During 1972-73, the company further increased production from 13,504 vehicles to 14,216, as against the installed capacity of 12,500 numbers. With a bigger contribution from all the divisions, the company's income and profits increased considerably. Despite increases in costs, margins looked up. The ratios of inventories and wages to sales were slightly lower compared to the previous year. Dividend, stepped up 1.5 per cent to 1 per cent, was well covered by earnings. Exports advanced from Rs 118 lakhs to Rs 233 lakhs. In addition to export of vehicles to Bangladesh and Sri Lanka, supplies were made against orders received from UNICEF. An order has been secured from New Zealand for ckd vehicles. The electronics division has begun in a modest way to export to Australia and is exploring other markets. The company expects to shortly finalise the revised terms and conditions of the rate contract for the supply of Jeep vehicles to the Government of India. During the first four months of the current year, the company produced and sold 4,357 and 3,799 vehicles against 4,500 and 4,136, respectively, in the corresponding period last year.

BINNY has shown substantially better results, with increased sales, margins and profits. The profit, together with a writeback of Rs 96 lakhs from the general reserve, has enabled the company to wipe off the loss of Rs 283 lakhs brought forward from the previous year and to clear arrears of dividends on preference capital for 1971 and 1972 as also to pay the dividend for 1973. The improved results have occurred, following better performance by the two mills of the textile division. What really helped the company was the rehabilitation of the old equipment, reorganisation of the marketing department and other measures taken over the past two years. The Bangalore mills were well covered for wool, but prices were "prohibitive". The management sees no indication yet of any decline in wool prices in the current year. Throughout the year, the mills were

obliged to supply controlled cloth to the extent of 10 per cent of production at prices fixed in 1968. The management points out that this obligation bears "unduly harsh" on coarse mills as compared to fine and superfine mills.

Exports in 1973 amounted to Rs 272 lakhs as against Rs 183 lakhs in the previous year and the outlook for the current year is considered better. The garment factory was operated during the latter part of the year, essentially to fulfil the company's export obligation. The engineering and agency department had an initial setback in jute, rope and paints on account of the power-cut in south India, but there was improvement in business after the power-cut was relaxed. Ten new agencies were secured last year. The Bontex department was seriously affected by short supply of yarn, because of the power-cut in Tamil Nadu and the distribution and price controls imposed by the Central government. In the engineering division, the Madras works had to shut down the electric furnace on account of a 75 per cent power-cut in the first half of the year. Sales of the rice mills were also not satisfactory due to power-cut in most of the paddy growing areas in the country and because of the delay in the announcement of government policy on the procurement and milling of paddy. The current year according to the directors, threatens to be one of abnormal inflation and shortages of various inputs with little or no control over their prices. The critical position of furnace oil is also a serious threat to the Bangalore mills. A strike in the B and C Mills, which commenced on February 1, will seriously affect profits.

SIRSILK showed a minor improvement in the year ended September 1972 and, as in the previous year, the entire trading profit was utilised to reduce the accumulated deficit, which now stands at Rs 7 lakhs. Once again, nothing has been provided even for depreciation; arrears on this account have mounted to Rs 304 lakhs. Besides, arrears of dividends on preference capital have increased to Rs 229 lakhs. Also, no provision has been made against the future liability of gratuity to employees, estimated at Rs 43 lakhs. Production of rayon yarn and staple fibre edged up from 1,952 tonnes to 2,015 tonnes, but the overall production of fabrics declined from 59 lakh metres to 51 lakh metres. Production of acetate yarn and staple fibre was restricted on account of inadequate supply of alcohol and the power-cut. The company received only about 22 lakh litres of alcohol against allotments made by the state government, whereas its requirement is about 63 lakh litres per annum. The shortfall had to be made up by purchases of acetic acid from the market at a higher cost. Costs of other raw materials also increased.

The supply position of alcohol during the current year is likely to further deteriorate on account of the growing demand for diverse uses and the market price has already shot up. The company has been informed by Herdillia Chemicals, with whom it has an agreement, that due to cut in the supply of furnace oil the supply of acetone would be proportionately reduced. The company complains that there is no prospect of meeting the requirement from any other source and that its own acetone plant has been lying idle owing to short supply of alcohol. In addition, the supply position of coal has deteriorated. All these adverse factors are likely to tell on performance during the current year. The directors, however, feel that improved market conditions will enable the company to show better results.

The Importance of Diego Garcia

G P Deshpande

IT was perhaps Walter Lippmann who once opined that clinging to the Asian mainland, as the Americans were doing in Vietnam, was the most disastrous course for American foreign policy to follow. A bloody war in Vietnam and over a hundred and fifty thousand casualties have taught the Americans a useful lesson that it is not particularly necessary to cling to the Asian mainland. Control of the seas was enough. The recent British decision to let Americans build a base on Diego Garcia — an island in south-central Indian Ocean — is a part of this new strategy. It is not exactly new. A super power like the United States always had substantial interests in the Pacific and the Atlantic. Now attention is focused on their interests in the Indian Ocean. But basically it is the good old principle: no area can be out of bounds for the super powers. Other people can go on expressing the pious hope that the oceans should be zones of peace. Probably they will be and the peace will be properly supervised by the super powers. What is more, the peace jointly supervised by the two super powers generally has very high chances of being a 'durable' peace. If that is what the littoral states wanted, the Americans would argue, the base in Diego Garcia gives it to them. To reinforce this peace, the Russians will have to be around. With some 'helpful states' around, to borrow Brezhnev's phrase, that should not be very difficult.

It is, indeed, misleading to suggest that it is the character of the base or the installations on it make a particular base a threat to security. The crucial question is what constitutes a threat to security and to whom. In other words, the question is above all political. The littoral states which are expressing their anxiety over American activities in or originating from Diego Garcia will have first to enquire whether the Americans would want to threaten them and, if so, why.

The remarkable thing about the Diego Garcia debate in this country is that nobody has bothered to ask this question. Why would the Americans want to threaten the regimes in any of the littoral states? It is really hard to find an answer to this question. To put it more pointedly, the question is why the Americans would want to put the security of India in jeopardy. When SEATO was formed in the early fifties, it constituted a threat to India. India then advocated a doctrine of non-alignment which in many respects did not accord well with the American view of the world. But it would be really difficult to see our non-alignment today as constituting any serious threat to American interests in the area. Our occasional anti-Americanism notwithstanding, we are not an anti-American power and the Americans know it. This is true of most of the other littoral states.

In short, the Indian Ocean elite, if such a term could be used, is not out to create a new world order. It wants instead to live in and benefit from the present world order. The base on Diego Garcia would, if anything, be of tremendous assistance to them in case of need. The threats to security in most Asian countries come from within. In this situation, it is not altogether unhelpful to have a friendly super power waiting in the wings. Thus its presence may not be totally unwelcome. In fact, it is inherent in the logic of dependency that the elites would be on surer ground if the waters are well policed. It is necessary to ensure that the waters do not overwhelm the ground! Ambassador Moynihan was absolutely right when he stated that the Indian Ocean could well have been named after Madagascar. His point (the one he later denied having made) was simple: whether it is India or Madagascar nobody had anything to fear from the Diego Garcia base. If anything, it could be useful to them.

What then explains the furore over Diego Garcia? Angry noises have been made over the Anglo-American deal. A part of the explanation lies simply in the hangover from the days of Nehru. Most of us are prone to think that non-alignment retains much of its original content. We do not like to believe that it has become such a hollow concept. Once 'non-alignment' is taken to mean what it originally meant, then it becomes a case of simple mechanical logic. Attack the bases — and so on.

However, that is only a part of the story. There are not many now who have a strong nostalgia for the Nehru era. One suspects that the debate may ultimately lead to a rationalisation of the increased naval presence in the Indian Ocean of the other super power. In normal course increased Soviet activity along the Indian coasts would have been rather hard to justify. It may be made increasingly less so — thanks to Diego Garcia. After all, so the argument would run, we require somebody around as a countervailing power to the US. And this somebody can be only the Soviet Union. The "fishing facilities" — a very useful term in naval parlance — could expand in their scope. Briefly put, the debate will eventually lead towards augmentation of Soviet strength in this area. The Americans will probably have very little to lose from such a development. We, for our part, would have the satisfaction that there are enough socialist vessels around in the Indian Ocean to offset the imperialist vessels.

The significance of Diego Garcia is, however, not limited to the super powers alone. It has some clear implications for the military machines of the littoral states as well. The army and the air force were getting their share of the ever increasing defence expenditure in these states. The navy was, however, left out. It did not get its proportion. This phenomenon is, in a way, global. Ever since the Second World War the navies have felt a little ignored as compared to the armies and the air forces. It seems that it is their turn now to grab as much as they possibly can of government expenditure on defence. Defence budgets can always be expanded provided there is a good enough argument about threats to security. The oceans are now providing the necessary argument. The seventies are going to be a decade of the navy. No costs are too prohibitive when it comes to the security of the states. The Diego Garcia debate will not, of course, result in any rethinking in Pentagon. But it will surely result in increased allocations for the navy in the littoral states. Long live Diego Garcia! Down with American Imperialism!

The problem that Diego Garcia has posed is thus likely to remain untackled. The crux of the matter is that the so-called high seas in this era of naval expansion are going to be less free than ever. The strategy in the circumstances will have to be one of *extending* the territorial waters as much as possible. Before long the seas south of

China will be virtually a lake shared by Malaysia, Thailand, the Indo-Chinese States, Indonesia and China. Indian Ocean cannot obviously be a lake. But the least we can do is to see very clearly the need to extend our territorial waters, if need be, to two hundred miles as some Latin American countries have done. Diego Garcia is just not another base. It is a reassertion of super power sovereignty over the world and its waters. The way to meet this situation is not to ask them to go back because they simply would not, but to try and extend our sovereignty as much as we possibly can.

WEST BENGAL

Unquiet Crisis and Quiet CPI(M)

A FULL-PAGE advertisement in Calcutta newspapers, issued by the West Bengal government to mark the completion of the second year of the Siddhartha Ray ministry, has quoted copious statistics in detailing the ministry's achievements. Considering the tidy sum of tax-payers' money that must have been spent on this public relation exercise, it is more likely to influence the increasingly critical Press than to impress the newspaper readers.

While the advertisement claims credit for the government's achievements in expanding electrification, public health, transportation and educational and other facilities and services, the people of this state cannot recall a period of greater suffering in living memory, except perhaps the terrible happenings of the Bengal famine of 1943 or the Great Calcutta Killings of 1946. The state has been pushed back literally into a dark age because of loadsheddings by the power supply agencies on the one hand and the acute shortage of kerosene on the other. Large areas in cities, towns and villages are now regularly plunged into darkness for hours together, sometimes up to midnight; even hospitals are not spared. The acuteness of the power shortage can be gauged from the fact that the British-owned Calcutta Electric Supply Corporation decided to announce that even the residence of the top boss of the Corporation in an exclusive Calcutta locality had not been spared from the ordeal of darkness. Industrial complexes in the Greater Calcutta and Asansol-Durgapur areas have been thrown off gear and forced to resort to layoff and closure. Small units are tottering on the verge of extinction. Even water supply and railway transport have been hard hit by the power famine.

As regards public health and sanitation, the municipal services, now mostly under the state government's administration as a result of the supersession of the elected bodies on petty party considerations, are starved of funds and corroded by corruption and have been allowed to reach a state of near-total breakdown. Heaps of stinking garbage have become the hallmark of their normal functioning. The six-week old strike of municipal workers of Howrah — a city of nearly a million — has turned it into a veritable hell. Originally designed by the British rulers as a 'coolie' settlement for servicing the railway terminus and jute mills, Howrah with its open drains and service privies, is even in normal times one extensive and unmitigated dungheap. Following the total stoppage of all scavenging services the whole city has turned into a stinking pool of nightsoil and the overflowing surface drains have flooded the city streets and adjoining houses.

The utter inadequacy of hospital facilities is normally manifested in the milling crowds before the out-patients departments and the overcrowded wards with patients lying on the floor and in the passages in every hospital of the state. Even this apology for medical services has been totally suspended as a result of the long-drawn strike of doctors in government hospitals.

Coming to transportation, the depleted fleet of overaged state transport buses, badly maintained by a corrupt administration and subject to frequent breakdowns on the road, are frequently garaged as a result of infightings among Congress leaders of the employees' union. There are strikes every now and then by the private bus and taxi operators, accompanied by increasing breakdowns of suburban train services on account of mechanical faults, power failure, theft of overhead wires or signalling equipment. Train services are further dislocated by work-to-rule or go-slow agitations by locomen or guards or some other sections of the railway staff. All in all, the extremely inadequate communication facilities in the vast metropolitan complex that is Greater Calcutta have been thoroughly disrupted. The outbursts of popular anger leading to damage and destruction of railway property in and around Calcutta and police violence such as that against a crowd of thousands of passengers waiting at the Sealdah railway station in Calcutta the other day are the clearest indications of the real state of the mass transit system in this part of the country.

As regards the educational facilities, the bunglings of the Secondary Education Board beggar description. Every year thousands of innocent examinees fall victims to its utter inefficiency, nepotism and corruption. This year on the eve of the Higher Secondary examination, the Board's Chairman, backed by the Education Department and the Congress rulers, provoked the employees into an agitation and then locked them out. Upto the eleventh hour, there was no certainty if the examination would be held on the scheduled dates. Then it was announced in the Press that admission cards for the examination had been posted and those who did not receive their cards in time would be allowed to sit for the examination if identified by the Head Masters of their schools. Many examinees received their admission cards with wrong entries. Every year, even with the machinery of the Board functioning normally, bundles of examination papers get lost in transit from the examination halls to the examiners' addresses. With the Board office still locked out, one can only wonder what will happen this year.

Against this background of all-engulfing crisis, with the members of the the ruling party solely occupied with infighting, involving murders of and murderous assaults on one another, with the Chief Minister and a veteran ex-Minister, Bejoy Singh Nahar, engaged in a slanging match (Nahar reportedly calling the Chief Minister Chief of thieves and the latter challenging Nahar to prove himself his 'father's son'!), the government's advertisement speaks of "progress and expectation" and reminds the people of the ruling party's "pledge".

An equally depressing aspect of the present situation in West Bengal, however, is the lackadaisical attitude of the Left Opposition headed by the CPI(M). While the basic social services and public utilities like education, sanitation, hospitals, public transports, etc, are coming to a grinding halt on account of the sectional movements of workmen, no doubt provoked by the bureaucratic highhandedness of the government, causing untold miseries to the common people, the Left parties are doing nothing to mobilise the people against the government.

The Season of Violence

(From a Special Correspondent)

THE turmoil in Bihar has been, while seemingly of briefer duration, even more vicious than in Gujarat. It is idle to hope that things will quieten down from now on. If food supply remains erratic, the parameters defining the situation could change their magnitudes at an extremely fast space. A movement, initially sponsored by students, will not then remain — as it has not remained in Gujarat and Bihar — confined to students alone. A welter of motives will keep churning. Diverse elements will try to cash in on the developing chaos. An indifferent population will watch from the sidelines. They, by and large, are no passionate devotees of violent acts. Still, enmeshed by the problems of daily living, they are reaching the end of their tethers. A phase of nihilism might well find a ready clientele in their midst. If valuable capital assets are destroyed, the nation's economic infrastructure is extensively damaged and, as a consequence, prices rise even further, in their present mood, they might not care less.

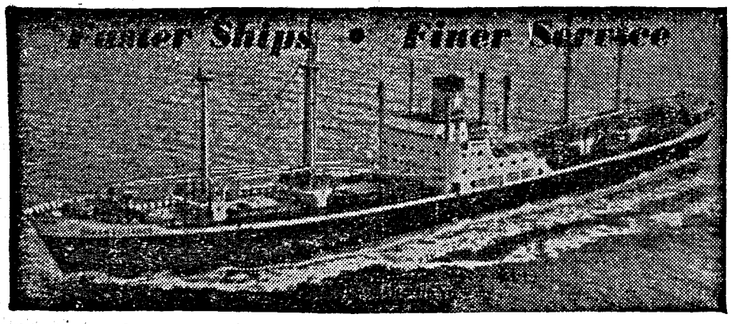
No Instant Solution

There is no instant solution to the issues which have come to the fore. The hands of the government ensconced in New Delhi are not clean; its reputation, despite the non-substitutability of Indira Gandhi, is anything but enviable. Besides, Gujarat has achieved, for those who are directly involved in the agitations, an important point of principle. Way back in [illegible] a so-called movement of popular [illegible] erala was allowed to be [illegible] for dismissing a lawfully [illegible] nent. The regime that [illegible] rid of belonged to the [illegible] genre. In the particular [illegible] parliamentary democracy [illegible] e, it was taken for grant- [illegible] emocratic tenets were not [illegible] by the manoeuvre. There [illegible] saving grace — or, shall [illegible] ace? Till Gujarat had [illegible] impression had persisted [illegible] nds that a mass upsurge, [illegible] aneous or got together, [illegible] le for the purpose of re- [illegible] office only a government [illegible] ile to the Centre. This [illegible] en rudely shaken in the [illegible] the happenings in Guja- [illegible] lents and their hangers-on have tasted blood. They now have discovered that provided their movement is sufficiently strong and sufficiently sustained, it can dislodge from office even a Congress regime.

The important operational principle thus established is bound to be soon applied to the other states — and conceivably to the Centre too. If the issues underlying the turmoil are the reluctance or inability of the authorities to check prices and their connivance in corrupt practices, a movement to get rid of them has a relevance not in Gujarat alone, nor in Gujarat and Bihar alone, but practically over the entire country. It could be that, following a spell of considerable bloodshed, Bihar too will be tamed. But in case prices cannot be turned back and corruption remains uncontrolled, there is going to be a fire next time, and other fires subsequently. These fires, sooner or later, will engulf the nation. It could even be that, given the combined might of the armed services, the para-military forces and the police, peace of a sort will, sooner or later, be clamped down in all corners of the land. But, unless the basic factors have been taken care of, the population will continue to be sullen and grumpy, and wait expectantly for the next round of incendiarism.

Emphasising the aspect of law and order will, in these circumstances, be of little avail. More rational solutions will have to be sought if the viability of the polity is not to be jeopardised beyond measure. Such solutions will have to be at two levels, the level of politics and at the level of economic practices. To take the latter one first: the government must be made to appreciate that everything else pales before the scourge of price rise. In this poor country, where a majority of the people subsist below all accepted nutritive standards and even the middle class can only boast of existence at the margin, there is a point beyond which unscrupulous bouts of price increase will not be tolerated, and people's wrath will be out. History has a remorseless way of asserting itself. How public stocks of foodgrains were quietly disposed of to private traders during 1971-72 under a decision of the Union Cabinet, or how sugar prices were decontrolled in 1971, in order that the ruling party could make a fast buck even as the consumers were put under squeeze, is no longer secret. The authorities must admit that they have much to answer for; they must be ready with at least some of the answers. Prices have to be controlled, relief of some kind or other has to be provided to the poorer sections as well as to that segment of the middle class unable to have its wages automatically adjusted to the rate of inflation.

Surrender to Blackmail



For controlling prices, however, the basic requirement is to control food prices, which are pivotal to the totality of price movements in the country. The kind of continuous surrender to the threats of blackmail by traders and rich farmers, as is being currently witnessed, could hardly be the way to bring about this price stability. You cannot control prices by raising the price level of basic staples. If cheap grains are no longer available from outside, the government must lower — and not raise — drastically the prices at which it commandeers food stocks; alternatively it must supply food to the more vulnerable sections at cheap rates by loading its cost on the richer consumers. The policy alternative that is at the moment being seriously contemplated, namely, abdication of the responsibility to commandeer grains and handing back the food trade, almost in entirety, to private operators, can therefore be an invitation to more chaos. Having taken the population for a ride in the name of populism, the government will now be hard put to run away from what is considered to be its primary responsibility, namely, providing food for the masses; if, instead, it assumes that the solution lies in reverting to a system where sharks of different species could mulct the masses at will, the turmoil will only grow in intensity.

The essential task is to dare to alienate — and not coddle further — those sections who today wield considerable political influence and do not hesitate to take undue economic advantage of this influence. A further task should be to curtail drastically bank credit to these elements and to deny the kind of subsidies which are flowing out to them, for example, in dubious-sounding employment and agricultural development programmes. Of the nearly Rs 1,500 crores which the Union and state governments and the public institutions have laid out in the past two years to expand farm production, there can hardly be any doubt that a

fair proportion has gone not to raise the output of foodgrains or other crops, but simply to strengthen the holding power of farmers and traders, so that progressively lesser quantities are marketed from out of a given crop? Can it not therefore be maintained that, other things remaining the same, one positive contribution toward controlling inflation and thus lowering the climate of political violence will be not to raise, but reduce substantially, the outlay purportedly for farm development?

Admittedly, this will scandalise the lovers of Dr Borlaug in the country, and those groups who have now made a fine art of chiselling the population in the name of agricultural growth. Admittedly, in the short run the government's ability to alienate those, upon whom it had lent heavily in recent years, will be limited. The courage being called for will be forthcoming, if at all, only to a moderate extent; to that extent, the impact on prices can also be of only a finite order. Such being the case, the government would have to look, simultaneously, for other solutions to the problem staring it in the face. It must abdicate its ego and agree to talk to some of the opposition groups who are today totally alienated from it. The Prime Minister's party has proved to its satisfaction that it can manage the business of winning elections. Questions have nonetheless been raised about the instrumentality through which this end is achieved, and more questions have been raised about the uses to which the power thus acquired has been deployed. There is, within the party, a certain superciliousness toward established political institutions, an attitude of *hauteur* toward parties in the opposition and a predilection for demagogy which completely cut athwart the conditions for a stable parliamentary democracy. You cannot pretend to run a democracy and yet behave as if the winner must always take all: the opposition must not only be tolerated but respected.

The ruling party can have genuine reservations about the credentials of a number of opposition groups, but to try to tar, as the party's president and the Home Minister are trying to do, the entire opposition with the same brush can be a grave act of folly, since it hastens the process of demolishing all bridges between the government and the opposition. When bridges are thus deliberately destroyed, intractable problems can arise, as they have arisen at the moment when the only dialogue found possible with the opposition is the dialogue *via* the army and the police. This achieves precisely the reverse of what is called for, and some more young idealists are alienated from the system. Till as long as this simple truth is not realised, the government's education is not complete and the season of violence therefore cannot be over.

PEPPER

Case for a Producers' Agreement

Angus Hone

PEPPER is likely to become subject to a producers' agreement within the next two or three years. The Asian Pepper Community of India, Malaysia, Indonesia and Sri Lanka has been established as a result of meetings in Bangkok at the end of 1973. These four countries account for 80 per cent of world production, as the following figures show:

	Estimated Production in 1972 (tons)
India	37,000
Indonesia	19,000
Malaysia	30,000
Sri Lanka	12,000
Brazil	16,000
Malagasy Republic	5,000
Others	5,000
Total world production	1,26,000

Exports broadly follow the same pattern, although India consumes about 50 per cent of its production domestically and Sri Lanka makes only marginal exports of 500-1,000 tons annually as a result of its failure to import low cost chillies from India. The exports of pepper by the different countries are as follows:

	Estimated Exports in 1972 (tons)
India	19,000
Indonesia	21,000
Malaysia	22,000
Sri Lanka	1,000
Brazil	13,000
Malagasy Republic	3,000
Total world exports	79,000

Pepper is an ideal product for producers' to influence prices. It takes at least 4-5 years to establish a pepper vine. The climate and conditions are broadly limited to the present major areas of cultivation, although West Malaysia, Philippines and parts of Africa could expand production. The size of crops fluctuate on a three-yearly cycle, meaning a good crop in India can coincide with a poor year in Indonesia. Pepper can be stored for very long periods provided it is kept dry Supply cannot be increased when prices rise, although it is technically possible to make more white and less black pepper in Malaysia (Sarawak) and Brazil when the price differential widens. Demand is almost totally price inelastic; partly because the final retail selling price after processing is six to ten times the f o b price and partly because in pepper's bulk use in the food processing industry the value of pepper is less than one per cent of total cost of the end product. The result is a product whose prices can be raised substantially if producers can agree among themselves.

The level of, and prospects for, pepper prices improved significantly in in 1973. The 1972 price levels were £ 500-550 per ton for Sarawak white and £ 400-450 for Sarawak black with Brazilian and Indonesian prices in London and New York broadly in line and Indian/Malabar and Tellicherry black peppers £ 50 or more above these market levels. The prices in January 1974 were £ 1,000-1,050 for Sarawak white and £ 675-725 for black. White pepper is in short supply as European and Japanese demand has risen steadily and black peppers have moved ahead on low levels of supply from Brazil.

The broad consumption pattern, which is as shown below, means that any pepper agreement between producing nations will have to take into account the major black and white centres:

	Estimated Imports in 1972 (tons)
Western Europe	30,000
Black	7,000
White	23,000
USA and Canada	27,000
Black	24,000
White	3,000
Japan	4,500
Black	500
White	4,000
Centrally planned countries	14,000
Black	13,000
White	1,000
Total: Black	44,500
White	33,000

Basically, pepper needs two separate agreements. The first, an agreement for black pepper between India, Brazil, Indonesia and Malaysia would control the volumes offered to North America, the USSR and Eastern Europe and the EEC, where Italy is a major black pepper consumer. The key markets are the US, which is dominated by Indonesian Lampong black and the USSR and Eastern Europe, which is dominated by Indian black peppers. Brazil only exports 2,000-3,000 tons of black to the US and less to Europe but production in Para State is likely to expand during 1974-1978. Sri Lanka would also be a valuable signatory to any agreement because its exports could expand rapidly when chillies are imported to release black pepper for export to the US. Any agreement to restrict output offered to the international market will require the widening of the Asian Pepper Community to include Brazil and the operation of a well-financed buffer stock working with minimum and maximum buying/selling prices on the New York and London markets. This buffer stock would only operate effectively if India's surplus pepper exports were marketed after consultation with the buffer stock managers. The operation would resemble the International Tin Council's very successful production control and buffer stock management scheme. White pepper is in much shorter supply, but an agreement would need to include Malaysia, Indonesia, Brazil and Malagasy Republic — the only important producers — and the buffer stock operation would have to be based on the London and Hamburg markets. The quality of both white and black peppers from differing origins varies widely and agreements would also have to be reached on price premia for different grades.

The result of such agreements could be the raising of prices to £ 1,500 per ton for white and £ 1,000 per ton for black, although fluctuations would be allowed ± £ 100 per ton. The countries of the Pepper Community would adjust target price levels each year in line with supply/demand conditions.

Pepper consumption is closely linked to meat consumption in the developed Western economies and the centrally planned economies. All indications are that meat consumption will rise substantially during 1974-1980 and there will be a partial switch away from beef to lower cost meats such as chicken, lamb and pork. The expansion of meat consumption and a continuous growth in the output of manufactured and convenience foods will stimulate a rise in demand for pepper at over 3 per cent per annum.

Pepper is an ideal product for a marketing consortium arrangement. India's average export earnings of Rs 14-16 crores ($ 20-22 million) could be raised to Rs 28-30 crores ($ 38-42 million) on the same volume of 20,000 tons if a black pepper marketing arrangement can be established by the Pepper Community.

ETHIOPIA

Time of Reckoning

Nilanjana Biswas

Lawrence J Sakarai

THE story of Ethiopia reads like a grim fairy tale. The Amharas and the Gallas, who dominate the Coptic Church and the Throne, make up the aristocratic landed gentry who form 0.1 per cent of the population. Seventy per cent of the land is owned by this 0.1 per cent. Ninety per cent of the population is engaged in agriculture and tenant farmers make up 80 per cent of the agricultural population. These farmers pay 75 per cent of their produce as rent to their landlords. Tenants are also required to spend one day out of three rendering various unspecified services for their landlords.

Industry accounts for only 5 per cent of the total output and is dependent on imported raw materials. The number of workers in industry is 85,000. Industrial workers earn a minimum daily wage of 1.50 to 1.75 Ethiopian dollars (E $ = Rs 3.75). Since 1960, the prices of food have gone up by 36 per cent and clothing by 27 per cent. Wages, in the same period, have risen by less than 5 per cent. In some areas they have actually declined.

The health situation is appalling. Fifty to 60 per cent of new born babies die in the first two-and-a-half years. Fifty per cent of the adult population suffers from syphillis. In some urban centres syphillis has reached epidemic proportions. Leprosy is endemic throughout the country. In the province of Gojjam alone it is estimated that there are 110,000 to 125,000 lepers. Of the 25 million Ethiopians, 10 million live in malarial areas. An estimated 20,000 people die of malaria every year. In 1958, 125,000 people were believed to have died in a malaria epidemic in Tigre. Typhoid, amoebic and bacillary dysentery and smallpox are widespread and rampant.

The majority of the hospitals are located in Addis Ababa where there is one bed for every 3,500 persons. There are 350 qualified doctors of whom only 150 are Ethiopians. There are another 150 'near doctors' who are really health officers. Counting both doctors and health officers, there is not more than one trained medical man for every 50,000 persons and 900 square miles. Despite this miserable health situation, the First Five-Year Plan allotted only 2.3 per cent of the total budget for public health. Under the same Plan, 30 to 35 per cent of the outlay was allotted for military expenditure. The 1972 national health budget (including foreign aid for such projects as malaria control) amounted to about one Ethiopian dollar per head per year.

Thirteen per cent of total national expenditure was on defence in 1972, the bulk of it going to the army. The proportion has risen sharply in 1974. Ethiopia has the largest and the best equipped armed forces in Black Africa: 30,000 in the army plus another 30,000 in the police. The air force is small but modern. Since 1953 Ethiopia has been getting one-half of the total US military expenditure for the whole of Africa. The US spends $ 12 million annually on arms to Ethiopia.

No other country in Black Africa spends as little on education as Ethiopia. Ninety-five to ninety-eight per cent of the people are kept illiterate — a figure unequalled in Africa. Of an estimated 6 mn school-age children, only 186,000 or 3 per cent, are actually in school. The government provides only 2,000 seats in colleges and there is only one University, the Haile Selassie Imperial University.

Famines occur with grim regularity. At least one major province suffers from starvation annually. In the four regions of Harar, Wollo, Tigre and Northern Shoa, which cover an area of 60,000 sq miles and are populated by 5.5 million people, two million are currently affected by the prolonged drought which is three years old in most areas and up to seven years old in some. The average number of starvation deaths per week range from 700 to 1,000.

The government has pursued a policy of exporting food even in the midst of the worst famine. In the first quarter of 1973, the export of such items as peas, beans and lentils was up 92 per cent over the same period of the previous year. In the last quarter of 1973, when the famine was at its most acute hundreds of tons of gram, beans and even some milk continued to be exported to the Arab world and Western Europe.

From time to time coup plots against the Emperor have been uncovered and squashed. Qualitatively different from the previous coup attempts was the 1960-61 coup staged by left-wing intellectuals together with the Imperial Bodyguard, the *coups d'elite* of the armed forces. Led by Germami Newve, the governor of Wallamo who began land reforms on his own initiative, the abortive coup rocked the feudal foundations of Ethiopian life. Radical students came out in the streets supporting the coup, relating it to a People's Government. But Germami and the other coup leaders erred in believing that a highly select band of revolutionary warriors could stage a coup by themselves. The rank and file of the army was ignored and the students were not armed. The coup was short-lived. In the end, all the coup leaders were hanged — including the corpses of those who were killed before being captured. The Emperor himself directed that the corpses of the fallen be exhibited in the streets of Addis Ababa. (It was apparently this single gruesome act which lost him the 1967 Nobel Prize!)

Inspired by Germami's land reform schemes, students demonstrated in the capital in favour of immediate and drastic reforms in landlord-tenant relations. The students demanded a land to the tiller programme, the destruction of all concentration camps, the repeal of fascist laws and the end of US involvement in Ethiopia. By 1969, student power had become a force to be reckoned with. Thousands of high school and university students demonstrated on the streets of Addis Ababa. At first it appeared as if they were out to wreck the educational system but their 15 demands made it clear that they intended going much further. Some of the demands were: compensation to parents of students killed, free education, end to the economic stagnation and unemployment, removal of the Peace Corps from Ethiopia, discontinuance of scandalous government expenditure on foreign guests and immediate release of all students from prison. At the same time, students held rallies and demonstrations expressing their solidarity with the Vietnamese peoples' struggle and with the anti-colonial struggle of the people of Zimbabwe (Rhodesia).

Though student strikes and demonstrations continued in 1970, the students failed to forge links with workers in urban areas. The most significant development was the students identifying themselves with the Eritrean Liberation Front (ELF) and adopting

the principle of self-determination of all peoples and nationalities.

By the middle of 1971, thousands of high school students between the ages of 16 and 20 years decided on a definite programme of action. They demanded land reforms, opposed the 20 per cent increase in bus fares and the steep and sudden rises in food prices and condemned the arrest of vagrants in Addis Ababa. They roamed the streets attacking buses, the Mercedes cars of the Royal Family and the Ministers and the homes of the more unpopular Ministers. What really gained public support for the programme of action adopted by the high school students was their guerilla sorties into the capital's market place where they forced traders to sell their products at lower prices. Significantly, the police did not intervene; they even rendered passive support, saying "this is not politics". The army was then called out and the decision was finally taken to arrest the demonstrators who were locked up in four detention camps.

A qualitatively new revolutionary situation began to prevail in early 1974. As part of their democratic programme, students called for a temporary administration until their demand for a new constitution was met. The resignation of the Prime Minister was successfully demanded and a new Prime Minister was in fact soon appointed.

With the students creating a highly inflammable situation, rebellion began to grow in the military barracks. The army revolted over pay and working conditions. The seamen of the navy joined the revolt and seized control over Asmara, Ethiopia's second largest city. Several naval officers whom the seamen wanted dismissed were imprisoned.

During the revolt, the air force refused to mount air strikes against the army. The Imperial Bodyguard also declined to challenge the revolt. Thus there was apparent a significant coming together of the three sections of the armed forces. They were, however, unable to identify themselves with the students and refused their support. Students launched anti-government demonstrations and five days of violence followed. The government called out the army and police to keep order. The regime appeared to be quite sure that by giving in to the demand for pay rise, it would break the revolt. A certain section of the army was appeased, but more trouble was brewing.

