after finding that their lyrical references in 1970 to its activities were rather less than justified by the facts of the case. The Calcutta police, therefore, regarded the document as giving valuable clues about the CCP's attitude to the CPI(ML) itself. Hence their sense of triumph over its seizure and the arrest of the young man in possession of it. They are reported to have informed the state's Chief Minister himself about their catch and shown him the priceless document. Incidentally, Siddhartha Shankar Ray's reported response to his minions' achievement is interesting in itself. He is said to have remarked, as he leafed through the document and put it down: "Well done, indeed...what, by the way, is the EPCP(ML)?"

Judging by what has been leaked out about its contents, the document appears singularly unprepossessing. Much of it seems to consist of such unexceptionable generalities as that it was important for the EPCP(ML) to build a "sound ideological basis" of the party or that "the nonsense of peaceful transition is counter-revolutionary ... it is the road to surrender". The document specifically recommends three articles by Chairman Mao for study. These are: (1) "On Introducing the Communist", (2) "The Chinese Revolution and the Chinese Communist Party" and (3) "On New Democracy".

What makes the document even less remarkable is the very strong possibility that far from representing the latest Chinese thinking on any subject it is in fact a communication sent by the CCP to the EPCP (ML) as far back as 1969. And what makes the Calcutta police's crowing over the seizure of this "document" positively farcical is the fact that excerpts from it were actually printed in the *Far Eastern Economic Review*, the Hong Kong weekly, in its issue of December 16, 1972. Indeed, it is not to be ruled out that what the police have got hold of is not even the full text of the hoary communication from the CCP but a copy of the excerpts from it published by the *Far Eastern Economic Review*!

LETTER TO EDITOR

Voltas Lock-Out

IN the Companies column of your issue of May 19 (p 893), you have dealt with Voltas, wherein you have made certain statements about the workers of the company, misrepresenting the facts as they are.

It is not true that on March 28, 1973 the workmen "gheraoed" Company officers at the Thana factory. On that day the Company issued suspension orders to 13 union activists for carrying out normal trade union activities. This act of the management was just one more vindictive move against the workmen after 45 days of lock-out at its registered offices and sales offices at Ballard Estate. The workmen at Thana went to see their departmental heads in deputation, requesting them to withdraw the suspension orders and to lift the lock-out. The workmen had even previously been meeting the management to explain to them their grievances. On March 28, 1973, the management had made prior arrangements for heavy

police protection. About 12 lorries full of police were present at the factory site, accompanied by the Magistrate who was authorised to give orders to shoot at sight. In spite of such grave provocation, the Union leadership kept the situation under control. The workmen were further provoked by being told by the management that on March 29 the Company had planned to lock out its 2,500 workmen at Thana. Even in such a tense situation, the workmen left the factory in an orderly and peaceful manner. The employees went in deputation to the factory authorities and requested them to clarify the information about the lock-out, which the management refused to do. No officer of the Company was "gheraoed" or was restricted from moving out freely, and, therefore, there was no occasion for the police to "rescue" the officers. This fact can be ascertained from the police authorities themselves. The Union has reasons to believe that

the Company had planned to lock out the establishment well in advance of March 29, which accounts for the heavy police protection on March 28 itself. Thus, it is clear that the lock-out has not come as a result of 'forcible restraint' of officers or 'work-to-rule' by the workers but is a preplanned move on the part of the management to render unemployed more than 2,500 employees who were demanding that the lock-out at Ballard Estate should be lifted.

The union and the All-India Federation have in fact proposed that normalcy should be restored and the outstanding issues should be discussed in an atmosphere of cordiality. This proposal has been turned down by the management. The management had earlier accepted in principle that a joint committee, consisting of management's and workers' representatives should be set up to decide as to what operations should be computerised. The Bombay union's demand for removal of ceiling on DA was also pending around this time. Taking advantage of this factor, the Company went back on its assurance to set up a joint committee and linked the DA problem with the issue of computerisation, hoping that the union would give up its demand for a joint committee, in exchange for a little more DA. The union's stand on the use of Electronic Data Processing coincides with the guidelines issued by the Maharashtra government and the recommendations of the Committee on Automation headed by V M Dandekar set up by the Central government. The Committee recommended that the consent of the recognised union must be obtained before any EDP can be introduced. The management has refused to abide by these recommendations and has flouted them by surreptitiously introducing the system of EDP without the knowledge of the union and the government. Voltas have rendered 4,000 workers unemployed in an attempt to break the recognised union, hoping that by prolonging the lock-out the Federation will succumb and give up its demand for a joint committee on EDP. The lock-out has now continued for more than 110 days. The union feels sure that all problems can be settled amicably if the management lifts the lock-out and restores normalcy. The management has only itself to blame for any alleged loss of profits.

V NADKARNI

General Secretary,
Voltas and Volkart Employees Union,
Bombay.

COMPANIES

Tax-Payer, at Last

Hansavivek

HINDUSTAN ALUMINIUM experienced notable contraction of margins during 1972, despite slightly higher production and sales. With the company attracting tax liability for the first time, profit at the net level was sharply down, but dividend was maintained at 12.5 per cent "to keep up the morale of the investment market". Profitability was impaired on account of increases in costs of raw materials and power. The company has approached government for revision of selling prices and asserts that without immediate revision "the industry cannot survive". The case regarding the threat of the UPSEB to cut power supply to the company's plant was decided by the Allahabad High Court in favour of the company. Cases relating to additional power supply in case of emergency shutdown of any of the units at Renuagar and also that of the one paise duty on self-generated power are pending before the Court.

The company completed its first stage of expansion about the middle of last year, raising installed capacity by 15,000 tonnes to 95,000 tonnes per annum, but the expanded capacity has been lying idle owing to UPSEB's refusal to supply power. The rest of the expansion programme to increase capacity to 1,20,000 tonnes is under implementation. The management complains that the UP government, in spite of its commitment to supply power at about 4 paise per unit, has now quoted 7 paise per unit, which is a "completely uneconomical rate" for the production of aluminium. The Central government has constituted a committee to determine the rate at which power should be supplied for this expansion. It is also stated that all other aluminium producers are getting power at about 2 paise per unit and that since an increase of 1 paise per unit means an increase in the cost of production of the metal by Rs 200 per tonne, no produ-

cer can retain his competitive capability if he has to pay a considerably higher rate for power than the others. The management believes that the government is contemplating fixation of a uniform power rate applicable to the entire aluminium industry in the country. Meanwhile, the government has permitted the company to instal a 110 MW thermal set for permanent supply of power for the expanded capacity, and has also asked the company to submit a proposal for installing a generating set of a higher capacity so as to be able to release the 55 MW of power being supplied by UPSEB. The company has, accordingly, submitted a proposal to instal a 250 MW bleeding turbine. HINDALCO has been also asked to reduce production of properzi wire rods from 22,000 to 12,000 tonnes which, according to the management, will affect conductor manufacturers in the small-scale sector, who do not have facilities for converting ingots into wire rods. The company's application for additional capacity for fabricated items, corresponding to the increased licensed capacity for primary metal, is still pending with the government.

been refused permission to expand capacity from 30,000 tonnes to 50,000 tonnes on grounds of uncertainty of alcohol supplies, but it has been issued a 'letter of intent' to produce nitrile rubber, a new product, to the extent of 2,000 tonnes per annum. Commercial production of this item is expected to be started next year. Meanwhile, the company is seeking a licence for manufacture of steel cord conveyor belting and other beltings and has also some other plans for diversification. It is also developing new grades of synthetic rubber, polymers and latices. The company is negotiating with the UP government and the Ministry of Petroleum and Chemicals for an assurance regarding regular supplies of alcohol in the coming years. In response to its request, the Central government has agreed in principle to the company making a 5-year contract for import of 4,000 tonnes of butadiene per annum on certain terms. Alcohol deliveries from the UP distilleries are also expected to be normal this year, as the current sugar season has been much better than the previous one. This, coupled with the availability of imported alcohol, as also the supply of butadiene from NOCIL, would help to ease the company's raw material problem for the rest of the current year. Even so, because of the loss of production from November to March last, owing to a vend fee dispute, total production is not expected to exceed 30,000 tonnes. Profitability, however, will depend considerably on the government's decision on the company's application for an interim increase in the controlled price of SBR, pending a comprehensive cost inquiry, to allow for the higher cost of imported alcohol and increase in prices of other inputs.

During the first 5 months of the current year, S and C's production of SBR has been 9,100 tonnes against 14,723 tonnes in the same period last year and sales were 7,700 tonnes against 13,394 tonnes. The shortfall in output was due to imposition of vend fee on alcohol at Rs 1.10 per litre against the delivered price of alcohol of 36 paise per litre. During 1972, production of synaprene rubber was 27,640 tonnes as compared to 33,010 tonnes in the previous year, but sales were almost unchanged at 32,626 tonnes, which was made possible by reducing the inventory of rubber from 5,855 tonnes to 1,340 tonnes. While sales brought in slightly more, gross profit fell by about 25 per cent to Rs 298 lakhs. Net profit dwindled to a mere Rs 15 lakhs (Rs 113 lakhs). Dividend, however, is maintained at 15 per cent which will demand Rs 80

lakh have demanded introduction of a production incentive scheme, and the matter has been referred to the industrial tribunal. Auditors were paid, apart from Rs 15,000 as fees, Rs 8,750 in "other capacity" and Rs 4,486 for expenses.

AHMEDABAD ADVANCE's scheme to expand its metals division has been delayed and this has resulted in the cost of expansion going up from Rs 380 lakhs to Rs 440 lakhs. To meet a part of the cost of expansion, it is proposed to increase the subscribed capital by issue of 21,000 new equity shares of Rs 100 each as 'rights' in the proportion of 1:6, which would yield Rs 21 lakhs. It is also proposed to raise Rs 30 lakhs by public issue of 9.5 per cent cumulative redeemable preference shares of Rs 100 each. In addition, the private placement of 8.5 per cent convertible debentures of the nominal value of Rs 75 lakhs each will be made during this year with LIC and UTI, for which consent of the Controller of Capital Issues has been already received. The company has placed orders for a Sendzimir mill, continuous bright annealing and pickling line and laboratory equipment after obtaining an import licence for Rs 89 lakhs. The import will be financed out of the foreign currency loan granted by ICICI. Orders for all major indigenous equipment have also been placed. Last year, the metal division experienced shortage of quality feedstock, spares and back-up bearings, and frequent power-cuts. It had to contend with not only increase in raw material prices, but also "severe" competition in the medium and high carbon varieties. Owing to the liberal issue of import licences, the market was flooded with cold rolled steel strips. With improved trading conditions during the major part of the year, the textile division fared well. The company's total sales and profits were higher compared to the previous year, and the unchanged dividend of 12 per cent was adequately covered. Last year's payment was very much short-earned.

PODAR MILLS has turned out good results for 1972, with a 27 per cent advance in gross profit at Rs 80 lakhs following a 17 per cent rise in net sales at Rs 908 lakhs. The results have been obtained after providing for gratuity Rs 14 lakhs against nil and after paying considerably more as wages and electricity charges. The unchanged dividend of 10 per cent, which was slightly short-earned last time, was covered 1.55 times. The Board has also proposed an issue of bonus shares on a three-for-ten basis and declared its intention to pay

ed capital for the current year. The company has taken up the second phase of modernisation. The auditors were paid Rs 8,000 for 'other services' and Rs 3,968 for expenses, besides their fee of Rs 6,000.

BATA INDIA is entering the market with an issue of 5 lakh equity shares of Rs 10 each and an offer of sale of 1 lakh equity shares of Rs 10 each, both at a premium of Rs 10 per share. The subscription list opens on June 25. In all 5 lakh existing shares of Rs 10 each are being offered for sale; of these 4 lakh shares are being offered to the LIC and the Unit Trust, also at a premium of Rs 20 per share; the remaining 1 lakh shares are being offered for sale to the public. The offer of sale of 5 lakh existing shares is being made by Leader A G of St Moritz, Switzerland, which holds the entire paid-up capital of 25 lakh equity shares of Rs 10 each. The object of the new issue of equity shares and the offer of sale of existing shares is to introduce Indian shareholding in the company. Bata India will have 33.33 per cent Indian participation in its share capital.

Bata started with its first production unit at Konnagar and has expanded into a complex with factories in Bata-nagar, Faridabad, Batagunge and Mokahehga. The company is equipped with modern Research and Development units manned by expert sloe-designers, chemists and market analysts. Bata India has maintained close technical collaboration with its international associates. This facilitates constant exchange of the latest technical information and marketing techniques. Bata India's machinery department also produces India-made shoe machines which are now being used in many parts of the world. The Company's retail and wholesale marketing set-up is manned by highly trained personnel who control Bata's 1,100 retail outlets plus 430 wholesalers who are linked to 10,000 dealers. The overall control and management of the organisation is in the hands of a newly appointed Board of Directors consisting of four executive directors and two non-executive directors. One of the four executive directors is an Indian. Bata India employs 22,000 people.

During the last six years Bata has earned Rs 25 crores of foreign exchange through exports to over 40 countries. The worldwide Bata Shoe Organisation is made up of 96 independently run companies in 90 countries employing 85,000 people and selling about 30,00,00,000 pairs of shoes each year.

Calcutta Diary

A M

THE United States of America, the regime of President Coolidge, the reign of the Eighteenth Amendment formally enforcing prohibition; Chicago, Wednesday, October 20, 1926; Hotel Sherman, a stone's throw from the City Hall, the headquarters of the Mayor, and across the street from the office of the chief of police. A famous peace conference was on. It was being chaired by Maxie Eisen, racketeer extraordinary, to whom every push-cart peddler in the fish-markets along the Lake Michigan waterfront paid tribute, and who had the reputation of being an 'intellectual' in the Chicago underworld. Till the other day, his alignment was with the Irish gang. But the erstwhile leader of the latter, the florist Dion O'Banion, had only recently been despatched to his coffin by the gunmen of you-know-who, and, discretion being the better part of valour, Maxie had been increasingly liking the role of a peace-maker. Amongst the participants at the conference in the Lavender Room of Hotel Sherman was Alphonse Capone, ostensibly a second-hand furniture dealer (although once, before a grand jury, asked to state his business, his response was: 'I must stand on my constitutional rights and refuse to answer anything particular about that'), otherwise known as Al Capone, by common repute the head of the Neapolitan faction, without question the monarch who had conquered nearly all he surveyed; sitting next to him was his crony, Antonio Lombardo, head of the dreaded Union Sicilione, the name by which the Chicago Mafia was generally known. Next to Lombardo was Jack Guzik, the manager of the Capone bootleg syndicate and prostitution chain; next to him was Ralph Sheldon, boss of Capone's beer concessionaires and illegal distilleries. One could not but notice sitting across the table George Bugs Moran, the reputed burglar and gunpacker, and Vincent the Schemer Drucci, premier jewel thief and rigger of elections; they were the surviving spokesmen of the North Side gang whom Al Capone had systematically annihilated since 1924. Next to them, sitting from right to left, were the delegates of the Irish gang: William Skidmore, ward-healer and fixer of judges; Christian P. Barney Bertsche, well known highwayman and blower of safes; and Jack Zuta, their

leading armament specialist. Amongst the major luminaries, only Polack Joe Saltis, the beer king of the South-West Side, was absent for circumstances beyond his control; he was temporarily in jail, because of certain regrettable misunderstandings with the police.

Maxie the fish-market racketeer was relishing his new role as peace-maker-cum-brother-confessor. By-gones, he appealed to those who sat round the table, ought to be by-gones. The Irish, the Neapolitans, the Sicilians and the Poles had lost as many as two hundred lives in internecine gang warfares ever since 1922. Their fights were over the issue of establishing sovereign jurisdiction; a matter of dividing up Chicago and its suburbs into so many clear-cut spheres of influence within each of which a particular boss would reign supreme. The latter would, so to say, hold the charter for the geographical area assigned to him for practically everything: bootlegging, prostitution, drug peddling, election terrorism, judge-fixing, blackmailing, robbery and so on. Egos had however clashed with egos, and the battle of annihilation and attrition had gone on for a long number of years. The original Neapolitan, Al Capone, had now managed to emerge as the major goon; the Irish had almost been totally decimated; the Sicilians were also in an equally bad way; so was the case with the Poles, with their leader Saltis very much on the run. Enough, Maxie argued, ought to be enough. The factional murders were giving the gangdom a bad name; the politicians, the legislators and the judges, who were on their pay-roll, were having trouble with the ordinary citizens and also with the Federal administration in Washington, who were demanding that drastic measures be taken to rid Cook County of the mobs. It was thus essential that the gangs patched up among themselves. Maxie accordingly took the initiative to organise the peace and disarmament conference. He had earlier spoken to the Irish and the other gangs, who were more than willing to throw in the towel. He then spoke to Lombardo, who spoke to Capone. A few informal, preliminary meetings were arranged to sort out the modalities of the big conference. Finally, on October 20, 1926, the plenary session convened at Hotel Sherman. It was a stellar occasion; barring one or two unavoidable absentees,

all the leading goons of the underworld were present. They spelled power and money. They controlled the corrupt politicians of Cook County belonging to both parties; they named the Senators and also the Governor of the State of Illinois; the mayor, Big Bill Thompson, was their henchman; the commissioner of police was a pal of Al Capone; and the judges were voted by their rigging machine. Here they were now assembled, in the manner of the Congress of Vienna, to carve up Chicago and the Cook County into distinct territorial zones, to impose and enforce their own law against the law of the society and the Constitution of the United States, to declare dividends and decide stock options with the smooth assurance of, say, the board of directors of any major holding company.

The conference had not proceeded even five minutes before it became obvious that it was Al Capone all the way. The assembled delegates were seized by an atrophy of fear and reverence. Their readiness to agree with whatever Al Capone said was nearly pathetic. He dictated the basic terms of the peace treaty; most of them were accepted without demur. If there were minor grievances felt by individual delegates, they kept those grievances to themselves. Power comes out of the barrel of a gun; Al Capone had established himself as the boss *uber alles*. He was supreme on the North, and his power on the West was by now beyond dispute. The South, from the Loop to the Chicago Heights, had also duly fallen to him. All that remained was mopping up operations. He had the line of communication with the police, the mayor, the senators and the judges. It was thus inevitable that, at the conference, whatever Capone said went. The terms of the charter of peace that was drawn up consisted of only five short clauses, namely, (a) general amnesty; (b) a moratorium on further murders and bashings; (c) all past killings and shootings to be considered as closed episodes; (d) all malicious stories carried between the factions by meddling policemen, or presented through the medium of the press, old telegrams, letters and other documents, dated prior to the peace treaty, to be disregarded; and, finally, (e) leaders of the individual factions to be held responsible for any infringement of the pact, and unfriendly activities on the part of the rank and file to be reported to the delegates, who would then ask the respective mob leaders to initiate the necessary disciplinary measures.

The terms of the pact were swiftly agreed upon, and the conference converted itself into a delimitation committee; the proceedings were of course *in camera*. Moran and Drucci were given the lease of a part of the northern segment of the city, consisting of the 42nd and the 43rd wards. The territorial acquisitions, alcohol-cooking and beer-selling privileges, as well as the vice and gambling concessions south of Madison Street were assigned to Al Capone, who was now formally recognised as the supreme boss of the entire West, from the Loop to Cicero, on the South from the stockyards to the Indiana boundary line, and on down to Chicago Heights. The Sicilians were confined to their backyard in the southwestern parts of the city. For the present, there was nothing for the Irish: they were on probation; once, however, Al Capone was satisfied with their conducts, some *concessionaires*, it was implied, would come their way.

As the conference ended, peace, all of a sudden descended upon Chicago. Up to October 20 during the calendar year, there had been 62 murders in Cook County. From that date till December 30, with the exception of a nondescript person not identified as belonging to any faction, who got killed on December 19, not a single killing took place in the city of Chicago. In the annals of crime, this interlude got known as Seventy Days' Peace.

The historical parallel was irresistible. In the first fortnight of this month, on June 7 to be precise, at the end of a delegates' conference in Calcutta, a 22-point treaty of peace was announced amongst the different factions of the Congress party in West Bengal. These points bear an eerie resemblance to the five-point truce which had been declared in Chicago 47 years ago following the conference in Hotel Sherman of the different gangster groups. By-gones be by-gones, no retributory steps for avenging past killings and assaults; no more falling into the trap of *agents provocateurs* belonging to the police and other elements; no MLA to organise or address meetings in the constituency of another MLA without the latter's written permission; in case of any infringement of the treaty by this or that individual member of this or that individual mob, a complaint to be lodged with a co-ordinating committee on which would be represented the delegates of the different factions and which would be the final arbiter. Although not reported in detail in the newspapers, it has also been agreed at the conference

that Calcutta and the districts of West Bengal are to be parcelled among the different factions in terms of delimitation arrangements to be worked out by the co-ordinating committee. The committee is scheduled to meet in the very near future.

The citizens of Chicago were lucky; they could enjoy uninterrupted peace for as long as 70 days. It is too early to say whether the uneasy peace thrashed out at the conference in Calcutta would have the same order of longevity, or whether the factions would resume their knifings and killings even earlier. The Chicago mobs fought amongst themselves over the concessions for bootlegged alcohol and beer, for the unrestricted franchise to kill and mug people in each area, for the right to collect the proceeds of blackmail and extortion, to peddle drugs and cocaine, to corrupt the politicians, and to rig the elections. Here in Calcutta, the concessions being fought over, one surmises, are about who will have the contract for moving rice from the surplus districts to the deficit ones; who is going to get the cut for importing mustard seeds from Uttar Pradesh and reaching them to the oil mills; who will have the franchise to

put the squeeze on the jute workers at Budge Budge or the Rajasthani businessmen in Burra Bazar; who will have the right to name the recruits for vacant government jobs; who will appropriate the bulk of the funds under the crash employment schemes or the *kharif* production programme, and who will control the money accruing to the exchequer of the state Congress. There are other concessions too to be decided upon, for example, which faction of the Chhatra Parishad is to be given the monopoly of controlling the university examinations and collecting the tithe from the students for mass copying arrangements, or which segment of the Youth Congress will be empowered to levy compulsory subscriptions on the public for organising community workshops.

One faction, gossip has it, is holding out for the franchise of trafficking in girls from the refugee colonies in 24-Parganas and Nadia. This one is as yet unconfirmed; one must not perhaps listen to such rumours, which are bad for the morale of the people, and which also slow down the task of ushering in socialism in, and eradicating poverty from, the country.

CAPITAL VIEW

Failure of Men and Systems

Romesh Thapar

ALTHOUGH a considerable effort is being made to present an unflappable exterior, there is turmoil within the confines of government. A number of happenings, sad and tragic, have lifted the blinkers. The PAC-Army collision in Uttar Pradesh tolled the bells for Kamalapati Tripathi. The IA crash outside Palam has put a question-mark over the future of Karan Singh who failed to see the emergency. Fakhruddin Ali Ahmed and K L Rao had already been tipped for removal. As for D P Dhar at the Planning Commission, he's been dressed down so thoroughly that he is half the man he was. The Prime Minister is certainly on the war path.

But, and it is here that we have to ponder, who is responsible in the final analysis for the mess that prevails in almost every area of activity? Where are the decisions being made? In Cabinet or in Cabal? Is there any follow-up of any description? At what level and to what effect? Who is con-

ducting personnel policies, making appointments at the highest levels? Do ministers really have the power to operate? Or are they dependent on *durbari* favours? Is one ministry destroying the capacity to act of another ministry? If the system of administration is a farce, who has refused to change it?

Indira Gandhi will have to face these questions of the critics even as she moves to reorganise her government. The incredible faith she places in individuals is naive, when the best of men can be defeated by the system under which she compels them to function. Are we to believe that the misuse of authority and the corruption under the Tripathi regime was any different from what is condoned elsewhere and even at the centre? Are we to believe that the poorly maintained equipment and the lack of spares, the absence of discipline, the incompetence and the inefficiency highlighted by the Palam crash are

features confined only to civil aviation? And so it goes on — the power crisis, the food crisis, the planning crisis, etc, etc.

In the same context, when the recent communal riots erupted in the Capital, how many heads fell in the Home Ministry headed by the Prime Minister's personal nominee, Uma Shankar Dikshit. Repeatedly, experienced police chiefs have warned about the neglect of law and order, the tendency to permit politicians to operate goonda gangs, the refusal to take serious notice of warning signals and the marked decline in police morale. The erosion of discipline is directly attributable to the politicians' compromise with legal processes. Indira Gandhi has failed miserably to halt this drift to perdition. Indeed, on occasions, she has appeared to protect the law-breakers.

Without a doubt, the economic and social crises have assumed political dimensions. Wherever one goes in the Capital, the attack is sharp and pointed. For the first time, there is no talk of progressives and reactionaries, only the demand for a government that works and a system which is not self-destructive. Indira Gandhi will have to undertake a drastic overhaul of her Council of Ministers if she desires credibility. The speculation is a kind of pointer to the stir. Chavan back to Home. Pai to Finance. Jagjivan Ram to Agriculture again. Locate the doers in the party and bring them in. Upgrade the young ministers who have shown promise, drop those whose presence makes little difference. Associate experts, with ministerial rank only, at all points where decision-making needs strengthening. And how about getting at non-party talent. Shake up the Council of Ministers.

But more important than this movement of personalities up and down the VIP ladder is the persistent demand for a total reform of the system of functioning. The shake-up in personnel, at all levels, becomes meaningless if the same sterile system continues to direct our lives. The Prime Minister and her advisers, in the party and outside, gloss over this. They seek change even as they preserve the petrified jungle of rules and regulations. No change possible within such a framework. This truth has to be faced squarely.

The system is rotten, so rotten that it is frightened to make the necessary corrections on any major scale. Yes, the threatened take-over of the rice

trade *a la wheat* has been stopped. The calculations of the Agricultural Prices Commission, and the charge about "kulak profiteering" is under scrutiny. The Planning Commission, too, believe it or not, has at last accepted the truth that inflation will cut the size of the plan. Electrical engineers are being prodded to ask for bigger allocations for power generation in the Fifth Plan. One broad corrective posture after another, but no one is working on the details. No one cares. And everything is running

down, although reading the newspapers you would think that only Palam airport was faulty. How fatuous can a nation become!

Small wonder that the world looks at the wretched condition of this sub-continent and convinces itself that almost every activity is massively mismanaged and that nothing can save the Indians unless they pull themselves out of their stupor. Exaggeration? Prejudice? I don't think so. We need to take a long, careful look at ourselves.

June 18

FROM OUR CORRESPONDENTS

Requiem for APC

(From a Special Correspondent)

CATEGORICAL statements to the effect that prices rise in the country because the government itself is interested in promoting increases in the price level are generally regarded as belonging to the category of the grotesque. That such statements are not necessarily hyperboles is currently being proved by the sordid drama over the fixing of the procurement prices for major foodgrains.

Ever since 1966, the Agricultural Prices Commission has set up a fairly logical schema for arriving at the administrative prices for farm products. The Commission has been operating through the *deus ex machina* of two sets of prices: the minimum support price and the procurement price. The minimum support price is in the nature of an insurance price; once such a price has been announced, the government, in the view of the Commission, will be committed to purchasing unlimited quantities of the crop concerned at this price, irrespective of the size of the harvest and irrespective of the level of the market price. This minimum support price is to cover the unit cost of production and should also include an element which would pass for normal profits. If, for example, there is a glut in production and market prices decline precipitately — sliding down below even the level of the minimum support price —, the farmers should nonetheless need feel no particular apprehension, since the government is committed to purchasing, at the announced level of support price, whatever quantities are offered for sale. So that the farmers could have a prior idea about the degree of insurance being provided to them, the Agricultural Prices Commission has been urging that

the minimum support price for each of the major crops be announced well in advance of the sowing operations.

RATIONALE OF PROCUREMENT PRICE

The role of the procurement price was envisaged somewhat differently by the Commission. Unlike minimum support prices, which come to operational significance only when the farmers on their own are anxious to sell to the public agencies — for example, in case of excess production —, procurement prices are to be the instrument when the government, on its own initiative, would like to buy from the farmers. Such purchases could be of foodgrains or, as we have seen in recent seasons, even of industrial raw materials, for example, cotton. The contingency of fixing a procurement price arises because of the government's acute need to appropriate a part of the available supply of a crop in the market. Since the government is here taking the initiative to buy, it is to be expected that the major realities would be duly taken into account by it while determining the level of the procurement prices. If the latter is excessively low in relation to the actual market price, farmers and traders may have little urge to unload their stocks voluntarily to the government. On the other hand the purpose of foodgrain procurement is to supply grains at reasonable prices to the weaker sections of the community who, it is assumed, cannot afford to pay the prevalent market price, particularly in a lean year; the *raison d'être* of procurement would disappear if the procurement price were to be the same as the market price.

In view of these considerations while

the procurement price could be generally expected to be somewhat higher than the level of the support price, it could not be equal to the market price. Since market conditions can be gauged precisely only after the size of the harvest has been taken into account, the Commission had been following the practice of recommending the procurement price for a crop as the marketing season came close. The rough and ready time-table has been to announce the support prices on the eve of sowing and the procurement price on the eve of harvesting. In the limiting condition, when there is a glut in the market, the procurement price, it was understood, would converge towards the minimum support price; in other seasons, it would be somewhat higher, the extent of the distance between the two prices being determined by the realities in the market and the requirements of the public distribution system.

HUSTLING THE APC

Whatever else the government did or did not do, through all these years it had not at least interfered with this format of recommendations favoured by the Agricultural Prices Commission. Then last year, under pressure from the wheat lobby, things started to happen. The surplus farmers from the north-western belt of the country, or those who claim to represent them, blandly began to demand that the procurement price itself ought to be announced on the eve of sowing; since the government was going to be the principal, if not the only, purchaser of grains following the take-over of wholesale trade, the farmers must know the price the government was prepared to offer them before they would finalise their production programme. The government was pressurised, and the Agricultural Prices Commission was forced to announce the procurement price of wheat for the current marketing season as early as in September last year. In the case of the kharif grains too, a similar stratagem was followed. Unlike in other years, when the report of the APC on the procurement price policy of kharif foodgrains was delayed till the end of September so that acquaintance with the actual crop conditions could inform its judgment, this year the Commission was hustled to submit its report by the first week of June.

To sit on judgment on the level of procurement prices for kharif cereals this early, when nothing was in fact known even about the conditions of sowing, was certainly an awkward exercise. But since it was the whim of

the government, the APC had to fall in. The Chief Ministers, congregated in New Delhi on June 14, were supposed to offer their views on the Commission's recommendations on the level of procurement prices for kharif foodgrains in the ensuing season. An astonishing thing however happened at the conference. The Union Ministry of Agriculture, in connivance with the Chief Ministers, decided that the frame of procurement prices recommended by the APC are to be accepted, but only as a frame of minimum support prices. In a complete reversal of what they themselves had stated barely a few months ago, they are now of the view that it was too early to decide upon the level of procurement prices; one must wait further, form a judgment on the size of the harvest, the requirements of public distribution, etc, before any conclusions could be reached about what this level ought to be for the coming marketing season. From a remark let dropped by the Union Minister of State for Agriculture, the government, it seems, is determined to fix the procurement prices for the kharif grains at levels much higher than what the APC has recommended, and this despite the fact that the latter has recommended prices which are mostly 15 to 25 per cent higher than what they were last year.

FURTHER BOOST TO PRICES

This is the time of the year when the supply of foodgrains, particularly of kharif grains, enters its most difficult phase. With the onset of the monsoon, the problems of transport are likely to queer the pitch further. Going by the evidence of the past six weeks, foodgrain prices have been going up at an annual average rate of 25 to 30 per cent. The mere fact that the Agricultural Prices Commission has recommended an across-the-board increase in procure-

ment prices was going to lead to another round of hardening of prices. With the announcement of the 'non-decision' on the part of the Chief Ministers — and the hint that procurement prices for kharif grains would be set at even dizzy heights —, the state of expectations in the market would assume a still greater buoyancy; nobody need be surprised if prices now really begin spiralling. The Chief Ministers are living in a fool's paradise if they pretend that what they have done would have any positive effect on the size of the crop. The latter would be largely determined, as everybody knows by now, by the bounty of nature. By advancing their discussion on procurement prices by four months and then by not announcing them but promising the farmers and traders pies-in-the-sky in the subsequent months, Krishi Bhavan and the Chief Ministers have done the worst possible mischief to the cause of price restraint.

SCHEME OF BONUS PAYMENTS

Alas, this was not the only malfeasance perpetrated in the meeting of June 14. Quite gratuitously, the Ministry of Agriculture and the Chief Ministers worked out a scheme of bonus payments to the governments of the states which fulfil certain proportions of the targets originally set for them for the procurement of wheat. According to the scheme, the states which succeed in fulfilling 25 per cent of the target set for them would get a bonus of Rs 4 per quintal; those who fulfil between 25 and 50 per cent of the quota would receive Rs 5; those attaining between 50 and 75 per cent of the quota would be rewarded with Rs 7 per quintal, those states which over-fulfil the quota would receive a bonus of Rs 10 per quintal.

Two comments appear to be called for. First, the procurement of wheat

SUBSCRIPTION RATES

	Inland	Foreign (surface mail)
6 months	Rs 40	
1 year	Rs 75	Rs 110
2 years	Rs 140	Rs 210
3 years	Rs 200	Rs 305

Concessional Rates for Teachers and Students

6 months	Rs 18
1 year	Rs 35
2 years	Rs 60
3 years	Rs 80

Concessional rates are not applicable to students and teachers outside India

this year, it is entirely possible, might even fall short of 5 million tonnes, and could be as much as one million tonnes less than what was procured last year. Given this context, those states which are unable to fulfil even 50 per cent of the target laid down for them deserve, one would have thought, not to be rewarded, but penalised. It is an indicator of the degree of perversity which has overtaken economic administration in the country that those who ought to be hauled over the coals for their dismal performance are instead being kissed on both cheeks. Second, one can, quite legitimately, enquire of the purpose for which this bonus is being offered to the state governments. Since evidently it could not be passed back to these farmers who have already sold their grains to Government agencies, the assumption is that the proceeds of the bonus would be used for providing indirect subsidies. Given the umpteen examples set by the various state governments in recent times, would it be unfair to conclude that these proceeds

too would go to swell certain slush funds which are blatantly political in nature?

The composite picture one obtains after adding everything together is of a thoroughly demoralised government which, in its panic, is now intent to scuttle whatever rationality was sought to be introduced over the years to the management of the nation's food. A set of politicians who, till the other day, had been bragging about their determination to nationalise, in wholesale manner, the foodgrains trade, are now surreptitiously inching back toward *laissez faire*. Maharashtra has withdrawn the ban on the inter-district movement of grains, and Uttar Pradesh has followed suit; the chief ministers of a whole array of states deficit in food are, in addition, clamouring for the unrestricted movement of wheat and the coarse grains between state and state. By unrestricted movement they of course mean — need one point it out? — unrestricted movement *on private account*. This is the way the world ends.

CONSTITUTION AMENDMENT CASE

What It Decided

T R Andhyarujina

THE supercession of the three senior-most Judges of the Supreme Court on April 25 has overshadowed the momentous decision delivered the previous day by the Supreme Court in what is known as the Fundamental Rights Case, or more appropriately, the Constitution Amendments Case. Thirteen judges heard the case for a record number of 69 days spread over five months. Eleven of them delivered separate individual judgments running into over one thousand pages in all. What did all this prodigious effort amount to?

Let us start where it all began. It began with the Golak Nath judgment delivered by the Supreme Court on February 24 1967 which held that Parliament had no power to amend any fundamental right in the Chapter on Fundamental Rights. Nine out of the 13 judges in the latest case now hold that the majority judgments in the Golak Nath case were erroneous; the remaining four judges (two of them, viz, Chief Justice Sikri and Justice Shelat who were parties to the Golak Nath majority judgment) say that it is unnecessary for them to decide whether the Golak Nath judgment was erroneous or not. The majority judgments in the Golak Nath

case thus stand overruled and it is now acknowledged by the Court that Parliament can amend fundamental rights.

SCOPE OF AMENDING POWER

The overruling of the Golak Nath case however did not conclude the Constitution Amendment Case, because the petitioners in the latest case raised the far-reaching question of the scope of the amending power of Parliament under the Constitution. As there was no express limitation on the subject matter of a constitutional amendment in the Constitution, they argued that there were inherent and implied limitations on Parliament's power to amend the Constitution. They further argued that whilst Parliament had the power to amend parts of the Constitution, the "essential features" of the Constitution could not be abrogated or, as they metaphorically stated, could not be "damaged or destroyed" by amendments. So far as the chapter on fundamental rights was concerned, they argued that whilst fundamental rights could be amended, "their essence or core" could not be amended.

Six judges (Chief Justice Sikri, Justices Shelat, Hegde, Grover, Jagan-

mohan Reddy and Mukherjee) accept this argument of the petitioners. Six other judges (Justices Ray, Palekar, Mathew, Dwivedi, Beg and Chandrachud) reject it. Justice Khanna's judgment accepts some parts of the petitioners' arguments and some parts of the government's arguments and thus turns out to be the most crucial judgment in the even division of six judges against six other judges. Justice Khanna holds that there are no implied or inherent limitations on Parliament's power of amendment apart from those which inhere and are implicit in the word "amendment" in the amending article namely, Article 368. According to him, the word "amendment" did not include the power to abrogate the Constitution nor did it include the power to alter the basic structure or framework of the Constitution. Subject to the retention of the basic structure or framework of the Constitution, Justice Khanna held that the power of amendment was plenary. Justice Khanna's judgment thus did find limitations on the amending power of Parliament arising not from inherent or implied limitations on Parliament's power or from the essential features or essence or core of any fundamental right, but from what he described as "the basic structure or the framework of the Constitution". As the six judges who held that there were inherent and implied limitations on Parliament's power to amend the Constitution, also included within their conception of limitations on Parliament's amending power the basic structure of the Constitution, etc, there are, in all, seven judges out of 13 (Chief Justice Sikri, Justices Shelat, Hegde, Grover, Jaganmohan Reddy, Mukherjee and Justice Khanna) who limit Parliament's power by limitations arising from the basic structure or framework of the Constitution. Thus, the greatest common factor in the subject of limitations on the amending power was that "Article 368 does not enable Parliament to alter the basic structure or framework of the Constitution". This is the "view of the majority", as summarised after the delivery of all the 11 separate judgments by nine out of the 13 judges. The remaining four judges (Justices Ray, Mathew, Dwivedi and Beg) did not subscribe to the "view of the majority".

AMENDABILITY OF FUNDAMENTAL RIGHTS

On the specific question of the amendability of fundamental rights, Justice Khanna's judgment is again pivotal. Six judges (Chief Justice Sikri and

Justices Shelat, Hegde, Grover, Jaganmohan Reddy and Mukherjee) held that fundamental rights were among the essential features of the Constitution and whilst Parliament could amend fundamental rights it could not abrogate them because of the inherent and implied limitations on Parliament's power to amend the Constitution. Six other judges (Justices Ray, Palekar, Dwivedi, Mathew, Beg and Chandrachud) held that there were no inherent and implied limitations on Parliament's power to amend any fundamental right and no fundamental right was immune from amendment or even abrogation. Justice Khanna held that "Subject to the retention of the basic structure or framework of the Constitution... no part of a fundamental right can claim immunity from the amendable process by being described as the essence or the core of the right". He, however, specifically held that the right to property did not pertain to the basic structure or framework of the Constitution. The reservation made by Justice Khanna about the retention of the basic structure or framework of the Constitution is of vital significance. It means that there is no majority finding of seven judges that there is an absolute unfettered power to amend fundamental rights except the right to property. Presumably, if an amendment of a fundamental right other than the right to property affects "the basic structure or framework of the Constitution", according to the majority view of seven judges (Chief Justice Sikri, Justices Shelat, Hegde, Grover, Jaganmohan Reddy, Mukherjee and Khanna) the amendment would be invalid. Ironically, the law which was to be determined by the largest bench of thirteen judges ever constituted by the Supreme Court is now to be found out by a strange process of the greatest common factor in seven judgments and in which process the views of one judge ultimately prevail. What constitutes "the majority view" is even disputed by four judges making the whole question of what the Court has really decided uncertain and unsatisfactory.

GREATEST COMMON FACTOR

The Constitution 25th Amendment Act enacted a new Article 31C. The first part of this article stated that no law giving effect to certain directive principles of State Policy (distribution of material resources of the community, and elimination of concentration of wealth and means of production, etc) would be void on the ground that it took away or abridged certain fundamental rights conferred by Articles

14, 19 and 31. The second part of Article 31C stated that such a law containing a declaration that it was for giving effect to such policy would not be called in question in any court on the ground that it did not give effect to such a policy. This article was vehemently attacked by the petitioners as a monstrous outrage on the Constitution. Here again, employing the process of the greatest common factor amongst the seven judges, "the majority view" was that the last part of Article 31C was invalid, and the first part was valid. The invalidation of the last part of Article 31C is not of great consequence to the government as the Union government had conceded at the hearing of the case that in spite of the device of the declaration to eliminate judicial review the Court could always examine whether the law had any relation to the professed object of giving effect to the directives of State Policy. The first part of Article 31C which the Court has held to be valid, by a majority of seven judges to six, is potent enough to eliminate the application of the most important fundamental rights in economic legislation of the Union and the states. From the government's point of view, therefore, the invalidation of the last part of Article 31C is serious only as it has been invalidated by judicially determined limitations on the amending power of Parliament.

'BASIC STRUCTURE' OF CONSTITUTION

The majority finding that Parliament's power of amendment is limited by the basic structure or framework of the Constitution is the most serious aspect of the decision for Parliament. The Constitution does not say what its "basic structure or framework" is. The examples of the basic structure or framework of the Constitution given by some of the judges include such nebulous concepts as "the essential features of the individual freedoms" and the "dignity of the individual". Such lofty concepts sound well in political theory but do not furnish any precise guidelines for courts to strike down the most vital exercise of the people's right to amend their Constitution and they necessarily introduce judicial control on the subjective opinion of judges of what is the "basic structure or framework of the Constitution". Lack of such judicially manageable standards and criteria for invalidating the people's right to amend their constitution has led the Supreme Court of the United States to refrain from

deciding the question of whether there are implied limitations on the power to amend the US Constitution, though every constitutional amendment which was challenged for violating implied limitations was held to be valid by the Court. Judicial verdicts have always been open to change through constitutional amendments but for courts to limit the amending power itself by judicially ascertained limitations which are not expressly found in the Constitution would deny a sovereign people their right to change their Constitution for ever. Such limitations imposed by judicial decree would remain unalterable except by the court itself.

LARGELY THEORETICAL CLAIM

The Supreme Court's finding (by a slender majority of one judge) that it can scrutinise the substance of a constitutional amendment means that in conceivable cases courts may impose a permanent veto on the people's desire for a change in their Constitution. However, in future this claim may prove largely theoretical as there may never be an occasion for the exercise of the amending power which the Supreme Court finds objectionable. With the court having conceded the validity of the 24th and 25th Amending Acts and the validity of constitution-protecting devices such as Article 31B and Article 31C and the fact that the majority have held that the right to property can be abrogated, it is unlikely that there will be any necessity for or resort to any amendments of a kind not already declared as valid by the Supreme Court. It was basically the right to property which had so far brought about the challenges to the amending power and with its passing the occasion for any conflict between court and Parliament may be remote. It is possible that in future the court's relations with Parliament on the question of constitutional amendments may never again reach the point of confrontation by the adoption of a compromise "dualism" similar to that which exists in the United Kingdom between courts and Parliament on the question of Parliamentary privilege. This dualism implies that theoretically the court asserts the right to scrutinise the substance of the amendment but in its practical application the power in each case is conceded to Parliament.

Developing the Desert

(From a Special Correspondent)

THE Rajasthan government has of late shown keen interest in the development of the dry areas which cover nearly three-fourth of the state's territory. Though measures to develop these areas had always figured prominently in state plans, in terms of concrete steps hardly anything worthwhile was done. The tardy progress of the Rajasthan canal project, which could be the single most important measure for the permanent elimination of drought and scarcity and could ensure rapid development of the driest parts of the state, is well known. Every second or third year the target dates for completion of the project are extended and the cost estimates too get revised upward. It has even been alleged that the government has developed a vested interest in the backwardness of the area and its vulnerability to frequent droughts.

'Drought and scarcity' has its own uses. To the state government it provides a ready excuse for its failures on the development front; it also provides ground for getting grants from the Central government (and from private agencies). To the workers of the ruling party it offers a unique opportunity to play the good Samaritan to the voters at public cost. To the administrative machinery, from the patwaris and overseers (posted to relief works) to the higher-ups at the district level (and also to a variety of contractors) it brings windfalls of unaccounted money. There are some more unconventional uses of the drought — such as higher achievements in sale of state lottery tickets and vasectomy operations; after all, what could be a more effective incentive than the possibility of employment on relief works or payment of a sum of, say, Rs 40 for inducing (compelling?) a hungry man to participate in these programmes.

Thus everybody who matters has reason to be happy with the frequent visitations of droughts. There are facts to show that the amounts spent on famine relief have increased — irrespective of the number of villages or the size of the population affected by drought — in election years and years preceding elections. The influence of relief works on elections results has been noted by a study of the Third General Elections in parts of the state conducted by the Rajasthan University. It is also well known how politi-

cal considerations get priority over meteorological facts in the determination of the extent of drought and identification of affected areas. The location of relief works and the dates of their commencement are similarly determined. The frequency with which the Udaipur division, hardly known to be drought-prone in the past, has been declared to be drought affected in the last 15 years is a case in point.

The Central government appeared to get wise to some of these tricks when it started to drastically slash the state's requests for relief funds. It was alleged in the last session of the state assembly that the Centre was discriminating against Rajasthan compared to other states like Maharashtra, in the grant of relief funds, etc. At the same time, it did occur to someone to suggest that perhaps the most effective ways to reduce the state's dependence on the Centre for relief funds was to develop the chronically drought-prone areas. The renewed interest in the development of these areas in the state's north-western districts has to be viewed in this context.

POLITICAL CHANGE

A few other factors which might have contributed to the present emphasis on development of the desert areas may also be noted. One of these is the realisation that the undeveloped and thinly-populated desert area are a major defence liability. This awareness has been sharpened by the difference the little development effected during 1966-71, mainly in terms of communication and drinking water, made to the performance of the armed forces on the western border in the 1971 war compared to that in 1965. The change in the politics, had never been a stronghold of factor. The desert area, particularly Jaisalmer, Barmer and Bikaner districts, had never been a stronghold of the Congress party. Amrit Nahata was the first Congress candidate to be elected to Parliament from this, largest parliamentary constituency in the country. Nahata was able to persuade Planning Minister D P Dhar to visit Barmer. The Planning Minister's visit might be another factor responsible for the state-government's renewed interest in the area. The third and most important factor is the opportunity offered by the special programmes

in the Central sector, particularly the Drought Prone Area Programmes (DPAP) which covers all arid and some semi-arid districts in the country. The state government can get resources from the Centre under the DPAP if it can put forward suitable schemes.

The Rajasthan government is currently, busy preparing many such projects (a few of them are even likely to be financed by the World Bank under the scheme known as 'drought-proofing'). The state government has already presented a comprehensive scheme costing Rs 5.76 crores for tubewell irrigated pasture-based cattle colonies in Jaisalmer (see "Developing the Desert", October 7, 1972): it has also proposed the idea of linking its milk producing dry areas with the ambitious "operation flood" scheme to be operated by the National Dairy Corporation. The latest scheme presented to the centre under the DPAP is for the development of "reserved pastures" to sustain the sheep economy of the area. The project is estimated to cost Rs 125.47 lakhs and envisages planting of a large number of trees, growing of grass and making adequate arrangements for drinking water in properly fenced pastures in Jaisalmer district, in areas where medium saline quality water (fit for drinking) is available at a depth of about 300 metres with a discharge of 40,000 to 80,000 gallons per hour. These reserved pastures will be open to sheep owners only during lean years and are expected to eliminate outmigration of sheep which has resulted in huge losses to this major enterprise of the desert farmer. According to a sample survey by the Sheep and Wool Department of the state government, about 70 per cent of Jaisalmer's sheep population has perished in the droughts of the last 3 to 4 years. The proposed reserved pastures are to be equipped with other facilities such as veterinary services, cross-breeding, machine shearing, etc, and will impart training in modern sheep management. Initially the state government will operate the reserved pastures, but these will be handed over to co-operatives of sheep breeders later.

This is by no means the first scheme formulated for development of sheep farming in Rajasthan. Ever since the early fifties the state has maintained a considerable paraphernalia in the name of sheep and wool development. A separate department of sheep and wool was created (which at times was assigned to less wanted senior officers); institutes were started for training supervisors; trained people were post-

ed at the block level; wool grading centres were opened and manned by supervisors, some of whom had been trained in Australia; sheep farms for raising quality rams were started; Russian Merino rams were imported for cross-breeding and when they proved ineffective in the desert heat, they were kept at Mount Abu; and through the Government of India and the ICAR, research work on sheep (including for developing an Indian Merino sheep) was initiated at Jodhpur and Malpura. However, none of these measures had the expected impact on sheep farming in the dry areas. The principal reason was that most of these measures were far removed from the realities of sheep raising in dry areas. The expenditure incurred per sheep in Research Institutes at times exceeded the per capita expenditure on human beings in the shepherd's family; the infrastructure, from the sheep and wool department to the wool grading centres, created for sheep development ignored the nomadic and semi-nomadic character of sheep enterprise in these areas. Where the seasonal out-migration of sheep to neighbouring states is unavoidable due to fodder and water constraints, facilities designed largely for fixed-location type of enterprise were bound to remain underutilised and ineffective. For example, wool grading centres could help the farmers in proper grading of wool for higher income, but this facility can be of no avail if, at the time of shearing and marketing (particularly during the summer), the herds of sheep are hundreds of miles away from these centres.

Similarly, it was partly because of the migratory character of sheep farming that the entry of the state government into wool marketing and the establishment of a few wool factories in the dry areas could not make much headway. The first prerequisite for development of sheep farming should thus have been the creation of conditions which could gradually reduce long distance migration. Unfortunately, in this regard the Rajasthan government has in the past done exactly opposite of what was required. Unmindful of the capabilities of the submarginal lands in dry areas, the government has encouraged the shift of grazing lands to cultivation. The economic and ecological consequences of such counterproductive policies have been discussed in these columns. The grazing space — wastes, fallow lands, pastures, etc, — in the arid region has declined from 11.3 mn hectares to 8.5 mn hectares in the last 15 years or so. The shrinkage of graz-

ing space has increased the degree of nomadism, as indicated by a number of studies in the Jodhpur, Naugaur and Bikaner-Jaisalmer areas of the dry region. This in turn has further added to the ineffectiveness of the facilities created for developing sheep and wool farming.

In retrospect, the past efforts of the Rajasthan government to develop sheep farming look like the proverbial act of putting the cart before the horse. In this context the new 'reserve-pasture' development scheme, though belated, is a realistic step in the right

KERALA

False Hopes from Delhi ?

THE monsoon session of the Kerala Assembly began on Monday. The main business for this session is the budget. Only a vote on account for four months could be passed in March, because of the delay in the preparation of the budget due to the NGOs' strike. However, at the request of the leader of the opposition, the government agreed to devote the first two days for discussions on the food situation, on the crisis in the coir industry and on the supply of cotton yarn to the handloom industry. The session began with a statement by the Food Minister on the efforts the government has been making to maintain the statutory ration at 100 grams of rice and 80 grams of wheat, in spite of the difficult food situation in the country. He assured the House that the Central Government had promised the state a monthly supply of 90,000 tonnes of foodgrains. He also thundered that the government would not hesitate to take drastic action against hoarders and blackmarketeers.

CRITICISM OF CENTRE

This statement came in the wake of the search of the godowns of four landlords in Kuttanad, the rice bowl of Kerala, and the arrest of the President of the Grain Merchants' Association and another leading merchant in Cochin, under the Defence of India Rules. What further proof was required to prove the government's determination to unhoard illegally held stocks and to distribute them to the needy? The government has also decided to enforce the guest control order strictly. The Food Minister called upon the people, irrespective of party affiliations, to extend their full co-operation in making a success of the government's efforts.

For the first time, E M S Namboodiripad, leader of the opposition,

How successfully the scheme will be implemented and extended to other areas is yet to be seen. At least the history of past efforts in that direction does not inspire confidence. In the past also, after former Chief Minister Sukhadia's foreign visit, it was publicised that sheep and cattle farming in the Rajasthan desert would be developed on the Australian pattern where through piped water supply over long distances, the migration of the animals is minimised. However in the case of the new scheme, the DPAP is a new strong and exogenous variable, which hopefully should work.

did not ask for the resignation of the government for its alleged failure to anticipate the situation and to build up stocks in time. His criticisms were mainly of the wrong policies of the Central Government and its ineptitude in handling the take-over of wholesale trade in foodgrains. But he failed to mention that even among the statutory ration areas, the ration per head was the lowest in Kerala. At the end of the four-hour discussion, a motion by a CPI(M) member for increasing the ration to 160 grams of rice and 160 grams of wheat was defeated by 70 votes to 50; it was opposed by the ruling parties on the ground that the government would not be able to get enough stocks to sustain the higher ration. Three days later an innocuous looking resolution moved by a CPI(M) member asking the Central Government to allot sufficient foodgrains to Kerala to raise the statutory ration quota to 320 grams (160 grams of rice and 160 grams of wheat) was passed unanimously. What the Food Minister was really asking the opposition parties to do was to stop all agitations and to remain satisfied with what the government could give, taking into consideration the sympathetic attitude of the Central Government in this difficult situation.

The discussion on the crisis in the coir industry, which gives employment to about two million people, directly and indirectly, and on the supply of cotton yarn to the handloom industry followed a different pattern. The Minister for Industries, who rarely travels outside the state, undertook a pilgrimage to Delhi, returned two days after the commencement of the session and announced triumphantly on June 11 that the Government of India had sanctioned a Rs 16-crore scheme which he had submitted in 1968 for the reorganisation

and development of the coir industry. He then painted a rosy picture of the industry and claimed that the task force of the State Planning Board had prepared a Rs 40-crore master plan for the coir industry for the Fifth Plan. It is not uncommon for a state Minister to return from New Delhi with the impression that his schemes have been approved by the Centre, only to find later that there remain many more hurdles to cross. Let us hope that this is not another case of the same type.

PROBLEMS' FOURFOLD

The coir industry's problems are four-fold. First, procurement and distribution of husk at a fair price. Second, exploitation by middlemen at different stages of procuring, processing and marketing. Third, keen competition from substitutes. And fourth, and the most important, ensuring regular employment and minimum wages to workers. The Minister told the Assembly that in a fortnight's time the government would announce the price for husk and entrust its procurement to the Kerala State Coir Corporation and to co-operatives. The same agencies may be used for the elimination of middlemen. The government is not satisfied with the scheme of canalisation through the State Trading Corporation and wants to nationalise the export trade. To meet the competition from substitutes, a lot of research and development and eventual mechanisation may be required. The workers are against mechanisation, while K T Chandy, Vice-Chairman of the State Planning Board and Chairman of the Kerala State Industrial Development Corporation, in a recent address to Rotarians at Quilon expressed the view that the future of the coir industry rested on mechanisation. Already machines have begun to be used for threshing the husk, which operation has the largest potential for use of manual labour. The Minister was non-committal on the question of mechanisation, though he admitted that the quality of the husk threshed by hand was superior to that threshed by machines. A resolution moved by a CPI(M) member to stop mechanisation was defeated. How is this conflict on mechanisation to be resolved? When unemployment is as acute as it is in Kerala, resistance to mechanisation from workers is only natural. Mechanisation may be desirable and may even be made acceptable, if labour could be made scarce to traditional industries like coir by rapidly establishing modern industries.

On the supply of yarn to the handloom industry, the Minister's mission to Delhi was not as successful as in the case of coir. The handloom industry is

dispersed throughout the state, with some concentration in Trivandrum and Cannanore districts. Even in normal times, the industry has to struggle for survival. When the supply of yarn dried up this year, thousands of families were thrown out of employment. The Minister has promised to meet 30 to 40 per cent of the requirements of the looms and appealed to members of the Assembly to view it as an all-India problem. Perhaps, the present scarcity may be temporary, having been caused by the power-cut in the yarn-producing states. But the industry has many long-term problems as well, which did not come up for discussion.

NEW POLICE POLICY, OR ... ?

The Police Department deserves bouquets for the excellent public relations work it is doing. In the Alleppey police station there is a small Ganapathi temple, which had gone unnoticed till now. All of a sudden it has come into prominence. It was thrown open to all communities for worship and a music group consisting of members of all communities — Hindus, Christians, Muslims and others — was formed to sing bhajans along with songs from the scriptures of the other religions. Though Gandhiji's prayer meetings included renderings from all scriptures, this is the first time that a temple has tried this experiment. The IG of Police would be doing a great service for communal harmony if he could extend this practice to other temples, churches and mosques! Crime rates, however, have increased. Still it should be said to its credit that during the last one year, apart from the brutal lathi-charge on the students of the M G College, the police has been using the lathi with great discrimination and there has been no case of firing, much to the discomfiture of the opposition parties. The year has witnessed a number of agitations like the fee equalisation struggle of the students, the land grab movement of the Karshaka Sangham, the NGOs' and School Teachers' strikes, the prolonged strike of FACT workers and a number of mammoth processions and public meetings, which are a regular feature of public life in Kerala, organised by different parties.

It is difficult to say whether there has been a change in the government's police policy and in the general attitude of the police or whether the present behaviour of the police is to be explained in terms of a change in the policy of the militant sections of the opposition parties. Even A K Gopalan is now going to the IG with petitions to stop torture in police lock-up. The days when the police lived in fear of the

communists are gone. Today Naxalites are not in the picture and perhaps the CPI(M) lives in fear of the Youth Congress and the police. After its experience in Bengal, the CPI(M) is understandably anxious not to lose its base in Kerala. In the meanwhile, a grateful state Assembly has voted, by 70 votes to 52, Rs 12.7 crores for the police department which is double that voted for 1969-70.

HOUSING SCHEME FALTERS

The one-lakh houses scheme, which has received worldwide publicity, has begun to face rough weather. The large-circulation, pro-Congress, *Mathrubhumi* daily has drawn the attention of the authorities to some of the things which people know have been happening but which have not been talked about openly. *Malayala Manorama*, an equally influential paper, has also come out with a critical story about the housing scheme. So far, the collection from the public has been only Rs 60 lakhs against the target of Rs 2 crores — and that too with a lot of pressure exerted by District Collectors and their staff. Till now, 20,000 houses have been constructed of which only 3,000 have been occupied. With the onset of monsoon some of the houses have collapsed and some have been wilfully destroyed by miscreants. There is also a universal complaint that the land for the houses has been bought at unreasonably high prices. Materials used are of poor quality and the workmanship is worse. Cement and good quality timber obtained from the government for the scheme are finding their way into the black market. Because of the poor design and construction, people are not enthusiastic about occupying the houses.

These reports may be exaggerated, but the time seems to have come for a thorough enquiry into the one-lakh houses scheme. They very foundations of this government may be shaken if this prestigious project ends in a fiasco.

How many jobs can the government create in a panic by haphazard methods? Recently, the Kerala government decided, under its crash employment programme, to recruit 14,000 people in various categories for training for posts falling vacant next year. The State Public Service Commission notified the vacancies and the Commission has received more than a million applications. Post Offices found it difficult to handle such large numbers of letters and it is reported that many applications are still on the way, though the last date for their receipt was June 14. The Public Service Commission is at its wits end over how to deal with the avalanche of applications!

LONDON

Capitalist Capers

Farrukh Dhondy

"INDEPENDENCE, the freedom of a self-governing nation, is in my estimation the highest political good, for which any disadvantage, if need be, and any sacrifice are a cheap price. It is worth living for, it is worth fighting for, and it is worth dying for." Thus spake Enoch Powell in a characteristic, rhetorical preach-in — words that assume that they are guiding the destiny of nations. It is one of the most important speeches he has ever made because it is a farewell to one ambition and an invitation to another. He chose some out of the way spot, as always, to launch his enterprise, one that he says he's ready to live and die for, but perhaps one not worth being thrown out of the Tory party for.

His speech, eagerly anticipated by a tipped-off press, came very close to directing his following to vote Labour, to give them the next election and perhaps put paid to the Tory party for the next twenty years. As always his speech provoked a storm of abuse, this time from the heart of the Tory party itself. They demanded a withdrawal of the whip from Powell, confident that he had cast himself into outer darkness through this gesture, into the obscurity reserved for the trespassing archangels of Toryism. Immediately Powell appeared on the networks and said he was born a Tory, would die a Tory and had in fact made a thoroughly Tory speech. Characteristically, the sentiment of his speech went further than the words. He didn't quite say where he stood, but left the press and subsequent debate to do his hatchet work for him.

The effect that his speech may have, will prove whether the enormous weight of his popular appeal is generated by his racist views or whether it is in fact the appeal of an extra-parliamentary politician in the twilight era of bourgeois parliamentarianism. The issue which Powell chose was the Common Market. The time he chose cast his heavy shadow across the proposals that the Labour party has put to the people as a manifesto for the next election. Wilson cannot begrudge him this stolen limelight as the proposals he unveiled contained a similar, if less forceful, pledge to look again at entry into the EEC. What the Labour proposals do say clearly is that they intend to protect Britain from monopoly capital domina-

tion. In this sense their purposes find an ally in Enoch who, apart from all his subterfuge about British heritage, etc, has been struggling to save the British capitalists from being swallowed by the multi-national cartels. Powell's speech was tantamount to saying "a vote for Heath is a vote for the monopolies, a vote for Labour is a vote for your friendly neighbourhood capitalist — vote Labour".