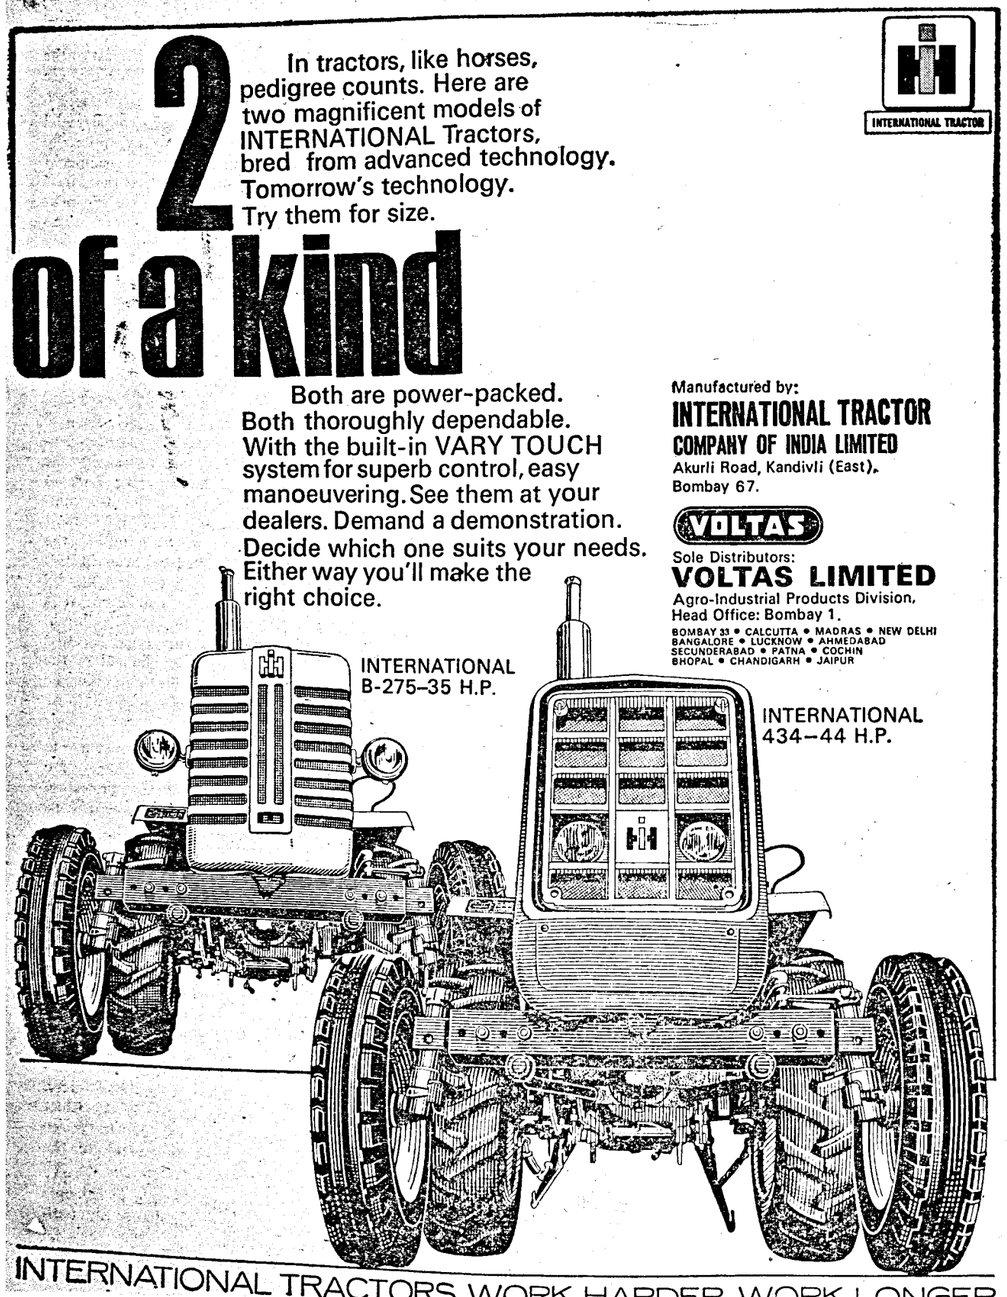
A secret group of non-commissioned officers (NCOs) prepared a new programme of demands which were similar to those of the radical university students: freedom of the press, release of political prisoners, land reforms, improvement of labour laws, free education and equal opportunity for all, price control on all essential goods, establishment of political parties and democratic elections and vocational training institutions for soldiers.

In the political climate created by the revolt of the students and the armed forces, the Confederation of Ethiopian Labour Unions called for a general strike. The Unions demanded new labour laws, pay increases, social security schemes and the right of organisation for workers in government services like telecommunications, electricity and water supply.

Faced with such a severe crisis, the first of its kind in modern Ethiopia, the Emperor drove into Addis Ababa's teeming market place and doled out money to the poor. The Emperor also gave in to the students' demands and appointed a new Prime Minister who quickly conceded the workers' demands in full. Basic wages were tripled, two pay increases were announced for the armed forces, the government promised to control spiralling prices and free universal education was introduced. The doors were also opened for the formation of political parties.

The radical students spearheaded the democratic movement in the urban areas. The revolt of the armed forces and the general strike called by the labour unions owe much to the environment created by the students. The urban revolt has also drawn on the inspiration provided by the ELF and the peasant guerilla movements in the Bale and Gojjam regions.

The ELF, waging a guerilla struggle for Eritrea's liberation from the feudal yoke of the Ethiopian regime, is principally a peasant movement. More than 14 years old, it has grown into a serious threat, particularly in view of the support extended to it by progressive elements within Ethiopia.



If the ELF appears as a distant threat, the guerilla movement in the Bale region, just 200 miles south of Addis Ababa, is dangerously nearer home. It has steadily waged its armed struggle for 13 years. The army has been unable to crush the movement which has fanned out to embrace many southern regions. Peasant upheavals have become widespread. North of Addis Ababa, the peasants of Gojjam have begun a revolt against landlords and high rents and taxes. There are recurrent peasant uprisings in other northern areas as well.

Compared to peasant movements, urban militancy is a comparatively recent phenomenon. Students have not as yet made common cause with the peasantry or the urban working class. Though all the urban groups voice more or less the same demands, no alliance has emerged between the various groups. Several factors are responsible for this.

The army, with its own tribal/racial divisions, treads cautiously, primarily because of its being a pampered elitist group. Ultimately, it is the armed forces which keep alive the whole neo-colonial structure of the country. The Ethiopian Students' Movement charges that Haile Selassie has "turned the country into a base for the neo-colonialisation of the entire African continent". The US maintains an important base in Ethiopia, the Kagnew Station. The importance of the base for the US position in Africa was brought out by the *New York Times* as far back as in 1965, "The Kagnew Station is in a relatively interference-free area, and has many advantages as the African and Middle East Link in the world-wide system of US communications. It is one of the most important stations of its kind in the world" (May 15, 1965). Seen in this context, the 1960 pact between the US and Ethiopia becomes significant. At a Senate Hearing, Senator Fulbright stated that the pact suggested "... that the US would come to the aid of the Ethiopian Emperor in the event he was faced with any insurrection" (*New York Times*, May 19, 1970).

Haile Selassie has every reason to be grateful to the US. There are special laws in Ethiopia protecting more than 200 US agencies and firms against expropriation. Ethiopia has among the most liberal investment policies in Africa. American monopolies dominate the country's economy. For instance, Ralph Pearson Corporates have a $45 million mining project in the Danakil Desert. US companies have also invested $100 million in potash mining. Playing an important supportive role for US imperialism in Ethiopia are the Israelis. The country's intelligence system is believed to be run by them. Israeli military experts play an important role in the country's armed forces. The Chief Traffic Engineer, the Chief Road Engineer and the Port-in-Charge are Israelis. Israelis run many of the country's essential services.

Thus the present struggle in Ethiopia is anti-feudal and simultaneously anti-imperialist. Perhaps Emperor Selassie realises that a peoples' war is about to erupt. Hence his seeming readiness to function as a constitutional monarch.

Play-Acting

THE so-called take-over of the wholesale trade in wheat last year was a fraud. So it is difficult to get overmuch exercised at the formal reversal of the decision this week. Out of the last rabi crop only a little over 4.5 mn tonnes was sold to the government. The wholesaler, who had supposedly been banished from the scene, snapped up most of the rest of what had been sold by the farmers. However, pretences have to be maintained; the game of fooling the people has to be played to the boring end. The government has to make out that, though the wholesalers were being allowed back into the wheat trade, they would be permitted to operate only "under a system of licensing and control" and that a variety of obligations were being imposed on them failure to fulfil which would, through a proposed amendment of the Essential Commodities Act, attract the most stringent penalties. For their part, the traders have to seem to be in a chastened, even contrite, mood.

All this is well-rehearsed play-acting. The so-called obligations imposed on the traders, and so readily accepted by them, are not worth a tinker's cuss. The traders are required to surrender to the government at the procurement price of Rs 105 per quintal one-half of all their purchases in the five surplus states of Punjab, Haryana, UP, Madhya Pradesh and Rajasthan. But what is likely to stop the traders from understating their purchases and, therefore, the quantities they are obliged to hand over to the government? How is that possible, asks Agriculture Minister Fakhruddin in all innocence. According to him, almost all the wheat markets in the country are 'regulated' and every transaction is recorded by as many as three parties: the commission agents, the market committees and the agents of the Food Corporation of India. But if the marketing arrangements are really so fool-proof, then how did it happen that last year except for about 4.5 mn tonnes the rest of the wheat sold by the farmers escaped the government's procurement net?

No trader worth his salt is going to hand over half his wheat stocks to the government at Rs 105 per quintal — high enough though that price is — when he can get at least Rs 175 and perhaps much more in the market. The government's hopes of collecting 6 to 7 mn tonnes of wheat through the levy on traders belong, therefore, to the category of pipe-dreams. That is not the main point, though. What is important is the grossly inadequate coverage of the public distribution system and the irrational choice of the sections of the population which it does cover. Under the public distribution system, foodgrains are supplied to areas which are covered by statutory rationing and through fair-price shops elsewhere. The former cover less than 3 per cent of the country's population, living in the metropolitan cities. The coverage of the fair-price shops is limited; in most states it is only a part of the population living in urban and semi-urban areas which has access to them. Far more important, supplies through these shops are inadequate and uncertain and become more so as shortages become acute and prices rise in the 'open' market.

In the given circumstances, however, the public distribution system cannot but be of this type. In the first place, it is inevitable that the government will be solicitous of the interests of the vocal and powerful middle and upper classes in the cities even if this means throwing to the wolves those in real need of government-distributed foodgrains. Second, the scale of operations of a public distribution system aiming to reach all the really poor would be so enormous that it will simply not suit the interests of the present government to organise it. For instance, Raj Krishna had estimated that to meet the minimum requirements of the poor — defined to exclude all income-tax payers as well as all cultivator families — would have required 20 mn tonnes of foodgrains in 1966. It is inconceivable that the government will be either willing or able to procure this quantity of foodgrains and at prices which, even after some government subsidy, the really poor will be able to afford. Since an adequate and rational public distribution system is beyond the present government — not, as is commonly believed, because of lack of administrative competence but because of the specific economic and political interests which the government represents — whether the trade in foodgrains is in private hands or is taken over by the government is not a matter of prime importance.

The procurement prices fixed for the different foodgrains have in effect served as assured support prices for the farmers. Similarly, the prices set for release of foodgrains through the public distribution system — which, in the case of wheat, are to be raised sharply by over 35 per cent from April 1 — will serve as the floor price for private trade. Thus both the large farmer with surpluses to sell and the trader can plan their operations secure in the knowledge that while there is no limit to how high they may raise prices, there is a floor below which prices will not fall!

Two Perspectives on Redistribution of Land

V M Rao

Redistribution of agricultural land to achieve equity would be easily recognised as one of those hardy ideas which survive, however lingeringly, despite more than two decades of non-implementation. Given the policy-maker's perspective on redistribution, and on land reforms in general, it is unlikely that the idea of redistribution would ever get out of that twilight zone which separates patently unworkable ideas (recognised as such) from those which are implementable (and implemented) in practice.

This, by itself, need not be a matter of much concern but for the fact that with a perspective more in tune with the broad objectives and policies of planning the policy-maker may still be able to squeeze something of value out of the idea of redistribution. More importantly, in the absence of a proper perspective, the opportunities to benefit from the reform-potential of the idea of redistribution may remain unrecognised by the policy-maker as and when they arise.

The divergence between the current practice and what it needs to be if the objective is to achieve equity along with elimination of absentee-ownership (in the sense of ownership of land by non-cultivators) suggests that the researcher has possibly been as casual in measuring the scope for redistribution as the policy-maker has been in implementing the programme. Our findings indicate that the measurement of the scope for redistribution calls for far more patience in collecting data and ingenuity in analysing them than are involved in cursory calculations based on distribution of land in a region or a state.

I
Introduction

THE purpose of this paper is to compare the perspective currently motivating thinking and policy-making on land reforms in India with what, in our view, the perspective needs to be if a measure of overall economic development and technological change in agriculture is envisaged to occur in the decades ahead. It is hoped that the latter is not an overly optimistic assumption to make in the light of the break-throughs that have occurred on the technological front in agriculture in the last few years and the further break-throughs hopes of which are held out by the scientists. Since land reforms in India is an area in which it is difficult to think of an idea or theme not written upon by many already, the contention of this paper is not that the components of what we regard as the new perspective on land reforms necessitated by development and technological change are unknown and need to be freshly discovered. The contention is only that the readjustment of major policy perspectives is usually, and possibly justifiably, a painfully slow process and that researchers can aid the process by resorting, to an extent, even to overdrawing the contrasts and labouring the obvious, as has been done in this paper, to help keep the need for readjustment a live and contentious issue.

The paper focuses on the idea of redistribution of land which in its twin manifestations — land to the landless and land to the tenant-tiller — has inspired much of the more ambitious legislative efforts to bring about basic reforms in the system of ownership and cultivation of land in agriculture. The attempt is to look at the reform-potential of this idea from the viewpoint of new perspective and, in the process, seek an explanation for the remarkably little headway which the programmes based on the idea have been able to make so far. It is obvious that the reasons for this must be connected with one or more of the principal aspects of these programmes, *viz*, the objectives of redistribution, the principles and criteria guiding the programmes for redistribution, the specific nature of these programmes and the manner in which they are implemented. It is our assumption that these aspects, in their turn, derive from the land-reformer's broad conception of the way in which the Indian agrarian economy functions and the role that land plays in it. We refer to these interconnected components as constituting a 'perspective' on redistribution of land. The stand taken in this paper is that a comparative consideration of the current perspective with what it needs to be in the context of development and technological change is of substantial help in understanding the past and in deriving the guidelines for future in relation to redistribution of land as a measure of land reforms.

The plan of the paper is as follows. The next section describes the main characteristics of what in our view is the current perspective on redistribution of land. The reference here is only to the perspective that can be inferred from the relevant legislative enactments and the accompanying pronouncements and not to the range of perspectives reflected in the writings of academics and others of widely divergent political hues. Section III contrasts this perspective with the perspective suggested as appropriate by development and technological change. A recurring theme in the literature on redistribution of land relates to the question of the scope for redistribution in terms of the size of the surplus available for redistribution. The last section of this paper draws attention to some pertinent issues relating to this question which seem to have remained unnoticed so far.

II
Current Perspective

The main proposition sought to be argued in this section is that the current perspective on redistribution of land derives, almost wholly, from a conception of the economy as a predominantly agrarian economy in which a growing population wages a ceaseless and precarious battle for survival in a context characterised by meagre economic development outside agriculture and little technological change within agriculture; consequently, the context is viewed as one with disheartening prospects of the all-important constraint of land getting progressively relaxed through opportunities to move out of agriculture and through opportunities to supplement labour with ingenuity in agriculture to coax a bigger bounty out of the given land.

Three obvious implications of this conception for the role that land plays in the economy are the following. Firstly, it is clear that a predominant part of the population in such an economy would depend for its livelihood on access to land in one form or another — as owners, as tenants or as labourers working for wage. Secondly, the differences among the population in relation to the extent and quality of access to land would not only be the principal determinant of distribution of income and wealth in the community but would also be the very basis of the stratification of the community into socio-economic classes with sharply antagonistic interest.[1] Thirdly, given the prospects of the struggle for access to land getting progressively more fierce, it is only natural to view with distrust and apprehension the capacity of the prevailing institutions and markets providing access to land to function equitably on their own without external intervention; in fact, almost inevitably it must appear that these institutions and markets, left to themselves, would aggravate the pace of the process of immiserisation and lend a sharp edge to the conflicting class interests by permitting the emergence of a class which thrives ostensibly on the miseries of their less fortunate brethren.

It is only to be expected that in the light of the conception of the economy and of role of land sketched above the question of land reforms should begin to loom large in the thinking of policy-makers right from the outset of systematic efforts at planning and development. Since the community consists of a vast mass of desperately poor people vulnerable to exploitation and since this exploitation, to the extent that it occurs, is likely to work through the relationships connected with land, the task of land reforms would appear to be the broad and basic one of maintaining 'economic' law and order as a precondition for development and as a measure to enable all sections of population to participate in the process of development. Redistribution of land would be expected to help this task by modifying the prevailing distribution of land to eliminate both "excessive" ownership of land and holding of land by non-cultivating rentiers. For any one conversant with "ceiling" and "tiller's day" legislation in India, the important role that these objectives have played in the conceptualisation of redistribution programmes should be obvious.

The main point that we would like to make in relation to the criteria adopted by the policy-maker to translate these objectives into programmes for redistribution is that these criteria draw their content primarily from the policy-maker's concern about and his conception of the requirements of "fair" income-distribution in the economy; in our view, the considerations relating to structure of farms envisaged in agriculture play only a secondary and relatively minor role in shaping these criteria. Since this point is contestable, we hasten to list briefly our reasons for holding it. Firstly, it is our impression that the issue of level of ceiling to be imposed on holdings is usually argued for and justified in terms of a need for having a reasonable and generally acceptable (i e, not too low) ceiling on income. Secondly, it is apparent that the policy-maker's conviction that taking away of the lands above the ceiling needs to be semi-confiscatory in nature rests on the view that in the prevailing scarcity of land it is *morally* repugnant to permit large owners to own as much land as they do, irrespective of the manner in which their lands are cultivated. Thirdly, it should be granted that the current thinking on distribution of surplus lands assigns high priority to the need to benefit as many as possible of the poorest in the economy, such as landless labourers, by providing them with at least a toe-hold on the land. In the light of these features of the criteria adopted in devising programmes for redistribution, it would seem fair to conclude that these criteria view land not so much as an input in a production process as generalised income whose distribution needs to conform to values and norms appropriate in judging distribution of income. It is needless to add that the assumption of a static and traditional technology in agriculture provides a strong temptation, and even a justification, to treat land as a proxy for income.

The last feature of the current perspective on redistribution of land to be noted relates to the nature of programmes sought to be implemented. As was noted above, a general premise underlying thinking on land reforms is the serious distrust about the capacity of free transactions in the arena of land — as between purchasers and sellers, landlords and tenants and employers and labourers — to be fair to both the parties to the transaction with the implication that almost any measure of land reforms one can think of would need direct intervention by the government to implement it. This must appear all the more true of the measures needed to modify the prevailing distribution of land. Looking at the situation from the current perspective, any suggestion that distribution of land may be amenable to modification in the desired direction by programmes other than "ceiling" legislation must appear preposterous.

It has been our attempt to bring out the logical consistency which, in our view, links up the different components in the current perspective on redistribution of land. The argument is that given the view of the economy and of the role that land plays in it, as outlined at the beginning of this section, the other components in the perspective would appear to follow as a matter of logical necessity and not because of any political or ideological predilections. Since the perspective has amazingly little to show in terms of redistribution of land actually brought about with its help, it is natural to look for hypotheses to explain this. To judge from the relevant literature, including official evaluations, the explanations offered appear to go along two alternative lines. There is, firstly, the contention that the present political-cum-administrative set-up of the economy is incapable of implementing radical measures such as redistribution of land; this contention usually forms part of a broader and more basic argument that formulation and implementation of specific types of developmental strategies as needed by countries like India are beyond the reach of the political systems prevailing in them. This may be termed the "soft democracy" hypothesis to explain the failure of redistribution programmes in India. The alternative explanation (if it can be regarded as one), which may be termed the "non-feasibility" hypothesis, traces the trouble to the fact that any "fair" ceiling would leave little surplus to distribute. This happens, so the argument goes, because viewed as a ceiling on income and in the absence of an overall policy for ceiling on incomes in the economy as a whole, the "fair" ceiling on land-ownership cannot be low enough to make redistribution feasible. Whatever the explanation, it is difficult at present to discern any genuine enthusiasm, either among the policy-makers or among the researchers, for the programme of redistribution of land.

A word needs to be added here about the hypothesis of "soft democracy". It is useful for this purpose to distinguish between the two distinct weaknesses of a "soft" democracy in implementing radical measures. Firstly, such a democracy lacks organisation, personnel, cadres and politically-disciplined populace to undertake measures — like redistribution of land, enforcement of rents and wages, etc — involving

comprehensive and continuous *direct* intervention in the economic activities of millions of individuals and of tens of thousands of communities and institutions; we may term this the weakness stemming from limited potential in a "soft" democracy for "regimentation". Secondly, the political influence in such a democracy is usually distributed very unevenly leaving large scope for small but tightly-organised groups to pass off what is good for them as national policies or to prevent national perspective from being brought to bear upon issues of major importance; we may term this the weakness of "domination by vested interests". While there are a number of indications that the second weakness in a "soft" democracy may conceivably diminish with time and growing politicalisation of different sections in the society, there appear to be none at all to suggest any increase over time in such society's potential for "regimentation". On the other hand, it is our feeling that the failure of the programmes for redistribution of land in India is traceable much more to the first weakness than the second; it looks improbable that redistribution of land has had to contend with vested interests much more powerful than those which could not prevent abolition of zamindari tenure in the fifties and more recently, abolition of princely privileges.

Thus, the current perspective on redistribution of land appears to lead us to a dead-end. On present indications, it seems capable of yielding nothing more tangible than a futile longing for revolution among those who yearn for a millennium or a ritualistic announcement of lowered ceilings which nobody takes to be implementable. A possible way of bypassing the dead-end is by asking whether the propositions with which the current perspective starts — *viz*, the view of the economy and the role that land plays in it — are valid today and would remain so in the decades ahead. While those who do not give a chance to "soft" democracy may not care to try this way, others — and they would include the policy-makers — may not be averse to exploring it, at least to escape the boredom of staring at a dead-end. One starts along this way by assuming that the Indian economy has already undergone a measure of overall development and technological change in its agriculture and that this process is likely to continue in future in conformity with the broad objectives of planning. The attempt then is to read the implications of this assumption for the policies for redistribution of land. This is the theme of the next section. The exercise may be looked upon either as a search for a perspective on redistribution of land which is consistent with the set of plan objectives and policies as they stand today or, by those who are more optimistic about the plan achievements, as a search for the right perspective. We choose a less colourful title — "Alternative Perspective" — to designate the results of the exercise.

III

Alternative Perspective

We begin the task of delineation of the alternative perspective by positing a different view of the economy and of the role that land plays in it; employing the line of argument used in the previous section, the attempt will then be to show that the other components in the alternative perspective arise as logical corollaries of the initial proposition. We assume that the Indian economy is and in the decades ahead, will continue to be a developing economy in the sense of affording growing opportunities to the population cramped in agriculture to move out to other sectors in the economy. Quite apart from the fact that the trend in the Indian economy since the beginning of the era of planning has been broadly in the direction of increased diversification, it is a truism to say that increased diversification is one of the principal objectives of planning for development in India. Given these objectives, it would seem reasonable to develop perspectives on specific policy issues — such as redistribution of land — on the assumption that these objectives will be achieved with a measure of success rather than that they will not be achieved at all. The second assumption that we make is that the realised technological change in agriculture will continue to be of the land-saving type permitting a far more intensive use of land in terms of combination of labour and material inputs with land in cultivation processes. The assumption, in effect, is that both the purposively planned research activities to create innovations and the fiscal, price and extension measures to promote their adoption will work in the direction of bringing about technological change in agriculture of the type needed by the economy and desired by the planner. Here, again, the contention is that the perspectives on specific policy issues should be based on the assumption of achievement of the broader objectives of planning.[2]

The main implications of the two assumptions made above for the role that land plays in the economy are the following. Firstly, the diversification of the economy and the land-saving type of technological change in agriculture should have the effect of relaxing the constraints imposed by land on the growth of income and employment within agriculture and in the economy as a whole; in other words the precarious dependence of a predominant part of population on land for livelihood may be expected to progressively diminish. Secondly, a somewhat less obvious implication of diversification and land-saving technology is that these developments should weaken the rigid link obtaining in traditional agriculture between a person's extent and quality of access to land on one hand and his income and socio-economic status on the other. Thirdly, these two implications together would appear to suggest that diversification and technological change should make for an environment in which the institutions and markets providing access to land in agriculture are likely to function less inequitably than they do in traditional agriculture.[3] The striking difference between these implications and the corresponding implications noted in the previous section lies at the root of the principal contrasts between the current perspective on redistribution of land and the alternative perspective being described in this section.

The need for a changed perspective on land reforms in general and on redistribution of land in particular arise from the fact that, while in the economy described in the previous section land comes close to being a unique and exceptionally potent repository of income, wealth, power and status — an instrument, in a word, which gives its possessor a stranglehold over the life and fate of the non-possessor —, this is no more true of the role of land in the economy undergoing diversification and land-saving technological change in its agriculture. In such an economy, land could indeed be a coveted scarce input — like foreign exchange or steel — capable of yielding to its possessor large and even spectacular, windfall gains but it need be no more than that. It is easy to see that there would be a scramble for land in such an economy, more

plausibly in the initial development phases, which needs to be regulated and umpired by the government; but its nature and its consequences for the mass of population are likely to be much less catastrophic than those of the elemental struggle for survival described in the previous section.

It should be apparent from the points made so far that in an economy subject to development and technological change the objectives of land reforms need to be scaled down from those of maintaining "economic" law and order to those of regulating the distribution and use of a specific scarce input. It is not suggested that the problems of "economic" law and order — and those arising from inequitable distribution of income and wealth — would not be important in such an economy. The point is only that the close link and identity obtaining in traditional agriculture between the two conceptually distinct tasks, *viz*, that of maintaining "economic" law and order and ensuring equitable income distribution on one hand and that of regulating the distribution and use of land on the other, would not obtain under the changed conditions. Under the latter, this distinction which remains latent in a traditional agriculture is likely to become progressively more manifest and, in the process, compel the policy-maker to devise distinct, though not independent, set of policies for the two tasks.

It looks both reasonable and plausible that, in an economy undergoing diversification and technological change in agriculture, the trend in the policies relating to distribution and use of land — *viz*, the land reforms policies — would be to become a part of the broader package of policies concerned primarily with promoting the structure of farms desired by the policy-maker in the light of the land-saving technology in agriculture. We have already assumed above that the policy-maker would work purposively, through research and extension, to put such a technology in the hands of cultivators. This objective would obviously need three distinct kinds of supporting policies — (a) policies to institutionalise the supply of inputs, including finance, to place them within the reach of all cultivators, especially the smaller ones, (b) policies to discourage certain forms of mechanisation which would imply substitution of scarce capital and land for labour in cultivation, and (c) policies — price, crop-insurance, etc — to ensure a minimum acceptable level of profitability to farmers in adopting the prescribed technology. It is easy to see that the cumulative effect of these policies is to eliminate the increasing returns to scale in cultivation, if any, owing to technological, pecuniary or risk-bearing-capacity reasons. Secondly, these policies should leave little room or justification to permit non-cultivators to own land without cultivating it since this would merely enable them to benefit from the windfall gains of technological change with no corresponding functional role left to them in cultivation.

The package of policies described above should suggest to the policy-maker the following two broad objectives to be achieved through redistribution of land — (a) putting the agricultural lands as far as possible in the hands of those who would cultivate them themselves, and (b) shaping the size-distribution of farms to get as many of the farms as possible close to but not much above the viable size of farm as indicated by the technology of cultivation sought to be promoted.[4] The second objective needs two supplementary comments. Firstly, a plausible commonsense argument can be constructed, as we do in a note at the end of the paper, to show that, given the assumption of land-saving technology, the viable size of farm in a region would be above the mode but, very likely, below the arithmetic mean of the size-distribution of farms prevailing in the region prior to technological change.[5] Secondly, given the scarcity of land, the policy-maker would obviously want to distribute the available supply among as *many* cultivators as possible subject to the constraint that a farm should not fall below the level of viability.

At first sight, these objectives of redistribution would appear to be the same as those met with in the previous section; the first objective calls for transfer of land-ownership from the landlord to the tenant and the second for transfer from the large owner to the small. It is, however, important not to miss the difference between the two sets of objectives in relation to the rationale underlying them and the criteria to be used in implementing them. Thus, the objective of no land to be held by non-cultivator derives its justification in this section from the consideration that it is best to distribute a scarce input among its users rather than allow part of it to go to non-users who would benefit merely from their title to its ownership without performing any identifiable function; the justification of the objective in the previous section was based on the apprehension that absentee-ownership of land in agriculture would reduce a sizeable section of population to a state of serf-like existence. Even more obviously, the redistribution of land from the large owner to the small being described here is the one guided by the criterion of viability of farm size and technologically effective use of land and not by criteria relating to fair income distribution; it is no more than a coincidence, though a fortunate one, that both the sets of criteria favour a more equitable distribution of land. The difference between the two sets of criteria should stand out sharply when one considers the case for semi-confiscatory transfer of land from the large owners. As we noted in the previous section, the current perspective on redistribution lends strong support to this case. In contrast, the approach consistent with the redistribution of land being considered in this section would be to compensate the large owner in terms of the appropriate non-land inputs so that the purpose of the redistribution, which is change in the combination of inputs on farms and not redistribution of wealth, is more likely to be achieved. It should, thus, be clear that, in the context of the alternative perspective, the criteria for redistribution of land need to be those which help promote effective use of a scarce input like land from the point of view of society; it would be best to separate this objective from that of ensuring equitable distribution of income and wealth and leave the latter to be taken care of through a separate set of policies.

The alternative perspective has two main implications for the type of programmes to be implemented for redistribution of land. Firstly, in the light of the rough and ready mode-mean rule of viable size of farm referred to above, the problems of *arithmetic* feasibility of redistribution must appear much less intractable in the context of the alternative perspective.[6] There is no gimmick in this since both the major assumptions made in this section — *viz*, diversification of the economy and land-saving technological change in its agriculture — have the effect of pushing redistribution of land closer to arithmetic feasibility, the first by relieving the pressure on land and the second by augmenting the effective supply of land. It is even possible that diversification and technological change affect

favourably the political feasibility of the programmes for redistribution of land in the sense of rendering them accomplishable within the present political-cum-administrative set-up of the economy. Secondly, the alternative perspective should widen the range of instruments available to the policy-maker to modify the distribution and use of land in agriculture. Increased monetisation, greater degree of sectoral integration in the economy, growing market-orientation of agriculture — all of which are the necessary and even inevitable accompaniments of overall economic development — and progressive institutionalisation of farm-services as a matter of deliberate policy should all contribute to the creation of an environment in which price and fiscal measures gain in efficacy to become close, if not better, substitutes for physical measures for control and regulation. Besides, as noted earlier above, the institutions and markets connected with land may also be expected to function more normally in the conditions of economy being assumed here. In the light of these, any suggestion that appropriate price-cum-fiscal measures may work as well as direct measures in regulating the distribution and use of agricultural land need not, in the context of the alternative perspective, have the same look of preposterousness as it had in the previous section.[7]

We conclude this section with a few comments on the broader significance of the results obtained. Firstly, any impression that the job of land reforms is rendered easier in the alternative perspective needs to be tempered by the realisation that this is due, partly, to the separation of the income-distribution objectives from those relating to distribution and use of land and, partly, to the more substantive role assigned to technological-cum-institutional policies in the arena of land. Secondly, so long as the perspective discussed in the previous section continues to co-exist with the plan objectives and policies as they stand now, the policy-maker will be open to the charge either of logical inconsistency or lack of faith in the achievement of the Plan. Thirdly, unlike the position in the previous section, the alternative perspective will become operationally relevant not necessarily at the same time in all the regions or on a day decreed by a legislative fiat but only as the assumed technological-cum-institutional conditions materialise; in some respects, the programmes for redistribution in the alternative perspective are likely to be akin to the present-day consolidation programmes in the mode of their implementation. Fourthly, if lack of political will is the main hurdle faced by land reforms in the current perspective, the villain of the piece in the alternative perspective is likely to be lack of luck or wisdom on the technological front. If the right technology remains long in coming, the opportunities for reforms would get proportionately delayed. More likely, if in the intervening period the wrong technology gets adopted for wrong reasons — e g, big tractors as status symbols — owing to the policy-maker's laxness, the opportunities would get aborted even before they arise; this could be already happening in some regions of "green revolution". Lastly, it would appear that in major respects the perspective on redistribution of land developed in this section is independent of the political route adopted for economic development. Given the initial state of the economy like India's diversification of the economy and land-saving technology in its agriculture should form the principal objectives of development under *any* political strategy of planning and, hence, barring socialisation of agriculture, the perspective of this section should retain some relevance in diverse political systems pursuing the same broad objectives of development.

IV
Scope for Redistribution: Some Neglected Issues

This section is in the nature of an aside on what appear to us to be fairly major deficiencies of concepts and procedures implicit in the current practice of looking at the scope for redistribution of land. It would be recognised that the common practice in this respect is to start with the ownership distribution of land prevailing in a region or a state and either calculate the surplus above a specified ceiling or go a step further and compare the surplus with the land needs of small holders and landless categories.[8] The results are, doubtless, expected to be no more than very crude indicators of the scope for redistribution and it is possible to suspect that such exercises are done more to emphasise the non-feasibility of redistribution than its feasibility. The purpose of this section is to try to show that the results could be a good deal worse than this in the sense of having little real relevance to the question of the scope for redistribution.

We hope the reader would excuse us for the classroomish kind of approach which is necessary to bring out clearly the deficiencies in the current practice that we have in mind. Let us assume that we have a rural community consisting of cultivators and non-cultivators, the latter being those who own land with no intention of taking up cultivation as an occupation. The land owned by the members constituting the community is assumed to consist of only two categories — "inside" land defined as land locationally close enough to the community to be capable of cultivation by any cultivator in the community and "outside" land defined as land which, owing to its distance, is accessible for cultivation to *no* member in the community; the obvious intermediate category of land is assumed out here for convenience. It is further assumed that the land leased-in by the cultivators in the community is wholly of "inside" type while the land leased-out could be of either type. An "outsider" is a member, cultivator or non-cultivator, belonging to another community. It is assumed that land which is "inside" from the standpoint of the community under consideration is "outside" land for every other community. A "region" is an aggregate of communities.

The next step is to list the land owned and the land cultivated by the members in the community according to its type and tenure-status. This is done below:

(A) *Land Owned by the Members in the Community*

"Inside" Land

a_1 — Land self-cultivated by owners;

a_2 — Land leased-out by cultivators to other members in the community; and

a_3 — Land leased-out by non-cultivators to other members in the community.

"Outside" Land

a_4 — Land leased-out to outsiders.

(Note: It needs to be noted that with the assumptions made above the tenants on "inside" lands are necessarily members belonging to the community and those on "outside" land are necessarily outsiders.)

(B) *Land Cultivated by the Members in the Community*

"Inside" Land

b_1 — Land self-cultivated by owners ($=a_1$);

b_2 — Land leased-in from cultivating members in the community ($=a_2$);

b_3 — Land leased-in from non-cultivating members in the community ($=a_3$); and

b_4 — Land leased-in from outsiders ($=a_4$).

(Note: In terms of the assumptions made, a member in the community cannot lease-in or cultivate "outside" land. Hence, land cultivated by the Members in the community = "Inside" Land.)

We are now ready to put to use framework of concepts and categories developed above. The principal point of this section is that the current practice of looking at the ownership-distribution of land in a region or state to estimate the scope for redistribution would make sense if the purpose were only to achieve a more equitable distribution of titles to ownership and nothing more. This single purpose, by itself, imposes no requirement that the person given land or permitted to hold land be a cultivator or that land be allotted only to those who are willing and able to cultivate it themselves. Given this single purpose, it is perfectly in order to measure the scope for redistribution even by taking the country as a whole as a single entity, as it is, say, for the purpose of redistribution of income. However, it is plain enough that no land-reformer would accept the restriction of objectives of land reforms to this single purpose. It is worth noting at this point that if the current practice of looking at the scope for redistribution has persisted despite the broader objectives of land reforms it is, plausibly, due to the fact that the perspective on redistribution described above in Section II — which, it will be remembered, views land more as generalised income and wealth rather than as an input — has become a habit of mind with not only policy-makers but also with researchers and with land-reformers themselves.

It is easy to see that supplementing the objective of equity in distribution of land with an objective such as elimination of absentee-ownership, as popular a sentiment among land-reformers as equity, would knock the bottom from under the current practice of measuring the scope for redistribution. In terms of the framework developed above, achievement of equity plus elimination of absentee-ownership would need redistribution of "inside" land (i e, cultivated land) among the cultivating members comprised in each community. Hence, the scope for redistribution needs to be assessed community-wise — not region-wise — by looking at the distribution of cultivated land among the cultivating members — and not distribution of land-ownership among the owners. It is, thus, seen that the current practice of measuring the scope for redistribution is inconsistent with the purposes of land reforms; the answers provided by the former do not relate to the questions raised by the latter.[9]

The second point that we want to bring out in this section relates to the inter-dependence between the objectives of equity in distribution and that of elimination of absentee-ownership. To see this, it is best to begin by noting that the latter objective, in strict logic, requires only that no person be permitted to own land without cultivating it himself. Let us assume that the redistribution for equity is to proceed in terms of a specified ceiling on ownership at the upper end and, also, a specified floor at the lower end. The interdependence between the objective of equity and that of elimination of absentee-ownership arises because the latter objective can be achieved in three alternative conceptually distinct ways with differing implications for the degree of equity obtainable through redistribution on the basis of specified norms. Firstly, absentee-ownership can be eliminated in a manner favourable to the tenant by permitting him to acquire ownership of leased-in land till his total ownership touches the ceiling, leaving the remainder to go to the landlord (if he is a cultivator) or to the pool of surplus land available for redistribution. Alternatively, elimination of absentee-ownership may proceed in a manner favourable to the owner by permitting him (if he is a cultivator) to retain leased-out land subject to the restriction of ceiling, leaving the remainder to go to the tenant wholly or in part, depending on the tenant's ownership, with the excess going to the pool. It will be recognised that the procedures adopted in the "tiller's day" or similar legislations intend to operate broadly in the first way, though, covertly, they may be operating in the second way. However, a point neglected by them is that elimination of absentee-ownership can be brought about in a third way, which may be termed favourable to those who are below the floor (this includes tenants and owners of leased land if they are below the floor), by including the entire leased land in the pool of surplus land.[10] It is easy to see that, given the ceiling on ownership, the total size of this pool — and, in turn, the degree of equity achieved through redistribution — will depend on which of the three ways (or some combination of them) is chosen by the policy-maker to eliminate absentee-ownership. It is in this sense that interdependence exists between the objective of equity and that of elimination of absentee-ownership.

The obvious implication of this interdependence is that the scope for redistribution needs to be measured after allowing for the extent to which and the why in which the absentee-ownership is going to be eliminated. For this purpose, one may either rely on the provisions of the prevailing legislation, if any, or develop alternative estimates of the scope by making suitable alternative assumptions. It is needless to add that this point and the consequent complications in estimating the scope for redistribution go unnoticed in the current practice of looking at the scope for redistribution. The main implication that we derive from the discussion so far in this section is that the programmes for redistribution would need extensive prior "feasibility studies" based on village-level (or group-of-villages

TABLE 1: INEQUALITY IN THE DISTRIBUTION OF LAND UNDER ALTERNATIVE ASSUMPTIONS ABOUT ELIMINATION OF ABSENTEE-OWNERSHIP OF LAND

Taluka	Lower Norm (acres)	Full Resumption		Partial Resumption		Non-Resumpton	
		Per Cent of Holding Below the Lower Norm	Average Size (acres)	Per Cent of Holding Below the Lower Norm	Average Size (acres)	Per Cent of Holding Below the Lower Norm	Average Size (acres)
Matar (Dist Kaira)	4.63	53.9	2.31	28.8	1.85	32.0	1.89
Nadiad (Dist Kaira)	2.32	71.9	2.00	43.8	1.79	47 9	1.91
Satara (Dist Satara)	4.19	50.9	2.33	31.8	2.18	35.1	2.34
Wai (Dist Satara)	3.26	61.0	2.29	41.7	2.05	41.7	2.08
Karjat (Dist Kolaba)	5.26	55.7	1.74	58.9	2.08	40.0	1.77
Panvel (Dist Kolaba)	4.82	73.3	1.18	75.9	2.28	50.2	2.04

level) data covering not merely the distributions of owned land and of cultivated land but also covering lease-relationships and the characteristics of parties involved in them. Some amount of playing with these data using alternative norms of ownership and assumptions about elimination of absentee-ownership would be worthwhile in terms of the insights gained into the operational implications for redistribution of the prevailing systems of ownership, cultivation and leasing of land. Our suggestion to researchers and research institutions is to enlarge the standard tabular output of general village surveys to include these data and the illustrative redistributions based on them.[11]

It was noted above that the termination of absentee-ownership of land can be brought about in three distinct alternative ways and that, to judge from the relevant legislation, the policy-maker's preference would appear to be for a combination of the first two of these ways to the exclusion of the third. It is tempting to speculate on the implications of this choice for the nature of the concept of equity which may be regarded as shaping the policy-maker's attitude towards the question of redistribution. While, strictly, these implications do not belong to this section, they seem to be important enough not to be put in a footnote. We read three implications in the policy-maker's choice. Firstly, the policy-maker's concept of equity seems to operate within the constraints imposed by his desire to respect the rights deriving from custom and property without going into their rationale or antecedents. Secondly, the concept of equity seems to be negative in its orientation in the sense that it is concerned more with curbing the manifestations of excessive inequity than with bringing equity within the reach of the population at large; the motto apparently is "Nobody shall own land above the ceiling" rather than "As many as possible of those below the floor". It is, probably, not a coincidence that this negative orientation affords maximum opportunity to the policy-maker to accommodate the rights deriving from customs and property. Thirdly, it looks plausible that the policy-maker's concept of equity lacks "democratic validation" in a specific sense; if the three alternative ways of terminating absentee-ownership were put to vote among the population affected/benefited by redistribution, it is unlikely that the policy-maker's present choice would get elected. Thus, the policy-maker's choice among the alternative ways of eliminating absentee-ownership of land seems to provide a particularly apt and illuminating illustration of the manner in which and the limitations with which the concept of equity works in practice — as constrasted with the radical overtones in which it is enunciated — in a "soft" democracy like India.

TABLE 2: INEQUALITY IN THE DISTRIBUTION OF LAND AFTER NOTIONAL REDISTRIBUTION ON THE BASIS OF ASSUMED NORMS

Taluka	Lower Norm (acres)	Redistribution After Full Resumption		Redistribution After Partial Resumption		Redistribution After Non-Resumption	
		Per Cent of Holdings Below Lower Norm	Average Size (acres)	Per Cent of Holdings Below Lower Norm	Average Size (acres)	Per Cent of Holdings Below Lower Norm	Average Size (acres)
Matar (Dist Kaira)	4.63	17.3	3.07	—	—	15.7	2.24
Nadiad (Dist Kaira)	2.32	42.5	2.24	7.0	1.85	10.8	1.88
Satara (Dist Satara)	4.19	48.0	2.88	28.9	3.02	27.5	2.59
Wai (Dist Satara)	3.26	37.0	2.67	5.7	1.37	41.7	2.59
Karjat (Dist Kolaba)	5.26	—	—	—	—	—	—
Panvel (Dist Kolaba)	4.82	50.0	1.83	46.2	1.61	50.2	3.28

Note: Dashes in the Table indicate zero inequality in the sense of no holding falling below the lower norm.

We conclude this section with a brief indication of some relevant findings obtained in a research project recently completed in the Department of Economics, University of Bombay. The field investigation of the project covered 36 villages selected equally from six talukas located in three districts — districts Kolaba and Satara in Maharashtra and district Kaira in Gujarat. For the purpose of the project, the analysis of inequality in the distribution of land was done at the village level. While, as was noted earlier above, village is not necessarily the most appropriate unit of analysis for this purpose, the results of the analysis could be of some interest to the readers who feel persuaded by the main arguments of this section. The detailed results of the analysis, along with an indication of the numerous difficulties of concepts and data met with in the process, are contained in chapter 6 of the report cited in note 11. It should suffice here to mention the two broad findings of the analysis which were: (a) the principle of "land-to-the-tiller" — i e, transfer of leased land from the owner to the tenant on the land — by itself would bring about only moderate reduction in the inequality in the distribution of land, and (b) in 24 out of the 36 selected villages redistribution of land would be arithmetically feasible.[12]

The second set of findings to be reported here arise from some further work with the project data subsequent to the completion of the project. This work was based on the taluka-wise tabulations of data (presenting the aggregate picture of the six selected villages in each taluka) and, hence, the findings are neither village-wise nor do they relate directly to the data in their primary form. The findings are presented in three Tables (given at the end of this section) along with brief comments on each Table. For the purpose of this analysis, the norms for redistribution were defined in terms of the average size of cultivated holding in each taluka, the upper norm used being three times the average and the lower norm used being half of the average.

The proportion of total holdings falling below the lower norm and their average size of holding are used by us as indicators of inequality in the distribution of land. Table 1 provides a rough comparison of the implications for inequality in the distribution of land of the alternative ways of terminating absentee-ownership. The available data restricted the choice to very simple alternatives and, hence, the results are no more than of illustrative significance. The alternatives considered are — (a) "Full Resumption", leased land to remain with the owner; (b) "Partial Resumption", leased land to remain with the owner if the owner is a cultivator and to be transferred to the tenant on the land in the contrary case; and (c) "Non-resumption", leased land to be transferred to the tenant on the land. It can be seen from the Table that the first alternative comes out badly in comparison with the other two. This is, very likely, due to the tendency of the distribution of owned land among ownership-holdings to be spread out over a wider range of size-classes than the distribution of cultivated land among cultivated holdings. While no consistent difference is seen as between the second and the third alternative, the latter — "Non-resumption" — appears to have an edge over the former — "Partial Resumption" — in the light of the conditions obtaining in Karjat and Panvel talukas.

TABLE 3: INEQUALITY IN THE DISTRIBUTION OF LAND AFTER NOTIONAL REDISTRIBUTION WITH DUAL CEILINGS

Taluka	Lower Norm (acres)	Per Cent of Holdings Below the Lower Norm	Average Size (acres)
Matar (Dist Kaira)	4.63	3.9	4.54
Nadiad (Dist Kaira)	2.32	—	—
Satara (Dist Satara)	4.19	27.5	3.30
Wai (Dist Satara)	3.26	41.7	2.62
Karjat (Dist Kolaba)	5.26	—	—
Panvel (Dist Kolaba)	4.82	50.2	3.39

Note: Dashes in the Table indicate zero inequality in the sense of no holding falling below the lower norm.

It needs to be mentioned that in each of the distributions considered in Table 1, scope existed for redistribution in the sense of existence of holdings above the upper norm of ownership; as may be expected from what was said above, their proportion was slightly higher under the first alternative as compared to the proportions under the other two alternatives. Table 2 shows the inequality remaining in each distribution after the land held above the upper norm is transferred to the holdings below the lower norm. The procedure adopted for this purpose was to move downwards in the listing in which the groups falling below the lower norm appear in ascending order of their deficit.[13] It is necessary to note that with this procedure (and given the grouped nature of available data) the lessening of inequality in distribution is reflected either in reduction in the proportion of holdings below the lower norm (with no specifiable change in their average size) *or* increase in the average size of holdings below the lower norm. While Table 2 does not abound in consistent and sharp contrasts, it would seem reasonable to conclude from it that the residual inequality remaining after redistribution is likely to be relatively large under "full resumption" and small under the other two alternatives, particularly under "partial resumption". On the whole, the results of Tables 1 and 2 together seem to provide a measure of justification for the policy of "land-to-the-tiller" in terms of its impact, along with programme for redistribution, on the inequality in the distribution of land. Since these results are conditional upon the norms of ownership and measure of inequality used in our analysis (both of which can be specified in many alternative ways), it is best not to read more than this cautious inference in Tables 1 and 2.

It will be noticed that the alternatives considered in Tables 1 and 2 for termination of absentee-ownership are favourable either to the owner or to the tenant. Table 3 presents the results of tilting the balance a little in favour of the holdings below the lower norm. It is assumed for the purpose of this Table that the owner is not permitted to resume leased land and that the tenant gets ownership of leased land if and to the extent that his self-cultivated land is less than twice the average size of the cultivated holding in the taluka. This, in effect, amounts to imposition of two ceilings — the upper norm specified earlier above (= three times the average size of cultivated holding in a taluka) applicable to self-cultivated land of a cultivator and the lower ceiling, specified now, applicable to the transfer of leased lands to the respective tenants; hence, the term "dual ceilings" in the title of Table 3. The difference in the inequality remaining after redistribution as between Table 3 and the "Non-resumption" column of Table 2 provides a rough indication of the potential for equity left untapped by the policies of "land-to-the-tiller". It may be mentioned here that, as a consequence of the dual ceilings, between 7 per cent and 17 per cent of leased land in the different talukas got added to the pool of surplus land.

The purpose of the findings reported in the last few paragraphs is only to illustrate the types of detailed and disaggregated analyses needed if the scope for redistribution is to be measured consistently with the attainment of other objectives of land reforms. They should provide helpful clues to researchers regarding the problems of concepts, procedures and data that are likely to arise in the process of measuring the scope for redistribution. While detailed and extensive findings on the scope, by themselves, need not bring redistribution programmes any nearer to implementation, they should at least serve to map out the context and to verify its conformability with these programmes. Unless this is done, it would be difficult to distinguish the blue-prints for castles in the air from those which promise less alluring but more habitable abodes on the ground.

Notes

1 By the term "quality of access to land" we mean the well known differences among owner, tenant and agricultural labourer in relation to security of access and the nature of income it provides.

2 Let us distinguish between the perspective on a policy and the detailed strategies and tactics needed for the implementation of the policy. It would seem reasonable to require that the perspective on a specific policy be consistent with the objectives and goals of other policies in the plan leaving the contingency of their non-realisation to be covered by the strategies and tactics of the policy under consideration.

3 This appears plausible since under the conditions assumed in this section the labourer and tenant may be expected to have a fairly high reserve-price when they bargain for access to land as compared to their position under the conditions considered in the previous section.

4 By a farm of "viable" size we mean the farm which a typical family can cultivate at the required intensity depending primarily on its own labour. A land-saving technology worth the name should provide incomes well above the subsistence level on such farms. If these incomes fall below the income of comparable categories in other sectors of the economy, the corrective policies needed will be those which impinge directly on terms of trade of agriculture and/or on the totality of resources used in that sector.

5 It appears plausible that the prevailing size-distribution of farms is, usually, a markedly positively skewed distribution with a sub-

stantial difference between the mode and the arithmetic mean of the distribution and with about two-thirds or more of the total farms falling below the arithmetic mean. Let us consider the following categories of farms in the distribution.

Category A — Farms falling below the mode of the distribution

Category B — Farms located at and around the mode

Category C — Farms located at and around the arithmetic mean

Category D — Farms above the arithmetic mean.

Let us now ask ourselves which of these categories is likely to have viable size, in the sense defined above, under the prevailing technology. It would appear that we can confidently rule out categories A and D, the first on the ground that the families comprised in it are likely to have cultivation as a secondary occupation and the second on the ground that the category D farms are likely to be those relying primarily on hired labour or on labour-substituting type of mechanisation. By definition, the bulk of cultivating families fall in category B. Most of these are likely to have cultivation as the main occupation with farms smaller than the viable size but not small enough to reduce cultivation to the status of secondary occupation to them; in other words, the mode of the distribution is likely to be below, but not much below, the viable size. Two things need to be noted regarding the remaining category, *viz*, category C — the size of farm in this category is likely to be substantially larger than the mode and these farms, plausibly, belong to the upper 7th or 8th decile-groups of farms. Both these considerations suggest that their size is unlikely to be below the viable size. It, thus, looks plausible that the viable size of farm under the prevailing technology lies between the mode and the arithmetic mean of the present size-distribution of farms. This proposition should be all the more plausible if we assume that the prevailing technology is replaced by a land-saving technology.

6 If the mode-mean rule is valid, redistribution of land is necessarily feasible so long as it is restricted to present cultivators, including tenants cultivating leased-in lands and agricultural labourers having cultivation as a secondary occupation. Additionally, the difference between the viable size and the arithmetic mean of the distribution would provide further scope to accommodate at least a part of pure agricultural labourers in cultivation.

7 Conceptually, the redistribution of land being considered in this section has the same end-results as could be achieved by imposing on owner-cum-users of agricultural land a set of shadow prices on inputs used in cultivation, including a price on land high enough to reflect its relative scarcity from the social point of view.

8 For a recent instance of such calculations, though based on the size-distribution of cultivated holdings, see "Poverty in India", Dandekar and Rath, Indian School of Political Economy, Poona, 1971, pages 68 to 86, particularly, Tables 5.2 and 5.3. Incidentally, the Dandekar and Rath argument together with their summary of policy pronouncements on ceiling on landholdings provides relevant reading material on two issues referred to in the previous section of this paper, *viz*, (a) tendency to view ceiling on holding as a ceiling on income and wealth, (b) the "non-feasibility" hypothesis for failure of redistribution programmes.

9 The framework used amounts to assuming, in effect, that communities along with their "inside" land are concentrated at distinct points with no overlap with each other. This assumption helps in clarifying the point that we have in mind without introducing any irrelevant complications. However, the communities in real world obviously have overlaps and, consequently, the operational definition of "community" for the purposes of redistribution would hardly be an easy task. In particular, it cannot be lightly assumed that "communities" can always be equated with villages as they now stand demarcated from each other. It may be mentioned here that the restrictions on redistribution implied by the framework would continue to hold so long as the intention is not to relocate the population over a broad region, like a state or the country as a whole, to match the need for land with its availability.

10 The case for this third way of eliminating absentee-ownership may not be as absurd as it may appear at first sight. One can argue as follows in its favour. Barring an owner, even if he be a cultivator, from resuming leased land may be justified by treating the fact of lease as an evidence of the concerned land being either in excess of the owner's need or inaccessible to him for cultivation. The tenant's case, which appears unassailable in terms of both principles and logic of land reforms, may not remain so if one begins to look into the manner in which the lease market allocates the land available for lease among those desirous of leasing-in land for cultivation. The tenant's case would be strong if it can be assumed that this market has always worked fairly in the past in the sense of putting leased lands in the hands of those with relatively more pressing need for land as judged by the criterion of equity. This would, however, appear to be a wholly gratuitous assumption to make for two reasons. Firstly, it is inconsistent with the general presumption that the markets connected with land tend to operate inequitably. Secondly, unlike ownership and leasing-out of land, curbs on who may lease-in land and on the extent to which land may be leased-in never appear to have figured in the ideas and programmes of land reforms. It is, hence, an unlikely coincidence that the distribution of leased lands among the tenants made by the lease market conforms to the distribution given by the rationing out of leased lands on considerations of equity. It would appear to be a curious lacuna in the current ideas on land reforms that they wholly neglect the possibility of divergence between these two distributions. It is easy to see that the acceptance of this possibility should weaken the basis of the principle of "land-to-the-tiller".

11 Such data should also have the effect of encouraging a more open-minded analysis of structure and functioning of lease market. See "Structural Features of Village Lease Markets" (chapter 7 in "Evaluation of Land Reforms", M L Dantwala and C H Shah, Department of Economics, University of Bombay, 1971).

12 The norms used in this analysis were defined in terms of the per capita ownership of land in the village with the lower norm equal to half of the per capita ownership and the upper norm equal to three times the per capita ownership.

13 The alternative procedure of moving upwards in the list entails some complications. The discerning reader would not fail to notice that the two procedures imply different strategies to tackle the problem of poverty and that the choice between them is hardly an easy one. It is needless to add that the distinction between the two procedures and the consequent problem of choice vanish if the surplus is sufficient to fully cover the deficit.

Window Glass

WINDOW GLASS, for the first time, has made a trading profit of Rs 9 lakhs which has been utilised to bring down the accumulated deficit to Rs 19 lakhs. Depreciation for the year amounting to Rs 5 lakhs has not been provided for, nor has any development rebate reserve been created for all the years in the absence of taxable income. Also, provident fund dues could not be paid within the time limit prescribed under the Companies Act. The gratuity liability too has not been ascertained. Sales increased from Rs 47 lakhs to Rs 90 lakhs and a substantial portion of the increase was accounted for by exports.

Notes on Farm Size and Productivity

Krishna Bharadwaj

In this paper the author revisits the debate on the relationship between farm size and productivity with a view to illustrating an approach based on some broad characteristics of rural markets and the nature and extent of participation therein of different groups of peasantry.

A large number of studies have examined the hypothesis of the inverse relation between farm size and productivity and suggested a number of explanations, mostly resting on the logic of production decisions in competitive situations.

Using data from the published farm management studies carried out in West Bengal, Bombay, Madhya Pradesh, Punjab, Uttar Pradesh and Madras, we examine the explanations already advanced and suggest how the relation between utilisation (and productivity) of inputs and farm size could be interpreted in terms of the unequal and diverse nature of market involvement of different groups of peasantry.

The analysis carried out here is merely suggestive of certain hypotheses and the approach is presented only in a rudimentary form. Much more comprehensive data and of a different kind would be needed to develop these hypotheses and to test them.

I

Introduction

1.1 THE publication of the "Studies in the Economics of Farm Management" has been followed by considerable research on problems of production and resource allocation in Indian agriculture. Much of the work is set out, explicitly or implicitly, in terms of conventional economic theory of competitive markets, treating the cultivator and his problems of resource acquisition and utilisation on the analogy of a producer of a competitive firm. To cite some common research endeavours: production functions, popularly of the Cobb-Douglas variety, expressing output as a function of land, labour and material inputs are fitted to cross-sectional data on holdings. Comparisons are then made between the marginal productivities of inputs derived from such fitted functions and the market prices of the respective inputs, in order to draw out inferences about efficiency with which resources are utilised.[1] A question commonly posed, for example, concerns the optimality of labour use, judged on the basis of whether or not the derived marginal productivity of labour equals the market wage rate. Some awkward problems arise when inputs are owned, like family labour, land or bullock labour. Attempts to impute market prices to such inputs have resulted in the majority of cultivators showing persistent net losses. This 'baffling' result has led to controversies as to whether it is the imputation of wages to family labour or of rent to owned land that explains the result!

1.2 Even when the researcher recognises the inadequacy or irrelevance of some specific assumptions like profit maximisation or mobility of resources guided by freely fluctuating prices, he is prone to tinkering with only those specific parts of the competitive model, keeping undisturbed the rest of the framework. Thus he may introduce imperfections in the form of monopoly (or monopsony) elements in specific markets, say the land lease market while other markets continue to enjoy their well-behaved status.

1.3 The analytical challenge emanates however from the interactions of varied institutional forms prevailing simultaneously in the agrarian economy. These interactions are not only influenced by the prevailing market situations but certain characteristics of markets develop because of the simultaneous existence of these different forms. Thus in a situation where capitalist farming is emerging out of a semi-feudal agriculture, the co-existence of both the modes shapes the labour market (e g, the availability of employment, the nature of labour contracts) while the characteristics of labour market itself influences the form and process of transition. The 'market' situations that develop are too complex to be treated merely as deviations from or imperfections of a competitive economy. Both the character and functioning of markets are qualitatively different and particularly complex in semi-feudal agriculture where the more powerful sections of the society exercise power through privilege as well as through the functioning of the markets.

1.4 In this paper we revisit the debate on the relation between farm size and productivity with a view to illustrating an approach based on some broad characteristics of rural markets and the nature and extent of participation therein of different groups of peasantry. A large number of studies have examined the hypothesis of the 'inverse' relation between farm size and productivity and suggested a number of explanations, mostly resting on the logic of production decisions in competitive situations.[2] Using data from the published farm management studies (hereafter referred to as FMS) carried out in West Bengal, Bombay, Madhya Pradesh, Punjab, Uttar Pradesh and Madras, we examine the explanations already advanced and suggest how the relations between utilisation (and productivity) of inputs and farm size could be interpreted in terms of the unequal and diverse nature of market involvement of different groups of peasantry. The analysis carried out here is merely suggestive of certain hypotheses and the approach is presented only in a rudimentary form. Much more comprehensive data and of a different kind would be required to develop these hypotheses and to test them.

1.5 In the following section we indicate, rather broadly, some features of market relations which not only violate the competitive premises but raise serious doubts against attempts at partially modifying the competitive assumptions only in specific markets. In section III we point out some features of the FMS that seriously delimit their usefulness to adequately illustrate our approach. In the subsequent sections IV, V and VI we examine closely the farm size and productivity issue.

II

'Market' Relations and the Agrarian Economy

2.1 The complexity of the network of market relations within which production decisions are taken in an agrarian economy becomes evident when we contrast them with the competitive premises: under the competitive framework while markets are interlinked, this

is so only through prices. Each producer decides on the use of a resource — owned or purchased — by treating its market price as an opportunity cost. Thus the cultivator, it is presumed, decides whether to put in more labour on his family farm or to hire himself out by comparing the net return from working on the farm with the wage rate (see below V). In the long run, each producer has open to him the possibility of buying or selling any particular resource in indefinite amounts at the prevailing price. Under a regime of complete mobility of resources and profit maximisation, with a well-behaved technology, every resource will have, in equilibrium, the same marginal value productivity in all uses, which equals the market price of the resource. (This underlies most resource allocational models; e g, see Hopper [1965].) The market does not discriminate between producers and decisions of the participants are linked by the purely impersonal forces of prices. Each producer decides on the basis of relative prices and his own budgetary constraint what best to produce and how. One important feature of decision-making is that any choice made by the producer in any one, factor or product, market does not directly influence the field of *feasible* choices open to him in any other market. (This assumption is significantly violated, as we see in 2.4 below, by the rural markets.) The actual choices that the producer ends up in making are, of course, linked through the prices he faces. For example, the producer's *feasible* production possibilities are defined for him independently of the *feasible* choices open to him, say, in the credit market. His *final* decision in production is certainly linked with the choice he makes in the credit market, through the credit operating on his resource constraint.

2.2 These competitive assumptions are violated in a fundamental way in the agrarian economy where the extent of market penetration and the character of markets is very different. While markets have penetrated into the rural economy in a significant manner, the *extent* and *type* of involvement in markets of the different sections of the peasantry is not uniform. The character of markets reflects — and is very significantly determined by — the local patterns of power. At the same time, the functioning of the markets itself may be such as to reinforce the patterns of power. The situation may be roughly sketched as follows: The initial resource position defines the 'bargaining position'[3] of the participants in the various markets. The relative bargaining strength (reinforced by forces of tradition, custom, social mores) determines the access to resources, the terms on which they can be obtained and the fields of feasible choices open to the individual producer in the various markets; or, in short, his current production activity and income-assets position resulting therefrom. This, in turn, defines his relative bargaining position subsequently. We elucidate this further.

2.3 We may distinguish, broadly speaking, three types of market involvements that may emerge, depending upon the economic position of the participant and his bargaining strength. There is, first, the category of operators with a clearly dominant position like the big landlord in the land (lease) market or the money-lender in the credit market. These operators are powerful enough to be able to exploit the market from a position of vantage and, more importantly, shape the market relations through contracts which interlock markets (see below 2.4). Secondly, we can envisage the category of the economically very weak sections of the peasantry, landless agricultural labourers, very small owners or tenants (called by us 'very small' farmers), all of whom have a rather weak bargaining position in markets. Yet they cannot avoid involving themselves in market operations. For example, as they do not have enough land to cultivate, they have to depend upon hiring out their labour and submit to the vagaries of the labour market (see below V). Given the uncertainty of employment they often lease-in a tiny plot of land, even on extremely onerous conditions. Not having enough circulating capital to produce even their subsistence they have to rely on credit. We shall indicate below how this element of compulsive involvement of the poorest farmers is reflected in their cropping pattern, their land and labour utilisation as well as the higher degree of monetisation of inputs and outputs under conditions of distress. The third category of peasants falls between these two: while not powerful enough to exploit or dictate market relations like the big operators they can be somewhat more self-reliant. They have or can make provision for more or less adequate circulating capital, possess bullocks or implements of their own. A part of them (whom we call 'small' farmers) still want to protect themselves from the market, playing yet a defensive role. Another part may be more comfortably situated and may be playing the market game with some advantage. In fact, if at all the competitive game of balancing costs and returns in determining crop-mixes and methods of production is played by any section of the peasantry, it could be this last group which we call 'middle' farmers. We shall be arguing in Section IV below that the economic status of the cultivating household and the nature and extent of its market involvement influence the degree of land utilisation, the cropping pattern, the level of employment and so on.

2.4 It may be argued that the differential bargaining position of the participants in any particular market may be fitted into the conventional models of monopoly or monopsony. What does complicate the analysis, however, is the fact that markets become interlocked through price and non-price links, given that market and social power is vested in the dominant rural classes and that the dominant party often combines multiple functions, enjoying a superior position simultaneously in a number of markets.[4] When a landlord combines the functions of a lesser and a merchant, the terms of the lease are not only themselves quite stringent (given his position *vis-a-vis* the tenants in the lease market) but quite often include stipulations as to what crops the tenant ought to grow and the mode as well as terms of rent payment. For instance, he can dictate the rent to be paid in kind and the time of payment. Thus the tenant's involvement in the lease market restricts his freedom to exercise choice in production (in terms of the crops to be produced) and/or in the output market (to whom and when to sell the produce). If the landlord also possesses land under personal cultivation, it is not unusual for him to extract underpaid or unpaid services from the tenant (or his dependents) on his own land and at a time he stipulates (more commonly in the busy season). Thus the decision to enter one market restricts the weaker participants' field of feasible choices open to him in other markets — a situation violating one of the competitive premises (see 2.1 above). Such interlocking of markets increases the exploitative power of the stronger sections because while there could be limits to exploitation in any one market — due to traditions or conventions — or due to 'economic' factors, the interpenetration of markets allows them to disperse exploitation over different markets and phase out exploitation over

time as well. Thus there may be a traditional or conventional limit beyond which a landlord cannot exploit his monopoly position in the land market in terms of the share of output owing to him under a crop-sharing system. Also he may possibly fear that if the tenant is left with too small a share at any time, he may not put in as much of his own (labour or other) inputs as he would under slightly favourable conditions. If the landlord also functions and/or enjoys monopoly advantages as a money-lender or a merchant he could then so work out the conditions he offers on the interlocked markets that he secures additional gains from exploiting in the conjoint markets. Thus the ability of the combined functionary to exploit interlocked markets is more than what he could achieve operating in any one individual market. The point about such interlocked markets is that the weaker party's fields of feasible choices shrink while, superficially, he would appear to be taking free decisions on the market.

2.5 Furthermore we cannot presume that all farmers are profit-maximisers irrespective of their economic status. In fact, we may not even presume that there are objectives of production defined *a priori* and uniformly applicable to all producers. The objectives of production themselves depend upon the resource position of the farmers and different farmers may presumably maximise (if maximisation is to be considered a universally applicable behavioural premise at all) profits or gross output or "farm business income" (i e, gross revenue minus paid out costs); some may be governed by the need to raise subsistence. As we note below (see VI) very small farmers may "choose" to raise as much gross value of output as possible per acre, even at the cost of having to incur debts to provide circulating capital; they may be found operating land intensively even to a point where the additional input costs exceed the value of additional output. On the other hand, the big farmers, while aiming to produce a surplus, may yet prefer not to cultivate land intensively for a number of reasons including possibly the existence of opportunities for making profits or for wielding social power through non-farming activities like say, usury.

2.6 These are only illustrative examples to indicate that, to be meaningful, an analysis of the agrarian economy would have to take note of these market and non-market relations, with the interlocking of markets. It is misleading when talking about individual producers to hypothesise that each producer confronts technical data and market prices in an impersonal environment and all are equally free to take decisions in all markets. Nor is it possible to analyse the producer's behaviour in any one single market without knowing how the markets are linked through price and/or non-price links. A comprehensive study to cover these aspects would call for detailed information in a historical, specific context about the agrarian economy under study.

III

Limitations of FMS

3.1 Given the issues on which agro-economists have been particularly engaged, the collection of data has come to concentrate predominantly on aspects of technological relations. This is well illustrated by the FMS, where aspects of production other than technological receive much less emphasis. For example, we obtain only cursory information on, say, tenancy. In the FMS, the proportion of land leased-in to land operated is taken as an index of the level of tenancy. Insofar as tenurial arrangements assume very many diverse forms in the matter of conditions of work, permanence of tenure, sharing of inputs, etc, the consequences of the variegated forms of arrangements escape our analysis. Land is, in fact, leased in by operators at all levels and unless we take account of the terms and conditions of the lease, it would be misleading to assess the effects of differences in tenurial status on economic performance on the basis of the proportion of area leased-in alone. Furthermore, in order to analyse the element of 'bargaining strength' in lease-arrangements, it would be necessary to know the overall resource position of the lessor as well as the lessee. In other words, a two-way information on *who leases from whom* would be significant. Unfortunately such information is conspicuously absent in most empirical studies, even in those dealing with the problem of tenancy. Also, the lease-arrangements, it is commonly known, involve interlocking of markets, as described in 2.5 above, (especially labour and credit links). We have no information at all on these.