Both Powell and the Labour party are attempting at this time to grasp the tide of disillusion that the British public feels when faced with a twenty-five per cent increase in food prices, rising rents, value added taxes, high unemployment, cuts in social services and benefits, the reshaping of the class consistency of city populations through 'redevelopment' plans, and all the other things that entry into Europe means. Anthony Wedgwood Benn, the *enfant terrible* of the Labour party, has just gone through the motions of demanding that Labour stand for election on a promise to nationalise certain profit-making companies and insurance firms. This is the Labour party's answer to the workers' demand for a halt to the fall in the standard of living and their demand for a solution to inflation and for workers' control.

Of course, the Labour party wasn't going to allow any of this. After a public fight with his left wing, Wilson declared that any commitment to nationalisation would cause an electoral drift from the party and ruled that in the interests of the *status quo* it was impossible to allow the rank-and-file of the party to control the policy platform.

Wedgy, as Wedgwood Benn is metaphorically known, has opened a festering wound in the Achilles' heel of the Labour party, the nationalisation question. He has forced the opposition to categorically state that the party shall be governed by the prospective cabinet rather than by its mass support. In his own way Wedgy may be as dangerous to the Labour party as Powell is to the Tories. The rejection of his plans (not his alone) has forced an exposure. Wilson has been compelled to declare that the Labour party is not in any way the enemy of capital or its owners. What he cannot say openly is that the Labour party is merely a machine to hoodwink the working class into a loyalty which cannot work in their interest.

The debate on nationalisation in the Labour party has certainly caused an upheaval. Powell saw his own particular nuisance value in terms of an 'earthquake on the political landscape'. Why have both tremors broken ground at the same time? Are the shake-ups going to result in an unholy alliance between the extreme right which believes in strong-arm repression of strikers and pickets and the Labour left which regularly parades its views on what it calls 'trade-union participation'?

In one sense the question is a red herring. Both debates are being conducted above the heads of the people and both — one about the EEC and the other about the nationalisation of a restricted number of commercial enterprises — are stunts of a weakening electoralism. They occur at a time when the "unacceptable face of capitalism", as Ted Heath called it a few weeks ago, has broken out in a syphilitic rash. Nixon's little lies have inspired a mood of revelation and sensation in the British press and a demand from the public for the lifting of the *pudrah* from the secret face of high politics and finance.

The British cabinet has in the meanwhile been rocked by a series of scandals, more important than the Profumo affair, which have turned this population into newsprint addicts. The least important are the revelations that Lords Jellicoe and Lambton, both Tory ministers, were the regular clients of prostitutes who could have had connections with foreign intelligence agencies. Both ministers resigned from the government, like the true gentlemen they were, and forced Heath to make a declaration that sexual misdemeanour was intolerable within the Tory echelons. All ministers have been asked to submit details of who they screw and why.

Much more important are the disclosures of straightforward capitalist thuggery. The Lonrho affair, as it has come to be known, revealed that Duncan Sandys, a former Commonwealth Secretary, had sold his services and consequently his influence with African governments to Lonrho, a firm with massive investments in Africa. Not only was his appointment as contact man illegitimate, but subsequent transactions between him and the company involved huge tax evasion schemes. Lonrho had agreed to pay his thumping big fees in the Cayman islands.

The Poulson affair, which provided clues about high officials being bribed by big companies, led to the resignation of the Home Secretary. The Lambton affair has led Scotland Yard into the

home of Lambton who was found with cannabis and other drugs. Influential newspapers have threatened further disclosures linking Tory ministers with gambling, prostitution and other money-making rackets. All this makes heavy weather for the Tory yachtsmen. And now a kick in the vitals from Enoch Powell. Just before this assault there was merry speculation that the Tories were gaining ground with the electorate and would call a snap election in the autumn, before the Labour party had resolved its nationalisation problem. Certainly after Powell's blow the government will think again about snap elections.

The children of the mother of parliaments are clearly discontent. They don't turn up on voting day, as shown by the phenomenally low turnout at mid-term poll for the control of city councils last month. It is as though the people of Britain are aware that the most serious political questions have to be resolved outside Westminster. Powell knows this. His actions within Parliament are soft-pedal accompaniments to his thunder outside. He appeals directly to his listeners and has built up a fantastic public address system which parrots and broadcasts his every word.

LAOS

The Vital Infrastructure

Harish Chandola

THE largest hospital in liberated Laos is in a cave. It is called the Laos-Vietnam Friendship Hospital because it was built with Vietnamese co-operation. In fact much of its equipment came from North Vietnam. North Vietnam had received it for its own needs but when it realised that the needs of the liberated area of Laos were more pressing, it gave that equipment to Laos. The large cave for the 100-bed hospital was completed on December 28, 1972, and it received its first patient on February 7, 1973.

When I visited it, there were 37 in-patients in the 84 room hospital. A steel door about a foot thick at the cave entrance was opened to let me in. Inside there was a long corridor, on both sides of which were out-patient clinics, operation theatres, dental surgeries, dispensaries, wards, administrative offices, aglimmer with electric lights. The hospital had 7 doctors, 15 medical assistants and 30 nurses.

Dr Pumak, who heads the hospital, had studied medicine in Paris and had

Still, because of his position within the Tory right wing, he can do nothing but arouse emotions. He can initiate no rank and file action. It is an untenable position, one which Oswald Mosley relinquished in order to form a real fascist movement. From where he is, Powell speaks to the people, but nobody speaks to him. On the industrial front he has no appeal and no support. Consequently both sides of industry reject his fascist formulations. Two days ago the workers of the Chrysler plant walked out in response to a bitter feud between them and the American management. Chrysler corporation have just put out a new model called the Avenger, whose sudden popularity and high sales have been sabotaged by the workers' resistance to a speed-up on the assembly line with no pay increase. The corporation's reply was not made to the union or the workers. They sent out a public letter saying that unless the workers came to heel, Chrysler would not invest any more money in Britain. The message went to Ted Heath — "deal with labour or we will deal with you". Poor man, he has enough headaches dealing with the flutations of his top colleagues, with ladies of ill-repute, with Soviet agents, and now through Enoch's speech with the supposed enemy, the Labour party.

also done post-graduate work in surgery there. He has been working in Lao Patriotic Front hospitals for seven years. His wife is a gynaecologist, also trained in France, and is working in the same hospital. I asked Dr Pumak why he chose to work in the liberated area when the Vietnamese Government would have offered him a far better-paid job and a higher position? After all, there are not many Lao medical graduates. He said, when he was a student he saw the US bombing and destroying his country and he felt very angry. It was then that he decided that he must join his people in fighting against US aggression. He felt that it was his patriotic duty to look after the health of his people so that they could be fit fighters and able bodied peasants. He did not want to seek ways for his personal advancement. It was the US intervention in Laos which brought him to work in the liberated area. He just joined his people.

What were the common ailments in

that area? The most common of them, he said, was getting hit by US bombs. The second was malaria, and the third, intestinal ailments like dysentery. The hospital, he said, was safe from even the heaviest US bombing. It had five electric generators, all inside caves, and if one failed, another was switched on.

He then took me on a tour of the hospital and showed me two new operation theatres, departments of ear, nose and throat, ophthalmology, gynaecology and obstetrics, radiology, a laboratory and isolation wards for infectious diseases. Most of them had brand new equipment, much of which came from China. Other equipment was mostly from the East European countries, though there were a few items of equipment and medicines from western countries, sent by their Red Cross societies.

Every district in the liberated area has a hospital of its own with 20 to 30 beds. Every province has a bigger hospital, with 50 beds, and each village clinic has five to seven beds.

Everyday, as we sat inside our cave talking or having a meal, we would hear US planes flying overhead and, sometimes, anti-aircraft guns going into action. But no bombs fell in the area where I was. One day, as we were driving out of our cave to visit a big printing house inside a cave in another area, an armed Lao Patriotic Front officer who sat in the front seat of the vehicle and scanned the sky for planes, said something to the driver who then pulled the vehicle under a tree. The vehicle was already decked like a tree with freshly-cut branches tied to its sides. It took me some time to locate the US jet bomber. I could spot it only when it came almost overhead. I think it was a Phantom F-4, on one of its missions of murder. It circled overhead a couple of times, seemed unsure about whether the faint movement it had seen on the dirt road was a vehicle, and flew away. But then it dumped its bombs in our neighbourhood on some boys and girls broadening Highway No 217, on which we were travelling. The young people were in the process of taking cover when the plane swooped on them and injured a few caught in the open.

I later visited a printing house located in a man-made cave in another mountain. One reached the cave entrance by climbing some steps. Its manager, Kieng Kham, offered us tea and said the printing house was established in 1950, during the struggle against the French. At first there were only six persons working in it and the old and primitive printing equipment had to be moved from place to place to hide it

from the French. Paper and ink were in short supply. In 1953 Sam Neua was liberated from the French and the printing house was moved into Sam Neua town. There the number of workers was increased and new equipment added. In 1957, after the Geneva Agreements and the establishment of national concord, the printing house was moved to Vientiane, the Laotian capital. There, more machines were obtained. But the rightist elements in the Laotian government created many difficulties for the printing house. Then the Rightist coup took place on August 9, 1960, and many members of the Lao Patriotic Front, including its Chairman, Prince Souphanouvong were arrested. And so the printing house had to move back to Sam Neua.

Because Sam Neua province was continuously bombed by the US, the Central Committee in 1969 decided to excavate the present cave to house the printing equipment. Now the printing house had more than 100 workers and when I was taken around, I saw treadles, flat-beds, a rotary and a colour printing machine. Most of the machines were from China.

THREE MAIN TASKS

It was busy printing a weekly newspaper of the Patriotic Front, which is distributed all over the country. It was also printing large paper flags, in colour, of both the Front and the Cambodian Government of Prince Sihanouk. There was also a stack of school text-books it had printed and another of some political documents. Kieng Kham said the printing house had three main tasks: to print documents, books and the newspaper, to obtain higher skill in printing and train others in the profession and to fight against US aggression. (They also grew vegetables to be self-sufficient.) While leaving, I was presented with a small diary of important events in Laos, printed there in the Lao language.

I also visited the broadcasting station called "The Voice of Pathet Lao", also in a cave, and attached to it, a school to train engineers in handling broadcasting equipment and another to train broadcasters. The station was set up in 1960. It is on the air for 19 hours daily, broadcasting in three languages — Lao, Vietnamese and French. It closes down at midnight and starts again at 5 am.

In another part of the cave, functioned the school for technicians and engineers. There were large transmitters, amplifiers, public address systems, recording equipment, being dismantled and reassembled again by some trainees

to make them familiar with the working of the equipment. In an adjacent room a class was in progress dealing with circuits, printed circuits, electron tubes, transistors, capacitors, transformers, and experiments were being carried out with the help of oscilloscopes on photo-electric circuits, computer circuits, electronic switches, signal tracers, etc. From their looks, one guessed that the students in that class came from villages and not from sophisticated societies like in our cities, from where our own electronics students come. They were diligently learning to handle all that complicated scientific equipment, and those who had learnt were operating and maintaining it, under extremely difficult conditions, more expertly than we in our so-called advanced cities do.

This was the new civilisation that was being created in war-ravaged Laos, where you need not have to put up artificial appearances to match your profession or vocation. There, like in North Vietnam, it was difficult to tell, by just looking at a man, that he was a doctor, a surgeon, an administrator or a party leader. They looked like any other citizen of their countries. In our country we assume poses to suit our vocation — start smoking a pipe, develop an accent or grow long hair — to differentiate ourselves from our common people and thus assume importance. But in the liberated area of Laos and in North Vietnam, the effort of the leaders is to identify themselves fully with the people and not to assume importance because of the nature of their work. In Laos and Vietnam you can never make out a person who might have spent long years abroad and then obtained specialised knowledge from a peasant because his aim is to identify himself completely with the common people of his country.

Another day I visited a textile mill also housed in a cave. Initially, it was a vast natural cave, enlarged later when more spinning and weaving equipment was received. At the time of my visit, it had 20 automatic looms and several other automatic machines producing various items like under garments, sarongs and shirt material.

The mill, the manager said, was started in 1964, in the open. But it was bombed twice. Though no one died, much equipment was destroyed. It was therefore moved into the present cave.

Most workers in the mill (there were 250 of them) were women and all of them had families. There was a crèche looking after babies when mothers were

at work. There was a common kitchen too. But those wishing to cook themselves, or wanting special dishes, could prepare them at home.

One group of workers, off-duty, was erecting a new structure, under the cover of an overhanging cliff, to store cotton bales. All the quarters and the extension of the cave for the mill were built by the textile workers themselves.

A CAVE FOUNDRY

Not far from the textile mill, across a river, was another set of caves housing a foundry. In the caves were an ingenious smelting plant, casts into which molten metal was being poured, lathes, turning machines, cutters, including gear-cutters, and five-ton hammers, all electrically operated. The foundry made a vast variety of agricultural implements and articles for household use. In the store for finished goods, one could see buckets, spades, sickles, hammers, hatchets, files, pliers, tongs, spoons, scissors, spanners, wood-working implements, nuts and bolts of all sizes, and large items like axles and machine parts.

The foundry was started in 1965. The first job of its workers was to assemble the textile mill in the cave. I asked the person in charge where he had obtained the supply of raw material for his foundry? He said initially it came from unexploded US bombs in the area which one could collect in plenty after a bombing raid. The metal casings of those bombs were melted and turned into implements. But now, since the foundry was enlarged, raw material for it came from North Vietnam, China and other socialist countries.

In the neighbourhood of both the textile mill and the foundry there were terraced fields. They belonged to the workers who grew some of their food requirements themselves during their spare time.

In other caves there are all kinds of institutions and working places, from workshops repairing tanks and radar to art schools. The liberated area has everything: electricians, engineers, printers, weavers, smelters, broadcasters, radar men, anti-aircraft gunners, tank troops, soil experts, teachers, doctors, in fact people to do almost any job needed to be done in that area, besides peasants and soldiers. The Vientiane government certainly does not have so many trained and skilled Laotians as the liberated area has. A complete infrastructure for a developing nation depending upon its own resources exists in the liberated area.

Medieval Barbarism in West Bengal Countryside

Ashok Rudra

PRIME MINISTER Indira Gandhi made quite a stir about a year back when she gave the verdict that the GNP could not be treated as an index of economic development for all purposes; there were aspects of economic welfare which were not reflected in that national accounting measure. Even though this is one of the elementary lessons one has to teach in any undergraduate course in national income accounting, it acquired a new halo on being pronounced by our wise Prime Minister. It was discussed a lot at that time in the Delhi economic circles, as if the foundation of a few school of developmental economics had been announced, and there was much speculation as to who among the Prime Minister's admirers could have originated this most unoriginal idea.

So GNP would not do. As a matter of fact, no single macro-economic measure would do — there have to be a whole set of indices, one index each to take care of particular aspects of economic development; level of output, level of consumption, inequality of distribution, import surplus, etc.

OTHER ASPECTS OF WELFARE

But surely there are aspects of social welfare which do not get reflected in any of the usual macro-economic aggregates or rates ratios but which are nevertheless such that unchanged conditions in them would reduce much of the importance of any improvements suggested by the more usual economic measures. Thus, many a student of Western societies would like to read, side by side with economic statistics, relating to crimes or drunkenness. The highly plausible idea here is that welfare ought not to be judged as having increased just because people have a second television set and a third motor car if, at the same time, the incidence of murder, rape and assaults on children has increased markedly. It would be similarly pertinent, when judging how far India has advanced since Independence, to

consider various non-economic spheres where one may expect to see certain indications regarding the goodness and sanity of our social system. Thus, how much satisfaction can one draw from statistics of food production and consumption and from pictorial publicity about the Bhakra Nangal and the atomic power projects, when the destitutes and beggars in the streets of our big cities seem to be just as numerous as ever before, when our slums remain as extensive, as populous and as putrid as they are? But 'Garibi Hatao' is still the slogan and there will perhaps be no hesitation at all even in official circles in admitting that as long as the indices of progress constructed to reflect progress in the matter of beggars and slums continue to take zero value (which they would take, if they could be constructed, right through the entire quarter of a century of socialist demogogy), rates of growth in aggregate consumption and aggregate incomes would have little meaning.

A CHANGE NECESSARY

But there are still other aspects of society where there must be a change before we can draw any comfort about our society becoming more civilised; some of them are such that ministers and official circles would rather not speak about them. One of them is the behaviour of the police *vis-a-vis* the citizen.

Liberal political theory would have it that the police are the guardians of law and order. But the reality as it was in pre-Independence India could be summed up by the following story:

An old village woman, gladdened by the just and generous dispensation of law in her favour by a touring Deputy Magistrate, blessed the latter in the following words. "Blessings my son! Live a hundred years and be born in your next birth as a Daroga." What after all was a Deputy Magistrate? He could at the most order around a few attendants and have free supplies of vegetables, fruit, chicken and egg from the villagers. But the Daroga: He

had the powers of a God. He could not only take any gifts he liked from anybody's field or vegetable garden or shop, he could, if his taste went that way, lift any woman from any peasant's house for a night's pleasure. If his wrath should fall on some poor villager, he could drag him to the thana, get him beaten up black and blue. Of course, there are always bigger gods over little gods; and the Daroga would be usually submissive to and in league with the local zamindars, moneylenders and other tyrants.

How far have conditions changed in this respect? GNP and, no such measures would reflect any change or absence of change in this aspect of social life in the countryside. Nor are there any objective studies that have been made of this aspect of our life. One has to go by impressions. No one person can, however, gather impressions from all parts of the country. One can only talk about first-hand experience for one's immediate neighbourhood. The present writer can, therefore, talk only about the West Bengal countryside. What he has to report may sound incredible to those who live in Bombay or Delhi; for such things as happen in the West Bengal countryside do not happen even in Calcutta.

One thing that is happening in the West Bengal countryside is the systematic use of torture by the police. The second thing that is happening is that this torture is not restricted to Naxalites or to hardened criminals to make them yield information, but may be (and is) visited upon just anybody. Just anybody may be (and is) picked up by the police without any warrant and without any obligation to answer anybody, detained at thanas and made the object on which sadistic police personnel can satisfy their appetite for brutality. The third thing that is happening is deliberate and systematic harassment of ordinary citizens by the hordes of armed ruffians who happen to be the guardians of our law and order.

TORTURE IN THANAS

The first item mentioned above, namely, the practice of torture by the police in thanas, is too well known and generally accepted to require any argument to show that it exists. The French military police used to practise it on Algerian guerillas and for years liberal intellectuals in France

fought the establishment over the issue and thus precipitated a crisis of conscience in the country as a whole. It is a characteristic feature of our kind of democracy, our kind of liberalism in this country that we all know what happens at thanas — it happens not only in the West Bengal countryside, but in every part of the country — but the public at large, including the most enlightened, the most law-minded and the most liberal, are not the least perturbed by it. It is well known that whoever gets brought to a thana by the local police runs the risk of being subjected to physical violence which may range from a mere few slaps and blows to such torture as may make the person unconscious or even lead to his death. This is so whether the person has been brought on charges of petty theft or on charges concerning the security of the state (like the alleged Naxalites) or on no charges at all. Such direct and pre-judicial inflictment of punishment is of course sheer barbarism and is not sanctioned by any of the country's laws. But such violation of the sanctity of the citizen's person took place during the British regime and it still takes place. And that is a measure of the progress in civilisation that has not taken place in the country! Why do our leaders, who talk of income and distribution and production and planning, never mention this continuing and systematic barbarism inside the country's thanas? Why do members of our judiciary who have fought so valiantly for the protection of the fundamental rights of citizens not made an issue of this regular practice of physical torture on persons produced before them by the police? Why does Mohit Sen, who is always sending out such good news about the social progress that is taking place under the collaborationist regime of the CPI in Kerala, never make any report about how much the thanas in Kerala have been cleaned up of this barbarism?

REMINISCENT POLICE

To come to the second point, we have first to elaborate the third. This third aspect of life in the West Bengal countryside *vis-a-vis* the police is more reminiscent of the immediate pre-British period than the British period. Literary and other historical records show how during the decline and fall of the Mughal Empire the countryside was overrun by marauding hordes of men in arms who used to commit all

kinds of atrocities on the rural population. If it be said that conditions in the West Bengal countryside are not very different today, it would sound like an exaggeration. But those who live in the West Bengal countryside know that people live in constant fear of the police. Young people are afraid of moving around late in the evening: they may get picked up any time by police vans and charged with such offences as (i) offending the sensibilities of the 'decent' citizens by having long hair or colourful shirts; (ii) engaging in immoral traffic (this if a young couple are caught taking a walk together or if a person accidentally becomes a witness to police personnel carrying on the traffic in women that they engage in everywhere); (iii) engaging in preparing for a war against the country or attempting to murder (this if a young man is found in possession of Left political journals which are registered and are available anywhere with newspaper vendors or, say, the collected works of Lenin or Mao); and, most serious of all, (iv) being involved in the reorganisation and revitalisation of the Naxalite movement (this in the case of all young people who might happen to meet and have any social dealings with any young men who might have been detained on charges of being a Naxalite and who have been released, either unconditionally or on bail).

LIVE IN FEAR

Not only young people. Women live in fear, lest they be insulted or molested. Villagers live in fear. Cases are frequently heard of a whole village full of people being beaten up by police parties who might have had some reason to be annoyed with some individuals belonging to the village.

Conditions like this prevailed in Bengal during the days when our villages were subjected to raids by Dutch and Portuguese pirates; that such conditions prevail under the government of Indira Gandhi, devoted to the cause of the poor and the unemployed, may sound incredible to the gullible who voted for her. But what is said above can be checked by whoever is prepared to take the trouble of living for a few days in the West Bengal countryside.

This brings us back to our second point about torture at thanas. Whoever gets brought to the thana — whether on charges of Naxalite re-

groupment or on grounds of carrying on with Santal women — stands every chance of being beaten up. Everybody seems to know about the arbitrary arrests and the very common occurrence of subsequent physical torture at thanas, but one either accepts it fatalistically or does not know what to do. For, the local level experience in every thana area is that protests never yield any results.

RELEASE WORSE THAN DETENTION

This police terror takes a particularly sinister form when it concerns suspected Naxalites. One has heard a lot about the summary killing of Naxalites by the police and there has been some amount of public attention focused on the illegality of thousands of young people being kept under detention without trial. But much less is known about what the police do to Naxalites whom they are obliged to release. This in most cases is resulting in a worsening of conditions for the young people involved. Release means the throwing back of a young man from the relative security of the inside of a prison to the mercy of a brutalised police. Release means rearrest and rearrest means further beating up at the thanas. Release means constant harassment by the police — raids, searches, interrogations. Furthermore, this harassment and bullying is not confined to the released detenu: the treatment is generously extended to all who come in contact with him. The declared purpose is to prevent any fresh regrouping of the Naxalites. The real purpose would seem to be to drive a young person to moral annihilation by denying him any society, any human contacts, any occupation, any means of livelihood (excepting that of a police informer). In terms of sheer cruelty, and the damage it can do to a young person's personality, this is certainly at par with physical torture and detention without trial. But its effects on society as a whole go deeper. Thus our society is gradually getting conditioned to accepting such atrocities and crimes committed by the police as quite normal — regrettable but unavoidable.

Fascism is a term which, like feudalism, has been done to death by indiscriminate use as a jargon in Left literature; so we shall not use such terms. But with full sense of history one can say that what is reigning in the West Bengal countryside is sheer Medieval Barbarism.

The Neglected Matrix

Industrial Relations in Kerala by K Ramachandran Nair, Sterling Publishers Private Limited, New Delhi 110016; pp 437; Rs 45.

THE book under review, according to the author, is intended to remove misgivings about the communist mentality of the Kerala worker which "has proved a barrier to the flow of investment capital into the State". The author concludes that his study has shown that the type of labour-management relations that have developed in Kerala can be "a guide and model for the rest of India".

The author has started from a wrong hypothesis. He has not given any evidence to show that the flow of capital into the state has been hindered by the alleged "indiscipline, impertinence, lack of respect for authority and communist mentality on the part of the Kerala worker". On the other hand, there is ample evidence that the business community has not felt shy of Kerala labour. The houses of Tatas, Birlas, Bangurs, Thapars, Chettiars, Somanis, Patodias, Binanis, Dalmias and Khemkas, are all operating successfully here. Even people with hardly any previous industrial experience and resources, like Desais and Anands, have been able to take capital into Kerala and to establish modern industries there with American and Japanese capital participation. Philips Petroleum in petroleum refining, Canadium Aluminium in aluminium and Cominco Binani in zinc smelting, are all here. At the same time, the industrial units of the big monopoly houses have almost doubled their capacity. In the sixties, Tatas were keen to enter the titanium industry. Birla had plans to enter the textile field in a big way, initially by taking over the sick mills. Even now, Thapars are trying hard to get a letter of intent revived for setting up a Rs 40-crore titanium complex. A well known American food-packing company is coming to put up, jointly with Agro Industries Corporation, a meat-processing plant, as well as allied industries, after putting aside a similar scheme sponsored by the KSIDC with FAO assistance.

Only local people, who have had no industrial experience elsewhere, blame labour for the industrial backwardness of Kerala. To understand the real reasons for backwardness, one should look elsewhere, not towards labour.

Industrial relations reflect the state of a society. They are not defined merely

by material benefits or by the struggles to improve them. When a worker accepts employment, he places himself under a discipline, the ways and means of which he seldom understands. Only after he is in, does the worker feel the need for collective influence "to regulate recruitment and training, the pace and methods of work, the allocation of men and tasks, promotion and seniority, and discipline and dismissal". The author of this book has failed to comprehend the nature of the society of which the worker is a part, and so to put industrial relations in their proper perspective. Consequently, he has reached some conclusions of a kind often heard in drawing rooms of the new industrialists emerging from the feudal class or from the adventurous among the petty bourgeoisie. A typical example is: "that agitation is in the blood of a Malayalee is no exaggeration". This may be an easy way of avoiding rational explanation; but it is not a scientific method of studying a complicated subject. Again, "it is the Machiavellian shrewdness and intelligence of the Malayalee that enables him to confer or deconfer leadership titles on any one of his leaders and, whatever his ideology or political affiliations may be, the Malayalee sticks to him for a lifetime. One can find more than a dozen of such old veterans in the trade union movement whom the working class of the present generation would never like to give up in the union activities.... They hold in their hands the destinies of the state and on them depend the prospects of industrial peace".

Apart from such remarks, which could well have been avoided without any loss to the main theme, the book will definitely be useful as an introduction to further studies of industrial relations in Kerala. The author had made a lucid historical review of work and wages, trade union movement, employer associations, industrial disputes and their settlements, and collective bargaining. The review ends with 1964-65. He has also made case studies of labour-management relations in Fertilisers and Chemicals Travancore Limited (FACT) and in the smelter unit of Indian Aluminium at Alupuram. Both are in the industrial belt of the Ernakulam District. The real problems in Kerala relate

to: pressure of population on land, high level of literacy, acute unemployment and underemployment. There are two types of industries here, the traditional labour-intensive industries with low technology, like cashew and coir, and modern sophisticated industries, like chemical fertilisers and petroleum refining. Most of the statistical information examined relate to cashew, coir, plantations, textiles, and knitting and bricks and tiles. It has been difficult to make any positive conclusions about the extent of disputes, duration, time-loss, worker involvement and participation and frequency. Though minimum wages have been fixed for as many as 22 industries in the first group, the level of wages has been invariably lower than the need-based subsistence minimum and the implementation of it has been also tardy. Further, industries like coir, cashew and tiles, which provide the greatest employment, have been threatened with either raw material shortage or declining markets. It is this gloomy prospect before the traditional industries that makes the industrial climate look depressing. On the other hand, modern industries in Kerala are comparable with similar ones elsewhere in the country. What people outside seldom understand, is the almost smooth working of unofficial industrial relations committees, the conciliation machinery, and the collective bargaining — industry-wise and factory-wise — in spite of the multiplicity of unions. This is an area for further research. Another aspect, which requires close study is the management outlook in modern industries. Any evaluation of labour-management relations would be incomplete unless it is made in relation to the attitude of the managements towards other factors of production. The management objective should be optimisation of various factors of production, not simple maximisation of labour efficiency.

Choice of Alternative Technologies Vital Task in Science and Technology Planning

Amulya Kumar N Reddy

The Approach to the Science and Technology Plan prepared by the National Commission on Science and Technology (NCST) contains no explicit picture of the national goals which the plan for science and technology is supposed to subserve. It adopts no particular pattern of growth, production, consumption or income distribution to constrain and channel the approach to the science and technology plan.

One immediate result of this is that "the areas of prime importance" in the science and technology plan have not been derived from any explicit pattern of development of the country. Rather, one must work backwards and attempt to discover the type of India which will result from the successful implementation of the science and technology plan.

Another result is that the numerous panels of the NSCT have not been given directive criteria regarding the choice of technologies; hence, the science and technology plan which emerges may well be at cross-purposes with the socio-economic plan — a result which is precisely what was hoped to be avoided by the setting up of the NCST.

An alternative approach to the science and technology plan must begin by assessing the pattern of socio-economic change over the past 25 years and then decide what pattern of socio-economic growth should be preferred in the national interest. From this pattern of growth, criteria for the choice of technologies must be derived.

It is the definition of these criteria which should constitute the essence of the alternative approach. For, the transmission of these criteria to the various NCST panels for mandatory use in the selection of science and technology tasks will ensure that the plan for science and technology will be directed towards the same objectives as the socio-economic plan.

This paper seeks to suggest some lines along which such an alternative approach to the science and technology plan may be developed.

THE preparation of a Science and Technology Plan by the National Committee on Science and Technology (NCST) will, for several reasons, constitute a landmark in the country's history. The plan will be the first such detailed exercise. Further, it is an expression of the government's commitment to the view that "scientific and technological activity must, and can be, planned towards the fulfilment of national goals". Finally, as many as 1,800 scientists, technologists, economists, etc., would have actively participated in discussions on the definition of R and D priorities and the formulation of scientific and technological tasks. Such a democratisation is in itself an achievement and a valuable precedent.

During the course of, but not prior to, the preparation of the Plan, the NCST has defined "An Approach to the Science and Technology Plan" and offered this document for public discussion and debate. The task of responding to the NCST is not easy because

- (1) the problem is complex;
- (2) there are a vast number of ideas in the Approach Paper, but these ideas have to be extricated from

the complicated terminology of western science policy studies; and

- (3) the constituent sub-sections of the Paper have not been woven with logical connections and continuities into a structure with all emphases and interrelationships made manifest.

Notwithstanding these difficulties, the importance of the subject warrants a serious response to the genuine offer of the NCST.

THE NCST AND NATIONAL GOALS

The NCST has taken up the challenge of "planning for science and technology in the context of national goals". An assessment of the NCST Approach Paper should therefore commence with a critical examination of what national goals it has adopted as targets. In the words of the document, "what is this science for?" and "what is the technology supposed to do?" are the two crucial questions which must be asked and answered before the formulation of a plan. The document goes on to state: "neither question appears to have been

asked in the past... An attempt to answer the questions would involve an analysis of the broad social and economic setting of each of the areas of scientific activity... Such analyses have not been made".

Assuming the validity of this judgment, one would have expected the NCST to adopt one of the following two courses of action. The NCST could have devoted considerable effort to answering the two questions and thus clearly delineated the national goals. Or it could have acted upon its realisation that the formulation of a science and technology plan must be an integral part of the process of social-economic planning and attempted to derive an approach to the science and technology plan from the Planning Commission's "Approach to the Fifth Plan". Strangely enough, the NCST has not adopted either course of action. Thus, the NCST Approach Paper contains no explicit picture of the national goals. It adopts, no particular pattern of growth, production, consumption or income distribution to constrain and channel the approach to the science and technology plan.

The immediate result of such a method has been that "the areas of prime importance" in the science and technology plan have not been derived from any explicit pattern of development of the country. Rather, one must work backwards and attempt to discover the type of India which will result from the successful implementation of the science and technology plan. Another result is that the numerous NCST panels have not been issued with directive criteria regarding the choice of technologies; hence, the science and technology plan which emerges may well be at cross-purposes with the socio-economic plan — a result which is precisely what was hoped to be avoided by the setting up of the NCST.

METHODOLOGY OF ALTERNATIVE APPROACH

If an alternative approach to the science and technology plan is to be attempted, such an approach must commence with an assessment of the pattern of socio-economic change over the past 25 years, and then decide what pattern of socio-economic growth should be preferred in the national interest. From this pattern of growth, criteria for the choice of technologies must be derived. It is the definition of these criteria which should constitute the essence of the alternative approach. For, the transmission of these criteria to the various NCST panels for mandatory use in the selection of science and technology tasks will ensure that the plan for science and technology will be directed towards the same objectives as the socio-economic plan. The purpose of this paper is to suggest some lines along which such an alternative approach to the science and technology plan may be developed.

In the 25 years since Independence, a tremendous amount of growth has taken place. The Gross National Product has increased considerably. The production of all industrial commodities has shot up. A vast variety of goods has appeared on the markets. Many prestigious products such as aircraft, ships and electronic instruments are now made in the country. On the agricultural front, the 'Green Revolution' has taken place and food production has increased markedly.

Despite these successes, it is well known that the picture is not all rosy. The sharp polarisation of society into haves and have-nots has been accentuated by the 25 years of industrialisation. This cleavage has been dramatically revealed by statistics of the severe maldistribution of incomes and expenditure.

Though the exact figures have been

debated because they involve definitions of poverty and minimum needs, the broad pattern is simple: about 90 per cent of India's population (456 million) have a per capita income of less than Rs 3,000 per year (Rs 250 per month) whilst only 5 per cent (25 million) have a per capita income of over Rs 5,000 per year (Rs 417 per month). Further, the top 10 per cent (50 million) accounted, in 1967-1968, for 24 per cent of the total expenditure in contrast to the bottom 60 per cent (304 million) which accounted for 37 per cent of the total expenditure. More glaringly, the annual consumption of the 25 million in the top 5 per cent, *viz.*, Rs 3,640 crores, was slightly higher than the Rs 3,500 crores spent by the bottom 30 per cent.

Thus the pattern of growth adopted hitherto has led to a sharp polarisation: a society of the top 10 per cent which includes, apart from rich businessmen and the landed aristocracy, politicians, bureaucrats, civil servants, rich peasants, professionals like scientists and engineers, and the bulk of organised labour; and a society of the bottom 90 per cent consisting mainly of the rural poor. The market economy encompasses almost exclusively the top 10 per cent which has emerged as a politically powerful, urban-oriented Indian elite. At the same time, the bottom 90 per cent, and in particular the bottom 40-50 per cent, exists in poverty outside the market economy.

It is also of crucial importance that the polarisation is associated with rural stagnation and impoverishment, with massive rural unemployment and underemployment, with mass migration to the metropolitan centres and with chronic balance-of-payments difficulties. Hopes that the benefits of industrial growth will percolate to the countryside and reduce income disparities have not been borne out by experience; in fact, it appears that the growth of industries of the type set up thus far has only accentuated the evils of rural impoverishment and unemployment, income disparities and balance-of-payments deficits.

TECHNOLOGICAL BASIS OF INDIA'S PRECIFICAMENT

In seeking out the root cause of India's predicament, it should be noted that the pattern of industrialisation adopted thus far has been based entirely on the technology of the developed world, *i.e.*, Western technology. This is a capital-intensive technology designed primarily to reduce labour, to supply vast markets and to produce goods for individual consumption. Its prolific development has invariably led to increase

in the degree of automation, in the scale of production and in the sophistication of luxury goods. Such is the brand of technology that has been imported into the country over the past 25 years through the medium of over 3,000 foreign collaboration arrangements.

Indian large-scale industry based upon this foreign, but now domiciled, technology, finds a market for its luxury products almost solely among the top 10 per cent of the country's population. It finds its managers, technical personnel and skilled labour among this same group. It gets its capital from the top 5 per cent and from the Government (either directly or indirectly from the financial institutions). The relative scarcity of capital, the shortcomings in management, techniques and skills, the restricted character of the market, the difficulties in procuring raw materials and spares — all these lead generally to underutilisation of capacity and to inefficient operation compared with similar industries in the West. Nevertheless, the demand for its products from the top 10 per cent has sustained the seller's market in which this domiciled technology thrives. Innumerable illustrations of this argument can be cited, but perhaps none is as widely appreciated as that of Indian automobiles. There is no doubt, therefore, that the top 10 per cent derive a large number of direct and fringe benefits from sustaining a Western-brand technology.

The converse is also true: imported Western technology, in its turn, sustains and consolidates the top 10 per cent, through the following mechanism. When capital-intensive technology operates in a country in which capital is scarce, this capital tends to concentrate in large urban plants and shy away even more from the rural economy. One result of this concentration of capital is a sharpening of the contrast in living standards, opportunities and outlook between the urban rich and the rural poor. Another result is a restriction on the number which can be absorbed into the capital-intensive metropolitan sector.

The basic cause of India's grave problem now seems clear. Western technology has buttressed the polarisation of Indian society into a dual society with a small, comparatively rich, acquisitive, conspicuously consuming, politically powerful, city-centred elite drawing its ideas and values from the West, and a large mass of poor people left out of the circle of production and consumption by the lack of employment and purchasing power. In short, the import of Western technology has created and bolstered metropolitan pockets of Western-orient-

ed affluence amidst vast expanses of rural poverty.

Such a development should cause no surprise. For, technology is like genetic material; it carries the code of the society in which it was produced and survived, and tries to replicate that society. To the extent that Indian conditions are not favourable to Western technology, this replication succeeds only in pockets. Thus the adoption of a Western pattern of technology into the Indian context must be viewed as the initiation of a package-deal which includes, on the one hand, metropolitan centres of relative affluence and, on the other hand, rural poverty, mass unemployment, income disparities and deficits in balance-of-payments.

A warning note should be sounded here to the effect that the contents of this package-deal will not be significantly altered if technology imports are replaced by the indigenisation of a Western pattern of technology, *i.e.*, by the imitation, adaptation and innovation of capital-intensive, labour-saving, luxury-oriented, large-scale technology. In this sense, even if the top 10 per cent become self-reliant with respect to foreign technology, that brand of self-reliance will not transform the lives of the bottom 90 per cent of India's population.

Some may think that the source of the Indian crisis lies, not in the adoption of Western technology, but in not adopting it *in toto* on a grand enough scale. Their solution is still more massive doses of Western technology. Others may argue that there is nothing intrinsically defective in Western technology, it only produces deleterious effects when transplanted into a tradition-bound society with scarce capital and abundant manpower.

These views have been rebutted by the youth of America and Europe who have risen against the results of the 'successful' application of Western technology in their own societies. They have shown that the unfettered quest for consumer goods erodes the quality of life, pollutes and destroys the environment, upsets the ecology and recklessly squanders natural resources. And above all, the desperate hunger for extra-territorial natural resources and for overriding influence in markets invariably leads to the perfection, and thence to the use, of the means of war. Western technology has become military technology to such an overwhelming extent that, in the eyes of many, technology is a curse. Its hoary traditions of being a boon to mankind are being fast forgotten amidst the horrors of science-based warfare.

It is clear that India's salvation lies in the development of an alternative technology. To derive the features of such a technology, one must examine whether an alternative pattern of economic growth has a rationale.

AN ALTERNATIVE PATTERN OF GROWTH

In recapitulating the national predicament, it should be emphasised that the past 25 years of industrialisation have driven home the following lessons. Growth is not synonymous with development. Increases in the GNP do not necessarily mean diminishing inequality and poverty. Economic development has overwhelming human dimensions. Investment in Western-style industrialisation does not necessarily solve the unemployment problem. Luxury consumer goods have a high import content and any increase in the production of such goods aggravates, rather than alleviates, the problem of balance of payments. If foreign aid is tied to industrialisation on Western lines, the country becomes more, not less, dependent; it is even forced to borrow money to pay the interest on money already borrowed. Above all else, "the existence of poverty... holds a potential threat to the unity, integrity and independence of the country" — according to the Planning Commission.

Thus, whether the Indian situation is looked at from the point of view of survival of the country, of humanism towards the poor and down-trodden, or of political pragmatism and economic realism, it becomes vital to work out a pattern of growth basically different from the present pattern in which the distribution of consumption expenditure is weighted far too overwhelmingly in favour of the top 10 per cent.

It is clear that this alternative pattern of growth must involve a radical redistribution of consumption expenditure so that there is a major shift in favour of the poorest sections of the population. Such an alternative has in fact been worked out and recommended as the "preferred variant" in the Planning Commission's "Approach to the Fifth Plan".

The variant has been preferred not merely because of its higher humanistic content, but also because it shows considerable improvement in the balance of payments when compared to the past and present pattern of growth. According to estimates, a reduction of 15 per cent in the consumption expenditure by the top three deciles of the population and an equivalent increase in the expenditure of the bottom three deciles will lead to a saving in foreign exchange of

Rs 2,000 crores over the Fifth Plan period. That is, the alternative pattern of growth must be preferred for two equally important reasons: (1) it will lead to greater reduction of poverty and, therefore, greater national stability, unity and integrity; (2) the goals of zero net aid and self-reliance can be achieved more quickly. These significant fringe benefits result from the fact that "there is a positive correlation between reduced inequality and self-reliance" because "the consumption pattern of the lower income strata has a much lower import content, compared to the middle and upper income strata... Any redistribution of consumption in favour of the poor is, therefore, found to have a favourable impact on the balance of payments. Greater equality and progressive self-reliance... are mutually reinforcing".

TECHNOLOGICAL IMPLICATIONS OF REDUCED INEQUALITY

The essence of the preferred pattern of growth is that there should be a major shift in the distribution of consumption expenditure in favour of the poorest sections of the population (in favour of the bottom 30 per cent of the population, according to the Planning Commission's "Approach to the Fifth Plan"). Such a shift can take place only if this poorest group (which lives mainly in rural areas) has more to spend by virtue of greater employment, and if there are essential goods which this group can afford to buy with its greater earnings. Thus, the reduced-inequality model of economic growth requires employment generation in rural areas, a dispersal of mini-production units to the countryside and the production of inexpensive goods of the mass consumption variety.

All these requirements of the reduced-inequality model have technological implications. In particular, the recommended pattern of growth compels and demands that preferences must be exercised in the choice of technologies. Some of these preferences are listed below:

- (1) a preference for capital-saving and employment-generating, rather than capital-intensive and labour-saving, technologies;
- (2) a preference for cottage-scale and small-scale, rather than large-scale, technologies;
- (3) a preference for the technologies of goods appropriate for mass consumption, rather than for individual luxury consumption;
- (4) a preference for technologies requiring little skill or small modifications in the skills of tradi-

- tional craftsmen like potters, weavers, blacksmiths, carpenters, cobblers, tanners and oil millers;
- (5) a preference for technologies using local materials, rather than materials which have to be imported from abroad or transported from distant parts of the country;
 - (6) a preference for energy-saving, rather than energy-intensive, technologies;
 - (7) a preference for locally available sources of energy such as the sun, wind and manure gas;
 - (8) a preference, in the machine building and machine tool sector, for the technology of mass-producing, scaled-down, dispersible, miniaturised factories, rather than the technology of mass-producing consumer goods;
 - (9) a preference for the technologies of manufacture rather than *machinofacture*;
 - (10) a preference for technologies which promote a symbiotic and mutually reinforcing, rather than parasitic and destructive, dependence of metropolitan industry upon the rural population.

The above set of preferences are for what may be termed the technologies of inequality reduction. Opportunities for the exercise of such preferences are not limited; they abound in a vast number of areas. The identification of such choices is necessarily a task for a large number of involved people. Fortunately, there are some groups concerned with the problem, in particular, the Appropriate Technology cell of the Ministry of Industrial Development. Leather tanning and footwear, ceramics (including pottery), food processing and, preservation, agricultural tools and implements, wooden furniture — these are a few of the promising areas which have been easily identified. It is clear that the number of technological choices will increase with the number of people committed to the task.

One can illustrate some features of the problem with the concrete case of the manufacture of dry cells used in torches and transistor radios. Today, barring the fabrication of the extruded zinc cans, the rest of the assembly of a dry cell can be done on a small scale. In fact, the Central Electrochemical Research Institute, Karaikudi, is offering the knowhow for the manufacture of 1.8 million cells per annum by about 40 workers. It would take about 33 such producing units employing a total of 1,650 workers to produce 60 million cells per annum. Current industrial li-

censing, however, is for large-scale factories each capable of producing 60 million cells per annum with only about one-fifth the number of workers. The point, however, is that the cells from the small-scale unit are not inferior performance-wise to the cells from the large-scale factory. In fact, when one considers the poor shelf life of dry cells at Indian ambient temperatures, the customer is more likely to get a 'full capacity' cell by bicycle distribution from a local producer than by rail-cum-truck transport from a distant factory. Hence, considering that 14 units have been recently licensed with a new/extra capacity of 60 million cells each, one can see that the opportunity for the employment of about 20,000 extra people has been lost by the preference for large-scale production.

It should be stressed here that the scale of 1.8 million cells per annum is not the lowest possible scale. It is possible to go down to a cottage-scale of 1,500 cells per day by 10 workers. It is also possible, by suitable design of hand-presses and mixers, to effect drastic reduction of capital and generate a production technology which is not very different from that used by housewives to make 'murkus' ('chaklis').

ROLE OF SOCIAL COST-BENEFIT ANALYSIS

It must be stressed here that in recommending preferences for alternative technologies, it is not proposed that they be chosen irrespective of cost considerations. In the case of each decision involving a choice of technology, it is necessary to carry out a complete analysis of the economics of the two options. But this economic analysis must not be based on the techniques of investment appraisal which is used by the private sector. Such techniques are confined in scope to the consideration of financial returns and cash outlays.

For instance, the well known argument in cases such as that of dry cells discussed above is that the unit cost of a product often goes down with increasing scale. Indeed, from the figures furnished by CECRI, it appears that the unit cost of a 'small-scale' dry cell is about Rs 0.70 per cell in comparison with about Rs 0.60 per cell produced in the large-scale factory.

However, such strictly financial appraisals of a project do not yield an adequate picture of its advantages and disadvantages to the community at large. It may therefore be necessary to employ the technique of social cost-benefit analysis which reckons with the social costs and social benefits attribut-

able to a project. Thus, in the dry cell case, the individual firm chooses large-scale production, irrespective of the price paid by society in the form of further concentration of purchasing power in metropolitan centres, of generation of further pressures for urban housing, schooling, health and transport facilities, of increased unemployment, of greater load on over-loaded transport systems (the raw material requirements for the 60 and 1.8 million cells per annum plants are 17 and 0.5 tonnes per day, respectively), etc. Society, however, must reckon with all the social costs and benefits.

In making social cost-benefit analyses for the choice of technologies, there are three reasons why it may be necessary to avoid using money costs and prices. Firstly, capital in India frequently appears cheaper than it really is, because public sources make available finance at interest rates lower than would have to be paid in the open market. Secondly, labour often appears more costly than it really is because the real cost (so-called social opportunity cost) of employing a hitherto unemployed worker is nil, a consequence of the fact that society is not foregoing any production in withdrawing him from what he was previously doing, viz, nothing. Thirdly, the cost of foreign exchange often appears lower than the international market rate because government rations the foreign exchange and allots it to successful applicants at rates below what these applicants would (rules apart) have been willing to pay rather than go without. These cost distortions make it rational for private and public enterprises (which largely see the issues only from the viewpoints of their own undertakings) to choose a type of technology that uses more capital and foreign exchange and less labour than would be in the best interests of the country. Hence, the cost-benefit analysis for the choice of technology is best based, not on market prices, but on so-called shadow prices which reflect the policy-maker's best estimates of the real costs of capital, labour and foreign exchange from the social point of view.

In choosing technologies for projects, the application of cost-benefit analysis can be envisaged to lead to the categorisation of four types of projects:

- (1) projects in which the alternative (capital-saving, labour-intensive) technology is more economical even taking into account existing market prices and production methods;
- (2) projects in which the alternative

- technology can become more economical on the basis of market prices provided there are improvements in production methods and technology (better design of tools, for example);
- (3) projects in which the alternative technology is costlier on the basis of market prices but cheaper if shadow prices or real costs are used;
 - (4) projects in which capital-intensive technology is more economical from a cost-benefit point of view even if real costs are taken into account.

It is only in the last that capital-intensive technology must be chosen unhesitatingly. For the third and second types of projects, the alternative technology must be chosen, but simultaneous attempts must be made to move the projects into the first category through technological advances. Alternative technology is, of course, a must for the first category of projects.

ALTERNATIVE PLAN FOR TECHNOLOGY

The first major step in the formulation of an alternative technology plan should be the application of cost-benefit analysis techniques to various sectors of industry and agriculture. The purpose of such an exercise would be to determine those projects in which alternative (inequality-reduction) technologies are more economical. In other words, a categorisation of existing and proposed projects into the four types listed above must be made. In this work, economists and cost-benefit analysts have as important a role to play as scientists and technologists.

Once various sectors or projects are selected for the adoption of inequality-reduction technologies, it becomes necessary to formulate the technological tasks that must be undertaken with a view to generating advances in these technologies and making them even more socially beneficial.

It must be stressed here that very few of the many possible technologies of inequality reduction are available indigenously. They are also not in vogue in the developed countries which have adopted precisely the opposite set of preferences, i.e. preferences for capital-intensive, labour-saving, luxury-oriented, skill-demanding, synthetic-based, large-scale, mass-production technologies. Thus, a vital part of an alternative plan for technology will consist of the development of a whole gamut of alternative inequality-reduction technologies. This aspect has

received no attention in the 'areas of prime importance' described in the NCST Approach Paper.

There are other technological tasks which arise from the fact that there is a significant, on-going, large-scale industry. Apart from examining the export potential of large-scale industry, two sections of this industry must be distinguished. Firstly, there are sections of this industry which have been proved on social cost-benefit grounds to require capital-intensive, large-scale technology. Needless to say, these sections of industry must not be starved with sub-critical technological inputs. The aim should be self-reliance in these technologies, which perhaps include nuclear energy, petrochemicals, etc. However, the growth of this socially beneficial section of large-scale industry must not be allowed to clash with the preferred pattern of economic growth weighted in favour of the poor and needy. Secondly, there are sections of large-scale industry which are unremunerative from the social cost-benefit point of view. Many industries devoted to large-scale production of luxury consumer goods are likely to fall into this class. If such industries are permitted to continue with their pattern of production, they should be restrained by suitable policies from squeezing out small and cottage-scale competitors. Or, these industries must be transformed so that they produce, for example, plants, machines, components, sub-assemblies or parts to be fed into rural industries. Electronics appears a particularly promising field for a symbiotic relationship between urban and rural industries.

Thus, there are a number of technological tasks which derive from the country's intention to change from the present pattern of growth to an alternative inequality-reducing pattern of growth. All these tasks need incorporation in the science and technology plan.

It is virtually certain that the alternative technologies for inequality reduction will not be either low or primitive technologies. The demand for new approaches to production engineering based on minimising capital, energy, scale and skills without sacrificing product quality, cannot be satisfied without a mastery of engineering. Emphasis on locally available materials requires advances in the science of materials (coir, bagasse, etc) that are not commonly used in conventional Western technology. That is, new applications of materials science (e.g. jute reinforced plastics) are required. The demand for rural electrification has already outstripped supply, and alternatives to nuclear-

power and hydroelectric-power and to petroleum products may have to be considered in order to achieve the dispersal of energy production. The harnessing of wind power merits examination. The problem however presents a different challenge from that in the West because Indian winds mostly have low velocities (5-10 KPH) and are seasonal. Windmills based on advanced aerodynamic designs, perhaps the generation of hydrogen and oxygen by electrolysis when winds are blowing, and the operation of hydrogen-oxygen fuel cells during wind-less periods — all these require new approaches to energy conversion and production. Thus, alternative technologies are bound to be advanced technologies, advanced, not in scale of production, but in their high science and/or technology content.

Apart from these inequality-reduction technologies, there are the technologies for meeting minimum needs. The point is that "even with expanded employment opportunities, the poorest sections will not be able, with their level of earnings, to buy for themselves all the essential goods and services which should figure in any reasonable concept of a minimum standard of living". In other words, there must be a national programme of meeting minimum needs, such as education, health, nutrition, drinking water, housing and communications. The technological tasks arising from such a programme are huge and complex. Many of them are probably new in the sense that they have not been accomplished elsewhere. For instance, the problem of bringing scientific ways of thinking to a population accustomed to believing that man's destiny is not in his own hands, or the problem of educating a massive population of illiterates when there is a desperate shortage of capital resources — these are challenging problems which are unlikely to be solved by tinkering and by Lilliputian efforts. These complex problems will require advanced thinking and wholly new technologies. The corresponding technological tasks must form part of the science and technology plan, as indeed they are sure to, judging from the section in the "Approach to the Science and Technology Plan" on the "areas of prime importance".

In conclusion, therefore, the core of the approach to the technology plan must consist of the technological tasks associated with the development of technologies for inequality reduction and for meeting minimum needs.

Failure by the NCST to urge this overwhelming emphasis may lead the

various NCST panels to recommend projects that buttress the present pattern of economic growth already so heavily weighted in favour of the top 10 per cent. It is worth remembering here that virtually all the personnel involved with the preparation of the science and technology plan belong to the top 10 per cent, and the bulk of them have strong affiliations to Western technology. What is required however is not a technology plan based on what scientists want to do, but a plan derived from what the country needs to do. If technology therefore is to be a tool for social and economic change, the political leadership must define the directive criteria for the choice of technologies.

SOME CONSEQUENCES OF CHOICE OF ALTERNATIVE TECHNOLOGIES

The choice of alternative technologies and the commitment of the political leadership to this choice is bound to have far-reaching consequences in Indian science and Indian society. Some of these are discussed below.

(1) The most important weakness of Indian R and D institutions has been in that aspect of the innovation chain concerned with scaling-up. But the key feature of the technologies of inequality reduction is that they aim at a minimisation of scale. Thus, the weakness of Indian R and D institutions *vis-a-vis* large-scale technology vanishes *vis-a-vis* the mini-technologies of inequality reduction. These institutions can therefore grapple from a position of strength with the task of developing alternative technologies.

(2) The period of Indian science corresponding to colonial rule possessed all the features inimical to the development of science. Nevertheless, most of the outstanding contributions of Indian science, notably those of Raman and Bose, belonging to that pre-Independence era. This so-called anomaly is only partly explained by the fact that the science of those days was coincidentally 'little science' in terms of scale of funding, sophistication of instruments and magnitude of manpower. Perhaps the real explanation lies in the fact that these gains of the pre-Independence era were indigenous products with native roots.

The post-Independence phase has been characterised by huge investments in science and technology, a significant expansion of the educational system, massive imports of technology and the building up of a considerable industrial base. But the science that has emerged during this period has one key feature: it derives its fashions, its standards, its source of recognition, its stream of ideas

and its instruments from the West. This Westward-looking character of science in India today has become the main inhibiting factor in harnessing science and technology to meet national goals.

A crucial mechanism for sundering these debilitating links with the West is a commitment to the technologies for inequality reduction and for meeting national needs. These technologies, the former more than the latter, will compel Indian science and technology to turn away from the West and towards India and its people and its problems. This attempt to strike native roots again is bound to have an invigorating influence on Indian science, and perhaps lead to its renaissance.

This stimulating influence can operate effectively only if the crucial dependence on imported instruments is served. But science is basically an inquiry based on instruments, i.e. instruments are the wherewithal of science. Hence, it is only a massive effort to indigenise instrument manufacture that can direct Indian science to its historical mission, viz, the transformation of the lives of the vast majority of our people. (A recognition of the vital need for instrument development and manufacture appears to be completely missing in the NCST's Approach Paper. The NCST must realise that just as the import of industrial plants and products inhibits the growth of indigenous technology,

the import of scientific instruments inhibits the growth of indigenous science.)

(3) The turning of Indian scientists and technologists towards the technologies of inequality reduction will encourage their contact with the countryside and the rural population. This contact cannot but have a mutually educative influence. In the long run, it is this contact which will resolve the inevitable problems of language and communication characteristic of the present day polarisation into a dual society, and bring Indian science and its methodology to the Indian people.

(4) The case for alternative technologies presented in this paper should stand or fall solely on the basis of its logic and facts. Thus, the validity of the argument cannot be influenced by quoting authorities or men held in respect. Nevertheless, it is of historical interest to mention that the damage done to the rural countryside by the adoption of Western technology was foreseen by Gandhi almost half a century ago. It was also Gandhi who saw India's salvation in labour-intensive technologies — which for strategic reasons he symbolised by the "ambar charka". Within a few years after Independence, the ideas of Gandhian economics were dismissed as utopian. However, it now looks as if the situation is all set for going forward to many crucial aspects of the Gandhian economic approach.

Centre-State Financial Relations

II—Approach of Past Commissions

This is the second in the series of articles discussing different aspects of financial relations between the Centre and the States in the context of the work of the Sixth Finance Commission.

The first article (May 12) examined the scope of the Finance Commission under the Constitution and brought out that the Constitution gives the Commission the maximum freedom to operate in the areas under its purview.

The present article reviews the approach of the five Finance Commissions, which have reported so far, to the question of resource-transfers between the Centre and the states.

The principal conclusion that emerges from the review is that if the Finance Commissions have emerged as mere fillers of budgetary gaps for the states, little blame, if any, lies with the terms of reference of the Commissions. The blame lies, really and truly, with the Finance Commissions themselves. They simply abdicated their Constitutional obligations.

If it wishes, the Sixth Finance Commission can, therefore, turn away from the gap-filling role and break new ground. The possibilities open to the Sixth Finance Commission will be examined in the next article.

IN the first article in this series (May 12, pp 873-76), it was brought out that the Constitution gives the Finance Commissions maximum freedom to operate in the areas under their purview. It is true that except for the First Finance Commission, hereafter referred to as the Neogy Commission after its chairman K C Neogy, the subsequent Commissions were required by their terms of reference to follow certain guidelines. But it is a moot point whether these guidelines, urged upon the Finance Commissions in their terms of reference, actually came in the way of their adopting a line of approach of their own preference. If they did not, cannot blame the terms of reference.

In this, the second article of the series, we concern ourselves with broad questions of approach to Centre-state resource transfers. Our examination of these questions takes on the form principally of a review of the position as it has evolved over the time-span covered by the past Five Finance Commissions. One principal conclusion that emerges in the course of this examination is that if the Finance Commission, as an institution, has emerged as a mere filler of budgetary gaps for the states, little, if any, of the blame for it lies with the Presidential orders appointing the Finance Commission every five years. The blame lay, really and truly, with the Finance Commissions themselves. They just abdicated their Constitutional obligations.

NEOGY COMMISSION'S APPROACH

Since the Neogy Commission was the one that was asked to give its dispensation without any attempt on the part of the Centre even to suggest how it might consider making its recom-

mendations in any regard, it will help in our examination of the question of approach to look, in some depth, at the approach decided upon by this Commission. In drawing up its scheme of financial transfers from the Centre to the states, the Neogy Commission explicitly proclaimed that it had followed certain guidelines. These guidelines, entirely of its own choice, were, in the Commission's words, as follows:

"Firstly, the additional transfer of resources from the Centre must be such as the Centre could bear without undue strain on its resources, taking into account its responsibility for such vital matters as the defence of the country and the stability of its economy. Secondly, the principles for the distribution of revenues between the states and the determination of grants-in-aid must be uniformly applied to all the states. Lastly, the scheme of distribution should attempt to lessen the inequalities between states."¹

Having laid down the above principles or guidelines, the Neogy Commission then drew up, what it called, a "plan of assistance" using "the methods both of devolution of [tax] revenues and grants-in-aid" but relying "substantially on the devolution of [tax] revenues for securing this transfer."²

On the face of it, all the three principles laid down by the Neogy Commission appear to be unexceptionable. Two questions can, however, be raised. Firstly, how relevant were these principles to its task? Secondly, to what extent does the approach adopted by the Neogy Commission actually reflect these principles?

That in any balanced scheme envisaging transfer of resources from one level of government to another, the needs and resources of both the levels ought to be properly assessed. In this

particular case, therefore, it was only right and proper that the Commission felt that however impressive a case the states could put before it 'for increased assistance to meet their growing needs', it was necessary to take into account "the ability of the Centre as well to assist the states by the transfer of a larger portion of its revenues". The Commission took the view that "while the states have large and expanding responsibilities for the welfare and development of the people, the capacity of the Centre to make additional resources available is conditioned both by the amount of revenue it can raise and by its own essential needs, which, in the ultimate analysis, are the needs of the country as a whole".³

STATES' AND CENTRE'S NEEDS

While there could be no two opinions that the genuine needs of the Centre relative to the resources it can raise have to be allowed for in any scheme of transfer of resources from the Centre to the states, the danger of over-emphasising this consideration must also be recognised. In fact, the really important thing is not to state the principle but to draw the line where the essentiality of states' needs start getting precedence over the essentiality of the Centre's needs in deciding upon the transfer of resources.

Let us not omit to note in this context two things. Firstly, even though the Constitution itself does not enjoin specifically on the Finance Commission to keep the Centre's own essential needs adequately provided for in its scheme of revenue transfer, the fact that the Constitution allows revenue transfers under few specific heads only,

With Best Compliments

of

BRAKES INDIA LIMITED

Padi, Madras 50

namely, income-tax and excise duties, a view can be taken that there is in the Constitution itself an implicit assumption to the effect that the essential needs of the Centre could be taken care of by the non-divisible heads of revenue in the Centre's list of taxes.