3.2 The FMS has adopted the size of operational holding as the ultimate unit in its sampling design. Size of holding may suggest itself as such a unit as official and other records are available on that basis and a holding is a relatively easily identifiable unit of reference. Land has also come to be viewed as a major 'limitational' input to which other inputs are applied. The choice of land-size as the basis of the sample (as well as arrangement and presentation of data according to size-groups) has meant underplaying of other aspects like the tenurial status, the size of investment on the farm or the scale of output, etc, which could have provided alternative ways of classification.[5] Further the concentration on technological relations on each holding taken as an independent unit means that there is hardly any information on property relations or even an indication as to what non-price links may prevail in the agrarian economy. Thus for illustrating our hypotheses discussed in II above, we have to seek only indirect evidence: we can at best only suggest that the 'observed' technological relations may be interpreted as reflecting the different character and extent of market involvement of the different sections of the peasantry, classified here according to the size of the operational holding. Basing such a classification only on the size-group of holding is no doubt restrictive.

3.3 In this paper we have used the data published in the FMS reports which are available as aggregated according to size-classes of holdings. This is bound to affect some results more than others. Classifying information on the basis of size-classes has the implication that the characteristics of an individual farm under study depend predominantly on its belonging to a certain size-group. This could be a serious shortcoming but it is not possible *a priori* to state any particular type of bias that may arise. Again the years of reference, 1954-1957, are prior to the emergence of the so-called 'green revolution' in India. It is possible that production relations have changed in their technological aspects as well as in terms of property relations, at least in some regions.

3.4 In the following section we discuss what could be considered as 'technological' aspects of the farm-size-productivity debate and examine some of the explanations offered. We conclude that the inverse relation between yield (gross value of output) per acre and the size of farm which appears to be not ruled out statistically may be explained in terms of differences in intensity of cultivation and in cropping pattern. These are not any new results although the cropping pattern appears to have received much less emphasis in

current literature. However in sections V and VI we offer some suggestive hypotheses as to how specific resource availability, the characteristics of market relations and market involvement of different groups of farmers may themselves bring about these differences in intensity of cultivation and cropping pattern.

IV

Yield Per Acre and Farm Size

4.1 One proposition that attracted considerable notice and has continued to recur in discussions is the alleged inverse relation between yield (i e, gross value of output) per acre and the size of holding. Even if such an inverse relation holds, based as it is on a static, cross-sectional comparison, it does not provide sufficient basis to judge the relative growth potentialities of the different size-groups nor to predict the further patterns of size distribution that might emerge. Also, the comparisons of efficiency are based upon the productivity of an isolated input, land, treating it implicitly as the only limitational input. Despite these limitations the inverse relation acquired significance as it provided ground for some to argue that the small farmers were superior to large ones on purely economic grounds.

4.2 The statistical finding itself has not had a smooth sailing. The controversy about its validity has acquired some history which we shall not detail here.[6] Taking the size-group data, we fitted a log-linear functional relation between yield per acre and the average size of holding for each district and for the three years. While in all the cases the regression co-efficient appeared with a negative sign, suggesting an inverse tendency, it was not significant in all cases. In their more recent studies, Saini (1971) and Saini and Bhattacharya (1972) using data on individual holdings reported stastically significant inverse relation in the majority of cases they studied. Thus the inverse relation, while not supported invariably, is not rejected either. A number of explanations have already been advanced.

An adequate 'explanation' is important not only for policy formulation but also for assessing the future possibilities — whether the productivity differentials are a characteristic that could persist, making the small peasant family farms a historically viable form (and possibly a relatively 'efficient' one) or whether their relative 'advantage' rests on a specific conjuncture subject to change or whether it is more of a static reflection of the economically vulnerable position of the small operators. We shall examine the issue here at the level of technological relations behind which may be a more complex network of agrarian market relations, to be commented upon in the next section.

4.3 Explanations that have been advanced fall mainly into one or the other of the following three categories:[7] (a) differences in techniques, the small holders using technically superior methods of production, (b) qualitative differences in factor endowments: either land or labour on small farms is intrinsically of a superior quality, (c) more intensive application of other inputs like labour, bullock power or irrigation. These are not strictly mutually exclusive categories and the overlap is particularly evident when one tries to identify each empirically. Thus if 'technique' is identified with a vector of inputs then the distinction between (a) and (c) vanishes. To avoid this, we may here interpret 'technique' as associated with a particular type of productive equipment and hence differences in techniques as different types of productive equipment in operation. Attitudinal differences (such as diligence and interest in work), if present, should be reflected in one or the other of these factors. Whether the difference is in matter of risk-taking or entrepreneurial ability or quality of management, it should ultimately reflect itself either in the adoption or otherwise of better techniques or in willingness or otherwise to apply inputs intensively. Thus while the attitudinal and behavioural factors could at best be hypothesised as underlying forces, the proximate factors with which productivity can be linked will come under (a), (b) or (c). If higher value productivity on small farms could be ascribed to superior techniques, it would provide basis for asserting that small farms are progressive and the relevant question about future possibilities would be whether their relative advantage would continue within the specified horizon. If it is due to qualitatively superior inputs, the question to raise would be about the process that explains the concentration of the better quality inputs on small farms and whether the process would continue. If, on the other hand, the explanation is to be found in intensive application of other inputs, the question would be why it is so and whether it would be considered efficient or not.

4.4 If 'superior technique' is to be interpreted as better quality or 'technologically advanced' inputs, the present FMS data do not favour the small operators on that ground. If anything, 'modern' equipment (which had made little headway in this period) is concentrated on larger holdings. There is, however, a stronger statistical ground for questioning this hypothesis. Taking the per acre yields (in physical units) of individual crops we carried out regression exercises to test the inverse relation between yield per acre and size of holding. We found that in the majority of cases there is no significant or systematic relation between the two.[8] In some cases the scatter showed such a relation only in parts (e g, dry bajri in Bombay, irrigated bajri in Nasik, pulses in West Bengal, irrigated and unirrigated wheat in UP, cotton and jowar combinations in MP) while in some others (e g, irrigated wheat-gram and cotton in Punjab) we noted a significant positive relation between yield per acre and the size of holding. If indeed the smaller holdings were characterised by 'superior technique' it should have been reflected in a productivity advantage in regard to individual crops as well. That it is not, goes against this hypothesis.[9]

4.5 Our result concerning individual crops raises the problem of reconciling these results with the inverse relation which appears not ruled out when the total yield in value terms is considered. The explanation may be found in the small operator's use of crop mixes and/or intensive use of land in the form of double-cropping such that he derives *higher gross yield per acre.* In the case of individual crops the area actually sown is reckoned so that the intensity of cropping cannot enter into productivity comparisons. That, in the case of the total *value* of crops, the inverse relation weakens when productivity is measured per *gross* cultivated acre rather than per net acre suggests that higher intensity of cropping on smaller farms is a contributory factor.

4.6 As for the qualitative differences in lands, some evidence can be found which suggests that smaller holdings could constitute better quality land. Again, it is analytically necessary, although in practice difficult, to separate between qualitative differences and those arising from application of fertility-augmenting inputs. Before we proceed, however, we must clear up a possible objection: It might appear that the 'superior land-quality' hypothesis should be rejected on the same ground as 'superior technique' hypothesis, namely, that systematic fertility differences over the holding sizes ought to have been reflected in a systematic inverse tendency between land productivity and size of holding in the case of individual crops as well. This however may not necessarily be true. For, to the extent the choice of crops is dictated by the quality of soil, the quality differences would be reflected more predominantly in cropping patterns.

4.7 Some evidence is available, for instance, in the Bombay Report, which indicates 'intrinsic' soil differences. Land is classified by types of soil — deep, medium and light. The percentage of area with deep and medium soil is noticed to be higher in the case of small holdings and lower on the larger holdings. Again, the proportion of area 'uncultivated' is higher on larger holdings.[10] This is also noticed in other *regions.*

4.8 If indeed the smaller holdings are characterised by a superior quality of land, how do these quality differences come about? An *a priori* argument was advanced by Sen (1964) in terms of population dynamics. Starting notionally with a situation where there are lands of equal sizes but of different qualities, operated by families of uniform size, Sen visualised a process by which higher per capita income on more fertile lands leads to larger sized families and thence to a more rapid fragmentation of such lands so that eventually better quality land gets parcelled into smaller units. It is not possible to test these hypotheses directly, based as they are on a dynamic process. The argument has certain weaknesses: First of all, it relies upon the Malthusian link between income and family size and then between a certain level of per capita income and fragmentation. Furthermore, it does not allow for members of the family seeking out alternative employment opportunities outside the farm.

4.9 An alternative explanation offered by Bhagawati and Chakravarty (1969) argues that when the relatively small operators are forced by circumstances to resort to distress sales to bigger landholders it is the poorer quality of land that is transferred, the former retaining the better quality land. It may be noted that, whether the associations between small farms and better land is due to fragmentation, *a la* Sen, or due to distress sales, the process giving rise to it holds no promise for economic betterment of the small farms nor does it reflect any progressive characteristics.

4.10 A possible explanation in terms of tenant-landlord relation may be suggested here. (For reasons already noted, the FMS data do not allow us to examine the hypothesis.) It may be argued that when a tenant, due to financial stringency can afford to lease-in only a small piece of land he may look for better quality land, less prone to risks of crop failure. Although land values and/or rents may capitalise the productivity differentials (possibly more than capitalise considering the tenant's weak bargaining position), for the tenant the risk of a poor crop may work out much higher than the additional cost of tenancy, at the bare subsistence level. An even more likely situation would be that the landlord himself prefers to parcel out his land into small tenant holdings, especially when they are of a better quality land. We shall try to argue in favour of such a possibility in the case of irrigated lands (see 5.7 below). To anticipate: the landlord's strategy may be to exploit the quality advantage to the maximum by controlling the size of the leased-out parcel. A small enough parcel would compel the tenant to put in a high amount of his own labour and other inputs in an effort towards providing subsistence for himself and his family after paying out the landlord's share.

4.11 Another hypothesis suggested by Bhagawati and Chakravarty (1964) attributing lower productivity on larger holdings to their higher degree of fragmentation is not very convincing. Bigger operational holdings, they argue, may have been built up by purchases of separate plots of land. However, the FMS shows that fragmentation is present on all sizes and possibly the adverse incidence on productivity due to fragmentation is more on small farms which constitute smaller-sized fragments.

4.12 It has also been argued [see

C H H Rao (1966)] that small farmers, mostly working with family labour, take greater care in performing operations and are better managers. A rather subtle distinction has to be made here: It is possible that some crops do require particularly more careful and efficient handling of operations (like weeding, watering, etc) and in such cases, the relative disadvantage of larger holdings on having to depend upon hired labour to a greater extent may be reflected in the smaller weightage given to such crops in their cropping pattern. If, however, these quality differences in labour and management were general, they ought to have been reflected in production of individual crops as well. As we have seen (see 4.4 above) this is not the case.

4.13 Neither the qualitative differences in land nor in labour provide an adequate explanation for the inverse relation. To the extent that quality of land is neither a perennial nor an unchangeable attribute one has yet to answer the question why the large operators do not undertake quality-augmenting productive investments, like, say, on irrigation or fertilisers. Thus the differences in value productivity boil down essentially to those in intensity of land use and cropping pattern. The intensity of land use, generally though not systematically or in all cases, varies inversely with the size of holding.[11] Intensive use of land, in turn, involves the application of other inputs to land in higher amounts. Smaller holdings are also noticed to have a higher level of irrigation, as measured by the percentage area irrigated and this too is suggested as a factor facilitating intensive cropping. Apart from intensive cultivation, cropping pattern also contributes to the higher value productivity on smaller farms.

V

Intensity of Cultivation and Size of Holding

5.1 In this section we shall further examine factors underlying the higher intensity of cultivation on smaller holdings. The higher degree of intensive cultivation has been attributed to the application of greater amounts of labour to land and partly to the higher level of irrigation. These are not independent of each other. We shall discuss them in turn.

(a) Intensity of Cultivation and Labour-use

5.2 The FMS does provide some ground for the hypothesis that small farms use relatively greater amounts of labour per acre. Taking total crop production activity, labour days (hired plus family) per acre show a tendency to decline with an increase in the average size of holding, the inverse relation being statistically significant. (In the case of individual crops, however, no such systematic or significant relation prevails, further supporting our conjecture that the statistical relations may mainly be understood in terms of intensity of cultivation and cropping pattern.)

5.3 One explanation of the greater labour use on small farms, derives from the usual competitive theory of factor-substitution: If land is taken as given (or 'fixed') for each holding, if all the producers face the same input and output prices, if they also confront the same production function allowing for factor-substitution, the small holders, as efficient profit-maximisers will choose a higher labour-land combination, with higher productivity per acre and lower productivity per man-day. Thus as a counterpart to the inverse relation between productivity per acre and size of holding, one would expect a positive relation between productivity of labour and size of holding. We found that no such systematic relation existed between the two. Thus the higher use of labour on small farms cannot be explained in terms of land-labour substitution along a *production-possibility* frontier.

5.4 An attempt to explain the relatively higher labour use observed on small farms was made by Sen (1964) in terms of a dual farming system — the small peasant households maximising gross output with the help of the available family labour (and hence the marginal prouctivity of labour approaching zero) while the capitalist farmers, represented by large operators, maximising profits with the marginal productivity of labour equalling wage. The dual farming system, based only on differences in objective functions, strictly interpreted, implied that the family labour on small farms was 'given'; or, in terms of conventional theory, the opportunity cost of labour was zero. A modified treatment of the problem was suggested by Sen, among others,[12] namely, that the opportunity cost of family labour, while positive, could be taken as less than the wage rate, so as to accommodate the fact that the probability of securing wage employment was less than one. In such a case, the small farms based essentially on family labour would end up in using relatively more of labour per acre than those based on hired labour. Thus, in this modified form, a dual wage system was introduced.

5.5 However, whether one could treat the wage rate as an opportunity cost, even in the modified form, would depend upon the extent to which hiring of labour and working on farm could be considered as substitutive activities and whether and to what extent decisions regarding labour-use are guided by the wage rate. Given the limited information available in the FMS we shall describe some aspects of employment relevant to these questions.

(a) *Total Number of Days Employed Per Worker*

5.6 The FMS gives the average number of standard days (calendar days converted into eight-hour standard days) worked on crop production by a permanent farm worker, according to size of holding, divided into *on farm* and *off farm categories* (see Table 1). Except Punjab (where outside employment is insignificant) *off farm* employment tapers off as the size of holding rises. An interesting, although not exact, pattern[13] can be noticed in the level of employment per adult worker in regions other than Punjab. On the 'very small' holdings (see 2.3 above) where the operator has to rely mainly on employment off the farm, outside employment does not always appear to be adequate to compensate for the very low level of *on-farm* employment. These operators are barely on the margin, exposed to the vagaries of the labour market and can be considered very close to landless labourers in their economic status. In the immediately larger size-group ('small farmer', see 2.3 above) total employment tends to increase, the farmer working both on and off the farm, although the size of holding is still small. In the next larger size group of holdings ('middle group'; see 2.3 above) total employment (on and off farm) per worker tends to fall again: it would seem that while the size of holding is not yet large enough to engage the permanent worker adequately on the farm (he is still hiring out labour, although not prominently), outside employment is not enough to compensate either. It may be that the worker is tied down to his farm and cannot offer himself for work when employment opportunities are relatively better, as in peak seasons. Although reluctance to hire out for reasons of prestige may also be one reason, the fact that he does hire out labour

Table 2 : Comparative Annual Input, in Eight-Hour Days, of a Family Worker and a Permanent Farm Servant (Cost Accounting Method)

(Average of Three Years)

Holding Size-Group (acres)	Annual Labour Put in by a Family Farm Worker	Permanent Farm Servant
0 - 5	224	204
5 - 10	248	231
10 - 20	280	306
20 - 50	295	258
50 and above	389	535
Overall average	279	375

indicates that this consideration is not altogether prohibitive. On yet larger holdings work on the farm increases and although work outside declines, the total employment per worker is quite high.[14]

5.7 Employment on farm and off farm cannot be treated as independent categories: the availability or otherwise of off farm work affects the rhythm and intensity of work undertaken by the operator on his own farm, through his choice of cropping pattern and crop mixes. If labour inputs in crop production are complementary over time, as appears probable, family labour will get committed to a certain rhythm of work on farm once a cropping pattern is settled upon. It may then be not possible for farm operators, even on relatively small holdings, to regulate their work so as to take advantage of outside employment opportunities. It is particularly so if many of the very small holdings also have a single earner.[15] Thus working on farm and off farm may not be purely additive activities or simple alternatives to choose from at any moment of time. On the 'middle' farms, the farmer, while not fully engaged on the farm, may be able to take up outside work only for short durations. If employers prefer to hire workers who are available for a continued stretch of time or are easily accessible in time of need, such family workers may find themselves discriminated against. While some farmers may thus be somewhat constrained as compared with agricultural labourers from offering themselves for outside employment, they have greater security of income from their holdings, relatively speaking, which explains, at least partly, why the landless crave for some piece of land to cultivate and why, even at the cost of oppressive tenurial conditions, there is so much hunger for leasing-in land. Claims on cultivation of land become all the more important when 'credit worthiness' is linked with it.

5.8 Another feature of employment for which we have no information in the FMS but which is known commonly to operate is the interlocking of credit and/or land-leases with labour services. It is not uncommon for landlords to lease out plots on a commitment binding on the tenant or his dependants to contribute free or underpaid labour services on his own land or his household. Similarly credit may be extended to landless labourers on the condition that they are obliged to work. Quite often these labour services are extracted in the peak season, when the small tenant or the labourer could have better chances of work. It is clear in such cases that no simple 'opportunity cost' concepts can be applied.

(b) *Categories of Farm Workers*

5.9 To appreciate the overall employment situation, it is necessary to note categories of farm workers and allocation of tasks among them, which are partly determined by tradition, caste, etc. Farm workers may be broadly divided into permanent and casual labour. Among the former are included family workers and permanent farm servants. Labour which can be hired out and labour which may be used on family farm are not always coterminus categories. More significantly, they are not independent of the economic status (or sometimes the caste status) of the household. For example, among very small farming households women and children not only work on their own farms but offer themselves for work outside; whereas among the class of the richer farmers female labour is altogether withdrawn from crop production. In some peasant households, while women and children may be employed on family farms, they may be considered a resource specific to the household inasmuch as while available on the family farm they are not entrants into the labour market. Thus for the same family, labour available on farm and that potentially available for hiring out differs. Much depends also on social conventions: female labour constitutes a much higher proportion in Madras and Madhya Pradesh as compared to say UP or West Bengal.

5.10 The distribution of work between male, female and child earners appears to follow largely traditional allocation of tasks. That female labour is mostly employed as casual labour for certain types of operations is clear from its higher concentration in certain months (e g, when hoeing, weeding is done). In the Madhya Pradesh Report it is observed, on the basis of histograms, that there is a higher degree of seasonal fluctuations in female than in male labour. In the same report it is observed that the casual female worker does the same type of work as the family female worker does. Further, there is considerable stability for comparable months over the years, in the *proportion* of female labour to total labour, in spite of the fact that the total labour input shows significant variations. Child labour is employed mostly in cattle grazing, crop watching, etc. The proportion of child labour increases with the size of holding possibly due to the increasing number of draught and milch cattle. Also, use of child labour is more prominent in regions where stall feeding of cattle is not common and cattle are grazed on common grounds.

5.11 The permanent servant is more or less fully employed even in areas of otherwise low employment. Employment of a permanent servant is rather rare on the small farms although at least some casual labour is employed by farms of all sizes. In the case of Punjab where the labour input contributed by a permanent servant and a family (adult male) worker is given, an interesting comparison emerges (see Table 2). Both the family worker's and the annual servant's labour input increases with the size of holding. It is evident that on the small holding a permanent servant is employed although the family worker himself is not fully employed: Reckoning on the basis of the number of standard eight-hour days, he is less fully employed than his counterpart on bigger farms. Also the permanent servant himself is not fully employed, on the same reckoning, on smaller farms. It is possible that the small farmers pay a lower wage to the annual servant in return for less work; or the permanent worker on small farms may be a part-time worker, hiring out part of his labour [see, e g, Report on Punjab (1954-1957) p 19]. What may appear surprising is that the small farmers employ permanent servants despite the low level of their own employment, which induces them to hire out their own labour. Part of the explanation may be that the semi-attached servants ensure an adequate supply of labour during the peak season when wages of casual labour tend to be high. Also the small farmer may himself want

to take advantage of outside employment in busy seasons, earning a higher casual wage, while reducing his work load on his own farm in that period. Employment of permanent servants thus appears to minimise the risk for both: the farm servant is assured of some stable minimum income while the farmer ensures adequate supply of labour (or can achieve some flexibility in his own labour input) during peak periods.

5.12 Does hiring in of labour on small holdings necessarily imply full utilisation of family labour? As a counter argument to the dual labour (family and hired) hypothesis, it has been pointed out that the small farmers not only hire out labour but also hire in and hence should be subject to the capitalist rules of equating marginal labour productivity to wage rate.[16] It is necessary to note the factors possibly lying behind such hiring of labour. The reason may be partly technological: In harvesting periods, in order to ensure that the yield is not adversely affected, operations may have to be conducted within a very short period. This urgency to complete a certain volume of work may necessitate the hiring in of labour even on small farms, particularly in the case of crops like sugarcane. (There are days on which a family worker works for more than 12 hours.) Insofar as labour is hired in to supplement family labour at such times it does imply momentarily full employment of family labour. However, the hypothesis that hiring of labour always implies full employment of family labour is questionable. In the Madhya Pradesh Reports (1955-56 and 1956-57) where, for example, monthly distribution of labour by the two types (hired and family) is given there appears to be no systematic relation between the proportion of work put in by family labour in any month and that by hired labour. One would expect that in the months in which the amount of farm work is much less, the proportion of casual labour would be much less, if any at all. However the proportion of work days contributed by hired labour was around 32 per cent in the peak season (July and August), while in February, a lean season, it was 31 in 1956 and 40 in 1957.[17] The Report for 1955-1956 (p 38) explains that there are some cultivators who get most of the work of a certain type done only by hired labour. It is possible that certain types of operations require specialised skills or are traditionally done by a certain class or caste of labourers. In such cases, family labour and hired labour are no more substitutive categories. Also, on small farms where there is deficiency of bullock power or equipment, hire of these may often be tied to hire of labour, e g, carting of grains may involve not only hiring of a bullock cart but also paying labour charges to the driver.

5.13 The point to note is that neither of the two hypotheses — that family labour and hired labour are exclusively separate categories so that family labour becomes a datum to the cultivating household, or that they are substitutes, so that the prevailing wage rate measures its opportunity cost — is justified. To what extent the two categories are substitutive depends upon a number of factors: the ruling wage rate is just one of them, and possibly not even the most important.

(c) *Seasonality of Employment*

5.14 We have already hinted at places above that the time-pattern and extent of work opportunities available to a worker outside his farm and the time-pattern and extent of work he can himself offer on the market are not independent. We note below certain features of farm activity relevant to this question of temporal distribution of work on and off farm:

(i) The permanent farm worker is employed, on farm, rather unevenly over days and months and his employment in terms of standard eight-hour days is much less than in calendar days. This conversion shows a much greater reduction in the case of small holdings. The actual disposal of work over calendar days, however, means that the worker, especially if he is the sole earner or supported by insufficient hands, is tied down to the holding.

(ii) Seasonality in operations implies a certain pattern of demand for hired labour. Work outside the farm reveals broadly the same seasonal pattern as work on farm. If work outside is mainly agricultural it implies such synchronous seasonality patterns that the total annual employment tends to be low. Secondly, seasonality also implies that the demand for labour will be predominantly for casual rather than for continuous hire.

(iii) The lack of continuous and guaranteed employment may compel small operators to adopt a cropping pattern which, while it may yet not be adequate to give full employment, eases the seasonality factor. The following comment from the Madhya Pradesh Report is pertinent in this context: "Male labour has been utilised on the farm more evenly. In no month more than 11 per cent of the total yearly hours of male labour has been utilised and in no month the labour put in was less than 5.5 per cent. Agriculture in this region depends almost entirely on rainfall and there was practically no double cropping. Even then the cultivator had arranged their cropping pattern in such a way as to be able to spread their work load throughout the year." However, adoption of such cropping patterns itself would imply tying labour to land.

5.15 This raises the other side of the question of employment: why indeed does not wage-based capitalist farming develop? No attempt will be made here to answer this complex question. For the period under study, 1954-1957, the FMS shows that not only small but also large holdings incurred losses when all costs are imputed. Especially when crops are prone to climatic risks, there are no well-developed markets for the more remunerative agricultural products, when transport and communication links are not well developed, the rich in the agrarian economy may find exploitation through usury and tenancy much more profitable, for which the surrounding poverty and land hunger provide a fertile ground. All in all, what may emerge is a situation in which intensively cultivated small peasant farms and less intensively cultivated large holdings mutually reinforce each other by generating certain conditions in the labour market.

5.16 What we have attempted here, in a rather rough and sketchy fashion, is to emphasise how the characteristics of the labour market in the agrarian economy cannot be understood without an intimate knowledge of the different types and degrees of risk that various sections of the peasantry face in the labour market, their areas of feasible choices, specialised character of certain operations, norms and conventions that govern the operation-wise distribution of tasks, etc. An important aspect which we have no means of exploring, even tentatively, is the tenurial and other contractual relations that would presumably restrict the choices concerning employment of the weaker sections of the peasantry.

(B) Intensity of Cultivation and Irrigation

5.17 The higher intensity of cultivation on smaller holdings has also been attributed to their higher level of irrigation. The level of irrigation, in the FMS is represented by the percentage area irrigated — a rather poor index as it does not indicate the effectiveness of irrigation, its source, quality, controllability or the quantum of water supply. Relating the level of irrigation to the size of holding we find a statistically significant inverse relation for both districts of the UP, Bombay, Madras and Hooghly district of West Bengal; inverse but not significant for Punjab and 24 Parganas in West Bengal. Madhya Pradesh had very little irrigation in the two districts.

5.18 The greater irrigational facilities on smaller holdings may be due to (i) better irrigated lands getting divided into smaller holdings and/or (ii) smaller operators creating and maintaining better irrigational facilities on their farms. We may consider the case of owner-cultivators and tenant-cultivators separately. To take up the first in the case of owner-cultivators, it may be argued that better irrigated lands are more prone to subdivision as the feasibility of producing a certain minimum produce on a smaller plot may permit families to subdivide their common possessions. As to the second, the argument rests on the ground that the small cultivators can deploy their family labour in creation and maintenance of irrigational facilities. If however such activities require capital expenditures in addition to labour, the relative advantage of the small cultivator in having relatively larger amount of family labour would diminish. The causal chain, small farms and hence higher level of irrigation, appears to be relatively weak.

5.19 Some additional factors operate in the case of tenanted holdings. When a landlord wishes to lease out land he may prefer to parcel out land into small units, for two reasons: his bargaining position remains strong *vis-a-vis* the petty tenant, who may prefer to lease-in an irrigated plot even at considerable cost (see 4.10 above). Secondly, by keeping the parcel small the tenant is put under pressure to apply intensively his own inputs, particularly labour, in order that his retained share, after paying the landlord, covers subsistence. While this could be the general strategy of the landlord, whether lands are irrigated or not, it appears even more relevant to irrigated lands. As we shall note below, the differences in yield per acre on irrigated and unirrigated holdings in the same size-group are less than proportionate to the differences in the quantum of inputs on the two types of holdings; irrigated holdings absorbing much more inputs per acre. This is so particularly in relation to labour input and on small holdings. The landlord may thus exploit the technical possibility of more intensive cultivation under irrigation by parcelling out the land into small plots, maximising thereby his return, as a share of gross produce, on the total land at his disposal.

5.20 While on this question of landlord's possible strategy with regard to irrigated lands, we may also refer to an observation that emerges from the Punjab Reports. We find that in Punjab the percentage of area irrigated is higher on fixed rented lands than on cash-rented lands. One explanation may be that those tenants who secure land on fixed rent system have a greater incentive to undertake the provision and maintenance of irrigational facilities. This however appears unlikely unless the lease is a secure, long-term one with the level of fixed rent remaining constant or varying predictably and slowly. If the tenant has a relatively weaker bargaining position or he is a tenant-at-will he will have little incentive to undertake investment in irrigation or in other durable assets that are not shiftable. A second possible explanation appears more likely: namely that, for a tenant, a fixed rent contract on an irrigated land may appear more attractive as he can then exploit the full economies of irrigation which requires intensive application of inputs, particularly labour. It may ordinarily be expected that the landlord, in view of the possibilities of intensive cultivation will prefer crop-sharing, where he can secure a proportionate share of the potential gains. In fact, the landlord can adopt two alternative strategies: (a) he can lease the land on crop-sharing basis, with the possible risk that the tenant, under crop-sharing, may not be willing any more to apply as much labour and other inputs as he would under a fixed rent contract, or (b) he may fix a rent under a fixed rent contract which is high enough to partly capitalise the higher productivity gains; the fixity of rents may yet provide the incentive to the tenant to cultivate the land intensively. If the tenurial contract is not secure the landlord can raise rents and capitalise the productivity gains for each new tenant or for the same tenant under the threat of eviction. In fact, intensity of cropping is found to be systematically higher under fixed rent tenancy as compared to that under share-cropping tenancy. The hypothesis suggested here needs to be tested on a more detailed informational basis than is available in the FMS.

5.21 Irrigation can raise productivity of land mainly by making possible multiple cropping, by increasing physical yield of crops, and by making possible the production of more lucrative crops. Irrigation not being as widespread and effective in all regions, during the years of study, the relation between intensity of cultivation and the percentage area irrigated turns out to be statistically not very significant. As pointed out in Madras Report (1956-1957; p 38), while irrigation makes possible the production of lucrative crops, it may not yet be adequate for multiple cropping. Thus the major contribution appears to be, at least in regions with generally low level of irrigation in improving cropping patterns and in increasing the gross yield of individual crops.

5.22 Comparing inputs and outputs on irrigated holdings with those on unirrigated holdings, it is generally noted that the higher yield per acre on the former is accompanied also by the higher use of inputs. For example, in Punjab, human labour per acre almost doubles and so does the total cost of inputs, for comparable size-groups of holdings. Defining $\triangle O$ as the difference between yields per acre on irrigated and unirrigated holdings, within the same size-group, and $\triangle C$ as the difference between total cost of inputs per acre, we computed the incremental ratio, $\frac{\triangle O}{\triangle C}$, for each size group. It was noted that, in most cases and especially on small farms, $\frac{\triangle O}{\triangle C} < 1$, implying that while irrigation increased productivity per acre by making feasible intensive application of inputs, the latter quite often increased more than proportionately to output. Similar observations could be made on the basis of comparison of irrigated crops with unirrigated crops. Also, the higher productivity on irrigated lands, as compared to unirrigated, appeared to have been accompanied by the much sharper lowering of productivity of labour, especially on small farms.[18]

5.23 Thus while the small farms have a higher level of irrigation, in general, allowing for higher intensity of cultivation, this may not be taken, in itself, as an indicator of their economic strength or superiority.

VI

Cropping Pattern and the Size of Holding

6.1 We have indicated at several places in the preceding discussion that the cropping pattern, along with the intensity of cultivation may explain a number of relations observed between input uses (and productivity) and the size of holding, which appear to hold for total crop production but fail to do so at the level of individual crops. In this section we shall indicate possible factors influencing the cropping pattern of the different size-groups of holdings.

6.2 In our discussion of the agrarian markets in Section II we referred to the two-way relation between the resources at the disposal of, or accessible to, a cultivator and his position in the factor and output markets: his initial resource position determines his 'bargaining' capacity in the credit, land and labour markets. His past and current involvements in the markets, in turn, influence his production 'decisions' and through these his future resource position. Furthermore, the economic status of the cultivator and his position in the nexus of property relations also define for him the 'objectives' he sets himself to achieve. There are no motivational forces which are definable *a priori* for any operator independently of the entire gamut of production and market relations in which he is involved. Thus it is futile to reduce all cultivators to profit maximisers. For many the category of 'profits' may not be relevant at all. They may be more concerned with total returns, i e, gross output net of paid-out costs. We also discussed in a rather stylised manner the types of market involvements and categorised cultivators into four broad groups — 'very small', 'small', 'middle' and 'large'. We shall attempt here to relate these ideas to the question of cropping pattern. These groups cannot be identified precisely given the nature of information we have and will vary in terms of the size range of holdings from region to region, so that the general discussion below does not specify the size range. In our notes on cropping patterns we shall broadly indicate them separately for each region.

TABLE 3 : EXTENT OF MONETISATION

(A) Percentage of Cash Expenditure to Total Input, West Bengal (1954-1957) (Districts Combined)

Size of Farms (acres)	1954-55	1955-56	1956-57
0.01 - 1.25	25.8	30.4	26.7
1.26 - 2.50	27.6	25.8	26.8
2.51 - 3.75	31.6	22.2	22.9
3.76 - 5.00	21.9	25.4	20.6
5.01 - 7.50	20.1	22.8	21.6
7.51 - 10.00	26.3	15.8	13.2
10.01 - 15.00	26.0	33.9	29.0
Above 15.00	21.2	31.7	33.9

6.3 The 'very small' group of cultivators are in their economic position, not very far removed from the landless labourers, as they possess very little land relative to the available labour and depend upon hiring out labour to supplement their income from land. Very often, possessing no bullocks, they have to hire in their services for payment or in exchange for labour. They have quite often to purchase seeds; the gross output of the previous harvest may just cover or fall short of family consumption. Also, if they have debt liabilities, and indeed they are heavily indebted, a part of the output may have to be disposed of immediately after harvest towards debt repayments. Quite often, they are compelled to raise consumption loans or even loans to provide for circulating capital on onerous terms, the own rate of interest on kind loans being very high. The hire rate for bullocks and equipment could be higher for this group (the per hired bullock day rate calculated for each size group showed that the rate was higher for this group). Furthermore, there could be diseconomies in buying inputs in smaller quantities. The dependence of this class on the market for providing even circulating capital is reflected in the index of monetisation of inputs (see Table 3). We note that the dependence on cash expenditure is very high for this group. It declines for the holdings in the next size-groups and picks up again on large holdings. The higher index of monetisation on large holdings is qualitatively a different phenomenon from that on the very small ones. While in the former, it reflects a higher degree of commercialisation of production in the latter it is a reflection of the distress conditions under which production is carried and market involvement assumes a compulsive character.