Secondly, even on the basis of the Neogy Commission's own review of the Centre's finances in both 1950-51 and 1951-52, the years immediately preceding its award-period, the Centre's revenues from sources other than income-tax and excise duties would have more than adequately covered the expenditure on defence and debt servicing after allowing for the costs of tax collection. Defence, debt servicing and costs of tax collection together amounted to Rs 221 crores and Rs 243 crores, respectively, as against the Centre's corresponding revenue receipts of Rs 295 crores and Rs 361 crores, respectively, in 1950-51 and in 1951-52, from all sources other than income-tax (as then defined to include income-tax but not corporation tax payable by companies) and excise duties. This means that even if almost all, say 99 per cent, of income-tax and excise revenue were given away by the Centre to the states, its essential needs would still have been met.

Thus one might legitimately raise the question if it was at all necessary, keeping in mind both the scheme of finances as envisaged in the Constitution and the actual position as well, to introduce this consideration regarding the Centre's essential needs. In fact, even a most thorough reading of the Neogy Commission's Report fails to show that this particular consideration really played any role in the scheme of transfers that ultimately emerged as a result of the Commission's labours.

EQUITY IN APPLICATION

Equity would demand the uniform application to all the states of the principles of distribution of tax revenues or of grants-in-aid. You cannot apply different principles to different states in these matters and still remain fair and equitable. Here, again, one might be cautious. It is one thing to lay down the guideline, in the name of equity, that whatever principles are decided upon for distribution between the states would be uniformly applied and another to lay down principles which themselves are equitable. Equity cannot be secured by the uniform application of inequitable principles of distribution. As we shall note, in the choice of principles for determining the actual

transfer of resources equity was almost forgotten.

The Neogy Commission chose also to attempt, through its scheme of distribution, a lessening of inequities among the states. This again is a principle with which, on the face of it, there could be hardly any quarrel. But we ought to be quite clear about what we mean by inter-state inequality in the context of inter-governmental financial transfers.

When the Neogy Commission's Report speaks of lessening of inter-state inequalities what it seems to have in mind are inequalities in the level of "basic social services" provided by the government. "An important purpose of grants-in-aid", it says, "is to help in equalising standards of basic social services." Thus, according to the Neogy Commission, "of the two states whose budgets, with the adjustments already indicated, point to the need for an equal amount of assistance, the one with a significantly lower level of social services should (in our view) qualify for a higher amount of assistance than the other with a relatively high level of such services".⁵

The objection one could raise to this approach towards lessening of inter-state inequalities is not that the equalisation of basic social services is not desirable but that there is implicit in the Neogy Commission's approach the assumption that the states with lower level of social services are necessarily the ones which are also the "poorer" states — an assumption which could find little support from the data with respect to primary education presented in the Commission's own Report. Travancore-Cochin, with the highest enrolment of 98.9 per cent, was certainly not the richest state. Nor were Punjab and Pepsu, with the lowest enrolment, the poorest of states. Uttar Pradesh did not qualify for specific-purpose grants-in-aid because its enrolment proportion happened to be above 30 per cent.⁶ This and the fact that whereas Travancore-Cochin did not qualify for such grants-in-aid but Punjab did should be enough to demonstrate the weakness of the Neogy Commission's approach to lessening inter-state inequalities.

But even more objectionable, from this particular angle, was the Commission's ready acceptance, for the devolution of tax revenues, of such criteria as could hardly be said to advance inter-state equality. It accepted "budgetary needs" as "an important criteria for determining the eligibility

of a state for grants-in-aid as well as for the assessment of the amount of the grants-in-aid".⁷ It is relevant to bring out here that while the Neogy Commission's general grants-in-aid added upto Rs 5 crores a year, its primary education grants added upto Rs 1.5 crores in the first year and Rs 3 crores in the last year.

IN THE FOOTSTEPS OF OTTO NIEMEYER

It is true that the Commission felt that "in using the budget as a basis for this purpose, several adjustments" are necessary in the state budgets not only to arrive at "what might be broadly termed a normal budget" but also to allow for relative tax effort and "for possibilities of economy in expenditure".⁸ It is true also that in accepting "budgetary needs" as the major criterion for the determination of grants-in-aid to the states, the Neogy Commission was following in the footsteps of Otto Niemeyer who in fixing grants-in-aid for Provinces "preceded from the premise that each Province should be so equipped as to be able to enjoy a reasonable prospect of maintaining financial equilibrium" and so determined the need of each Province on the basis of his examination of its budget, "making necessary adjustments in the budget to make it reflect as far as possible the prospective position of a Province".⁹

But these facts do not detract from the force of the objections based on grounds of equity and equality. The budgetary needs of a state, as reflected in its budget deficit, are no reliable index of the relative economic position of that state relative to that of another state. Whether or not a state incurs a budget deficit and of what magnitude reflect more the revenue effort of the state in relation to its expenditures than the state's revenue-raising capacity in terms of its per capita income and the dispersion of that income. Further, the fact that, under the Neogy Commission's dispensation, Punjab and West Bengal (both high per capita income states) qualified for Article 275 general purpose grant and Uttar Pradesh and Bihar (below average per capita income states) did not, should demonstrate how the Commission's own guideline, namely, lessening of inter-state inequalities, was vitiated by the approach to the actual manner of devolution adopted by the Commission.

What is even more objectionable about making the so-called budgetary need as the basis for determining a state's entitlement to grants-in-aid is

that it puts a premium on budget deficit. The Neogy Commission was quite aware of this because it itself says that "if the amount of grants-in-aid were to be merely in proportion to the financial plight of state, a direct premium might be placed on impecunious policies and a penalty imposed on financial prudence". The higher the deficit a state succeeds in establishing for the purposes of the Finance Commission, the greater is its entitlement to grants-in-aid. This is highly objectionable on economic grounds because it creates a strong disincentive to tax effort and to economy in expenditure.

Add to the above the fact that the Neogy Commission recommended (i) the inter-state distribution of the states' share of income-tax on the basis of 20 per cent weightage for collection and 80 per cent for population, and (ii) the inter-state distribution of the states' share of excise duties on the basis of population only and one is naturally led to ask how, if at all, did the Commission attempt to lessen inter-state inequalities. Collection as a basis of distribution was clearly weighted in favour of the 'richer' as against the 'poorer' states and population, as a basis of distribution ignores altogether the existence of income disparities among the states.

In the circumstances, the conclusion is difficult to avoid that the actual "plan of assistance" adopted by the Neogy Commission not only reflected little of equity and equality, but in fact violated the canons of equity, equality and also economic efficiency.

A VICTIM OF THE PAST?

What is it, one might well ask, that militated against the self-chosen guidelines of the Neogy Commission so as to make it put forth a plan of resource-transfer that hardly reflected these guidelines? True, Otto Niemeyer had, working under the more or less comparable provisions of the Government of India Act of 1935, chosen the same method of effecting transfers from the Centre to the states. But the point of the matter really is whether this was the only way open first to Otto Niemeyer and then to the Neogy Commission.

What, if any, was the compulsion to interpret the words "in need of assistance", used in Section 142 of the Government of India Act of 1935 and repeated in Article 275 of the Constitution, to mean in need of assistance to meet the budgetary deficit or gap?

One could say this for Otto Niemeyer, however, that at least he did not swear by equity and equality. His

goal was an extremely limited one, namely, that of enabling each Province to enjoy the prospect of maintaining financial equilibrium. The Neogy Commission, on the other hand, proclaimed explicitly that it would attempt, through its plan of assistance, to lessen inter-state inequalities. How could the Neogy Commission work out broadly the same scheme of resource-transfer as Otto Niemeyer? The Commission's terms of reference did not seek to impose on it any extraneous constraints as to what it should, or should not, take into account in giving its dispensation and still it failed to break a new path and adopt a fresh approach to the question of effecting resource-transfer from the Centre to the states.

FOLLOWING FOUR COMMISSIONS

The four Finance Commissions which followed the Neogy Commission have more or less retained the same scheme of transfers except for two changes. Firstly, the Second and subsequent Commissions did not continue with the specific primary education grants-in-aid. Secondly, the Finance Commission's grants-in-aid came to be viewed as a device to help deficit states meet not their overall deficit on revenue account but only their 'non-Plan' deficit on revenue account.

Let us deal first with how it came about that the Finance Commissions concerned themselves only with the non-Plan deficit on revenue account. Once the subsequent Finance Commissions followed the Neogy Commission in regarding as their major task the budget deficit (however calculated), it was only a logical sequence to the establishment of a Plan, covering both the Centre and the states, whose financing was separately determined and provided for, that what remained to be covered by the Finance Commissions was only the non-Plan deficit on revenue account. Actually, however, it was the Fourth Finance Commission (the Rajamannar Commission) which formally "confined itself to non-Plan revenue expenditure vis-a-vis the revenue receipts anticipated in the coming five-year period".¹¹ In fact, it could perhaps be asked right here whether the logic should not extend further. A plan's financing is not decided upon in vacuum. In the case of each state's Plan, the content of Central support will depend upon the surplus or deficit its budget is expected to yield annually on its non-Plan account. Therefore, if the Finance Commission did not cover a state's non-Plan deficit in its award, such deficit would have to be

taken care of through Central assistance for the Plan. The same position would obtain should the Finance Commission's award seek to cover a state's non-Plan deficit partially. In either case, ultimately the non-Plan deficits of states have to be provided for through Plan finance. That being so, why, it might well be asked, did any other Finance Commissions have at all to concern itself with filling the state's non-Plan revenue deficits?

As regards the discontinuation of the specific-purpose grants-in-aid for primary education, the Second Finance Commission (the Santhanam Commission) did it on the ground that "it is the function of the Planning Commission and National Development Council to ensure the equalisation, as far as practicable, of the standard of essential social services in the various states of the Union". Having taken this view, the Santhanam Commission apparently felt that all that was left to it to do was to help the states balance their revenue budgets.

The Santhanam Commission, therefore, accepted for the purposes of its scheme of devolution that the Plan ensured "an equitable development in the field of social services".¹² This abdication by the Finance Commission of its role in the field of social services in favour of the Planning Commission cannot be blamed on the Terms of Reference of that particular Commission. What, one might ask, was the Santhanam Commission's view with respect to the agency responsible for improving the standard of essential administrative services? This question was never posed but there was nothing to prevent the Commission from arguing that the improvement of basic administrative service being an essential prerequisite to successful implementation of the Plan was rightly and properly the function of the Planning Commission.

Having forewarned all interest in the improvement of either essential social services (this was made explicit) or administrative services (this was not made explicit), the Santhanam Commission apparently felt that all that remained to be done, after giving its dispensation on tax sharing, was to help the states to balance their budgets. This is how the Santhanam Commission put it:

"In our scheme of devolution, we have sought to close the revenue gap for each state as nearly as possible and we believe that with reasonable prudence on their part all the fourteen states should be able

to balance their budgets."¹³

As has been argued by us above, the Santhanam Commission might as well have left even the task of balancing the state's revenue budgets to the Planning Commission. The Constitution did not place any specific obligation on the Finance Commission to help states balance their revenue budgets. Nor did the terms of reference of the Santhanam Commission require it to do so.

TERMS OF REFERENCE

It is true that, as stated earlier, the terms of reference of the Santhanam Commission, as of the Chanda Commission which followed, asked it to specifically give regard, among other considerations, to "the requirements of the Second Five-Year Plan" and "the efforts made by the states to raise additional revenue from the sources available to them", while recommending grants-in-aid for the states in need of assistance. But the particular reference to the requirements of the Plan, however exceptionable on grounds of Constitutional propriety, could not be construed as, in any sense, an attempt to restrict the Finance Commission's freedom. If anything, it could be construed as an invitation by the Centre to the Finance Commission to lay down a scheme of resources transfers which would cover not only normal expenditures but also developmental expenditures provided for in the state plans. There certainly was nothing in the terms of reference of the Santhanam Commission to suggest that specific purpose grants-in-aid for purposes of improving the standards of essential services in the states, was outside of the purview of the Commission because improvement of social services was the function of the Planning Commission.

The Chanda Commission seems to have, more or less, accepted the Santhanam Commission's view that it was no longer the function of the Finance Commissions to seek to improve or equalise the standard of services provided by the state governments. Even the Rajamannar Commission, whose chairman personally subscribed to the view that "ex facie, there is nothing in this Article [Article 275] which confines its operation to filling up of any gap",¹⁴ recommended grants-in-aid to the states on the basis only of its assessment of their non-Plan revenue gaps.¹⁵

The Tyagi Commission, which followed, states its position on the question of whether or not the Finance

Commission could consider providing for improved services at the state level in these terms:

"It has been argued before us that while our terms of reference exclude the requirements of Plan schemes, they do not contain an embargo on our considering increased expenditure so as to improve the levels of specific social services outside the Plan and that it was open to us to recommend grants for meeting such increases in expenditure. We are not, however, able to agree with this view as it would blur the entire division of functions between this Commission and the Planning Commission."¹⁶

The above view was taken by the Tyagi Commission even though it felt that in "a purposive scheme of federal finance" it was "desirable to see that the transfer of funds is so designed as to assist adequately the states with comparatively less capacity to raise resources". On the specific of helping backward states "to come up to the average level of services", however, the Commission felt that this was a matter "to be decided not merely on fiscal considerations, but with due regard also to the promotion of a sense of national unity". Evidently the Tyagi Commission felt that it would not go into these other considerations. So, like the earlier Commissions, the Tyagi Commission too did no better than attempt to help states fill up budgetary gaps, not as worked out by the states but by the Commission. It would be quite relevant to bring out here that, according to the Tyagi Commission, several states as well as "a number of eminent witnesses" commented adversely on the gap-filling approach of the Finance commission on the ground that it "puts a premium on disregard of proper fiscal management".¹⁸

However, the operative reason given by the Tyagi Commission for not undertaking to help backward states to improve the level of their services was not that the Constitution precluded the Commission from such a task but that to agree to do so "would blur the entire division of functions between this Commission and the Planning Commission". The Santhanam Commission was much more positive in that in its opinion improvement in the standard of social services was a proper function of the Planning Commission. The Tyagi Commission did not put it that way. It did not undertake to consider the improvement of state services in order not to come in conflict with the Planning Commission.

But the question really is: was there any basis whatsoever for a con-

flict between the Finance and Planning Commissions on the question of improving state services? Even though the Neogy Commission's recommendation for a specific purpose grant was made for the explicit purpose of improving a basic social service, namely, facilities for primary education, the recommendation was not rejected by Parliament. It is worthwhile recalling that the Planning Commission was already in existence for almost two years when the Neogy Commission reported. If only the Santhanam Commission, instead of completely abdicating its responsibility for the improvement of state services, had enlarged on the Neogy Commission's concept, probably the question of conflict that bothered the Tyagi Commission might not have arisen at all. But was the damage so irreparable that the Tyagi Commission could not undo it? That remains an unresolved question.

TWO GUIDELINES

It remains further to ask whether the principal approach to the questions of resource-transfer from the Centre to the states as it has emerged over the terms of five Finance Commissions was at any stage influenced by the terms of reference set out in the Presidential Orders appointing these Commissions. It has been noted already that the terms of reference of the First Finance Commission did not attempt, in any manner whatsoever, to influence the Commission's approach and still the Commission decided to follow an approach whose ultimate objective turned out to be to fill the budgetary deficits, if any, of the states. The terms of reference of the Second and Third Finance Commissions were similar. They did include two guidelines, one urging that the Commission's dispensation should have regard for "the requirements" of the Plan and second requiring that the Commission shall take into account the state's own efforts at raising revenues.

Whatever view one might take about the desirability of the Presidential Order attempting to lay down any guidelines whatsoever, it is difficult to see any connection between the guidelines actually set out for the Second and Third Finance Commissions and their decision to continue the gap-filling approach. The Second Finance Commission not only showed no qualms of conscience about this approach but, as we have seen above, in fact went out of its way to "emphasise" the importance of covering the budgetary gap.

However, when we come to the Fourth Finance Commission's terms of reference, we can discern in the guidelines included therein a built-in requirement to use grants-in-aid for the purpose of filling the states' budgetary gaps. In its terms of reference, the Fourth Finance Commission was told that in its calculations for the purposes of Article 275 grants-in-aid, the Commission should forecast the states' revenues "on the basis of the levels of taxation likely to be reached in the financial year 1965-66" and the states' expenditure so as to include not only committed expenditure with respect to schemes completed during the Third Plan but also "any further expenditure likely to devolve upon those states for the servicing of their debt". While no reference was made in the terms to the states' tax effort, the Commission was asked to have regard for "the scope for economy consistent with efficiency" in the states' administrative expenditure. The terms of the Fifth Finance Commission were broadly similar in this respect.

The question we have now to ask ourselves is: what is it that could have made the Centre virtually commit itself to a gap-filling line of approach implicit in the terms of reference of the Fourth and Fifth Finance Commissions. The answer possibly is that since, on the basis of

the record of the first three Commissions, to none of which had it been even remotely suggested in at least their terms of reference, it is clear that the Finance Commissions regarded their role principally as one of gap-filling, the Centre was only attempting through the terms of reference of the subsequent Commissions to ensure, firstly, that additional tax effort by the states was left out of account as a resource available for the Plan, secondly that certain types of expenditure were allowed for and, thirdly, possibly, that the exercise did not degenerate into a "mechanical" one in which the states would possibly vie with each other in inflating their expenditures and depressing their receipts for the forecast period. By undertaking to become "gap fillers", the Finance Commissions were not only encouraging laxity in fiscal management but also discouraging tax effort on the part of the states.¹⁹ In the circumstances, the Centre was not really committing itself to this gap-filling approach but only accepting the reality of a sort of commitment by successive Finance Commissions. But if this answer is valid, it should follow also that the Sixth Finance Commission could, if it felt a sufficient sense of revulsion for the gap-filling approach, break new ground without any fear of Central disapproval. To the possibilities open to the Sixth Commission we shall

apply ourselves next.

FROM THE CHAIR

The Andhra Bank Limited

Speech of the Chairman, Shri K Gopal Rao

THE following are excerpts from the speech of the Chairman, Shri K Gopal Rao, The Andhra Bank Limited, at the Fortyninth Annual General Meeting of the Shareholders held on June 16, 1973.

REVIEW OF THE YEAR

The year 1972 has been a good year for your Bank despite the general economic climate in the country and the somewhat unfortunate staff relations in the Bank itself, to which I shall refer later. During the year under review, the Bank opened 40 branches taking the total number of branches at the end of the year to 279 excluding Extension Counters. The deposits increased from Rs 79.91 crores to Rs 109.50 crores registering an increase of 37.03% as

against a 17.43% increase for the banking industry as a whole. The Bank's advances have increased from Rs 52.48 crores to Rs 68.51 crores registering an increase of 30.54% which is far higher than the increase for the Banking industry which was 6.8 per cent. The Bank's investments in Central and State Government securities increased by Rs 7.75 crores during 1972. The profits increased from Rs 12.21 lakhs to Rs 16.11 lakhs.

LAST QUINQUENNIAL

As the Bank enters the Golden Jubilee Year, it also completes a quinquennium under Social Control, in terms of which a whole time Chairman and Chief Executive was appointed in

your Bank. It is only relevant and proper that I should review for you the achievements of the Bank in this 5 year period and compare this with your Bank's performance during the preceding 5 years.

In the field of Branch expansion, your Bank has opened 164 branches during the 5 years 1968 to 1972 and of these 152 branches are opened in Andhra Pradesh. As against this, the Bank could only open 40 branches during the years 1963 to 1967. It has been our endeavour to open as many branches as possible in the rural areas so that the Bank could be an effective instrument of growth and serve the largest number of people in Andhra Pradesh. It has not, unfortunately, been possible to open as many branches as

we would like to have, in the Telengana region partly due to the tensions between the Telengana and Andhra regions and partly due to manpower constraints. In the twin cities of Hyderabad and Secunderabad as many as 14 new branches have been opened during the last 5 years taking the number from six to twenty.

NEW SERVICES

As you are aware, several new techniques have been employed by your Bank in branch expansion like Cluster branches, one man branches, pilgrim centre branches, branches in educational institutions, etc, with a view to inculcate banking habit and render service to all segments of the society. Some of these techniques have been perfected and it should be possible in the coming years to employ them more effectively and reap the benefits in fuller measure. It is our ambition that as soon as possible the Bank should give the fullest coverage to Andhra Pradesh so that no customer — present or prospective — should have to travel more than 5 miles to get service from your Bank.

DEPOSITS

In the matter of deposit growth, the Bank's deposits increased from Rs 39.69 crores to Rs 109.50 crores during 1968-1972 recording a rise of Rs 69.81 crores as against an increase of Rs 21.51 crores during the previous five year period 1963-1967. During this period your Bank introduced several new schemes for deposit mobilisation notable among them being the Kiddy Bank scheme which has caught the imagination of the young children and through them of their parents. There is considerable scope for further deposit mobilisation by fuller use of the existing schemes and drawing up new ones.

ADVANCES

While the Bank's advances have increased from Rs 27.29 crores at the beginning of 1968 to Rs 68.51 crores at the end of the year 1972, the growth in the previous 5 years (1963-1967) was from Rs 10.25 crores to Rs 27.29 crores. The rate of growth of advances in the Banking industry had not been uniform in the last 3 years; the increase of advances in your Bank has

been of the order of Rs 10.82 crores in 1970, Rs 6.21 crores in 1971 and Rs 16.03 crores in 1972.

ASSISTANCE TO WEAKER SECTIONS

Consistent with the social objectives set for the Banks, every endeavour is being made to step up advances to priority sectors and weaker sections of the community. At the end of the year 1972, our advances to the agricultural sector including direct and indirect advances amounted to Rs 10.49 crores: of these the direct advances stood at Rs 9.54 crores spread over nearly 80,000 borrowers. The average loan per agriculturist worked out to Rs 1,200/- approximately.

As has been mentioned by me in my earlier statements, though your Bank is in the private sector, it has associated itself voluntarily with all schemes drawn up by the Government both in the field of agriculture and in other priority sectors. This is as it should be since we are one of the only two banks in the private sector chosen for the Lead Bank role. We are Lead Bank for six districts, five in Andhra and one in Orissa. Your Bank is financing primary co-operative societies and small farmers under the Small Farmer Development Agency Scheme (SFDA) in Srikakulam and Ganjam districts and under the Marginal Farmers and Agricultural Labourers Scheme (MFAL) in Vizag district; similar schemes would be taken up shortly in Cuddapah and Nalgonda. Your Bank is financing tribals in Srikakulam district under a scheme drawn up by Tribal Development Agency. The Bank is financing minor irrigation schemes in Miryalguda, Banganpalli, Pithapuram and Samalkot under International Development Agency project with the guidance of Agricultural Refinance Corporation. The Bank has also undertaken a number of developmental schemes in its Lead Districts. The Bank has undertaken all these schemes with caution, on a scale, commensurate with our size and strength and I am glad to report that our experience of these new types of advances has been on the whole satisfactory. In spite of the drought conditions, repayment of our agricultural advances has been quite satisfactory.

The Bank has financed small scale industrial units to the extent of Rs 9.07 crores at the end of the year under review. The pattern of leading to this sector has undergone a change during the last two years. Previously the Bank

was financing mostly traditional small scale industries like rice mills, oil extraction units, etc. Your Bank is now financing many non-traditional industries, engineering units, plastic units, chemical units, highly sophisticated electronic units, etc. The Bank is also financing number of technocrats and self-employed both in the crash programme recently undertaken by the Andhra Pradesh Government and outside. At the end of the year 1972, we have financed about 300 self-employed persons. We have also been financing a number of small retail traders at several of our branches.

The Bank has stepped up substantially its financing of exports from India during the year under review.

The total advances to priority and neglected sectors including advances to retail traders amounted to Rs 22.47 crores as at the end of 1972 forming 32.8 per cent of the total advances of the Bank.

STRUCTURAL REORGANISATION

With the growth of your Bank, in the light of new management techniques and with a view to handle effectively the challenge of rapid expansion, it is necessary to decentralise administration and also restructure the organisational set up of the Bank. It is with this end in view that Regional offices in charge of Regional Managers have been set up. It is proposed to develop the Regional Offices as miniature Head Offices with adequate support to the Regional Managers in all fields of banking operations, like financing of small scale industries, agriculture, planning and development, personnel and inspection and devolve on them sufficient powers. This would enable expeditious customer service and a closer supervision on the branches in a region. A beginning has been made in this regard and the process would be speeded up. Simultaneously, other steps are also being taken with the help of the Adviser to streamline the set up at Central offices and to update the system of working, so that the organisation becomes operationally more effective to withstand the stresses and strains caused by expansion and diversification and to meet the demands of the future.

Note: This does not purport to be a report of the proceedings of Annual General Meeting.

Bank of Baroda

Directors' Report on the Bank's Working for the Year 1972

THIS is the Fourth Directors' Report on the Bank's working after nationalisation. Along with it are submitted the Profit and Loss Account of the Bank for the year ended December 31, 1972 as well as the year-end Balance Sheet.

ECONOMIC SCENE

Although the economy had emerged largely unscathed from the pressures put on it by the challenge of the war with Pakistan, its health suffered a set-back in the second half of 1972, largely on account of the fall in agricultural production following the widespread drought. Power shortages emerged in various parts of the country.

AGRICULTURAL PRODUCTION

Foodgrain production which was a little over 108 million tonnes in 1970-71 declined to 104 million tonnes in 1971-72 and further to about 100 million tonnes in 1972-73. The buffer stocks of 9 million tonnes, partly depleted by relief supplies to refugees and to Bangladesh, are now being supplemented with imports.

On current indications the production of raw cotton, jute and oilseeds is expected to decline while that of sugarcane and plantation crops may increase marginally.

On balance, the overall decline in agricultural output in 1972-73 would be in the region of 5.6 per cent over the previous year.

INDUSTRIAL PRODUCTION

After the 3 per cent growth in 1970 and 1971, industrial production increased by over 7 per cent in 1972. A large number of industries contributed to the increase in industrial production during 1972. A major part of the improvement was, however, accounted for by high growth in the production of textiles which has a weightage of 27 per cent in the index of industrial production.

Though uneven, there was an overall improvement in capacity utilisation. There was a noteworthy improvement in industrial relations in terms of the reduction in the number of man-days lost through disputes. The capital raised by non-Government companies in 1972 exceeded the total amount raised in 1970 and 1971. Imports of capital goods have also been at a higher level in 1972, indicating the likelihood of faster growth of investment in the current year.

The present idle capacity in industries could be utilised in an optimum manner to improve the rate of industrial production in 1973 and help ease the pressure on the general price level. Conditions could turn favourable in 1973 if the monsoon turns out normal.

PRICE TRENDS

The economic situation was characterised by the emergence of inflationary pressures in 1972. The price increase of 12 per cent between January 1972 and January 1973 is the highest for any single year since 1965-66. The price index for food articles rose by 15 per cent during this period and that for industrial raw materials by 17 per cent. During this period money supply rose by 15 per cent.

BALANCE OF PAYMENTS

Our balance of payments position which had shown a remarkable improvement in 1971-72 came in under pressures in 1972-73. During the first 10 months, foreign exchange reserves registered a decline of about Rs 60 crores, notwithstanding a trade surplus of Rs 152 crores against a deficit of Rs 251 crores in the corresponding period of the preceding year. The fall in reserves is mainly due to larger debt repayments, delays in the accrual of certain promised credits and the larger free foreign exchange expenditure on imports.

Exports during the first ten months increased by 20 per cent over the corresponding period of last year, reflecting partly the impact of grant financed exports to Bangladesh. In 1972-73, imports declined for a variety of reasons: the cessation of aid-financed food imports, reduction in imports of raw cotton due to the bumper domestic crop and lower

international prices for non-ferrous metals. A genuine revival of industries would, however, boost the import bill.

It is significant to note that the net inflow of external assistance has tended to fall off. The amortisation and interest payments on past debts, often contracted under stiff terms, absorb progressively increasing amounts of foreign exchange resources. The net inflow of external resources fell from Rs 863 crores in 1967-68 to just Rs 355 crores in 1971-72. In 1972-73 the net aid transfer was around Rs 123 crores.

BANKING DEVELOPMENTS

The objectives of bank nationalisation gained focus during the year. A decision was taken to introduce the Differential Interest Rate Scheme. The Boards of Directors of the nationalised banks were made broad-based. The new Boards, announced in December, include for the first time a representative each of the award staff and officers, thus making a beginning in participative management.

The Government constituted six Regional Consultative Committees, each comprising a group of contiguous States. The formation of such Committees marks the beginning of association of the State Governments with regional banking developments. The discussions at these Committees will help to identify and solve regional banking problems.

An important development was the publication of the Report of the Banking Commission. The report is under consideration of the Government and the Reserve Bank of India.

DIFFERENTIAL INTEREST RATE SCHEME

The Scheme was originally confined to 130 backward districts. Loans were to be given to specified categories of disadvantaged sections of society who live by their own labour. The rate of interest to be charged was fixed at 4 per cent. Every bank was required to give upto ½ per cent of its outstanding advances in the previous year. The Scheme did not seem to get off the ground. In the latest Budget the Finance Minister, Shri Y B Chavan, announced certain welcome improvements in the Scheme which, it is hoped, would help implementation of the Scheme in a more satisfactory manner.

A new system of statistical reporting — Basic Statistical Returns (BSR) — was introduced by the Reserve Bank of India in October 1972. This was done with a view to systematising the reporting of banking data and to ensuring the availability of fairly comprehensive information with a minimum time-lag.

With a view to explaining the importance of an effective information system to the officers looking after the submission of statistical returns at regional offices, a seminar was arranged in December last at Bombay by the Department of Statistics. Shri A Raman, our Director and the Chairman of the Committee which suggested the new system of BSR, was the chief guest at the function.

PROGRESS IN RETROSPECT

The past year was not quite satisfactory for the banking system. The growth rates of deposits and advances showed downward trends. Banks were highly liquid during the greater part of the year. Advances to the priority and neglected sectors continued to remain stagnant.

Bank credit expanded by only Rs 346 crores in 1972 against Rs 599 crores in 1971, Rs 812 crores in 1970 and Rs 570 crores in 1969. The rate of credit growth dropped sharply for the banking system to 6.9 per cent in 1972 from 13.5 per cent in 1971. Banks could utilise only about one-fourth of the deposit accretion during 1972 against a little less than one-half of the deposit growth in 1971. In 1970, deposit mobilisation and credit expansion were almost of the same order while mostly during the sixties credit expansion exceeded deposit growth. The surplus resource position brought down the credit-deposit ratio of the Banking System to 66.3 per cent from 72.8 per cent over the year.

From the angle of deposit growth 1971 was better than 1972. In absolute terms the deposit growth of the order of Rs 1,209 crores in 1972 showed a marginal fall of Rs 43

ECONOMIC AND POLITICAL WEEKLY

June 23, 1973

crores. However, there was a marked decline in percentage terms — from 22.0 per cent in 1971 to 17.4 per cent in 1972. This decline against the background of budgetary deficits requires to be analysed thoroughly.

BRANCH EXPANSION

Following the hectic pace of branch expansion after July 1969, the year under review was one of consolidation. New branches in 1972 numbered 1,763 against 1,801 in 1971 and 2,133 in 1970. The number of new offices opened in unbanked centres during 1972 was 838 as against 1,073 in 1971.

The total number of branches increased by 6,477 or 78 per cent during the period of three and a half years, that is, from July 1969 to December 1972. Branches in rural areas witnessed a two-fold increase. The population served per branch improved from 65,000 at the end of June 1969 to 37,000 at the end of December 1972.

SATISFACTORY PERFORMANCE

Bank of Baroda continued to make satisfactory progress all round in its business during the year under review. As a result, the profit subject to bonus for the year was higher at Rs 240.51 lakhs as against Rs 218.79 lakhs during 1971.

DEPOSIT GROWTH

During 1972, Bank of Baroda's overall deposits registered a rise of Rs 106.59 crores or 21.82 per cent. The rise recorded during the year was higher than that of the previous year both in absolute as well as in percentage terms. During 1971, the Bank's deposits had increased by Rs 68 crores or 16.18 per cent. The improvement in our deposit accretion was all the more significant in view of the fact that there was a slow-down in the growth rate of deposits for the banking system as a whole. Moreover, the Bank can take legitimate pride for registering the highest deposit growth in 1972 for any single year during the last six years. During the year our deposits of overseas branches grew at the rate of 19.5 per cent.

As a result of the faster branch expansion in rural and semi-urban areas, during the past 3½ years, the growth rate of deposits in these areas has increased substantially. During 1972 deposits of our Bank's rural and semi-urban branches increased at the rate of 36.6 per cent and 24.2 per cent respectively as compared to the 12.4 per cent rise recorded by urban branches and the 22.7 per cent rise recorded by branches in metropolitan centres.

At the end of December 1972, the share of deposits of rural and semi-urban branches in total deposits of the Bank's Indian branches worked out to 24.6 per cent as against 23.2 per cent a year ago. The share of metropolitan and urban branches continued to be quite high at 75.4 per cent at the end of 1972 as compared to 76.8 per cent a year ago.

CREDIT EXPANSION

The total credit extended by Bank of Baroda during 1972 expanded by Rs 38.87 crores as against Rs 27.33 crores in the previous year. The credit expansion would have been larger but for a sharp decline in advances for food procurement. In percentage terms the rate of credit expansion during 1972 at 11.51 per cent was higher than that of the preceding year at 8.80 per cent. The growth rate of credit for the banking system declined from 13.46 per cent during 1971 to 6.86 per cent during 1972. The Bank's advances for food procurement declined from Rs 26 crores to Rs 3.25 crores or by Rs 22.75 crores during 1972 against the increase of Rs 17 crores recorded during 1971.

Our Bank's advances for purposes other than food procurement operations increased by Rs 61.61 crores or 19.78 per cent during the year under review. The Table in the adjacent column gives a comparative position of credit expansion.

During 1972, the deposit accretion of the Bank was markedly higher than the growth of advances. About 36 per cent of the additional deposits mobilised during the year was utilised for credit expansion against 29 per cent by the banking system.

CREDIT DIVERSIFICATION

The two important features of the Bank's credit opera-

TABLE

(Rs in cro)

	Bank Credit At The End Of		Increase		Credit-Depo- Ratio	
	1971	1972	Absol- ute	Per- cent- age	1971	1
Bank of Baroda	337.47	376.34	38.87	11.52	69.1	6
State Bank of India	1138.44	1283.76	145.32	12.76	65.1	5
Other Banks	3575.73	3738.00	162.27	4.54	76.1	6
All Scheduled Commercial Banks	5051.64	5398.10	346.46	6.86	72.8	6

tions during 1972 were: (i) diversification of credit in favour of the priority and the hitherto neglected sectors and (ii) a larger flow of credit to backward regions, particularly in the Bank's lead districts. At the end of December 1972, outstanding advances to the socially preferred sectors amounted to Rs 117.77 crores as compared to Rs 95.04 crores a year ago. The advances to these sectors rose by Rs 22.73 crores or 23.9 per cent. As much as 71 per cent of the total additional advances made by the Bank through its Indian branches in 1972 went to these sectors. Advances to the socially preferred sectors have been given a heavy weightage in the Bank's credit portfolio. Outstanding advances to the priority and hitherto neglected sectors of the order of Rs 117.77 crores at the end of December 1972 accounted for nearly 34.4 per cent of the Bank's inland advances as against the similar percentage of 30.7 a year ago.

The credit expansion of the order of Rs 22.73 crores to these sectors was shared by all of them in more or less equal proportions. Advances made for the purpose of exports rose by Rs 8.58 crores to Rs 33.84 crores during the year. Assistance extended to small-scale industries increased by Rs 6.18 crores to Rs 35.31 crores. Finance to agriculture moved up by Rs 6.50 crores to Rs 38.64 crores and to small borrowers went up by Rs 1.47 crores to Rs 9.98 crores.

Special emphasis was placed on taking the Bank to the lead districts. Over 65 per cent of the branches opened in 1972 were located in the lead districts. Through these branches the Bank extended credit to the priority sectors. About a fourth of the credit to priority sectors extended by the Bank in 1972 went to the lead districts.

BRANCH EXPANSION

In the beginning of the year, the Bank had in all 633 branches — 610 in India and 23 abroad. During the year the Bank opened 74 new offices and closed two offices for their unsatisfactory functioning. As many as 44 new branches were opened in rural and semi-urban centres. Thus, at the end of the year the Bank had 705 branches — 680 Indian and 25 overseas. Of our Indian branches, 143 branches were operating in metropolitan centres, 139 in urban centres, 166 in semi-urban centres and the remaining 232 in rural centres.

LEAD BANK SCHEME

During 1972 considerable progress was made in the working of the Lead Bank Scheme. Out of the 72 branches opened in India, as many as 49 were in our lead districts. Most of these branches are located in unbanked rural centres. At the end of 1972 the Bank had 266 branches operating in our 30 lead districts. During 3½ years ended December 1972, the Bank opened as many as 176 branches in our lead districts.

The Bank had only 6 branches in its lead districts of Uttar Pradesh and only 3 in its lead districts of Rajasthan in July 1969. At the end of 1972, the number of branches in the lead districts of Uttar Pradesh had shot up to 59 and in the lead districts of Rajasthan to 41.

At the end of December 1972, the branches in our lead districts constituted 37 per cent of our Indian branches. These branches accounted for 23 per cent of deposits and 12 per cent of outstanding advances.

OVERSEAS BRANCHES

The number of our overseas branches rose from 23 to 25 during the year. In addition there were three branches of our Subsidiary in Uganda. Two new branches were opened by the Bank, one in Mauritius and the other in Fiji Islands.

Important events in countries where our Bank is operating are summarised below:

UNITED KINGDOM

The reviving optimism was obscured by events like the coal miners' strike. Retail prices continued to rise throughout the year. The Government, therefore, imposed a freeze on prices, wages, rents and dividends as a first step towards introducing long-term measures.

The Bank of England directed commercial banks to make credit less easily available to property companies and for financial transactions not associated with maintenance and expansion of industry. These measures had the desired effect.

To fight inflation, the Bank of England imposed a new 'Minimum Lending Rate' linked to the Treasury Bill Rate. It replaced the Bank Rate. With a view to bringing about a gradual moderation in the growth of money supply, it called for 'Special Deposits' from banks.

The foreign exchange market remained unsettled during the first few months of the year. It was decided to float the Pound on June 23, 1972.

All our branches in the United Kingdom continued to make satisfactory progress.

MAURITIUS

The past year was exceptionally good for Mauritius. According to preliminary estimates, national income recorded an increase of more than 10 per cent over 1971. This was mainly due to the new peak reached in sugar production. Also, higher sugar prices were obtained under the Commonwealth Sugar Agreement for 1972-74. Tourism witnessed significant expansion. The economy is expected to yield a balance of payment surplus of nearly Rs 90 million.

Mauritius achieved a growth rate of more than 10 per cent for two successive years. Banking business — both deposits and lending — increased considerably. Deposits of our branches in Mauritius have risen by 24 per cent.

Our Bank celebrated the 10th Anniversary in Mauritius on October 19, 1972. The occasion was graced by the presence of the Prime Minister, Hon'ble Dr. Sir Seewoosagar Ramgoolam. A third branch of our Bank was opened in Vacas in January 1972.

Our Bank's performance was encouraging.

FJI ISLANDS

The sugarcane crop, the mainstay of the Fijian economy, was severely affected when a hurricane struck the western districts of the Islands. The authorities have estimated the damage at F\$20 million.

The tourist industry is expected to earn around F\$40 million, that is, 20 per cent more than the previous year. The Government decided to set up a Central Monetary Authority for an interim period about 3 years before constituting an independent Central Bank. In order to combat inflation the Government formed the Price Control Board. The Government has also set up the Fiji Sugar Corporation which would take over the sugar industry from the South Pacific Sugar Mills sometime in April 1973.

Fill had its first post-independence general election in May 1972.

During the year we opened one more Branch in Nadi, bringing the total number of our branches in the country to 5. We now have branches in all the 5 important cities of Fiji. Our branches in Fiji made satisfactory progress during the year.

KENYA

After prolonged and severe drought conditions, the year 1972 witnessed good economic growth both industrially and agriculturally. Maize, tea, coffee, wheat, sisal and pyrethrum have shown a good rise during the year. Steps have been taken to increase the land under tea and pyrethrum cultivation, instal a milk plant, launch an artificial insemination programme for dairy and beef cattle and undertake several water development projects with the help of foreign countries.

A project for the exploitation of rich silver and lead deposits was undertaken during the year. A large paper mill in collaboration with the Birla Group was inaugurated during the year. Kenya's international trade showed an adverse balance of trade on account of the continued high rate of imports. Additional restrictions are, therefore,

imposed on imports of items which can be indigenously manufactured.

GUYANA

Bauxite mining which is the key industry of the country experienced a setback in its output and exports. However, the industry was able to maintain its gross earnings on account of fluctuations in the local exchange rate for the US dollar as well as improved prices for calcined bauxite.

The Government proposes to launch a Development Plan (1973-77) which aims at providing the people with the basic necessities of life. It was decided to set up an Agricultural Development Bank, a Mortgage Bank and an Insurance Organisation with the participation of co-operatives.

Our branches in Guyana showed satisfactory progress during the year.

UGANDA

Our subsidiary in Uganda — Bank of Baroda (U) Limited took over the subsidiary of Bank of India in Uganda — the Bank of India (U) Limited from 1st July, 1972.

Under the Uganda President's proclamation of August 8, 1972, all Asian non-citizens were asked to leave the country within three months.

PLANNING AND PERFORMANCE BUDGETING

With a view to introducing a system of Performance Budgeting and adoption of a Management Information System, the Bank has retained the services of consultants from the Indian Institute of Management, Ahmedabad. The consultants are presently designing a Management Planning and Information System for the Bank. They will also make recommendations on the changes that need to be made in the organisation structure. Their report is awaited. An internal team has been formed to assist in the implementation of recommendations.

The Consultants have designed a Performance Budgeting System. This is being introduced in a selected group of branches. By the middle of 1973, it is hoped that all branches in two selected regions will be operating the system of Performance Budgeting. On the basis of this experience, a regular system of performance Budgeting will be in operation in all branches of the Bank in India from the beginning of 1974.

PERSONNEL

An event of far-reaching significance was the appointment on the Bank's Board of Directors of two representatives of the staff. The award staff is represented by Shri Jitobhai N Patel of the All India Bank of Baroda Employees' Federation which is recognised by the Government as a majority union. The Officer staff is represented by Shri K C Chokshi, General Secretary of the All India Bank of Baroda Officers' Association.

In keeping with the expansion of business, the number of staff members in all categories increased by 918 to 16,099 over the year. At the end of December 1972, there were 3,588 officers, 8,319 clerks and 4,192 subordinate staff members.

During the year under review, industrial relations between the Bank and its employees were harmonious except for two regions. During June-July last, some local unions in Uttar Pradesh and Rajasthan regions not belonging to the majority union, viz, All India Bank of Baroda Employees' Federation, started agitations against the Bank's general policy of transferring officers from one State to another. These agitations disrupted for a short while the working of the branches in these regions, apart from affecting the branch expansion programme for the year.

ACKNOWLEDGEMENT

In the course of the year, Dr. D. N. Saxena was nominated as the Government Director in place of Shri A. K. Dutt. In December last the interim Board was replaced by the full-fledged Board of Directors. From the interim Board, only Dr. D. K. Desai and Dr. D. N. Saxena continue as members of the new Board. We would like to place on record our appreciation of the services rendered to the Bank by the former Directors, Shri H. N. Bhargava, Shri Bhuvanesh Chaturvedi, Shri H. A. Mohite, Dr. C. D. Datey and Shri A. K. Dutt.

We also appreciate the efficient services of all Executives and record with pleasure the hard and diligent work put in by the staff members at all levels.

For and on behalf of the Board of Directors

This factory would lose out big on materials handling time and space...

but for the tailor-made traction batteries from world renowned CHLORIDE

Chloride India are the unrivalled leaders in battery making. They have the finest trained experts, advanced research and development, the longest experience—all backed by the latest know-how of the world-wide, world renowned Chloride Group. This gives Chloride all it takes to bring you not only traction batteries tailor-made to meet specific requirements—but with built-in quality none can beat. And this same unrivalled battery technology is playing a major role in India, providing battery power for industry, agriculture, defence, transport and communication.

Overland, air or sea—
CHLORIDE know batteries best

The CHLORIDE brands: Exide,
Dagenite, Index, Chloride.

REVIEW OF AGRICULTURE

This year 13 million more will share pot-luck with us

so we have some down to earth
ideas cooking

The thought of 13 million more for dinner every year puts food on your mind. Even a small helping for each means millions of tonnes of food grain. How are you going to dish it out? By prodding the earth to produce more. That brings us to fertilizers. One tonne on 30 hectares means an extra 10 tonne production of food grain.

We don't make the fertilizers but we play a major role in manufacturing and installing fertilizer plants. That's one industry we've thought of in a big way. The largest evaporator crystallizer in India was made by us for a fertilizer complex. Other jobs include fabrication of all kinds of process plant and equipment for the chemical industry. In fact we design, manufacture and instal plant and machinery for every vital industry.

Serving major industries is demanding work. We do it by building up our engineering expertise. By adapting foreign technology. By developing manufacturing techniques. And by encouraging technical talent. After 30 years, we have over 10,000 engineers, technicians, computer programmers, skilled welders and workers and other specialised personnel in our associate and subsidiary companies and in our network of offices all over India.

That Was the Stability That Was

THE official summary of the Congress Party's manifesto for the state assembly elections in 1972 had opened with the following paragraphs:

"The progress of our country demands a strong and stable government not only at the Centre but equally strong and stable governments in the states. At present there is no other political party which can provide such governments at the Centre and in the states..."

"The Congress, therefore, appeals once again to the people to vote for Congress candidates in the states which are going to the polls and thus ensure a co-operative and harmonious functioning of the Indian federal system in order to complete our social revolution through democratic methods."

The same document had claimed later on, after references to the liberation of Bangladesh, to "the inspiring leadership of the Prime Minister, Mrs Indira Gandhi", to the numerous amendments of the Constitution and other intrepid actions of the Congress government at the Centre, all intended to cut various vested interests down to size:

"The emergence of a strong and stable Central government enabled the nation to face external challenges. The need now is for strong and stable governments in the states so that the Centre and the states can together carry the war against poverty and the drive towards 'purna arthik swaraj' to a successful conclusion."

The people of India, it is history now, took the Congress at its word and voted it to power with massive majorities in the state assemblies. But somewhere something went awry. The fate of the 'war against poverty' was sealed by the agricultural failures, the industrial stagnation, the accelerated progression of unemployment and the wanton economic and financial mismanagement which has yielded the highest ever rate of inflation since Independence. As for the drive towards 'purna arthik swaraj', an embarrassed silence is in order as the government anxiously opens the doors wider to foreign private capital and sets about frantically looking for all the aid it can get, including aid to finance food imports. The worst let-down, however, has been in regard to the one claim of the Congress which had appeared the most plausible — the claim to provide strong and stable governments in the states. The size of the majority won by the party in most of the states appeared to suggest that at least this claim of the party manifesto would be fulfilled.

But even that has not happened. In Andhra, Orissa and Uttar Pradesh, Congress party governments have already had to yield place to President's Rule. In Bihar and Gujarat, Congress governments with absolutely safe majorities in the assemblies have been pushed out of office. And one or the other of the above fates awaits Congress ministries in many of the remaining states. Surely, such precipitate collapse of the appearance of stability created by the elections less than a year-and-a-half ago calls for some questioning of the basis of the Congress party's success in the elections.

The Prime Minister's personal popularity, it is accepted all round, played a crucial part in the Congress triumph in the state elections. The most important factor underpinning this popularity was, of course, the projection of policies which promised all things to all people. Political commentators had at that time described this impressively as the revival of the 'Nehruvian consensus'. After the elections this supposed consensus has been translated into a series of populist measures which have, for instance, made it possible for the government to pay high prices to the farmers with surpluses to sell and charge relatively low price to a section of the urban population, albeit at the cost of Rs 150 crores or so of budgetary subsidy per year, or to allow producers and sellers of the necessities of life to profiteer without let or hindrance even as the poor are held just back from the brink of starvation by doles disguised as wage payments under the drought relief programmes and the numerous special employment schemes.

The impact of these policies in terms of burgeoning deficit spending by the government, spiralling prices and erosion of resources available for financing development has been obvious enough. At the same time, to the leadership of the Congress, these policies have appeared as a substitute for building a party organisation reaching down to the grass-roots levels, the absence of which enormously facilitates its control over the state parties. Thus after last year's elections most state Congress parties meekly accepted the Prime Minister's nominees as chief ministers. Now that some of these have fallen, they will no doubt be followed by fresh nominees of the Prime Minister.

From the Congress party's point of view the most hopeful sign is that it still faces no serious challenge from any of the other parties. But from a more general viewpoint, this only suggests that the best of all possible worlds within the present political set-up consists of a sequence of Kedar Pandey's being succeeded by Ghaffoor Khans, and both being eventually succeeded by Presi-

The Big Two Strange Parallels?

IF the Cuban missile crisis in 1962 was a forceful indication to the Soviet Union of the limits beyond which it could not transgress the susceptibilities of the United States, Czechoslovakia in 1968 finally indicated the bounds within which the Soviet Union would brook no external interference or even influence. It has taken more than two decades and several such episodes for the big two to work out, with some semblance of clarity, the demarcating lines of their power and interest. And while a wide range of economic and political interests have brought the two closer to each other, the nuclear 'balance of terror' has undoubtedly added more than a touch of clarity to the need for mutual accommodation.

It is therefore, perhaps, no coincidence that the personage who has been exuding *bonhomie* in America and bringing good cheer to its beleaguered President is none other than the 'hard-liner' who is reputed to have insisted on sending in Soviet and other Warsaw Pact troops into Czechoslovakia to undo Dubcek and his deviationists. The consideration and tenderness with which the American and Soviet leaderships look after each other have so grown that there is not even any further Khrushchevian talk of peaceful co-existence and competition between the socialist and capitalist systems. The talk is now of exchange of goods and services, of mutual benefits, of goodwill towards all mankind, of collaboration. This movement of the big two towards each other has gathered momentum over the last few years also because of the growing economic power and political influence of Western Europe and Japan. Additionally, the moves towards unity in Western Europe in the shape of the EEC cause concern both in Washington and Moscow. China's politically organised strength along with its increasing nuclear armory have made it possible for Washington to hint at the possibility of US-Chinese collusion against the Soviet Union, thus making Moscow even more keenly aware of the need for closer co-operation with Washington.

But this preoccupation in Washington and in Moscow with seeking the goodwill of the other major centre of power may also be seen as a reflection of the inability of both the American and the Soviet political systems to cope competently with domestic demands and pressures. Watergate is only the most dramatic and obvious symptom of the wider corruption of American political

organisations. But if Nixon has his Watergate, Brezhnev has to keep a step ahead of his Shelest and Voronovs within the inner sanctum of the CPSU. If the American people want more honesty in public life, the Soviet people are beginning to demand a more open polity and a more consumer-oriented economy.

The inadequacy of the bureaucracy which Brezhnev heads is most sharply apparent in the frequent Soviet agricultural failures. For decades, the CPSU leadership has gone through the motions of transforming the basis of Soviet agriculture by changing from state farms to collectives to a mixture of private plots meshed together with state or collective farming, without much success. All the while, the stolid *apparatchik* has maintained his bureaucratic hold over whatever the pattern of farming, resulting in a persistently low Soviet agricultural output. No Soviet leadership has dared to indulge in an anti-bureaucratic revolution, as distinct from a purge of a section of the bureaucracy suspected of being 'disloyal'. The latest in the line of Politburo members who have been demoted for, among other reasons, their association with agricultural policies, was Voronov, last April, along with Shelest, who was said to be nurturing nationalistic tendencies through his position as Communist party chief in the Ukraine. Both were also noted to be opposed to increasing co-operation with the West. These demotions do not by any means represent a major upheaval within the party-bureaucracy. The Soviet bureaucracy can hardly attempt a serious internal shake-up without endangering its own power position.

In all this there are seemingly strange, but significant, parallels with what is happening within the US political apparatus. The Watergate affair, for all its high drama, can hardly be expected to lead to any sea-change in the working of American political institutions. Even if John Dean's revelations prove Nixon's complicity in the affair, the caucus of senators holding the hearing and all the other connected caucuses which control the House of Representatives, the Republican as well as Democratic parties, the Pentagon, the CIA, the industrial conglomerates, the farm lobbies, would be most reluctant to get rid of Nixon. A summary dismissal of the President of the United States would bring into serious disrepute, if not endanger, all those cabals who together make up the US political-economic establishment. Yet, while both Nixon and Brezhnev are not in imminent danger of being overthrown, they are acting under strong domestic pressures. Due to the inadequacies of their respective political pro-

cesses, the Soviet Union requires millions of tons of American wheat and fertiliser, technological knowhow and dollar credits, and the United States needs to reaffirm, with Soviet help, that despite all its inner and innate corruption it remains a power in the wider world. Nixon and Brezhnev must seek to satisfy these needs and urges — while denying other urgent needs — so as to help preserve the establishments they represent and epitomise.

Deficit Financing

Why This Coyness?

THE Central Government's budget for 1972-73 had anticipated an overall budgetary deficit of Rs 251 crores, which the Finance Minister had at that time considered "a reasonably safe level". In the same budget speech he had also emphasised that "deficit financing must be kept within reasonable proportions". The revised estimates, presented along with the latest budget, placed the budgetary deficit for 1972-73 at Rs 550 crores, exclusive of Rs 421 crores given to the state governments as assistance for clearing their overdrafts with the Reserve Bank. The total deficit in 1972-73 thus worked out to Rs 971 crores. Reports in the newspapers now talk of an actual budgetary deficit in 1972-73 ranging all the way from Rs 800 crores to Rs 1,400 crores. The Finance Ministry itself has, however, put out a figure of Rs 848 crores, suggesting a slight reduction in the budgetary deficit over the revised estimate.

As is well known, the budgetary concept of deficit is a very narrow one. In respect of the Central Government, it comprises (i) increase in treasury bills sold to the Reserve Bank, and (ii) withdrawal from cash balances. In the normal course, the public does not come to know about changes in either till the budget for the next year is released. The Reserve Bank's weekly statement of affairs could provide the requisite data, but, despite all the changes that have taken place in the economy, the Reserve Bank has not cared to effect any change in the format of its statement of assets and liabilities since its inception in 1935. For instance, Government of India rupee securities now form a preponderant part of the total assets of the Bank's Issue Department. Yet there is not even a simple break-up of these as between *ad hoc* treasury bills, other treasury bills and dated securities. Similarly, some details could be given also about the item 'investment' on the assets side of the statement for the Banking Department. The item as it is presented now is a conglomerate of all in-

vestments by the Reserve Bank — in the securities of the government and of financial institutions alike. In the absence of the details, it is almost impossible to work out separately the extent of the government's indebtedness to the Reserve Bank against treasury bills and against dated securities.

One may nevertheless try to derive the data on these aspects of the budgetary deficit with some considerable effort. According to a statement on Government of India treasury bills published in the Reserve Bank's monthly *Bulletin*, the outstanding treasury bills sold to the Reserve Bank rose by as much as Rs 936 crores between March 31, 1972 and March 31, 1973 (*RBI Bulletin*, April 1973, p 660). If the Finance Ministry's latest figure of budgetary deficit in 1972-73 of Rs 848 crores is correct, the cash balances of the Central Government with the Reserve Bank would have increased by Rs 98 crores on the last day of 1972-73. However, on the basis of the last Friday figures published by the RBI, the government's cash balances should have declined by as much as Rs 160 crores during 1972-73. Even so, the government's figure of the budgetary deficit is a plausible one, because of the large adjustments that take place in the government's finances in the last week of March every year. According to the April 1973 issue of the *RBI Bulletin*, there was an increase of Rs 321 crores in the outstandings of treasury bills issued to the Reserve Bank in the last week of March 1973, of which an increase of Rs 150 crores took place on the last day of the month. This may explain the difference of Rs 248 crores between the last Friday figures of the Reserve Bank and that derived from the figure of budgetary deficit released by the government.

In a sense these calculations are not very relevant, since the budgetary concept of the deficit is a restricted one and is not very useful from the point of view of economic analysis. To get a correct idea of the government's dependence on the created funds of the country's central bank three more items have to be considered: (i) the Reserve Bank's subscription to dated securities; (ii) its acquisition of treasury bills by discounting them from the market; and (iii) the increase in its holdings of rupee coins, which are also a form of the government's liabilities.

There is, in addition, also the small amount of subsidiary coins. Any injection of these coins, though it involves no expansion of money supply because it is done against RBI notes or rupee notes, does amount to extension of additional credit to the government (*RBI Bulletin*, November 1964, pp 1378-9).

The increase in these coins in 1972-73 can be estimated from the Explanatory Memorandum on the Central Budget for 1973-74. It would work out to about Rs 12 crores. On the other hand, surprisingly, the Reserve Bank data on estimated circulation of small coins show no increase at all (*RBI Bulletin*, April 1973, p 651). In any case, the current practice is to treat the putting into circulation of these coins as a commercial proposition. Thus, "the expenditure on the purchase and acquisition of the metal for coinage is charged to capital and the difference between the face value and the metallic content of the coins put into circulation is adjusted as profit" (Explanatory Memorandum, p 19). It is not taken as a financing item at all. Neither does it enter as part of Reserve Bank credit to government. The only excuse for tolerating this procedure seems to be that the amount involved is small.

To return to the other three items of Reserve Bank credit to the Central Government mentioned above, the total of these items on the basis of the last Friday figures would work out to about Rs 360 crores in 1972-73 as against Rs 234 crores in 1971-72. In the 1971-72 figures there was some book adjustment to the tune of about Rs 175 crores (*Economic Survey*, 1972-73, pp 55 and 129). Inclusive of these, the Reserve Bank's net credit to the Central Government in 1972-73 works out to Rs 1,204 crores against Rs 500 crores in 1971-72. Even if the assistance of Rs 421 crores given to the state governments to clear their overdrafts with the Reserve Bank are excluded, the Central Government's deficit in 1972-73, at Rs 783 crores, would be considerably higher than that in 1971-72.

Deficit spending has continued apace in the current year. In the first three months of the current financial year, between the last Friday of March and June 8, there has been an increase of Rs 630 crores in the Reserve Bank's credit to the government as against an increase of Rs 545 crores in the corresponding period of 1972-73.

The consequences of profligacy on this spectacular scale are there for all to see and have been commented on in these columns. Here a different issue may be raised. The Reserve Bank, if it cannot exercise a restraining influence on the government's recourse to created money, has at least the responsibility to publish accurate data on the government's deficit spending. To discharge this responsibility it needs to take a fresh look at the presentation of these data in its publications. For instance, it does not publish monetary data on final March 31 basis. And it still does

not disclose the nature of the so-called 'book adjustment' effected in 1971-72 to which there is reference in the *Economic Survey* for 1972-73. Lastly, the Bank regularly publishes notes examining important economic developments and government policies — covering, for instance, industrial policy, capital issues control, index numbers of agricultural output, and the like. The subject of deficit financing by the government is particularly relevant to the Reserve Bank's responsibilities as the central bank. A regular annual review of deficit financing by the Reserve Bank is, therefore, overdue.

Industrial Economics

Stop-Go Policies Fail

PRESIDENT Nixon's decision to clamp, once more, a price freeze in the United States illustrates rather aptly the dilemma of price and monetary policy in industrial economies. The adoption of the standard Keynesian prescriptions makes it easy to push such an economy full speed on the path of growth till as long as latent capacity is built into the system. Short of the deficiencies which stem from social arrangements, full employment comes within what can be described as asymptotic reach. But the process brings in its train intimations of instability; the economy is heated up in no time; in the absence of a completely interventionist set-up, it becomes difficult to work out the little, local adjustments necessary to take care of excess demands showing up here and there. As the point of full employment draws near, the demand for specific skills meets headlong with supply inelasticities, and prices rise across a broad front. Since meanwhile the pitch of expectations has been queered, the price rise in one sector fits snugly into the inflationary trends emerging from the other sectors; the entire economy is in danger of being overwhelmed.

This process, during which real advance is almost obliterated by fiscal and monetary expansion, is of course self-defeating; the consequences are aggravated if the rise in the price level in the world market is substantially less than the increase in the domestic price level. The United States, in addition, continues to be afflicted by its international commitments — and misadventures —, leading to a further strain on its real resources. Hemmed in on all sides, the Republican administration, going against its inherited philosophy as well as its ingrained prejudices, did, in mid-1971, what till then was considered

as out-and-out heresy, namely, a freeze on prices accompanied by a freeze on wages. Phase One was succeeded by Phase Two, which saw the blanket ban on prices and wages being supplanted by a regulated system of adjustments. A few months ago, basking in the glory of his smashing re-election triumph, President Nixon felt that the time had arrived for the unveiling of Phase Three, which was more or less synonymous with a return to unfettered market adjustments. This attempted homage to nostalgia has not worked: the annual ratio of increase in prices in recent weeks in the wake of the relaxation of controls surpassed even the rate that prevailed in the late 1940s. The American administration has therefore been forced into ordering the current Phase Four, marked by a procedure of stop-go which was the stock-in-trade of several West European countries in the 1960s during their battle against inflation.

The rationale for applying rigid controls is that an economic system, which has gone wayward, can be compulsorily retrained into adjusting itself to a scaled-down norm of expectations through this device; the people can be told to cut back their consumption, restrain their demand for inventories, and add to the volume of savings; once the lessons get implanted and are conformed to, the regulatory measures may then be withdrawn. Quite evidently, the learning curve, here runs the danger of developing a kink. There is at least one theory of consumption behaviour which suggests that any sudden increase in income leads to the emergence of a propensity to consume even greater than unity; whenever an individual is persuaded to believe that the shift in his income level is of a temporary nature, his attitude towards such income is likely to be different from that where the rise in income is slowly grafted into the system. With a windfall income, the tendency is often to spend it wholly; in certain instances, a sum even greater than the additional income accruing is frittered as a consequence of such a psychology of windfalls. A similar phenomenon could also happen with a nation which deliberately refrains from adding to its income and consumption for a while. The latent forces which get built into the psychological process ferment inside; as soon as the stoppers are released, there is a great gushing out of consumption desires. In case the fiscal and monetary instruments are so deployed that few restraints operate on

such outbursts of consumption, the inevitable outcome is an intensification of demand all along the line. If one were to take a five-year period, the first three years of which were featured by controls over incomes and prices, while the subsequent two years were years of unbridled liberalism, the average annual increase in demand and prices might well then turn out to be even greater than what would have ensued in case no restraints were in vogue at any time. This behaviouristic phenomenon has gradually made converts of most economists; for their own survival, the politicians too will have to imbibe its lesson. There is, of course, an even broader lesson to be derived from all this, namely, that it is difficult to manage a highly sophisticated industrial economy approaching full employment on the basis of only part-time, half-way measures. Controls are a delicate mechanism; you cannot turn them on and off depending upon your whims. If, for structural and other reasons, you arrive at the conclusion that the mechanism of the free market cannot deliver the goods, the alternative is perhaps a total conversion to a regime of controls: the juxtaposition of the two, and periodic switches of policy from one to the other, might cause more overall harm than good.

Fertilisers

Unused Levers

WHEN the Sindri fertiliser plant came to be set up in 1951, it was considered one of the largest ammonia-based fertiliser plants in the world (capacity about 270 tonnes/day ammonia). Since then the country has come a long way in the fertiliser field and the economy offered by centrifugal compressors has now made it possible to have large single stream plants with a capacity of 1,100 tonnes/day (e.g. the Southern Petrochemicals plant, which is under construction at Tuticorin). Also, considerable skills have been built up within the country and except for the basic process package, a limited amount of checking and advice and import of some proprietary and critical equipment a fertiliser plant can now be built on the basis of indigenous expertise and facilities.

The country, however, continues to depend on considerable imports of fertilisers — in terms of nutrient content, about 800,000 tonnes of nitrogenous and about 210,000 tonnes of phosphatic fertilisers. It is perhaps not very well known that at this level of imports,

India is the largest buyer of fertilisers in the world. So also it is the largest purchaser of fertiliser plant and machinery in the world and, in course of time, it would also be one of the largest producers of fertilisers.

Given these facts, one would expect India to have considerable leverage, be it in purchase of equipment or of fertilisers themselves. As things are, however, this does not seem to be the case. India has at present an operational capacity of about 15 mn tonnes of nitrogenous fertilisers (in terms of N) from 15 plants. Eleven new and three expansion schemes are at various stages of construction with a total additional capacity of 2.2 mn tonnes. When all this capacity materialises, the total fertiliser capacity will be 3.7 mn tonnes. But even at that level, the demand estimate of 5.2 mn tonnes for the Fifth Plan indicate a shortfall of over 1.5 mn tonnes of fertilisers a year. Even for such a potentially large buyer, fertilisers are not all that easy to procure at the moment and prices are also firming up. A major reason for this is the emerging demand for fertilisers from other developing countries, particularly in Africa. Our failure to exploit our advantage in the market for fertiliser equipment must be attributed to the fact that in our anxiety to hit targets, indigenous skills and expertise built up over a number of years have been thrown to the winds and we are on a shopping spree for turn-key contracts.

This is only one side of the story. The other relates to the continued absence of a clear-cut policy on feedstock, the high capital cost of domestic equipment, which is about 60 to 90 per cent more expensive than imported equipment, and the pricing of both feedstock and finished output. Some *ad hoc* decisions have been taken but there has been a lack of follow-up measures. For example, the feedstock problem of the fertiliser industry is tied to the question of its pricing and in the absence of a clear policy in this respect, approval of many fertiliser projects has been delayed.

Targets of fertiliser consumption nonetheless continue to be set at over-optimistic levels. Instead of these point-less exercises in target-setting, there are other problems which should concern the government — uncertainty with regard to feedstock (Trombay is a classic example), high capital cost of equipment, statutory price controls on the one hand and poor returns on capital employed on the other (this is particularly true of the Fertiliser Corporation of India) and, finally, the continued dependence on turn-key contracts.

Maharashtra

Politics of an Irrigation Project

Our Maharashtra Correspondent writes:

THE Khujagaon flow irrigation project in the Sangli district of Maharashtra was approved by the Planning Commission in 1965 and work on it began the next year. Yet so far the project has made little progress. The reason is that the project has not found favour with Vasant Dada Patil, former President of the Maharashtra Pradesh Congress Committee and now Minister for Irrigation and Power in the state government. Vasant Dada Patil wants to substitute the Khujagaon scheme with a lift irrigation project located at Nandoli, also in Sangli district. Their respective protagonists have put together an impressive array of vital statistics in support of the two projects, both of which will cost well over Rs 50 crores each and are expected to irrigate about 2.5 lakh acres. But more interesting than these statistics is the manner in which the claims of the two projects are being pressed forward and the role that the controversy is playing in the intra-party politics of the Congress in Maharashtra.

The Khujagaon project has the support of the co-operative sugar factories and big bagaitdars led by R A Patil, former Minister for Industries and sitting MLA, Ratnappa Kumbhar, prominent Congress leader and co-operative sugar overlord from Kolhapur, and other chairmen of co-operative sugar factories from Satara and Kolhapur like Jaywant-rao Bhosale and Tatyasaheb Kore. This is understandable because the Khujagaon project will double the area under sugarcane around the Walva, Krishna, Panchganga and Warna sugar factories. In course of time this will enable these sugar co-operatives to enlarge their crushing capacities still further. The Khujagaon project will also bring large benefits to the big bagaitdars in the area who, it is an open secret now, have perfected the art of stealing water on a large scale from government irrigation projects.

The supporters of the Khujagaon project openly allege that in bringing forth the Nandoli lift irrigation scheme, the state Irrigation and Power Minister is promoting the interests of the big manufacturers of electric pumps, engines, cement pipes and other equipment. The protagonists of the Nandoli project point out, among other things, that the Khujagaon project, with a "dead water storage" of 52 TMC, which will not be

available for use at all, will weaken Maharashtra's case in the Krishna river water dispute.

Feelings evidently run high in the dispute. The supporters of the Khujagaon project talk in terms of "shedding blood" to push the project through. Their opponents have also declared their firm resolve to sacrifice "any number of heads" to secure the acceptance of the Nandoli scheme. The supporters of Khujagaon have recently held conferences and public meetings in the region to put pressure on the state government. They also sponsored special supplements in Poona newspapers on the occasion of a conference held on June 17 in the premises of the Walwa co-operative sugar factory, controlled by R A Patil. The conference was attended by 15,000 people and 200 trucks of the four co-operative sugar factories referred to above were reportedly used for transporting people from their villages to the venue of the conference. R A Patil and Ratnappa Kumbhar were the main men behind the show. The finances for the conference and for the newspaper supplements reportedly came mainly from the four sugar co-operatives. The supporters of the Nandoli lift irrigation scheme have also formed an action committee consisting of MLAs from Sangli and other Congressmen.

Chief Minister V P Naik has taken a non-committal stand on the controversy. He has appointed a sub-committee of the Cabinet to examine the Nandoli scheme put forward by Vasant Dada Patil. According to Naik, even though the Khujagaon scheme had been approved by the Planning Commission, it was "no crime" to examine the alternative proposal. Further, he has let it be known that it might take a good deal of time for the cabinet sub-committee to give its verdict. In the meanwhile, work on the Khujagaon project will no doubt remain suspended. All this has irked R A Patil and Ratnappa Kumbhar who had stood by Naik in 1971 when he had faced a threat to his position from Shankarrao Chavan and Vasant Dada Patil. Barring a few members like Y J Mohite, Minister for Co-operation, most of the members of the cabinet sub-committee are the Chief Minister's supporters. Naik will thus be able to influence the sub-committee's decision in the direction politically most suitable to him. For the moment, he will keep the controversy simmering because it keeps his rival, Vasant Dada Patil, engaged in a fight with R A Patil and Ratnappa Kumbhar. The split in the party and among party legislators in three districts of southern Maharashtra suits him very much politically.

LETTERS TO EDITOR

Organising the Landless in Shahada

IN the March 10 issue (pp 501-4), PB has given a very interesting account of the organisational work done in Shahada. It shows quite clearly, and beyond any measure of doubt, the intolerable oppression in the countryside and how easy it is to organise the rural poor.

But on analysing this article in detail, one finds it full of political errors and contradictions. Take the very heading: "Organising the Landless in Shahada" — but organising for what? Increased wages, land, revolution — what is it? PB says organising for land redistribution is essentially petty bourgeois and as for the question of revolution there is only a passing reference to the raising of political consciousness when he says "political education is necessary..." and "...it can be done". Why then was it not done, and if it was done why not give us the benefit of the experience? Surely the experience of connecting the economic to the political struggle is of greater significance than

a mere report on organising the peasantry, of which there are hundreds of examples from practically all the political parties.

So much for the organisational aspects; now let us consider the major political points made. Firstly, while referring to the two forms of peasant rebellions PB calls them "social banditry and sporadic riots". This certainly is a creative application of bourgeois terminology to the just reaction of the peasantry against their inhumane oppressors. However, let us not dwell on this point any longer, nor on the very next sentence which refers to some mysterious "failures" (surely he did not expect the movement to achieve political power), but let us consider the very failures themselves. He says that these failures were due to the "objective conditions of peasant life — their scattered population, their heterogeneity, their isolated existence, their role in the process of production, etc". But in the very

next sentence PB contradicts himself by saying that "the whole situation" changed when the peasantry found a leadership. Surely PB does not mean that the leadership was able to change the 'objective conditions' mentioned above and so turn the failures into success. So the failure, as PB admits, was not due to the "objective conditions" but due to the objective factor of lack of correct leadership.

Marxist terminology is very precise and should be understood before being used. Take, for example, the term "independent young radicals" utilised by PB. What does this term "independent" mean? Independent of whom or what? Independent of political parties? Or is he referring to individuals with a progressed independent political line? Again, this is not made clear. In a class society such terms as independent, neutral, non-aligned, have no place. Either you are for the people or against them. Such terms are normally used by the bourgeoisie to confuse the people.

Then PB goes on to say that a "united front" was formed between these young radicals and certain other groups. Though sounding very impressive he does not seem to understand that a "united front" really means. A united front means an alliance of classes and does not mean a few individuals uniting. A united front involves organisations forming an alliance, by means of which the masses of people associated with these organisations drop their differences to fight a common enemy. A united front cannot be formed by some "young radicals", a few elements of the Sarvodaya movement and a peasant union, without any of them having significant mass base.

PB has briefly touched the question of capitalist development in agriculture in the particular area of Shahada. He has given numerous figures on mechanisation and the number of landless labourers and vague figures on landholdings, degree of commodity production in the market, amount and nature of reinvestment of the surplus and the degree of industrialisation. What is more surprising is that after such an incomplete economic analysis of one small corner of one district of one of the states of India, PB is able to "call for a rough re-examination of the left parties' analyses, programmes and policies". Shahada is not India. And if everyone is to generalise on the basis of his particular experience, we would end up with parties with different programmes in every taluka of India. I would suggest that PB first re-examine some of the points in his own article before bother-

ing about the programmes of other parties. Let us help him.

First of all, there appears to be some confusion on the question of the rich peasant and the kulak. The fact that they are not one and the same is, I think, realised by PB as he says at the very start that "a small section of the richer middle peasants, who have close ties with the kulak leaders have also gradually emerged as rich peasants". This being so, during the one year of the movement, covered in the five "phases", the concentration of the attack appears to have been against the kulaks — in fact there is no mention of the movement having fought the rich peasant. But then, suddenly in a fit of anger, he says that the rich peasant is the principal enemy. Why then was one year spent fighting some one other than the main enemy? This I cannot understand.

Perhaps, it may be of some help if we clarify the nature of the rich peasant and that of the kulak. The rich peasant as a rule possesses comparatively abundant means of production and liquid capital, engages in labour himself, but regularly relies upon exploitation for a part, or the major part, of his income. The kulak is the rural bourgeoisie. There is a vast difference between the two. Perhaps in the light of these facts it may be worth re-analysing whether it is the rich peasant or the kulak who is the principal enemy. Also, the rich peasantry is a specific class, and its class nature does not change from place to place; so the rich peasant of Shahada is no different from the rich peasant of, say, Bengal or any other part of India. And in no case will he constitute the principal enemy.

PB also says that "the big landowners are thus no longer semi-feudal landlords..." and implies that they are capitalists. A little later PB says that the workers have no fixed hours of work, no holidays at all, are not paid when the weather is bad, etc. Do these conditions exist under capitalist wage labour relations? The so-called wage labour that PB talks about is in fact not free wage labour but semi-free labour — labourers who are enslaved and exploited in other ways besides that of exploitation of their labour power. Hence, even though the so-called kulaks produce material for the market and employ wage labourers they cannot be classified as capitalist farmers as their mode of exploitation employs feudal methods — and therefore we can, in fact, call them semi-feudal landlords. (The cultural aspects have not even been considered. These should not be ignored.)

Finally, PB makes the most phenomenal statement of all: "the demand 'Land for the landless'... is essentially petty bourgeois in character and is justified on tactical grounds alone". But what is wrong with petty bourgeois demands and what is wrong with making such demands on tactical grounds? So long as the petty bourgeoisie are included in the alliance of progressive forces against the enemy we must invariably use petty bourgeois demands. Of course, organising the landless on the question of wages is more significant, but PB himself has mentioned how successful the effort to organise the landless on the very demand of 'land for the landless' has been (see phases 1 and 4 mentioned in the article). PB is confusing tactics with strategy. We must utilise all progressive demands that are closest to the wishes of the people and not only demands we fancy.

A number of issues have been raised in his article and I would request the author to reply and explain them. I am, to say the least, confused, and I am sure so are many others.

KG

Bombay

Vande Mataram

THIS is with regard to A G Noorani's documented and persuasive article: "Vande Mataram: A Historical Lesson" (June 9, 1973, pp 1039-43).

The attitude of the leadership of the Congress party on the communal question reminds me of the Puritan attitude towards sex in Freudian analysis. Communalism according to the Congress leadership is a dirty word, and this pushes into the sub-conscious the fact that communalism and nationalism are two sides of the same coin. A little self-introspection would reveal to Hindus the reason for the tremendous appeal of Vande Mataram to them. It seems to me, however, that the denial of such symbols of communal appeal is synonymous with the denial of the creative role of the libido in the progress of civilisation. Unconscious repression of the libido results in a truncated personality; conscious awareness of its role makes it possible to harness its energies for a creative life. Awareness and recognition of the communal reality by the leadership in power would perhaps enable a more imaginative handling of the many problems of national integration. It should not be a question of attempts to destroy communalism — whether of the majority community or

the minority community — as to tap the reservoir of creative energy in communal affections and find mechanisms for transforming this for purposes of nation-building. But the Congress party throughout its history has refused to concede to communal reality. Communalism is seen as a pathological condition of the body politic which would vanish with economic and social development. Thus a particular frame-of-reference to the communal question has been a mental block preventing the creative solution of the many problems posed by it.

No matter what the protestations of the Congress administration and leadership regarding its secular character and sympathies for the Muslim population, its ham-handed treatment of issues affecting the Muslim community is a matter of record, as anyone who would take the trouble of reading the various riot reports would concede. Moreover, considerations about Muslim vote banks have been persuasive enough for the Congress to pursue the most Machiavellian electoral strategies whenever it found itself in difficulty as in Kerala. Thus the reality of both the majority and the minority communal interests has always narrowed the degree of freedom of the Congress leadership on the communal question. Indeed, the continual denial of the communal reality — facts notwithstanding — has merely deepened the distrust and increased the insecurity of the Muslim community in this country. It is not surprising, therefore, that 25 years of existence of the secular state have not made possible any consensus between the two communities on issues such as the singing of Vande Mataram. Nor is it surprising that Muslim communal parties such as the Ittehad-ul-Muslimeen or the Muslim League which seemed to have been completely crushed at the time of partition, have now been given a vigorous new lease of life.

RAJNA DUTTA

Delhi

II

MAY I make a few observations on A G Noorani's article "Vande Mataram: A Historical Lesson" (June 9).

Noorani believes that Bankimchandra "was positively and fiercely anti-Muslim" and that "Vande Mataram" is essentially a religious homage to the country conceived as a deity. And it is to this form of worship that the Muslims object. Noorani further suggests that the context in which the song was written makes it the more objectionable from the Muslim point of view as the novel, "Ananda Math", in which the

song appears is anti-Muslim. Finally, he says that objection to the adoption of such a sectarian song was expressed by the Muslims as early as 1908 and that the Muslim League which had voiced its objection was till 1937 a believer in Indian nationalism.

It is true that "Ananda Math" deals with the story of a band of sannyasis in revolt against the oppressive rule of the rulers, who were Muslims, and in which they were prepared to lay down their lives. Bankim's is not the only example of an artist using his art in an allegorical vein to criticise his contemporary situation. Novels and premisses in Tsarist Russia or in Bourbon France were often oblique and indirect attacks on their contemporary rulers. Bankim was a government servant writing in the late nineteenth century; to expect him to oppose foreign rule — then British — directly and openly is to expect the incredible. If Bankim was really anti-Muslim as he is made out by Noorani, how would one explain Bankim's fierce championing of the peasants, both Muslims and Hindus against the oppressive treatment meted out to them by Bengali landlords who were in most cases Hindus?

Noorani quotes from R C Majumdar to prove his point that Bankim was anti-Muslim and that his nationalism was Hindu rather than Indian. It is true that Bankim used certain symbols which were Hindu in character in his approach to nationalism. So did Gandhi — Ram-raja, etc. And so did Jinnah. Could one suggest that Gandhiji was also fiercely anti-Muslim? And would Noorani who accepts Majumdar's assessment of Bankim's nationalism concur with Majumdar's assessment that the roots of Pakistan lay in the separatist mentality of the Muslims exemplified as early as the second half of the nineteenth century in the writings and activities of Sir Syed Ahmed Khan? And does Noorani want us to believe that the Muslim

League was a believer in Indian nationalism as late as 1937!

The pertinent question is not whether "Vande Mataram" in its origin is a sectarian song or not, but what role it has played in the national struggle. "Vande Mataram" was used as a rallying cry in Bengal at the time when Curzon partitioned it in 1905. In these rallies both Hindus and Muslims joined. Will Noorani explain why the British banned "Vande Mataram", if it were merely a sectarian cry aimed at the Muslims? Later a number of Hindu and Muslim leaders joined in the singing of "Vande Mataram". Jinnah is also on record for having paid his respects to the "Vande Mataram" as long as he was with the Congress. If Noorani's thesis were to be accepted, then we would have to consider the British to be terribly stupid in cherishing the Magna Carta as a great document in their struggle for freedom in England. Every student of constitutional history knows the Magna Carta as basically a feudal document and, in a sense, reactionary. However, the significance of Magna Carta lies not in its origins nor even in its actual wordings but in the creative role it played after the thirteenth century, particularly in the seventeenth when it was used (though creatively misunderstood!) by the parliamentarians against the oppressive rule of the Stuarts.

By Noorani's logic, we should ban the cry of "Allaha-o-Akbar", which in a certain stage of Indian history was used as a war-cry against the Hindus. By the same logic we should also shut down the Aligarh Muslim University which originated the separatist ideology that led to the vivisection of India. Surely, Noorani may be presumed to understand the difference between the present role of symbols and institutions on the one hand, and their past history on the other.

Calcutta Diary

A M

INDIA, the Prime Minister is reported to have informed an audience in Canada, has no ideology to export. Nothing could be more true. We have not only no ideology to export, but have none for home consumption either. It is usually when there is a spillover of what is produced that the question of exports can be seriously considered. In our case, that possibility has to be ruled out, since we have tackled the problem at its source. We have no ideology: as the Americans say, period.

Is not the malady precisely this? As one looks around, there is no dearth of individuals who love their country, who are honest, who have done, and are doing, magnificent work in their respectable spheres: poets, writers, scientists, technologists, engineers, painters, artisans, agronomists, farmers, workers, teachers. They have a primal passion for their work. They do not belong to the run-of-the-mill category of career-mongers. They are not those who corrupt others and believe in corrupting themselves. These are the quiet ones: no elegies are written about them. On public occasions, these persons are missed out. Because they are not at the centre of the stage, the tendency is to forget their existence wholesale. Because they are honest, they are unable to hold the limelight. If in a crowd of one thousand honest individuals, just one crook smuggles himself in, the chances are that the crook will hog the atmosphere; journalists will write rapid-fire books on the role of the crook, while the good ones will be claimed by oblivion.

The matter has a deeper root. The role of good men, honest men, integrated men, is dissolved in the society we have built for ourselves. Everybody is for zero-cost solutions: the dominant urge is to grab something without paying for it. The honest ones cannot but tell those in power that this urge cuts across elementary scientific principles, and cannot therefore be fulfilled. Such forthright statements merely make them lose their accreditation with the political decision-makers. A variant of Gresham's Law sets in. The good people are weeded out; the skunks and the scoundrels, who will promise the politicians anything, succeed in obtaining access to the levers of power. This is where the state of ideologylessness affects the most. A nation without any

ideology is one without moorings, whose politicians shuffle along in search of immediate, short-run victories. Pragmatism emerges as the major attribute to be cherished and appreciated in men. None can be better pragmatists than the opportunists. Gandhiji, in his own manner, adumbrated the notion that ends and means are indivisible and that morality must be an integral part of the political process. Perhaps the rot started right from there. It is difficult to hide away the sham in Gandhiji's stance, for, in his own political practices, he found it expedient to deviate widely from the morality he preached. He did not mind splicing his stratagems with a liberal mixture of crass opportunism. The manner in which he combined religious superstition with political warfare made a hash of the claim about means and ends; a predilection for G D Birla and the rack-renting landlords went ill with the professed wearing-the-heart-out in the cause of the Harijans and the dumb, poverty-stricken millions.

WORSE THAN HAVING NO IDEOLOGY

The Gandhian pseudo-ideology was in fact much, much worse than not having an ideology at all. It elevated hypocrisy to a level of respectability, from where it is yet to be demoted. That you can preach one thing and do another became a part of the national ethos. Jawaharlal Nehru's style was altogether different, but, in this particular aspect, his long reign following Independence scarcely marked any improvement. His too was a split-level existence: the preaching of socialism was combined with the tolerance of a most virulent form of self-aggrandisement on the part of private entrepreneurs. Nehru's left liberal instincts were non-starters also in the sphere of politics: otherwise, he would have cogitated several times over before agreeing to the dismissal of the Nambudiripad ministry in 1959. It was this wobbly ideological mooring which made it so easy, during his fading years, for elements belonging to the rabid right to capture the commanding heights of the economy.

That state of affairs continues. We are not hemmed in by ideology; there is therefore not the least batting of eyes in taking recourse to indiscriminate populist slogans which, about every-

body knows, are for the birds. A milieu is created where practically anything goes. High falutin' talk of moral challenges and responses co-exists with the worst forms of trading and commercial practices. The devices of socialism are used to conceal nepotisms of a vicious order. The existence of a considerable body of well-intentioned and dedicated technologists and scientists is despoiled by the simultaneous presence of a bunch of hucksters, who rapidly take over the most crucial processes of scientific and economic decision-making, in government as well as outside. We have no ideology; therefore, it is a field day for those with pretensions of ideology. These pretensions, given enough rope, will of course be found out in the long run. But given the state of demoralisation noticed on all sides, it becomes inordinately difficult to wait for the long run. It is an instant world where issues are decided instantly on the basis of instant judgments. In helping to arrive at such judgments, the pretenders have an advantage over the honest ones: the former would claim that they know all the answers to all the questions; the honest ones could never put forth a claim of this nature. In a period of confusion, it thus is inevitable, the imposters have the ear of the politicians sans ideology. They can prove to the satisfaction of the rulers that you can leave things as they are and yet reach your targets: revolution without any involvement of cost will always have a sales appeal, particularly since in contrast, the honest ones can only promise that in the long-run you will have a greater potential for growth and prosperity, but only if in the short period you work hard, abstain from coveting the good things in life and force yourself to decisions which are unpalatable to the time — preference of large masses of the people. Their pervasive lack of faith in anything basic or fundamental persuades our politicians that, the weight of philosophical tracts notwithstanding, there is nothing to compare with the epicurean existence; you might as well adopt the primrose path for yourselves, and let other matters be sorted out in due course on their own.

The Indian predicament — will it be unfair to suggest? — consists of this phenomenon of the saints being overshadowed by the crooks. Where each is for himself or herself, self-righteousness takes over on a large scale. In this exercise of promoting the ego, the

saints lose out; they suffer from enough sensitivity so as not to beat their own drums. The good people therefore remain under cover, the army of the four-flushers monopolises the headlines. If the pervading cynicism has to be pierced, one must begin at the beginning. The meek, who are supposed to be inheriting the earth and currently are not, have to be sought out from the anonymous ranks of the non-descript and appealed to. It is only they who can yet bail out this nation. They

are no water-diviners, no mongers of zero-cost solutions. But at least there will be less outlay on scarce newsprint on their account. And, who knows, they might even turn up with an ideology, an ideology which will be without cosmetics, but which may still provide the catalysis for growth. It will be an old-fashioned ideology, and will consist of only home-spun-truths: such that honesty in its own reward, or that you cannot have something in life without offering anything in return.

in town and countryside. Education and jobs need careful linking, a process which would destroy the fateful quest for BAs. Transport, once it is mass oriented, can solve the problems of mobility, of moving people from their existing homesteads in the countryside to work sites. In the process, a new discipline of work and productivity would evolve — and we would begin to emerge from our man-made mess.

At last, there is acceptance of the fact in usually cautious policy-making circles that we need a new texture for decisions. The context and the value system for these decisions have changed. There must be a break with past practice. This break cannot be brought about by committee operations. Too many contrary forces and vested interests compel a return to the *status quo*. Democratic functioning cannot become a cover for non-functioning. At some point in the hierarchy of democratic power, someone must be entrusted with autocratic power to attempt a breakthrough. And he must not be inhibited by the jackals who in envy and hatred wait to destroy those who are action-inspired.

The reason why an attack is building on Indira Gandhi personally is that she talks a lot of sense but fails to organise the instruments for action. Either she carries through her own brand of a revolution or stops the meddling which makes the present system impotent. Increasingly, the demand for freeing the system of governmental controls and regulations is heard because the free enterprisers feel that the public has lost confidence in Indira Gandhi's capacity to create a viable egalitarian society. This assessment can only be disproved by the formulation of a mass line which works in our conditions.

In Delhi these days only the political morons are worked up about ministerial shuffles and reshuffles. These are meaningless exercises in house-keeping when the house is collapsing. A carefully sketched perspective, with the necessary implementational underpinning, must accompany the politicking. Indeed, all we need is the perspective and the implementation instruments. The ministers are really superfluous. One is as good or as bad as the other. Only rarely does an individual minister change the quality of the thrust.

How delightful it would be if we could speak of quality both at the ministerial level and at the level of economic, political and social perspective.

Those days have passed...

June 25

CAPITAL VIEW

What Is the Perspective?

Romesh Thapar

THESE are uncertain days. From all over the country reports come in of demonstrations, riots, clashes and running fights. The "mob" varies from a bunch of hoodlums to a crowd of anything between 5 and 10 thousand persons. The sparking point always appears irrelevant, unconnected to the passion let loose. If this is the state of public mood recorded by the press, one can imagine the quantum of unrecorded violence and bitterness. The extraordinary patience of the Indian people, developed over centuries of quiet, hopeless suffering, is showing signs of exhaustion.

The politicians and the bureaucrats continue to wonder at the comparative calm over the subcontinent, and at a time when prices seem to have gone berserk. Had it not been for the remarkable work done in the drought-affected areas of Rajasthan, Gujarat, Maharashtra and Andhra — although at phenomenal, inflationary cost — it would not have been possible to hold the situation with the existing police forces and their instruments. The urban areas, which are sullen and explosive, cannot but recognise the work being done in the rural areas. At the poorest levels, divided families tend to take a total view of the bad times — a very different posture from that of the middle classes.

The question is being asked: how long will this general patience persist? There comes a time when someone or the other with the capacity to mobilise nationally, is going to say that we cannot blunder along like this, and he is going to be heard. The surface signs suggest that we have reached this catalytic moment. Indira Gandhi, on her

return from what is being dismissed as a frivolous tour, will have to either head the movement for a new orientation in national policies or face the awful fact that someone else might get going to seize the initiative. To imagine that we are going to jog along as we are is to put faith in astrology.

In its present *status quo* mood, laced with radical frills, what is going to restore the credibility or elan of the GOI? The arrival of food ships from the Soviet Union, the United Kingdom, Australia and Canada? The discovery of vast oil reserves in the Bombay High region? A total *detente* with Pakistan and the opening of trade links? A new economic relationship with the developed world and the wiping out of old debts? The explosion of a nuclear device?

All this is tantamount to putting our faith in acts of God and gimmickry. Cold, calculated decisions have to be taken to conserve the resources of this country and to expand them. We can feed our people if we stop chattering about *kulaks* and pay a proper price to the growers of food. We can clothe our people if we insist that only two or three types of standard cloth will be available and that all finer varieties will be used for export. We can house our people in some dignity if we plan for water, drainage and electricity in carefully designed mud complexes, conserving the limited brick, cement and steel for larger work centres. We can organise the health of our people by organising a basic and very simple medical kit of drugs and aids effective against ninety per cent of the diseases that affect us and capable of being used by averagely intelligent persons

COMPANIES

From Convenience Foods to Heavy Chemicals

Hansavivek

HINDUSTAN LEVER is investigating investments in the core/heavy investment sector and has applied for issue of letters of intent for manufacture of industrial phosphate and caustic soda. This, it is stated, will provide an opportunity to associate more Indian capital in the growth of the company. Of HL's total paid up capital of Rs 1,445 lakhs, as much as Rs 1,229 lakhs is at present held by Unilever. Of the total capital, shares of the value of Rs 204 lakhs were allotted for considerations other than cash and shares of Rs 1,116 lakhs by way of capitalisation of share premium and accumulated profits. The board has recommended issue of further bonus shares on a one-for-six basis by capitalisation of Rs 241 lakhs from the general reserve. The company has produced good results for 1972, with higher sales, better margins and, consequently, bigger profits. Dividend, step-

ped up a point to 16 per cent, finds a better cover. Of the gross total turnover of Rs 14,044 lakhs, detergents and toilet preparations accounted for Rs 8,231 lakhs and edible fats and other foods for Rs 4,341 lakhs — the former showing a 6.8 per cent increase over 1971 and the latter a 7.9 per cent decline. Animal feed, chemicals and other products brought in Rs 1,472 lakhs, 49.1 per cent more than in 1971. Exports were up from Rs 552 lakhs to Rs 882 lakhs.

The directors complain that prices of indigenous soap-making oils and tallow have risen sharply and that only a "substantial price revision" will prevent a situation in which soap can only be made at a loss. Meanwhile, efforts are being made to increase the production of synthetic detergents, following the government's decision to classify this as a core-sector industry and to permit ex-

pansion of capacity in order to relieve growing pressure on oil supplies for soap. The directors also complain that the rigours of price control continued to affect the company's vanaspati business adversely last year and add that increases in prices allowed by government from August last on the basis of the Tariff Commission's recommendations were "very inadequate" and were confined mainly to the West and East zones. The company has developed a process to make vanaspati with high levels of cottonseed oil, thus reducing the demand for groundnut oil which is in short supply. Milk collection was adversely affected by drought conditions. It is stated that price control on baby food has not taken into account increases in the price of milk and other essential ingredients and has, therefore, sharply eroded the viability of this business. The company has decided to stop making convenience foods, as demand for them continued to fall. In the chemicals section, facilities for production of nickel catalyst for hydrogenation of oil have been increased to meet the growing demand. Preparation of other nickel catalysts for industrial hydrogenation of

chemicals based on indigenous know-how has been started. The range of chemicals produced by the fine chemicals unit at Andheri in Bombay has been increased, and several processes developed by the research group have been commissioned. Additional manufacturing units for animal feeds were set up in several places in the country.

KILLICK NIXON earned a lower profit during 1971-72 despite a non-recurring gain of about Rs 3 lakhs on sale of investments. Although sales brought in slightly more, 'other income' by way of commission, remuneration for secretarial and other services, interest and dividends, etc., was considerably lower than in the previous year. Dividend was reduced by 2 points to 9 per cent. Both production and sales of the steel files factory were higher than in the previous year. File steel is now being produced indigenously and there is a restriction on imports, but the Indian steel has been offered at prices higher than the landed cost of imported material. The engineering factory showed improved performance and the prestressing division also fared well. The company is considering an increase in production capacity by the addition of new machine tools and replacement of some of the old ones. Although the furnace division secured a substantial share of the market, its turnover declined owing to raw material and other problems. The drilling division showed significant progress, with turnover rising by about 60 per cent. The steel sales division had a successful year, and the marketing divisions showed improvement in turnover and operating results. The subsidiary companies generally fared better. Killick Slotted Angles, however, experienced lower turnover and profits, allegedly because of the disturbed conditions following the Indo-Pakistan conflict.

Killick Nixon has given guarantees on behalf of subsidiary, associated and erstwhile managed companies for cash credit and/or loan facilities for a maximum amount of Rs 598 lakhs. Included in this figure is a guarantee of Rs 67,50,000 given jointly and severally with Kohinoor Mills and other parties in respect of cash credit facilities to Navjivan Mills. The balance sheet of Navjivan as at the end of 1971 disclosed that the paid-up capital and reserves amounted to Rs 59,39,001 and the accumulated losses amounted to Rs 1,11,39,656 without providing for arrears of depreciation, doubtful debts and advances, etc. It is stated, however, that in view of the improved working of Navjivan, the outcome of the company's guarantee is unlikely to

be adverse.

Notes appended to the accounts reveal that no provision has been made for Rs 6 lakhs out of the doubtful items aggregating to Rs 10 lakhs appearing in the balance sheet. Also, no provision has been made in respect of the difference between the book value and the market value of quoted investments as also for the estimated diminution of Rs 7,50,000 in the value of certain unquoted investments. The directors say that the diminution in the value of quoted investments is not permanent and, therefore, at this stage no provision is necessary. However, there is an amount of Rs 11 lakhs in the reserve for depreciation of investments. Among the miscellaneous expenses is included Rs 52,000, being the cost of advertisement in the souvenirs of a political party.

SHRI AMBICA MILLS earned substantially lower profit in 1972, despite considerable rise in turnover. Even so, dividend was steeped up two points to 20 per cent, which is less than a third covered by earnings. This performance is blamed on the sharp rise in prices of foreign cotton and other cost components coupled with power shortage. Besides, it is stated that exports rose to a new high and, being less remunerative, affected profitability. The latest completed year's profit has been arrived at after providing over Rs 47 lakhs for gratuity, for which no amount had been allocated last year. The company is pursuing its modernisation and replacement programme in the textile division. Modernisation of unit number three at Baroda has been completed by installing 10 ring frames, one set of combing machinery, 32 automatic looms and four dry doublers. In the process house of the number one unit, a new Stenter machine was installed, and the newly-acquired rotary machine commenced production. The company has been able to fulfil the total export obligation against the import of the rotary machine in only one year. An order has been placed for a modern Vaporloc bleaching range which will be the first of its type to be installed in the country. This is expected to be commissioned by the end of the current year. The company's tubes division obtained a slightly higher supply of raw materials despite shortages. The licensed capacity was doubled to 50,000 tonnes per annum. Production increased from 10,691 tonnes to 17,300 tonnes, but profitability was affected by the "prohibitive cost" of imported raw materials. The machinery division has secured an order for a continuous bleaching plant, despite competition from some reputed manufacturers. The cylinder division worked partially last year

owing to lack of adequate supply of LPG sheets from HSL and TISCO. During the past few months, the company has been receiving a steady supply of materials which has enabled it to produce about 7,000 cylinders per month. With the increase in prices of raw materials, representations have been made to IOL through the trade association for a price increase with retrospective effect. The company is participating in a joint-sector project in association with the Andhra Pradesh Industrial Development Corporation for the setting up of a nylon project with a capacity of 2,100 tonnes in Chittoor district of AP. The company's investment will be to the tune of Rs 125 lakhs.

RAYMOND WOOLLEN has heavy commitments for exports of all-wool fabrics, but is not able to fulfil these orders because of shortage of wool. The company says that the export replenishment licences are inadequate to meet the requirements of raw materials, and wool prices have shot up since the beginning of this year. It has approached government for an *ad hoc* licence and also for a subsidy for the loss it will have to incur on export commitments on account of rise in prices of wool. The company expects to complete its expansion scheme by installing 3,600 new worsted spindles during the current year. It is also going ahead with its second modernisation scheme. Machinery of the value of Rs 74 lakhs was received last year, and the balance of the machinery is expected to arrive soon. The sheep and wool research and development project, set up at Dhulia in Maharashtra, is making satisfactory progress. The 947 Polwarth ewes and 18 Merino rams, imported from Australia for Rs 10 lakhs, have acclimatised themselves reasonably well to the farm. Last year, the company stepped up exports from Rs 181 lakhs to Rs 235 lakhs. Of this, woollen and mixed fabrics and readymades accounted for Rs 162 lakhs (Rs 124 lakhs). Production of engineers' files and rasps was better than in the previous year, and over 56 per cent of the output was exported. The subsidiary, Raymond Woollen Mills (Kenya), has taken up a project for further expansion into manufacture of woven and knitted fabrics. Raymond (Mauritius), incorporated in April last year, is expected to go into production early next year. The parent company's proposal for establishing a joint venture in Indonesia for manufacture of engineers' steel files has been approved in principle by the Government of India. Approval of the Indonesian government is expected soon.

FROM OUR CORRESPONDENTS

NEW DELHI

Frantic Search for Food Aid

THE take-over of wholesale trade in wheat has proved to be an even bigger flop than its critics had anticipated. Inevitably, the question has arisen whether trade in rice should now be taken over. From the political standpoint, it may be difficult for the government to formally abandon the take-over programme. But the government appears to have reached the conclusion that a "go slow" has become necessary and even desirable. Even Planning Minister D P Dhar, who till now was a staunch supporter of the policy of taking over the wholesale trade in foodgrains is beginning to wilt under the pressure.

The Food and Agriculture Ministry was never enthusiastic about the take-over scheme. It was practically forced to fall in line when pushed by others, particularly the Planning Minister. The same was true of the Chief Ministers, except the Punjab Chief Minister who thought that with his well established arrangements for procurement the take-over of wholesale trade will create no particular difficulties. Even at that stage, most Chief Ministers had made it clear enough that the question of taking over the trade in rice will have to be examined afresh in the light of the experience with wheat. In this context, it is not without significance that the recent Chief Ministers' conference on price policy for kharif cereals did not care to discuss the take-over of wholesale trade in rice. The Chief Ministers from the rice-producing states appeared to have assumed that, after the miserable performance in wheat the question was not on the agenda any more. They were not wrong.

The issue has not been clinched yet, though. The Planning Minister as well as the Finance Minister still support take-over of the wholesale trade in rice. They take their stand both on economic and political grounds. The Prime Minister is reported to have an open mind on the question. The Food Minister does not favour the proposal. The Minister for Heavy Industry, T A Pai, whose incursion into the affairs of the Food Ministry as the head of the Task Force on procurement was a sad misadventure, is now openly against the extension of the take-over scheme for rice. The

decision taken by the Chief Ministers' conference to treat the procurement price recommended by the Agricultural Prices Commission for paddy as the support price was itself intended to set the stage for an eventual shelving of the take-over scheme. There is, after all, no point in having two sets of prices if there were only one agency making purchases in the market — as would be the case if the wholesale trade were taken over. The idea of a procurement price different from the support price has meaning only when government agencies have to compete with private traders in making purchases.

In any case, the arguments for and against take-over of the rice trade is of little practical significance. If, as in the case of wheat, the government has no intention of introducing monopoly procurement of the entire marketable surplus of rice — and it is clear enough that the government has no such intention — it hardly matters whether or not there is a formal take-over of the rice trade. In either case, the crucial business of procurement would be governed by similar sets of rules. In case there is a formal take-over, the wholesaler would be barred from bidding for purchase of what the producer brings to the market. But, as the wheat experience has shown, he can, in collusion with the bigger producers, operate outside the organised markets and frustrate the activities of the public procurement agencies. The procurement agencies have to rely exclusively on the price incentive, but in this regard they cannot match the expectations of the producers in the prevailing conditions of shortage of foodgrains. Thus, as with wheat, only a part of the marketable surplus out of the kharif rice crop will become available to the government for supply through the public distribution system. Inevitably, therefore, the government has to turn to heavy imports as the mainstay of the public distribution system. The principal concern of the government, therefore, is no longer with the take-over of rice trade, but with the problem of arranging for adequate imports.

Unfortunately for the government, arranging for imports of foodgrains is

also not proving to be an easy matter. Brave statements that there would be no concessional imports and that all imports would be made on a commercial basis are no more being heard. A frantic search for credits to finance food imports is on. There could be no clearer hint of this than the Prime Minister's public statement during her visit to Canada that the government had not yet decided upon the mode of payment for foodgrain imports. From that she went on to refer specifically to the need of credits for the purpose.

The bulk of India's requirements of imported foodgrains can be met only by the United States. The hopes pinned on Australia and Canada have been found to be misplaced. Canada can give only small quantities of food and Australia can provide practically nothing. The question of credits for foodgrain imports, therefore, pertains directly to the US. However, the political constraints on making a straightforward approach for American aid to finance food imports are obviously considerable.

The question of US aid for food imports was raised in different ways at the recent meeting of the Aid India Consortium in Paris; it has also been taken up through other channels. The American response has not been exactly warm. The US position appears to be that it is not too anxious to give aid of any kind if such aid is regarded as a kind of imposition and as intended to serve ulterior purposes, as many statements by responsible Indian spokesmen in the last two or three years have tended to suggest. The US government, it is pointed out, is sympathetic to India and would like to help, but if any aid is needed, it is for the Government of India to say so. After that bilateral talks between India and USA could be initiated on the subject. The initiative for such talks must come from India. It is difficult to find fault with this position taken by the Americans, though it has some pretty serious implications for the Government of India. Nevertheless, given the food supply position, as well as the overall economic situation, the government has no alternative but to prepare the ground for the kind of initiative that the US wants India to take. And this is being done. What the government is seeking to make sure of is that once such an initiative is taken by it, there will be no rude rebuff from the Ame-

rican side. The hopes entertained earlier that we could use our foreign exchange resources to finance imports of foodgrains are no longer regarded as realistic. The scale of food imports

required, or even what the government has in view, will exhaust our free foreign exchange reserves at a time when the pressure for imports is growing on all sides.

Some Notes on the Poona Riots

Anil Avchat

SALAUDDIN is a peon in the Poona College. It was not safe to stay at home. So he thought of moving into the College premises. He packed his belongings in a metal trunk and was on his way to the College with his family and a friend. As he was passing through Nanchowdi Chowk a mob accosted him, attracted by the trunk he was carrying. No one waited to see what was in the trunk. Salauddin was stabbed. His family was taken to safety by his friend.

The rioters idolised Namdev Pawar. In the float organised on Shivaji Jayanti, he had enacted Shivaji's part and was shown as killing Shiasta Khan. Angered by this, a Muslim Pabelwan, Yasin Khan, had cut off Namdev's thumb with a sword. Such was the talk among the people. Hindus were agitated. Muslims were secretly happy that Shiasta Khan had been avenged in 1973.

Namdev Pawar is a lineman in the Maharashtra State Electricity Board. He is between 30 and 35, a tough looking man with a paunch. He is the leader of one of the alley gangs. Money-lending is his business. He charges four annas a rupee per month. He is constantly involved in fights over money deals.

Yasin Khan is a body-builder and has won the Maharashtra Shri title. Only a few months ago, he had stood second in the all-India contest at Patiala. His father is a driver in the Poona Municipal Transport. His mother is a money-lender. Yasin himself is not much involved in gangsterism. But the people around him are known goondas. His uncle, Badshah, was a notorious dada and had just completed a 15-year jail term for the murder of a man in Bhokarwadi. His maternal uncles, Rahman and Sardar, had similar reputations.

Namdev Pawar's thumb was cut on May 8. That night a quarrel between a gang of Hindus and another of

Muslims started in the Dilkhush Hotel. The Dilkhush Hotel is next to a jhopadpatti called Pattriyachi Chawl ('tinplate chawl'). The chawl is opposite Chhaya Talkies which is on the border between Poona city and the Cantonment. The excuse for the fight was non-payment of a hotel bill. Abuses directed at the respective communities were exchanged and soon there was a regular fight. The hotel-owner dragged the two groups to the police chowky. Namdev Pawar was on duty at the time. Members of his gang informed him of the fight and he started for the scene of the fighting by ricksha. On the way he was attacked by Yasin Khan with a sword. The blow was aimed at his neck. Pawar tried to protect himself with his hand. That was how his thumb got chopped off. He also got a superficial 8 inches long cut on his neck. He walked to the Sassoon Hospital and got himself admitted.

The police soon arrived at the spot, but Yasin Khan got away. He is still absconding. According to his mother, Yasin is a nice boy; he never quarrels or fights with anybody. On the 5th of May, Yasin's brother was angry with him for having brought home no money. So Yasin left his meal unfinished, packed his suitcase and walked out of the house. He had not returned since then. So he could not have been present when the fight took place on the 8th. This was his mother's version. The police, however, say that many people saw Yasin, sword in hand, that night.

I asked a friend of Yasin how Yasin had happened to bring along a sword to an ordinary fight. His answer was as follows: Namdev Pawar was already in the fight. When we began to overpower his gang, some of them went to a nearby Shiv Sena group for help. The Shiv Sena group refused to come, but we expected that it would and by way of preparation we brought the sword.

Namdev Pawar's house is just a room in Pattriyachi Chawl. But in the room there are two huge steel cupboards and piled on top of them are columns of utensils as in a vessel shop. Namdev

removed the bandage on his left hand for me. There was no thumb.

The Shivaji Jayanti procession was on May 4. In the past different groups used to take out separate processions. This time after much effort by some people, a joint procession was organised. It was a procession with music. And, as the procession passed in front of a mosque, there were obscene slogans besides. Red coloured powder ('gulal') was also thrown on people in front of the mosque.

Many days earlier, on April 20 — as if to herald the expected arrival of Bal Thackeray in Poona on April 22 — the Shiv Sena had taken a procession of 200 to 300 people to the house of Maruf Khan, a leader of the Muslim community. There were slogans such as 'Burn Maruf Khan'. The procession then went to the Mecca, Medina, Bagwan, Jumma and Tamboli mosques. Gulal wrapped in paper was thrown inside the mosques and music was played in front of them. The clock on top of the Mecca Masjid was broken. Stones and chappals were thrown into the courtyard of Jumma Masjid and tubelights were broken. One person in the procession played the part of a Muslim and the others pretended to force him to sing Vande Mataram. The 'Muslim' would refuse. For that he would be belaboured by the others and he would scream "Ya Allah, Ya Allah", to which the crowd would respond with obscene abuse.

There were as many policemen with the procession as there were participants. Yet the police did nothing to stop the provocations hurled at the Muslims. The newspapers also took no notice of these goings on. It was only on the third day after the procession that two persons were arrested. The Shiv Sena promptly organised a dharna before the main police chowkey to get them released. After negotiations between the police and the Shiv Sainiks, the two arrested persons were provided with mattresses and otherwise looked after and the dharna was called off.

Paigambar Jayanti was celebrated on April 16 and a procession was taken out by Muslims. Two acid bottles were thrown at the procession when it reached the Shatranjiwala Chowk on Lakshmi Road. Afterwards two Hindu youths were arrested.

On the previous day there was a Matang (neo-Buddhist) marriage procession with one of the most expensive bands in the city, the Rajkamal Brass

Band, in attendance. After playing music for 15 to 20 minutes in front of a mosque, the procession came to A D Camp Chowk. There Maulana Wasiuddin was delivering a public sermon in connection with Paigambar Jayanti. When the procession reached the place of the sermon, the band stopped playing. Immediately a Matang youth came forward to demand why the band had stopped and slapped one of the musicians. The band began to play again. Wasiuddin stopped his sermon. A member of the audience came to the procession and pleaded that now that music had been played for 15 minutes, the procession should move on. The Matang youth climbed on to the band cart and began to abuse the Muslims. The police arrived and tried to push the procession on. No one knows from which side the first stone came. But people in a hotel nearby say that persons from the procession entered the hotel and took away soda water bottles. People started to run helter-skelter. The band disappeared. The car in which the bride and bridegroom were travelling had to be escorted to safety by the police. The procession was reorganised some distance away and continued on its way.

On the same day there was stone-throwing at the house of a Muslim lawyer called Bagwan.

May 15 was the Bombay bandh which flopped. There was a feeling in Poona that the Poona bandh on May 16 would meet with the same fate. The Shiv Sena had refused to take part in the Poona bandh. On the morning of May 16 there was to be a morcha by the Leftist parties to hand over a memorandum to the Collector in his office. The Congress was determined to oppose the bandh. Mandai, the prominent market, is a Congress stronghold. So the shops there were to be kept open on the 16th. Prominent Congress leaders, such as Baban Padwal, Baban Kirad, Ghore and and Hiroli, a Muslim, had decided to keep their shops open and had tried to persuade nearby shops to stay open as well. But no one had listened to them. In the morning there had been skirmishes between Congressmen and Jan Sangh volunteers who had gone to Mandai to get the shops there closed, but peace had been soon restored. Baban Padwal had kept his cycle shop in Nana Peth open. There too the organisers of the bandh had created some trouble, after which the shops closed down.

The morcha organised by the Left parties was a big one. It passed in front of Alpana Talkies on Lakshmi Road at about 11 in the morning. It had gone one or two chowks ahead when stones began to be thrown at the mosque in front of Alpana Talkies. And the Poona riots started.

The known information about the event is as follows. There are many Muslims egg shops in Takar Street near Alpana Talkies. Some boys were shouting in front of one shop, asking it to close down. There was some stone throwing, upon which there was a return hail of stones, bricks and soda water bottles from the mosque. The boys fled. But soon afterwards gangs appeared from three sides and started to throw stones at the mosque. A ricksha parked in the courtyard of the mosque was destroyed. The mobs also burnt a hotel and three or four shops just outside the mosque. This is the information which every newspaper published the next day.

The trustees of the mosque gave the following version of the events: The stone-throwing at the mosque had started suddenly. We were forced to retaliate. The police arrived and told us to go inside the mosque. We went in. But the moment the police went away, the mobs were back. They burnt the shops. They were able to do so because we had been forced to go into the mosque. Otherwise we would not have let the shops be burnt.

The egg shop owner claimed that his shop had not been open to begin with. The boys had thrown stones through the ventilators, smashing a few photo-frames. Had the shop been open, he said, all the eggs and other property would have been destroyed. This had not happened.

Hasmatbai has a little pan shop at the corner of Gururvar Peth. She lives near the shop. She had this story to tell: On bandh day I closed the shop and stayed at home. But soon there was trouble. A mob tried to forcibly enter our group of houses. The Maratha residents of the locality stopped it. Muslims may live here, but so do we, they said. The mob moved on. Then I heard the sound of my shop being broken open. I ran to the door and saw metal vessels ('lotas') from my shop being thrown on the road. One man was carrying away my steel weighing machine. How could I stop him?

Balwars are tongawallahs. Balwar al-

ley is off Gururvar Peth. Tonga driving is no longer a paying profession and so tongawallahs have entered other occupations. They call themselves kshatriya rajputs. Some Balwar boys had destroyed a haircutting saloon owned by a Muslim barber situated outside a mosque. I went to the saloon.

The young barber was standing there. He was a god-fearing person. His shop was a tin shed. Now it looked like a photographer's darkroom. The barber told me not to touch anything lest my clothes should get dirty. He showed me all the blackened instruments and the furniture which had been completely burnt. I asked the barber whether he had any quarrel with anybody. He said that all the boys who had come to burn his shop had been his regular customers. The boys had come to burn the mosque, but since they couldn't do it they burnt his shop, he said.

The bearded Muslim who was standing by said: I had gone to stay in the Anglo-Muslim High School for safety. My house was looted in my absence. I have lost everything. My landlord has occupied my room and is not prepared to give it back to me. The landlord's boys must have looted my room. Now I am going to the corporator from my locality to get justice. I do not have the money to go to court. Why had he not gone to the Peace Committee? Where is the Peace Committee? After the 1965 riots the Peace Committee was active and it had settled similar problems immediately. But this time the Committee has no intention of doing anything.

Mominpura is a locality densely populated by Muslims. The Mecca and Pinjari mosque are situated in this locality. It was here that Hamid Dalwai, the founder of the Muslim Satyashodak Samaj, had been beaten up by Muslims last year. Shiv Sena processions make it a point to go through Mominpura. The Muslims of Mominpura are weavers and are migrants from Andhra Pradesh or Gulbarga in Mysore. This locality had remained quiet during the 1937 riots as well as the 1965 riots. But this time things were different.

Next to Ghorpade Peth is the Chand Tara Chowk. This is the popular name of the chowk, but some Hindu youths have organised a Lal Bahadur Shastri Mandal here and have started calling the chowk Lal Bahadur Shastri Chowk. In retaliation, Muslim youths have started

a Zakir Husain Mandal. They had called the Mayor at the time of the famine relief fund collection drive and had thus got recognition. There was tension in the locality also because a Muslim had abducted a Hindu girl and a Hindu had kept a Muslim concubine.

The riots here started at 12 o'clock. It all began with the stabbing of a youth named Maruti Mankar. The Hindus were throwing stones from one side and from the other an armed Muslim mob was coming. The Muslims were carrying knives, gupitis, iron bars and swords. A few Hindu shops, including a washerman's and a grocer's, in Chand Tara Chowk were burnt. Also a hotel called Jagdishwar Bhuwan. There is a difference of opinion about who burnt this hotel. The general view is that the Muslims had done it. But some Muslim leaders maintain that the Hindus themselves had set fire to it because the building belonged to a Muslim. But the building was not burnt; only the furniture, which belonged to the Hindu hotel-owner. Further, on either side of the hotel there are Muslim shops which were spared by the mob.

The story of the stabbing of Maruti Mankar, which triggered off the riots, is as follows: Maruti Mankar was a cart driver working for a timber shop. He was well built and liked to play the drum. He had collected the boys of the alley and organised a Jay Bajrang Balmandal. The Balmandal used to organise music and lezhim contests. It also played a prominent part in the Shiv Sena and Shiv Jayanti processions that passed through the neighbourhood. These processions invariably played music in front of mosques. The Muslims thus had a grouse against Maruti Mankar. On the day of the bandh, at about 12 noon, he went to a Muslim shop to get it closed. As the shop-owner refused to close the shop he kicked the shop door. At that point two or three people appeared on the scene and Maruti Mankar was stabbed.

The Matang Society was very active in the neighbourhood of Islampur and Chhaya Talkies. Namdev Pawar was a Matang as were many of those who had participated in the neo-Buddhist wedding procession on April 15, mentioned above. Referring to the attack on Namdev Pawar, one old man, who spoke in the vein of Ambedkar and Phule, thundered: "So you cut off our thumb. We will revenge by cutting your throat."

In this area the Muslims and the Matang-Buddhists have a master-servant relationship. This was another factor

making for tension between the two communities. The Shiv Sena, which had entered the area recently, made full use of the Matang-Buddhists' resentment against their Muslim employers. Shiv Sena leaders and Hindu fanatics made provocative speeches at public meetings. Traditionally the Socialist Party has exercised influence over the Matangs. But this time they ignored the party.

Bhoiees and Tambats are the two major communities in Kasba Peth. They are always quarrelling with each other. The Bhoiees are a fishing community. More recently they have taken to bootlegging, which is no longer as flourishing a business as it once was. The Bhoiees live by the river. The Tambats are like the Deivadanya Brahmins. They don't the sacred thread. Kaka Wadke, the Shiv Sena leader, is a Tambat. Tambats are generally well off and so the gangsterism they practice is more sophisticated. The burnings that took place at Kagdipura was the work of the Bhoiees. Other riots were organised by Tambat youth.

In Kasba Peth, by the Nagzari Nalla, there is a notorious liquor den belonging to a Muslim. It is always crowded in the evenings. The Muslim has a Bhoiee as a partner. The two partners have become affluent enough to buy an Ambassador car each and build six-storey buildings. The Muslim owner of the den sent six bags full of grain to Muslim refugees following the riots. The Bhoiees were enraged by this and arrived in force to burn down the Muslim's house. His Bhoiee partner, however, intervened on his behalf. The crowd asked him: "Why do you need this Mussalman partner? We have no objection to your owning even three Ambassadors."

The next Corporation elections are very near. Many aspirant candidates find themselves in an awkward situation, particularly those who aspire to contest from mixed constituencies of Hindus and Muslims. The last time most Congress corporators had got elected with the help of Muslim votes. But now if they go to help the Muslims, they will antagonise the Hindus. At the same time, they cannot side with the Hindus. Both communities are angry with the Congress. Hindus feel that the Congress has pampered the Muslims. The Muslims allege that in their heart of

hearts Congressmen are communal-minded and that the love they profess for the Muslims is artificial.

In Kasba Peth two boys came running into a building and closed the doors behind them. The SRP police chasing them jumped over the compound wall and started beating up the residents, including women, children and old people. Mohan Dharia, Union Minister of State for Planning visited the building on his casual tour of the riot-affected city. Rambau Wadke, a Socialist Corporator, was accompanying him. Wadke suggested to Dharia that he should listen to the people's complaints about the atrocities committed by the SRP. The people surrounded Dharia. The police inspector on duty got nervous and started firing in the air to disperse the mob.

The SRP had also beaten up women in the Ganj Peth hutments. The wife of a Corporator, Chhailal, took out a procession of these women and gheraoed the police chowky. Mayor Nilubhai Limaye was persuaded to interrupt a lunch he was hosting for Mohan Dharia and Sharad Pawar and go to the police chowky. A large mob had gathered at the chowky. The anger of the people was directed at Congress leaders. Shivajirao Dhare, a Congress MLA, had to leave the scene. Some people from the mob even tried to chase him. Mayor Limaye tried to persuade the crowd to be peaceful. When the mob did not respond to his appeal, he went so far as to threaten that he would immolate himself unless the people heeded his appeal. After the Mayor's speech, Mohan Dharia expressed a desire to speak. Knowing the mood of the mob, some people told him not to speak, but Dharia insisted. In the meanwhile the mob was demanding the suspension of Inspector Kale. Immediately, Mohan Dharia spoke to one of the high-ranking police officials standing nearby and declared with a smiling face that Inspector Kale had been transferred. The people greeted this with long applause. But instead of transferring Inspector Kale, Police Commissioner Kadambande decorated him with a silver medal for his work during the riots.

The riots were concentrated in the eastern part of Poona city in a horizontal belt. The areas were marked off so neatly that when Shukrawar Peth was shaken by riots and had been put under curfew, adjoining localities were completely unaffected. Particularly, people

from the posh areas were enjoying the three-day holiday in their bridge clubs.

Brahmins from Shaniwar Peth are fond of day-dreaming about annihilating the Yawans (Muslims), but when the riots start they bolt their doors and busily take stock of enemy casualties over cups of tea.

There is a Mandal in the locality and a few Brahmin youths come together to take physical exercise. But, since they are Brahmins, they cannot behave like ordinary Pahalwans. Nor will their 'culture' permit them to tease passing girls. So their immediate target becomes Chandabai Daruwala, a Muslim shop-owner of the locality. Some boys made a vain effort to burn the shop at night by throwing kerosene-soaked cloth.

Socialist Corporators, some independent public leaders and a few persons from the opposition parties made valuable efforts to restore peace. Congressmen invariably took no part in these efforts. The contribution of S M Joshi is particularly noteworthy. A large mob had gathered in front of the Manusha mosque in Rasta Peth, demanding that the mosque be searched for suspected stockpiles of lethal weapons. S M Joshi and Baba Adhav tried to pacify the mob. They selected a representative each of Hindus and Muslims to go along with the police while it searched the mosque. A few acid bottles were found in the mosque, hidden under soiled clothes kept for washing in a bucket. Somebody questioned the Muslim representative about this as he came out of the mosque. The Muslim took fright and shouted for help. Immediately there was confusion. The mob thought that somebody was throwing something from inside the mosque. Stone-throwing started and the police started firing. Many people were injured. S M Joshi tried to tell the police to stop firing. A young boy was giving Joshi a piece of cloth soaked in water to protect himself against the tear gas. The next moment the boy was hit by a bullet. Arun Limaye, a Yuwak Kranti Dal leader, pleaded with S M Joshi to sit in his car. But S M Joshi did not accept the suggestion and ran to urge the police to stop firing. In the meanwhile, a bullet went through the rear window of Limaye's car and came through the wind-screen.