6.4 Given their higher availability of family labour, it may be expected that these very small farms will concentrate on the relatively more labour-absorbing crops. The intensity of cultivation is higher on these holdings as well, so that bullock use *per acre* is not any lower compared to other and they have to hire in a substantial part of it, if not the entire amount. Given their resource base, they are thus severely constrained by the need to raise cash resources even in order to keep the cycle of production going. This may explain why the cultivators in this group are seen to allocate a higher proportion of their area to more lucrative (i e, yielding high gross revenue per acre), although risky, cash crops. This is especially so when cash crops like jute, groundnut and cotton require also a high labour input per acre and

TABLE 3 (CONTINUED) : EXTENT OF MONETISATION

(B) Percentage of Cash Expenditure to Total Expenditure on Various Inputs, Madhya Pradesh

Size of Holdings (acres)	Seed		Human Labour		Bullock Labour		Overall	
	1955-56	1956-57	1955-56	1956-57	1955-56	1956-57	1955-56	1956-57
0 - 5	81.9	86.7	93.3	80.0	60.4	66.9	77.1	71.1
5 - 10	81.9	72.7	85.4	70.8	52.3	53.5	67.5	64.0

50 and above	51.4	68.3	74.8	72.8	21.6	32.0	51.3	58.6

do not require specific investments in equipment, etc. Also it is quite often possible to get credit more easily for cash crop production on the condition of repayment in kind. Land can sometimes be more easily leased-in and circulating capital or a part of it borrowed from the landlord on a contract to raise the cash crop. For example, in West Bengal the FMS reported that the holdings producing *only* cash crops (constituting only 1 per cent of the sample; there are very few such pure cash crop holdings) were all in the very small size-group. Our notes below, separately for individual regions, bring out a similar feature of cropping pattern in other regions as well. Of course, there is a greater risk attached to a lack of self-sufficiency in food. However, part of the food requirements of the family may be earned as kind wages for hire of labour. More importantly, the very small farmer has to borrow circulating capital even to produce food crops. This, in most cases, may compel him to dispose of a major portion of his harvest and hence he may have to depend, in any case, on market purchases of food or consumption loan to support the family through the year. In the circumstances, the greater gross revenue yield of cash crops as compared to food crops might weigh with the cultivators in favour of cash crops.

6.5 The next group of small farmers, with somewhat larger holdings, is also characterised by higher availability of family labour. However, they are less dependent on the purchase of operational inputs (as reflected in the lower extent of monetisation of inputs) than the very small farmers, and hence under less pressure to raise cash. Employment outside the farm is much lower in their case but they seem to be better able to defend themselves from the vagaries of markets. They raise more of subsistence crops on the land, especially the ones that are the more labour-absorbing.

6.6 The following group of 'middle' farmers is more self-sufficient in terms of bullock labour, seed requirements, etc, and equipment and generally produce a surplus over subsistence. They produce a crop-mix which covers a larger variety of crops, although mainly food crops, the more lucrative ones. These crops, like vegetables, require considerable care in weeding, watering, etc. Unlike the first two groups of the 'very small' and 'small' cultivators, whose dependence on the market appears to be primarily a product of the struggle for raising subsistence for the family, the 'middle' farmers are producing, at least in part, to benefit from the market. If at all the careful balancing of costs and returns, etc, given market prices, has a descriptive validity it could be for this group, which is neither at the mercy of the market nor dominating it.

6.7 The 'large' holdings produce in order to raise a surplus for the market. In poorly irrigated regions, the 'large' holdings are found to have a lower level of irrigation, in general, than the smaller holdings. Intensity of cultivation is much lower. They do not depend totally on hired labour, family labour yet playing an important role, although the ratio of hired to family labour may be higher compared to other holdings. Many of the large holdings, too, showed losses in the years under study when all costs were imputed. All these may appear to be contradicting the fact that they are engaged in producing a surplus for the market. A reason, for which FMS does not provide evidence but which appears reasonably possible, is that for the large land operator cultivation is only one source of income. His position as a large landowner in the rural economy, with powers and privileges that accrue from it, places him in a favourable position to extract incomes and/or economic power from other activities, like money-lending or trade. He may thus not be interested in extracting the maximum from the land by investing in assets on land. The lower level of asset formation, irrigation, etc, goes hand-in-hand with the lower intensity of cultivation and lower use of hired labour. Especially in these poorly irrigated areas, the large holdings appear to economise on hired labour by concentrating on crops that use relatively less of labour. The level of irrigation being low, they concentrate on the more sturdier varieties of cereals which can better stand climatic variations. A very small proportion of the area, or none, is devoted to the more lucrative food crops (like vegetables, fruits, etc), possibly because they require more careful planning. Also, given the rather austere and low level of consumption of such products in the neighbourhood, their marketability might be an additional problem. Inadequacy of preservation and transport facilities makes their production for a distant market and on a large scale additionally risky.

6.8 The situation appears to change quite significantly in the case of the better irrigated regions like Punjab. With better irrigation, the hazards in cultivation diminish. The area under cash crops (like American cotton in Punjab and sugarcane in UP) is seen to be quite high on the larger holdings. During the period under study, the intensity of cultivation on the large holdings, even in Punjab, remained significantly lower than on the smaller holdings. The level of irrigation, generally higher for the region, was yet lower on the large holdings compared to the smaller ones. This possibly has led to the existence of the 'inverse' relation between yield per acre and farm size even in Punjab, although the large holdings do produce lucrative crops quite prominently.

6.9 With a view to studying the size-group-wise variations in cropping pattern we recorded for each individual crop and for each size-group of holding, labour input, bullock labour, paid-out costs, gross revenue and farm business income, all *per acre*. Alongside we recorded the percentage area allocated to the crop on that size-group of holdings. For the sake of economy of space we have not given the tables here[19] but only noted some brief comments on the same.

West Bengal: The two major crops of the region are paddy (*Aman* and *Aus*) and jute, of which Aman paddy occupies a large area. The proportion of area allocated to the crop is smallest (about 67 per cent) on the very small group (below 1.25 acres) and rises thereafter. It remains high for middle farmers (5 to 10 acres) and falls again to 68 per cent on the large group (above 10 acres). Aman paddy does not absorb as much labour and bullock power as jute; the paid-out cost per acre is also lower, but it brings in a lower gross revenue per acre. Jute absorbs a large amount of human labour per acre. It has a higher paid-out cost per acre relative to other crops, but yields a higher gross revenue per acre as well. It is particularly favoured by the very small farms of under 1.25 acres. The proportion allocated to jute falls as the average size increases, to rise again in the last two size-groups, i e, for large holdings above 10 acres. Mesta, again a crop absorbing a significant amount of labour and of bullock labour, with a high paid-out cost per acre but yielding a high gross revenue per acre, absorbs a relatively higher proportion of area on small- and middle-size holdings (upto 7.50 acres). The proportion is lower thereafter. It is not so much favoured on 'very small'

holdings, possibly because of the rather high hired labour component and high bullock labour requirements per acre. Potatoes, again a very labour-intensive crop, requiring also a very high bullock labour input, but bringing in a very large gross revenue per acre, are grown on a very small proportion of area, but the proportion declines over size-classes. On the other hand, pulses, a hardier crop requiring much less labour per acre but yielding also less gross revenue per acre, are allocated a much higher proportion of area on large holdings (above 10 acres). This crop occupies 5 to 7 per cent of area on other holdings, and about 13 and 17 per cent on the highest two size-groups.

Uttar Pradesh: Sugarcane, planted and ratoon, is the main cash crop of the region. Sugarcane 'planted' requires a high amount of labour and of bullock input (though not as high as for wheat) and a high paid-out cost per acre, but yields the highest gross revenue per acre. It is favoured by the very small (upto 2.5 acres) group. Sugarcane ratoon, which also requires a high amount of labour input but lower bullock labour input per acre and brings in the next highest gross revenue per acre as compared to sugarcane planted, is even more favoured by this group of very small farmers (29 per cent area devoted to it compared to 21 per cent under sugarcane). The proportion of area devoted to sugarcane ratoon falls in the middle groups (5 to 10 acres) and rises slightly on large holdings (above 10 acres). Wheat, which requires comparatively less labour per acre and more bullock labour than sugarcane, but brings in much less gross revenue per acre, rises generally with the size of holdings, a relatively greater proportion of area being devoted to it in the 10-20 acre group; the proportion falls somewhat on the large holdings above 20 acres, where sugarcane reasserts its importance. Paddy, which requires much lower labour input than sugarcane, is a relatively minor crop and the area devoted to it generally increases with the size of holding. Gram, another of the relatively minor crops, does not show much variation in the proportion of area devoted to it over the different size-classes of holdings, possibly because it is grown more for self-consumption.

Punjab: Wheat (irrigated and unirrigated) and cotton (American and *Desi*) are the main crops in the region. We find that, even on very small holdings below 5 acres, American cotton and *Desi* cotton play an important part. The percentage area allocated to cotton declines above this group upto the 20-acre group (i e, small and middle groups), after which it rises again on the large holdings. In the very large holdings of above 50 acres it occupies about 64 per cent of area. American cotton absorbs a higher level of labour input per acre, a little less bullock labour and paid-out cost per acre as compared to irrigated wheat, and brings in a high gross revenue per acre. *Desi* cotton, while absorbing somewhat less bullock labour input and paid-out costs per acre than American cotton, brings in a lower gross revenue per acre. It also occupies a rather small percentage of area as compared to American cotton on all holdings. Irrigated wheat and irrigated wheat-gram absorb a high level of labour input as well as bullock labour, but the gross revenue per acre is higher for wheat. The area allocated to wheat and irrigated wheat-gram remains around 26 and 36 per cent, respectively, upto 10 acres and then shows a continuous decline. While in the 10-50 acre group unirrigated wheat-gram gains relative importance at the cost of irrigated wheat-gram and cotton, in the largest group of above 55 acres, it is American cotton that gains at the cost of all others. The varying importance of irrigated wheat-gram possibly reflects the levels of irrigation on the holdings. It is a crop which absorbs much less material inputs, producing lower revenue per acre as well.

Madras: Complete information for the individual crops was not available except for paddy, cotton and *cholam*. We obtain, however, the percentage distribution of area between different crops. Paddy requires a very large amount of human labour and bullock labour per acre. The paid-out cost per acre is also very high, and it requires an adequate water supply. Although it yields a high gross revenue per acre, the very small holdings (below 2.5 acres) favour cotton and groundnuts (the two important cash crops), possibly because of the excessively high cost and bullock labour requirements of paddy. Cotton, while yielding a high enough gross revenue per acre (more than *cholam*), requires less bullock labour per acre. On the small farms (2.5 to 5 acres) paddy and *ragi* gain in importance while groundnuts and cotton decline. The middle group (5 to 15 acres) produces a more even mix of crops, while on the large holdings (above 15 acres) paddy (which absorbs a very large amount of labour) declines considerably in importance, as also does cotton, while the sturdier crops, *ragi* and *cumbu*, occupy a greater proportion of area.

Bombay: Ahmednagar and Nasik have somewhat different cropping patterns: while *bajri* and *jowar* predominate, with wheat and gram as minor crops, in Ahmednagar, *bajri* and wheat dominate the pattern in Nasik, with gram receiving a somewhat higher allocation than in Ahmednagar. The non-food crops (which are not important in either district) receive the highest percentage allocation on the very small farms (below 5 acres), declining in importance on the small farms (5 to 10 acres), increasing somewhat on middle farms (10 to 20 acres), only to decline again on the large (above 20 acres). *Jowar* and *bajri* are somewhat comparable crops as far as labour and bullock input per acre are concerned. *Bajri* yields a relatively higher gross revenue per acre but requires a better water supply. With a somewhat higher level of irrigation on smaller holdings, this crop occupies a larger proportion of area on these holdings in Ahmednagar. The distribution of area between *bajri* and *jowar* appears to be dictated by climatic factors. In Nasik, wheat, which is a relatively labour intensive crop, is favoured on very small holdings (below 5 acres), while *bajri* appears to partly displace it on the very large holdings (above 50 acres). In Nasik, vegetables (included in 'other crops') are grown predominantly on small and middle holdings (5 to 20 acres).

Madhya Pradesh: Crop-wise data on inputs are not available for Madhya Pradesh, but the Reports gives the cropping pattern for unirrigated area according to the size of holding. The irrigated area forms a very minor proportion and is mostly devoted to the production of fruits and vegetables. It may be noticed that on the very small (below 5 acres) size-group the proportion of area under cereals is less and that under cash crops (oilseeds, cotton) is more than on other holdings. Commenting on this, the Report remarks (1955-1956; p 23) "In almost all the size-groups of holdings, about half of the area is under food crops and of the remaining about 80 per cent under cotton. The only exception being the smallest size-group where the area under food crops is less than even half the area. The above crop pattern leads one to think that the subsistence needs

of a farmer in this tract play little part in determining the crop pattern. If that would have been the fact more percentage area under food crops is expected in smaller holdings than in bigger ones. If anything is borne out by this data, it is contrary to this." It is evident from our discussion that while the very small farmers do not directly grow the subsistence crops their production activity is geared to providing subsistence, for which they need to raise cash crops.

Summing Up

In this paper an attempt has been made to suggest a framework in terms of the extent and type of involvement of different sections of the peasantry in agrarian markets which are interlocked by price and non-price links. The FMS data are not adequate to explore the implications in sufficient detail. Taking up the productivity and size of holding debate, we have attempted to illustrate the approach, although in a rudimentary fashion.

[These notes are taken from my "Production Conditions in Indian Agriculture: A Study Based on Farm Management Surveys", which is being published by the Department of Applied Economics, Cambridge, as one of its occasional papers. An earlier version of this paper was presented at the Seminar on Political Economy of Agriculture held at Calcutta in 1973. For economy of space, I have not included here the detailed tables and the results of statistical tests, on the basis of which I have suggested some hypotheses. Those interested may kindly refer to the occasional paper, to be out very shortly.]

Notes

1 A critique of such models recently in a paper by A Rudra (1973) which contains also references to work done along the lines using Indian data.

2 A summary of the debate with references appears in Bhagawati and Chakravarty (1969).

3 The word 'bargaining' here may be somewhat misleading in that there may not be actual bargaining taking place on the market between individuals or groups of individuals. In part, custom, tradition, social mores crystallise the relative strength of different classes of the peasantry. To a certain extent the laws of the state (concerning, say, minimum wage or tenurial contracts) may influence the terms on the market. But these, in turn, may themselves reflect the relative economic power of the different classes of peasantry as also the class composition of the state.

4 For a model of the landlord operating also as a lender of consumption loans, see a paper by A Bhaduri (1973).

5 Other suggested classifications are in terms of scale of output or the ratio of hired to family labour.

6 See A P Rao (1967), A Rudra (1968a, 1968b), C H H Rao (1968), Saini (1971), Saini and Bhattacharya (1972).

7 See Sen (1964).

8 A Rudra in his 1968 paper recorded similar observations concerning individual crops.

9 Incidentally, with regard to individual crops, there are two possible ways of interpreting the scale of operation. Two types of scale effects could be envisaged: (i) related to the economy of the entire holdings, its resources and hence to the size of holding (ii) related to the actual size of area under a crop. The area devoted to a particular crop does not always vary positively with the size of holding. We found that there was no systematic relation between yield per acre and size of *cropped area* even in the few cases where there was a significant relation between yield per acre and the *size of holding*. Thus effects of scale, if at all, present, were due to (i) rather than (ii).

10 This, however, should be cautiously interpresented as the 'uncultivated' area includes, apart from uncultivable area, that under bunds, canals, etc.

11 It does so in Punjab and UP where the percentage area irrigated is generally high for the whole region. It is inverse although not systematic in the two districts of Bombay. In the case of Madhya Pradesh there is no variation in intensity of cultivation over size holdings worth noting. In West Bengal and Madras, intensity of cropping is higher on smaller size groups than on larger; although the inverse relation is not systematic. For similar observations, see A Rudra (1968b).

12 See Sen (1964, 1966), Agarwala (1964b), Mazumdar, D (1963), (1965).

13 This pattern is not altogether uniform in all regions, partly because the size-class divisions are not the same. The sampling procedure of the FMS involves dividing the holdings into five equal strata after arranging them in ascending or descending order in every village. The size-range not being uniform over regions, this has led to different size-classes.

14 In the case of West Bengal, the smallest size-group shows slightly higher level of employment than the next. In the case of Bombay the largest size-groups shows a decline in employment. In the case of West Bengal, the size-classes are narrower so that the smallest class constitutes holdings less than 1.25 acres. In the case of Bombay, the largest group exceeds 50 acres and at that level of holdings, the family worker is not known to be very active (in contrast to Punjab).

15 To quote, for example, from the West Bengal Report (1954-1957; p 25): "... over a third of the total number of farms have just one earner, while more than half the farms in the largest size-group have only one".

16 See Bhagawati and Chakravarty (1966).

17 Similar observations are recorded by A Rudra (1973b) in a recent article on the basis of individual holdings for West Bengal.

18 A model in terms of risk-bearing to explain the inverse relation between yield per acre and land size, given that irrigation level is higher on small farms, appears in a paper by Srinivasan (1973).

19 These Tables are presented in the occasional paper "Production Conditions in Indian Agriculture ..." referred to above.

Trends in Real Wage Rates of Agricultural Labourers

A V Jose

This paper makes a comparative study of wage rates of agricultural labourers in the different states over the period 1956-57 to 1971-72.

While according to earlier studies wage rates improved significantly in real terms only in Punjab (including Haryana and Kerala), our extension of the series to 1971-72 shows that improvement in real wages took place also in Tamil Nadu, Uttar Pradesh and Gujarat. However, these states still account for less than 30 per cent of the agricultural labour force in the country.

This study also brings out that inter-state disparities in money wage rates have tended to widen since 1964-65.

SEVERAL attempts have been made to study the changes, if any, in the economic status of agricultural labourers and small farmers in India during the sixties. The available data in this regard for whatever period they cover present none too bright a picture. Mention must be made in this connection of three studies. Krishnaji's[1] study using wage data covering a period upto 1964-65, Pranab Bardhan's[2] study of IADP districts upto the period 1967-68 and the Herdt and Baker[3] paper which covers upto 1968-69. All of these suggest that during the sixties in all the states, with the exception of Punjab/Haryana and Kerala, agricultural wage rates have declined in real terms. The purpose of this paper is to make a comparative study of the wage rates of agricultural labourers in various states covering the period 1956-57 to 1971-72, thereby bringing up-to-date the study of agricultural wage rates.

Let me start with a few procedural details.

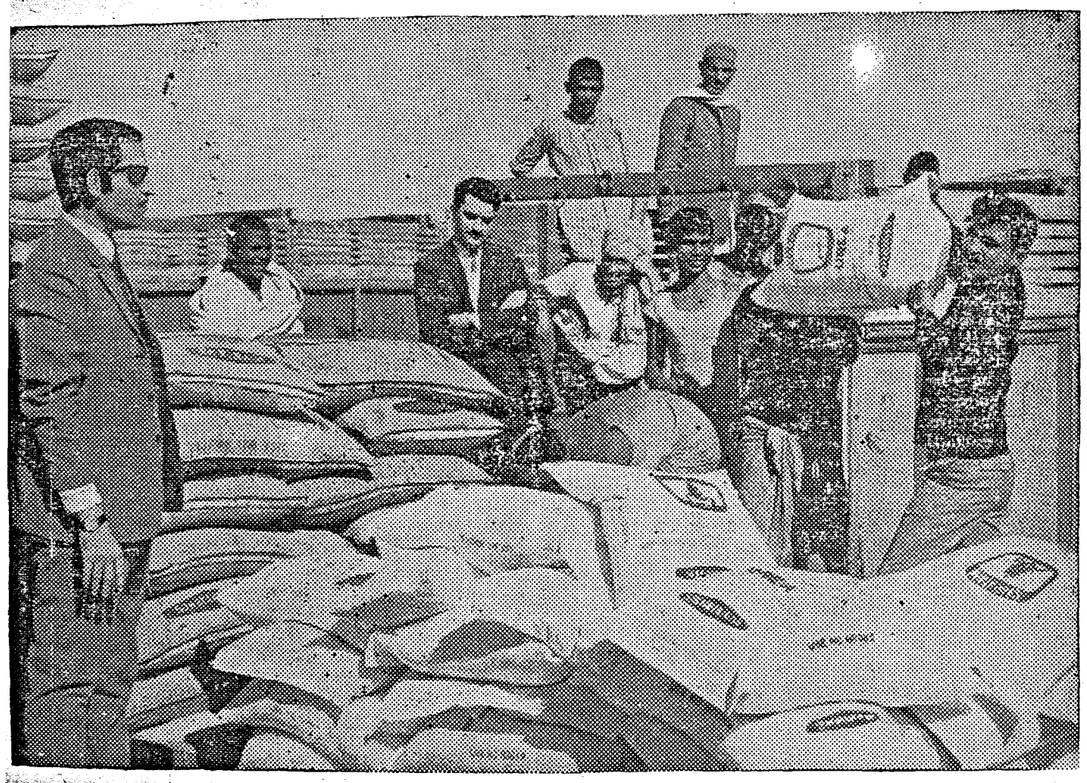
(1) The data used here have been collected from the records of the Krishi Bhavan, New Delhi.[4] They are to be published in "Agricultural Wages in India", brought out by the Directorate of Statistics of the Ministry of Agriculture.

(2) As in the case of the earlier studies on this subject, in our study too only wage rates corresponding to the category of 'male field labour' are used. However, in the case of states where data are not available for that specific group,[5] the average wage rate for ploughing alone is taken, as there is near uniformity in the wages paid for agricultural operations like ploughing, sowing, weeding, and harvesting.

(3) In estimating the wage rates corresponding to each place, we have, following Krishnaji, chosen the wage rate corresponding to one month of the peak agricultural season in each state, as is given in the Indian Crop Calendar. Accordingly, it is December for Andhra Pradesh, Assam, Bihar, Maharashtra, Gujarat, Karnataka, Uttar Pradesh and West Bengal; April for Punjab/Haryana; October for Kerala; November for Madhya Pradesh and January for Tamil Nadu. But to avoid any possible misunderstanding that the choice of one particular month would introduce some bias in our analysis, it must be stated that the monthly wage data reported in "Agricultural Wages in India" show virtually no seasonal variations in wage rates.[6] V M Rao's detailed study on the reliability of agricultural wages notes that the wage rates reported in "Agricultural Wages in India" fail to capture interseasonal variations in rates and that they leave no scope for any study on seasonal variations.[7]

(4) The district has been chosen as the basic unit for our analysis. Wage data for each district are obtained by taking the average wage rate for the different centres falling in it. These district average wage rates have been weighted with the proportion of male agricultural labourers in different districts to arrive at the state-wise weighted average wage rate. The money wage rates thus obtained have been deflated by the Consumer Price Index Numbers for Agricultural Labourers to arrive at the real wage rates. The Consumer Price Index Number for Agricultural Labourers (ACPI) in each state is estimated by the Labour Bureau, Simla, on a monthly basis and is published every month in the *Indian Labour Journal*.

(5) ACPI numbers are available for most states from 1951-52 onwards. However for Maharashtra and Gujarat (former Bombay region) they are available only from 1960-61 onwards, and for Tamil Nadu and Uttar Pradesh only from 1965-66 onwards. We have attempted alternate estimates of the missing index numbers in the case of these four States.[8]



In Table 1 are given the Money Wage Rates,[9] the Deflators and the Real Wage Rates in each state during the period 1956-57 to 1971-72. In Table 2 are given the indices of real wage rates.

For studying the trends in real wage rate movements during the period under study, we have worked out three sets of indices with 1956-57, 1961-62 and 1964-65 respectively as base years. The first one gives the trends right from the time of the linguistic reorganisation of states; the second one describes wage rate movements in real terms during the sixties; the third one has been introduced specifically with the purpose of studying the changes, if any, introduced by the new technology in agriculture. Hence, the choice of 1964-65 as the base year for this purpose.

Before we start interpreting our calculations with respect to movement of wage rates it would be appropriate to enter a plea of caution that wage rates alone, even when expressed in real terms would not give a complete picture of the income of agricultural labourers. Here, since we are making inter-state comparisons of the movement in wage rates, particularly in real terms, this caution is no less important to enter because in the absence of information on the changes, over the same period, in the quantum of employment offered to agricultural labour, it is difficult to assert that if in a particular state, e g, Kerala, the wage rates have improved in real terms it necessarily follows that the real annual income per worker has also increased correspond-

- Increased foodgrain production todate : over 4,000,000 tonnes.
- Total foreign exchange saving todate : over $ 100,000,000.

SHRIRAM CHEMICALS

ingly. Nor can we assert that just because the real wage rates have not improved in another state, e g, Karnataka, that the real annual income in that state has also *not* improved.

From the available data, one notices that there were wide differences between states in the quantum of employment available to agricultural workers in the early fifties. The Agricultural Labour Enquiries of 1950-51 and 1956-57 give information on the unemployed days per worker in various states.

From Table 3 it can be seen that there were wide interstate disparities not only with respect to the incidence of unemployment among agricultural labourers but also in the rate of change in this incidence between 1950-51 and 1956-57. Although information on the incidence of unemployment is not available for the period covered by our enquiry, we have no basis to argue that inter-state disparities in the rate of change in the incidence of unemployment between 1956-57 and 1971-72 could be ignored. Hence, the need for caution in interpreting inter-state movements in wage rates.

To start with the behaviour of money wage rates in different states, it can be seen clearly from Table 1 that while inter-state disparities in money wage rates declined during the period 1956-57 to 1964-65 (Krishnaji's study brings this out) they widened during the period 1964-65 to 1971-72. The co-efficient of variation (a weighted index with the proportion of male agricultural labourers in each state as weights) shows an increase from 18.46 per cent in 1964-65 to 30.80 per cent in 1971-72 (see Table 4).

On the strength of the observed trend in the inter-state disparities during the period 1956-57 to 1964-65, Krishnaji had predicted that the trend was likely to be towards an inter-regional convergence of money wage rates. In fact, the trend seems to have reversed itself. While a detailed exploration of the

* For the purpose of this study, the states of Punjab and Haryana (which were separated in 1965-66) are clubbed together.

Source: Wage Rate Figures are estimated from "Agricultural Wages in India" and from data collected from the Directorate of Statistics, Krishi Bhavan, New Delhi.

factors that possibly contributed to this divergence is beyond the scope of this study; one cannot but notice that the relatively high-wage states, experienced relatively fast growth in wage rates in the period beginning with 1964-65. Compound rates of growth of money wages in various states from 1965-66 to 1971-72 given in Table 5. In states like Punjab and Kerala the rates of growth in money wages are much higher compared to the low money wage states like Madhya Pradesh and Uttar Pradesh. Even in this respect, however, the pattern is not clear-cut in that states like Karnataka and Orissa with middle-level of money wage rates are seen to have experienced relatively very low rates of growth during the same period.

For studying the movement in real wage rates, the states can be classified into two groups: states where real wage-rates have risen between terminal years and states where real wage rates have declined over the same period. Taking 1956-57 as base year, by 1971-72 real wage rates seem to have risen in Uttar Pradesh (172), Kerala (151), Punjab (148), Gujarat (125), Andhra Pradesh (119), Tamil Nadu (113) and Madhya Pradesh (102). The two states which have recorded the highest and the lowest rise, *viz*, Uttar Pradesh and Madhya Pradesh, need to be looked into separately. In both these states, the initial absolute level of real wage rates were very low compared to other states. In 1956-57 the average wage rate in Uttar Pradesh was only about one-third of the wage rate which prevailed in Punjab. In 1971-72, there still was a wide disparity between Punjab and Uttar Pradesh wage rates but the disparity was somewhat less than in 1956-57. In Madhya Pradesh also, the average wage rate recorded in the same year was less than half of the Punjab wage rate. Still taking the two terminal years the wage rate in real terms appears to have hardly risen in Madhya Pradesh over a period of fifteen years. In fact, if one took 1959-60 as the base year the real wage rate in Madhya Pradesh can be seen to have registered a substantial decline.

In the states where real wage rates declined during the period 1956-57 to 1971-72, the intensity of decline in the eastern states of Assam, West Bengal and Orissa varied depending on differences in the original wage levels. In the case of Assam there was a 22 per cent decline from the original level of Rs 2.39 whereas in West Bengal and Orissa, the decline was only 4 per cent from Rs 1.63 and Rs 1.05, respectively. In the case of Bihar, unfortunately, we have not been able to collect complete

data covering the whole period. (Our impression is that starting with a wage rate of Rs 1.20 in 1956-57, at least there was no substantial decline over the period.) Karnataka and Maharashtra are the other two states in which the real wage rates declined during this period. In these states the original levels were Rs 1.39 and Rs 1.34, respectively. In Karnataka the extent of decline was 8 per cent and Maharashtra it was 1 per cent.

When we shift the base year to 1961-62, 5 states, *viz*, Kerala, Punjab, Tamil Nadu, Uttar Pradesh and Gujarat show a rise. In Kerala between 1961-62 and 1971-72 there has been a 28 per cent rise from the level of Rs 1.82, in in Punjab a 23 per cent rise from Rs 2.76, in Tamil Nadu a 21 per cent rise from Rs 1.27, in Uttar Pradesh a 20 per cent rise from Rs 1.13 and in Gujarat a 6 per cent increase from Rs 1.72. In the states of Andhra Pradesh, Assam, Karnataka, Madhya Pradesh, Maharashtra, Orissa and West Bengal (and possibly Bihar also), which together account for more than 70 per cent of the country's agricultural labour force, real wage rates declined during the sixties. It can be seen that in all these states, excepting Assam, real wage rates registered an improvement between 1956-57 and 1961-62. Evidently, this thrust failed to be maintained in subsequent years. The decline in real wage rate was quite substantial in Orissa (19 per cent), Karnataka (19 per cent), Assam (18 per cent), Madhya Pradesh (14 per cent), Maharashtra (13 per cent), and West Bengal (11 per cent). Only in Andhra Pradesh was the decline in real wage rate of the order of 4 per cent.

However, when we shift the base year to 1964-65 for comparing real wage rates, the picture becomes brighter in all the states except Orissa and Karnataka. The declining trend in real wage rates, which we noticed in most states from 1961-62 onwards, seems to have been arrested in the latter half of the sixties. It is significant that during the two disastrous agricultural years of 1965-66 and 1966-67 real wage rates reached rock-bottom levels (a classic case of money wage rates lagging behind spiralling price rises). However, from then onwards, the real wage rate improved except in Orissa.

As we said at the very outset, our principal reason for choosing 1964-65 as one of the base years for purposes of charting the movement of real wage rates of agricultural labourers is to see if the introduction of new technology in agriculture in the form of large-scale use of high-yielding varieties might have had an impact on the movement of wage rates. Though no attempt has been made to analyse precisely how increase in agricultural productivity has helped to raise wage rates, the relationship between the two, to the extent it exists, is brought out in Table 6. Given in the Table is a consolidated index of productivity per hectare of land in different states from 1964-65 to 1971-72. These indices have been arrived at by taking the weighted average of productivity of each agricultural crop (except the plantations), the weights being the share of value which prevailed in 1956-57.

A preliminary examination of the data relating to state-wise increments in agricultural productivity shows that per hectare output increased substantially in Punjab (37 per cent), Gujarat (36 per cent), Karnataka (26 per cent) and Tamil Nadu (25 per cent). Of these four states, three, *viz*, Punjab, Gujarat and Tamil Nadu registered increase in the rural real wage rates: Punjab (43 per cent), Gujarat (22 per cent), and Tamil Nadu (14 per cent). In Karnataka, however, the rural real wage rate not only did not increase but declined by 4 per cent. In Bihar and Kerala also per hectare productivity increases were of the order of 15 per cent or more during this period. But we do not have complete information about Bihar. As for Kerala, the improvement in real wage rate was of the order of 25 per cent.[10] In fact, Punjab, Gujarat, Tamil Nadu and Kerala are the four states which have shown a consistent rise in real wage rates since 1956-57 (allowing, of course, for the dip during the mid-sixties) and they are also the states in which per hectare productivity increase also con-

sistently improved over the same period. We do not wish, however, to go any further to suggest how, if at all, productivity increases in per hectare terms get necessarily translated into wage rate increases. We doubt very much if this could at all come about automatically. The question, therefore, would still remain with respect to the compulsions in response to which wage increases take place even in states registering productivity improvement.

In conclusion it may be noted that while according to earlier studies wage rates improved significantly in real terms only in Punjab (including Haryana) and Kerala, our extension of the series to 1971-72 leads us to conclude that real wage rates improved not only in Punjab and Kerala, but also in Tamil Nadu, Uttar Pradesh and Gujarat. Still these states account for less than 30 per cent of the agricultural labour force in the country. Our study also brings out that inter-state disparities in many wage rates have tended to increase since 1964-65.

Notes

Robert W Herdt and Edward A Baker "Agricultural Wages, Production and the High-Yielding Varieties", *Economic and Political Weekly*, Vol 8, No 13, March 25, 1972.

4 The author is very grateful to the officials of the Directorate of Statistics, Krishi Bhavan, New Delhi, who kindly arranged to provide the required data for this study.

5 In the "Agricultural Wages in India" wage rates for the category 'field labour' are reported for states like Andhra Pradesh, Assam, Gujarat, Kerala, Maharashtra, Karnataka, Orissa, West Bengal, Tripura and Himachal Pradesh. In the case of other states wage rates for the different categories of 'field labour' are given; but not for 'field labour' as such.

6 In the data available with us for Kerala for the period July 1971 to June 1972, 13 out of 19 reporting centres recorded the same wage rates. The same phenomenon was observed in Tamil Nadu in the case of 15 out of 25 centres, in 11 out of 18 centres in Punjab/Haryana, in 10 out of 16 centres in Assam and in 17 villages out of 24 centres in Gujarat. In the case of Uttar Pradesh, Madhya Pradesh, Maharashtra, Karnataka and Rajasthan, in almost all the centres where wage data are available continuously for 12 months, there is no variation in wage rates reported. Also in the case of West Bengal (where only district-wise rates are available) there is no noticeable inter-seasonal variation present. Andhra Pradesh is the only state where one notices some amount of seasonal variation in wage rates. However, in the case of reporting centres where wage rates do not remain the same for all the twelve months of the agricultural year they do not seem to follow any definite seasonal pattern. These variations are generally in the upward direction; if the wage rate rises to a higher level in any particular month it tends to stick to that level without coming down, and appears to reflect mainly secular changes.

7 V M Rao, "Agricultural Wages in India — A Reliability Analysis", *Indian Journal of Agricultural Economics*, Vol XXVII, No 3, July-September 1972.

8 The revised estimates of ACPI are estimated using the weighting diagram for consumer goods obtained from the 1956-57 Agricultural Labour Enquiry. Since in these four states about 80 per cent of the consumer expenditure is incurred on food out of which cereals account for 70 per cent, the movements in the average farm prices of cereals were taken as a rough index of the movements in ACPI in each state. The price indices of different cereals were weighted with the relative importance of each item in the diet pattern of every state. From the consolidated index of cereal price movements, alternate estimates of ACPI were worked out backwards for Gujarat and Maharashtra for the years prior to 1960-61 and for Uttar Pradesh and Tamil Nadu prior to 1964-65.