The Cantonment area is not usually affected by communal riots. Even in the 1965 riots, this area had been spared. This is a cosmopolitan locality. There is a sizeable population of tailors, dhobis, barbers, etc., who originally set-

tled in the Cantonment in the service of the Army. More recently merchants from Centre Street, particularly the Marwaris, have begun to support Jan Sangh. In the last election to Lok Sabha Mohan Dharia was opposed by Mhalgi of Jan Sangh. One of the big merchants with shops on Centre Street is Hiroli, a Muslim and secretary of the Poona City Congress. According to the decision taken by the Congress party, Hiroli kept his shop open on the day of the Poona bandh and appealed to other shop-owners to keep their shops open. Other Muslims warned him not to take part in these activities.

Till the evening the area was quiet. Then people saw a large armed morcha of Muslims coming from the Gai-Kasai mosque. One Gama Pahalwan resides in this locality. His elder brother had been injured in the riots in Nawa Peth. Incensed by this, Gama Pahalwan had organised the armed procession to go round the locality.

In retaliation, the Hindu mob marked out Hiroli's shop for destruction. To begin with there was some minor stone-throwing at the shop. But immediately Hiroli showered stones and soda-water bottles on the mob. Muslims claim that Hiroli acted in self-defence. But when the police searched his place, they found two cartloads of bricks, stones, acid bulbs, iron bars, etc. Now Hiroli is under arrest on charges of murder.

According to newspaper reports, one Kuldip Pathak died of burns caused by acid thrown by Hiroli. But there were no acid burn injuries on Kuldip Pathak's body. He had died of kerosene burns. These facts were mentioned in the post-mortem report. Yet local newspapers cling to the acid burn story.

According to the police version, Hiroli threw kerosene on Kuldip who was one of the activists burning his shop. The defence version is that the kerosene had accidentally fallen on Kuldip. However, posters soon appeared with photographs of Kuldip, hailing him as a modern-day Dharmavir (after Dharmavir Sambhaji, son of Shivaji Maharaj). The nearby chowk has also been renamed Kuldip Chowk. Those who know something of Kuldip's past are struck by the irony of his deification after death.

A number of Muslims had taken refuge in the Motedina High School and the Anglo-Urdu High School. Muslim social workers were busy helping them. While the relief material came from all sources, only Muslim workers were distributing them among the refugees. A local doctor had collected medicines to help the Muslims, but he was told by a

Muslim League worker that the medicines should be given to them and that they would distribute them. The doctor and his co-workers, however, ignored the opposition of the Muslim workers and distributed the medicines themselves and gave medical treatment to the Muslim refugees.

Muslims found that if they met riotous mobs with heavy stone-throwing, then the mobs invariably withdrew. Many Muslims removed tiles from their own houses to use as missiles. Some of them broke down partition walls in their houses to remove the bricks.

Dawood had rented his pan shop in front of Chhaya Talkies to Sheikh Mahmud for a rent of Rs 4 per day. The shop was looted during the riot and Sheikh Mahmud lost Rs 300 worth of property. But since Dawood was the owner of the shop, it was he who received compensation from the government. Sheikh Mahmud was left grinding his teeth.

The help received from the government is generally paltry compared to the loss suffered by shop owners. The Muslim National Bank has given loans of Rs 1,000 to its shareholders. But even this would not enable them to revive their businesses as there are many difficulties to be overcome. The closure of shops for one-and-a-half months has also resulted in much loss of business.

The reaction to the riots of aspiring candidates for election to the Corporation was interesting. A Pahalwan from Ganj Peth wanted to contest the elections. In the first few days of the riots, he did not dare move out of his house. Then some people formed the Peace Committee. After the Peace Committee had been formed, the Pahalwan took a leading part in the morcha organised by the Peace Committee. The residents of the locality were incensed by this and asked one of the popular corporators why, when he had done all the work endangering his life, the Pahalwan was taking credit for the work of the Peace Committee.

Newspapers exaggerated the severity of the riots out of all proportion. Some 50 families were rendered homeless in the riots and about 50 shops, big and small, were looted. There were about 10-20 stabbing incidents. The toll taken by the Poona riots is nothing com-

pared to that of the Ahmedabad, Ranchi or Jabalpur riots. Yet they have received a great deal of attention. This was on account of a political coincidence.

The Central Home Minister, Uma Shankar Dixit, was in Bombay to attend a wedding when the riots started in Poona. Someone, perhaps pointed out to Dixit that there might be questions in Parliament as to why, in spite of being so close to Poona at the time of the riots, he had not gone there. To avoid such embarrassment, he decided to make a hurried trip to Poona and arranged for the Maharashtra Chief Minister, V P Naik, to accompany him. The two dignitaries visited the Cantonment area and one or two other places. Thereafter they held a press conference and went through the motions of discussing the situation with Socialist leader S M Joshi and Mayor Limaye. Both were back in Bombay in two or three hours. The news of the visit of the Union Home Minister and the Maharashtra Chief Minister immediately received all-India coverage. Much political significance was attached to the visit. Leaders of all political parties rushed to Poona to show their concern. Nanaji Deshmukh (Jan Sangh), George Fernandes (SP), Madhu Mehta (Swatantra), Banatwala (ML), two observers of the AICC, as well as the Mayor of Bombay, Sudhir Joshi (SS), came to Poona, Mohan Dharra and R K Khadilkar were present all through, Poona being their parliamentary constituency. All the distinguished visitors followed the same stereotyped programme. On arrival, they went on a quick 'survey' of the riot-affected areas as accompanied by two Corporators and then held a press conference. After that, they quietly disappeared. Most of the visiting dignitaries were not prepared to go to the worst affected areas. The police were as much harassed by these leaders wiping their crocodile tears as by the actual riots.

I met a high ranking police officer. He said that the communal riot, and the tension which had preceded it for the last four or five months, had proved a great 'nuisance' to the police. Police officers had been given orders to report even minor quarrels between members of the two communities, such as over the filling of water at common taps. January is the month for kite-flying and it is customary for boys to fight over kites. But if in a particular instance one boy was a Hindu and the other a Muslim, then it became a serious matter for the police. Policemen had to run to the

scene of the quarrel dropping everything else. Only few days ago some Muslim, Hindu and Sikh boys were playing hide-and-seek in the Shiva temple in Sangavi village under the Poona Municipality. Some of them urinated in the temple. The moment the incident was reported to the police officer I was talking to, he himself rushed to the village and arranged to suppress the news. And with the consent of their parents he even sent the boys to the Renand Home. Otherwise news would have spread that some Muslim boys had urinated on Lord Shiva. Jan Sanghis and Shiv Sainiks would have been immediately rearing to go and urinate in mosques!

Maruf Khan said to me: The sufferings of the Muslims will end if our right to vote is withdrawn. We were opposed to the Congress in 1965; so the Congress harassed us. Congressmen spread the news that Maruf Khan was in possession of an illegal transmitter. So many years have passed since then, but still no case has been filed against me. Now the Muslims support the Congress, for which they are being harassed by Jan Sanghis and Shiv Sainiks. Ultimately it all boils down to our vote. Why not take it away? Then we will be happy.

Talking about the riots, Maruf Khan said that wherever the Muslims had retaliated their houses had been saved. Where they had no defence, they had

suffered. According to him, the police had been partisan. This is how he put it: Whenever our people were ready to retaliate or defend themselves, the police persuaded us to go back. And when we went back, the rioters burnt our houses without let or hindrance. But Muslims from Ravivar Peth refused to retreat. They told the police that they would withdraw only after the police had driven away the mob. As a result, even though it was an overwhelmingly Muslim locality, there was relatively little damage. The Buddhists who took an active part in the riots will in the end meet with the same fate at the hands of the Hindus as we have.

The riots ended. Soon came the news of the postponement of the Municipal elections by six months. The sitting corporators and other aspiring candidates were relieved. They need not worry how the riots and the hostility between the Hindus and Muslims will affect their election prospects.

Some Hindu Mahasabha people went to Namdev Pawar asking him for permission to felicitate him. Namdev told them that he was not a politician. He was in fact rather unhappy to have in a way been the cause of the riots.

Matangs, Chamars, Bhavsars, Balwars, Tambats, Bhoies — all have gone back to their usual business. Even Hasmat-bai, the owner of the pan shop, has purchased new 'lotas' and reopened her shop.

MAHARASHTRA

Not the End of the Peasantry's Problems

D N

A COUPLE OF DAYS of steady rain in Bombay, and reports of showers in the countryside were turned into the end of the drought. And the end of the drought was taken to mean the end of the acute problems of the peasantry. It was conveniently forgotten that peasants would have to earn some income in order to live till the next harvest.

But even the drought itself has not ended yet. Most of Maharashtra has had deficient and scanty rains. Seeds that have been sown are drying up. To make matters worse the bajra seed supplied by the government, through the zilla parishads and co-operatives, is mainly hybrid — which is not as hardy as the ordinary variety and is particularly dependent on quick and

timely water supply.

The last few years of famine have left the peasants with absolutely no seeds of their own (they don't even have grain). Seed prices are two to four times the normal. Trading in seeds (as in bullocks) is now one of the most profitable lines. Traders who formerly smuggled in grain from other states are now openly bringing in seed.

There are many peasants who have already carried out sowing. If the rains do not come soon they will have to re-sow. There are others who have not yet sown. Not being able to take the risk of losing the seed after having paid for it, they are waiting for regular rains before buying seed.

Many peasants reduced to conditions of absolute impoverishment are being forced to change their crop pattern. In Ahmednagar district, which is a predominantly rabi area, the peasants, unable to wait so long, are attempting to cultivate kharif crops. In restarting agricultural operations, availability of seeds and their prices are not the only, nor even the main, problem that the peasants face. In fact the most pressing problem is that of the paucity of bullocks. No firm estimates of the loss of cattle have been made, but enquiries show that it is likely to be as high as 50 per cent of the total stock of bullocks. The loss of bullocks is of course greater among the poorer sections of the peasantry. Some have been saying that it is perhaps a good thing that such a large number of cattle have died, since India has an excess stock of cattle and a large proportion of the cattle is very weak, etc. These persons forget that while it might be true that India has an excess stock of cattle when seen from the point of view of some kind of capitalist farming (which however need not necessarily be mechanised), India's stock of cattle is not excessive when seen from the point of view of peasant farming. The weak condition of the cattle (and of the peasant and his family) is then an effect of the weakness of peasant farming itself; and the loss of bullocks will weaken the peasant even further.

The government is distributing *tagai* for the purchase of bullocks and the amount has been fixed at a maximum of Rs 1,000. But the total amount of *tagai* being distributed is entirely inadequate and will hardly be enough to purchase two or three bullocks in every village.

The price of bullocks has gone up — bullocks that a few weeks ago sold for less than Rs 300 are now selling for more than Rs 1,000. Along with the purchase price of bullocks, their rental has also gone up. Rich farmers who managed to save their bullocks and also bought cattle from the poor and middle peasants are now charging from Rs 30 to Rs 60 per day for a team of bullocks.

LOSS OF CATTLE

The loss of cattle is still continuing at a rapid rate. In the village of Bhoire Pathat, in Ahmednagar district, for instance, cattle are dying daily. Government which was formerly distributing *tagai* in the form of fodder, is now distributing money and leaving it to

the peasants to buy their own fodder in the open market. As in the case of seeds, there could be no plainer admission of the government's unwillingness to move against the traders who are reaping huge profits from the existing situation.

The loss of animals has also made milk very scarce. In places tea is now usually drunk without any milk at all. A more important effect of the loss of bullocks has been that some peasants who have no bullocks have had to give their land to the richer peasants to cultivate. They will get a share of the crop and will have to supplement this by working as labourers, agricultural or other.

At the same time, at least for the coming season, very few peasant families will be able to return to working only on their own land. While some members of the family work on the land, others will have to regularly earn money as labourers. The burden of working for a wage will fall particularly on the women, who do not have much of a role in agricultural production till harvest time.

Many would be forced to borrow for consumption purposes — even at the 50 per cent to 100 per cent per annum rates of interest that prevail. But moneylenders are unwilling to give 'unsecured' loans. Even though there is at present hardly any market for *jirayat* (dry) land, the moneylender would be only too glad to give loans if the peasants would sign their land against the loans. But the peasants knowing full well that land pledged to the moneylender never returns to the peasant, and knowing the condition of landless labourers, are quite unwilling to mortgage their land. By working on relief and eating less the peasants have got to this point without substantial losses of land.

The main losses of land have been due to the tanks, roads and other such projects. In areas where there has been little consolidation of land holdings and peasants own many scattered strips of land, it is quite likely that very few have become completely landless as a result of the projects. But the amount and timing of compensation are sore points. Some *ad hoc* advance payments have been made, but in many cases the assessment of the land value has not yet been done. Where it has been done the valuation seems on the low side. Land acquired for the irrigation tank Deulgaonsidi (Ahmednagar taluka) has been valued from Rs 1,200 per

acre for *jirayat* land upto Rs 1,800 per acre for *bagaiyat* (irrigated) land. This valuation is not based on market prices but on certain calculations made by the relevant government department. That the valuation is on the low side can be shown by the fact that over the last five years market transactions of some *jirayat* plots in a village in the same taluka give an average price of Rs 2,500 per acre.

UNPRODUCTIVE RELIEF WORKS

Many of the 'productive' works that were taken up are not producing any results. Take the 'community' wells for instance. First of all, one wonders why these wells were ever called 'community' wells. The community does finance their construction, but it has little to do with the benefits that flow from them. The famine has been a god-send to many rich farmers who have managed to have 'community' wells dug on their land. But bungling of various kinds is seeing to it that they do not benefit as much as they could have. In Ahmednagar district, 55,000 workers are busy digging 2,247 'community' wells. But the labour on almost all of these wells is likely to be a waste. For not many wells have as yet struck water, and even in those that have struck water the masonry work has not been taken up. In Ahmednagar taluka, for instance, 251 wells are being dug. Of these 35 have so far struck water. But no masonry work has been taken up. The rains so far have not been heavy. But when there is substantial rain these wells will get flooded and their walls will cave in. There are no pumps around with which to pump out the water. So the work on a vast majority of the wells will have to be abandoned. Government is now getting ready to give loans to peasants to complete digging of wells on their own lands and to instal pump-sets. With the inevitable discrimination against the poorer peasants this will mean that even those among them who have been having wells dug on their land will not really benefit from the work.

There are other relief works which have come to nothing. A lot of metal has been broken. But the metal has not been laid on the roads that have been constructed. Even the little rain that has fallen so far has started washing away the roads. Percolation tanks were constructed with little rolling and some of them are reported to have developed cracks.

NORTH

Going the Whole Hog!

IN the belief that a drive to build up an ultra-socialist image may cover up the lack of concrete achievements, the Punjab government is rushing ahead in directions where the implicit risks dictate the utmost caution. The craze for takeover is the latest example. Despite all the loud claims made by Punjab Ministers during April and May, the chances of fully achieving the 34-lakh tonne wheat procurement target cannot be rated high. Chief Minister Zail Singh fears that even the Union Food Ministry's bonus scheme might not make much impact on procurement since it has come rather late in the day. In fact, most North Indian farmers have rejected the scheme as inadequate and have focused attention on their basic demand for higher procurement prices. The long queues at the ration shops and the scramble for vanaspati hold out the dismal prospect of a prolonged summer of discontent. Even so, the state government is actively considering a takeover of the trade in other essential goods.

During the recent Chief Ministers' Conference in Delhi, spokesmen of Punjab went out of their way to impress the Centre with the state's achievements on the food front, compared to the other states where the procurement drive had either failed or yielded totally unsatisfactory results. On June 19, the government appointed a 10-man committee, headed by the Chief Secretary, to plan the supply of essential commodities to the common man at reasonable prices and submit a report in three weeks. Another committee of publicmen will scrutinise the report before the cabinet finally takes a decision on it. The Chief Minister has admitted that the "middle-of-the-road" policy now being followed in this sphere had failed; hence the need for going the whole hog. The entire process, right from the manufacturing stage to the point of distribution, he said the other day, "must be under the government's complete control".

In Haryana there is no scheme for such complete control. But though the wheat procurement drive has met with only partial success (the achievement is unlikely to exceed half the target of 13 lakh tonnes), plans are being

drawn up to acquire substantial stocks of maize and bajra, apart from rice, in the next kharif season. The paddy levy has been enhanced from 90 per cent to 95 per cent. The state's Agriculture Minister, Bhajan Lal, stated on June 22 that the official machinery had been put on a "war footing" to increase kharif production and make up for the setback in wheat that has tarnished Haryana's image. Unless the vagaries of the weather thwart the plans, Haryana is hopeful of having a record kharif production of 16 lakh tonnes, of which about 12 lakh tonnes could be handed over to the Central pool. Officials contend that a bumper kharif crop would also lead to larger market arrivals of wheat.

Touched to the quick by New Delhi's snub for failing to fulfil its wheat commitments, the Haryana government has just launched a massive drive to unearth and procure wheat stocks held by the big farmers. For this purpose, a task force of officials has been organised in each district. Groups, each a dozen strong, visit the villages where intelligence reports indicate the existence of large wheat stocks retained by affluent landlords in the hope of netting handsome gains in the lean months. Among such profiteers are some leaders of political parties. Payment for the grain unearthed is made on the spot.

The Haryana Ministry, under the leadership of Bansi Lal, has so far been remarkably stable and free of wranglings, but it is now showing signs of strain. At a meeting of the Congress Legislature Party held a few days ago, the Chief Minister sharply criticised his colleague in charge of Food and Agriculture and held him responsible for both the low rabi output and the state's failure to fulfil its procurement commitments. The Agriculture Minister also blamed for having "misled the government" about the crop prospects. The Minister did not take the charge lying down but retorted that his department was "as good or as bad as any other". The Chief Minister had instructed the Deputy Commissioners to visit the farms and take over as much wheat as they could. But the Agriculture Minister asked them to go slow. He explained that he had merely advised them to

be "cautious" so as not to provoke clashes.

Shyam Chand, the only Harijan Minister of Cabinet rank in Haryana, is also under fire, though for an altogether different reason. Party members have repeatedly accused him of spending most of the Harijan welfare funds in his own constituency or in the constituencies of senior Ministers and other favoured people. Discrimination in the disbursement of such grants is indeed widespread. VIP constituencies flourish while others are continuously neglected. A Congress MLA who is on the Welfare Fund's board of directors managed to secure Rs 14 lakhs out of Rs 19 lakhs at the Board's disposal, for his own constituency. The Minister's western education and polished manners have made him popular among the elite, but some legislators complain that Harijans do not feel at home in his company! The party decided that all fresh grants out of the Harijan Fund would in future be spent on constituencies that have not been covered so far. Two days later, however, the Chief Minister scotched all rumours of a ministerial shake-up. Denying the reports of a rift in the party, he claimed that the party remained "completely united". He said there was no question of reshuffling the ministry or of changing the portfolios of any of the Ministers.

In Himachal Pradesh, the clamour for a ministerial reshuffle seems to have died down following repeated directives from the Centre to the dissidents not to precipitate matters since there was no intention "at present" of effecting any change in the state Congress leadership. The party has meanwhile launched a mass contact programme (described as "the first of its kind") to acquaint workers with its policies and programmes through a series of conferences and seminars being held throughout the state. The basic aim of the "Know the Party programme" is to make Congressmen effective in implementing the progressive measures taken at the Pradesh and national levels. Chief Minister Parmar, who inaugurates most of these seminars, has repeatedly urged party-men to sink their differences and forge unity "to meet the challenge of reactionary forces". This is being interpreted as a calculated move to queer the pitch for the dissidents who have not been associated with the drive. But the dissidents have not lost their strength and are biding their time.

SOUTH

Moves in Kerala

Mohit Sen

THE relatively greater political stability in Kerala should not be taken to mean that the state has become an Indian version of Dullsville. On the contrary, precedent-setting events continue to take place, which a crisis-fed national press often chooses to ignore.

Among the more interesting of these developments is the controversy that is beginning to surface in the CP(M). It has been rumoured that Sundarayya wrote to his Kerala unit warning against entering into any alliance with the Right. As a result, when the Kerala Congress publicly appealed to the CP(M) for a joint campaign against the state government on the issues of prices, the state secretary of the CP(M) equally publicly proclaimed his party's inability to respond to that appeal. He correctly pointed out that whereas Kerala Congress was of the view that to bring down prices the free market system should be restored, his party was for the state take-over of the wholesale trade in foodgrains. On this, as on many other issues, the standpoints of the two parties were too dissimilar to permit any kind of joint front or campaign. The CP(M) state secretary's statement was splashed across the front page of the CP(M) daily *Deshabhimani* along with critical remarks against the CPI and others who were accusing the CP(M) of joining the grand alliance of reaction.

But soon there came the statement of A K Gopalan, the CP(M)'s politbureau member. This statement was also very prominently displayed on the front page of *Deshabhimani*. In the statement Gopalan welcomed the Kerala Congress's wish to have a joint campaign and added that, despite the known political differences, the CP(M) would plan joint or convergent actions from issue to issue.

It did not escape the notice of political commentators in the state that not only were the two statements almost diametrically opposed to one another but that both received equal treatment in the columns of the party organ. Some even recalled that this was what used to happen in the undivided CPI in the days of the sharp inner-party differences when not only did leaders openly differ but their respective followers were strategically placed so that nobody had a monopoly

of publicity, at least as far as the party press was concerned.

Against this background there is considerable speculation on the now confirmed report that Namboodiripad would be shifting to Calcutta to take over the editorship of the CP(M)'s central organ, *People's Democracy*. The official explanation is that the present editor, Basavapunniah, is in indifferent health and the party is thus not getting the kind of centralised guidance from the paper that it needs and expects. But other alternative explanations are also being offered. It is said by some that the Kerala state secretary of the CP(M) and those leaders who do not like at all the idea of a united front with the Right are anxious to have the former Chief Minister out of the state. Others are of the view, however, that Namboodiripad would proceed to the centre to strengthen those elements in the all-India leadership who want the party to build an all-India anti-Congress front irrespective of the differing aspirations of the components of that front.

It is quite possible that the truth of the matter is a combination of all the three explanations. However that may be, there are indications that important sections of the CP(M) leadership are quite worried by the menace of Right reaction and its growth. They are said to be of the view that while it is true that Indira Gandhi has to be overthrown, it is essential to remember that the CP(M) should be around when that happy event takes place. But if the Right wins, there would be no CP(M) to take advantage of the fall of the lady! And all the perennial arguments are on as to whether the Right can be fought without overthrowing the government or whether there should be a simultaneous battle against both or whether the main fire should be directed against the government while also fighting the Right.

It would be a great pity if the CP(M) is not able to see the writing on the wall not only in India but more particularly in Kerala. Not only is the Right on the offensive and the Centre wobbling before it, but it is in Kerala that the proper kind of alternative to both has been found, has functioned and done a great deal of good to the toiling people as well as to the state as a whole. Where else in India with the

Congress also as a part of the government has the DIR been used against prominent and so-called well-placed hoarders? Where else is one to find that kind of dialectical unity between constructive activities and the struggle for social advance? After all, it was life's experience itself that led the CP(M)-controlled panchayats in the state to be in the forefront when it came to implementing the one-lakh housing scheme initiated by M N Govindan Nair of the CPI. The pity of it is that there is no attempt made to generalise from actual experience.

It would be, of course, too much to expect the CP(M) to give up all at once its oppositional role in Kerala. But when, for example, the Rs 15-crore scheme for the reorganisation of the coir industry is at last sanctioned by the Centre — a scheme put forward by T V Thomas of the CPI in 1967 when Namboodiripad was the Chief Minister — on what grounds can the CP(M) refuse to offer co-operation for the implementation of the scheme? The issue-to-issue approach advocated by Gopalan *vis-a-vis* the Kerala Congress could far more profitably be applied by his party to the Kerala government. This would lead to far-reaching and most advantageous political changes, not only in Kerala but throughout the country.

In the meantime, it is all to the good that Kerala's Chief Minister has declared that in the state, as well as throughout the country, the public sector should be in a preponderant position in the industrial sphere. The Left inside the ruling Congress in Kerala should remonstrate with the party's central leadership against the Central Government's advice to hand over the ilmenite deposits in the state to the Thapars despite the state government wanting its development in the public sector. This kind of concessions to the monopolists bodes ill for the nation and certainly is quite opposed to the social stand adopted by the KPCC that the mixed economy should be replaced by a genuine socialist economy. Such struggle by radical Congressmen against backsliding in their own party would have a galvanising impact, not least on the mass following of the CP(M).

It is not at all ruled out that all the moves going on in this state would lead to that kind of regrouping of the Left and democratic forces which would give the country a big push to the Left.

Manuscripts intended for publication should reach the Editor at least six weeks ahead of the date of publication.

Abdication of Responsibility

IT is one thing to recognise that the government's failure on the procurement front reflects what a hash has been made of the abolition of private wholesale trade in wheat; it is quite another to suggest that the decision to take over wholesale trade was in some way responsible for the collapse of the procurement effort. Yet that is precisely how the matter is being put. Instead of learning from it what needs to be done to make a success of procurement of kharif cereals, the experience with wheat in the current rabi season is being seen as a warning against going ahead with the take-over of wholesale trade in rice. It is, of course, understandable that foodgrain traders and other directly and indirectly affected business interests should see things in this light. Nor is it surprising that the Congress party and the government should also try to use the wheat fiasco as an excuse to wriggle out of what has turned out to be an unprofitable involvement.

But what about the Agricultural Prices Commission? Surely, it was expected that the APC would draw the appropriate lessons from the limited experience with the wheat trade take-over and use them in formulating policies for the kharif foodgrains? This, regrettably, it has not done. Its latest report on the price policy for kharif cereals has nothing to add, in terms of analysis or facts, to the debate on the future of the take-over of foodgrains trade. The unexceptionable argument is advanced that the abolition of private wholesale trade enlarges the government's obligation to provide foodgrains to the consumer through the public distribution system. The equally non-controversial point is made that the government can discharge this obligation only if it is able to procure enough foodgrains to build up public stocks. But once such generalities have been exhausted, the Commission turns casual and cursory. Take, for instance, its approach to estimating the likely demands on the public distribution system. On the basis of annual per capita supply of 100 kg of wheat and rice, the requirements of the urban population of these two cereals are estimated at 11 mn tonnes. And if the demand of that segment of the rural population which is not self-sufficient in foodgrains is taken into account, the requirements "could substantially mount up". On the specific question of how much rice would have to be procured out of the next kharif harvest, the Commission can only say that it would have to be "considerably more than double the maximum achieved in the past". "This implication" the Commission then proceeds to point out, "would deserve to be taken into account before deciding to alter the structure of the dual market in rice in the coming marketing season". The same warning is repeated with regard to coarse cereals: "Without an adequate cushion of the buffer, any large-scale tampering with the market for these commodities could be ineffective and even lead to adverse consequences."

If this is intended to scare away the government from persisting with the take-over of the wholesale trade in foodgrains, then the effort is unnecessary. The government does not seem to need any persuasion in this matter. Instead, the Commission could have addressed itself usefully to giving a more tangible indication of the size of the procurement effort called for and, more important, spelling out the policies required to carry through this effort. The first the Commission doesn't do; and as for procurement policies, the only positive measure it has to suggest is an increase in procurement prices. There appears to be little basis for the actual increases — from Rs 54 to Rs 63 per quintal for paddy, for instance — recommended in procurement prices. For, the Commission itself admits that the crucial determinants of the level of procurement prices, such as the prospects for the ensuing crop and the likely trend of market prices, are all "imponderables in the situation at this stage". In this respect at least it has served the Commission right that last month's conference of Chief Ministers decided to convert the procurement prices recommended by it into minimum support prices — on the impeccable logic that the only prices that could be meaningfully fixed for the next kharif season at this stage were support prices! The Commission's attempt to justify the higher procurement prices in terms of the costs of production is even less convincing. It begins by complaining that the available estimates of costs of production "suffer from various deficiencies". Yet it does not hesitate to ask state governments to furnish cost estimates for paddy. And lo and behold, all the estimates "are found to converge, by and large, within the range of Rs 50 and Rs 55 per quintal". To make doubly sure, the Commission also asks the state governments to suggest procurement prices and these again neatly fall between Rs 55 and Rs 65 per quintal. Thus satisfied, the Commission goes on to fix the procurement price of paddy at Rs 63 per quintal.

It is true that the Agricultural Prices Commission has long suffered from consistent neglect of its recommendations by the government. Also, the present is perhaps an inopportune moment to get the Central and state governments seriously interested in procurement policies which have any bite in them. Increasingly, official concern with food policy seems to be getting narrowed down to how much foodgrains to import, from where to import them and how the imports are to be paid for. None of this, however, justifies abdication of responsibility by a body of non-official experts like the Agricultural Prices Commission. The value of the Commission's work — rather like that of the Monopolies Commission — lies in the uncovering of facts and the spelling out of the implications of the government's policy objectives. In this respect, its latest report is a non-starter and a sharp come-down compared to even some of its own predecessors.

Wheat Price Movements

An Analysis

N Krishnaji

The rapid rise in the production of wheat following the record crop of 1967-68 did not bring about a significant fall in wheat prices. It is argued here that this trend in prices must be attributed to the policies followed by the government.

Two policy instruments are examined in this context, viz, (a) procurement and (b) movement restrictions. It is shown that both these instruments have been used to further a policy that favours the large farmers, particularly of the Punjab-Haryana region.

I

Introduction

ANY review of price policy must begin with a clear understanding of the underlying objectives. A statement of these is to be found in the terms of reference of the Agricultural Prices Commission (APC) formed in 1965. The APC is asked to advise the government on price policy through a relative price structure for various agricultural commodities which should be "in the perspective of overall needs of the economy and with due regard to the interests of the producer and the consumer".¹ The commission is exhorted to keep in view the need to provide incentive to the producer... and the "need to ensure rational utilisation of land..." as also the "likely effect of the policy on the rest of the economy..."² These considerations are reflected in some measure in the package of recommendations made year after year by the APC. But these are never accepted (Table 1 presents just one feature of this phenomenon) by the Chief Ministers who

are the policy-makers. Could this be because the APC's recommendations are never in consonance with the real objectives of price policy as against the declared ones? The following analysis shows that the answer is in the affirmative.

II

The Policy Instruments

THE PRICE STRUCTURE

In theory as well as practice the price structure is a three-tiered one comprising a minimum support price, the procurement price and the market price. One could add a fourth, viz, a statutory maximum price, to this scheme but it is of no significance because of the universally acknowledged existence of the black market. The conceptual framework of this price structure is easily understood: the minimum support price should cover costs plus normal profits and hence should be a guarantee price to farmers at times when market price falls (or threatens to fall) appreciably in good years; the procurement price should be below the market price

but above the support level and hence procurement should essentially be regarded as a tax. No one would dispute with this scheme if the overall objective is one of price reduction but if it is not — and it is not —, a re-ordering of the three tiers is needed. If, for example, the objective is to hike up prices to the maximum possible extent there is no need for the procurement price to be below the market price and the support prices need play no role at all even in good years; the procurement and market prices can stay close to each other for ever. That the government had never any intention of accepting the distinction between support and procurement prices is clear from the preface to the APC's report on minimum prices for 1968-69 signed by a secretary to the government: "...it was decided not to announce the minimum support prices for wheat and gram for 1968-69 crop as government was already committed to purchase any quantity of foodgrains offered for sale at procurement prices. It was considered that as procurement prices were vir-

tually fulfilling the role of the support prices, the announcement of minimum support prices might confuse the farmers and create apprehensions that the policy of offering incentive prices was being revised by the government...³ And last year (1972) early December "saw the Union Minister of State of Agriculture, A P Shinde, admitting in Parliament that procurement of foodgrains in the kharif season was likely to fall considerably short of the target of 4.5 million tonnes... The reason for this failure to attain the target, he blandly explained, was that the government's procurement prices were currently much lower than the open market prices"⁴ Procurement prices cannot stay behind (not far, anyway) market prices for long, as we have already remarked. Given this regime of prices it is easy to understand why the government is unable to procure grain in years of crop failure and it is equally legitimate to identify procurement as essentially a support operation in good crop years. No comment is needed on the relevance of this arrangement for a policy of price reduction. Procurement as an instrument of price policy cannot, however, be fully evaluated in isolation from the other instrument, viz, movement restrictions and it is to this that we now turn.

ZONES

The subject of movement restriction by zoning has aroused a great deal of

controversy among economists as well as policy-makers but the essential point is that the case for movement restrictions rests on the single argument that the constitution of every state into a zone makes it easy for the government to purchase large quantities of grain in surplus states and also in surplus regions elsewhere.⁵ A little reflection shows that the impact of a given combination of zoning and pricing policies on final prices would crucially depend on (a) the

procurement price, (b) the amount procured and (c) where the procured grain is distributed and at what price. Now, these three elements can be so chosen as to increase the average all-India price in very much the same way as to decrease it. So much for the theory, but how did the combination actually work in practice? The year to year changes in the movement restrictions⁶ might, at first sight, appear to be symptomatic of a St Vitus' dance, but closer examining

tion reveals at least one simple empirical rule: relax restrictions in good years. We shall study in detail the impact of this policy on prices in a later section but it is clear that such a policy is advantageous to sellers because unfettered movement is an excellent cushion against a fall in prices in a bumper year while strict zoning might bring about a drastic price reduction. This cushion is, of course, strengthened by the procurement price fulfilling the role of a support price.

by a falling trend in prices (except for the last year of the period, i.e., 1956-57, but note that this price was lower than the 1952-53 price by 12 per cent) in contrast to the queer trend of 1968-72. The difference, of course, was that in the earlier period there was practically no procurement and price support. We shall discuss the contribution of zoning policies to this difference in price behaviour in the two periods later on.

A MODEL OF PRICE BEHAVIOUR

To explain price variation over the period 1951-72 we begin with the simple formulation that the price level, in the absence of governmental intervention, depends only on excess demand (i.e., the excess of demand over supply). This gives rise to the question: How does one measure the demand-supply imbalance? We follow the usual econometric practice of looking for a 'proxy' for excess demand instead of trying to estimate the gap by using assumed consumption norms. The quantum of imports is the most obvious candidate for this purpose but we have considered the quantum of grain operated through the public distribution system as a competitor for the obvious reason that a part of the deficit is met through stocks to which locally procured grain also contributes. An extreme case may, perhaps, illustrate this more clearly. Suppose in a given year that there were no imports. Do we conclude that there was no deficit? No; because the deficit might have been met through depletion of stocks and both imports and procurement are used for stock-building. The grain released

III Production, Imports, Procurement and Prices

Some all-India wheat statistics are given in Table 2. The relationship between prices and production appears distinctly anomalous for the post-1968 period. That there was a decline in the overall deficit during this period, following a rapid rise in production, is reflected in the clearly declining trend in both imports and the quantum of public distribution of wheat. But one may argue that what is of relevance here is not just the demand-supply imbalance for wheat but the deficit of all foodgrains because the latter might also exert pressure on wheat prices. However, the declining trend is clearly visible in respect of the imports and public distribution of all foodgrains also (Table 3); on the other hand, the quantum of procurement has risen very rapidly. The APC has this to say on the question: "There is an obvious oddity in the situation in which prices undergo a spurt in the face of increasing production and mounting stocks of the cereal. That the producers have benefited from the wheat revolution is only as it should have been. But there must come a stage when the benefit starts percolating to the consumer too".⁸ The post-1968 period also stands in marked contrast with 1953-54 to 1956-57 which was also characterised by production increases, minimal imports and low stress on the public distribution apparatus (Table 2); the earlier period (1953-57) was governed

1970-71	0	0	1
1971-72	0	0	1

Note: The zoning system that prevailed in 1959 and 1960 was officially described as single state system but since freedom of movement of Punjabi wheat to Himachal Pradesh and Delhi was allowed we have re-designated the two years to correspond to the large-zone set up. The information on which this Table is based is collected from the APC reports.

by the government might thus be a better indicator of shortage.

Table 4 gives some simple correlations between all-India wheat prices and the 'proxies' discussed above. We have accordingly chosen to work with the quantum of public distribution of all foodgrains to serve as a 'proxy' for excess demand (of all foodgrains) to explain variation in wheat prices.

Our next step is to assume that movement restrictions simply shift the price curve (i.e., price plotted against excess demand) parallel to itself (either upwards or downwards). However, broadly speaking, two kinds of zoning systems have been in force, viz., single state zones and larger zones. Under the latter, movement is relatively freer than under the former because of the presence of more than one state in a large zone and it is reasonable to expect *a priori* that the magnitude of the

TABLE 6 : ESTIMATED PRICE EQUATIONS : ALL-INDIA, 1951-52 TO 1971-72

Dependent Variable	Constant	Least Square Estimate of Co-efficient of				R^2
		I	D	L	S	
Annual average price	68.87	6.03 (0.65)	64.54 (4.91)	1.84 (4.39)	-12.54 (4.72)	0.976
Harvest price	68.15	4.69 (0.59)	66.70 (4.81)	1.27 (4.30)	-5.01 (4.63)	0.973
Off-seasonal price	84.23	7.40 (1.04)	56.61 (8.53)	-0.01 (7.39)	-23.33 (8.50)	0.937

Note: Numbers in parentheses are standard errors of the co-efficients.

shift corresponding to the single state system would be higher than the shift due to the large zone system. This presents no difficulty in the analysis because the two systems are mutually exclusive and we merely introduce two 'shifter' (dummy) variables: L_t which takes the value 1 for those years when the large zoning system was in force and 0 for the rest of the years and similarly S_t which assumes the value 1 for the years corresponding to the single state zones and 0 otherwise. (These values are given in Table 5.)

Our final step is to hypothesise that the procurement-cum-support operation also simply shifts the price curve parallel to itself; the fact that the procurement prices for common white and Mexican varieties of wheat have remained practically stable at Rs 76 per quintal (Table 1) since 1967 supports such a hypothesis. We have identified the period 1967-68 to 1971-72 as the period corresponding to support operations. It is explained earlier why the procurement price during 1968-72 should be regarded as a support price. The inclusion of 1967-68, a marketing year corresponding to a poor crop, in this period is dictated by the fact that high procurement prices were offered, particularly in UP (Table 1). We thus introduce a dummy variable D_t which takes the value 1 for the years corresponding to the support operation and 0 otherwise. (These values are given in Table 5.)

Based on the discussion of the preceding paragraphs we finally arrive at the following price equation

$p_t = a + b_1 I_t + b_2 D_t + b_3 L_t + b_4 S_t$ where p_t is the annual average all-India price in the year t , I_t = quantity of foodgrains (in million tonnes) operated through the public distribution system and D_t , L_t and S_t are dummy variables corresponding to support operations, large zoning and single zoning, respectively (Table 5).

We also assume that the same set of variables, viz, I , D , L and S determine the harvest prices (average of prices prevailing in April-June) and also the off-seasonal price (average of prices during January-March). While the use of proxy I might be justified, despite its crudity, for explaining variations in annual and year-end prices, its use for harvest prices might be objected to on the ground that excess demand gets determined only at the end of the year. But, if we assume that expectations on the level of the deficit determine harvest prices and that such expectations in the beginning of the year are well

Note : These are simple averages of prices for the following markets (the quality of wheat is mentioned in brackets).

Punjab-Haryana :	1952-53 to 1966-67 : Abohar (Dara) and Moga (Farm); 1967-68 : Sonapat, Rohtak, Moga and Bhatinda (Indigenous White, all markets)
	1968-69 : Sonapat, Ambala, Moga and Bhatinda (all White)
	1969-70 to 71-72: Sonapat, Ambala Jullundur and Bhatinda (all White)
Uttar Pradesh :	1952-53 to 1963-64: Hapur and Bahraich (quality unspecified)
	1963-64 to 1966-67: Hapur (Dara) and Bahraich (White)
	1967-68 to 1971-72: Hapur and Bahraich (both White).

founded, the objection is at least partly met with. We have tried the alternative of using lagged production but the results are not satisfactory. The estimated price equations are given in Table 6.

For the purpose of this estimation we had converted the entire price series to the common base 1952-53 = 100 (this meant conversion of the series after 1961-62 to the old base) and hence all the following reckoning of the prices is in index terms with 1952-53 = 100. The results are interesting. The vari-

ables we have considered account for almost the entire variation in the harvest and annual average price and only to a slightly smaller extent in off-seasonal prices. Shortages (as measured by I) have a greater impact on the off-seasonal price than on the harvest price, which is only to be expected. The impact of support operations (measured by the dummy D) on the harvest price (67 points) is greater than the impact on off-seasonal price (57 points). Thus, other things remaining unchanged, the support operation

seasonal price—harvest price) by 10 points and contributes significantly to intra-year price stability. Large zones make no significant impact on prices; single state zoning reduces the off-seasonal price by 23 points and the annual average by 12 points while it makes no significant contribution to harvest price variations (the annual average is not very different from the average of the two seasonal prices we have considered here). Hence the single state zoning system also has a tendency to reduce seasonal variation and bring about intra-year price stability. (Of course, this is in a way a restatement of the data for 1951-54, the period of single-state zones, which exhibit very little seasonal variation—Table 2.) But the fact is of no moment for the period 1968-72 during which there were either no zones or there were only the larger zones which are now demonstrated to be ineffective. The contrast between 1953-57 and 1968-72 with respect to price behaviour is now easily explained: in the first there was no significant support-cum-procurement drive and stiff zonal restrictions were present in 1953-54 and 1954-55 while the later period was characterised by both support and the virtual absence of movement restrictions; these facts explain the declining trend of 1953-57 and absence of such a trend during 1968-72.

And since the support policy enhances harvest price more than the off-seasonal price and on the other hand, the absence of zones implies a normal seasonal rise (which their presence might well neutralise) the two factors might combine to produce a measure of seasonal stability. Hence, the policy of relaxation of movement restrictions in good years must be interpreted as a deliberate policy to keep price at a high and fairly stable level throughout

Source : Reports of the Agricultural Prices Commission.

the year. We must also remember that the normal seasonal rise that can be attributed to market forces (i.e., excess demand) gradually decreases with rising production. This, of course, eminently suits the large farmers because they need not wait for the seasonal rise till the end of the year but instead can dump practically all their surpluses in the harvest season thus saving on storage costs in the bargain. The expected result on the pace of market arrivals is to be found in the actual data (Table 7).

Turning back to the computed price equations we now wish to see if the seasonal pattern of market arrivals influences the seasonality in prices. For this purpose, strictly speaking, one must look at the seasonality in both these variables in all the four quarters but in this study we have concentrated on just the harvest and lean seasons. We simply used the proportion of arrivals in a season as an additional variable to see what difference it makes to the equations of Table 6. Market arrivals information is available only from 1958-59. After this year, excepting for 1967-68 when single-state zoning was in force, there were either large zones or no zones at all. And, since large zones are ineffective we finally used I , D and the rate of arrivals (A) to explain variation in seasonal prices with the data for 1958-59 to

1970-71 except 1967-68.¹⁰

These are the estimated equations (omitting the suffix 't') based on the 12 observations:

$$(a) p_h = \text{harvest price} = 76.63 \\ - 0.21 A_h + 5.24 I + 67.94 D \\ (0.43) \quad (0.71) \quad (8.7) \\ R^2 = 0.977$$

$$(b) p_o = \text{off-seasonal price} = 133.72 \\ - 3.52 A_o + 7.92 I + 21.44 D \\ (0.83) \quad (0.85) \quad (9.36) \\ R^2 = 0.978$$

where A_h and A_o denote the proportion of arrivals in the harvest and off-seasons respectively.

It can be seen that the arrival rates do not influence the harvest prices but they have a significant impact on the prices in the lean season. Although these equations are estimated on the basis of fewer observations the proportion of variation explained in (b) is very much higher than in the previous case (Table 6) lending credibility to the estimates. Except for the co-efficient of D in (b) there is close agreement with the earlier estimates. Equation (b) implies a much smaller impact (21 points) of support policies on p_o than the earlier estimates (57 points).

This is essentially because in the earlier estimate the price increase is mostly attributed to D while, as it is clear now, at least part of it should be attributed to the slackening of year-end arrivals.

Shriram Urea and other Shriram fertilisers are fulfilling their promise of plenty in food production.

Now when the country is facing its toughest challenge on the economic front, Shriram Chemicals is well prepared to meet its responsibilities in the crucial field of chemicals.

With the increase in production of fertilisers, Shriram Chemicals is not only helping the farmer but is also keeping the imports to the minimum. In addition, it is contributing towards the development of the country's plastic industry by manufacturing PVC resins/compounds.

**Quality products from
Shriram Chemicals:**

• Urea • Superphosphate
• PVC resins/compounds
• Caustic Soda • Sulphuric acid • Chlorine.

SHRIRAM CHEMICALS

fulfil their promise of plenty...
through chemicals.

TABLE 11 : ESTIMATED PRICE EQUATIONS—PUNJAB-HARYANA

Dependent Variable (price) No	Estimated Co-efficients of						Constant	R ²	Period of Study
	I	D	L	S	A _h	A _o			
(1) Annual	2.68 (0.37)	27.07 (2.84)	-2.09 (2.44)	-11.40 (2.80)			33.77	0.964	1952-53 to 1971-72
(2) Harvest	2.24 (0.36)	28.36 (2.80)	-3.04 (2.40)	-7.51 (2.76)			32.93	0.961	-do-
(3) Off-seasonal	3.31 (0.76)	23.44 (5.80)	-2.97 (5.02)	16.46 (5.71)			42.14	0.872	-do-
(4) Harvest	2.13 (0.99)	21.68 (9.45)			0.08 (0.42)		38.82	0.808	1958-59 to 1971-72 except 1967-68
(5) Off-seasonal	3.69 0.78	18.76 6.72				-1.10 0.74	40.97	0.906	

Note : In the Table A_h and A_o stand for per cent of arrivals in Punjab-Haryana in the harvest and off-seasonal periods, respectively.

However we have already remarked that the arrival rate itself is determined by state policies. If this inter-dependence is taken into account in an appropriate manner much of this estimation difficulty will disappear. But it must be noted that the present set of equations, (a) and (b), only strengthen the conclusion arrived at earlier that support policies reduce the seasonal rise by raising the harvest price higher than they raise the off-seasonal price. However, they also imply a smaller impact (rise of 44 points) of support operations on the annual average price than estimated earlier (rise of 64 points).

IV

Inter-State Variations

So far we have been discussing the behaviour of the all-India average price. We now examine prices in the Punjab-Haryana region and Uttar Pradesh. Since price indices are not available we have estimated prices for these regions based on whatever little market information is available (Table 8). These estimates are not strictly comparable over time and we must bear this important limitation in mind in what follows. Data on pace of market arrivals in the two regions are given in Table 9. The change in the pattern of arrivals since 1968 can be seen to be more marked in the Punjab-Haryana region than in UP.

Now, the bulk of the grain is procured in these two regions (Table 10) and we can reasonably expect the influence of support prices to be reflected in fair measure in the prices prevailing there. But UP's contribution appears to be marginal, except in 1968-69 and 1971-72. In any case, we have decided to work on the hypothesis that 1967-72 was governed by a regime of support prices for both the regions. Since Punjab-Haryana has always been a surplus region we have used the same set

of variables, viz, I, L, D and S, as in the case of all-India to explain price variations. The underlying assumption is that the all-India excess demand determines the Punjab price. Besides we have also tried to see if the arrival pattern influences the seasonal prices. The results follow (Table 11).

The results are strikingly similar to the all-India ones. Since this analysis was done with wholesale prices in Rs per quintal a comparison can be made with the co-efficients in Table 6 (which are in index terms with 1952-53 = 100) by multiplying the co-efficients of Table 11 by a factor 100 ÷ 34.5, this latter being the average Punjab price in 1952-53. It can be seen that support operations raise the annual average Punjab-Haryana prices by about 80 points while raising all-India prices by only 65 points (or 44 points if we were to go by an alternative estimate). Similar relations hold between Punjab and all-India in respect of seasonal prices. As in the case of all-India, large zones have no significant impact on prices; single state zoning has a far greater impact (a reduction by 33 points) on annual prices of the Punjab region than on all-India average prices (a reduction of 12 points). All these conform to expectations but the implication of these facts to interregional inequalities cannot be overemphasised: relaxation of zonal restrictions in good years has a similarity with the policy of support — both favour the farmers of Punjab-Haryana more than the others. We have already discussed the influence of these policies on seasonal stability in prices and the rate of market arrivals. In recent years, in the Punjab-Haryana region market arrivals in the lean season (January-March) barely constituted 2 per cent of the year's total (Table 9); the Punjabi farmer is able to unload as much as 75 per cent of his surplus in the post harvest period at — thanks to

the government — what might be euphemistically described as an incentive price.

Our Punjab analysis has highlighted how policy measures contribute to the enhancement of interregional inequalities. We shall examine how far the UP data support this conclusion. For analysing UP prices we have used net imports of wheat into UP (i) by rail and river¹² as a proxy for excess demand. This is not very satisfactory because of possible year-to-year variation in the proportion of grain moved by road but, perhaps, is the best choice from the available data. Also, the zoning status for UP is different from the all-India pattern in one important respect: under the large-zone system UP continued to constitute a zone by itself in all but one of the years (1966-67) when this system was in force. In 1966-67 UP was merged with the northern wheat zone.¹¹ Since large zones are ineffective we have introduced one single dummy for zoning, Z, which assumes the value 1 for 1953-54, 1954-55, 1957-58 to 1960-61, 1964-65, 1965-66, 1967-68 and 1968-69 and 0 for the rest of period. (Our analysis of UP is restricted to the period 1953-54 to 1969-70 for want of data on UP's imports for the other years.) The results of the analysis will be found in Table 12.

To make these co-efficients comparable with those in Table 6 we must convert these into index terms with 1952-53 = 100; since average price in 1952-53 in UP was Rs 50.9 per quintal this implies multiplication of the entries in Table 12 by approximately 2.

The results present a mixed picture partly because of the unsatisfactory nature of i (imports into UP by rail and river) as an indicator of shortage. However, some tentative conclusions can be drawn. Support operations raise average annual prices by about 40 points in contrast to a similar rise

TABLE 12: ESTIMATED PRICE EQUATIONS—UTTAR PRADESH

Dependent Variable (Price)	Constant	Co-efficient of					R ²	Period of Study
		i	D	Z	A _h	A _o		
Annual	35.00	22.32 (8.69)	20.70 (12.73)	10.27 (7.71)			0.672	1953-54 to 1969-70
Harvest	34.76	11.45 (8.04)	33.65 (11.52)	10.75 (7.13)			0.692	-do-
Off-seasonal	38.22	31.24 (9.18)	9.37 (13.56)	5.15 (6.16)			0.668	-do-
Harvest	106.16	5.65 (6.12)	38.29 (7.21)	4.71 (5.15)	-1.23 (0.31)		0.912	1953-59 to 1969-70
Off-seasonal	88.77	25.63 (8.03)				-2.54 (0.91)	0.725	-do-

Note: A_h and A_o represent arrival rates in UP in the harvest and off-seasonal periods.

in the Punjab-Haryana region by 80 points. The policy of support appears to raise the harvest prices and leave the off-seasonal prices undisturbed at their normal levels. This could be a reason why in UP market arrivals in the lean season have not slackened off to such a great extent as in Punjab-Haryana (Table 9).

None of the co-efficients of Z are significant at the 5 per cent level but the one in respect of harvest prices is significant at the 10 per cent level. If at all anything is implied in this it is that zoning raises harvest prices in UP which may indeed be true.

All these are factors that promote inter-state inequalities. Relaxation of movement restrictions is a policy that favours the farmers of Punjab but not of UP, while support prices favour farmers everywhere but they favour the Punjabi farmer more than the others.

It is possible now to use our estimated equations to evaluate the net effect of various combinations of support and zoning policies on the trend and seasonal variation in Punjab-Haryana as well as UP. However, we shall restrict ourselves to just two alternative policies and evaluate their implications for the period 1968-72. The two policies are: support combined with unfettered movement, the actual policy that prevailed during this period, which we shall call policy A; and the policy of withdrawing support combined with the single-state zoning system everywhere, which we shall call policy B. Now, it is obvious that policy B will bring down prices; in particular for the period 1968-72 this policy would have seen prices dropping to the floor levels — or the currently notional support prices — which would have enabled the government to procure large quantities of grain at these depressed price levels. For evaluating policy B it would thus be

necessary to bring in such considerations as support prices that would cover costs and normal profits. We are not attempting this here but merely using our equations which are based on the working of the single-state zoning system of the early fifties and hence our estimates corresponding to policy B would merely reflect the 1951-55 pattern so far as the impact of zoning is concerned, without reference to the rational concomitants of the policy like, for example, a properly planned regional allocation of the procured grain. However, for what they are worth, we give these estimates (Tables 13 and 14).

For Punjab we have computed harvest prices on the basis of the second equation in Table 11. We give two sets of estimates of off-seasonal prices, (1) and (2), based respectively on equations 3 and 5 of Table 11. The latter of these has A_o as one of the variables. We have already argued that the arrival pattern itself is influenced by policy measures. Hence, for estimation in (2) we assumed that the lean season arrivals (A_o) will increase to 5 per cent (in contrast to the current 2 per cent) under the regime determined by policy B. The prices in the second set of estimates are higher than in the first because of this smallness of A_o. Under policy B we can reasonably expect harvest arrivals to

diminish very significantly from their current high levels (75 per cent); taking this fact into account we must regard the second set of prices as being on the high side. We have estimated UP prices corresponding to policy B for the years 1968-69 and 1969-70 only because of the lack of information on i (import into UP by rail and river) for the later years. These estimates are based on the equations in Table 12. For harvest prices the first set (1) is based on equation 2 and the second (2) on equation 4 with the additional assumption that A_h will be 50 per cent under policy B. The first set (1) of estimates of off-seasonal prices are based on equation 3 and the second set on equation 5 where we assumed that A_o = 15 per cent (as against the actual 13.7 per cent and 10.7 per cent for 1968-69 and 1969-70, respectively).

Our estimates of actual prices for both the regions, for the period 1968-72, are all fortunately based on prices for indigenous white wheat and this, we hope, validates their comparison. It will be seen that actual prices (i.e., those corresponding to policy A) in UP were lower than their corresponding levels in Punjab-Haryana (except in respect of the off-seasonal price in 1960-70). It will also be found that policy B will not only reverse this relation but also

TABLE 13: PRICES UNDER ALTERNATIVE POLICIES—PUNJAB HARYANA

Year	(Rs per quintal)				
	Actual prices (Policy A)		Policy B		
	Harvest	Off-Season	Harvest	Off-Season	
				(1)	(2)
1968-69	75.7	92.8	48.1	59.2	72.9
1969-70	80.9	95.9	46.6	59.0	70.3
1970-71	83.2	84.1	45.3	55.4	67.5
1971-72	80.4	91.0	42.7	51.2	63.9

lower prices everywhere and give rise to declining trends in Punjab in keeping with the rapid increase in production. Since UP has continued to be a net importer even in recent years it is easy to see why policy B will bring in such a change in relative prices and equally easy to see policy A as an instrument responsible for increasing inter-state disparities.

V

Intra-State Inequalities

Recalling that market prices are determined by the combination of the three factors, excess demand, support prices and zoning policies, we may now examine the nature of the contribution of each of these to the fortunes of different rural classes. For this purpose we need to remember the following facts: (a) the choice between selling during the harvest season and holding on to sell later for a price advantage exists to a significant degree only for the large farmers (loosely speaking, the holding power increases with farm size); (b) a phenomenon related to (a) is that market dependence also declines with farm size. At the bottom is the landless labourer who is almost entirely dependent on the market for his consumption needs.¹³

Now, an increase in excess demand enhances both the average price and the seasonal rise, i.e., the increase in the lean season price over the harvest price (Table 6). Given the pattern of selling and buying determined by (a) and (b) above, it is obvious that small farmers and labourers are much better off when production rises faster than demand. The tendency of unfettered grain movement to dampen seasonal variation is a factor favourable to small farmers and landless labourers so far as their buying is concerned, but this same factor gives a very big advantage to the large farmers in their selling operations. But the kingpin is the support scheme which raises prices all round the year by an amount which wipes off any marginal advantage that small farmers and labourers may derive from the other two factors, particularly from a rapidly rising production. Table 15 illustrates the operation of policies A and B on all-India prices.

A superimposition of these two sets of prices on (a) and (b) will yield information on the impact of policies on inequalities between different classes of farmers. Despite the absence of detailed data on (a) and (b) we can see

TABLE 14 : PRICES UNDER ALTERNATIVE POLICIES—UP

Year	Actual Prices (Policy A)		Policy B			
	Harvest	Off-Season	Harvest		Off-Season	
			(1)	(2)	(1)	(2)
1968-69	74.1	82.0	53.5	53.5	65.2	68.6
1969-70	78.7	100.9	72.9	63.0	118.3	112.2
1970-71	81.8	84.7				
1971-72	73.1	86.5				

TABLE 15 : ALL-INDIA PRICES UNDER POLICIES A AND B* (1952-53 = 100)

Year	Actual Prices (Policy A)		Policy B	
	Harvest	Off-Seasonal	Harvest	Off-Seasonal
1968-69	174	191	111	136
1969-70	179	211	108	131
1970-71	185	190	106	127
1972-72	181	197	99	118

* Computed on the basis of the equations of Table 6.

that policy A tilts the income distribution in favour of sellers while the low prices corresponding to B give immense relief to all the rural poor.

VI

Concluding Remarks

The events of this summer (1973) following the take-over of the wholesale trade in wheat confirm our main finding that prices are made to behave as they do. A good harvest of wheat succeeding a poor kharif season has created the right atmosphere for securing price increases. The procurement price of Rs 76 per quintal made no impression on the farmers and all the well known devices for enhancing the price are already at work: bonus schemes, subsidies for inputs and so on. The APC has also fallen in line, recommending an increase in the procurement price of paddy for the coming kharif season and the chief ministers have accepted this subject to the proviso that "these would be support prices and not procurement prices."¹⁴ And "the implication of this decision is that the government will have freedom to offer a higher price to the growers, if market conditions necessitated, to fulfil procurement targets".¹⁵

We have been arguing so far that price policy has been designed mainly to protect the interests of the large farmer and that this form of intervention contributes to the worsening of both inter-state and intra-state inequalities. Given a highly skewed land distribution and the resulting concentration of mar-

keted surplus in the hands of the big farmers it is obvious that any upward movement of the price level combined with seasonal stability will have adverse effects on the income distribution. In the context of this argument it is, however, necessary to examine the relationship between cost and price. Another related question is that of price incentives. Both these issues require detailed study and a beginning can be made by raising the question of how actual cost of production compares with, say, a procurement price of Rs 76 per quintal.

Unfortunately, even the APC has not gone into the question of costs in detail: the Commission mainly looks at the increase in the price of some inputs to determine the warranted increase in the procurement price leaving aside the more important question relating to the level of prices. While lack of suitable data could be one reason for this, other difficulties are also likely to arise in the estimation of costs: for example, how does one treat family labour? These questions are being examined and the results will be reported separately.

[An earlier version of this paper was presented at the seminar on Political Economy of Indian Agriculture at Calcutta in March 1973. The author is grateful to Shri K Gurumurthy of the APC for making available a number of APC reports. Thanks are due to Nirmal Chandra, T N Krishnan, Ashok Mitra and K N Raj for useful discussions.]

Economics of Irrigation Engineers

Deepak Lal

The Irrigation Commission's report, while providing ample evidence of the importance of irrigation in India's past and future economic performance, contains fundamental and elementary errors of economic analysis which should make an undergraduate blush. The economics of irrigation is an important, sophisticated and technical subject and, in attempting to tackle a subject outside its competence, the Commission has made a terrible mistake. It is imperative, therefore, that the Commission's chapters on the economics of irrigation be set aside and a commission of economists be appointed to determine the economic criteria for designing, selecting, running and financing irrigation projects.

IF any proof were needed, the Irrigation Commission (1972)'s report now provides enough justification for the view that irrigation policy is too important to be left to irrigation engineers, and in particular to the Ministry of Irrigation and Power. For the Commission report (written mainly, I presume, by irrigation engineers) whilst providing ample evidence for the importance of irrigation in India's past and future economic performance, also contains enough fundamental and elementary errors of economic analysis which should make an undergraduate blush, and if it didn't, would certainly lead to his failure! To avoid a similar fate for the much more important future of India, it is imperative that the Commission's chapters on the economics of irrigation be set aside and an economists' commission be appointed *post haste*, to determine the economic criteria for designing, selecting, running and financing irrigation projects. The rest of this paper will substantiate these harsh conclusions.

IMPORTANCE OF IRRIGATION

"The Commission estimates the total irrigation potential of the country, both from surface and ground water resources... as of the order of 81 million hectares. This would provide irrigation facilities to about 50 per cent of

the total cropped area" (para 19.38) "...the massive investment of Rs 21,300 million made since 1947 on irrigation works, and the very large programme recommended by us... which is likely to cost Rs 100,000 million..." (para 11.80)

"The hard-core areas of drought comprise about 16 per cent of the total geographical area of the country and account for over 11 per cent of its population. At present, about 13 per cent of the cropped area of the drought affected region is irrigated. This is likely to rise to about 19 per cent when the schemes under execution are completed. In the drought areas of Madhya Pradesh, Mysore, Maharashtra, and Gujarat, where the present level of irrigation is lower than 13 per cent, the position may be worse. The extent of the area irrigated in the drought districts is not likely to go above 25 per cent of the cropped area when all the works proposed by the states for these areas are completed" (para 19.31).

"The food and fibre requirements at the end of the century will... increase by about 100 per cent... The country must, at the very least, produce twice its present output of food and fibre. This increase is possible if more areas are brought under irrigation" (para 19.35).

The above quotations from the Commission's report underline the importance of irrigation, and also underline the scarcity of irrigation water, whose allocation between uses and users will thus have significant welfare effects. The Commission is also right in stressing the integrated use and development of surface and ground water resources (para 19.14), and the need for irrigation policies which take account of both efficiency and equity, and which moreover are formulated within a new administrative framework of river basin authorities (paras 19.10 and 19.52). It is when it tries to provide guidelines for these policies that it falls flat on its face!

INVESTMENT CRITERIA

The Commission recommends the use of a benefit-cost ratio for selecting irrigation projects. In comparing it with the rate of return criterion it states:

"In the benefit-cost ratio, the benefit represents the total gains accruing from a project, and the cost represents the expenditure involved in producing them, all in terms of current values. The rate of return deals with a different aspect, as it connotes a ratio between the current annual net benefits from a project and the capital investment on the project. The *inter se* ranking of two projects can be different with these

two criteria. The rate of return method, which is more complicated than the simplified benefit-cost ratio, is more suited as a basis for making a choice between two investments and *where financial return is the dominant consideration and no constraints are imposed by national goals*. Of these two criteria, we recommend the continued use of the benefit-cost ratio for irrigation projects" (para 11.7, emphasis added).

More seriously, the Commission states: "In working out the ratio [benefit-cost], the benefit should be taken to comprise the difference in the value of total annual agricultural production less the cost of cultivation, before and after the introduction of irrigation. The cost should be taken to comprise the annual interest on capital, depreciation, and expenditure on maintenance and operation" (para 11.5). In para 11.17, the "Benefit-cost ratio = Net annual benefit/annual cost".

However, it is well known that the benefit-cost ratio thus defined is not a correct investment criterion to use for either private or public investment. The correct criterion to use is the present value or internal rate of return criterion (taking account of possibilities of terminating the project) [See Feldstein and Flemming, Arrow and Lehari]. Moreover as Prest and Turvey point out: "Where a rule which is not algebraically equivalent to the present value approach is used, the issue is not one of convenience, but involves either error or a different maximand" (p 97).

A benefit-cost ratio which is algebraically equivalent to the present value rule can be derived, and this would be given by the ratio of the present value of the benefits to the present value of the costs. However, this ratio will only give the same investment decisions as the present value/internal rate of return criteria if "no projects are interdependent or mutually exclusive, where starting dates are given and where no constraints are operative" (Prest and Turvey, p 96). Thus if there are two mutually exclusive projects (e.g. whether a large or a small dam should be built on a particular site), one project may have the lower cost-benefit ratio, and yet may be better if the *extra* benefits are greater than the *extra* costs (See McKean). The other complications, too, can only be dealt with within a present value framework [Marglin(a), (b)].

Given that there is now a large and sophisticated literature on cost-benefit analysis, and much of it developed

specifically for the design and evaluation of water-resource systems (See Mass, *et al*, Eckstein, Marglin) the naivete of the Commission's discussion of investment criteria is surely unforgivable.

MEASUREMENT OF SOCIAL BENEFITS

In para 11.17, the Commission gives a proforma for calculating the benefit-cost ratio. Both benefits and costs are to be calculated at market prices. There is a sufficiently large literature which shows that particularly in developing countries with their distortions in factor and commodity markets, market prices are not good measures of social value, and hence it is necessary to use 'shadow' or accounting prices (See Little-Mirrlees, UNIDO). Moreover, there have been attempts at evaluating Indian irrigation projects at shadow prices (See Raj, Lal, Lal and Duane).

Even if market prices did represent social values, there is no justification for the Commission's recommendation that "share and cash rent" be included as social costs in the calculation of the net annual benefit of an irrigation project (para 11.17, items A (b), 6 and 7). These items represent transfer payments, and whilst there may be a case for putting distributional weights on these items, they do not represent a cost to society, though they obviously do to the private cultivator. Thus the measure of benefits which the Commission recommends is clearly just the *private* annual net benefit, and not (as it should be) the *social* net benefits of the project.

UNCERTAINTY, DISCOUNT RATES, AND INCOME DISTRIBUTION

Compounding its previous errors, the Commission also states: "We are informed that projects with a benefit-cost ratio of less than 1.5 are generally not considered for acceptance, although theoretically a ratio of unity should meet the criterion. We consider this to be a prudent precaution. We have come across several instances where project costs have increased twofold or even more while the rise in commodity prices has been much less. A lower benefit-cost ratio than 1.5 would in these circumstances, lead to the acceptance of marginal projects which may later prove to be economically unsound" (para 11.10).

There is no justification for this recommendation. For public investments (as Arrow and Lind have shown), given the opportunities open to society for spreading and pooling risks, any uncer-

tainty should be taken account of by delineating the various possible outcomes of the relevant variables, assigning probabilities to these outcomes (here past experience with other projects can be a help), and obtaining the *expected* present value of the project, by multiplying each possible outcome by its probability of occurrence, and summing over all possible outcomes. If the risks cannot be spread, this risk neutral criterion would not be valid, and then it will be necessary to adopt an expected utility framework, in which the risk aversion of those bearing the risks will need to be taken into account. However, in both cases the rule of thumb recommended by the Commission would be wrong. (For an attempt to take account of some of the uncertainty associated with minor irrigation in Maharashtra see Lal).

Equally arbitrary is the recommendation for using a 10 per cent interest rate (which would presumably be the discount rate in present value calculations) in calculating the benefit-cost ratio (see para 11.9 of the report). The choice of the correct discount rate is a complex one depending upon the choice of numeraire (present consumption or savings), and the existence of absence of an overall savings constraint, which depends on the social value judgments concerning the value attached to aggregate consumption at different dates, and the present and future productivity of investment (see Little-Mirrlees, UNIDO). The naive treatment of this extremely important parameter in investment planning in the Commission's report will just not do. (For an attempt to estimate a discount rate and the associated intertemporal parameters for India, see Appendix II, in Lal.)

Finally, there is the sketchy and naive treatment of the important issue of intratemporal income distribution problems in paras 11.26 and 11.27 of the report. There is clearly a case for incorporating distributional weights into project analysis, and elsewhere I have attempted to derive such weights [Lal (b)], and they have been applied in a reappraisal study of a World Bank financed irrigation project in India (see Lal and Duane). Though these weights inevitably depend upon explicit value judgments (of the form and parameters of a social welfare function) it is better to face this issue squarely, than to recommend as the Commission does that "the Union Government should provide loans" for irrigation works in drought prone areas "at a concessional rate of half the normal rate charged for irrigation schemes" (para 11.27)!

AYACUT DEVELOPMENT, SOIL CONSERVATION AND SILTATION OF DAMS

The Commission is right in stressing the importance of ayacut development as an integral part of major irrigation projects. The past neglect of this important aspect of project design has led to a high degree of underutilisation of irrigation water, with consequently substantial losses to the national economy (See Lal and Duane). Here again the economist's skills are necessary at the design stage to determine the best way to carry out these developments.

The problem of siltation of dams, too, is rightly noted as an important one by the Commission, as is the role of soil conservation measures in preventing this erosion. However, here again the economist can offer advice on how much expenditure on soil erosion is justifiable to prevent siltation. Thus, if we assume that (a) reduction of the annual siltation rate is proportional to expenditure on soil conservation as far as a lower limit (of siltation) below which it is impossible to get; (b) there is a dam already constructed, and no possibility of constructing another on the same site; (c) there is no distinction between dead and live storage, which is a legitimate assumption if it is true that the silt reduces live and dead storage in the same proportions, and not as is fondly hoped that first the dead storage is silted up; (d) benefits are directly proportional to the capacity of the reservoir; (e) there is a constant rate of interest; (f) all soil conservation can be done at once (which is a restrictive assumption) and works without a time lag (which is not a restrictive assumption, since we can take at the time at which the soil conservation takes effect as our zero point), then it can be shown (see Appendix A to Ch VI by Roger Witcomb, in Lal and Duane), that *all or none* of the soil conservation work is the optimal policy as

$$f \leq (b/r^2) [1 - (se^{-rv/s} - Le^{-rv/L}) / (s - L)]$$

where f - net cost of reducing siltation by one acre-foot
b - benefit per year accruing from one acre-foot of storage
r - rate of interest
s - untreated rate of storage
v - capacity of reservoir at time zero
L - lower bound on rate of siltation

THE PRICE OF IRRIGATION WATER

Publicly produced irrigation water is an important public intermediate good. There is by now a very large and tech-

nical literature on the 'optimal' pricing policies of public enterprises. The classic Hotelling case for marginal cost pricing was based on the implicit assumption that public sector deficits (which might ensue by following this rule) could be financed by non-distortionary taxation and the distributional effects could be neglected. Once these assumptions are relaxed, as they must be, more complex rules ensue (see Diamond-Mirrlees, Feldstein). The determination of the 'optimal' water rates subject to the relevant constraints, for each major irrigation project is an important and to the best of my knowledge, hitherto neglected subject in Indian applied economic research. This lacuna needs to be filled. But meanwhile, whilst agreeing with the Commission's view that in general existing water rates in India are probably too low, its recommendation that "the rate should be related to the gross income from the crop and not to the cost of the project. [It] should range between 5 per cent and 12 per cent of gross income, the upper limit being applicable to cash crops", must be dismissed as being arbitrary, with no clear economic rationale. Its statement that "there can be no precise formula for the fixation of water rates, which must therefore remain a matter for administrative decision" (p 268), can only fill one with extreme gloom for the future of any sensible policies being developed and adopted in this extremely important area!

CONCLUSIONS

Enough has been said above to substantiate our main thesis that irrigation policy is too important to be left to irrigation engineers. What needs to be further stressed is that the economists'

skills are not only required to evaluate projects, but even more importantly at the design stage. There are passages in the Commission's report, like the following, which make one suspect that irrigation engineers are likely to design projects on purely engineering criteria, and having done so, will use any argument available to justify them and get them sanctioned. Thus the Commission rather revealingly states:

"During our discussions with the state governments a fear was expressed by some that a joint appraisal of an irrigation project and its ayacut development, particularly the operations of land leveling and land shaping, would show the project to be less attractive, and for this reason there may be some difficulty in securing approval. We have examined this apprehension by studying a few cases for which data could be had... the effect of including the cost in working out the benefit-cost ratio would be relatively small" (para 11.15). Does this imply, that if its studies had shown that the costs would have been high, and hence he 'fears' of the state governments were 'justified', that it would have recommended that the ayacut development costs should not be included in working out the benefit-cost ratio? It is this cavalier treatment of the economics of irrigation which is the most distressing and dangerous aspect of the Commission's report. Lest it be taken seriously, it should be remembered that as we have tried to show, the economics of irrigation is an important, sophisticated and technical subject, and that in attempting to tackle a subject outside its competence, the Irrigation Commission has made a terrible mistake. Engineers (and economist!) had perhaps best stick to their lasts!

Public Issue by Prabhudas

C PRABHUDAS AND COMPANY, which has a wire drawing plant at Bhavnagar and has been in production since 1970, is stepping up its annual installed capacity from 9,000 tonnes to 15,400 tonnes. The range of products comprises high tensile, spring steel, mild steel, tyre bead and other varieties of wires. The company has been granted ISI mark and also sanctioned quotas for wire rods, zinc and lead. Moreover, when the wire rod plant of the sister concern 'S I F Steels' goes into production by the end of 1973, the company will be able to secure its requirements of wire rods and save to the tune of Rs 200

per tonne on transport charges. It is proposed to offer to the public equity capital of Rs 57 lakhs in shares of Rs 10 each for subscription at par under a Prospectus. Part of the finance proposed to be raised will be utilised to repay some of the loans taken by the company and part for extension of manufacturing facilities. Increased capacity would reduce cost of production and yield good profits. Promoted by the Mehta Group of industries, the company will be managed by a board of directors consisting of professionals and persons experienced in the line.

Factors Affecting Wage Rates for Agricultural Labour

Kalpana Bardhan

Any increase in irrigation and cropping intensity is likely to raise agricultural wages more in an area with a smaller proportion of the rural labour force dependent on wage employment and/or with higher non-agricultural wage rates than in an area where vast masses of tiny peasants and the landless flood the labour market and the non-agricultural sector is too small to absorb much of it. This may not happen if the farmers in the former area resort to using a lot of labour-saving machinery, or the labourers in the latter organise themselves for group bargaining. If the former is characterised by substantial and wide-spread underemployment it would dampen or block entirely the rise in the wage rate. Much of the data studied here indicate that irrigation or multiple cropping does generate a positive response not only in the wage income but also in the daily wage rate for agricultural labourers.

It seems that the worst possible combination of factors is to be seen in areas where the labour market is flooded by the virtually landless, the level of agricultural productivity is stagnant, and the non-agricultural employment opportunities too small. This is more or less the case in many parts of Madhya Pradesh, eastern Uttar Pradesh, Bihar, and any number of pockets in almost every state. The situation is relieved a bit from time to time by migration of labourers. But usually the migration is not large enough, and the wage rates continue to remain depressed. All our crash schemes for rural employment need to be concentrated in these areas of extremely low levels of wages, even if overt unemployment at the prevailing wage rate is not so large in their case, instead of being spread out thinly over the whole country.

N a situation where a substantial proportion of the rural population is primarily dependent on agricultural wage employment, and where such labour is hardly organised for group bargaining¹ or covered by effective wage protection measures by the government,² how do the wage rates for agricultural labour tend to respond to certain economic and other changes? Most of the data on agricultural labourers in India, though rather inadequate or a time series analysis (besides being affected by changes in concepts used for different nationwide surveys), are quite suitable for cross-sectional analysis. This paper is based on the results of some village-level and state-level cross comparison between variations in agricultural wage rates and those in certain basic factors affecting the demand and supply parameters.

I

Let us consider wage determination in a simplified situation where agricultural production depends only on land and labour. A landowning household can either lease out its land beyond what economically utilises the supply of family labour) or cultivate with hired labour. Similarly, a landless household can either lease in land or hire out the labour of its members. In this situation, the equilibrium involves equalisation of the demand for and the supply of wage labour and, on the other side, similar equalisation for the use of land, both being functions of the wage rate and the rent. If production functions are unchanged, the mar-

kets for labour and land perfectly competitive, and there are no exogenous effects, the equilibrium would determine the rates of wages and rent along with the extent of wage employment and of land under tenant cultivation.

Irrigation, with the usually accompanying changes in the pattern and intensity of cropping and biological-chemical innovations, comes into this picture as a major shift parameter. An increase in irrigation shifts upward the demand as well as the supply curve for labour. The higher yields for the wet crops, the multiple cropping, and the more intensive interculture required in irrigated cultivation serve to raise directly the demand for labour,³ apart from the indirect effects of maintenance of the irrigation system. The labourer too would charge a higher rate as the alternative of leasing in land becomes more remunerative. Besides, the rise in the demand for labour for the peak season operations is likely to enhance his bargaining strength. Given other things as equal, a region with a larger proportion of its net sown area under irrigation can thus be expected to have a higher wage rate for agricultural labour (as well as a higher level of rent). The same would be true of intensity of cropping which reflects some of the effects of rainfall and soil conditions as well as irrigation.⁴ An alternative approach would be to look at the degree of production uncertainty which arises mainly from fluctuations in rainfall and the extent of weather dependence of production (inversely,

the extent of assured irrigation). On the demand side, more uncertainty would induce the landowner to lease out and the cultivator to plan for a less intensive cropping pattern with more of drought-resistant, labour-saving crops. On the supply side, by raising the uncertainty of getting agricultural wage employment, it would induce the landless to seek non-agricultural employment. A simple, though rough, index of production uncertainty in a region is the variance of production around the trend over a period of time. One would expect a negative relationship between this and the agricultural wage rate. This line of reasoning assumes, of course, the absence of substantial regional differences in the degree of unemployment or underemployment of labour in the agricultural sector.

An important factor on the supply side is the wage level prevailing outside the agricultural sector. For the landless and the marginal cultivators, there is a third alternative apart from agricultural wage employment and leasing in land, viz. non-agricultural wage employment. Hence, given other things, the wage rates for unskilled labour in the non-agricultural sector would affect the agricultural wage rates. A state like West Bengal or Maharashtra with more industrialisation and urbanisation tends to have higher agricultural wage rates than Orissa. Similarly, the presence of a large plantation sector may have a positive effect on agricultural wages in Assam and Kerala.

Notations : Y : Daily wage rate for casual male agric. labour
Y' : Annual wage for the same (from Agr. work).
X₁ : p. c. of net sown area irrigated.
X₂ : Agril. labour household as p. c. of rural households.
X₂' : Average debt per agric. labour h.h.
X₃ : Annual wage for the lowest paid labour in manufacturing industry (earning less than Rs 200 per month).
X₃' : Daily wage for casual male agricultural labour in non-agriculture work.
X₄ : Variance of agricultural production index numbers around the 1951-1961 trend.
*** : Co-efficient significant at the 1 p.c. level (two tail 't' test)
** : Co-efficient significant at the 5 p.c. level.
* : Co-efficient significant at the 10 p.c. level.

A reasonable approximation for the supply parameter is the proportion of rural people or rural working force primarily dependent on agricultural wage employment. The actual time distribution of this labour supply between different kinds of employment, self-employment, and unemployment tends to reflect the equilibrium. Differences in the proportionate size of the agricultural labour population are also likely to reflect something more than shifts in the supply curve. Like the co-efficient of concentration of cultivated area, they may indicate varying bargaining position of agricultural labourers. The more the labour market is flooded by those with very little or no land, and the smaller the number of large farmers who are the major employers capable of exerting monopsonistic pressures, the weaker is likely to be the bargaining position of the labourers and the more depressed would be the wage rate within the range determined by the given supply and demand conditions. As indebtedness, particularly for consumption and from cultivator moneylenders, often leads to adverse employment contract, it may be an indicator of the bargaining weakness for the rural labourers.

Several possible qualifications to this description of wage determination in terms of normal demand and supply factors need to be considered. One is that shifts in the demand for labour may affect not the wage rate per unit of labour employed but the extent of employment and wage income. This

possibility may arise from the supply curve being perfectly elastic over a large range or, stated differently, from the presence of un(under)employment at wage rates that are inflexible downwards beyond a limit set by institutional, physiological or other reasons. This hypothesis, if generally valid, would indicate that the wage rates are unresponsive to changes in irrigation or cropping intensity, except marginally when the demand curve is pushed by fertilisers and high-yielding seed varieties beyond the wide horizontal part of the supply curve. Conversely, an observed significantly positive relationship between the two would be inconsistent with this hypothesis as a general description of reality.

Another possible qualification arises from widespread use of labour saving machinery for the peak season operations and from any substantial scope for shifting family labour from unemployment, idleness or from other occupations to meet the larger labour requirement. Extension of irrigation and multiple cropping through the direct pressures on wage rates may encourage, and be partly cancelled out by, the use of machinery for the peak seasons and increased use of family labour. How far this possibility is likely to be strong enough to make the wage rates unresponsive to irrigation and multiple cropping is a question that can be answered with reference to specific test cases and by looking at the general intertemporal or cross-sectional relationship between them. They can give some

idea as to whether the net rise in demand for labour generated by irrigation and the associated changes in technology (in their mechanical and bio-chemical aspects) has been significant enough.

II

In this section we shall analyse, on the basis of the NSS data, interstate variations in wage rates for 1956-57 and 1970-71, both agriculturally normal to good years for almost all parts of the country. The wage rates we have used refer to male agricultural labour. This is in order to abstract from the socio-economic factors responsible for differences in the female participation rate, and to achieve better comparability with the wages for non-agricultural workers. For 1956-57, the wage figures refer to casual labour which is likely to be more comparable between states, because of substantial heterogeneity in the nature of an attached or permanent labourer's wage contract as it ranges from semi-feudal bondage in parts of Orissa, Madhya Pradesh and Andhra Pradesh to more or less voluntary agreements in Punjab, Haryana and western Uttar Pradesh. The wage figures for 1970-71 represent an average for casual and attached labour, as the 25th Round of the NSS which is their source scrapped the distinction. Besides, they refer to the male workers (of 15-45 years age group) belonging to rural non-cultivating households. This group, though not necessarily representative of the population of agricultural labour households

TABLE 2 : INTER-STATE REGRESSIONS FOR 1970-71

(i) $Y = 2.879 + .040^{***} X_1 - .050^* X_2$	$R^2 = .508, d.f. 11$
(ii) $Y = 1.519 + .045^{**} X_1 - .050 X_2 + .001 X_3$	$R^2 = .529, d.f. 10$
$\log Y = -5.038 + .392^{**} \log X_1 - .342^* \log X_2 + .759 \log X_3$	$R^2 = .528$
(iii) $\log Y = .371 + .139 \log X_1 - .173 \log X_2 + .659^{***} \log X_3$	$R^2 = .739$

X_1, X_2 same as in Table 1.

Y, X_3 as in Table 1, but referring to male agricultural labourers (casual and attached) belonging to 15-4 years age group.

X_2 is male agricultural labourers as proportion of male rural workers.

*, **, *** indicate co-efficients significant at the 10, 5, and 1 per cent levels by two tail 't' test.

like the group to which the 1956-57 data relate, does consist predominantly of agricultural labourers as is evident from the pattern of time disposition of the workers in this group.⁵

We shall try to explain inter-state variations in the agricultural wage rate thus defined in terms of the following factors:

(a) Irrigated proportion of the net sown area; alternatively, the percentage intensity of cropping. For 1956-57, we considered another alternative, viz, variance of agricultural production index around the trend over 1951 to 1961.

(b) The proportion of rural households (or workers) primarily dependent on agricultural wage employment.⁶ As indicated earlier, the extent of consumption debt incurred by agricultural labourers may also be an indicator of their bargaining position. In the absence of purposewise breakdown of borrowing at the state level, we have used for 1956-57 the figures for total outstanding debt per agricultural labour household.

(c) An average wage rate for the relatively low paid (presumably the relatively unskilled) non-agricultural labour-

ers. The available data permit two alternative specifications for this. One is the average (annual) income of workers in manufacturing industries with monthly earnings of less than Rs 200 (less than Rs 400 for 1970-71),⁷ which is the lowest size-group for which the Labour Bureau publishes these data. This obviously is a rough indicator of the wage alternative that the agricultural labourer associates with (wholtime or even primarily) non-agricultural employment. The comparability improves by using (as we have done for 1956-57) the average annual wage income from agricultural employment⁸ rather than the daily wage rate. But some things are still left out. For the labourer considering the alternative of migrating to the city, the income from wholtime industrial employment would be comparable with his total income from all kinds of employment (including self-employment), after adjusting for different degrees of susceptibility to income fluctuation. For the labourers who are simply adjusting their time disposition between various kinds of employment (even those involving seasonal migra-

tion), the relevant comparison is between the different wage rates they offer. For this reason we have considered, apart from the industrial worker's wage income, the average wage rate for the casual rural labour engaged in non-agricultural work.⁹

The wage rate in manufacturing industries is more likely to have an independent effect on agricultural wages in the sense of being more of an exogenous variable. The relationship with the non-agricultural wage rates prevailing in the rural areas is more likely to be one of mutual or simultaneous determination, although quite often the opening up of a large source of non-agricultural employment, like a major construction work or a sugar mill, within the rural area may generate a sustained independent effect on agricultural wages that were depressed earlier. It is possible that the wage rates for non-agricultural rural labour is an exogenous variable in some cases and an endogenous one in others. We shall not dismiss it as an independent variable unless it is found to be strongly correlated with the other independent variables.

Obviously, a better approach is to look at wage determination in terms of a simultaneous equation model. But we do not have sufficient data for estimating such a model, for knowing precisely all the structural parameters of the system. What we have tried to do here is to indicate the effect of changes in the major exogenous variables on agricultural wages.

For each year we have tried to explain inter-state variations in agricultural wage rates in terms of combinations of these factors. Using both linear and log-linear relationships, and selecting the alternatives that give distinctly better explanation of the observed wage variations, the results are given in Tables 1 and 2.

For both the years irrigation and the proportionate size of agricultural labourers come out as of major importance in explaining inter-state wage variations. In spite of differences from year to year in some of the data, the results are consistent enough as far as the signs and the significance of the co-efficients are concerned, particularly for irrigation. The agricultural wage rate responds positively to variations in the former and negatively to the latter. The response to cropping intensity is similar to irrigation though somewhat less significant.

For the year that we tried as an explanatory factor the variance of agricultural production in place of the percentage area irrigated, it seems to have a

significant negative effect on the agricultural wage rate.

The response to the labourer's indebtedness is insignificant. This could be because inter-state differences in terms of the extent of total debt need not indicate differences in labour's bargaining position. A larger volume of debt may not lead to bargaining weakness if the income level of the labour household is larger too. Besides, the labourer who has some land may find it worthwhile to borrow more for production purposes, and it may even strengthen his bargaining position. In other cases, indebtedness may turn him into an attached labourer (or a sharecropper) with an unfavourable wage (or sharecropping) contract. Often a small cultivator may be pushed by an emergency into mortgaging his land and become an agricultural labourer. So much depends on the purpose, the source and the terms of borrowing that without more detailed data one cannot say much about its impact on bargaining position and wage rate across regions.

From Tables 1 and 2 it appears that non-agricultural wages, whether referring to casual non-agricultural or full-time industrial labour, has a significant positive effect on the wage rates for agricultural labour. As mentioned earlier, a part of this positive relationship may conceivably arise from their being affected by a common independent

factor. While we do not know about the operation of all such factors, we at least know whether the non-agricultural wage rate in either form is strongly correlated with irrigation or the proportion of agricultural labourers for the particular cross-sections that we have studied. Variations in the wage level of the lowest paid workers in manufacturing industries in a state has little relationship with those in the other factors considered here.¹⁰ The wage rate for casual non-agricultural labour is mildly correlated with the proportion of agricultural labourers during 1956-57 and with irrigation during 1970-71.¹¹ It seems reasonable to think that at least the wage level for the lowest paid industrial workers has a significant independent effect on agricultural wages. Together with this, the two other independent variables explain 53 to 65 per cent of the variance of wage rate or income of casual agricultural labour across states during 1956-57. Use of the other non-agricultural wage indicator raises the explained variance to nearly 75-80 per cent of the total.

Variations in the intensity of irrigation and in the proportion of agricultural labourers explain about 51 to 62 per cent of the variance of agricultural wage rate. Actually, if we compare for each state the observed wage rate with the one derived from equation (i) of Tables 1 and 2, then we find a remarkable closeness (despite the limited number

APPENDIX TABLE A.2 : INTER-STATE VARIATION IN WAGE RATE FOR MALE AGRICULTURAL LABOUR (OF 15-45 AGE GROUP) FROM NON-CULTIVATING HOUSEHOLDS AND SOME RELATED VARIABLES, 1970-71

State	Agriculture Wage/Rate (Rs/day)	Irrigated p c of Net Sown Area	Male Agricultural Labourers as p c of Male Rural Workers	Daily Wage Rate for Non-Agricultural Labour	Annual Wage Per Worker in Manufacturing Industry Earning Less Than Rs 400 per Month

Indian Labour Statistics.

of independent variables considered) between the two for most of the states and equally remarkable gaps for a few. Table 3 gives the deviations expressed as multiples of the standard error of estimate. For most of the states the deviation does not exceed the standard error of estimate. The major exceptions are: Kerala, Haryana, and West Bengal, where the actual wage rate is considerably higher than the estimated; and, on the other hand, Tamil Nadu, Uttar Pradesh and Rajasthan (during 1956-57), where it is the reverse. Even after we take account of the non-agricultural wage level as an additional factor [equations (ii) and (iii)], the observed level of the agricultural wage rate is still systematically higher than the estimated level in the case of Kerala, West Bengal and, to some extent, Haryana, and lower in the case of Tamil Nadu and Uttar Pradesh.

Without additional information it is difficult to say exactly what other factors have been working to push up the agricultural wages in the former and to pull them down in the latter. Crop price differences may theoretically affect the wage levels, though most attempts at relating wage and price behaviour over time²² show sluggish and weak response of wages to price changes. In connection with this study, we made two attempts at relating cross-sectionally wage rate for casual agricultural labour

to current year average crop price index: one for a set of 39 north Indian villages, another with state level data for 1960-61. Neither indicate any significant relationship between variations in the average crop price and in the wage rate. It seems that crop price differences, unless they are sufficiently stable over several years, may not have much effect on the wage rate (though they may change its cash-kind composition).

Other factors that may give rise to inter-state wage differences are: rural trade unionism, and mechanisation. In the case of Kerala, better organisation of agricultural labourers for group bargaining is possibly an important factor behind the large/positive deviation, particularly during the more recent year. Alleppey and Palghat probably have the strongest rural trade union movement in the country. Though group bargaining has been less widespread in the other districts of Kerala, it has been spreading much better than in any other state which is partly due to a more or less sympathetic government being in power over a prolonged period.

In the case of Haryana and Punjab, it seems that the much talked about agricultural mechanisation have not yet been on balance a strong depressant for the money wage rate. The observed wage rates in their case either exceed substantially or are close to the levels estimated on the basis of irrigation and

the proportionate size of agricultural labourers.

III

A state can be too heterogeneous an unit, and sometimes thinking in terms of state-level averages may be misleading. For this reason it is worth finding out whether relationships observed at the inter-state level hold in the case of a cross-section of smaller units, like villages. With some amount of village survey material available, this can be done.

We started with 60 villages of pre-bifurcation Punjab and Uttar Pradesh, plus 20 of them resurveyed after an interval of five years, by the Agricultural Economics Research Centre at Delhi over the period 1955-56 to 1964-65. After scrutinising for quality and comparability of data, we finally worked with a set of 39 villages from 18 districts with reference years ranging from 1956-57 to 1962-63. This set excludes the villages surveyed prior to 1957-58 (reference year 1956-57), those with too many gaps in the wage data, the villages of eastern UP, and one point of each resurveyed village.¹³

The major problem of using these data is that the villages were not as a matter of principle, selected on a random basis so as to represent the region. Instead, they were picked out from time to time on assorted grounds that happened to make them interesting. For this reason we cannot use the magnitude of the regression co-efficient as estimates for the region. But their signs may still be regarded as good approximations, as they indicate the directions of response of wage rate for a fairly large and varied section of the region.

The basic regression equation with which we have analysed inter-village variations in the average wage rate for casual agricultural labour has three factors similar to the inter-state case: intensity of cropping;¹⁴ the proportionate size of agricultural labourers, or the degree of concentration in the distribution of cultivated area, and wage rate for casual non-agricultural labour. Later, we bring in few other factors like the location of a village and the incidence of tenancy, which are more meaningful at the village level than at the more aggregative and heterogeneous state level.

The main results are as follows:

$$(A) \log Y = -2.690 + .513^{***} \log X_1 \quad (.19)$$

$$-.533^{***} \log X_2 + 1.064^{***} \log X_3 \quad (.17) \quad (.11)$$

$$R^2 = .733, \text{ d.f. } 35$$

APPENDIX TABLE A.3 : DATA ON DAILY WAGE RATE FOR CASUAL AGRICULTURAL LABOUR AND CERTAIN RELATED FACTORS FOR 39 VILLAGES OF PUNJAB AND UTTAR PRADESH

Village/District	Wage Rate for Casual Agricultural Labour (Rs/day)	P C Intensity of Cropping	Concentration Co-efficient for Cultivated Area	P C of Households Cultivating 0 to 2.5 Acres	Wage Rate for Casual Non-Agricultural Labour (Rs/day)	Ranking for Location, Communication	Agricultural Labourers as p c of All Agricultural Workers	P C of Cultivated Area Leased In	Average Agricultural Price Index
(0)	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)

Notes : I indicates first point surveys, II resurvey. For calculating the daily wage rates for both casual agricultural and non-agricultural labour, care has been taken to consider only those wage payments or receipts for which employment data (in days) are also available.

The Lorenz concentration co-efficient is calculated as $C = 1 - \sum (H_{i+1} - H_i) (L_{i+1} + L_i) i = 0, \dots, n-1$; where H and L refer to the cumulative proportions of households and cultivated area in each of the eleven size-groups considered by us.

The derivation of the rankings of villages in terms of location and communication factors is based on the following considerations : (a) distance from the nearest pucca road(s), (b) distance from the nearest railway station(s) and bus stop(s), (c) distance from the nearest big city or town(s) and (d) the nature of any major industrial area or trading centre or construction works going on near the village. Based on these considerations, the ranking indicates 1 for excellent, 2 for moderately good, 3 for moderately bad and 4 for very bad position in terms of location and communication.

The average crop (and milk) price index for a village as proportion of that for the whole sample is derived as $P_i =$

$$\sum_j \left(P_{oj} q_{ij} \cdot \frac{P_{ij}}{P_{oj}} \right) / \sum_j P_{oj} q_{ij}, \text{ with } i \text{ indicating villages, } j \text{ crops (and milk) and } P_{oj} \text{ the price of crop } j \text{ for the whole sample.}$$

where

Y : average wage rate for casual agricultural labour¹⁵ (covering, as usual, cash, kind payments and perquisites)

X_1 : percentage intensity of cropping

X_2 : Lorenz co-efficient of concentration in the size-distribution of cultivated area among all households

X_3 : average wage rate for casual non-agricultural labour¹⁶ and ***, **, * indicate co-efficients significant at 1 per cent, 5 per cent, 10 per cent.

The signs of the co-efficients are consistent with *a priori* expectations and with the earlier state-level results, and they are statistically significant. The level of agricultural wage rate in a village responds positively to the intensity of cropping and the non-agricultural wage rate, and inversely to the degree of concentration in the distribution of cultivated area.

A larger degree of concentration of the operated area among a smaller number of farmers gives them a stronger bargaining position in the labour market. On the other side, a larger proportion of the village households either operate tiny plots or no land at all. As this group is usually the major supplier of wage labour for agriculture, their bargaining position in the labour market would be weaker. On both these counts a larger co-efficient of concentration may be expected to depress the wage rate, given other things unchanged. This comes out significantly in the case of the present set of villages.

If in place of the concentration co-efficient derived from the entire Lorenz curve we consider only the proportion of the village households belonging to the size-group of zero upto 2.5 acres of cultivated land,¹⁷ we get a closely similar picture. With X_2' as the percentage of households in the size-group 0-2.5 acres, we get the following alternative estimate parallel to (A):

$$(B) \log Y = -1.729 + .578^{***} \log X_1 \quad (.19)$$

$$- .255^{***} \log X_2' + .991^{***} \log X_3 \quad (.08) \quad (.11)$$

$$R^2 = .740, \text{ d.f. : } 35$$

In place of the proportion of households cultivating no land or farms upto 2.5 acres who are likely to be the major suppliers of hired agricultural labour, if we directly consider the actual suppliers of such labour¹⁸ as a proportion of all agricultural workers¹⁹ (cultivators as well as hired labourers), we would expect to find a similar relationship. With X_2 denoting this proportion,

$$(C) \log Y = -.935 + .513^{**} \log X_1 \quad (.21)$$

$$- .117^{**} \log X_2 + 1.058^{***} \log X_3 \quad (.056) \quad (.12)$$

$$R^2 = .698, \text{ d.f. : } 35$$

From (A), (B), (C), it can be seen that the agricultural wage rate is positively responsive to the wage rate for casual non-agricultural labour. Changes in the latter for the set of villages, unlike in the 1970-71 inter-state case, is practically unrelated to changes in the two other independent variables.²⁰

There may be still other factors which affect both the wage rates. A village that is favourably placed in terms of location and communication with urban areas may, given other things, have high levels of both the wage rates. This, however, is a rather difficult thing to quantify. From the available data and observations made by the field investigators, we ranked the villages roughly on the basis of a number of considerations: such as distances from the nearest pucca road(s), railway station and bus stop (and number of bus routes connecting with urban areas), distance from and importance of the nearest town or city as a source of non-agricultural employment. After ranking the 39 villages in four groups of ascending order in terms of location and communication (rank 4 standing for excellent, 3 for moderately good, 2 for moderately bad, and 1 for very bad), we noted a moderate degree of positive relationship between the level of non-agricultural wage rate and the location-communication factor across the villages. The correlation is not very strong for the simple reason that the non-agricultural wage rate depends on other things as well.

Using this factor (X_4) in place of the non-agricultural wage rate, we get

$$(D) Y = 1.299 + .009^* X_1 \quad (.005)$$

$$- .026^{***} X_2' + .400^{***} X_3 \quad (.008) \quad (.139)$$

$$R^2 = .295, \text{ d.f. : } 35$$

The response of agricultural wage rate to this factor does turn out to be as expected, the wage being higher in a village more favourably placed in terms of location and communication. But the overall goodness of fit is lower in this case partly because of the rough manner in which the variable could at all be defined and because the extent of non-agricultural employment opportunities in and around a village depend on other things too.

Besides, unlike in the inter-state case, for this particular set of villages the non-agricultural wage rate seems to have

a more significant effect than the cropping intensity and the proportionate size of agricultural labourers. When we drop the former out of (B), the two remaining variables explain a much smaller proportion of the inter-village variation in agricultural wage rate:

$$\log Y = -.727 + .541 \log X_1 \quad (.359)$$

$$- .313^{**} \log X_2, R^2 = .143, \text{ d.f. : } 35 \quad (.140)$$

As the sample is not necessarily representative of the region, this may or may not be a correct description of the relative strength of the different explanatory variables in a proper random sample. The signs of the co-efficients are, however, more likely to hold out.

Into the basic regression model we next introduce two additional explanatory variables. One is the incidence of tenant cultivation which, given the enormous variation in the form and content of tenurial systems in different parts of the country, is more likely to make sense for a relatively small and homogeneous region. The other is the average level of agricultural prices, changes in which may possibly influence those in money wage rates for casual agricultural labour.

Given the degree of concentration in landownership or the proportion of landless households, a larger degree of tenant cultivation would indicate two things. On one side, the supply of landless labour for hiring out would be smaller than otherwise as more of them have leased in land. On the other side, the demand for hiring in would be smaller as more land is leased out instead of being cultivated with hired labour. For our particular set of villages the supply effect seems to be stronger, and the wage rate varies directly with the net leased in proportion of cultivated area which is denoted by X_4 in

$$(E) \log Y = -2.274 + .389^{**} \log X_1 \quad (.19)$$

$$- .304^* \log X_2' + .921^{***} \log X_3 \quad (.18) \quad (.11)$$

$$+ .131^{**} \log X_4, R = .777, \text{ d.f. : } 34 \quad (.05)$$

The price variable seems to have no significant effect on the wage rate for casual agricultural labour. With X_5 denoting the average agricultural price index for a village during the reference agricultural year,²¹

$$(F) Y = .347 + .038^{***} X_1 \quad (.003)$$

$$- 1.952^{***} X_2' + 1.172^{***} X_3 \quad (.642) \quad (.151)$$

$$- .128 X_5, R^2 = .734, \text{ d.f. : } 34 \quad (.158)$$

Although the set of villages that we have studied may not necessarily be a representative sample for the region (consisting of Punjab, Haryana and western UP), they are still numerous and varied enough to have some general implication. And we still come out with results that are both meaningful in themselves and consistent with those relating to wage variations across states. A significantly large proportion of the variation in agricultural wage rate is explained by variations in (a) the intensity of irrigation or cropping, (b) some index of the supply and the bargaining position of agricultural labourers: the relative size of agricultural labourers, the degree of concentration in the distribution of cultivated area, or the proportion of non-cultivating or poor cultivator households, and (c) wage level for non-agricultural labour. Almost all our results consistently indicate that the agricultural wage rate responds positively to (a) and (c) and negatively to (b).

IV

Any given increase in irrigation and cropping intensity is likely to raise agricultural wages more in an area with a smaller proportion of the rural labour force dependent on wage employment and/or with higher non-agricultural wage rates than in an area where vast masses of tiny peasants and the landless flood the labour market and the non-agricultural sector is too small to absorb much of it. This may not happen if the farmers in the former area resort to using a lot of labour-saving machinery, or the labourers in the latter organise themselves for group bargaining. If the former is characterised by substantial and widespread underemployment, it would dampen or block entirely the rise in the wage rate. Much of the data studied here indicate that irrigation or multiple cropping does generate a positive response not only in the wage income (1956-57 regressions iv and v) but also the daily wage rate for agricultural labourers.

It seems that the worst possible combination of the factors is to be seen in areas where the labour market is flooded by the virtually landless, the level of agricultural productivity is stagnant, and the non-agricultural employment opportunities too small. This is more or less the case in many parts of Madhya Pradesh, eastern Uttar Pradesh, Bihar, and any number of pockets in almost any state. The situation is relieved a bit from time to time by migration of labourers. But usually the migration is not large enough, and the wage rates continue to remain depressed.

All our crash schemes for rural employment need to be concentrated in these areas of extremely low levels of wages, even if overt unemployment at the prevailing wage rate is not so large in their case, instead of being spread out thinly over the whole country.

[This is a revised version of a paper I worked on at the Agricultural Economics Research Centre at Delhi. It was presented in the Seminar on Political Economy of Indian Agriculture held in Calcutta in March 1973. I am grateful to Nikhilesh Bhattacharya for his detailed and helpful comments on an earlier draft.]

Notes

- 1 Except to some extent in parts of Kerala and Tanjore district of Tamil Nadu.
- 2 This is particularly true of the period prior to 1961 during which there was merely the minimum wage legislation for agricultural labour that even with its extremely narrow coverage was hardly ever implemented. The Rural Works Programmes of the Third Plan had a modest target, and the achievement was even less. From 1961 to 1966 employment was generated for about 400,000 persons under these programmes for the entire country. The Crash Scheme for Rural Employment, started in 1971, seeks to employ a maximum of 1,000 persons in each district on construction works at wage rates that are on par with the local off-season rates or else designed to give a monthly income of not more than Rs 100 per head which is considered to provide a minimum level of living. Though the scheme is large in absolute terms, it is spread out thinly thus diluting its possible impact on the labour market in most areas. More recently, the scheme has been modified to permit concentration of efforts in districts with severe unemployment and alternative kinds of projects offering the employment.
- 3 Use of machines may depress the total rise in the demand for labour generated by the extension of irrigation, but is rather unlikely to cancel it out altogether. Even tractors, which may be labour-displacing for seedbed preparation, may be labour-using when used for pumping and increasing cropping intensity. Harvester combines are, of course, purely labour-displacing.
- 4 Being a more comprehensive variable than irrigation, it is theoretically better for a cross-sectional analysis. On the other hand, the way it is calculated biases it against the sugarcane growing areas. Besides, the labour requirement per acre tends to be larger in the areas enjoying more irrigation and/or assured rainfall because of not just multiple cropping but also the predominance of labour intensive crops like paddy and sugarcane and the higher labour intensity for the same crop raised with irrigation (for watering the fields, applying fertilisers and reaping the larger harvest). Some of these factors may be left out by considering variations in the cropping intensity, but a major part is likely to be captured. We have often taken into consideration both irrigation and cropping intensity, with marginal differences in the results.
- 5 On an average, about 80 per cent of their employed weekly mandays were engaged in agricultural wage employment.
- 6 Because of changing data, this is slightly different from year to year. For 1956-57 it is the proportion of agricultural labour households among all rural households (11-12 Rounds of the NSS). For 1970-71 it is the proportion of male agricultural labourers among all male rural workers (the 1971 Census).
- 7 Considering the rise in prices and cost of living from the earlier year, this does not mean any significant difference.
- 8 The average daily wage rate multiplied by the average number of days of agricultural wage employment per head of casual male labour.
- 9 Derived from the NSS data, this non-agricultural wage rate relates to the casual male agricultural labourers in 1956-57, and to the male workers of rural non-cultivating in 1970-71.
- 10 The correlation coeff. (R) between X_3 and X_1 is .034 during 1956-57 and -.289 during 1970-71; and R between X_3 and X_2 is -.089 and -.226 respectively for the two years.
- 11 R between X_3 and X_1 is .268 for 1956-57 and .694 for 1970-71. R between X_2 and X_3 is -.591 and -.176 respectively.
- 12 See Rath and Joshi, "Relative Movements of Agricultural Wage Rates and Prices", *Artha Vijnana*, June 1966, for a study of wage price movements in Bombay Presidency over 1924 to 1940, and in a number of states during the period 1954-57. S. C. Chaturvedi, in his "Rural Wages in the United Province", has a similar study for the United Province over the period 1911 to 1944.
- 13 The villages surveyed prior to 1957-58 are left out because they suffer from frequent changes in the categories, and because of the general impression among those connected with the surveys that the earlier ones are less reliable. The villages from Kangra district are left out as they are characterised by special production conditions (fruit growing) and special modes of labour use (co-operative). Most of the surveyed villages from eastern UP are unusually depressed,

and we left them out for the sake of comparability. Out of the two points of a resurveyed village we selected one, even though quite often a village is substantially changed in five years' time.

14 We have not used the irrigation data, because for some of the villages they seem to be overstated, probably giving the gross irrigated area.

15 This is derived from the cultivation schedules as total wage payment for casual labour derived by the number of such labour days employed on the farms of the village cultivators located both inside and outside the village. From the schedules for agricultural labourers, one can derive another wage rate which refers to what they receive from outside cultivators as well as the village cultivators (with farms located both inside and outside). One may expect, and there actually is, some degree of correspondence between these two. Since for explaining inter-village variations in wage rate one needs certain information about the farms on which the labourers are employed

at the particular wage rate, we have used the wage rates derived from the cultivation schedules which are also the source for X_1 and X_2 .

16 Wage rates for casual non-agricultural labour are derived from the labour schedules for the purely non-agricultural and the mixed casual labourers of the village, dividing the wages by the number of days worked during the reference year both in and out of the village.

17 For much of this region, a farm of not more than 2.5 acres would be considered a very small one. Together with the non-cultivating households they constitute the major suppliers of rural wage labour in this area.

18 For the sample of 39 villages the co-efficient of correlation between the two wage rates is about .6 which is significant. It is not nearly equal to unity for the simple reason that their respective coverages of employers and of employees though overlapping are not identical. In particular, the non-cultivators and the poor cultivators need not ex-

haust the population of agricultural labourers or consist entirely of them.

19 Classification of workers, following the general practice, is in terms of the main occupation as reported by the worker himself.

20 The correlation co-efficient of the non-agricultural wage rate is —.070 with cropping intensity, .110 with Lorenz co-efficient, —.022 with percentage of households cultivating zero upto 2.5 acres, and .166 with agricultural labourers as percentage of all agricultural workers.

21 The average crop (and milk) price index for a village, expressed as a proportion of that for the whole set, is derived as a Paasche index.

$$P_i = \left(\sum_j p_j q_{ij} \times \frac{p_{ij}}{p_{oj}} \right) / \left(\sum_j p_{oj} q_{ij} \right)$$

i denoting villages and j crops (and milk), and p_{oj} the price of crop j for the set of villages as a whole.

On Cobb-Douglas and Related Myths

Jock R Anderson

N S Jodha

This note argues that continued analysis of economic efficiency in farming within a framework of cross-sectional production functions is bound to be an unrewarding activity for economists. Particular criticism is directed at the inevitable Cobb-Douglas function, supporting the apparently unheeded plea of R K Sau [10] against uncritical and uncritical use of this restrictive model.

ASHOK RUDRA [8] in his recent elegant and laudable piece of Methodological Doubting has performed a needed service in (i) chastising the mechanistic and uncritical users of least squares methods and (ii) exposing the conceptual irrelevance of most of the frameworks proposed for testing hypothesis about allocative efficiency in farming. We find little fault in these critiques except that Rudra has neither gone far enough nor taken himself seriously enough. On (i) we believe that the state of the art of fitting cross-sectional production functions is in practice at an even lower ebb than is implied in Rudra's criticisms of some specific curiosities in the reported work of the trend setters in this field. One needs to sniff around the unpublished studies in dusty dissertations or better still observe the computer-based antics of candidates in the death-throes of their allotted thesis time, to get a feel for the drought of economic thinking, for the arbitrariness and range of model specifications, for the misconceived elaborateness of the game of maximising R^2 or $\bar{R}^2$. In some institutions analysts have even been "aided" in their work by the fiendish technology of a computer programme that, given a mass of data, automatically fits and selects "best" equations of "satisfactory statistical" quality.

SURVEY USEFUL

On (ii) his survey of approaches to studying allocative efficiency was useful. The inherent limitation in most works (including those of Dillon and Anderson [4] and Srivastava and Nagadevara [12]) of focusing on only the "average" farmer rather than on each individual has also been observed by Anderson and Dillon [1] and Molster [7]. However, no mention was made of the untested proposition of Dillon and Anderson [4] that farmers, if they try to maximise anything, probably maximise something (multidimensional) other than profits. To sum up, Rudra still seems impress-

ed with the notion that farmers' allocative efficiency can be usefully appraised in a profit-maximising context and, further, he has little quarrel with the Cobb-Douglas (C-D) production function as an analytical device. His faith in a C-D world seems further declared by his exploitation of the C-D model in the promised follow-up Numerical Exercises [3, 5].

VIGOROUS CRITICISM

It is not easy to reconcile his vigorous criticism of the Allocative Efficiency school with his continued acceptance of the C-D function, especially when he has emphasised some of the practical difficulties such as the handling of zero inputs in C-D estimations — difficulties that have also been usefully explored by Johnson and Rausser [6] and Burt [2]. For the relative simplicity of estimation of C-D functions (which must surely explain the frequent resort to the form for melting down an embarrassing heap of data) one pays a high price in algebraic-economic restrictiveness — notably the presumptions of constant partial and total elasticities of production and of unit elasticity of substitution. The restrictiveness enters implicitly into his test of the hypothesis of allocative efficiency so that the conditional question he is asking is, effectively, "Do farmers maximise profits given that they are operating under a single C-D production function that is common to all members of some group [i.e., common C-D technology]?"

If, for the moment, we go along with the idea that it is useful to test hypotheses about farmers' allocative efficiency, then we might well enquire why it is necessary to accept the contamination of these hypotheses by the usual presumptions that (a) individual technology is C-D and that (b) the individual technology is common to all members of a group of farmers? Such an analytical route should, logically, successively and successfully test hypotheses concerning presumptions (a) and

(b) before exploring any conditional hypotheses about efficiency. Otherwise, the results of testing composite hypotheses dealing concurrently but not disaggregatively with efficiency, the nature of technology and the commonality of technology are bound to be inconclusive. In the event that such a composite hypothesis was accepted, could consumers of such research endeavour be persuaded that underneath the apparent efficiency there really does exist one common C-D production function? Historically, it appears that at least some members of the Allocative Efficiency school have been so persuaded, presumably on the fragile basis of "good" G-D fits as suggested by high R^2 statistics. But, non-believers in a C-D world (like the present writers) will demand some more convincing. Of course, if the composite hypothesis is not accepted, the Allocative Efficiency school can take comfort, along with the non-believers, in the knowledge that the simple C-D model was too simplistic to allow adequate appraisal of efficiency!

PRETTY EFFICIENT

To us, it seems that if we want to reinforce our belief that individual farmers are pretty efficient at achieving their objectives within their constrained operating environment, we must first take a close look at their objectives and the constraints, risks and markets they face before we can possibly appraise efficiency. The simplest imaginable case would be that of a farmer bent only on maximisation of yearly expected profits. For this farmer a well-specified linear programming model might adequately represent the productive set-up. Efficiency could then be crudely estimated as the ratio of achieved to expected planned profit but even here we should want to be cautious. If planned fertilisers and channel irrigation water prove to be unavailable to our farmer we surely do not want to penalise his efficiency on this account and so we should add further appropri-

ate constraints in a new effort at benchmark planning. If the high black-market price of wheat has attracted our farmer to a different-from-plan crop area and market channel and realised price, we should not want to compliment him unfairly and should accordingly respecify the optimising model against which we are judging him.

In short, judging economic efficiency down in the farm, where life may be dull but is nevertheless highly dynamic and stochastic, needs to be a rather sophisticated business if it is to be done properly. When it is complicated by the further real-world considerations of farmers' multidimensional goal structures and their non-indifference to risk, the effort and sophistication required to model benchmark behaviour seem to us to be far greater than is warranted by the value of the answer to the question of whether or not farmers are efficient.

PROFITABLY ADOPTED

Issues related to those we have been discussing arise in discussions of the farm-size neutrality or otherwise of recent technological advances in agriculture. Proponents of the scale-neutrality of the new farm technology believe that since the technological package of advice, HYV seeds, recommended inputs of fertilisers, water and tillage is perfectly divisible it can be profitably adopted on farms of all sizes. By implication, new technology need not benefit large farmers more than small ones. However, this ignores the non-divisibility of farm-level infrastructure which, by influencing the flow of complementary services, determines the farmers' capacity to adopt the "size-neutral technology". Opportunities of new technology open to a small farmer are further restricted because of predominance of the informal as against formal channels of input supplies (including extension advice) in a scarcity economy. Its real impact may range from complete non-availability of inputs to their availability at higher acquisition cost (normal price + informal channel's margin) and at inappropriate time to the small man whose capacity to use informal channels in keeping with his resource base (including capacity to influence) is very limited. The same amount of an input (in a physical sense) availed of and used at different times for a crop may have different production implications, so that it may be appropriate to treat

such an input as qualitatively different inputs. However, such qualitative dimensions of quantitative details, which are very much part of the real world situation, seldom find place in the C-D scheme.

LITTLE HEED

Given such a real world situation, are questions about purely technological neutrality in the context of an arbitrarily specified cross-sectional production function [13] at all relevant? Other studies relating to size-neutrality of technology rest directly on C-D assumptions by fitting C-D functions and testing hypotheses about, say, the influence of size of farm on the marginal productivity of inputs in a technological package (e.g. [11]). There seems to be a pronounced tendency for such analysts happily to forget or to ignore the strong conditionality of their "findings" on the C-D assumptions and on the final specification involving the few "significant" variables. Similarly the legion of studies of returns to scale in farming pay little heed to the sensitivity of tests about total elasticity, to alternative model specifications. Indeed, the C-D model, with its implication of fixed total elasticity of production (which in turn fixes the long-run average cost curve at one only of falling, constant, or rising with increasing size [9]) seems particularly inappropriate in study of phenomena related to size of farm or farm.

Our few random thoughts can be summarised thus. We have severe misgivings about uncritical (and unskilled) use of simple algebraic models to underly tests of rather sophisticated hypothesis. The C-D function is especially suspect in this regard with its severely restrictive implications about technological relationships. Unfortunately, alternative and less restrictive models are not readily estimated. We suggest that we must await a more sophisticated analytical technology to test adequately more sophisticated hypotheses.

Variations in Economic Behaviour and the Green Revolution

An Anthropological Perspective

Barry H Michie

This article seeks to examine certain assumptions regarding the behavioural aspects of economics, in particular production, and the implication that strategies of development based upon them may have for the course of development in India.

On a theoretical level the assumptions found in development literature with regard to what influences and conditions production decisions and performance among farmers will be examined.

Secondly, an attempt will be made to examine current trends of agricultural development with an eye to its differential effects and the consequences on the structure of agrarian society and mass participation in the development process as indicated by the problems of unemployment, displacement and income disparities.

Focus will be placed on the organisation of production, as it is that domain of economic activity which is being most affected, and out of which the new problems of development have emerged. It is also in that domain that solutions to these problems are to be sought.

AGRICULTURAL development in India, as in other areas of the world, is recognised as more than just a change in technology, practices and levels of production. As part of a concerted programme of induced change, agricultural development is seen as part of the effort to transform agrarian society, providing for an increased standard of living and social justice. Along with the gains of the Green Revolution during the past half of a decade, several rather disturbing trends and aspects of growth have begun to emerge; those of employment and income distribution. Until recently, these aspects have been largely ignored in the face of food production deficits which have heretofore been of paramount concern. It is proposed here that there is another reason for ignoring these aspects, that of certain traditional conceptual limitations in most development literature.

The object of this discussion is to examine certain assumptions regarding the behavioural aspects of economics, in particular production, and the implications that strategies of development based upon them may have for the course of development in India. On a theoretical level the assumptions found in development literature with regard to what influences and conditions production decisions and performance among farmers will be examined. Secondly, an attempt will be made to examine current trends of agricultural development with an eye to its differential effects and the consequences on the structure of agrarian society and mass participation in the development process as indicated by the problems of unemployment, displacement and income dis-

parities. Focus will be placed on the organisation of production as it is that domain of economic activity which is being most affected, and out of which the new problems of development have emerged. It is also in that domain that solutions to these problems are to be sought.

FOCUS ON PRODUCTION

Most studies of agricultural development have, understandably, been presented from the perspective of the agricultural economist. The primary concern has been that of food production. Most attention has been placed on manipulation of factors of production and market prices in order to boost output on an aggregate level. The key concepts have been profitability and modern technology. The indices of growth and progress have been by and large the spread and usage of new inputs like fertilisers, seed, pesticides, and irrigation with consequent increases in productivity. Most measurement has been done on the aggregate level with some notice taken of differential growth as between states or across districts.¹

The paradigm which has been most consistently used to explain growth includes as its main variables, modern agricultural inputs and price support systems to provide incentives to invest. The behavioural assumption is that the economically rational farmer will maximise the return on his agricultural activities to the fullest extent possible.² Shown how to increase production and gain more profit, the farmer is assumed to follow the more profitable path. This assertion seems to be borne out upon

examination of aggregate growth rates and trends over the past ten years. What is of interest, with great implications on the validity of the working assumptions, is the disaggregation of the data in order to see who "the farmer" really is, or, rather, to see if there are "several farmers" with differing behavioural characteristics.

The approach of manipulating production factors and prices has been dubbed the "production first" approach. This orientation, which has had a major impact on growth and production rates has tended to push other considerations to the periphery. This is most apparent in the notion of "generations of problems" as put forward by Falcon; production first, marketing second, and social third.³ Taken as a programme for tackling development problems as if in sequence, it compartmentalises the realm of production from that of other concerns. The problems of unemployment and income disparity are seen as somehow distinct and apart from that of production. It will be argued here, rather, that these problems arise from, and are being exacerbated by the form of production being engendered in the development process.

SOCIAL ASPECTS IGNORED

This orientation in its most extreme form further compartmentalises the social aspects of development from the realm of production. The "Asian Agricultural Survey" put out by the Asian Development Bank in its suggestions on guidelines for the formulation and implementation of policy asserts that there can be little patience with those who confuse social and political considera-

Reaching petroleum products wherever needed

With a nation-wide storage and distribution network, Indianoil maintains an uninterrupted flow of petroleum products to serve the nation.

With more than 200 installations, bulk depots and aviation fuel stations, and over

3000 petrol/diesel stations, Indianoil ensures that products are delivered wherever needed. All modes of transportation are pressed into service—coastal tankers, pipelines, rail tank wagons, tank trucks and tank carts. Indianoil marketed about 14

million kilolitres of products during 1971-72 thus meeting nearly 55 per cent of petroleum product requirements of the country—serving the nation in its development plans as well as in defence efforts.

is with those of production. Only latest findings of science, biological, mechanical, and modern management techniques are to be applied in order to achieve production goals. Again, a motivating force to be harnessed is that of profit maximisation. It is assumed that this is the primary value and all subscribed to by farmers everywhere, and that the profit motive is the dominant conditioning factor influencing production behaviour. The social problems of unemployment and income disparities are given low priority in the belief that disparities are inevitable and at distribution is easier once there is something to distribute.⁴

Formal economics has by and large been able to ignore the social and cultural characteristics of economic organisation in favour of building abstract formulations based on a limited set of assumptions regarding behaviour. The assumptions of economic rationality and profit maximisation are primary. The problem arises in empirical situations where these abstractions must be made concrete. Often the analyses and policy prescriptions flowing from them are based on vague notions of what actual economic behaviour, local norms and social features may be.

The premises underlying the concepts of maximisation and rationality are: (1) the multiplicity of ends (in the formal economic sense pertaining only to pecuniary or material gain), (2) the scarcity of means to fulfil desired ends, (3) the necessity of choice in allocating means to ends. In the allocation of means to ends, the object is to minimise cost and maximise profit. The element of choice, however, opens a whole range of difficulties. Choice is made in relation to valued ends and scales of preferences. The setting of goals and preferences is essentially a-rational. Rationality and maximisation can only be predicated on the means to, but not the ends of action.⁵ The assumption so prevalent in the development literature, that farmers everywhere are interested in improving their well-being, and thus will respond to altered profit potentialities obscures more than it reveals. The issue is not with the validity of the concepts but rather their application. Ends are multiple and motives and strategies for achieving them differ from individual to individual and from group to group. Maximising behaviour is exhibited to a range of goals, whether it be profit in the formal economic sense, or social position, prestige, power, or simply in the maintenance of relationships with friends and kin. One may maximise a number of satisfactions not

all of which are necessarily "economic." The pursuit of such satisfactions involves an allocation of some sort of resource and this in turn can influence behaviour within a strictly delimited field of economic activity.

There is a tendency in development literature, however, to apply these concepts to only those goals concerned with pecuniary or material gain. Any type of behaviour which negatively influences the attainment of these ends is seen as non-rational and exogenous to economics. In a sense this approach has worked itself into a conceptual box from which it cannot extract itself without seriously examining the assumptions it makes about behaviour.

TRADITIONAL AGRICULTURE CONCEPT

The environment of values and preferences is indispensable for understanding economic behaviour. Goals of a non-economic nature will compete for resources which can be used in economic pursuits: for instance, a farmer who has ready access to capital and puts it into his daughters' marriages or in a new house instead of farm improvements. Most literature dealing with the Green Revolution and development generally does not attempt a specification of this environment. Valued ends and goals are assigned *a priori*, and with the assumption of all things being equal, social and cultural factors are written off as irrelevant.