9 It may be noted that the money wage-rates for different states given in Table 1 are markedly different from those furnished in the Herdt and Baker paper. This disparity has stemmed mainly from differences in the methodology followed in the two studies. It is difficult to identify the precise source of data in the Herdt and Baker study. It is mentioned that the "the average daily money wage-rates by months were obtained for a number of locations from wage data published in *Agricultural Wages in India* and the *Agricultural Situation in India*. For each month, observations from between three and nine locations in each region were averaged to obtain representative wage for the nine regions". *Agricultural Wages in India* have been so far published upto the period 1965-66. If Herdt and Baker have collected wage data for the subsequent years from *Agricultural Situation in India* those figures are likely to be misleading, as they are inadequate for the kind of analysis they have done. Every month *Agricultural Situation in India* reports wage-rates prevailing in one or two or at the most three centres in each state. These figures are by no means representative of a whole state, and using them would certainly introduce a bias into the analysis. On the other hand, in this study, in each state, district-wise wage rates have been collected for the period under study. Again, for estimating state-wise figures, instead of taking a simple average, we have opted for a weighted average, the weights being the relative proportion of male agricultural labourers in each district as per 1961 Census report. These factors might explain the differences in the two sets of estimates.

10 In an earlier paper by me ("Wage Rates of Agricultural Labourers in Kerala", in *Economic and Political Weekly*, Annual Number, 1973, pp 281-88) I had explained that the wage rate improvement in Kerala was possibly lower than when calculated on the basis of ACPI numbers. It is not certain, however, if the factors which operate in Kerala give reason for one to question the use of ACPI numbers as deflators for other states, either in the same measure or at all.

Character of Poverty among Rural Labour

A Study of West Godavari District

G Parthasarathy

S Venkateswara Rao

G Dasaradha Rama Rao

There are very few empirical studies which throw light on the association between poverty and other characteristics. We need to know in which regions and for what class of people poverty can be identified with unemployment and areas and categories in respect of which poverty has other implications.

The data collected by the authors on employment and unemployment of rural labour in West Godavari district are examined in this article to throw light on this problem.

DANDEKAR AND RATH concluded in the section on rural poor as follows: "In spite of these rather old and fragmentary data it is clear that the rural poor consist predominantly of agricultural labour households and small landholders with cultivated holdings less than 5.0 acres and particularly less than 2.5 acres.... The urban poor are only an overflow of the rural poor into the urban areas. Fundamentally they belong to the same class as the rural poor."[1] They estimated that out of the 40 per cent of rural poor the bulk, i e, 30 per cent, are poor because they are unemployed. Thus they presume a strong association between poverty and unemployment. Amartya Sen, in a recent address at the Indian Statistical Institute at Calcutta, objects to the procedure of measuring unemployment by a low income norm.[2] Raj Krishna has pleaded for the presentation of separate estimates of poor and unemployed.[3] There are very few empirical studies which focus light on the association between poverty and other characteristics. We need to know in which regions and for what class of people poverty could be identified with unemployment and areas and categories in respect of which poverty has other implications. The data collected by us on employment and unemployment of rural labour in West Godavari district[4] are examined to throw light on this.

Dandekar and Rath estimated per capita total annual consumption requirement to ensure a minimum calorie equivalent of daily diet at 1961-62 prices. The figure for Andhra Pradesh is Rs 236, at 1961-62 prices. The consumer price index of agricultural labour in Andhra Pradesh in 1971-72 was double that of 1961-62 prices. At the 1971-72 prices a per capita income of about Rs 450 is required to ensure the minimum level of consumption.

An alternative procedure is also adopted to arrive at the minimum level of expenditure required. In a revealing article "The Concept and Measurement of 'Minimum Living Standards'", N N Franklin reviewed[5] various studies made in measuring minimum living standards. He particularly commended the procedure adopted by Rowntree and Laver.[6] Rowntree and Laver sought information on how much different families actually do spend on meeting different needs and regarded the actual expenditure (of some proportion of families at the more frugal end of the spectrum) in obtaining what is considered necessary for maintenance of health and working capacity. He, however, feels that the proportion suggested, i e, 25 per cent is too large. Our data do not enable us to make this type of estimate. However, we have data relating to consumption expenditure incurred by rural labour families on a day during a busy agricultural season. Assuming that in the peak season rural labour get adequate employment and wage income enabling them to consume the minimum food requirement, the average expenditure of the top ten per cent of rural labour households in respect of food consumption is considered. If all the labour households could be assured of getting this level of income it should enable them also to spend adequately on obtaining what is considered as minimum food requirement. The average per day per capita consumption expenditure on food in the top ten per cent families is observed to be Rs 1.27 and the annual per capita income requirement would work out to Rs 463.55. On the other hand the average per capita per day expenditure on food in respect of all the rural labour households in Re 0.74. If the goal is to ensure this average per capita expenditure for all the rural labour households then the average per capita per annum food budget would come to Rs 270.10. In view of this, two levels of poverty are chosen:

(a) at the level of Rs 450 per capita; and

(b) at the level of Rs 300 per capita.

To examine the association between levels of poverty and other character-

TABLE 1 : ASSOCIATION OF POVERTY WITH OTHER VARIABLES

Association of Poverty with	Degrees of Freedom	Chi-square Values Calculated			
		Poverty Level being at Rs 450 Per Capita Per Annum		Poverty Level being at Rs 300 Per Capita Per Annum	
		All Labour Households	Landless Labour Households	All Labour Households	Landless Labour Households
(a) Land possession	1	6.55**	—	6.83**	—
(b) Worker-dependant ratio	1	0.49	1.29	5.43*	5.10*
(c) Presence of female workers or otherwise	1	0.27	2.34	0.73	0.00
(d) Average wage rate	1	0.27	0.00	0.18	0.24
(e) Size of the family	1	2.21	4.02*	6.01*	6.15*
(f) Average level of employment	1	1.55	0.74	9.34**	2.94
(g) Caste	1	1.08	2.08	0.19	1.52
(h) Regional variations	2	2.09	2.07	2.39	2.50

* Significant at 5 per cent level.
** Significant at 1 per cent level.

Note: Table value of X^2 for one degree of freedom at 5 per cent level is 3.84 and at 1 per cent level 6.64; for two degrees of freedom at 5 per cent level it is 5.99 and at 1 per cent level 9.21.

istics two-by-two *contingency* Tables (see Appendix I) are constructed. The variables chosen for examining the association are:

(a) possession of land;[7]
(b) average wage rate;[8]
(c) worker-dependant ratio;
(d) size of the family;
(e) presence or absence of female workers;
(f) average level of employment;[9]
(g) regional variations;[10] and
(h) caste.[11]

The association is examined for landless and landed labour together and separately for landless labour. Chi-square test is adopted to judge the significance of association. The results of X^2 at Rs 450 per capita level are as follows:

For all rural labour, i e, landed and landless possession of land alone is found to have significant association, the landless being significantly different in respect of poverty as compared to the landed. The regional characteristics, wage rate, employment, caste and family characteristics have no significant association with poverty when landed and landless are considered together.

The exercise is repeated by taking the landed households out of the analysis and confining the examination only to landless households. The results are found to be different. Size of the family which was not significant when both the groups are clubbed together assumed significance when landless alone are considered. But surprisingly neither employment nor wage rate are found to be significant.

When poverty level is reduced to Rs 300 per capita land ownership, worker-dependant ratios and size of the family became significant variables explaining the association when all labour is considered. Significant association was found between level of per capita income and level of employment. However, wage rate was not significant. The exercise is repeated for landless labour separately. Even here no significant association is found between employment and poverty (see Table 1).

Dandekar and Rath presumed that 75 per cent of the poor are poor because they are unemployed and only 25 per cent of the poor because of the family characteristics. In this analysis we have taken a group which is considered to comprise the bulk of the the rural poor, *viz*, landless labour and *small cultivators. Even in this group* surprisingly association as measured by X^2 test between level of employment and poverty is not found to be significant.

This requires further probe. Unemployment and poverty may not be *significantly associated if the households* which show higher levels of employment record higher size of the family, lower proportion of supporting women

TABLE 2: MEAN LEVELS AND ELASTICITIES AT MEAN LEVELS

	Variable		Mean Level	Elasticity of Per Capita Income
(1)	Per capita income	Rs	351.25	—
(2)	Wage rate	Rs	2.54	0.88
(3)	Employment	Days	200.65	0.37
(4)	Size of household	No	4.31	—0.09
(5)	Workers as per cent of members in the household	Per Cent	58	0.79
(6)	Size of land-holding	Acres	0.24	0.14

APPENDIX I (A): DISTRIBUTION OF HOUSEHOLDS BY LEVEL OF POVERTY AND LEVEL OF EMPLOYMENT PER WORKER

Level of Employment	All Households				Landless Households			
	Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level		Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level	
	Below Poverty	Above Poverty	Below Poverty	Above Poverty	Below Poverty	Above Poverty	Below Poverty	Above Poverty
240 days and below	61 (77.2)	19 (90.5)	28 (66.7)	52 (89.7)	44 (74.6)	8 (88.9)	24 (68.6)	28 (84.8)
Above 240 days	18 (22.8)	2 (9.5)	14 (33.3)	6 (10.3)	15 (25.4)	1 (11 1)	11 (31.4)	5 (15.2)
Total	79 (100.0)	21 (100.0)	42 (100.0)	58 (100.0)	59 (100.0)	9 (100.0)	35 (100.0)	33 (100.0)

Note: Figures in the brackets indicate percentage distribution of households in the respective groups.

APPENDIX I (B): DISTRIBUTION OF HOUSEHOLDS BY LEVEL OF POVERTY AND AVERAGE WAGE RATE PER DAY

Average Wage Rate Per Day	All Households				Labour Households			
	Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level		Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level	
	Below Poverty	Above Poverty	Below Poverty	Above Poverty	Below Poverty	Above Poverty	Below Poverty	Above Poverty
Rs 2.50 and below	29 (36.7)	6 (28.6)	14 (33.3)	21 (36.2)	24 (40.7)	4 (44.4)	13 (37.1)	15 (45.5)
Above Rs 2.50	50 (63.3)	15 (71.4)	28 (66.7)	37 (63.8)	35 (59.3)	5 (55.6)	22 (62.9)	18 (54.5)
Total	79 (100.0)	21 (100.0)	42 (100.0)	58 (100.0)	59 (100.0)	9 (100.0)	35 (100.0)	33 (100.0)

Note: Figures in brackets indicate percentage distribution of households in the respective groups.

workers, lower weighted wage rate per *worker and lower number of workers* per household. The range of employment per casual labourer among landless labourers varies between 89 days and 360 days. But there was only one household reporting above 300 days and one household less than 100 days of employment per worker. Therefore the data are studied in three frequency groups of employment, *viz,*

(i) 180 days and below;
(ii) above 180 days to 240 days; and
(iii) above 240 days.

The distribution of the 68 landless households among the three groups is 19, 32 and 17 respectively. As expected the average size of the family was found to be larger in groups recording higher level of employment per worker in the household. Average number of workers per household was also found to be lower in the group recording above 240 days of employment per worker. The weighted wage rate was lower. The proportion of women workers is also low. The families which could escape poverty at lower levels of employment were fortunately situated in respect of family characteristics as compared to general average. Thus it is not the extremely large size of the family or a higher worker-dependant ratio that was responsible for lack of association between employment and poverty. Those families which recorded low levels of employment but are found to be above the poverty level as defined by us were in a particular phase of life cycle with high proportion of workers. (Detailed Tables are given in Appendix II.)

To examine this we categorised the households by employment level and income levels. A household with a per capita income of Rs 450 is considered poor and a household with per worker level of employment of more than 240 is considered fully employed. Based on these two norms four groups are identified and their respective distribution among the landless labour families are as follows:

(1) Poor and fully employed 23.5 per cent
(2) Poor and unemployed 61.8 per cent
(3) Not poor but unemployed 13.2 per cent
(4) Not poor and fully employed 1.5 per cent

Among these groups the poor and fully employed and unemployed but not poor are chosen for detailed examination. (Details relating to the characteristics of these households are presented in Appendix III.)

Those who have escaped poverty even at low levels of employment among landless labour are found to have some unique characteristics. In

APPENDIX I (C): DISTRIBUTION OF HOUSEHOLDS BY LEVEL OF POVERTY AND POSSESSION OF LAND

Position of Land Possession	All Households			
	Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level	
	Below Poverty	Above Poverty	Below Poverty	Above Poverty
Landed	20 (25.3)	12 (57.1)	7 (16.7)	25 (43.1)
Landless	59 (74.7)	9 (42.9)	35 (83.3)	33 (56.9)
Total	79 (100.0)	21 (100.0)	42 (100.0)	58 (100.0)

Note: Figures in brackets indicate percentage distribution of households in the respective groups.

APPENDIX I (D): DISTRIBUTION OF HOUSEHOLDS BY LEVEL OF POVERTY AND SIZE OF THE HOUSEHOLD

Size of the Household	All Households				Landless Households			
	Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level		Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level	
	Below Poverty	Above Poverty	Below Poverty	Above Poverty	Below Poverty	Above Poverty	Below Poverty	Above Poverty
Four and below	41 (51.9)	15 (71.4)	18 (42.9)	38 (65.5)	33 (55.9)	8 (88.9)	16 (45.7)	25 (75.8)
Above four	38 (48.1)	6 (28.6)	24 (57.1)	20 (34.5)	26 (44.1)	1 (11.1)	19 (54.3)	8 (24.2)
Total	79 (100.0)	21 (100.0)	42 (100.0)	58 (100.0)	59 (100.0)	9 (100.0)	35 (100.0)	33 (100.0)

Note: Figures in brackets indicate percentage distribution of households in the respective groups.

APPENDIX I (E): DISTRIBUTION OF HOUSEHOLDS BY LEVEL OF POVERTY AND NUMBER OF DEPENDANTS PER WORKER

Number of Dependants Per Worker	All Households				Landless Households			
	Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level		Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level	
	Below Poverty	Above Poverty	Below Poverty	Above Poverty	Below Poverty	Above Poverty	Below Poverty	Above Poverty
Two and below	67 (84.8)	19 (90.5)	32 (76.2)	54 (93.1)	51 (86.4)	9 (100.0)	28 (80.0)	32 (96.7)
Above two	12 (15.2)	2 (9.5)	10 (23.8)	4 (6.9)	8 (13.6)	—	7 (20.0)	1 (3.3)
Total	79 (100.0)	21 (100.0)	42 (100.0)	58 (100.0)	59 (100.0)	9 (100.0)	35 (100.0)	33 (100.0)

Note: Figures in brackets indicate percentage distribution of households in the respective groups.

almost all the households all members of the family are found to be workers. On the other hand the fully employed but poor do not have exceptionally large families but most of them belong to dry region and get a low weighted wage rate per worker. Therefore, much reliance should not be placed on the observed lack of association revealed in Chi-square test between levels of employment and levels of poverty.

A further exercise in identifying the characteristics of poverty relates to households which report that members of the family are engaged as permanent farm servants in cultivator households. Out of 68 households, 11 report this phenomenon, and the total workers engaged as permanent farm servants are 13 out of 99 male workers. Six of them are cow-boys. In the agricultural sector working as permanent farm servant imposes a disability without conferring very much the benefits of permanent service that are conferred on workers in other sectors. We separated these households from the rest of landless labour households and examined the family characteristics (see Appendix IV). It is noticed that the average size of the family of the households reporting permanent farm servants is far higher. The number of workers is also higher. One possible inference is that those who tie themselves to cultivator families are large sized families which seek at least some stable incomes through secure employment for at least some members of the family. It is also noticed that the average debt of permanent farm servant households is higher.

The Chi-square tests in two-by-two contingency tables are likely to be blunted. First, the tests are likely to be dependent upon the way in which the characteristics are classified into two levels, one lying below and the other above Rs 450. It is found that for all the labour households only size of the holding is associated with per capita income. On the other hand, if the break-even income level chosen happens to be Rs 300 not only size of the family, but worker-dependant ratio and level of employment are found to be associated with per capita income. What is said of classification in respect of per capita income applies equally well to classification of any of the characteristics considered. The point is that when characteristics are capable of being quantitatively measured, zero-order correlations are better measures of linear dependance between any two characteristics. Secondly and more importantly, these tests examine the possible association between characteristics taken two at a time. It is possible that one of the characteristics is being systematically influenced by outside factors and therefore Chi-square test may not be able to detect the true degree of association between the two characteristics in question.

If per capita income levels for the rural households are in fact simultaneously influenced by many independent factors, it is through regression analysis rather than contingency tests that we may hope to detect and unravel the influence of each of the independent factors on the dependent variable. Accordingly, a classical regression model is set up. The variables included are as follows:

X_1 — annual per capita income (in rupees)

X_2 — annual wage income/number of days employed during the year

X_3 — number of days employed during the year/number of workers

X_4 — number of members in the household

X_5 — workers as per cent of members in the household

X_6 — size of land holding (in standard acres)

The hypothesis posited is that annual per capita income depends upon wage rate, employment, size of the household, percentage of workers in the household, and size of the land possessed. We specify that the relationship is linear.

The equation estimated for all the hundred households is given below:

(1) $X_1 = -381.47 + 121.15\ X_2 + 0.65\ X_3 - 7.46\ X_4 + 4.80\ X_5 + 209.63\ X_6$
(— 3.59) (5.41) (3.06) (— 1.21) (10.14) (9.41)

The figures in the brackets denote the t-ratios. The co-efficient of multiple correlation, R^2 is 0.69, signifying that sixty-nine per cent of the sampling variations found in X_1 is explained by the factors X_2, X_3, X_4, X_5, and X_6. The signs obtained for all the co-efficients are as may be theoretically justified. All the estimated co-efficients except that for X_4 are significant at 1 per cent level.

Interpreting the co-efficients in equation (1) as 'propensities' or partial derivatives, we find that, other things being equal:

(i) An increase in the wage rate by a rupee is associated with an increase in per capita income by Rs 121.15,

(ii) An increase in employment per worker by a day during the year leads to an increase in per capita income by Re 0.65,

(iii) An increase in the size of the household by one member results in a decline in per capita income by Rs 7.46,

APPENDIX I (F): DISTRIBUTION OF HOUSEHOLDS BY LEVEL OF POVERTY AND PRESENCE OF FEMALE WORKERS IN THE FAMILY

Presence of Female Workers in the Family	All Households				Landless Households			
	Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level		Poverty at Rs 450 Per Capita Level		Poverty at Rs 300 Per Capita Level	
	Below Poverty	Above Poverty	Below Poverty	Above Poverty	Below Poverty	Above Poverty	Below Poverty	Above Poverty
Yes	54 (64.6)	15 (71.4)	26 (61.9)	40 (69.0)	41 (69.5)	8 (88.9)	25 (71.4)	24 (72.7)

Total	79 (100.0)	21 (100.0)	42 (100.0)	58 (100.0)	59 (100.0)	9 (100.0)	35 (100.0)	33 (100.0)

Note: Figures in brackets indicate the percentage distribution of households in the respective groups.

APPENDIX II

(a) Association between Level of Employment and Size of Family

Level of Employment	Range of Members	Mean	Extremes	
			2 and Below	Above 5
180 days and below	1 - 7	3.84	5 (26.3)	3 (15.78)
Above 180 to 240 days	2 - 8	4.25	7 (21.87)	8 (25.0)
Above 240 days	2 - 8	4.23	3 (17.64)	4 (23.52)
Total	1 - 8	4.13	15 (22.05)	15 (22.05)

(b) Association between Level of Employment and Proportion of Women Workers

Level of Employment	Range	Mean Proportion	Median	Extremes	
				33 Per Cent and Below	Above 67 Per Cent
180 days and below	0 - 100.0	51.2	50.0	5 (26.31)	3 (15.78)
Above 180 days to 240 days	0 - 50.0	31.0	41.5	16 (50.0)	—
Above 240 days	0 - 50.0	22.5	33.0	9 (52.44)	—
Total	0 - 100.0	34.5	50.0	30 (44.1)	3 (4.41)

(c) Association between Level of Employment and Wage Rate

Level of Employment	Range of Wage Rate	Mean Wage Rate	Median Wage Rate	Extremes	
				Rs 2 and Below	Above Rs 3
180 days and below	2:00 to 2.98	2.49	2.49	1 (5.3)	—
Above 180 days to 240 days	1.63 to 3.37	2.57	2.70	4 (12.5)	2 (6.25)
Above 240 days	1.19 to 3.04	2.22	2.50	8 (47.05)	1 (5.88)
Total	1.19 to 3.37	2.46	2.55	13 (19.1)	3 (4.4)

(d) Association between Level of Employment and Total Number of Workers in the Household

Level of Employment	Range of Workers	Mean	Extremes	
			One	Four nd Above
180 days and below	1 - 5	2.26	5 (26.3)	2 (10.5)
Above 180 days to 240 days	1 - 5	2.34	2 (6.25)	5 (16.62)
Above 240 days	1 - 4	1.94	6 (35.29)	2 (11.7)
Total	1 - 5	2.22	13 (19.1)	9 (13. :3)

Note : Figures in brackets indicate percentage of households on the extremes as indicated.

(iv) If the number of workers as per cent of the members in the household increases by one, per capita income increases by Rs 4.80, and

(v) An increase in the land owned by the household by one (standard) acre is associated with an increase in per capita income by Rs 209.63.

The mean levels and the elasticities computed at the mean levels are given in Table 2. The elasticities[12] of per capita income with respect to each of the factors — wage rate, employment, size of household and size of land possessed — are all less than unity. It is significant to note that the elasticities with respect to wage rate and worker-member ratio are significantly greater than the remaining.

Equation (1) helps to identify the underlying causes of poverty and to suggest policy measures designed to eradicate poverty. If a per capita income of Rs 450 in 1971-72 prices is regarded as the critical poverty income level, the following measures, taken separately, or as a weighted combination, would lift the current average per capita income Rs 351.25 to Rs 450.

(A) Raise the wage rate by Re 0.82;

(B) Increase employment by 152 days; (this is unrealistic considering the current levels of employment — 201 days);

(C) Increase the percentage of workers in the total household from the current level of 58 to 79;

(D) Increase the land holding from the current level of 0.24 to 0.71 (wet) acres.

The average size of the household being 4.31, not much can be done by way of limiting the size of the family. If possibilities of land redistribution on any significant scale are ruled out, policy measures A and B imply employment oriented technology with autonomous gain in productivity.

Summary

This paper presents character of poverty among rural labour households. The data are drawn from a sample study of "Employment and Unemployment of Rural Labour" conducted in West Godavari district for the period 1971-72. Two poverty levels are chosen, *viz*,

(i) per capita income of Rs 450, and

(ii) per capita income of Rs 300.

Eight variables namely:

(a) possession of land;
(b) average wage rate;
(c) worker-dependant ratio;
(d) size of the family;
(e) presence or absence of female workers;
(f) average level of employment;
(g) regional variations; and
(h) caste

are chosen and poverty levels are related to suitably classified levels of each one of these variables. Two-by-two contingency tables are constructed and by means of Chi-square tests the association between poverty and other variables is judged. The results of the Chi-square tests did not show association between poverty and employment or wage rate except in one case. Therefore, a further disaggregated study of households categorised into four groups based on employment levels and poverty levels is made. Sixty-two per cent of the households are found to be poor and unemployed and those who escape poverty even at low levels of employment among landless labour are found to belong to a certain phase of the life cycle of the farmers.

To measure quantitatively the significance of other variables on per capita income a multiple regression of linear type is run. For this purpose five independent variables, *viz*,

(1) wage rate;
(2) employment;
(3) size of the household;
(4) workers as a percentage of members in the household; and
(5) size of land holding

Appendix III : Characteristics of Households

Sl No	Size of Household	Total Workers	Average Wage Rate	Female Workers	Region (Dry/Wet)
		(a) Unemployed but Not Poor			
(1)	5	5	2.30	2	Wet
(2)	2	2	2.80	1	,,
(3)	3	3	2.78	1	,,
(4)	4	4	2.92	1	,,
(5)	3	3	2.49	1	,,
(6)	2	2	2.47	1	,,
(7)	2	2	2.51	1	,,
(8)	3	2	2.83	0	,,
(9)	2	2	2.50	1	,,
		(b) Fully Employed but Poor			
(1)	4	4	1.25	2	Wet
(2)	7	1	2.99	0	,,
(3)	8	4	2.90	0	,,
(4)	2	1	2.70	0	,,
(5)	4	1	2.84	0	,,
(6)	3	1	3.04	0	,,
(7)	4	2	1.60	1	Dry
(8)	2	2	1.40	1	,,
(9)	2	2	1.60	1	,,
(10)	4	2	1.92	0	,,
(11)	6	2	1.59	1	,,
(12)	3	1	3.00	0	,,
(13)	7	3	1.23	1	,,
(14)	5	1	3.00	0	,,
(15)	4	2	1.19	1	,,
(16)	4	2	2.50	1	,,

Appendix IV : Characteristics of Households with Permanent Farm Servants as Compared with Others

Factor	Households with Permanent Farm Servants	Others	Total
Average size	5.2	3.9	4.1
Average number of workers	2.6	2.2	2.3
Ratio of workers to population	0.50	0.56	0.56
Average outstanding debt (Rs)	195.45	104.56	119.26

are chosen. Sixty-nine per cent of the sampling variations found in X_1 are explained by the factors chosen. The estimated co-efficients are all significant at 1 per cent level except one in the case of (3) above. An increase in employment per worker by a day leads to an increase in per capita income by Re 0.65. An increase in wage rate by a rupee is associated with an increase in per capita income by Rs 121.15. If possibilities for land redistribution among rural labour on any significant scale are ruled out the policy implications are employment-oriented technology with autonomous gain in productivity.

1 V M Dandekar and Nilakantha Rath, "Poverty in India", *Economic and Political Weekly*, January 2 and 9, 1971.

2 Amartya Sen, "Dimensions of Unemployment", *Mainstream*, January 12, 1974.

3 Raj Krishna, "Unemployment in India", *Economic and Political Weekly*, March 3, 1973.

4 G Parthasarathy and G Dasaradha Rama Rao, "Employment and Unemployment of Rural Labour and Crash Programme: A Study of West Godavari District", Andhra University Waltair (Mimeo) and also G Parthasarathy and G Dasaradha Rama Rao, "Employment and Unemployment among Rural Labour Households", *Economic and Political Weekly*, (Review of Agriculture) December 29, 1973.

The district of West Godavari was stratified into three agro-economic regions and from each of the regions one typical block was selected. From these ten villages were chosen with probability being proportional to the percentage of agricultural labour to total workers according to 1961 census in each of the regions. One hundred households from the universe comprising all households which reported their principal activity to be unskilled wage paid employment and all those where at least one member offered himself or herself for unskilled wage employment for a continuous period of three months. The distribution of this sample among the selected villages was proportional to the size of the universe in the village keeping a minimum limit of 8 and maximum of 12 households.

6 B S Rowntree and G R Laver, "Poverty and the Welfare State", London, Longmans, Green and Co, — as referred to by Franklin in his article.

7 Land area is in terms of standardised acres. Considering the land revenue paid all area is converted into standard wet acres.

8 Average wage rate is total wage income earned by the family/total days of wage employment, irrespective of sex of the worker.

9 Average level of employment is total days of wage employment/number of casual workers in the household, irrespective of the sex of the worker.

10 The district of West Godavari was stratified into three agro-economic regions:

(i) double cropped rice area;

(ii) rice-sugarcane crop complex area; and

(iii) upland area where dry crops like chillies, tobacco and millets are grown.

11 Scheduled Castes, Christians and Scheduled Tribes are grouped as one category and all others are grouped as a second category.

Hypothesis Testing in Relation to Cobb-Douglas Myths

Ashok Rudra

ANDERSON AND JODHA'S comments[1] on my article[2] raises some interesting points of Statistical Inference Theory which call for further discussion. To enable me to react to their comments it is necessary to quote somewhat extensively from their writing which I do in the following.

(A) "To summarise, Ashok Rudra still seems impressed with the notion that farmers' allocative efficiency can be usefully appraised in a profit maximising context and, further, he has little quarrel with the Cobb-Douglas (C-D) production function as an analytical device. His faith in a C-D world seem further declared by his exploitation of the C-D model in the promised follow-up Numerical Exercises. It is not easy to reconcile his vigorous criticism of the allocative efficiency school with his continued acceptance of the C-D function."

After recounting some of the well known 'algebraic-cum-economic restrictiveness' of that functional form, they comment on some tests proposed by me in the following words:

(B) "The conditional question he is *asking is, effectively,* 'Do farmers maximise profits given that they are operating under a C-D production function that is common to all members of some group (i e, common C-D technology)?'"

Further they argue:

(C) "If for the moment, we go along with the idea that it is useful to test hypotheses about farmers' allocative efficiency, then we might well enquire why it is necessary to accept the contamination of the hypotheses by the usual presumption that (a) individual technology is C-D and that (b) the individual technology is common to all members of a group of farmers? Such an analytical route should logically, successively and successfully test hypotheses concerning presumptions (a) and (b) before exploring any conditional hypotheses about efficiency. Otherwise, the results of testing composite hypotheses dealing concurrently but not disaggregatively with efficiency, the nature of technology and the commonality of technology are bound to be inconclusive. In the event that such a composite hypothesis was accepted, could consumers of such research endeavour be persuaded that underneath the apparent efficiency there really does exist one common C-D production function?"

I would comment on (B) and (C) before taking up (A). I would readily agree that (B) is a correct statement of what I am doing while not agreeing with all the arguments made in (C) against such a procedure. I would emphasise that almost all statistical tests are conditional tests and almost all statistical tests could be regarded as 'inconclusive' in the sense in which it is understood in paragraph (C) above. Consider a small sample test for the hypothesis H_0 ($m_1=m_2$) where m_1 and m_2 are the means of two populations. The usual t-test involves a composite hypothesis H consisting of the following components:

- A_1 Both the populations are normal;
- A_2 The sample observations in each case could be regarded as independently drawn from the respective population;
- A_3 The two samples are independent of each other;
- A_4 The standard deviations of the two populations are equal and then H_0 $m_1=m_2$

A significant t value need not therefore imply rejection of H_0 above. Falsity of any one of A_1 A_2 A_3 and A_4 could give rise to a significant result for t. Conversely, even when $m_1=m_2$ is untrue, the t may fail to be significant because of one of A_1 A_2 A_3 and A_4 not being valid. Hence, in interpreting the t result as applying only to H_0, one is saying exactly this: "*Given* the assumptions A_1 A_2 A_3 and A_4, the test rejects (or does not reject) H_0" and *this is precisely* the type of conditional statement quoted in B above to which Anderson and Jodha find objections.

According to the suggestions made by the authors in paragraph (C) above, one should first test for A_1 A_2 A_3 and A_4 *in that* sequential order and then only test for H_0. The authors must be aware that such a course is very rarely, if ever, taken. Practical difficulties there are: there is no satisfactory small sample test for A_1 and tests for A_2 and A_3 are also difficult. Given A_1 A_2 and A_3, there is a standard test for A_4 and that *is indeed* often carried out. But not doing something because of practical difficulties does not amount to a logical defence of any procedure. The logical position that would be taken by one conducting a test for H_0, assuming the validity of A_1 A_2 A_3 and A_4, would be on the following lines: "Prior knowledge about the problem in hand *provides sanction for accepting* A_1 A_2 A_3 and A_4 *without testing for them,* so that the *test for the composite* hypothesis H amounts to a test for the simple hypothesis H_0". But it has to be recognised that quite often such prior knowledge *is not really* available and sometimes it cannot even be had in principle. Thus, if a regression test involves an error term which is assumed to be normal, *the normal population* in most cases is a hypothetical one and there is no test possible for the normality of a hypothetical population, nor can there be any prior knowledge about the error term's stochastic properties. Again, if there is a sample of observations which are unique in the sense that repeated observations are not possible (e g, dated macro-economic magnitudes) *there is no means of* having any prior knowledge about the stochastic properties that are ascribed to them in econometric models.

We can come now *to the testing* of the allocative efficiency hypothesis. The hypothesis that has been tested by Hopper and others has the following component hypothesis:

- A_1 There is a common production function underlying each farm;
- A_2 The common form is the Cobb-Douglas form;
- A_3 The logarithm of the multiplicative error term is distributed normally, independently and with a constant standard deviation;
- H_0 Each farmer's input-output combination is such as to maximise his profit.

The non-significant t-test results presented by Hopper and others are to be interpreted in the following way: "Given the assumptions A_1 A_2 and A_3, test results do not suggest rejection of H_0".

It is in this context that my attitude towards the Cobb-Douglas production function as revealed in the alternative tests proposed by me is to be judged. I was interested primarily in hypothesis H_0 and only subsidiarily in A_1 A_2 and A_3. If my alternative test procedure would test for a composite hypothesis that would involve H_0 and assumptions B_1 and B_2, etc, different from A_1 A_2 and A_3 then a different test result obtained by following the procedure would be open to interpretation as following from differences in the assumptions and it would therefore be inconclusive with respect to H_0. So my test procedure makes exactly the same three assumptions A_1 A_2 and A_3 as made by Hopper and others and I would take the view that the onus of justifying the assumptions A_1 A_2 and A_3 rests with them. The interpretation of the significant test results presented in my subsequent joint paper[3] would be as follows, "Given the assumptions made by Hopper and others, a properly formulated test procedure would reject the hypothesis of profit maximisation". I do not think that the procedure followed by me could be interpreted as declaration of any faith *in the assumptions* A_1 A_2 and A_3. In this connection, I may emphasise that I could not have taken such an agnostic position *vis-a-vis* A_1 A_2 and A_3 if I were engaged, not in refutation of a hypothesis advanced by others, but in advancing a hypothesis of my own. In the latter case the problem would be not of Hypothesis Testing but of Estimation and of model building. If I were to put forward a model involving a few component hypotheses, it would surely be incumbent on me to check the validity of each of those component hypotheses. Also if I had put forward H_0 myself then only could it have been said of me that I am "impressed with the notion that farmers' allocative efficiency can be usefully appraised in a profit maximising context". I am interested in rejecting H_0 only because it has been advanced as a theory. My interest in rejecting the profit maximising hypothesis does not indicate that I consider that *profit maximisation is indeed* the best way of expressing allocative efficiency.

I shall now turn to the statements made by Anderson and Jodha in paragraph (A). I must reiterate that I have really no serious quarrel with assumption A_1, which states that the technological knowledge *is equally shared* by all farmers included in the sample. *Insofar as most of the work done in* this field involves samples drawn from geographically localised populations, the assumption does not seem to be all that very unrealistic. As to the Cobb-Douglas form, I myself have pointed *out various absurd results (e g, negative* co-efficients) and situations (zero variable values) its use has given *rise to* in the concerned literature, and in fitting a production function I myself have departed from the form.[4] Having said this I would hold on to the view that the fundamental logical flaws that rob the results of the marginal-product-at-geometric-mean-equalling-market-price school are all independent of the form of the production function. It is in this sense that I said that my least quarrel is with the Cobb-Douglas function.

Finally, I am to express my regrets for having failed to make references to the works of Molster, Johnson and Rausser and Burt referred to by the anthors and also to one of the two papers of Anderson and Dillon cited by them.

Reaching petroleum products wherever needed

With a nation-wide storage and distribution network, Indianoil maintains an uninterrupted flow of petroleum products to serve the nation

With more than 200 installations, bulk depots and aviation fuel stations, and over 3000 petrol/diesel stations, Indianoil ensures that products are delivered wherever needed. All modes of transportation are pressed into service—coastal tankers, pipelines, rail tank wagons, tank trucks and tank carts.

Indianoil marketed about 14 million kilolitres of products during 1971-72 thus meeting nearly 55 per cent of petroleum product requirements of the country—serving the nation in its development plans as well as in defence efforts.

New Statesmanship

Nireekshak

NEXT year, *The Statesman* will join the small band of Indian dailies which have celebrated their centenaries — namely, *Bombay Samachar*, the oldest surviving paper (Gujarati), founded in 1822; *The Times of India* founded in 1838; *The Pioneer*, founded in 1865; *The Amrita Bazar Patrika*, founded as a Bengali weekly in 1868; and *The Mail*, founded in 1868.

A full-length history of *The Statesman* by Assistant Editor Niranjan Mazumder and an anthology edited by him are to be published to mark the centenary. *The Statesman* will not qualify for a commemoration postage stamp because like *The Pioneer* and *The Mail* which celebrated their centenaries on this side of Independence, it was not founded by an Indian. Like the Indian National Congress, the cynic might be pardoned for pointing out.

Even in the days of A E Charlton, the last British editor *The Statesman* as well as the country has had, the paper had come under Indian ownership though Calcutta, the home of the paper, continued to be the centre of British finance capital in India. The fire-eating, fire-worshipping group that gained control of the paper found itself replacing the first Indian editor before long. But there has been no let-up in the labour problems the Indianised paper has been facing in both the centres of its publication, Calcutta and New Delhi.

After *The Hindustan Times*, *The Statesman* is the capital's oldest English daily. Others who went in for Delhi editions later have done far better with their circulation than *The Statesman*. Though its circulation has no relation to the influence the paper commands, for years now there have been intermittent rumours of the New Delhi edition shutting shop due to perennial labour problems. During the last few weeks the paper has been reaching the readers anytime between noon and late afternoon, what with a go-slow. In the cosy drawing rooms in New Delhi, *The Statesman* is discussed for a different reason, however, — the changes in its editorial set-up.

Resident Editor Kuldip Nayar was quietly replaced by London correspondent S Nihal Singh. S Viswam, the political correspondent, has gone to South-East Asia as correspondent in the place of V M Nair who has gone to London. A new category of working journalists, not contemplated or provided for by the wage board, was created when Kuldip Nayar was designated the Political Editor, whatever that means. Nihal Singh combines resident editorship with heading the bureau of special correspondents, the function of the political correspondent in the past. So far, the Political Editor's role has been that of supernumerary special correspondent.

There is a little story behind the reshuffle. *The Statesman* management offered to loan Kuldip Nayar's services to the Press Trust of India to replace its retiring General Manager but the agency's Board of Directors (which includes a representative of *The Statesman*) turned the suggestion down. K S Ramachandran, the retiring General Manager, was given an extension of over two years. But the reshuffle plans in *The Statesman* had already gone too far and it had been decided that Nihal Singh was to return to New Delhi. He had been the political correspondent before Viswam. And they say, in the Foreign Office and in *The Statesman*, no one returns to the same position; it always has to be something higher. So Nihal Singh's name appeared in the print line as the Delhi editor.

New Delhi already had the largest number of English dailies for any city when it got the eighth daily last month when the *Financial Express* launched its Delhi edition. Fourteen years ago Delhi had just four English dailies when Bombay and Calcutta had three each and Madras two. And this week *The Economic Times* has caught up with its rival and started its own edition from the capital. The race began 14 years ago. G L Mehta is credited with suggesting a financial daily to both the newspaper-chain owners and both began planning the project independently of the other. Ramnath Goenka beat the Sahu-Jains by less than a month and both the dailies were launched from Bombay. It is surprising that it took the two dailies 14 years to think of simultaneous publication from New Delhi.

The newsprint squeeze has not checked the proliferation of newspapers and journals though it has shot most newspaper budgets to pieces. The newsprint shortage has cut into advertisement space and revenue. The findings of a nation-wide survey, published in the inaugural issue of *Indian Press*, monthly journal of the Indian and Eastern Newspaper Society, suggests that the shrinkage has forced some papers to skip editions, cut down or give up their magazine sections, use fewer pictures and even to truncate their editorial pages to accommodate more news. On the other hand, some dailies are actually devoting more space to news now. Speeches of politicians are being ignored by four out of five dailies, to go by the findings of the survey. *The Hindustan Times* even relegated the Prime Minister's New Year-eve press conference to column eight on the front page — and quite appropriately.

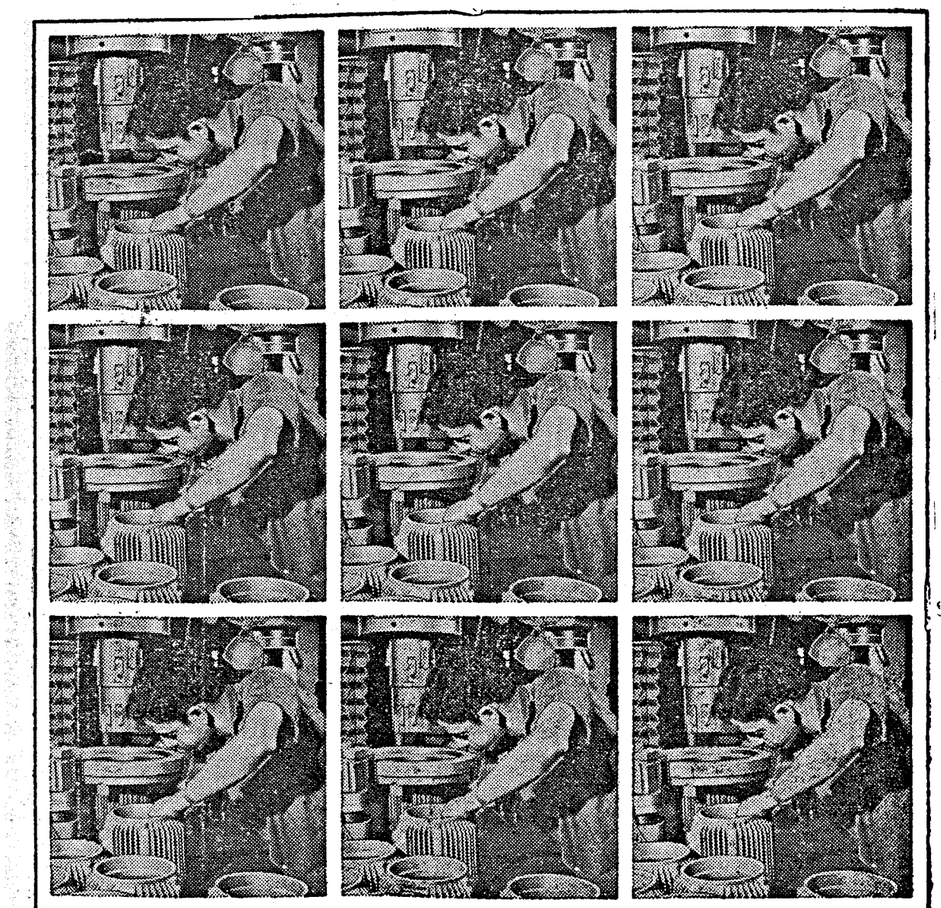
Economic Growth in Industrial Societies

V Nath

Norman Macrae: **The People We Have Become,** *The Economist,* April 28, 1973; pp Survey 1-36.
Brian Needham: **A Special Strength — A Survey of Japan,** *The Economist,* March 31, 1973; pp Survey 1-72.
The Hudson Institute: **France in Ten Years' Time,** Paris, 1973.

AMONG the more interesting economic phenomena of the post-war period is the large difference in the rates of economic growth of the developed countries. Britain has had a growth rate of 2-3 per cent a year, France and West Germany have had rates ranging between 4 and 8 per cent, and Japan's rate has ranged between 10 and 15 per cent. The persistence of these differences for more than a quarter of a century has significantly altered the relative economic positions of the different countries, with consequent changes in their economic power and influence in world affairs. As Norman Macrae says in his survey of Britain (which is one of the subjects of this review), "Britain entered the post-war era as the richest country in north-west Europe except Sweden. Because our economic growth rate since then has been about half that of our neighbours we are now the poorest except Ireland"[1] (p 7).

Table 1 shows the growth rates of GDP at current market prices during the two decades, 1950-60 and 1960-70, and the per capita incomes in four selected years since 1949, in five developed countries — *viz,* Britain, Japan, France, West Germany, and the US — and in India. The changes in relative per capita incomes of the different countries may be noted. Japan's per capita income of $ 100 was about one-eighth of Britain's in 1949; by 1969, it had almost reached the latter's level; and by 1972 it had surpassed it. France and West Germany, with per capita incomes in the range of 40-60 per cent of Britain's in 1949, were approaching the latter's level by 1958, and they had much surpassed it in 1969. The figures for India, on the other hand, show the persistence of extreme poverty and a rapidly increasing disadvantage in relation to the developed countries. The comparison with Japan is particularly striking. In 1949, Japan's per capita income was only 70 per cent larger than India's; by 1972, it was almost 30 times as large.



Continuation of these differences in growth rates for even 10 or 20 years holds frightening prospects for countries with relatively slow rates. Thus Britain's per capita income could fall below those of Spain, Greece or Mexico by the late 1980s. Even the United States, the unquestioned economic leader of the post-war period is uneasy about forecasts that during the second half of the 1980s it could be surpassed in per capita income by Japan. Already, after the second devaluation of the dollar, the US per capita income is not much higher than the per capita incomes of West European countries, such as Sweden or Switzerland, though the standard of living of the Americans may be higher owing to the higher domestic purchasing power of the dollar.

The second fact, though it may seem paradoxical at first sight, is that economic growth has been faster in countries like France and Japan, where the growth outlook at the end of the war was relatively unfavourable, than in Britain where it was far more favourable. Both France and Japan had ended the war as defeated, humiliated, nations; much of their industry and physical infrastructures had been destroyed or badly damaged. They had, moreover, to reconstruct their political and economic institutions (substantially in France, and entirely in Japan) because the earlier institutions had either proved unsuitable for economic and social progress or were internationally unacceptable. The French economic system was burdened with various ills, notably a large and inefficient agriculture mainly of small peasant farms and dominance in industry of family firms that were small, poorly capitalised, inefficient, and seeking protection rather than growth and which had contributed to both political instability and economic stagnation. The Japanese had witnessed the collapse of their vision of an 'Asian co-prosperity sphere' dominated by themselves, and had to build a viable industrial structure and an internationally acceptable system of economic relations, based on competitive imports of raw materials and fuels (of which Japan is so woefully short) and exports

TABLE 1

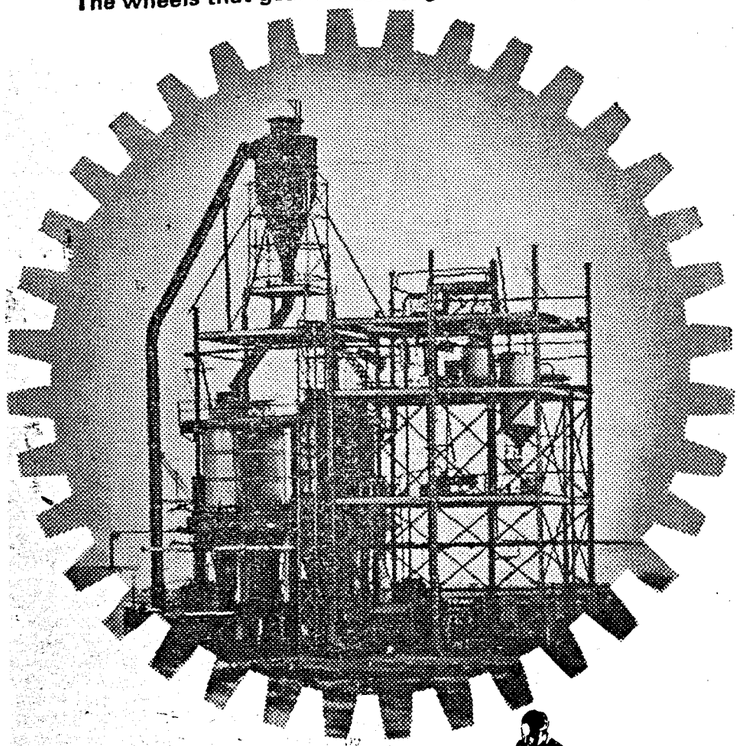
of manufactures. In contrast, Britain had emerged from the war with far less damage to its industry or its physical infrastructures. Moreover, the war had demonstrated the superiority of its democratic institutions. These differences, it turns out in retrospect, were growth-inducing for France and Japan (and West Germany) and growth-inhibiting for Britain.

An adequate understanding of the causes of these differences in economic growth is, of course, necessary for forecasting the medium- or long-term economic prospects of the individual countries. More important, such understanding is essential for a fuller understanding of the process of economic growth itself. It is also of interest to developing countries like India, which were colonies or dependencies of European countries and which have inherited in the vital modern sectors of their economies the institutions and operating practices modelled on the former metropolitan country. The decision-making elites in these countries still follow, consciously or otherwise, the example of the former metropolitan country in innumerable ways — from creating new political or economic institutions to setting the norms of public or private conduct. What is done in Britain must be right (and hence the model to follow) has been an unwritten rule in most former British colonies — and even more so in most of the former French colonies. The influence on economic growth of these institutions, attitudes, and behaviour patterns, though difficult to measure is cumulatively quite large.



In this context, the two surveys of Britain and Japan, which appeared early in 1973 in the London *Economist*, and a study of the growth prospects of France, made by the Hudson Institute (an American research group) are of considerable interest. The *Economist* surveys are not systematic academic studies, but they contain a wealth of incisive observation on the institutional and psychological impediments to economic growth in Britain and on the mainsprings of Japan's phenomenal growth, of interest to students of economic growth. The Hudson Institute study concentrates on an assessment of the growth prospects of France but also contains an interesting analysis of the causes of its brisk economic growth of the post-war period. The survey of Britain written by Norman Macrae, a Deputy Editor of the *Economist*, is perhaps the most interesting of the three studies for Indian readers, because of the historical and hence institutional links between Britain and India and the influence of British attitudes and practices on the Indian elites. It is remarkable, moreover, for its wide coverage of British political and economic institutions and its candour and sharpness in pointing up their weaknesses and deficiencies. It makes a bold attempt to go beyond the obvious causes of Britain's slow economic growth — obsolete equipment, poor management, low productivity of labour arising partly from frequent strikes and dilatory and obstructive tactics of the labour unions, etc — to institutional and psychological factors. Its highly critical and generally pessimistic tone is in marked contrast with the general smugness of the British about their institutions and behaviour patterns. Indeed, the latter attitude, symbolised by the phrase, "it's odd but it works", comes in for especially severe criticism.

Differences in investment ratios and in rates of growth of productivity of labour: The differences in rates of economic growth of the three countries are related, of course, to differences in investment ratios and in rates of increase in productivity of labour. Japan maintained incredibly high investment ratios, 30-35 per cent of GNP, throughout this period; the ratios in Britain and the USA were only half as high, 15-18 per cent of GNP. The resulting gains in productivity of labour were also more than twice as high in Japan as in Britain or the USA; the labour productivity index for 1972 was almost 350 in Japan (1960 = 100) but only 160 in Britain and 150 in the USA. France and West Germany were in between these extremes with investment ratios of 20-27 per cent of GNP and 1972 productivity indices of 180-210. It may be noticed also that the investment ratios of Japan, France and West Germany all have upward secular trends while those of the USA and Britain were more or less stagnant. Second, while the French investment ratios were appreciably lower than the West German during most of the period, the increase in productivity was higher in France than in West Germany. The greater efficiency of investment in France is explained by the Hudson Institute as being due to France not having to reorient a Ruhr and concentrating investment instead on the faster growing technology and service industries.

The two surveys and the Hudson Institute study seek to go behind these differences in the economic indicators and to identify the attitudes, values, behaviour patterns and institutions that influence them and to analyse the ways in which the influences work. Why, for instance, are the Japanese willing and able to achieve such high investment ratios with consequent gains in productivity and in GNP, while the British who led the industrial revolution for more than a century have been content to let themselves slide? This emphasis on the social and institutional influences on economic growth, particularly by the authors of the two *Economist* surveys who would be more at home in corporate boardrooms than in an academic seminar is gratifying; it shows that recognition of the role of these influences in explaining the economic performance of nations has travelled from the academics to economic journalists.

The authors of the *Economist* surveys are aware of the limitations of GNP as a measure of the level of economic development and also that rapid economic growth can involve high social costs. Needham gives in the Survey of Japan data on various indicators of level of living for Japan and other major Western developed countries (Table 2) to show that the Japanese level of living is in fact considerably lower than what the per capita income figures would lead us to expect. The figures of Table 2 indicate for instance that although Japan's per capita income in 1972 was marginally higher than Britain's, its score for housing was almost half of Britain's and that for public amenities barely one-third. The figures show also that despite appreciably lower per capita income, Britain scored higher than both France and West Germany on most of the indicators. They support Macrae's point that the British level of living has not suffered much because of slow economic growth (see below), but not his assertion that Britain is now the poorest country in Western Europe except Ireland. Needham discusses at considerable length social problems such as severe environmental deterioration in the principal industrial and population centres and a grave housing shortage, and the measures being considered by the Japanese Government to meet them. But both he and Macrae consider the rate of economic growth to be a valid measure of overall social progress. Needham sees Japan's phenomenal growth as an expression of the prodigious energy and dynamism of the Japanese people and a measure of the strength of their social system which has sustained them through the process of extremely rapid change, "from a near-feudal society to a supermodern state in a single century, including the cataclysmic experience of 1945" (p 12). Macrae similarly sees Britain's slow economic growth as a symptom of a deep and pervasive social

Rs. 4800 lakhs of industrial loans sanctioned!

What else has GSFC to offer you?

A portfolio full of assistance schemes. Valid solutions to your industrial finance problems. May be, you want to start an industry calling for investment many times over your resources. Come to GSFC. It can help. GSFC has a scheme of *deferred payment guarantee*. For machinery purchases. Whereby you don't have to block your funds on machinery. GSFC can even participate in your *debenture issues*. And if you envisage importing of plant and machinery for your unit, you can obtain *foreign exchange loans* from GSFC. Industrial units set up in backward districts get special concessions from GSFC: *soft loans*. Let not our loan limit of Rs. 30 lakhs stand in your way of approaching us. If your need is beyond this limit, GSFC can get you the funds in collaboration with GIIC, IDBI, IFCI and ICICI.

Consult GSFC. It offers flexible schemes for industrial finance.

1 Based on number of rooms available per 100 people.
2 "Private goods" based on daily calories consumption per person; amount of textiles used per person per year: ownership of cars, television sets and telephones per 100 people.
3 "Public amenities" based on percentage of road mileage that is surfaced; percentage of houses on water supply and sewerage system: number of public libraries per million people; amount of parkland per person in main cities; percentage of 3.5 year-olds in kindergartens.
4 "Working conditions" based on average number of working hours per week; lives lost in accidents per 1,000 workers in manufacturing industry; average worker's number of minutes per day spent in getting to and from work.
5 "Tension-makers" are number of crimes per 100,000 people; number of victims of traffic accidents per 1,000 cars: tons of air pollutants per square kilometre: traffic congestion, in number of cars per kilometre of road: number of passengers in main city undergrounds per day per kilometre of line.

malaise. He debunks the comfortable notion held by many Britons that although its post-war economic growth has been slower than that of most other industrial nations, Britain remains a more decent and humane society in which basic human values such as freedom, decency and public order have been preserved much better than in the other nations. Besides discussing the institutions such as the political system, the civil service, the public sector enterprises and the labour unions which directly affect economic growth, he discusses several others such as the judicial and law enforcement systems and local government whose influence is less direct, to show that the British disease is not merely slow economic growth but malfunctioning of the whole array of institutions.

II
What Ails Britain

Several of the economic ills of Britain discussed by Macrae are familiar enough:

(i) A public sector that is too large, too non-achievement-oriented and too inefficient. The sector, consisting both of industries such as coal, steel and the railways which were nationalised after World War II and of public services ranging from law enforcement to garbage collection, provides employment to almost half of the British labour force. Its inefficiency is indicated by the fact that "the annual deficit of the nationalised industries is already upto something over 1 per cent of the GNP and will continue to go up the longer they are protected" (p 22).

(ii) The trade unions, very large and very powerful but preoccupied with obtaining higher pay and benefits for their members and maintaining their own power with little regard for increases in productivity or the convenience of the public. "... annual wage settlements now soar up to 20 per cent or so against an annual productivity growth of between 3 and 4½ per cent. If this is continued, it must lead to a Latin American situation and a total breakdown in society", and "... British trade unions have come to regard as respectable to call strikes even to cut off public utilities — whose sudden stoppages must endanger life — in order to win their members a few extra pennies a week" (p 30).

(iii) Inadequate depreciation of equipment leading to use of obsolete, low productivity equipment over a wide area of industry. The British have apparently not realised well enough that "in this age ... anybody relying on plant and equipment that are over 15 years old is likely to go bust" (p 4).

(iv) A poorly educated labour force. "As late as 1960 only 12 per cent of 17-year-old Britons were still at school versus 70 per cent of Americans; ..." (p 34).

Of particular interest are his analysis of the ways in which the inefficiencies operate and are perpetuated, and his including obsolete institutions and attitudes along with obsolete equipment among the principal causes of economic stagnation. Institutional absolescence is considered by him to be due primarily to the fact that unlike in the other major European countries in Britain the institutions were not destroyed or seriously damaged by the war. "We are therefore left with a lot of institutions that no sensible country would have re-created", and, "there is a surfeit in Britain of closed rather than open minds, of men whose thinking has been conditioned by the rules and atmosphere of a single institution rather than those who see over the partitions and adapt institutions to suit their own ends" (p 34).

For every institution discussed by him, he makes a number of specific suggestions for reform, and makes the point that Britain's ability to make adequate and timely institutional innovation is the key to its survival. But he is not hopeful about the prospect of reform, because of the attitude of smugness to which reference has been made earlier and because of strong opposition to reform of established pressure groups. The Survey therefore ends on an almost prophetic note. "'The characteristic danger of great nations like the Romans or the English which have a long history of continuous creation', said Walter Bagehot a hundred years ago, 'is that they may at last fail from not comprehending the institutions they have created.' The theme of this survey has been that this danger is now, for Britain, at possibly mortal crisis point. Almost all of the great institutions Britain has created — parliament, the civil service, local government, the law enforcement authorities, the other public services, the nationalised industries, the trade unions — are not performing the functions which were their original purpose. Most are being operated mainly in order to allow the able top people in each of them to enjoy themselves by concentrating on doing the things that give them the most satisfaction. Almost all of the changes that are needed are therefore ones that would cause maximum disruption in what the most intelligent public men in the country have come insensibly to regard as their entirely reasonable sense of purpose. This is why they are the opposite of the changes that are likely

to be put into effect. That is the British disease" (p 36).

Among the other requisites of economic success he puts foremost Britain's ability to shift rapidly its labour force from manufacturing industries particularly the more labour-intensive ones, such as engineering (including automobile manufacture) and textiles, and into those among the more promising growth industries of the last quarter of the 20th century for which it has the greatest competitive advantage. He explains that the competitive advantage of industries such as automobile manufacture is increasingly with regions such as South-East Europe and North Africa where there are large bodies of educated, trained (or trainable), low-paid workers — the shift of the automobile industry to Southern Europe has already started, witness its rapid growth in Spain — and of simpler industries such as textiles with poor countries such as India and Indonesia. The growth industries listed for the rich countries are: management (systems design or capital intensification); banking; training (packaging and transmission of knowhow); higher technology, such as supersonic transport, telecommunications and computers; bio-physics; very large construction, and high fashion goods and services. He discusses Britain's chances of effective participation and leadership in each group of industries and finds them best in banking and high fashion. Not unexpectedly, the USA and Japan are listed as the countries with the greatest advantage for the higher technology industries.

Towards the end of the survey, Macrae makes an interesting analysis of the reasons why the British may not recover the Puritan work ethic which will remain, in his view, the dominant work ethic in the industrial countries for the next 15-20 years. He explains that in most other industrial countries industrial work is a first generation experience for significant proportions of the labour force so that the defensive attitudes towards work that "litter British industry" have not yet developed. In Britain on the other hand, the great majority of the workers are sons and daughters of wage and salary earners so that the dominant attitude towards work is "something which you have to do (preferably without the boss working you too hard) in order to get a living" (p 34). "Another hidden influence on all the 24 mn Britons over the age of 40 is that Britain was probably the only industrial country where the real income of about four-fifths of the people must have gone up in the depression of the early 1930s (because anybody still in a job benefited from the drop in prices" (p 34).

From among the institutions discussed by him, we have selected three — the public sector, the civil service and Westminster model of parliamentary government — for this review because his observations relating to them are of particular interest for Indian readers.

The Public Sector

Macrae considers the narrow national monopoly (public enterprises having a national monopoly of production of a narrow, specialised range of goods or services) model adopted by the Attlee Government while nationalising coal, steel, railways, etc, to be the most important cause of inefficiency of the public sector enterprises. He backs up this conlusion with an analysis of the particular deficiencies of this model and with references to the eminently successful broad-ranging public enterprises such as the IRI of Italy. He explains that each of the British national monopolies is prevented from diversifying into production of related (such as travel agency work by the railways), substitute or competitive goods or services. In this situation, with demands for their specific products shrinking on account of technological and socio-economic changes, the enterprises could stay efficient only by increasing productivity in their specific areas of production and thus becoming "very prolific producers of redundancies" (p 211). As an example of the quantitative effects of technological change on demand, he mentions that in case of the chemical industry (which narrowly escaped nationalisation in the late 1940s) the items manufactured then, form a very small and least profitable part of the present production. But both diversification by the national monopolies as well as technological change (for which they are well situated because of easy access to cheap Government capital) are rendered impossible because of the opposition of the trade unions which are particularly large and powerful in them. He argues for break-up of the national monopolies and introduction of competition in their specific areas of production. He feels that the case for reform is very strong because, as mentioned earlier, the deficits of these enterprises are very large and are constantly increasing. But he is not sanguine about the prospects of reform, because the proposals for reform would not only lead to a confrontation with the unions, but would also be opposed strenuously by the other centres of power and influence, in British society — the entrenched bureaucracy including that in the nationalised industries; the Press and the Parliament, especially the Parliamentary Labour Party. The order in which the three centres are listed is of interest; it is in accord with his assessment of their real relative influence. He explains that the civil service is much the most influential and powerful of the three because the Press takes its cues primarily from it and because the Ministers listen more to the civil servants than to the MPs.

The Civil Service

Macrae states that the club system in the British civil service is quite effective in bringing the best men to the top. But the trouble is that having got to the top they stay there and concentrate on things that give them the most satisfaction which are often not the most important things and turn their attention away from the things which gave most dissatisfaction. But, "when the things that give dissatisfaction (and are therefore ignored) are increasing at a frightening pace, this can be a recipe for cumulative breakdown in any society" (p 8).

At an example he mentions the fact that the brightest brains in the British civil service tend to concentrate in the Treasury because working there is the most fun. "The sad reason for this is that the clever Englishman finds it less tiresome to deal with figures than to deal with people" (p 10), while the most important jobs needing to be done are elsewhere — in law enforcement and prevention of crime, improvement of the environment and education for instance.

The system under which senior civil servants who get to the top stay there for long periods comes in for especially strong criticism. First, it is one of the major causes of ineffectiveness of the Parliament whose main role has been reduced to that of helping pick up the Cabinet; the most talented and dynamic MPs do get in. But after getting into the Cabinet, the Ministers are inclined to listen much more to their senior civil servants than to the MPs. As a result, what goes on in Parliament is generally uninteresting and frequently irrelevant. At the same time, "civil servants in their fifties who have been around the corridors of power for 30 years are bound to impose rule by caution and precedent-ridden bureaucracy in place of rule by innovating democracy" (p 14).

Macrae's remedy for this situation is to have new and daring leadership in a few old, dignified institutions (besides the Ministries and old established public enterprises, he includes companies such as the ICI among them), but old and dignified leadership in a lot of new and daring institutions. The recommendation is based on the management principle that "comfortable jobs whose danger is that they can become bureaucratised should be filled by the restless young, while embarrassing jobs where there will be pressures (from the electorate or from the need to tread over uncharted ground) can best be handled by the cannily experienced". (p 14). Accordingly, top positions in the civil service and in the established enterprises should be filled by young and dynamic men in their thirties and forties, on the basis of short-period tenures — the post of Permanent Secretary should be redesignated as Temporary Secretary — while the more senior civil servants with their ambitions behind them should be increasingly employed in new areas of activity and in inspectorial positions. The young men in top positions in the old institutions will bring dynamism and innovation into them and will save them from getting into a rut while the older men will use their experience in doing embarrassing and difficult jobs or guiding the younger men in avoiding costly mistakes. He cites the successful experience with this practice in both France and Japan, where top civil servants put on their slippers in their forties and are given senior position on the boards of large established enterprises.*

Another argument in favour of the recommendation is that in the age of the data processing revolution when the correctness of an increasing proportion of the decisions, policies and prophecies can be checked by computers, the necessary flexibility in decisions is most likely to be achieved in societies in which the top executives are not old men who have to justify all their decisions and judgments taken over a long period of tenure in the top job but "transitory young birds", and where "the inspectors general are very senior men whose own bureaucratic ambitions are past" (p 15).

* Brian Needham mentions in the Survey of Japan that the outstanding performance of the Ministry of International Trade and Industry in directing Japanese industry (and the economy) is due to this practice. The former civil servants on the boards of the companies serve as the channel through which the objectives and policies of the Government are known to the companies and their implementation ensured.

The Westminster Model

Macrae is very critical of the Westminster model of parliamentary government which has, in his view, proved to be most inefficient in Britain and disastrous for the Colonies.[2] Reference has been made above to his criticism that in Britain, the Ministers listen more to the senior civil servants than to the MPs and that this practice reduces the effectiveness and relevance of the proceedings in parliament. The principal disadvantage of the system is that it enables "a bureaucratically advised Ministry to pass quickly its whims through a satellite legislature", because "instant government intervention which is what our British sort of constitution allows, has since 1945 most usually proved to be wrong" (p 16). He cites the post-war economic experience of Western European countries and the USA to argue that "some of the most successful countries in 1954-73 have been those with constitutions or problems that prevent them from having strong governments at all" — the Netherlands and Belgium are mentioned as examples — or those like the USA where there is separation of powers between the legislature and the executive. His recommendations for reform include:

(i) transfer of responsibility for formulation of macro-economic policy from the Treasury to the Bank of England because macro-economic policy making by the central banks has proved to be generally more successful than that by the Governments;

(ii) introduction of proportional representation, and

(iii) ending the myth of the possibility of the Government resigning and a general election being precipitated by recognising officially that "the British Governments do not have to resign between five-yearly general elections until they want to".

But here again he is not hopeful about the prospects of reform because "the established pressure groups in favour of the present mess are too great".

A journalist is in the happy position of not having to back up his views with supporting statistical or other empirical evidence in the way that an academic writer has to do. His analysis may lack academic rigour or depth and some of his conclusions may even be unwarranted but the writing permits a wide-ranging view of situations which most academic writing fails to achieve. Macrae exploits this journalist's privilege fully and as the foregoing presentation indicates, he subjects to his critical gaze the entire range of British political and economic institutions and the attitudes and behaviour patterns of the decision-making elites. Most of his suggestions for reform are not particularly noteworthy because they consist in reproducing in Britain, American or West European institutions or practices. But his readiness to include within the scope of his critical review institutions such as the Westminster model of parliamentary government which are so firmly rooted in the British political tradition, and to hold it up as a prime cause of economic stagnation is noteworthy.

If one accepts his position that the British malady is serious malfunctioning of the whole array of economic and political institutions and that Britain's ability to survive depends upon its ability to undertake rapidly a fundamental restructuring of the institutions, then one must share his pessimism about Britain's prospects. Because, despite Britain's truly remarkable capacity for institutional innovation, it is doubtful if it can undertake the fundamental restructuring that Macrae considers necessary. Indeed, it is doubtful if any society could achieve such a restructuring without violent and revolutionary changes.

One does not expect the Deputy Editor of a journal like the *Economist* to be non-partisan in his views or to select and present his facts except to suit his chosen bias. The timing of the survey, on the morrow of Britain's joining the EEC, and its central theme are closely related to the Heath Government's objective of accelerating Britain's growth rate to 5 per cent a year. But the value of the survey and its impact on policy-making would have been greater if Macrae had been more objective and less partisan in selection of his facts or in presenting his conclusions. Two examples will illustrate the point. First, while discussing the inefficiency of Britain's national monopolies and their ever-increasing deficits, he fails to mention that they are mainly in industries such as coal, steel and railways, which are sick and declining in all western developed countries, because of particularly severe impact of technological and human obsolescence — besides outdated technology they have large numbers of old or middle-aged workers who cannot be fired because of the power of their unions or other social reasons — and have had to be supported by state subsidies. The contrast with the chemical industry in Britain, to demonstate the superiority of private enterprise or with the dynamic petro-

leum-dominated giants such as the IRI of Italy to argue that broad-ranging public enterprises are more efficient than the narrow national monopolies is particularly unfair because the chemical (largely petro-chemical) and petroleum industries have been among the most profitable and dynamic industries in the post-war period, because of the low price of petroleum as a source of energy and its versatility as a raw material.[8] Again, while condemning the British trade unions for their growth-inhibiting and anti-social practices, he fails to raise the more basic question: Why is their behaviour so different from that of their counterparts in the Low countries or Northern France where the industrial tradition is nearly as longstanding as in Britain. Indeed, his linking of the decline of the Puritan work ethic in Britain with the length of the industrial experience appears fatuous. Might not part of the problem be due to Britain's social rigidity — Britain has not experienced the social mobility which the USA with a much shorter industrial experience and starting with an immigrant labour force has experienced — and the attitudes and behaviour patterns of the employers? Macrae finds the attitudes and behaviour patterns of the members of the British elites within Government particularly growth-inhibitive. Perhaps the members of the elites who go into industry are also not significantly more innovative or growth-oriented!