An excellent example of this is found in the concept of "traditional agriculture" propounded by Theodore Schultz.⁶ Schultz's basic thesis can be stated succinctly: the poor but efficient farmer. This concept has had a great influence

on development thought and also provides a basic model for describing agriculture in developing countries as well as providing an explanation for stagnation and the best way to effect change. As I understand this concept, traditional agriculture refers to a state of equilibrium in which optimum efficiency, given the technology and resources at hand, is attained and perdures through time because (1) the level of the "arts" — technological and managerial — remain constant, (2) the level of motives and preferences for holding and acquiring factors of production as sources of income remain constant, and (3) these two states remain constant long enough for the marginal productivity of additional factors and motives and preferences for acquiring them to arrive at an equilibrium. The second category, motives and preferences, is explained in a strange way. They remain constant in the state of equilibrium because "it is difficult to conceive of developments" that could change them if, once equilibrium is reached in the third stage, there is no incentive to save and invest in production factors when the margin of profit is low or non-existent.⁷ From this it can be inferred that the only conditioning factor influencing economic behaviour which can be called cultural, i.e., preference, motive, or value, is that of pecuniary profit or material gain. This is reinforced by assuming that the production behaviour of a given group does in fact reach an equilibrium in which everyone is as efficient and productive as his technological, resource, opportunity, and risk constraints allow him to be.

The traditional agriculture concept

has been based on a limited number of empirical examples, two of which Schultz draws from India. One concerns the response of Punjabi cotton farmers to price changes. This is considered indicative of traditional farmers' response to price incentives.⁸ It must be pointed out that cotton farmers, by the very fact that they engage in cash cropping and sell their product on a monetised market have made a commitment that other farmers might not make. A peasant household engaged in subsistence grain cultivation is little affected by prices on a monetised market. A farmer producing for his own consumption and engaging in limited local exchange is less likely to respond to price movements on a market in which he is at best only marginally participating. Cotton farmers respond to market price fluctuations because they are directly involved in the market and price represents the value they are maximising. What may be of interest in their case is the variation in output and efficiency among them even given their commitment to the market. This, however, is not discussed.

Senapur, UP, the second example, is described as materially poor but efficient. To the question, "Are the people of Senapur realising the full economic potential of their physical resources?" the answer cited by Schultz is "From the view of the villagers the answer must be 'Yes' for in general each man comes close to doing the best he can with his knowledge and cultural background."⁹ The complete quotation drawn from the original source somewhat modifies this evidence.

From the point of view of the observer, appraising the resources with an entirely different set of standards than those applied by the community, and answer must be 'no'. The large hoards of gold and silver... Capital diverted [for] ceremonies and conspicuous consumption... [points to the fact that] Senapur people, as a whole, do not suffer from a paucity of resources... but the present organisation and use of their physical resources leaves a wide gap between the income that 'is' and the income that 'might be'. The explanation of this gap is not to be found in the analysis of the physical resources themselves, but must be sought in the substance, organisation, and form of the community of men.¹⁰

In a telling comment from the same source, the author relates his difficulties in eliciting precise answers regarding production allocation with which to construct a detailed input-output flow analysis. "This confusion between production expenses and household outlays made the job of building a realistic matrix picture of village inter-

action a practical impossibility."¹¹ This is of significance as it points to a different type of economic strategy and organisation which is no more or less rational and efficient once the notion of "rational man" defined as the maximiser of one kind of value, pecuniary profit and material gain, is recognised as too narrow.

ASSUMPTION OF UNIFORMITY

The traditional agriculture approach assumes a uniformity of response and behaviour. This is due to the narrow conceptualisation of preferences, maximisation, and rationality. It does not take into account variations which may occur among farmers as to forms of economic organisation and goals to be maximised. It also fails to take into account striking variations in efficiency and productivity that occur even among farmers having equal access to resources and opportunities, an aspect of agriculture amply demonstrated for the United States as well as India.¹²

Variations in efficiency and levels of production are hidden by the use of aggregate data. Out of the undifferentiated aggregate, "the farmer," the paragon of economic efficiency and rationality is born. The profit motive is proffered as the explanatory device for understanding his behaviour and on the gross aggregate level this seems to work well. This loses much of its explanatory value when the data are broken down and the scrambling after

profit as an overriding behavioural norm may be operative for only a fraction of the total number of cultivators involved. Even then it must be imputed. The real proof of the concept lies in testing for variations in production efficiency among farmers having equal access to inputs and opportunities and also in looking at the alternative strategies which may not be as remunerative as the optimal one open to these farmers. Unfortunately there have been few studies of agricultural organisation and behaviour on these lines.¹³

One shortcoming of the "production first" and "traditional agriculture" approaches is the inability to explain such variations in behaviour. This is the focus of concern which Kusum Nair investigates in "The Lonely Furrow", a study of production variability in the United States, Japan, and India. Implicit within the study is Schultz' thesis; but it is treated as an empirical question rather than a valid assumption.

Nair discovers that behind the facade of the American farmer as the paragon of economic rationality, there exists a wide range of variation both in levels of productivity and efficiency. The data show that only 14.8 per cent of US farmers earn over \$20,000 per year and that they enjoy 63.4 per cent of the total farm receipts. Fifty-five per cent of the farmers earn less than \$5,000 and they obtain only 8.2 per cent of the total farm receipts. Three and seven-tenths per cent of all farms occupied 49.2 per

cent of the total farmed area; one-fifth of the farms marketed 72 per cent of all produce and controlled three-fourths of all farm assets.¹⁴

Along with this variation in production levels and control over resources, data are produced which indicate variations in efficiency as well. This is done with the use of case studies which compare the careers of farmers who began with the same or similar resources and opportunities but who have pursued divergent strategies. One set of cases compares farmers engaged in dairying within the same region. All had equal access to extension, credit and technology, began their careers with similar resources and educational backgrounds, and operated under identical constraints and incentive of public policy and private institutions. At the time of the study, these four farmers showed wide variations in income, value of assets, quality of produce, techniques of production, and standards of living. These four farmers due to differences in motivation and aspiration had taken differential advantage of the resources at their disposal and the opportunities open to them.¹⁵ Other cases demonstrating the effect of non-economic motivations influencing economic behaviour come from wheat farmers. One refused to make use of irrigation facilities because "it's too much work"; another is unwilling to take water from the canal if his allotted time falls on the Sabbath.¹⁶ Obviously motives other than profit incentives are operating in these cases.

NOT BY PROFIT ALONE

With Japan the author discovered that levels of production and efficiency were remarkably even and near optimum levels in all cases. Measured in terms of units of land, there is virtually no variation in output. Furthermore, the Japanese farmer outproduces the American farmer crop for crop if measured in units of land. This is essentially a function of intensive hand labour input — almost entirely family labour — on small holdings (86 per cent of Japanese farms are less than 0.5 hectares, only 4 per cent exceed 2 hectares, and maximum legal holding is 3 hectares), and the use of inputs neutral to the size of farm such as fertilisers, pesticides and high-yielding seeds.

The question the author asks is why do Japanese farmers produce uniformly at optimal levels while on the other hand US (and Indian) farmers do not. The answer lies, as the author discovers, in a total system of constraints as well as incentives. Using historical data, she

traces the development of agriculture in Japan. The basic production pattern was established in the Tokugawa period; intensive hand labour on small farms was the consequence of a hand tool technology and population pressure. Added to this was a high rate of taxation and rent demand. There were also strict sumptuary regulations and control over production decisions. The minuscule scale of farming in conjunction with high demands on the farmers' product left the farmer with little option other than to produce the maximum amount from his piece of land or get out.

Presently the demands made upon the farmer in the form of taxation and rent are not exorbitant, nor are there sumptuary regulations, but the value placed on squeezing the last pound of produce possible from the land remains. A farmer's social position in large part depends upon his cultivating technique and level of production. To produce less than is humanly possible is unthinkable.

The conclusion the author makes is that production performance is not determined necessarily by profit incentive alone. It is, rather, a constellation of variables — economic, social, and cultural — which influence farmers' economic behaviour. If farmers' goals and motives are dissimilar, their performance on the farm will vary. Given a number of alternative production strategies and levels of efficiency within which a farmer can perform and still remain viable, there can be no certainty that all farmers will opt for one and the same production performance. The effectiveness of a profit incentive will differ with aspirations and will compete with other incentives of a social and cultural nature. Variations will occur and persist as long as there is a range of viable alternatives present. Production efficiency is determined not by potential profitability alone but also by the floor of economic and technical feasibility and social expectation below which it is impossible to farm.¹⁷

CHOICE OF STRATEGIES

For any given farm economy there can be postulated a range of viable alternate strategies that a farmer can pursue. These are delimited by the optimum level of efficiency and production that is feasible given resources and opportunities at hand, and also by a minimum level below which a farmer cannot perform and still remain viable. The only obligation a farmer has to meet in his economic performance is to fall within the range of alternatives before him. The manner in which he fulfils

his obligations is influenced, as we have seen, by more than strictly economic considerations. Where the range of economic alternatives is wide, performance may be expected to vary. Where it is narrow, it will be more uniform.

If, as is argued here, economic behaviour is influenced by competing goals of a "non-economic" nature, and economic actors may try to maximise a number of goals at the same time, then the concepts of maximisation and rationality must be accepted as applicable to a wide range of activities. The problem then becomes one of determining what is and what is not economic. "[I]f we accept as a definition of economics that it is the study of the allocation of scarce resources among alternative ends... almost every human action can be seen as involving a decision concerning the allocation of scarce resources [including time] among alternative ends; every human act is then an economic act."¹⁸

One formulation which proves fruitful is: "The economy is that field of men's culturally mediated activity in which they interact with their physical and social environment in the calculated pursuit of acquiring a living."¹⁹ The calculated pursuit of a living implies the purposeful and rational weighing between alternative courses of action to achieve at least certain minimal ends. Economic activity is culturally mediated, that is shared values and beliefs influence a decision maker as to what and how much is important to achieve or gain. The interaction with the physical and social environment ties in ecological, technological, and demographic considerations as well as organised relations between people. Finally, the making of a living limits the field of economic behaviour to material ends needed for sustenance and maintenance and whatever the material aspirations or goals of the unit under study. (This does not imply that aspirations or goals remain static over time.)

For purposes of analysis it is correct to postulate material or pecuniary goals as the object of economic behaviour. But to dismiss as irrelevant other motivations, goals and values operating in other fields of activity which overlap with the economic field, competing for "economic" resources is too narrow an approach.

"Anthropologists have long argued among themselves as to the applicability of formal economic theory to the societies they study. There is one basic point of agreement, however. Economic organisation and behaviour — production, exchange, distribution — is a form

of social action. This involves the combination of various kinds of human services and non-human goods in order to meet given culturally defined ends.²⁰ A particular economy is socially organised to the extent that it involves relationships between persons having more or less specific rights, duties, and obligations with regard to one another.²¹

UNTENABLE DICHOTOMY

The realm of production provides one point of convergence in which economic and social behaviour converge. With regard to the "generations of problems" of the Green Revolution, the dichotomisation of social and economic phenomena is untenable. The relations into which people enter for purposes of production and the manner of their participation in this process has far-reaching implications for social organisation as a whole as well as for the problems of unemployment and disparities in income and wealth.

In the "traditional agriculture" and "production first" approaches the farm is conceived of as a commercial enterprise. It is contended here that this is not the dominant form of economic organisation in Indian agriculture. Perhaps only a small percentage of those engaged in agriculture can be delimited as commercial farmers. The overwhelming majority approach the subsistence peasant form of organisation.

The peasant form of organisation partakes of some of the characteristics of the commercial enterprise but also displays aspects peculiar to itself. It is a household, at once a production and consumption unit, producing primarily for its own consumption, mainly using its own rather than hired labour, engaging in only limited exchange, and participating only marginally in any widespread monetised market network. It is an economic unit which can be typified by a paucity of resources which must be allocated to a number of ends, including those lying outside a strictly economic field. The peasant attempts to produce enough to balance his own requirements against demands made upon his time, energy, material resources, and product coming from within and outside the household.²² The form of strategy employed is one of balancing those demands, of fulfilling various commitments to at least some minimal level, all of which affects the strategy employed in production. This is supported by the difficulty encountered by some scholars (as mentioned above), in eliciting budget breakdowns for production expenditures in peasant households. The "confusion" demonstrated by the

respondents in being unable to separate household outlays from production expenditures is indicative of an organisational pattern different from that of the commercial enterprise. The "confusion" is in the mind of the observer who is applying different categories and perspectives to the peasant than the peasant applies to himself.

The first demand the peasant must meet is a caloric minimum required to sustain each member of the household and to keep his livestock in good condition. For those whose operational holdings are too small or who lack other resources, this demand may be met by outside work with payment in either cash or kind.

The second demand is that of maintenance and replacement. The peasant must produce or obtain in some manner an amount over and above his energy requirements in order to provide for the next season's seed and enough for the servicing, repair or replacement of productive equipment and household necessities he cannot provide for himself.

These then, are two absolute demands which must be met by the peasant in order to sustain life and remain viable. These represent a floor below which production and/or income cannot fall. The second demand is somewhat more flexible; it is subject to cultural definitions of what the minimum necessary might be. "Like the Greek philosopher Diogenes, a man can rid himself of his last cup, since he need not suffer thirst as long as he can make a cup of his hands. But once... cups are a part of man's cultural expectations, they become more than that — they become something he must commit himself to obtain."²³

The peasant as all men, also maintains social relations with fellow neighbours and kinsmen. The maintenance of some modicum of order and stability in society is also necessary for carrying out the business of making a living as well as ensuring such things as rearing and enculturating new members of society. It is necessary too to enlist the aid of others to help perform tasks and obtain services the household does not provide for itself. Such social relations are surrounded by symbolic constructions which serve to justify, regulate, and explain them. Ceremonial requirements must be met at least according to some culturally determined minimum. Most importantly, this affects the peasant's economic strategy. The expenditure for meeting social obligations and ceremonies comes out of time, energy, and capital which might be spent in agricultural production. In like manner,

these expenses may provide an incentive to produce more, in order to pay for them through profits earned in production. However, where resources are scarce and the obligation to fulfil ceremonial functions great, investment in productive activities will suffer.

POWER RELATIONSHIPS

There is also a demand for rent which must be met. The peasant is involved in asymmetrical power relationships with dominant groups who have, in effect, a claim on part of his product. On the local level this may be manifest in the landlord-tenant relationship. In a wider realm it is ascribed to the demands of the state and its capacity to extract a portion of the peasant's product in the form of taxation.²⁴ In the case of India, the number and percentage of farms falling into the former kind of relationship is quite large, as will be discussed below. With regard to extractions by the state, however, India is an exception. There is virtually no tax on agricultural production and income and only a nominal land tax. Of importance, however, is the capacity of the state to influence and manipulate labour through policy (e.g. through taxation), the strategy a farmer might pursue by changing the alternatives before him.

The general features of agrarian social organisation in India are well known. Social organisation is characterised by a marked degree of social stratification, division of labour and a hierarchy of status position. Society is segmented into endogamous caste divisions which often coincide with occupation as well as ritual divisions. There is typically a high degree of cultural elaboration surrounding inter- and intra-caste relations in the form of rules, sanctions, and rituals which demonstrate, maintain, and legitimise those relations.

For the vast majority of people in India, economic organisation is built upon agriculture. One or several caste groups usually hold the dominant economic and power position through the ownership of land and control of capital. The crucial organisational features are those relationships between landlord/landowner, tenants, artisans, and labour. These are not exclusive categories as there can be various permutations combined in the same person. Those operating farms which do not produce enough to meet the required minimum for meeting the various "demands" will work as labourers on larger farms to meet their requirements. Likewise, the landless will work as agricultural labour as well as perform other economic activities, e.g. the Chamars and Regars of

North India who work leather as well as provide the bulk of agricultural labour.

If one were to assume that those who meet the criteria of paucity of resources to fit the peasant category are those operating farms of less than ten acres (the lowest ceiling recommended for the best of land), then some 83.1 per cent of all farms in India fall into this category. Those that might be considered deficit farms are below 5 acres or 64.4 per cent of the total. These latter have to make up the deficit by selling their labour or getting other outside work; considered with those operating no land, they constitute 73.8 per cent of all households in agriculture.²⁵

GREAT VARIATIONS

It is well known that variability in levels of productivity and efficiency has been the norm in Indian agriculture. The peasant type of organisation itself has shown great variation not only from region to region, but also among peasants within the same locale. It seems there have always been good farmers and poor ones.²⁶ This reflects not only differences in resources and opportunities, but also differences in motivation and consequent production strategies.

This is due to the wide range of viable alternatives within agriculture. With no income-tax and a nominal land tax there is very little overhead. The subsistence farmer can survive as long as he meets his minimum requirements, regardless of the potential return he could make from his resources; neither does he come into competition with the commercially minded farmers. For those with deficit holdings or no holdings at all, they can currently survive by selling labour to the larger farmers. This environment will not last forever; the floor of viability will be raised by labour displacing technology through the mechanisms to be outlined below.

The differential in yields of new varieties of grain also indicates variability in productivity and efficiency. This is in spite of the high profit potentialities of the new methods and seeds. The average yield for the new varieties of wheat for the year 1967-68 was 2,365 pounds per acre although the range went from below 2,000 pounds to over 6,000 per acre. (In Pakistan, the yield was 1,600 pounds for the same year.)²⁷

What is significant is that Indian agriculture has so far been able to accommodate this wide range of behaviour and efficiency, from the subsistence farmer just trying to get by, to the rich peasant 'kulak', to the few entrepreneurs running their farms as business enter-

prises. The Green Revolution is producing changes in this state of affairs. The results, however, have been the compounding of economic disparity between the vast majority at the lower end of the scale and the few at the top. The widening gap has been accompanied in many instances by the absolute deprivation of those at the bottom.²⁸ This trend is reinforced by the skewed distribution of land resources and the type of technology being introduced.

In the absence of up to date material, data collected in 1960-61 are used to indicate the distribution of land holdings and farm sizes. Although land is concentrated in relatively few hands, the size of land holdings on the average is quite small. Out of 64 million land owning families, 86.51 per cent own less than 10 acres. Out of a total of 317 million acres of farm area, this group owns 40.52 per cent. Conversely, almost 60 per cent of the land is owned by less than 14 per cent of land owning families. The rural landless and those owning less than 0.005 acres are not included in these figures, consequently they are over representative if all households dependent on agriculture are to be included.²⁹

The average size of farm (operational holding) is 4.55 acres. The size of farms and the total area covered by each category is, however, quite varied. Of the 72.5 million farming families in India, 87.5 per cent operate no land or farms of less than 10 acres; these covering 41.5 per cent of the total farm area. Conversely less than 13 per cent of all farm families operate about 58 per cent of the total farm area on farms larger than 10 acres.³⁰

INEFFECTIVE LAND REFORM

Despite tenancy and land reform legislation, there is evidence that no change has occurred to offset this lopsided feature of agrarian organisation, and nothing much of benefit has accrued to tenants and landless labour. Often the very legislation which was meant to protect the rights of the tenant has worked to his detriment and to the benefit of larger landowning groups. Land ceilings have been easily circumvented through dispersal of titles among family members and provisions for resumption of land for self-cultivation of ten facilitates the eviction of tenants. Most tenancies are oral contracts which have no legal basis in court where a length of occupancy is a requisite to tenancy rights. The large landlord also has the balance of power and resources to win a dispute. He is able to evict his tenants fairly much at

will and/or shift them from plot to plot to make sure there can be no claim to occupancy.³¹

The point here is twofold. First, landowners are not effectively restricted from evicting tenants. Secondly, the organisation of agricultural production is currently changing, requiring less of the services of tenants and labour. This is due to a change in the technological base which has made use of bullock power and hand labour. The question then arises as to what consequences a change in the technological base will have upon the landlord/landowner, tenant, artisan and labour relationships. It will be the small percentage of entrepreneurial farmers who will be of significance in this change. Given the ability of landlords to evict tenants and resume their holdings for personal cultivation, it is reasonable to assume they will do so. Such farmers will dispense with large amounts of hand labour inputs when it is possible and to their advantage. Their advantage lies in high price supports enhancing the continuing profitability of agriculture. This trend will also dispense with the services of artisans who make and repair hand and bullock drawn implements. With regard to the social organisation of production, lines of vertical integration based upon participation in the production process will be broken. Furthermore, aside from the changed structural relationships, the number of persons displaced from the production process and the agrarian sector will be of outstanding proportions.

The new inputs and practices being introduced are aimed at the farmer at large but critical types are designed in such a manner that only the large farmers can take advantage of them. New seeds, fertilisers, and pesticides have been introduced, inputs which have opened up new potential levels of productivity and are neutral to the size of the farm. The full genetic potential of the new varieties can be realised regardless of the size of farm, and in fact there is evidence that yields per acre are higher on smaller farms than on larger ones.³² The type of mechanisation being introduced, however, is not neutral to scale (except perhaps for irrigation pumps). While it is true that machines can be manufactured of any size and horsepower, the ones being introduced and for which credit facilities are provided are designed for large-scale farming. Furthermore, only large farmers can avail themselves of these facilities as certain minimum land assets are a prerequisite. In addition credit for other inputs also tends to flow to larger farm-

ers as they have more collateral and credit-worthiness.

EFFECTS OF MECHANISATION

The introduction of large mechanised equipment will have two effects. One is the displacement of tenants and labour. The other is the increase in average size of farms, displacing small landowners. While a farm of a few acres can make use of a power hand tiller, this type of operation cannot compete on a commercial basis against a large farm operated by a 50-55 horsepower tractor. Large-scale farming is becoming more attractive and land values have risen as a consequence. It is often very tempting to a small owner to sell his land and realise a certain amount of cash even if not forced out by competition.³³ The way small subsistence landowners — those not running their farms as a commercial enterprise — will be forced out is through the decreased demand for their excess labour and lesser amount of land available on lease. Unable to fulfil his living requirements from his own land and having these two venues of income cut off, he will have to leave agriculture or expand his holdings to the detriment of someone else. Land ceilings will not keep this from happening. Though there is a ceiling on ownership, there is none on rented land. Those owning deficit holdings may come to form a large body of petty landlords, renting their land at distress rates to larger farmers with more resources.³⁴

Mechanisation has so far been applied to the plowing and preparation of fields, and to some extent threshing. This has had little negative effect on labour inputs. Rather the immediate impact of the bio-chemical and irrigation improvements has been to expand the demand for labour through multiple cropping. What former tenants have lost, they have been compensated for in the short run, through increased farm wages. However, with the expansion of mechanisation into all the cultivating and harvesting operations, the effect will be labour displacing.³⁵ Given the capital expenditure a farmer makes for a tractor, it is reasonable to assume he will mechanise as many operations as possible to make full use of his investment. Such a farmer will also try to expand his production unit for the same reason.

Assuming then that the larger farm will come to predominate through the elimination of smaller units, a rough projection can be made as to the structural alterations and displacement of persons from the agrarian sector. If due to resumption of land and displacement

through economies of scale all farms below 5 acres are eliminated and absorbed into larger units, some 34.4 million or 64 per cent of all farming households will be affected. If they and the landless are no longer needed to supply labour, the number of households displaced from any participation in agriculture will be 53.4 million or 74 per cent of all agricultural households. This would affect less than 20 per cent of the land.

The question then arises as to where these households will get an alternative source of livelihood. The number of people affected by such a shift would be about 240 million (as of 1960-61), which includes workers and dependents. The landless and small ex-farmers are the least likely to fit into other sectors of the economy, even if there were openings. They, by and large, do not have the training, education, or resources to fit into industry or start their own business. Massive public works are at best stop-gap measures and are in the end self-defeating if a major portion of the population is essentially on a dole. The idea that these people will all be absorbed into small local agro-industries is short sighted. There is the problem of the sheer numbers involved. Industry, more than agriculture, operates under the constraint of economies of scale which will force out small workshops over time unless they are heavily subsidised. Competitive industry cannot be labour intensive. Since the flow of population will be towards the cities, it is surprising that not more studies have been made with regard to its impact on urban areas and its desirability.

DANGER OF POLITICAL INSTABILITY

The time element is of importance; the rate at which displacement takes place. This need not be a slow process. Displacement is in direct relation to the rate of mechanisation. This depends on the supply, either through importation or domestic manufacture of the full range of large-scale equipment which can be applied to all operations. Such a trend has occurred in so-called developed countries. For instance, there was a large outflow of population from the agrarian sector in the US during the 1930s and 1940s as US agriculture mechanised. The problems of urban unemployment and unrest in the states need no elaboration. In India, the consequent social problems of unemployment and disparities in income will be increasingly exacerbated as this trend accelerates.

The change that such a development trend engenders will be to completely

alter the structure of agrarian society. With the displacement of most small and tenant farmers and landless labour, only large independent farmers will remain with a much reduced labour force. It will also alter economic and political ties. Displacement without opportunities of employment in other sectors will create a class of persons who have nothing, and consequently nothing to lose. They will become a free-floating political resource. The kinds of alliances they will enter into and the kind of pressures, if once mobilised, they can bring to bear on the political system at large is fairly speculative. Given the experience of other countries, such as Mexico, the form it will take will most probably be violent. This is essentially the conclusion of Frankel's "India's Green Revolution". Given the trend of large-scale mechanisation, larger farms, and displacement, the ultimate consequences will be political instability and/or revolution.³⁶ Frankel sees no other outcome, primarily because of her assumption that large-scale farming is the only way to modernise agriculture. There are, however, several roads to agricultural modernisation. The control of technology and radical land reform, such as in Japan and Taiwan, is an alternate route.

One recent sign of change in thinking is in the "Report of the Committee on Land Reforms". This document recognises the problem of displacement, disparities in income, and unemployment. These are linked to the development process currently under way. They have "been particularly noticed in areas where the yield break-through has been significant".³⁷ Furthermore, it ties these problems not only to the demographic situation in which people must stay on the land in the absence of employment in other areas, but also to the organisation of production through restructuring land tenure systems without necessarily harming productivity.

RELEVANCE OF JAPANESE EXAMPLE

The example of Japan cited is particularly relevant to the Indian situation of high population and limited land resources. A land reform programme similar to Japan's would solve two of the three major problems facing India today: employment, by keeping people on the land engaged in agriculture, and income distribution, by equitably distributing land, the basic factor of production. Land reform alone cannot solve the third problem, productivity. This can be tackled by making extension facilities and improved inputs available to all farmers; combining this with fiscal policies (e.g. taxation), which raise the

floor of economic viability. This was successfully done in Taiwan. Equal distribution of land will be one means of reducing differential access to inputs. It will also eliminate the comparative advantage of larger farmers over smaller ones and lead to a wider participation in the development process.

The report's recommended ceilings, however, will not stem the displacement of persons from agrarian areas. If farms were of an average of 10 acres (the lowest ceilings recommended for a family of five on the best of land), there would be only 32.9 million farms. This would be a decrease of 20.5 million farms, the households of which if included with the landless comes to 39.5 million households (as of 1960-61 figures).³⁸ For other types of land there are, of course, higher ceilings — up to 54 acres which would mean even fewer farms. As was pointed out earlier, there is no ceiling on rental of land. Ceilings on ownerships will not necessarily mean a ceiling on farm size. If the average size of farm should increase to 18 acres (the highest recommended ceiling on the best of land), then only 18.3 million farms will remain, displacing 54.1 million households from agriculture. It is possible that relatively few farmers on large farms can produce all the food India needs. Warehouses can be bulging, yet due to displacement and consequent unemployment a major portion of the population will be unable to purchase the grains. India with its limited resources cannot afford to put them on a welfare dole; indeed, it would not be possible in a wealthy country such as the US.³⁹ Even if this current land reform proposal can be implemented and enforced, the problems it seeks to rectify will barely be touched, particularly if mechanised technology is not also controlled. Mass participation in agricultural development will still remain an elusive goal.

This discussion has addressed several points. The assumption formal economics makes regarding economic behaviour has been examined and is found in need of serious modification, particularly regarding the sort of influences which come to bear upon farmers in their production decisions. This directly relates to effecting mass participation in and equitable sharing of the benefits of development. The separation of production from concerns of employment and income distribution has been found untenable. It is precisely the organisation of production, the combination of human beings and physical resources that determines to a major extent patterns of employment and income distribution. Finally, trends and shifts in agrarian social organisation and demography with regard to displacement have been ex-

amined and their ultimate consequences have been tentatively outlined.

The social problems of the "third generation" are being felt more and more. Thankfully, there is some new thinking on development, discarding the old assumption that aggregate growth must be benefiting everyone. There is an increasing focus on what is being produced by whom and to whom the benefits are or are not flowing. Also the problem of how best to effect mass participation in development without displacement is being addressed. Hopefully programmes of development can be engineered to bring this about. The social and political costs of alternatives other than greater equity through equitable economic participation are too high for any country to bear.

India's biggest undertaking in the field of Fertilizer Industry, the Fertilizer Corporation of India Limited, is one of the largest producers of plant nutrients in the world.

HOW BIG IS FCI? FCI's five functioning units at Sindri (Bihar), Nangal (Punjab), Trombay (Maharashtra), Gorakhpur (UP) and Namrup (Assam) have the installed capacity of half a million tonnes of plant nutrients. This will rise to over two million tonnes when additional six plants under construction go on stream.

CATALYST KNOW-HOW — FCI is one of the few organisations in the world to develop and produce a complete range of fertilizer catalysts, so vital to the industry.

TOTAL FERTILIZER TECHNOLOGY — Backed by its intensive Research & Development efforts, FCI has now developed its own know-hows, design and engineering capability and can execute six to eight modern fertilizer plants at a time from the blue-print to the final commissioning stage.

MARKETING SET-UP — With a vast network of sales outlets and promotional activities, FCI now serves about 80 per cent of the country.

OF INDIA LIMITED**

The Continuing Struggle in Vietnam

Lajpat Rai

THE Press and Information Department of the Foreign Ministry of the Democratic Republic of Vietnam (DRV) has issued a White Book listing the "serious violations of the Paris Agreement on Vietnam by the US and its Saigon stooges headed by Nguyen Van Thieu. The period covered by the document is between January 27 (the day the Agreement was signed) and May 31. According to the White Book, while the DRV and the South Vietnam People's Liberation Armed Forces "scrupulously observed" the cease-fire throughout South Vietnam, remained in their places and stopped all offensive activities acts of force, the US-backed Thieu administration failed to abide by the Agreement and systematically violated many of its essential provisions.

The Paris Agreement was signed on the basis of the recognition of the existence in South Vietnam of a zone under the control of the Provisional Revolutionary Government (PRG) of the Republic of South Vietnam. But with US backing, the Thieu administration has stubbornly tried "to negate and do away with this fact", and as stated by *US News and World Report* (January 29, 1973) "moved into contested areas, even communist controlled regions in order to reduce the number of people and territory dominated by the reds". Since January 28, 1973, says the White Book, the Saigon administration has mobilised all regular forces, civil guards and militia and has launched in quick succession over 20,000 operations, including 18 of division size, 97 of regiment size and 3,121 of battalion size. As the French newspaper, *Le Monde*, stated (March 1, 1973): "The Saigon troops have, and a great deal of evidence is explicit, violated the cease-fire, sometimes with the knowledge of the commissions of control".

The second charge the White Book levels against Thieu's regime is that it has "trampled upon the democratic freedom" of the people of South Vietnam and has "failed to achieve material reconciliation and concord" as stipulated by the Agreement. Quoting the Saigon paper, *Tin Song*, it says that immediately after the Agreement was initialled, Thieu issued "10 instructions" to his police, ordering them to "smash all schemes of pro-communist demonstrations". "to dissolve all

political gatherings", "to continue to destroy the communist infrastructure" and to bar "the communists from moving at will". He also empowered the provincial police chiefs to tighten up control in towns and cities, as a result of which, according to *US News and World Report* (February 5, 1973), "youth are subjected to strict control, sometimes they are forced to prove their identities to the security police as often as two or three times an hour".

In the meantime, the Thieu administration has pushed the 'pacification programme' to frenzied heights, with a degree of cruelty which surpasses even his war time operations. "Administration has herded over 300,000 people in concentration camps in the Mekong delta and in the plains of central Vietnam. In Quang Ngai province alone, by March 22, 1973, it had herded 19,176 families, ie, 104,496 people, in 22 concentration camps. The Thieu administration has also made frenzied efforts to consolidate its ruthless apparatus of coercion in the countryside. From January 28 to April 27, it has conducted 32,045 police operations in zones under its control, especially in densely populated areas, "purged" 139,587 people, arrested 20,616, and killed 4,125. With regard to achieving national reconciliation and concord as stipulated in Article 11 of the Paris Agreement, the White Book quotes what the US paper, *International Herald Tribune*, wrote on March 6, 1973.

"There [in Saigon] no one reports the slightest signs of that reconciliation and concord as promised in the Agreement. The shooting and the political tyranny continues ... President Thieu has ordered the arrest of neutralist and pro-communist elements ... He said in January that he would "arrest or shoot on the spot" anyone working for the PRG. Newspapers are totally controlled by his government, and political meetings and movements forbidden except for Thieu's own party. Thousands are held in jail without trial and under savage conditions on political grounds."

With regard to the 'general elections' under the Agreement, the White Book exposes the efforts of the Thieu regime to scuttle them or reduce them to a farce. On April 25, 1973, the

Saigon Administration put forward a so-called "preliminary draft agreement", raising in the first place the question of general elections, even proposing a specific date, thereby pretending to have at heart the achievement of the South Vietnamese people's right to self-determination. "But", says the White Book, the general elections mentioned in the Agreement are "genuinely free and democratic elections (Article 9B), ie, they should be held in the context of the two South Vietnamese parties ending all 'armed conflict' (Article 10), achieving national reconciliation and concord and ensuring democratic liberties of the people (Article 11)". Not merely this, the so-called "preliminary draft agreement" demands that "all Vietnamese armed forces that do not belong to South Vietnam withdraw from South Vietnam" and regards this as a prerequisite for the cease-fire, ensuring democratic liberties and the holding of general elections. This really was the old contention of the United States which was insisted on by Kissinger and then dropped at the time of signing of the Paris Agreement. The demand is obviously beyond the framework of the Agreement and according to the White Book is a "perfidious trick to sow confusion, to side-track public opinion, to delay the settlement of the internal matters of South Vietnam and to maintain Nguyen Van Thieu's dictatorship".

The most heinous crimes of the Thieu clique that the White Book exposes with telling effect, pertain to its treatment of the military and civil prisoners which under the Paris Agreement had to be exchanged with the prisoners held by the PRG and its armed wing. Transfer of prisoners from one prison to another, dispersion of prisoners, inclusion of military and political prisoners into category of common law detainees, compelling detainees to sign 'release certificates' or applications for 'Hoi Chinh' status (a Hoi Chinh is a person who has defected to the Saigon Administration), etc, are some of the crimes exposed not only by the White Book, but before it by the liberal US press.

According to the still incomplete data, from January 28 to March 28, over 32,000 prisoners were taken to unknown places and 103 political detainees were turned into common law prisoners by the Saigon regime. As to the living conditions of the prisoners in Saigon jails, *Time magazine's* correspondent, David De Voss, report-

TEN SERVANTS OF MAN

How India gave the world one of its most useful inventions.

It is India that gave man the ingenious method of counting all numbers by ten symbols and freed him from the bondage of counting on his fingers.

Among these symbols the most modest, yet the most valuable of India's subtle gifts to mankind was the zero.

Derived from the square shape of the Yagnakunda used in worship, each of these symbols was given a value of position as well as

an absolute value.

These numbers were in common use in India in Ashoka's time (273-232 B.C.). It was to be a thousand years later that Muhammad Ibn Musa al-Khwarazmi introduced them to Baghdad, from where they found their way to Europe.

Lending mathematical computations ease and simplicity, these symbols made possible the calculation of what before was incalculable.

Over the ages man's methods of solving mathematical problems have been growing to meet his complex needs. Today

ingenious devices enable him to make intricate calculations in billionths of a second. Making it possible for him to attack problems in ways never possible before.

With computers.

We are proud that IBM introduced the manufacturing of computers and other data processing equipment in India, which are helping the nation meet the challenge of building a new tomorrow.

©1973 IBM World Trade Corporation (Incorporated in the U.S.A.)

ed on March 19, 1973: "It is not really proper to call them men any more ... due to a steady diet of beatings as well as sand and pebbles in rice, dysentery, tuberculosis and chronic stomach disorders. Water was limited to three swallows a day, forcing prisoners to drink urine". Conditions worsened after the ceasefire, adds the *Times* correspondent. "When told of the Paris Agreement, the prisoners cheered, only to be stopped by doses of lye and bamboo. 'We had hoped to begin the new year with happiness', said one, 'but my new year began when I was doused with excrement'".

With regard to captured and detained civilian prisoners says the White Book, "it is common knowledge that Nguyen Van Thieu's Administration has built with US financing and aid thousands of 'tiger cage' type prisons and detention camps to detain patriots and all those who stand for peace, neutrality and national concord". It accuses the United States of complicity in this continued detention and maltreatment of the political prisoners lodged in Saigon jails and reminds it of the provisions of the Agreement and the protocol concerning the return of the captured personnel, according to which the US has a major responsibility for their safe return. Section IV of the White Book deals with violations relating to the withdrawal of troops and ending of US military involvement. At variance with Articles 5 and 6 of the Agreement, the United States has refused to dismantle its military bases in South Vietnam. While withdrawing from South Vietnam its troops and those of its allies, it has not removed huge stores of weapons, munitions and war material, which have been handed over to Thieu's generals "with a view to strengthening the tool of US colonialism in South Vietnam". The US has left behind in South Vietnam some 10,000 military personnel disguised as civilians, with the intent of maintaining a US presence in South Vietnam after the troop withdrawal. Their job is to continue the Vietnamisation programme and to co-operate with Saigon's notorious pacification campaigns designed to win the control over the population during and after the ceasefire. According to the Gai Phong Press Agency of South Vietnam, out of the 17,000 disguised US military personnel now in South Vietnam, 2,400 are acting as advisers to the police force and the 'Phoenix Plan', 1,300 are deputed to assist the Saigon Administration's Defence Ministry, while 77

are advisers in the 'equipment transfer team'. In serious violations of Article 7 of the Agreement, the US has overtly brought weapons and war materials into South Vietnam in order to buttress the Thieu regime. According to despatch from Saigon by AFP (March 21, 1973), in the first three weeks of March 1973 alone, the US brought into South Vietnam over 30,000 tons of armaments and war materials.

Besides this, the US has not stopped encroachment on the sovereignty and security of the Democratic Republic of Vietnam. According to the White Book, in March-April 1973, it repeatedly undertook air reconnaissance activities in the air space of the DRV over Vinh Linh, Quang Binh, Ha Tinh, Lang Son and Quang Ninh. On April 19 and 24, US planes carried out reconnaissance over areas including Hanoi and the part of Haiphong. These actions constitute violations of the Article 2 of the Agreement. Another serious charge levelled by the White Book against the Nixon Administration is its refusal to undertake its obligation of removing, permanently deactivating or destroying all mines in the territorial waters, ports, harbours and waterways of the DRV. The White Book condemns, what it calls, "United States' resort to procrastination" in the matter and its deliberate "prolonging of the blockade of the territorial waters of the Democratic Republic of Vietnam".

Lastly, the White Book accuses the United States of escalating the war in Cambodia, launching B-52 extermination bombings against densely populated areas and of sending Saigon and Thai mercenary troops for direct aggression against that country. These acts violate Article 20 of the Paris Agreement on Vietnam which acknowledges "the commitment of the parties to the Agreement to respect the independence, sovereignty, unity, territorial integrity and neutrality of Cambodia and Laos."

II

The White Book is no doubt a useful document, especially for those who are unable to keep pace with day-to-day developments in Vietnam and Indochina or do not have access to American and European newspapers and magazines which are quoted in the document liberally and effectively to make charges against the United States and Thieu's puppet regime — charges of open and blatant violations of practically all the important articles of the Paris Agreement.

But going through the 25 odd pages of this well-reasoned and well-brought out document, one cannot help asking the question: "But, what did you expect? Did you expect that the US imperialists and their stooges in South Vietnam would honestly implement the Paris Agreement and its protocols in letter and spirit?" The heroic Vietnamese people and their brilliant leaders of the Workers Party of North Vietnam and the NLF had their bitter experience with the Geneva Agreement of 1954 as well as with South Vietnamese puppets like Diem, Ky and their ilk. Or had the leopard changed its spots, as is being maintained by the revisionist leadership of the socialist camp? One cannot really understand the North Vietnamese leadership agreeing to sign the Agreement except in terms that they were pressurised to do so by their Russian and Chinese allies, who had acquired vested interests in what *Nhan Dan* characterised as an unprincipled *detente* with imperialism for the sake of petty, narrow, nationalist interests. Even a non-Marxist bourgeois politician like Prince Norodom Sihanouk of Cambodia displayed a greater awareness of imperialism and its stooges when he told a Paris bi-weekly *Afrique Asie*: "I firmly believe Nixon to be Machiavellian, cynical and intellectually dishonest". He compared Nixon with Hitler "in the sense that agreement and treaties will never be more than scraps of paper for him". Sihanouk, therefore, refused to negotiate with the Americans and their stooges in Phnom Penh, and declared that "we shall never accept an agreement with the United States and with the traitors in Phnom Penh ... and we have indicated this to our brothers in Vietnam and Laos". The Vietnamese were obviously in a position in which they could not afford to take a similar stand. The Paris Agreement was, however, hailed in Moscow and Peking as "a brilliant victory" for the liberation forces. The rulers of these two socialist states, acting as honest brokers for US imperialism, had played an important behind the scenes role in persuading the North Vietnamese to sign the Agreement on January 27, 1973. They, therefore, took a great deal of pride in its signing. In his January 30 speech given at a banquet in honour of Le Duc Tho in the Kremlin, Leonid Brezhnev pointed out that the signing of the Agreement "opened new possibilities for easing tensions, for consolidating security and world peace", adding that "now it is possible to find a peaceful and just solution to other conflicts, to liquidate the danger from

And Quiet Flows Orthodox Economics

Ranjit Sau

Industry and Underdevelopment by R B Sutcliffe; Addison-Wesley Publishing Co, London, 1971; pp xiv + 386.

THE richest one-third of the world's population receives roughly two-thirds of world income. The rate of growth of per capita national income in developed countries for the 15 years from 1950 to 1965 was noticeably more rapid than that for underdeveloped countries. There is some evidence that the rate of per capita income growth in underdeveloped countries is in fact slowing down. Even allowing for a fairly large margin of error in the figures it is clear that the gap in incomes per head is widening.

In 1960 over four-fifths of the world's manufacturing output took place in developed areas and less than one-fifth in underdeveloped areas. Whatever shift may be taking place towards the industrial sector in the structure of production within underdeveloped countries it has not been accompanied by similar changes in the occupational structure of the labour force. Industrial growth almost everywhere — in Asia, Africa and Latin America — is failing to create adequate employment.

In comparison with developed countries the performance of underdeveloped countries since 1950 has been even worse in agriculture than in industry.

Why does one part of the world languish while another surges ahead? This is one of the most vital questions of the century. Opinions differ, views diverge, and so the debate continues. What is to be done? And here also the controversy is as open as ever.

Meanwhile, the literature on the so-called development economics is increasing in volume without respite. You can discern two strands in this continuous stream. One comprises the brisk activities of the 'pattern-finders' (as Sutcliffe calls them) who with their statistical, econometric gadgets have mapped the path of industrialisation and economic growth. Walter Hoffman, Hollis Chenery, Simon Kuznets and many others, including a team of the United Nations, are on this track. The author, however, has mercifully ignored Walt Rostow. Then there is the other strand: a set of prescriptions straight from the cook-book of neoclassical economics on how to choose the optimal technique, how to compute shadow prices and evaluate investment projects, how to fi-

gure out trade and tariff policy, and so on. I M D Little, Harry Johnson, and others are engaged in this.

The broad tenor of the book under review is aptly summed up in the opening sentence of its preface: "Neither the Keynesian nor the neoclassical tradition of economic analysis has very much to say about industrialisation". The book, in the words of the author himself, is intended to be "a critical survey of this literature". And in this respect it has been quite successful.

In the course of writing this book, we are told, the author's "own scepticism of orthodox economics deepened". He hopes that some of the tentative views outlined there will communicate this scepticism in a constructive way to students of economic development. He exhorts that they have an opportunity and responsibility to search for a more penetrating analysis of questions of industrialisation and underdevelopment than those which they are accustomed to finding in the text books. It should not take them long to realise that only if their search moves from a purely economic plane to a social and political one can it help to redress the inequality and poverty which symptomise the present economic and political structure of the world.

So here is a book that casts doubt on conventional economics, and calls upon the reader to stir into action in search of the root cause of underdevelopment.

I

The usual discussion on agriculture-versus-industry as a strategy for development does not pose the fundamental question in the correct manner. For economic growth, in the sense of rise in per capita income, must entail industrialisation at some stage. Besides, agriculture and industry are not necessarily competitive, either in terms of their respective drafts on investible resources, or in the demand pattern of the consumers' budget. Institutional changes alone can take agriculture a long way. The concept of 'priority' to be assigned to agriculture or industry in such circumstances is at best nebulous, if not misleading.

At any rate, what is industrialisation? Which countries are industrialised? Sutcliffe proposes three tests: (a) a minimum of one-fourth of the gross domestic product has to originate in the 'industrial sector'; (b) in order to rule out the cases where mining is the predominant industry (e.g. Venezuela or Zambia with a large foreign-owned mining sector), at least three-fifths of the industrial output must be in manufacturing; and (c) industry should be strong enough to affect the distribution of labour force so that not less than one-tenth of the total employment must be located in industry. Out of the 98 countries examined, 30 pass these three tests, of which only three — Argentina, Hong Kong and Japan — fall outside Europe, North America and Oceania. India meets only the second criterion.

Is there a standard pattern of economic growth? Hoffman's stages, reckoned in terms of the relative growth of consumer goods and capital goods industries, are open to question as a guide for the developing countries. Also it is interesting to note that China appears to have passed through all of Hoffman's stages in a single decade. The studies of Kuznets and Chenery also offer very little, if at all, by way of indicating the path of growth for the developing countries to follow. Sweeping generalisations across countries on the basis of dubious data and mechanical concepts do not add even an iota to the knowledge about the road that lies ahead. Historical consistency still does nothing to answer the question of whether underdeveloped countries at low levels of income will or can pursue the same patterns of growth.

The context today is very different from what the now-developed countries faced in the eighteenth and nineteenth centuries. Lancashire cotton textiles can no longer launch the vessel of industrialisation as it did in England two hundred years ago. As Sutcliffe puts it, the current environment has four dimensions as it were: *lateness* in the timing of the beginning of industrialisation in underdeveloped countries; their *backwardness* in absolute and relative senses (the underdeveloped countries are too poor to take advantage of modern technology, and they are poorer than the forerunners of industrialisation were in their corresponding periods); their *co-existence* with the highly developed countries; and their *contact* with the latter, stretching over a long span of history.

Lateness can conceivably be advan-

existing hotbeds of war, above all in the Middle East". For Comrade Brezhnev, the Agreement was a harbinger of a new era in the world in which all tensions would disappear and all hotbeds of war would be eliminated, including the one which concerned him the most — in the Middle East.

In the same address, the Russian leader proudly noted that the Soviet Union "had helped actively on all fronts to bring the Agreement about — military, political and diplomatic", and hinted that the Soviet Union intended to press for strict implementation of the terms of the Agreement by all parties. (Not by the United States or Saigon, but by all parties!) This was perhaps a warning to the liberation forces in Vietnam that the Kremlin will tolerate no 'violation' of the accord, such as armed defence against Thieu's repressive terror. The *New York Times*, however, explained the Russian role in effecting the cease-fire in a different way: "The Russians", wrote Bernard Gwertzman (January 31), "were said, by US officials, to have been active in the last few months in assuring Hanoi that Washington was genuinely seeking an agreement and in relaying similar information about Hanoi to the White House". Brezhnev had, however, not yet finished his banquet speech. He told Le Duc Tho and his party: "The Democratic Republic of Vietnam resumes constructive work. It now has opportunity to concentrate its efforts on socialist construction and new prospects implementing the behests of President Ho Chi Minh for creating a peaceful, united, democratic Vietnam have opened. A road for peaceful democratic development opens before South Vietnam."

The fact that a peaceful democratic road has opened in South Vietnam will surely be news to the people of the South — the refugees and prisoners behind Thieu's barbed wire, the opposition leaders facing torture and death in Saigon jails, the inhabitants of tiger cages and for the workers and peasants exploited under the shadows of Thieu's guns. The White Book also indicates the kind of "peaceful democratic development" opening before the people of South Vietnam, as maintained by the Soviet chief who now goes to Washington to collect his honest broker's fees from Nixon.

The Chinese, too, regarded the Agreement as a brilliant victory for the Vietnamese. The Chinese leadership

which not a long while ago had frowned upon negotiations between the Vietnamese and the Americans, became the ardent supporters of the secret talks at Paris culminating in the Paris Agreement on peace in Vietnam. They too arranged a banquet in honour of the chief North Vietnamese negotiator in Paris, Le Duc Tho, in which Chou En-lai after paying tribute to the "valiant, tenacious, inspiring and heart-stirring struggle" of the Vietnamese people, declared that "the Vietnamese question could now be solved without outside armed intervention" and that the end of the fighting would have a "positive influence on the reduction of tension in Asia and the world". The Chinese leader spoke no words of caution and made no reference to the treacherous nature of the "imperialist wolf" which did not change its habits. Neither did he warn the Vietnamese against the expected machinations of the Saigon stooges, nor did he mention his own inner fears of Hanoi's domination of the Indochinese peninsula that would permit an enhanced Soviet influence (according to Peking) on China's southern flank, a fear mutely expressed in the January 28 issue of *Renmin Ribao* by a leading Communist Party functionary. Chinese worries were not on account of the United States' and the Saigon regime's intentions to press on in their counter-revolutionary moves, but only with regard to their encirclement by the Soviet social imperialists, in league with the Vietnamese. In his interview with Takeo Kimura of the ruling Liberal Party of Japan who visited China in the middle of January this year (published in *Washington Post*, January 29, 1973), Chou said that the Vietnamese cease-fire would not bring peace to Asia, not because of the United States and its Saigon puppets, but because "a certain country would not give up its attempt to dominate the area". The obvious reference was to the Soviet Union. "The Chinese leader", the *Washington Post* elucidated, "explicitly exonerated the United States, saying that Washington and Peking had agreed not to seek hegemony over Asia and the Pacific ... The 'certain country' is the Soviet Union unless, of course, the Maoists have North Vietnam in mind".

One negative effect of the characterisation of the Paris Agreement as a "brilliant victory" has been a sharp decline in the anti-imperialist and pro-Vietnam activities of the international anti-war movement. With "victory" won in Vietnam the movement seems to have folded up its activities. Even before the cease-fire its effectiveness

was limited, thanks to the Sino-Soviet schism. Both Moscow and Peking commanded the allegiance of millions in the international workers' movement, millions who could be mobilised into massive worldwide campaign to force US imperialism out of Indochina. But no call for a united front for the defence of the Vietnamese revolution was forthcoming from the Soviet and the Chinese leaderships. In fact, in many countries, political parties and mass organisations in solidarity with Moscow and Peking worked at cross purposes, often opposing each other's actions in support of the Vietnamese struggle.

In India, as elsewhere, the legendary resistance of the Vietnamese people and not even the dastardly December 1972 carpet bombing of Hanoi and Haiphong, could bring together the two communist parties and the mass organisations led by them for a joint action on behalf of Vietnam. The CPI's contribution in this regard was the holding of a few minuscule gatherings by the Afro-Asian Solidarity Committee (a semi-official body led by some CPI stalwarts) in the fashionably located Constitutional Club in New Delhi, a few tiny demonstrations before the US Embassy where the uniformed police generally outnumbered the demonstrators two to one, or a perfunctory signature campaign to demand the withdrawal of US troops from Vietnam. The CPI(M)'s activity consisted in holding a few big rallies in Calcutta or adopting routine resolutions in their party or trade union conferences. Since the signing of the Paris Agreement, however, even this activity has come to a standstill. The cease-fire has been effected, the Paris Agreement for peace in Vietnam has been signed, "brilliant victory" has been achieved, the peace movement has come out with colours! And after the victory, rest. This is the prevailing mood now among the militants of the anti-war movement everywhere. The recent savage bombing of Cambodia by Nixon's B-12 planes hardly evoked any reaction among the pro-Moscow or pro-Peking partisans of the Vietnamese struggle or from the humanitarian anti-war militants of America and Europe.

The White Book on serious violations of Paris Agreement by the United States and the Saigon Administration might act as an eye-opener for those activists who, having fallen victim to the propaganda of "a great and brilliant victory", have folded up their activities in defence of the Vietnamese revolutions.

Adopting latest scientific and engineering achievements V/O NEFTECHIMPROMEXPORT designs and renders technical assistance in construction of highly efficient oil refining, petrochemical and chemical enterprises as well as cellulose and paper producing plants.

Project reports are prepared by leading design institutions of the Soviet Union.

V/O NEFTECHIMPROMEXPORT:

- carries out scientific, research, survey and design work;
- furnishes equipment, materials and spare parts;
- deputes highly qualified experts for rendering technical assistance in construction, effects designer's supervision in the field, takes up construction, erection and adjustment work, puts enterprises into commissioning;
- trains customer's personnel both in the field and at the USSR plants.

Equipment, instruments and material supplied by V/O NEFTECHIMPROMEXPORT conform to all modern requirements and are tested by experience under various climatic conditions at the plants constructed in the USSR and abroad.

Write for detailed information to:

tageous to the extent that technology has progressed in the meantime. But, at the same time, the cost of initial investments necessary to start many types of industrial production also has gone up disproportionately. A rough calculation suggests that the average cost of total capital, in a single typical industrial operation in France in the nineteenth century was roughly the same as six to eight months' wages for the average worker; in England it had been even less; the corresponding cost for underdeveloped countries is roughly three hundred and fifty months' wages.

Sutcliffe has thus very ably analysed the implications of the current situation that stares the developing countries in the face.

II

Coming to specific, analytical issues like choice of technique, plant size, trade and tariff, the book examines the theoretical literature in the light of concrete experiences as embodied in various empirical works. With regard to the choice of technique, for instance, it emphasises that an answer to this question must be approached by a rather circuitous route: firstly, what exactly does this question mean? Secondly, is there really any choice? And, thirdly, who makes the choice? Only when these three questions are answered is it possible to suggest a solution to the problem itself, which in most of the literature has been posed and answered in entirely too narrow a way. In this connection, it also bears in mind Myrdal's words: "scientific and technological advance in the West has had, and is having, an impact on the South Asian countries that is very detrimental to their development prospects". Thus the canvas of analysis is not only quantitatively broadened but it is also qualitatively deepened. However, as one might expect, the book finally does not end up with a handy formula for the choice.

During the early sixties in Pakistan, 62 per cent of consumer goods industry, 78 per cent of intermediate goods industry and 50 per cent of capital goods industry were working at below 40 per cent of capacity. In Brazil, utilisation of capacity, reckoned at one-shift basis only, is estimated at 53 per cent for capital goods industry and 65 per cent for consumer goods industry. Country after country — Burma, Formosa, India, Ceylon — presents the same pattern of enormous excess capacity in industries. Are the plant sizes too big relative to the market? Sutcliffe gives an answer in the affirmative. Such high levels of ex-

cess capacity cannot all be explained as the result of time phasing of investments or shortage of inputs due to administrative failures, supply problems or foreign exchange shortage. The main reason is, he asserts, the small size of the market relative to the size of the plant which has been adopted, which in many cases must be the minimum available size. This is not just the result of small populations and low incomes, but just as much of the distribution of income, tariff policies and the type of products thus produced.

Indeed, the average population of African countries is only six million (distinctly less if Nigeria is excluded); it is eleven million in South America, but once again Brazil considerably raises this average; and forty-three million in Asia, though again it would be very much less if two or three countries were omitted. Per capita income in many of these countries is a minute fraction of that in the developed countries. Most underdeveloped countries have a very low population and a massive poverty; the internal market for manufactures therefore is then bound to be small. Nevertheless, there is one more factor that accounts for the prevalence of excess capacity, at least in India in particular. It is monopoly power. Evidently, large monopoly houses in India have pre-empted industrial licences and built up excess capacity so as to prevent entry or expansion of competitors. One does not know how much this factor is active in this way in other countries.

Sutcliffe has taken up a number of other policy issues: import substitution, foreign aid, regional integration, protective tariff, and so on. His approach is refreshing and his analysis competent. However, as he says, "the more technical subject matter of this book is less important than the answer to a number of puzzling and intractable political questions. Whether the social and political changes necessary for successful industrialisation can take place in the Third World, or whether they depend upon political changes in developed countries as well; whether steps towards effective economic integration of small countries is possible, and whether future industrialisations can take place without the social horrors which have been associated with earlier industrialisations, capitalist and Stalinist".

III

The failure of the present form of industrialisation in the Third World to employ the rapidly growing labour force in the industrial economy has far-reach-

ing consequences. The prevalence of capital-intensive techniques, largely the result of connections with foreign capitalism and the need to satisfy the tastes of a privileged elite, has prevented the formation of an industrial proletariat on anything like the scale experienced in the Western European countries. On the other hand, the march of urbanisation is going ahead with enormous speed. And at the same time, because of the unprecedented growth of population, the countryside is forced to absorb increasing numbers of people. There seems to be no historical parallels to what is now occurring in many underdeveloped countries — in a sense a partial industrialisation without either the bourgeoisie or the proletariat. Without the bourgeoisie, because the public sector is assuming an overwhelmingly large role in total investment; and without the proletariat, since the capital-intensive technology does not generate much employment. So argues Sutcliffe, and then he continues as follows:

The closest parallel is with Russia in the late nineteenth and early twentieth centuries. Here too capitalist industrialisation of a sort was launched, with considerable involvement of the state, much of it financed from abroad, and in the context of an increasingly integrated world economic system. At the same time technology had moved in such a way since Western European industrialisation that more capital-intensive methods were used and no vast industrial working class was created in comparison with countries which industrialised earlier. It was partly this Russian experience of industrialisation, or, if you will, non-industrialisation, and the subsequent revolution which has led to the view common in socialist writing that true industrialisation is impossible under a capitalist system in underdeveloped countries.

But Sutcliffe's view on this question is unambiguous: "The possibility of further capitalist industrialisations cannot be in principle ruled out". However, he adds, there seems little doubt that neither the complacent dictatorship and oligarchies nor the timid imitations of Western European parliamentary democracy, both of which abound in the Third World, have sufficient power to mobilise and allocate resources on a scale large enough to produce a social and economic transformation which will keep pace with the demands for it. If these demands are not met then there are increasing prospects of social and political upheaval.

Within the last 50 years there are

two examples of countries which have successfully undergone an industrialisation more rapid than any country which industrialised in the nineteenth century, except perhaps the United States; these are the Soviet Union and Japan. According to Sutcliffe, the success of both these cases may seem to leave open the question of whether only a socialist path to industrialisation is viable. Both the Soviet Union and Japan, however, pursued a course of development which was very different from the nature of industrialisation in Western capitalist countries. In many respects the two countries diverged from each other; but some crucial differences from the Western capitalist pattern they experienced in common. And most economically backward countries now are different again in character from the Soviet Union and Japan. So is the world economic situation which confronts them. Hence, if these countries are serious about industrialisation, they have to blaze a new trail which will defy such

labels as capitalist or Stalinist. In any case, their technological and economic effort is likely to be fruitless unless it is accompanied by a social and administrative revolution.

Sutcliffe does not say so; but the fact of the matter is that the spectre of the Chinese Revolution is already haunting the ruling classes in many of these countries.

IV

This is an interesting book written by a competent author. He has succeeded in bringing into the corpus of his analysis the really fundamental questions related to industrialisation in underdeveloped countries. One does not, however, require much foresight to say that nevertheless the dominant stream of economic analysis would brush aside all this as outside its scope, and continue to flow in its usual, sterile course. But that also would be an indirect confirmation of the basic hypothesis of Sutcliffe.

Paternalistic Capitalism

ANDREAS G. PAPANDREOU

The distinguished economist and Greek political leader presents here a powerful critique of Western capitalism and its relationship to government and foreign policy. Dr Papandreou first examines the orthodox view of the contemporary capitalist economy and the 'myth of market capitalism' which it has engendered. He then considers the Neo-Marxist view that the economy can best be understood as monopoly capitalism, and the technocratic interpretation of society proposed by J. K. Galbraith. **Minnesota £2.75**

The Aberystwyth Papers: International Politics 1919-1969

Edited by BRIAN PORTER

This book, with a foreword by H.R.H. The Duke of Edinburgh, Chancellor of the University of Wales, is a collection of papers by fourteen leading international scholars. The papers were written in honour of the fiftieth anniversary of the founding of the University College of Wales, Aberystwyth, of the world's first Chair of International Politics, a Chair that has been occupied by such distinguished scholars as Sir Alfred Zimmern, Sir Charles Webster, and Professor E. H. Carr. **£5.50**

Indian Defence Expenditure in Global Perspective

K Subrahmanyam

There is a general trend in many parts of the world for defence outlay as a percentage of GNP to decline with the rapid growth of GNP and with the increasing spirit of detente that has developed in various traditional areas of tension. World military expenditure had been around 7 per cent of world GNP throughout the 1960s but fell to 6.3 per cent in 1970 and to about 6 per cent in 1971. This is still well above the Indian defence burden. In spite of this overall decline, in the areas immediately around India — such as Pakistan, Iran and China — there are no indications of a downward trend either in absolute terms or in terms of defence outlay as percentage of GNP. All these countries spend far above the world percentage.

Even in regard to countries which are exhibiting a declining trend in their defence burdens, it is necessary to view the totality of their defence expenditure over the last two decades. A number of them have already developed certain levels of forces and presently do not find it expedient, in the light of the detente, to expand their forces or add to their military stockpiles. This appears to be the case in respect of countries like the United States, France, West Germany, Italy and Canada.

The amount of defence outlay to be devoted to manage the security of a nation without unduly high expenditure is a matter of sophisticated political and economic judgment. But there is no study available in India estimating the cost to the economy of the postponed military/economic decisions due to the various uncertainties arising out of the national security Crisis of 1962, 1965 and 1971. A cost-benefit analysis of a slightly higher order of defence outlay, which might reduce the uncertainties in decision-making, would be very desirable.

DEFENCE expenditure as a percentage of gross national product is one of the commonly used indicators to calculate the defence burden on the economy of a country. This is a better indicator than the percentage of defence outlay to the total governmental expenditure since the governmental expenditure of a country depends upon its constitutional set-up (whether it is federal or unitary) and its economic philosophy. A socialist government brings within the scope of its budget a greater degree of the economic activity of a country than a non-socialist government.

Indian defence expenditure which was less than and around 2 per cent of the GNP in the 1950s started rising after the Sino-Indian conflict in 1962. The peak was a 4.5 per cent outlay in 1963-64. In the latter half of the 1960s there was a tendency for the defence outlay to stabilise at around 3.3 per cent. In 1971-72, in view of the grave national security crisis, defence outlay went up. It is estimated to have gone up to perhaps 3.7 to 3.8 per cent (firm figures of GNP at current prices are not yet available for 1971-72). Thereafter the trend appears to be towards a slight decline from this level.

Table 1 gives the figures of defence expenditure of the country, the GNP at current prices and the percentage of

defence expenditure to GNP, since 1960-61.

Out of 64 countries for which percentage of defence outlay to GNP has been calculated for 1971, 24 countries spent more than 3.7 per cent of their GNP on defence. Yet none of these countries had to face the hostile environment India has had to during the last 25 years.

There is a general trend in many parts of the world for the defence outlay as a percentage of GNP to decline with the rapid growth of GNP in many countries because of the spirit of *detente* that has developed in various traditional areas of tension. The world military expenditure had been around 7 per cent of the GNP throughout the 1960s but fell to 6.3 per cent in 1970 and to about 6 per cent in 1971. This is well above the Indian defence burden. In spite of this overall decline, in the areas immediately around India, such as Pakistan, Iran and China, there are no indications of a downward trend either in absolute terms or in terms of defence outlay as percentage of GNP. All these countries spend far above the world percentage.

Even in regard to countries which are exhibiting a trend towards decline in the defence burden as percentage of

GNP, it is necessary to view the totality of defence expenditure of those countries over the last two decades. A number of them have already developed certain levels of forces and presently do not find it expedient, in the light of the spirit of *detente*, to expand the forces or add to their military stockpiles. This appears to be the case in respect of countries like the United States, France, West Germany, Italy and Canada.

For the period 1950-70, it has been computed that the average increase per year in Indian defence expenditure, on the basis of constant prices, has been 5.4 per cent. Out of 83 countries for which similar calculations have been made, 48 countries had a higher percentage of annual increase in defence expenditure. This includes countries not only in military alliances but non-aligned countries like Yugoslavia.

An analysis of our defence expenditure as a percentage of the non-developmental expenditure of the country as a whole (including Central and state outlays in the total governmental expenditure) exhibits an interesting pattern (Table 2).

Indian defence expenditure, as a percentage of total governmental expenditure of both the Centre and states, has declined from 17 per cent in 1964-65 to 14.36 per cent in 1970-71.

Since the final actual figures of total governmental expenditure for 1971-72 and 1972-73 are not available at the moment, it is necessary to calculate them on the basis of the revised estimate (RE) for 1971-72 and the budget estimate (BE) for 1972-73. This gives percentages of 14.99 and 15.68 respectively. However, since the final expenditure is likely to be somewhat higher, these percentages are likely to decline.

An analysis of the defence expenditure as a percentage of non-developmental expenditure of the Centre and the states shows that it has declined from 44.41 per cent in 1964-65 to 32.98 per cent in 1970-71. In spite of the war in 1971-72 and the sharp increase in defence expenditure that year, it would appear that as a percentage of non-developmental expenditure, it is likely to register a decline, showing thereby that the rise in the non-developmental expenditure, other than defence, was even higher than the defence expenditure. This trend seems to continue even for the year 1972-73. It is obvious that the expenditure classified as 'non-developmental' has been increasing at a faster rate than the defence expenditure in the last eight years for which data has been analysed. Table 3 is an analysis of defence expenditure and non-developmental expenditure of Central and state governments.

Defence expenditure as a percentage of GNP has been relatively constant between 1964-65 and 1972-73. The two slight peaks in 1965-66 and 1971-72 indicate the war years. In the late 1950s, peak percentages occur in the years 1962-63 and 1963-64 when the country's armament programme began in earnest following the Sino-Indian conflict.

Non-developmental expenditure, other than defence, has a tendency to catch up with the developmental expenditure. It is obviously clear that the constraints on developmental expenditure do not arise from increased defence expenditure. It is, however, not very clear whether or not these constraints arise from the rapidly rising non-developmental expenditure of the Central and state governments. This appears to be an area worth further detailed study.

Defence expenditure as a percentage of GNP seen together with the rate of economic growth does not show any correlation whatsoever between the two. As mentioned earlier, defence expenditure as a percentage of GNP has been relatively stable since 1962-63 while the economic growth rate has been fluctuating violently. Monsoon and favour-

able agricultural seasons are well known to have any correlation, positive or negative, with defence outlay. This is not surprising because that other factors, they do not seem to have been the worldwide experience.

Defence expenditure as a percentage of GNP has been worked out for 15 major countries for the last twenty years in Table 5. It would appear that contrary to popular belief high defence expenditure does not seem to have a negative correlation with a high economic growth rate.

Even with very high levels of defence expenditure in the post-war period, the economies of the developed countries grew at a rapid rate. Thus, the Soviet Union reconstructed its economy after it was devastated by the war and even assisted in the development of Eastern Europe. Erhardt's miracle and the rapid growth of Western Europe and Japan also occurred at the same time. This is not only true of developed countries but also of China in the

1950s. The European Economic Community countries grew at an average rate of 5.4 per cent during 1950-68. The average annual rate of growth of real net material product of the centrally planned economies of Eastern Europe was 8 per cent between 1950-68. Instead of a negative correlation, one is almost tempted to derive a positive correlation between high defence expenditure and a high growth rate. That would, however, be a fortuitous one.

It is, however, possible to derive a positive correlation between economic growth rate and fixed capital formation which in turn has a negative correlation with personal consumption expenditure. All the countries mentioned above have personal consumption expenditure as a percentage of GNP in the

region of 60 as against the Indian case where it is in the high 70s. The normal pattern in all these countries appears to be that over and above the personal consumption expenditure of the order mentioned above, the governmental consumption expenditure — of which defence expenditure is a part — ranges from 10 to 15 per cent and the balance constitutes savings and investment. Unfortunately, in the case of India we do not have corresponding data except for the period 1960-61 to 1965-66. For this period, Table 4 gives the percentage of government and private final consumption expenditures.

The Fifth Plan envisages a rise of gross domestic savings from 12.9 per cent in 1973-74 to 16.6 per cent in 1978-79. This is still very much below the savings rate of all the countries which have a reasonable growth rate.

There is also a difference between the defence expenditure of countries which have full employment or near full employment and the other developing countries. In the case of the full employment economies the opportunity cost of deploying personnel in defence services,

* Estimates from 1965 onwards.

** From 1951 to 1968 the estimates are from figures furnished by SIPRI. For 1969, 1970 the estimates are those of the Institute of Strategic Studies.

† Does not take into account military aid from USA and China

as against other productive enterprises, is very high. On the other hand, in the case of economies with much unemployment, defence expenditure does not have the same impact. Hitler's rearmament programme as well as the US rearmament programme and participation in the Second World War absorbed the slack in their respective economies. This is not to justify a large rearmament programme, but to point out the difference in the nature of arms expenditure in the two kinds of economies.

Defence expenditure is mostly consumption expenditure and is only a minor portion of governmental consumption in a modern state. The marginal adjustment of defence expenditure within the overall consumption pattern of the economy, without upsetting the rate of savings and investment, is a matter of good national economic management.

This, however, is not to underestimate the specific problems arising from certain categories of scarce resources such as foreign exchange, highly skilled personnel, scarce raw materials, etc. These problems present somewhat more rigid constraints on defence effort than the issue of a marginal increase in the level of domestic resources to be applied. This will, however, highlight the need to manage the defence plan as part of the overall national planning and as part of an integrated process of national economic management.

R AND D EXPENDITURE

It has been estimated that during the 1960s, the annual world military R and D expenditure was of the order of \$15-16.5 billion. 85 per cent of this was spent by the US and the USSR. The United Kingdom, France, China and West Germany together spent another 12 per cent, leaving 3 per cent of the world total to be spent by all the other countries.

The military R and D expenditure is estimated to account for more than 50 per cent of the total world R and D expenditure. In terms of GNP it exceeds 1 per cent for the United States and well above 0.5 per cent for France and UK. As a percentage of the defence budget, it is of the order of 10 per cent for the US, UK, France and Sweden. For India defence R and D expenditure has just crossed the 2 per cent mark in the defence budget and constitutes 0.07 per cent of our GNP. In terms of the total Indian R and D effort, military R and D expenditure is likely to be of the order of 10-12 per cent.

In the advanced industrial countries, military R and D expenditure constituted an even higher percentage in the 1950s and a trend is noticeable in the 1960s of a substantial rise in the civil R and D expenditure. A study by SIPRI (Stockholm International Peace Research Institute), observes that the tendency to devote larger shares of the countries' budget to civil R and D in the 1960s may have been stimulated by the military efforts during the 1960s. "In particular, the allocation of very large sums — in hundreds of millions of dollars — to civil R and D may reflect an enthusiasm for the potential civil benefits of R and D investment which has been spurred on by the earlier successes in weaponry of the very large scale military R and D effort".

Specific efforts are being made in the US to develop an infrastructure which will readily transform the spinoffs from military R and D into civil applications. This, however, is still to make significant headway.

There is, however, an increasing fear in the minds of those who have been in the forefront of disarmament efforts (like Alva Myrdal) that the enormous outlays of military R and D are placing the super powers in a position of technological hegemony *vis-a-vis* other countries. The space communications and

earth resources satellites, computers, advances in oceanography, fission and fusion research, laser communications systems, etc, it is feared, are likely to put the super powers in a dominating position over the world's energy sources, transport and communications systems, and exploration of underground under-ocean resources.

The amount of defence outlay to be devoted to manage the security of a nation without incurring unduly high cost is a matter of sophisticated political and economic judgment. There is no study available in India to estimate the cost to the economy of the postponed economic decisions due to the various uncertainties arising out of the national security crises of 1962, 1965 and 1971. A cost-benefit analysis of a slightly higher order of defence outlay, which might have reduced the uncertainties in decision-making, would be very desirable.

The defence outlay of a nation has to be related to the threats it perceives to its security from the strategic environment. In countries with centrally planned allocation of resources for defence and development, it has been possible to combine a fairly high level of defence expenditure with a high rate of economic growth by imposing restrictions on consumption.

IDA Credit for Pakistan

THE International Development Association (IDA) has granted a \$45 mn loan to Pakistan. The credit will help manufacturers in selected industries to make fuller use of existing capacity by enabling them to import raw materials, components and spare parts. A wide range of manufacturing industries — textiles, iron, steel, chemicals, paper, plastics, rubber and commercial vehicles — will benefit from the credit. The credit will meet the foreign exchange cost of industrial imports required in 1973-74.

Manufacturing is the second largest sector of Pakistan's economy accounting for about 17 per cent of the gross domestic product and providing employment to about 16 per cent of the country's population. About 60 per cent of value added in manufacturing comes from agro-based industries, including textiles, sugar, edible oils, leather and tobacco. While the basic raw materials come from domestic sources, these in-

dustries require substantial imports of chemicals, machinery components and other inputs. Industries accounting for the remaining 40 per cent of value added are largely dependent upon imported materials.

According to an IDA press note, the IDA credit will support the continuing adjustment of Pakistan's economy to last year's trade and exchange rate reforms. The credit will help to support continuation of liberalised import policies and to provide the imports needed to maintain the growth of exports and rising domestic consumption. The progress of this adjustment is reflected in the rapid growth of exports and in the growing production of goods to replace imports.

The IDA credit is for a term of 50 years, including 10 years of grace. It will be interest free, but will carry the usual service charge of 3/4 of 1 per cent to cover IDA's administrative costs.

And Ever the Twain Shall Meet

G P Deshpande

IT was that most formidable of the "communist demons", Leon Trotsky, who once said that Europe had produced two great things: one a great ideology and the other a great technology. It was his view that while the ideology travelled east, the technology travelled west. The two, he insisted, had to meet. His dream, it seems, is coming true; except that on the way it has become a nightmare. The technology that he talked about has over the years demonstrated, in Vietnam and elsewhere, what a monstrous force it can be. As regards the ideology, nobody seems to know what it means or ever meant. At any rate, the latest American rendezvous with Comrade Brezhnev, which ended on Monday, the 25th, had very little to do with it.

It all started at Camp David. I do not refer to Brezhnev's quiet weekend at the mountain retreat of the American President. Camp David has by now a 14-year history in the annals of the super-power *detente*. Going by the glowing newspaper accounts and the pious editorials, it might appear as though the *detente* began with Nixon's trip to Moscow last year. The fact of the matter, however, is that the *detente* is easily 14 years old. It was in 1959 that Khrushchev and Eisenhower met at Camp David and brought it to each other's notice that peaceful co-existence between different social systems was always possible when you had the whole world to divide up among yourself. There has been a steady growth since in the general American and Soviet belief that the more organised the world is — that is, organised under their aegis — the better it is for peace. Admittedly there were a few problems, but it was left to the smaller powers to imagine that these problems constituted the ultimate irreconcilable contradiction between world capitalism headed by the United States and world socialism (in the true sense of the term; not the Chinese deviation!) headed by the Soviet Union. Then the small powers, if they belonged to a specific camp, could let out steam against either 'imperialism' or totalitarian communism. Meanwhile, the Americans and the Soviets could wait for the water-melon of the world to ripen. The non-aligned found the myth useful. They had managed to establish a useful balance

between radical slogans and foreign aid. Everything seemed to work fine. Of course, the major operative condition was to pretend that the *detente* had not yet arrived so that every successful Soviet-American summit could be made out to be one more necessary step towards *detente*, world peace and what have you.

It is blatant nonsense to pretend that Soviet-American relations in the last 10-odd years have been plagued by anything more than manageable tensions. Tensions and contradictions were of course there, but they only served as reminders to the world that the two social systems were after all different and that it was in everybody's interest that they remained different. The dominance of the world by the two super powers has been a fact of international life for over a decade now. Brezhnev's trip to the United States only confirms it once again. There are a few hopefuls still around who think that the Americans and the Russians do not get along well. They might find the meetings useful. Comrade Brezhnev asked the Moscow-based American correspondents in for a chat in his Kremlin office a day before he was to leave for the United States. Answering a question he said that he did not remember when he last used the hot line between President Nixon and himself. The use of the hot line has been either unnecessary or much too commonplace a thing to remember!

II

It is interesting that while Brezhnev was in the United States the admissions committee of the United Nations has decided to admit the two Germanies. Nothing could have demonstrated better the simple fact that the jigsaw puzzle of the world was finally falling into place. President Park Chung-hee of South Korea likewise called for normal ties with the Soviet Union and China during the same week. The Chinese kept almost obediently silent. The only noises made were those of the cease-fire in Vietnam; but those, in any case, everyone has decided to ignore. There has been one more agreement in Paris; so at least on paper the war has ceased.

The world seems to have become a

better and happier place to live in. To contribute to the allround feeling of friendship and understanding between the South Koreans and the Soviets, between the Canadians and the Indians, between the two Germanies, between the Chinese and the Americans and so on, Nixon and Brezhnev have pledged themselves to a comprehensive agreement on the restriction of atomic weapons by 1974. They have pledged to rule out nuclear war between themselves and with any third power. The SALT talks, being held at Geneva, promise to be a success now.

The Chinese used to describe the super power *detente* as "two super powers contending and colluding with each other for world domination". This formulation will have to be restated as "two super powers occasionally contending but normally colluding with each other for world domination". The only dark cloud on the otherwise peaceful horizon of Soviet-American understanding was the Middle-East, as Brezhnev himself recognised. It is doubtful, however, that even this cloud is all that dark. Some apparent tension between the two super powers is always desirable. Otherwise, what will the faithful talk about? The radicals in power in countries like India will lose an issue on which they can safely be the anti-status-quoists. On all other issues, there is a movement towards peace.

There are several points on which this almost idyllic picture of a quiet, peaceful world, dominated (to everybody's good) by the Americans and the Soviets is likely to break. The continuing war in Indochina is a bloody reminder that the Americans have, in fact, not withdrawn yet. The politics of peace there is going to be as tortuous as the war has been. For the sumit-teers, however, this is scarcely a problem. As of today, the Indochinese people are something of an exception. The others have learnt to appreciate the bounties of compromise.

III

There is much, thus, in Brezhnev's achievements in Washington to make him and the Soviets happy. In spite of the middle kingdom of Chairman Mao trying to play a deft political game, it has been reiterated that the most important relationship in the world today is the one between the Soviet Union and the United States.

The other agreements that Comrade Brezhnev has reached during his American safari, however, tell a story which

Mahindra Ugine Steel Company Limited

Statement of the Chairman, Mr Harish Mahindra

THE following is the Statement of the Chairman, Mr Harish Mahindra, to the Members on the occasion of the Tenth Annual General Meeting of the Company held in Bombay, on June 29, 1973:

At the very outset I would like to refer to the untimely and tragic death of Shri Mohan Kumaramangalam and Shri Satish Loomba. Shri Kumaramangalam had the enviable reputation of being a legal luminary. As a Minister he was known for his dynamism and fresh approach to tackling the problems confronting the Steel Industry in particular and maladies in general which continue to plague the country. His life was cut short at a time the numerous bold measures he had initiated for the resurgence of the Indian Steel Industry were about to bear fruits. Shri Loomba was my valued colleague on the Bonus Review Committee and was well known for his total dedication and his spirited advocacy of the cause of labour. I take this opportunity to convey my personal condolence to the bereaved families of Shri Kumaramangalam and Shri Loomba.

EXPANSION

It is gratifying to be able to report to you that after patient waiting for three seemingly interminable years we have received the Letter of Intent sanctioning our scheme for substantial expansion of the capacity of the Alloy Steel Plant from 24,000 tonnes to 60,000 tonnes of finished steel per annum. I had mentioned to you in my last statement about the delay on the part of the government in sanctioning our scheme for substantial expansion and the impact of the delay on the capital cost of the Project. The previous cost estimates of capital plant and equipment for the expansion scheme are no longer valid owing to the substantial escalation in the prices of plant and equipment not only in India but all over the world. Previous projections of capital cost require to be updated — an exercise to be undertaken on the basis of firm offers for supply of plant and equipment from indigenous sources and abroad. We have decided broadly regarding the specifications of plant and equipment required for expansion in conjunction with our technical collaborators, Ugine Aciers. After the capital cost estimates have been finalised in the light of firm offers for supply of plant and equipment from India and abroad,

a detailed feasibility study will be prepared based on which our financing plans for expansion will be submitted to the Lending Institutions. I expect to be able to spell out the details of the expansion scheme in the next Report of the Directors.

FIRE

Before I review the economic and political situation of the country, I would like to refer to an unfortunate incident which occurred on the 10th January. A devastating fire broke out in the Registered Office of your company and destroyed furniture, fixtures, typewriters, etc. In the Directors' Report we have mentioned about this untoward happening. We have intimated the authorities concerned about this destruction wrought by the fire. We were obliged to move over temporarily to another building and we are expecting to move to a permanent address within a short time. In this connection, what is most heartening was that the members of the staff, from bottom to top, worked untiringly and with unqualified dedication for restoring normalcy. Fortunately, bulk of the records pertaining to the previous year could be salvaged and we were able to reconstruct the rest of the records, so that the audit could be completed within the statutory time limit. That we have been able to hold the Annual General Meeting within the statutory time limit is by itself an ample testimony to the dedication with which the members of the staff had applied their mind and energy for building up the records afresh. They have my deepest appreciation and thanks for their efforts in restoring normalcy.

ECONOMIC AND POLITICAL SITUATION

The year 1972 has been exceptionally difficult one for the economy as well as for the corporate sector. It was in some respects one of the most damaging years for the country's economic development. Practically there was no growth at all in our gross national product and what little increases were achieved in some of the sectors of the economy, mainly Secondary and Tertiary Sectors, were not big enough to compensate for the shortfall in other Sectors, particularly in food-grains production. As against the anticipated 104 million tonnes actual food-grains production in the agricultural

year 1972-73 is expected to be of the order of only 100 million tonnes. The vexatious problem of fall in production in almost all the Sectors is further complicated by hyper-inflation, as bad as during the post-war period. The major factors responsible for the slide back in the economy are quite well known. Firstly, the failure of the monsoon in some of the largest states of the country has seriously affected the food-grains production. It has also meant lack of adequate water in the reservoirs of Hydel Power generation stations. Secondly, there has been an over-too-much deficit financing over the past 2/3 years of the order of nearly Rs 2,000 crores. Thirdly, there has been a dramatic increase in the prices of basic physiological requirements such as food, clothing and shelter. Finally, there have been staggering increases in money supply. As against a marginal 3 per cent increase in overall production over the past 2 years, money supply has increased by about 30 per cent during 1971-72 and 1972-73. It is indeed sad that an arduous and troublesome situation was not anticipated and measures taken in advance to forestall the adverse developments.

Most of the solutions to these contentious problems are rooted in commonsense. For one thing, it is patently unwise to take for granted a satisfactory monsoon. Only 25 per cent of the total area under cultivation is provided with assured water supply. It is therefore high time that even at the risk of delaying growth in other sectors we take up a number of small new irrigation projects and execute them within the shortest possible time.

Given this kind of a setting for the economy it would be natural to call for stepping up immediately production in all the fields, more so in items of mass consumption, whose prices have been mainly responsible for the present inflationary situation. Success in these fields require as much determination and resolution as we displayed while fighting an external force only recently. It is unfortunate that such a spirit and bonhomie is nowhere to be seen. Nor is there any attempt to mobilise public opinion to concentrate on increased production practically in every field. In this context I feel that industrialists and heads of corporate bodies should actively participate and

is less than glorious. He has reached in all nine agreements with the United States. Most of these once again make clear that the United States is the most dominant power in the world today. If the Soviets are a super power, it is so in no small measure due to American endorsement. The agrarian problem which was Khrushchev's undoing still haunts the Soviet leadership. And now American technology will step in in another area where everywhere Soviet experiment has failed. The Americans are going to play a very active role in exploring the energy resources of Siberia. Comrade Brezhnev had a special meeting with American 'capitalists'. Twenty-five new firms will be permitted to open offices in Moscow. That doesn't sound like different social systems, does it? It has been brought home by now to many that the *detente* in fact means peaceful co-existence between unequal socio-economic systems.

Robert Scalapino in his speech at the Indian Institute for Defence Studies and analyses about a year ago said that

in his view there were two important triangles in the world and in both the United States was at the top. The first was the USA- the USSR-China triangle and the second the USA- the EEC-Japan triangle. Scalapino's confident assertion about the undisputed supremacy of the Americans is very typical of the present American mood. It surely will not last. But meanwhile the Soviets have demonstrated that their different social systems can co-exist with the US only on the strength of guaranteed supplies of corn, wheat and oats and barley, which constituted two-thirds of the total Soviet imports from the United States in 1972. There does not seem to be any likelihood in the near future that this economic dependence would disappear. The US has thus proved that it probably is the only real super power. The other super power is miles behind it. Scientific co-operation in oceanography or a reciprocal income-tax agreement cannot hide this very basic backwardness. That the Senate should have made trade with the Soviet

Union conditional on the latter's treatment of Soviet Jews is one small indication of the respect with which the Soviet sovereignty was treated in the United States. Comrade Brezhnev, of course, was much too gallant to mind these little acts of interference in the internal affairs of the Soviet Union. He hosted a lavish lunch for the Senators on the 21st to explain to these champions of Jewish freedom how the Jews have all their rights protected in the Soviet states. Whereas "Watergate" is America's internal affair according to Brezhnev, the question of Soviet Jews evidently is not an internal matter of the Soviet Union!

All this speaks of a very unequal relationship in which the Soviet Union seems to be at the receiving end. In short, the present era does not seem to be of two super powers, but rather of one and a half super powers. That probably is the lesson of the adventures of Comrade Brezhnev!

FROM THE CHAIR

Alembic Glass Industries Limited, Baroda

Speech of the Chairman, Shri R B Amin

THE following is the Speech of Shri R B Amin, Chairman, Board of Directors, at the Twenty-eighth Annual General Meeting of Alembic Glass Industries Limited, Baroda, held on June 26, 1973:

Ladies and Gentlemen,

I have pleasure in welcoming you all to the 28th Annual General Meeting of the Company. The Accounts for the year ended 31st December, 1972 and the Directors' Report have been circulated to you and with your permission, I shall take them as read.

During the past year, production in our factories slightly declined and sales recorded only a slight increase. Production was held up and handicapped because of power cuts and this problem continued into this year as well. Further, five furnaces out of the six had to be closed for repairs at some time in the course of the year; normally three furnaces are to be repaired every year.

The drought in the past twelve months meant that the growth of sales of aerated waters, food products, etc.,

was checked, more so in the rural areas. This, in turn, meant a slack in the orders for bottles for such products; it also led to a cut-back in the running of the decorating plants and a corresponding reduction in earnings thereof. Overall earnings were further adversely affected by the price reductions your Company had to make in order to make some of its products more competitive. Taken together with the unchecked and sharp increase in costs, all this has meant that 1972 has been a difficult year for your Company. Costs of packaging materials have gone up and increased freight rates have also substantially raised the transport costs of bulky goods like ours. These adverse factors have continued into 1973 and we are endeavouring to cope with them.

We have developed some new items and the sales of our pressed ware are maintaining their upward trend. With the installation of a mixed melter furnace at the Bangalore plants this year, it will be possible to counteract the erratic supplies of electric power and also to manufacture amber bottles for which there is a good demand.

The steps taken by your Company in development of exports are now giving results. Markets have been developed in Bangladesh, the Middle East and East Africa and a beginning has also been made in Australia and Cyprus.

There are enough indications that this also will be a difficult year. The prospects of increased and uninterrupted supplies of power are not yet clear; this has a direct influence on the costs and efficiency of operations. It is clear that the rise in other costs are not being checked. Our efforts to cut down expenditure continue but here, too, there are limitations. All in all, it is not going to be an easy period and we have prepared ourselves accordingly.

Before I finish, I would like to place on record our appreciation of the co-operation and hard work put in by the workers as well as members of the staff of the Company, both at Baroda and Whitefield. I also wish to thank my colleagues on the Board for their support and guidance.

I now commend the Annual Accounts and Directors' Report for your consideration.

articulate their views and debate on the numerous measures initiated or are on the anvil by the Government. I am an optimist by nature and I believe that when the noise, din and bluster settles down, we will have attained a measure of economic and political maturity that will provide the most important bulwark for rapid advancement. I also subscribe to the view that a larger share of the benefits of the growth of the economy must be made available to the less-privileged sections of the community. At the same time, I feel we should not abandon totally the concept of growth, even at the risk of being accused of growthmanship — an attitude and approach which is being pejoratively described in certain quarters as growthmania. I believe while the benefits for the under-privileged and socially vulnerable sections of the society require imperative increases in productivity, greater attention to education, training and employment opportunities for the weaker sections and the assurance of a stable and high rate of growth are as much of a *sine qua non*.

BUDGET FOR 1972-74

Last year I had occasion to say though it has been reiterated by the Government that there will be no revival of the Development Rebate in its original form, it is likely that the Government would seek out a suitable substitute so that the withdrawal of DR does not hinder or inhibit industrial development in the country. In the Budget for 1973-74 the Finance Minister has hinted that the Government might introduce an Initial Depreciation Allowance admissible to selected industries in lieu of DR. In this connection, it would be necessary to underline the fact that while DR together with Depreciation Allowance worked out to 115 per cent or 125 per cent depending upon the industry concerned, the Initial Depreciation Allowance would only mean accelerated writing down of the value of the assets. In other words, initial Depreciation Allowance will not mean any extra allowance beyond 100 per cent. To quote the Finance Minister in this context, the Initial Depreciation Allowance "provides additional resources to the concerned industries in the early years of their development". I doubt very much whether initial Depreciation Allowance can serve the purpose of stimulating capital investment as effectively as DR.

The concept of DR had been introduced to enable companies to plough back funds for expansion and growth

of business and it had acted as a catalytic agent for industrial growth. I must, in this connection, draw the attention to a recent memorandum submitted by the Federation of Indian Chambers of Commerce & Industry on the issue of termination of DR. It is well known that many units who had applied for expansion or are in the process of setting up new units were not able to materialise their schemes on account of the procedural delays in regard to clearance from Monopolies Panel under the MRTP Act. The delay in the issuance of Capital Goods Licence and the complex procedure laid down for obtaining clearance for import of capital equipment from the indigenous availability angle had also delayed implementation of the schemes for setting up new units or attainment of substantial expansion. The indigenous suppliers of plant and equipment have failed to live up to their commitments for supplies of plant and equipment for the new projects or for expansion on account of massive power cuts throughout the country. The cumulative result of all these is that, despite their best efforts, companies which have substantial expansion programmes or new projects on hand will not be able to ensure that their schemes materialise before May 1974 — the terminal date for withdrawal of DR — for no fault of theirs. Consequently, they will not be able to avail themselves of the concessions accruing from the admissibility of DR. From this point of view and in the larger interests of industrial production, I strongly recommend to the Government that the terminal date be extended by about 2 years — say till May 1976. This has also been the recommendation by FICCI, which deserves to be considered in all seriousness and earnestness.

It has been stated that a void would be created once the DR is totally abolished. I have explained that initial depreciation allowance would not yield any positive incentive and would not serve as an adequate substitute for stimulating investments. Therefore, I would recommend that the Government should seriously think in terms of introducing the concept of initial investment allowance, which had been adopted by the Government of Great Britain for a considerable number of years. This initial investment allowance can be of two types. One serving as an initial investment allowance for industries located in backward areas and the other meant exclusively for core and capital intensive industries, which require longer gestation period. I under-

stand that initial investment allowance in different forms have been incorporated in the tax structure of most of the advanced countries. I feel that the Government of India should introduce this concept in our tax structure not only to accelerate growth of industries in backward areas but also to stimulate investments in core and capital-intensive industries.

A second point in regard to the Budget that I would like to make relates to the imposition of a fresh levy of Rs 50 per tonne plus the auxiliary duty of 75 per cent on Electric Furnace Steel. I have not been able to fathom the rationale of this move. We have made numerous representations to the Government pointing out that the imposition of the Excise Duty on Electric Furnace product does tantamount to double imposition of Excise Duty, since scrap, which is the basic raw material of Electric Furnaces, has borne once the incidence of Excise Duty. The inequity entailed in the withdrawal of exemption from Excise Duty applicable to ingots made in Electric Furnaces is too obvious to be laboured. It appears that this move has been taken under a mistaken, though popular, view that Electric Furnaces enjoy "considerable advantages" *vis-a-vis* interested steel plants. The truth is that while some time ago the Electric Furnace Industry enjoyed certain basic advantages in view of shorter gestation period, smaller capital outlay, proximity to market, etc, the advantages have virtually been neutralised by sharp escalation in prices of almost all the essential raw materials, such as scrap, power, graphite electrodes, refractories etc. To take the example of scrap alone, the increase between 1968 and June 1972 have been of the order of 100 per cent in the case of Mild Steel Turnings and Borings, 170 per cent in the case of No. 1 pressed bundles, 118 per cent in the case of Heavy Melting Scrap Grade III and 163 per cent in the case of Heavy Melting Scrap Grade II. Similarly, prices of graphite electrodes have increased from Rs 6,200 to Rs 6,900 or more per tonne over the past 3/4 years. Therefore in the light of these substantial escalation in prices of most of the inputs of the Industry, it would be incorrect to maintain that Electric Furnace Industry continues to enjoy "considerable advantages" over the integrated steel plants.

STEEL INDUSTRY

It is necessary to undertake a detailed techno-economic study of the ideal process or rather, an ideal mix of routes

for attaining the country's steel targets for 1975 and 1980 which have been set before the country. The Blast Furnace/Open Hearth Process, the BOF Process and the Electric Furnace Process — all have their own individual merits and have been accepted as viable routes of steel making for augmenting steel production in the country under certain given techno-economic conditions. It would be necessary as such to evaluate each process and split the targets amongst the three main Processes.

These remarks regarding the pattern of steel production in the country are prompted by the ambitious steel programme for attaining targets. Also I have in mind not only the mushroom growth of mini-steel plants, but also the heavily capital intensive projects for both new plants on green-field sites and the expansion of the existing tonnage plants. All over the world there is a very distinct trend towards Basic Oxygen Process and Electric Arc Furnace steel making even for bulk steel making. Though the Open Hearth/Blast Furnace Process is very much in vogue, one cannot ignore the fact that some of the old units are being scrapped and BOF or Electric Furnaces have been taking their place. In Canada, for instance, according to informed opinion, while in 1972 the Open Hearth Furnaces accounted for 40 per cent of the steel production, LD Convertors 45 per cent and Electric Furnaces 15 per cent by 1982 the position is likely to be completely transformed to such an extent that the Open Hearth would account for only 15 per cent, LD 60 per cent and Electric Furnaces 25 per cent. The position is very much the same in countries such as the USA, the UK, Japan, West Germany and also in most other developing countries.

Whenever we consider the desirability of augmenting the liquid metal production through Electric Furnaces route of steel making by about 2 lakh tonnes every year, it would be advisable to make a prior estimation of the scrap generation in the country, power requirements and its generation, availability of other raw materials such as graphite electrodes, refractories and so forth. The work initiated in this direction to size up the requirements of raw materials of the Electric Furnace Industry and the matching supplies that would be forthcoming over the next 5 to 10 years by the Committee on Perspective Planning for Electric Furnace Industry appointed by the Steel Furnace Association of India, whose Report has become available, calls for a deeper

study and its recommendations deserve to be thoroughly discussed.

POWER CRISIS

The fact that the authorities in Delhi were almost caught unawares by the power crisis deepens our forebodings about the validity and success of the planning process in the country. During the last decade, there were manifestations of an emerging power crisis but apparently the warnings went unheeded and the attitude of the Government in regard to power generation, transmission and maintenance of thermal plants was characterised by complacency and indifference. The power crisis, despite the incontrovertible fact of a maverick monsoon, which manifested itself in the last drought, is more man-made than nature-made. The planning process had basically gone wrong in the macro-projections of power requirements for industrial and non-industrial purposes. During the Fifth Plan period it is a matter of sheer necessity that the present generation capacity of about 17 million KW is more than doubled to 41 million KW as a matter of priority. In this context the shortfall in attaining the Fourth Plan target of about 23 million KW does not augur well either for agricultural or industrial growth. Some of the reasons attributed for the shortfall such as delays in the supply of generating equipment by indigenous manufacturers, shortages of construction materials such as steel and cement, and finally paucity of funds have been evading solutions for quite some time. It is a pity that the so-called inadequacy of funds has always come in the way of implementation of power schemes, so vital and urgent to the economy.

Simultaneously with the expansion of the power generation capacity, it is equally essential that a certain measure of efficiency is attained in the transmission of power by cutting down all losses. The appointment of two Expert Groups, one for Thermal and the other for Hydel, though late in the day, is welcome. It should be hoped that the findings and suggestions of the Study Groups become available at an early date. The neglect of preventive maintenance in our thermal power stations has been one of the major contributing factors to the power crisis. Loss in transmission in India is considered by technical experts to be considerable more than such losses in any other country — a shortcoming which can be easily got over with concerted efforts and certain initial capital expenditure. However, it would be unwarranting to delve into the causes which have con-

tributed to the massive power crisis, but we should take all conceivable steps to narrow the widening gap between supply and demand. What I am pleading for is an end to adhocism in tackling the vital and crucial problems of additional power generation, distribution as well as optimum utilisation of the existing capacities in the country for power generation.

I have dilated at length the question of power crisis. Ours being a power intensive industry, we are deeply concerned about the energy shortage, which tends to perpetuate itself if adequate steps are not taken immediately. In my previous Report to you, I had reported about the abnormal increase in power cost in the State of Maharashtra. The effective power rate for your Alloy Steel Plant registered a sharp increase from 9.3 paise per KWH (average for 1972) to 13 paise per KWH following a revision of the power tariff in the State in October 1972. Although we have made numerous representations to the Government of Maharashtra to consider certain concessions for power intensive industries like Electro-metallurgical and Electro-chemical industries — which use power not as one of the utilities but as a raw material — our efforts have not yet yielded any tangible results so far. However, we are still persisting in our efforts and I hope that the Government of Maharashtra will favourably consider our representation for rationalisation of power tariff structure in the State for power — intensive industries.

OPERATING RESULTS IN 1972 AND OUTLOOK FOR 1973

The Directors' Report has mentioned to you about a decrease in sales in 1972 compared to the previous year. The decline in sales as explained in the Directors' Report, was due to non-utilisation of the surplus capacity in the Rolling Mill on account of inadequate availability of ingots and blooms from external sources. It will be recalled that in 1971 it was possible to achieve higher sales through greater utilisation of the capacity in the Rolling Mill as we could arrange for supplies of bought-out ingots and blooms in large quantities. I had predicted in my last Report that it might not be possible to achieve the same turnover in 1972 as availability of bought-out blooms and ingots was uncertain, a factor over which your Directors had no control. Thus the turnover as well as the operating results in 1972 and 1971 are not, strictly speaking, comparable and any conclusion regarding the drop in turnover

would be misleading.

The demand for most of our products continued to be satisfactory throughout the year and the order book position at the end of the year reflected a very comfortable position. There is a considerable growth potential in the demand for Alloy and Special Steels during the next decade due to the anticipated pick-up in the pace of industrialisation. During the first 5 months of 1973, sales have aggregated to Rs 403.04 lakhs as against Rs 427.96 lakhs during the corresponding period of the previous year. Efforts are being made to contain escalating operating costs despite inflationary pressure through greater operating efficiency at different levels.

DIVIDEND

My colleagues on the Board and I have recommended a dividend of 12½ per cent as will be noted from the Directors' Report. This dividend, I am happy to say, would be totally tax-free in terms of Section 80K of the Income Tax Act and the necessary certificate from the authorities is expected shortly. In recommending the above quantum of dividend to the share-holders, the Directors have taken into consideration the necessity of preservation of the retained funds and the cash resources, which we have built up over

the last 5 years, as these resources will be needed for substantial expansion schemes, to which I have already referred.

MERCHANDISING DIVISION

As reported in my last year's statement, steps are being taken to establish a Merchandising Division and efforts are being made to acquire franchise for various products of Pechiney Ugine Kuhlmann. We have already finalised broadly the terms of marketing special carbon products of Le Carbone-Lorraine, in this country. Le Carbone-Lorraine is known for its sophisticated technology for carbon blocks and carbon brushes and these products are being used by the Defence and Defence-oriented industries, Space Research Centres, etc. Establishment of the Merchandising Division is intended basically to pave the way for diversification and broadening of our activities into fields where sophisticated technology of Pechiney Ugine Kuhlmann can be deployed.

DROUGHT IN MAHARASHTRA

1972 will be remembered as the "year of drought" which has left landmarks of misery of their own for tens of millions of people. Although drought is prevailing in varying degrees of inten-

sity in different States, Maharashtra appears to be the most afflicted State, not only because of its extreme severity but also because it is the third in succession. The efforts made by State Government in mitigating the sufferings of the people are indeed commendable.

Since our operations are located in the State of Maharashtra, we feel deeply concerned with the sufferings and sorrows of the teeming millions. Your company has donated funds for scarcity relief and the Company has participated in a scheme for providing tractors and trailers to provide water supply for the drought-affected areas.

THANKSGIVING

Before I conclude I would like to express on behalf of my colleagues and myself my thanks to the staff and workers for their loyal and dedicated services. I would also like to express my appreciation of the sound advice and counsel given to me by my colleagues on the Board. We continue to receive closer co-operation and assistance from Ugine Aciers in resolving any technical problem which we encounter.

Note: This does not purport to be the proceedings of the Annual General Meeting of the Company.

Blue Star Limited

Speech of the Chairman, Mr Mohan T Advani

THE following is the Speech of the Chairman, Mr Mohan T Advani, at the Twenty-fourth Annual General Meeting of Blue Star Limited held in Bombay, on Thursday, June 28, 1973:

LADIES AND GENTLEMEN

It gives me great pleasure to welcome you to the 24th Annual General Meeting of the Company. The Directors' Report and Accounts for the year ended December 31, 1972, have been with you for some time. May I, therefore, take them as read?

PERFORMANCE AND FUTURE PROSPECTS

There has been significant all-round improvement in the performance of the Company in 1972, and I trust the share-holders are happy with the results. It gives me particular satisfaction to report an increase of 33 per cent in our export earnings, an area vital to the development of the country's economy.

I would like to assure you that the

Directors of your Company are far from complacent. They are aware that there is scope for greater improvement. Unabated efforts will continue to be made to increase the efficiency,

Mr Mohan T Advani

In spite of difficult conditions prevailing in the country this year, billings in the first five months of the current year have been satisfactory and the order book shows a healthy state. We are hopeful that this trend will continue during the remaining months of the year but much depends on how the monsoons behave this year and whether the Government is able to put the country rapidly back on the path to progress.

The present severe strains on the country's economy, the shortages of electrical power and raw materials and the spiralling inflation may well affect the Company's growth rate for 1973. Your Directors, however, view the future with confidence based on the Company's sound financial structure, the effectiveness of its policies

and the efficiency of its personnel.

COPING WITH THE PROBLEMS OF GROWTH

As an organisation dedicated to growth, we recognise that successful growth must overcome problems, both internal and external. It is our responsibility to solve the first set of problems but solutions to external problems depend largely upon an environment that encourages healthy growth rather than stifles it.

In handling the internal problems of growth, the guiding philosophy of the Company is our belief that people perform better when they are led, not when they are pushed. Your Company is fortunate in having a first-class team of managers. This has enabled us to follow a successful policy of decentralisation. The Board of Directors lays down broad policy and takes important decisions affecting the Company as a whole, while at the local level all over the country operating decisions are taken by the managers concerned. Such decentralisation has helped to promote entrepreneurial thinking and produces quicker responses to chang-

ing conditions.

Since the future of any company depends primarily on the people who work for it, we give considerable attention to recruitment, training and promotion of our employees. We ensure that everyone is given a fair opportunity for advancement and, therefore, lay great emphasis on a systematic and periodic review of the progress and welfare of our employees.

When we turn to external problems, however, the picture does not look as encouraging. The present inflationary situation has placed a heavy responsibility on us to hold costs within tolerable limits. We are conscious of this and I would like to assure you that continuous efforts are being made to avoid unessential expenditure without hurting the efficiency of our operations.

We do not question the social objectives of the Government but we firmly believe that the fulfilment of these very objectives requires speedy decisions to step up production and productivity. Re-distribution of wealth by itself cannot achieve the social objec-

tives of the country if we ignore the basic need to produce more. The solution lies in the hands of the political leaders elected by the people to the State Legislatures and Parliament. I can only hope that they show wisdom and courage to pull the country out of its present rut so that the teeming millions can truly benefit from progress.

OUR THANKS

Finally, I would like to pay my tribute on your behalf, to all employees of the Company, now numbering almost 2,000, for the excellent work put in by them during the year under review. Good relations between the Company and its employees at all levels has been a source of strength for its rapid growth and development during the last few years. It will continue to be our basic policy to develop further the existing relationship based on mutual understanding, trust and goodwill.

I now propose that the audited Statement of Accounts and the Directors' Report be adopted and passed.

Shri Jaykrishna Harivallabhadas

GSFC'S CHAIRMAN'S STATEMENT

SUBSTANTIAL INCREASE IN PROFITS LEADS TO STEPPING UP OF DIVIDEND ON EQUITY SHARES TO Rs. 20 PER SHARE

FIRST PRODUCTION OF CAPROLACTAM IN THE COUNTRY EXPECTED IN THE CURRENT YEAR

Shri Jaikrishna Harivallabhadas, Chairman, Gujarat State Fertilizers Company Limited, stated at the 11th Annual General Meeting of the Company held on the 22nd June, 1973 that despite several adverse factors, the Company registered new records of production, sales and profit during the year 1972-73. He also announced that new expansion projects were under way. THE following is the text of the statement:

LADIES AND GENTLEMEN,

I am glad to welcome you to this, the Eleventh Annual General Meeting of your Company.

The audited annual accounts and the report of your Directors have been with you for some time. With your permission, therefore, I take them as

read.

It is indeed a matter of gratification that in spite of several adverse factors mentioned in the report of your Directors, your Company has been able to register new records of production, sales and profits. It has maintained steady progress all-round. The past year has ended with a gross profit of Rs. 17,61,24,797, after meeting all expenses and interest on loans, but before providing for Depreciation and Development Rebate Reserve. With Rs 5,78,86,965 provided for Depreciation, and Rs 8,07,77,000 for Development Rebate Reserve, your Company's net profit for the year amounts to Rs 3,74,60,832. Your Directors have recommended declaration and payment of dividends for the year ended on the 31st March, 1973 at Rs. 9.30 per share

on the preference shares, and at Rs 20 per share on the equity shares. Thus the dividend on equity shares has been stepped up from Rs. 16 per share to Rs 20 per share. You will be happy to know that no tax will be deducted from the dividends as the portion of such dividends on which income-tax is not payable by the share-holders under Section 80-K of the Income-tax Act, 1961 has been provisionally worked out at 100 per cent by the Income Tax Officer, Ahmedabad. It seems unnecessary for me to evaluate these noteworthy results, and I am confident that you share with me the satisfaction over the excellent performance and progress of your Company. But nevertheless I wish to assure you that this will not result in any complacency, and we shall continue as ever

to strive for better proficiency and brighter future for your Company.

Nature has once again let us down at a time when the country had almost achieved self-sufficiency in food production. Last year, the monsoon failed and severe scarcity conditions are being faced in Gujarat and elsewhere in large parts of the country. The Government has been making a determined effort to mitigate the sufferings of the people, and to save the cattle from starvation. Your Company has also contributed its mite to the scarcity relief measures undertaken by Government of Gujarat. I am confident, with the grace of God, we shall soon come out of our present difficulties. But, one thing is certain that our agriculture is still overwhelmingly dependent on Nature in spite of the execution of four five-year plans. A much greater effort is called for to make our agriculture less dependent on Nature, and to put it on a sounder footing. This is particularly true of Gujarat where facility of irrigation extends to only 11% of the total area.

Agricultural development of any country is as important as its industrial development, if not more. Rapid agricultural development can be assured only by provision of adequate irrigation facilities together with required quantities of fertilisers and improved seeds etc. India is not wanting in water resources. But every day that passes in allowing our large rivers to empty their abundant quantities of water into the sea, leaves the country poorer. If only we forget the regional barriers, and allow these water resources to be tapped to the advantage of the country as a whole, green revolution would automatically follow, and India would once again be one of the richest granaries of the world.

The past decade has witnessed a fast growing demand for fertilisers. Today shortage of fertilisers is increasingly felt. Import of fertilisers results in draining out of the country's scarce foreign exchange, and cannot be allowed to continue indefinitely. India has to be self-sufficient in fertiliser production, and with this objective in view, the country's planners are contemplating setting of several more fertiliser manufacturing units in the country. Your Company has also been informally sounded by the Government of India to consider establishing new fertiliser manufacturing facilities even larger than its existing facilities. I am glad to inform

sently engaged in examining the feasibility of undertaking establishment of another large fertiliser project, for being presented to Government of India.

Your Company's aim is not limited merely to production and sales of fertilisers. It is equally conscious of its social obligations. While it undertakes for itself research work for the modification and improvement of existing processes and for the development of new processes, it associates itself actively in the all round agricultural development, agricultural research, and development of new extension methods for the benefit of the agricultural community. Your Company has already introduced and implemented a package plan on a limited basis for the promotion of the high-yielding varieties of crops. This plan has been well received by the farmers, and has changed their attitudes towards adoption of improved farm practices. With the gathering of experience, it will be extended to further areas and other crops. Your Company is also ready with pilot schemes for the development of backward areas, cultivation of sunflower and sheep breeding, and will soon undertake execution of such schemes.

It is difficult for any industrial organisation, of whatever magnitude, to grow indefinitely and to contribute to the national wealth without diversifying its activities. With the growth of its experience and resources, it becomes its duty to put them to better use in diverse fields. It was with this view that your Company entered into the Petrochemicals field and undertook establishment of its Caprolactam Project. For reasons beyond your Company's control, there has been a little delay in the completion of that project. However, as you must have seen, the work on that project is going ahead with the outmost speed and unless unforeseen difficulties arise, we may well expect that by about the end of the current financial year, caprolactam will start being produced by your Company for the first time in the country.

At this stage, I feel it is my duty to make reference to some reports that have appeared in the press very recently about this project, because they give a rather misleading view of the project and its progress.

The Caprolactam project was for the first time thought of in the year, 1966. Thereupon, your Company invited global tenders for the project in

world.

At no time had the Government of India specified any particular country or any particular credit for the project. After careful consideration of the tenders received, your Company selected Messrs Hitachi Limited of Japan as the contractor for the caprolactam project and the contract with them was signed on the 1st July, 1968. The Government of India approved the contract in February 1969. Thereafter, in spite of several efforts both by the Government of India and your Company spread over a period of about a year, the Government of Japan did not approve allotment of Japanese Credit for the project. In the result, the contract with Messrs Hitachi Limited had to be abandoned.

Thereafter, in consultation with the Government of India, your Company entered into negotiations with the European parties for the project in February 1970. The negotiations for the project with Messrs INVENTA of Switzerland and Messrs TECHNIP of France were concluded in May 1970, and Letters of Intent were issued to them on the 8th June, 1970. The contracts with the said parties were signed on the 23rd June, 1970. The Government of India approved the said contracts by March 1971. The foreign exchange required for the imported equipment was released by the Government of India in three instalments namely 60 per cent in March 1971, 25 per cent in May 1972 and 15 per cent in December 1972. This delay in the release of foreign exchange naturally affected the project schedule.

According to our country's policy, we placed orders for about 70 per cent of equipment required with indigenous manufacturers, and unfortunately, they have not been able to adhere to the delivery dates agreed to by them. For some of this delay there were reasons over which they had no control. Then, there have been severe shortages of power and raw materials such as steel and cement in the country during the past year. Nevertheless, we now expect that by about the end of December 1973 or soon thereafter, the erection of the plant would be completed. Even so, you will observe that the project will be completed within 33 months from the first release of the foreign exchange by the Government of India, and 28 months from the date the foundation stone was laid. Such a complex and complicated project is being set up for the first time in India,

one will come to be regarded as a major achievement by your company. And this has been made possible only because of the advance planning undertaken by your Company, and the vigilance with which the project has been pursued to overcome numerous difficulties which your Company has had to face.

This is why I have been distressed by the uncharitable comments in the press. What we have done and hope to do should be a matter of pride for all of us.

Your Company is contemplating to further diversify its activities. As stated in your Directors' Report, contract for the styrene plant has been awarded to a foreign party. Since then, your Company has also selected and issued a Letter of Intent for the supply of processes, technical knowhow and imported equipment for the Polystyrene plant. Both these contracts have been awarded to Messrs Badger Limited of the United Kingdom, and they will be negotiated and finalised in the near future. Your Company is also considering offers for a Nylon-6 Chips plant, and expects to select a contractor for that plant before long.

Shri Arvind N Mafatlal, Shri Arvind N Lalbhai and Shri Rohit Chinubhai Mehta have resigned from your Board of Directors. Shri F J Heredia has also resigned from your Board of Directors, and his resignation has been accepted with effect from the 21st May, 1973. Shri Arvind N Mafatlal, Shri Arvind N Lalbhai and Shri F J Heredia

were associated with your Company since its inception, and Shri Rohit Chinubhai Mehta was with us for the past over five years. Their contribution to the growth and prosperity of your Company was by no means small. I am sure you will all join me in recording our warm appreciation and deep sense of gratitude for the valuable services rendered by, and the guidance, co-operation and advice received from one and all of them during the period they were with us. I must place on record particularly my deep appreciation of the services of Shri Heredia to the Company, who served as its Managing Director for a period of over three years, and had to resign because of domestic reasons. Throughout his stay he served your Company with single devotion and sincerity.

You will be glad to know that in the casual vacancies caused by the resignations of Shri Arvind N Lalbhai and Shri Rohit Chinubhai Mehta, Shri Gordhanbhai Shambhubhai Patel and Shri S K Gangopadhyay have respectively been appointed as Directors of your Company with effect from the 8th June, 1973. We welcome them on the Board. I am sure, your Company will benefit from their experience of public administration.

In the end, I take this opportunity

to express on your behalf, on behalf of my colleagues on the Board of Directors and on my personal behalf, our sincere thanks to the Government of Gujarat, the Government of India, the Industrial Development Bank of India, the Industrial Credit and Investment Corporation of India Limited and other financial institutions for their continued support and assistance. I am grateful to my colleagues on the Board for their never-failing guidance, assistance and co-operation. I would like to place on record on behalf of my fellow Directors and myself, our appreciation of the excellent and dedicated work of the entire personnel of your Company, without whose united efforts we would not have been able to achieve what we have done. My colleagues and I are greatly enthused by their devotion to duty and by the excellent spirit that prevails amongst all sections of your Company's staff, who work as a team.

I thank you all for your good wishes and good will.

JAI HIND

The Sandur Manganese and Iron Ores Limited

Speech of the Chairman, Shri Y R Ghorpade

THE following is the Speech of Shri Y R Ghorpade, Chairman and Managing Director, The Sandur Manganese and Iron Ores Limited, at the Nineteenth Annual General Meeting held on June 29, 1973.

LADIES AND GENTLEMEN,

At the outset I wish to express our deep sense of sorrow and loss at the passing away of Shri Mohan Kumaramangalam whose qualities of head and heart have left an indelible mark on the progress and development of our country. His stewardship of the Ministry of Steel & Mines at this crucial period will be long remembered. His passing away is an irreparable loss to the nation and to all those who knew him personally.

tonnes from 2.61 lakh tonnes in 1971 and 2.34 lakh tonnes in 1970. During the second half of 1972 as much as

1.40 lakh tonnes was shipped to Japan. The Company has a shipping programme of three lakh tonnes during 1973 consisting of one lakh tonnes of 38/40 per cent Mn ore; 50,000 tonnes of 36/38 per cent Mn ore; 1.4 lakh tonnes of 31/33 per cent Mn ore and 10,000 tonnes of Siliceous manganese ore. The production, raiting and shipping programme of three lakh tonnes for the year 1973 represents a high water mark in the Company's export activities. The raiting capacity is adequate for such a programme. In the last four months, the raiting has been at the rate of 26,000 tonnes per month. The prices of manganese ore have shown distinct improvement and the company will be exporting three lakh tonnes to Japan in 1973 on the basis of the new prices

The company is also mining iron ore in its lease hold area. It supplied about 40,000 tonnes of iron ore to the MMTC during the year and has programmed to supply about 1.5 to 2 lakh tonnes during 1973. This tonnage will be progressively stepped up in the years to come depending on economic feasibility, availability of transport and other facilities. It is the intention of the company to step up iron ore production and export to the maximum extent possible in co-operation with the MMTC and consistent with the country's export programme. As I stated in my speech last year, "Smiore is conscious of the fact that manganese and iron ore production is and ought to be labour intensive and employment oriented. We are, therefore, determined to do as much manganese and iron ore production as is economically feasible, keeping in mind railings, shipping and other available facilities".

The Metal & Ferro Alloys Plant had a successful year of operation during 1972. It may be recalled that during 1971, the Company's 15,000 kVA electric reduction furnace had to be shut down for a period of nine months for the purpose of relining. However, the relined and modified furnace is now functioning at optimum efficiency. The production of pig iron during 1972 was 32,016 tonnes in spite of the 25 per cent power cut imposed by the Mysore State Electricity Board since October. If there had been no power cut, the production would have exceeded 34,000 tonnes. The despatches of pig iron during the year were 31,113 tonnes.

The Company has had to revise its pig iron selling prices to offset to some extent the increase in the cost of raw materials especially coke and electrode paste. To further improve the economics of the furnace, the Company intends to concentrate on the production of special grades of pig iron including super-special grade with a maximum phosphorus content of 0.08 per cent which has a promising future. The Company has also taken steps to instal capacitor banks which will be commissioned in August this year and further improve the efficiency and working of the furnace. However, the prices of coke have shown a steep increase and there was considerable difficulty in getting coke during the first half of 1973 due to problems of transportation.

The Company achieved a gross profit of Rs 37.96 lakhs for the year 1972 before depreciation as against a loss of Rs 40.30 lakhs during 1971 due to the long shut down period. The net profit after providing for depreciation of Rs 29.54 lakhs is Rs 8.42 lakhs. With the

improvements in the manganese ore prices and the working of the furnace, the financial outlook for 1973 and subsequent years is very encouraging. During the year the Company has paid Rs 14.45 lakhs to the financial institutions towards repayment of loans. However, due to devaluation of the Dollar, the Company's deferred payment liability has increased by Rs 7.62 lakhs.

In my speech last year I had stated that the Company expects to make up by 1974 the losses incurred in 1971. However in view of the improvement in the prices of manganese ore, it is now expected that the carried forward loss of Rs 43.76 lakhs will be substantially wiped out during 1973 itself. 1975 will be the year when the Company's two new furnaces to produce 24,000 tonnes of ferrosilicon will go into operation. Thus, the company can be said to have overcome its initial problems and the period of low manganese ore prices and is poised to achieve a significant breakthrough in production and profitability both in the field of mining and electro-metallurgy. The capital cost of the Ferrosilicon Project will be Rs 6 crores which will be financed to the extent of Rs 90 lakhs from internal accruals of the Company and the balance Rs 5.10 crores by issue of fresh capital and loans from the financial institutions, viz, Industrial Development Bank of India, Industrial Credit and Investment Corporation of India, Industrial Finance Corporation of India, Life Insurance Corporation of India and Unit Trust of India. The foreign exchange component will be of the order of Rs 170 lakhs. The import of plant and equipment has been cleared by the Director General of Technical Development. The Company has entered into a 12 year agreement with the Mysore State Electricity Board for the supply of 40,000 kVA of power on the basis of the present HT-1A tariff. The Company expects to complete the financing of the project and place orders for plant and machinery in a month or two. The two ferrosilicon furnaces are expected to be commissioned by September 1975. This will greatly strengthen and diversify the activities of the Company.

With regard to labour welfare, the Company has been fully conscious of the rise in the cost of living and has done its utmost to neutralise the effect of rising prices by guaranteeing to supply adequate quantities of essential commodities such as foodgrains to our employees at prices prevailing in March 1972. In other words, the Company

subsidises the cost of these essential commodities to the extent to which prices have increased since March 1972. The Company has 3,862 employees and the Smiore Employees Co-operative Society, which has a turnover of Rs 35 lakh per annum, established a Departmental Store at Sandur on the Vijayadashimi Day, viz, 17th October 1972, for efficient purchase and supply of essential commodities and consumer articles on a 'no profit no loss' basis. This Departmental Store has been a big success and has played a significant role in supplying essential commodities at reasonable prices not only to our employees but to the general public as well. This co-operative effort is significant pointer to what can be done in a period of rising prices to safeguard the real wages of the worker and also benefit the general public.

The year 1972-73 has been very significant for Sandur and its development. The foundation stone of the Narihalla multi-purpose project, which has been one of our main demands for the last decade or so, was laid by Shri D. Devaraj Urs, Chief Minister of Mysore on 29th October 1972. This is a multi-purpose project which will be completed in 1974-75 and constitutes a very important landmark in the industrial and agricultural development of Sandur and the neighbouring areas. It will facilitate the establishment of the two million tonne Pelletisation Plant in the valley of Sandur apart from irrigating 3,500 acres of agricultural land. The Vyasankere Lift Irrigation scheme to irrigate 3,800 acres and the Hulikunta irrigation tank to irrigate about 2,000 acres have also been commenced during the year. The Government of Mysore have decided to establish a Post-Graduate Centre at Nandihalli, in the proximity of Sandur and the Vijayanagar Steel Plant. This Post-Graduate Centre will provide higher educational facilities in various disciplines like Metallurgy, Soil Mechanics, Chemical Engineering, Public Health Engineering and Water Resources and develop in due course into a Technical University. Work on the Vijayanagar Steel Plant is also expected to be accelerated resulting in an investment of about Rs 500 crores during the Fifth Plan period. The Mining and Metallurgical activities of Sandur Manganese & Iron Ores Limited is a service to the nation which fits into this overall development.

Thank you.