III

Japan's Special Strength

Unlike the survey of Britain which is the first such survey of the country to be published by the *Economist*, the survey of Japan is the third, the two earlier ones having been published in 1963 and 1967. The causes of the phenomenal economic growth of Japan had been analysed in detail in the earlier surveys so that a large part of the present survey is devoted to non-economic subjects such as political parties and the political process, defence, foreign policy and the educational system. The principal economic question to which the survey is addressed is: Can Japan reorient successfully its economy from its present overwhelming export-orientation to a more balanced export-cum-domestic-consumption orientation which is needed in order to meet pressing national problems such as the extreme housing shortage and the severe environmental pollution, and which will in any case be forced on it by the other developed countries in order to achieve greater balance in their trade with Japan and to remove the threat to the international monetary system, which the astronomical balance of payments surplus of Japan poses? The author, Brian Needham, is quite hopeful about Japan's ability to make the needed changes rapidly, without serious economic dislocation or even significant slackening of the growth rate, although its post-war economy had been built up specifically to pump out a flood of cheap, well made exports. This optimism is based on his very high regard for the quality of Japanese economic management and the strength of the social system. While the management has directed the rapid economic changes of the last century, the social system has provided the security which has enabled the Japanese to keep sane during the extraordinary transition.

He forecasts an average growth rate of 9 per cent for the 1970s which would mean that the Japanese had by the start of the 1980s "overtaken the Americans' present standard of living per head. And, if they could manage to keep it up a bit longer and the Americans did not accelerate they would become the richest people in the world sometime in the second half of the 1980s" (p 24). Before reaching this conclusion however, he discusses two recent assessments of the growth prospects of Japan, made by American authors (Herman Kahn: "The Emerging Japanese Superstate, 1971, and Zbigniew Brazezinski: "The Fragile Blossom", 1972). Kahn had forecast an annual growth rate of 11-12 per cent for the 1970s, only a bit lower than the record rate of 12.2 per cent achieved in the second half of the 1960s. Brazezinski was much less optimistic: he forecast a significant slow-down in the growth rate to an average of 8 per cent in the first half of the 1970s and 6 per cent in the second half. Since both authors had essentially completed their assessments before the first revaluation of the yen (in 1971) Needham's forecast of 9 per cent indicates therefore his confidence in the capacity of the Japanese economy to sustain a very high rate of growth under increasingly adverse conditions.

Of course all such forecasts of growth have to be revised after the recent Arab restrictions on exports of oil and the steep increases in oil prices that have followed them. Japan's growth rate during the 1970s is expected to be reduced much more than that of almost any western industrial nation because its dependence on imported oil (as a source of energy and as an industrial raw material) is so much greater.

The survey starts with a discussion of the Japanese value system, particularly the values which enable the Japanese to identify themselves completely with their company; two results of the identification are the norm of life-time employment with a single company and intense loyalty to it. Drawing upon the work of Chie Nakane, a Japanese woman sociologist,[4] Needham mentions that the explanation lies in the fact that in Japan, "the feeling of belonging to the same group does not come from people of the same sort voluntarily banding together but from different sorts of people recognising that they are linked to each other by membership of the same organisation. The connection with the family is obvious and indeed the Japanese often talk about the company they work for in the language of a family. The word *ie* which means household lies at the root of Japanese society" (p 11). This is because the group in Japan is created by the 'frame' which is defined as "the fact of living in the same place or working for the same company or being involved in any relationship in which people of different sorts serve a common purpose". One result of this frame-centred group loyalty is weakness of class consciousness; Needham calls Japan "the most unmarxist society". But his explanation of the linkage between this loyalty and the limited impact of the youth rebellion of the late 1960s which had swept the western universities is less than convincing. According to him, "the neat, polite, helpful youngmen with their noses down on their desks in the junior executive levels of those offices might be a different species from the uncontrollable undergraduates many of them were three years ago ... Three years ago these youngmen were a part of the community of students, and behaved and believed accordingly. Now life has transferred them to a new community, and they have changed their ethos as if they were changing a jacket" (p 23). Why, one may ask, did the frame-centred group loyalty not extend to the University in the same way that it extends to the company and prevented the rebellion from occurring at all? And, if the students consider themselves to be members of a community why do not the workers do the same?

Apart from the intense loyalty of labour and management to the company, Needham lists the following as

the principal reasons for the phenomenal economic growth:

(i) Ultra-modern high-productivity equipment, financed by extraordinarily high rates of saving and investment, which are expected to rise to about 37 per cent of GNP by 1978. The two principal motives for large savings are: (a) the need to provide for retirement (the retirement age is quite low) and (b) the intense desire to send children to universities. Saving is promoted also by curiosities such has the practice of paying a substantial proportion of the workers' salaries in the form of Christmas bonuses. The modern high-productivity equipment is a legacy of the hectic post-war reconstruction (with liberal American assistance) and an indirect result of World War II during which most of Japanese industry was wiped out. The success of the reconstructed Japanese industry illustrates the principle of success feeding upon itself. "When an industry is growing fast so much of its equipment is new and efficient that its prices can undercut those of its neighbours which means that it earns such big profits that it can put in even newer and more efficient machinery and so on all over again" (p 23). Now the position is that "big Japanese firms keep large staffs of people whose sole job is to think how soon they can put new machines in".

(ii) Excellent economic management. "The bureaucracy and to a slightly lesser extent the planning staff of the big companies remain among the very best in the world. Intelligent, numerate and accustomed to thinking five years ahead these people are recruited from among the brightest graduates of the best universities".

(iii) A highly educated labour force. "Something like a third of the new entrants to the labour force each year have just come from university or college".

(iv) Close co-operation between the Government and industry. "This extraordinary combination of labour and capital is supervised by one of the world's most intelligent government machines which knows what it wants businessmen to do and by virtue of the authority it wields in Japan's social system by and large gets them to do it" (p 15). The Government's power is reinforced by the practice of employing people who do not get to the very top in the civil service in senior positions in industry. "This connection is the lever by which the government operates its so far uniquely successful powers of guidance over the economy" (p 23).

IV

The Future of France

On the basis of its post-war economic performance and current growth, the Hudson Institute has forecast that "ten years hence France can hope to become the most powerful country in Europe in terms of total production. It possesses the most dynamic economy in Europe and that its rate of growth is one of the most rapid in the developed non-Communist world, apart from Japan". It explains that France's GNP is already 25 per cent higher than that of Britain (the exact reverse of the ratio in 1958); that output per capita is higher than that of West Germany and that total output will overtake that of the latter by the next decade and, finally, "that by 1990 the French will enjoy the highest living standards in Europe".

The reasons for these predictions have been listed as follows:

(i) a consistently high growth rate, 4-4.5 per cent in the 1950s, 5.5 to 6 per cent now;

(ii) a labour force that is more hard-working, better educated, more productive per head than those of its neighbours;

(iii) a general consensus favouring industry so that the growth rates of 5-6 per cent is not considered too high, by the workers or the politicians;

(iv) relatively large service sectors (which have faster rates of growth than manufacturing) and concentration of investment in advanced technology industries, aerospace, information processing, electronics, etc, which have much higher growth potentials than traditional industries such as steel. Unlike Germany, France did not have a Ruhr to modernise and reorient, and concentrated instead on these advanced technology industries.

(v) at least 3 million foreign workers whose wage and living levels are much lower than those of the French. Since a large proportion of them are Italian, Spanish or Portuguese, they can settle and integrate into the society so that their presence does not constitute the problem which presence of larger numbers of foreign workers does in most West European countries. The supply will not last forever and France will have to depend increasingly upon workers from other sources notably Africa, whose integration will be more difficult.

The Institute adds that France's political and economic ascendance constitutes only a resumption of the historic position — France was the most powerful country in Europe from the 16th to the 18th century — which was interrupted early in the 19th century by the French Revolution and the Napoleanic adventure. They exhausted France physically and demographically. Second, their traumatic experience left the French bourgeoisie without dynamism and imagination. Finally, since the social structure that emerged from them the peasants were bound to the soil, increment of the population from the country to the towns, which is essential for economic growth was slow.

V

The Case of India

Reference has been made above to India's slow economic growth during the post-war period and the increasing economic distance between India and the developed countries. If a survey, similar to Macrae's survey of Britain, were written for India, it could also begin by mentioning that India's economic performance has been poor despite the fact that it started the post-war period with major advantages, some of them unparalleled among the developing countries. The most important among them were the following:

(i) A fairly large and diversified industrial sector. India was among the first 8 or 10 countries in the value of gross industrial output in the immediate post-war periods. Its industry had not suffered any damage during the war, but had on the contrary accumulated large resources for modernisation and expansion. Moreover, it had for several years after the war, an unrivalled position as the principal exporter of manufactures, such as textiles, in the markets of the developing countries of Asia and Africa.

(ii) Fairly well developed physical infrastructures, particularly rail and road transport and communications;

(iii) Well established structures of administration and social services which had been manned even in the higher echelons by Indians for considerable periods;

(iv) Considerable educated and skilled manpower, including large numbers of persons with administrative and managerial experience and a large body of entrepreneurs with a long historical tradition, and

(v) Outstanding political leadership which gave India stability during the

critical first two decades of Independence and enabled it to work successfully the institutions of parliamentary democracy which have collapsed in most of the developing countries.

India's economic growth has remained slow moreover in a period characterised by brisk and accelerating growth in most of the developing countries, so that India has continued to be very poor while a large number of the developing countries, including several of those that have not been blessed with large oil revenues have moved to the intermediate stage of development while some, like Taiwan, have reached a near-developed stage. The Indian growth rate of 3.7 per cent during both 1950-60 and 1960-70 has been significantly lower than the average rates for all developing countries — 4.7 per cent during 1950-60 and 5.2 per cent during 1960-70. The comparison is even more unfavourable to India if the South Asia region is excluded; the Indian rate has been scarcely half of the average rate for all developing regions excluding South Asia.

The consequences of the sluggish economic growth have been far more alarming for India than for Britain. First, the most basic economic problems, such as chronic undernutrition and malnutrition of the large mass of the population and recurrence of periodic famines are not much nearer solution than they were 28 years ago. Second, India is today not merely among the poorest countries in the world—it has almost half of the total population of the countries classified as the "poorest" by the International Development Association of the World Bank.[5] And continuation of these trends for another 25 years will mean that by the end of the century when most of the present-day developing countries will have moved to the developed, near-developed or intermediate stages, India will still be poor and will have in the poorer half of its population, perhaps the world's largest human mass for which extreme poverty continues to be a daily experience.

The above has not been written either to minimise the handicaps with which India started its post-war economic career or to underrate the very considerable increase in the development potential that has occurred during this period. Foremost among the handicaps were extremely slow economic growth and stagnation in the agricultural sector the most serious consequences of which were growing pressure of population on land and a steadily deteriorating food supply position. Large size itself was probably a major handicap: the transition from economic stagnation or progressive deterioration to sustained economic growth is *in our view* significantly more difficult when the human mass involved is 400-500 millions than when it is a few millions.[6] As for the increase in the development potential, it is necessary to refer only to a few indicators such as near doubling of the literacy rate, from 16.7 per cent in 1951 to 29.5 per cent in 1971 and the increase in the numbers of educated, trained and skilled personnel. The number of students in secondary schools had increased five times, from 1.1 million in 1950-51 to 5.5 million in 1970-71 while the annual outturn of engineering graduates almost tripled within a single decade, from 5,700 in 1961 to 15,000 in 1969.

The principal object of writing the above is to point out that (i) a significant acceleration of India's rate of economic growth is essential, and that (ii) in the search for measures to achieve the acceleration, it will be necessary to take a critical look at the values and attitudes of India's economic and political management and at the economic efficiency of the British-modelled institutions that dominate the modern sectors of the Indian economy. A further point may be made also particularly from the experience of Japan, namely that borrowing of values and institutions is not as critical to achieving rapid economic growth as technological borrowing. Japan's example illustrates not only that vigorous economic growth can occur in non-Western societies — this would have been hotly disputed by many Western economists not so very long ago — but that these societies may find the mainsprings of growth in their own (suitably reoriented) traditional values and institutions. It will be necessary for India's decision-making elites to move away from their present attitude of uncritical condemnation of traditional Indian values and institutions and to have instead a more discriminating and perceptive attitude towards them. The strength of some of the traditional institutions such as the joint family is undoubted; most corporate business in India continues to be organised round joint or extended families. Some of them contain also elements that could assist in sparking rapid economic growth. There is a precedent for such discriminating acceptance of tradition in India's recent political history. The Father of the Nation, while vigorously opposing the social inequity and abuses of the traditional Indian society — these were symbolised by his total opposition to untouchability and ill-treatment of the scheduled castes and tribes — could nevertheless move India on the path of political freedom by appealing to deeply held traditional values. Movement towards vigorous economic growth may yet require similar perceptive appeal to Indian tradition.

Notes

1 The page numbers after the various quotations relate to the respective surveys.

2 Referring to the experience of the Colonies with the model, he writes, "The countries of the new Commonwealth are now almost without exception among the few areas of the world where government is not succeeding in inspiring either economic growth or personal freedom or political stability. Our usual legacy has been to leave squabbling within their power structures the two governing types that have proved most inappropriate for ruling any people in the last third of the twentieth century. Our imperial epilogue is that for the past two decades London School of Economics socialists and Sandhurst-types-of-generals have been running *coups d'etat* over the parts of the world that now are indeed painted red . . ." (p 7).

3 If the recent 3-4-fold increase in the price of crude oil stays, the position could change radically. Coal and railways could experience rapid growth while the petroleum and petrochemical industries could go through a period of major restructuring in which their growth remains slow.

4 Chie Nakane: "Japanese Society", Weidenfeld and Nicolson, London, 1970.

5 The countries classified as the "poorest" (with the capita incomes under $ 120 in 1972) by the IDA were the following:

	Population (millions)
"Least developed" countries: about 20 countries of Africa (mostly former French colonies in Central and West Africa) and Asian countries such as Nepal and Afghanistan	131.0
India	538.1
Pakistan and Bangladesh	130.2
Indonesia	115.6
Nigeria	55.1
Zaire	18.8
Sri Lanka	12.5
Total	1,001.3

6 While we are not aware of any study of the relationship between size and economic development, among the present-day developing countries, the fact that most of the large developing countries are in the lowest per capita income group and have experienced relatively slow rates of economic growth during the period, 1950-70, is not without significance.

A Chronicle of the DMK Split

K Ramaswamy Sastry

The 1969 split in the Congress took place at least partly because of the warring postures assumed by the party's organisational wing and the parliamentary leadership. Later, the split was sought to be used as an ideological tool.

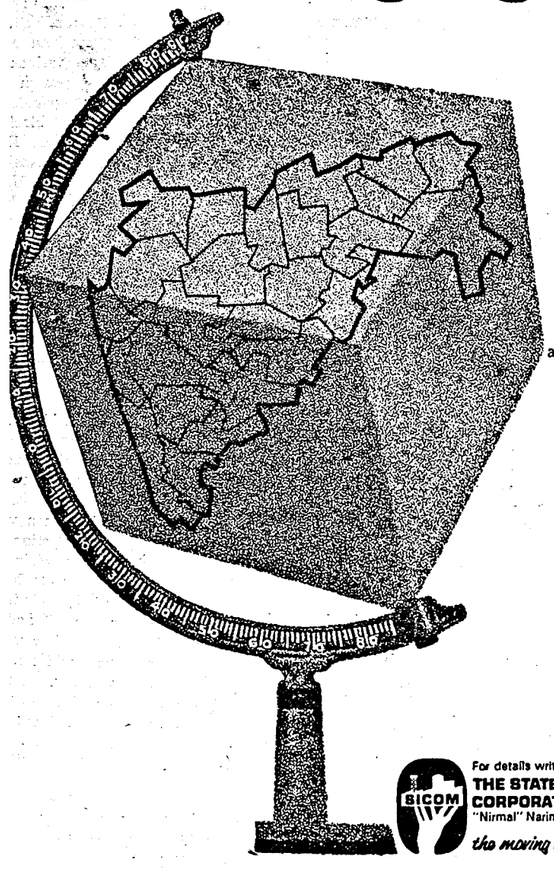
But the DMK split occurred mainly because of a clash of personalities.

EVER since it displaced the Congress as the ruling party in Tamil Nadu in 1967, the DMK seems to have developed certain diseases commonly associated with political power. Corruption has become rampant under DMK rule. Its image, which was assiduously built, has been tarnished by elements in the party who have made money by unfair means. Its contacts with the people have also weakened. For instance, the students, who strongly backed the DMK's rise to power in the 1967 general elections are no longer its passionate torch-bearers.

The 1969 split in the Congress took place at least partly because of the warring postures assumed by the party's organisational wing and the parliamentary leadership. Later, that split was sought to be used as an ideological tool. But the DMK split occurred mainly because of a clash of personalities, though M G Ramachandran contended that it was basically due to a clash of principles.

Matters within the DMK came to a head on October 11, 1972, when the DMK Treasurer, M G Ramachandran (popularly known as MGR), was suspended from the primary membership of the party. 26 out of 32 members of the DMK's Executive Council signed a memorandum demanding disciplinary action against MGR for his vehement criticism of the party leadership. But MGR was no common, garden variety of politician but a leading film-star and thus a more 'genuine' idol of millions than any of his erstwhile brothers in the DMK ranks. He was in his own way instrumental for the astounding successes of the party first in the 1967 elections and then in the 1971 elections. According to Kuldip Nayar, the conflict began in March 1971 when MGR reportedly pressed his claims for a berth in the state cabinet. Karunanidhi hedged on the ground that the rules of conduct did not allow for a minister who would combine a film career with an executive job.[1] From then on, MGR tried to strengthen his hold on the party with the help of his 'MGR Manrams' (fan clubs). The other personal reason for Karunanidhi's ire against MGR was the latter's popularity and mass base. The MGR Manrams and MGR Rasigar Manrams claimed a membership of three lakhs against the DMK's total membership of six lakhs. Karunanidhi, therefore, tried to project his son, M K Muthu, as an alternative to MGR before the film-loving party masses. It was alleged that attempts were made to convert thousands of MGR Manrams into manrams named after the Chief Minister's son and naturally MGR resented these efforts.

Thus the tussle had already reached a point of no return, when MGR raised the sensitive issue of corruption and deviation from Anna's ideals such as prohibition. Karunanidhi was only waiting for an excuse to get rid of MGR from the DMK. MGR was expelled for his 'anti-party activities', the most important being his insistence that the DMK leaders at all levels, and their relatives should disclose their assets.



Earlier, matters had come to a head at the Madurai District DMK Conference, when MGR as the party Treasurer had insisted that proper accounts be rendered for the funds collected. He had even questioned the figure of over Rs five lakhs announced as collections at the Madurai Conference. It was alleged that only a little over Rs one lakh had in fact been collected.[2]

Later, MGR threatened that he would go to the people, if the party's General Council did not accept his plea about disclosure of assets. But what alarmed the top DMK leadership was MGR's determination to move a resolution concerning the disclosure of assets at the party's General Council scheduled to be held on October 12, 1972. Evidently to forestall this move the party took the abrupt and preemptive step of expulsion. The Chief Minister and President of the DMK, Karunanidhi, defended the action taken against MGR on the ground that it was meant to "save the party". He, however, stated that it was painful for him to have taken this action on one of his closest associates of well over two decades.

MGR's suspension made thousands of his fans extremely restive and there were state-wide demonstrations against Karunanidhi. Pro-MGR rallies were held at Coimbatore, Trichi, Erode, Mettupalayam, Tirunelveli, Madurai, Vellore, Gudiyattam and Madras. The MGR supporters at various places, including Bangalore which has a sizeable Tamil-speaking population, reacted sharply, carrying black flags and shouting slogans against Karunanidhi. At some places the processionists even burnt the effigy of the Chief Minister. For quite some time, violent demonstrations protesting against the suspension order continued in all parts of Tamil Nadu. It was obvious that Karunanidhi and the DMK High Command had made a major miscalculation; they had not expected the storm that broke out. Whether the stability of DMK government was affected or not there was now no doubt that the DMK would not be the same again. MGR, on his part, exhorted his followers and all DMK workers to support him in 'relentless battle' in the cause of righteousness and saving the party from dictatorship.[3]

Kamaraj, who had been very critical of the DMK administration ever since it came to power, saw in the emergence of MGR a rival to his popularity. He described the split in the DMK as "a stunt or drama" and said that MGR had been defending the DMK all the time and he could not have suddenly become virtuous. On the other hand, Rajaji, the elder statesman, applauded MGR and his efforts to topple the corrupt ministry. The CPI, also very critical of the DMK's misrule, joined hands with MGR in his campaign against Karunanidhi's ministry. MGR had two clear advantages over his rivals: (1) he was challenging the DMK leadership on the emotive issue of corruption and, (2) he was filling the leadership vacuum in the opposition camp created by the abdication of the Congress in DMK's favour in the 1971 elections.

Note the latest change in Maharashtra's industrial geography.

This Package of Graded Incentives makes all areas more attractive.

"Grading"— a new advantage

Maharashtra's Package Scheme of Graded Incentives has divided the State into 4 zones—the developed areas and the developing areas. All developing areas have been graded according to existing circumstances and higher scales of benefits apply in areas which are relatively less favourably placed. For instance the Sales Tax Refund is offered for 6 years in certain areas but for 10 years in other areas.

Similar gradations apply to incentives like relief from incidence of certain rates (electricity tariff, octroi, water royalties, and non-agricultural assessment) and preferential treatment under the government purchase programme.

There's something else

This scheme is implemented by SICOM—the people who work hard with expertise and guts. What's more, you can take advantage of SICOM's flexible financial assistance and plant location, project investigation and project implementation services. All given to you in SICOM style.

Avail of the Maharashtra Government's Package Scheme of Graded Incentives. Now!

The DMK executive which met on October 12, 1972, at Madras, viewed the unexpected fierce public reaction to MGR's suspension with concern. After taking stock of the situation, a peace feeler was sent to MGR, offering to reconsider his suspension in the event of an expression of regret for his public utterances. The offer was promptly rejected by MGR when he asserted that "it is they who should express regret and not me". E V Ramaswamy Naicker and K Manoharan, MP, earnestly tried to bring about a reconciliation but in vain.[4] Gradually, violence spread throughout the state as a result of the stalemate.

Meanwhile, MGR added a new dimension to his campaign by calling for a judicial probe into the assets of senior partymen who had earlier been accused of corruption and nepotism. Faced with this unexpected success of MGR in mobilising the masses against the Karunanidhi ministry, the policy-making General Council of the DMK approved the action taken by the party high command against MGR. Endorsing its action, it also asked the high command not to make any more peace overtures to him. All the 277 members present (out of the total strength of 310) supported the resolution. It was generally interpreted as an unambiguous slamming of doors, although Karunanidhi said the "doors always stay open". MGR observed that he was amused by this remark of Karunanidhi because the late Annadurai had repeatedly told his partymen that the DMK had "no door" and it was an open house to all those who believed in the party's ideals. He reiterated that there was no question of his expressing regret as he had not done anything wrong. He also expressed surprise at the party General Council's decision ratifying the action taken against him. He praised the people for their spontaneous support to his operation cleansing which had assumed the proportions of a mass movement.

Birth of Anna-DMK

On October 16, 1972, MGR formed a new party together with his followers in Alandur, a suburb of Madras city. The new party was named Anna-DMK, with the same red and black colours of the DMK flag along with a picture of Annadurai in the centre. MGR explained that his party would steadfastly implement Annadurai's policies and programmes, including prohibition. Later, he toured the state extensively to explain to the people the need for the new party. He drew large crowds wherever he went and generally felt satisfied by the people's response to his views. Since the formation of the new party, many in the DMK had switched their loyalties to the Anna-DMK and every day thousands joined the new party. The immediate reaction of Karunanidhi to the formation of the Anna-DMK was that MGR had "achieved what he wanted and planned to do".[5] K A Krishnaswami, MP (Rajya Sabha), who had become the second casualty of the DMK when he was also expelled for violation of party discipine and 'anti-party' activities, was promptly made the State Organiser of the Anna-DMK. *Thennagam*, the daily edited by Krishnaswami was made the mouthpiece of the new party.[6]

However, the split was anything but ideological because the programme and policies of the Anna-DMK are in no way different from those of the DMK. The basic goals are almost the same: (1) more powers to the states and the need for transfer of residuary powers to the states and (2) the regional language should be the official language in each state and English should continue as the link language of the country. It is evident from the Anna-DMK Manifesto[7] released recently that apart from the above two common features, the one most important issue which the new party pledges to implement if voted to power, is total prohibition in the state.

The other socio-economic principles and objectives that the party stands for — collectively called *Annaism* by MGR, after the late Annadurai — include, among other things, ceiling on urban income, elimination of intermediaries, nationalisation of more banks and more effective implementation of social goals of bank nationalisation, nationalisation of heavy industries, takeover of the means of production and distribution of essential commodities, demonetisation of hundred-rupee notes to eliminate black money, etc. Also, students are promised job opportunities after completion of their studies or in the absence of jobs some kind of "guarantee for a living".

The Anna-DMK manifesto also asks for a constitutional amendment to grant the power to the electorate to recall elected representatives who have lost popular confidence or have swerved from their duties. An Anna-DMK Chief Minister, in the event of the party being voted to power, would have to seek an annual vote of confidence from the party's General Council. These policies sound far-reaching, if not sensational, in the context of the pervasive political permissiveness.

To continue the narrative of events — on November 4, 1972, MGR and M Kalyanasundaram, MP, met the Governor, K K Shah, to present separate petitions containing lists of 'specific charges' against the DMK ministry to be forwarded directly to the President of India. The Governor informed them that he could forward the petitions to the President only after verifying the facts from the state government as the constitutional procedure required him to do so. The Governor's reply led them to present their petitions directly to the President on October 6, 1972. They urged the President to appoint a commission of inquiry to go into the charges of corruption against the DMK ministers. Again, on November 19, 1972, K A Krishnaswami and K Manoharan, MPs, met the President and the Prime Minister and urged them to set up the proposed *inquiry commission*.

The Centre promptly forwarded the memoranda to the Tamil Nadu Chief Minister for his comments. Karunanidhi, after going through the charges levelled against his ministry, is reported to have remarked that the two petitions did not contain anything new. The CPI leader, Kalyanasundaram, reacted sharply to the Chief Minister's remark and said that the Centre had forwarded the petitions to the Chief Minister as a matter of routine and the Chief Minister had given the impression of ignoring these charges. He said Karunanidhi should not have hesitated to face a commission of inquiry even if he felt the charges were not serious enough.[8]

On December 14, 1972, Karunanidhi sent his comments running to 246 pages on the memoranda of charges presented to the President earlier. He denied all the allegations and dubbed them as "extremely frivolous, vexatious and false".[9] Further he raised a fundamental constitutional question in stating that a "state cabinet is not accountable to the Union government".[10] He also said that the state cabinet could not be subjected to a commission of inquiry as demanded by the Anna-DMK and the CPI.

Most of the national dailies, however, asserted that the Centre had the right to enquire into charges of corruption. But most of the opposition MPs were inclined to agree with the view held by Karunanidhi. Generally, they felt that it would not be healthy for democracy if the Union government were to

act just on the basis of complaints as in that case no government would be invulnerable.[11] On the other hand, some Congress MPs felt that the tone of Karunanidhi's reply to the Prime Minister was challenging in nature. They believed that Karunanidhi wanted to assert that there were specific spheres of functioning for the states and for the Centre and what he said was a reiteration of his demand for the states to have a larger measure of autonomy.[12]

The Anna-DMK and CPI leaders later submitted a 200-page rejoinder to the Prime Minister in answer to Karunanidhi's reply.[13] Indira Gandhi also referred this rejoinder to Karunanidhi for his comments.

Popular Support for Anna-DMK

Meanwhile, M G Ramachandran had been alleging that the DMK government was indulging in acts of lawlessness, police repression and violence on innocent people who supported the Anna-DMK. He had led a mammoth procession to Raj Bhavan on November 10, 1972. The sole aim of the procession was to express people's agony to the Governor. The procession was peaceful and orderly and it was an impressive demonstration of popular support for the Anna-DMK and its twin demands: (1) the resignation of the ministry and (2) the setting up of a commission of inquiry into the charges against the Karunanidhi ministry.[14] But commenting on the rally, the Chief Minister said that it was "a victory for the Communist party", thereby deriding the appeal of the Anna-DMK. In the meanwhile, the Congress High Command met at New Delhi on November 12, 1972, and decided that it should not involve itself in the situation created by the split as this was only a "purely internal party matter".[15] However, it felt that the Centre should look into the charges of corruption levelled by MGR against the DMK Ministry and act in accordance with the provisions of the Constitution.

On November 15, 1972, Tamil Nadu observed a near total hartal in response to a call given by the Anna-DMK and the CPI. The hartal was called to demonstrate "popular ill-will" against the DMK ministry, to protest against lawlessness and to back up the demand for a judicial inquiry into the corruption charges against the state ministry. This time the Chief Minister claimed that the hartal was no indication of the people's attitude towards DMK rule. But more independent observers described it as "the most complete witnessed in the state".[16]

For the third time within a month, the Anna-DMK and the CPI have organised a demonstration in the shape of a 'voters rally' throughout the state on November 26, 1972. As planned earlier, memoranda were submitted to the DMK MLAs requesting them to withdraw their support from the ministry. There were conflicting reports about its success or otherwise. About 500 persons marched to the Gopalapuram residence of Karunanidhi and and four leaders were allowed in to present a memorandum to the Chief Minister, who received it personally. Later he commented in his usual inimitable style that "I polled over 63,000 votes (in the 1971 Election). But the procession consisted of only 500 persons ... And I don't know how many of the processionists were from my constituency".[17] The Harijan Welfare Minister, Satyavani Muthu, also accepted a memorandum personally. In other cases, either family members of the MLAs received the memoranda or they were pasted on the doors of their houses. The organising parties, the Anna-DMK and the CPI, claimed that the voters rally was a big success in the state as a whole. They characterised the rally as the third phase of the "struggle against the Karunanidhi ministry's continuance in office".[18]

Earlier, on November 14, 1972, the Governor, K K Shah had prorogued the session of the Tamil Nadu Legislative Assembly and Council. This was a logical sequel to the extraordinary ruling adjourning the Assembly till December 5 by the Speaker, K A Mathialagan. Earlier, he had advised the Chief Minister to secure a fresh mandate from the people. The Chief-Minister had rejected the suggestion and said his party would go to the polls when the term of the Assembly expired in 1976. The order of adjournment followed, although the Speaker had declared earlier that he would allow discussion of a motion for the removal of the Speaker on the following day. But as a result of the prorogation the motion for the removal of the Speaker lapsed.[19] However extraordinary the situation might have been in Tamil Nadu in the wake of the split the stand taken by the Speaker was clearly improper and unjustified. Karunanidhi's hold over the Assembly was clear as 178 MLAs of the ruling coalition were solidly with him. The Chief Minister in a statement appealed to Mathialagan to accept in true democratic spirit the suggestion made by an overwhelming majority of the MLAs to resign from the speakership. Mathialagan rejected the demand and stated that although he had earlier announced that the motion for the removal of the Speaker would be taken up on November 14, he felt that since there was an extraordinary situation in the state following the split in the DMK it called for an extraordinary solution to resolve the crisis. The Speaker's partisan loyalty to the Anna-DMK was revealed when he observed that "it is not enough for a chief minister to enjoy the support of MLAs alone".[20]

Soon after, the Madras High Court admitted three writ petitions filed by Mathialagan, MGR and Thangamani (CPI) challenging the action of the Governor in proroguing the session of the legislature. In yet another development on November 28, the Governor summoned the Tamil Nadu legislature to meet on December 2, 1972. All its members were telegraphically informed of the Governor's notification.

On December 1, 1972, the Madras High Court made it clear that the business of the Tamil Nadu legislature need not be stopped because of the pendency of the writ petitions filed against the prorogation by the Governor of the legislature.[21] On December 16, 1972, a full bench of the Madras High Court upheld the Governor's prorogation of the legislature. The Court justified the Governor's action as being guided by the "advice of the Council of Ministers".[22]

Removal of the Speaker

The Tamil Nadu Legislative Assembly met on December 2, 1972 and witnessed unprecedented scenes of confusion. Pandemonium prevailed when the House had two presiding officers conducting parallel proceedings simultaneously. It all started when the Speaker took up the no-confidence motion tabled by the Anna-DMK against the DMK government. As Mathialagan was speaking, Veerswami of the DMK read out a resolution and asked for the removal of the Speaker from his office. Veeraswami was supported by 183 members of the Assembly. The DMK floor leader and Education Minister, V R Nedunchezian, then stated that when such a motion was being discussed the Speaker ought to step down. Mathialagan refused to comply with the DMK leader's request. However, the House resolved that the Deputy Speaker should preside and conduct the proceedings of the House. Thereupon, P Sreenivasan, the Deputy Speaker, moved close to the Speaker's chair and began conducting the proceedings. In utter disgust Mathialagan left the House and the entire opposition followed suit. The Deputy Speaker occupied the chair vacated by the Speaker. Nedunchezian then moved a resolution removing the Speaker and empowering the Deputy Speaker to preside.

Against his removal, Mathialagan filed a writ of *Mandamus* in the Madras High Court on December 5, 1972, praying that the Deputy Speaker, the Chief Minister, the Leader of the House and the Secretary of the Legislative Assembly should be restrained from interfering with his right to continue to function as Speaker. Admitting the writ petition, the Madras High Court directed issue of notices to the respondents to be returnable in a fortnight's time. P Sreenivasan, the Deputy Speaker, who was one of the respondents, however, told the Assembly that he did not propose to be subjected to the authority of any court in performance of his functions.

On February 27, 1973, a full bench of the Madras High Court dismissed the writ petitions filed by Mathialagan challenging his removal as Speaker. The Court held that the matter was beyond its purview under the Constitution. The Court further observed that the two acts of the Assembly — taking up the motion for the Speaker's removal and authorising the Deputy Speaker to conduct its business — were "not illegal or unconstitutional" and the House had the power to deal with and decide upon them. The Court also declared that Mathialagan's attempt to cling on to the chair when a resolution for his removal was round the corner was indeed a violation of the Constitution and that Mathialagan ought not to have allowed MGR to move the motion of no-confidence against the ministry before transacting the routine business of the House.

Bindigual By-Eelection

Dindigul By-Election

electoral appeal came with the Dindigul by-election on May 20, 1973. The Anna-DMK won the Dindigul Lok Sabha seat by a most impressive majority, polling 25,000 votes more than the total jointly secured by all three opponents — DMK, Congress and Congress(O). The electorate decisively rejected the DMK and almost completely ignored the Congress. The massive mandate in favour of the Anna-DMK indicated that the charges made by the Congress and the Congress(O) of corruption and mismanagement against the DMK government had lent greater credibility to the anti-corruption stand of the Anna-DMK.[23] Also, the electorate probably regarded the contest as primarily a trial of strength between the DMK and the Anna-DMK, and backed the latter. The other decisive factor, caste, was largely neutralised by all the contesting parties taking care to set up a candidate from the majority caste in the Dindigul constituency — the Thevars. On the whole it would be reasonable to assume that the electorate registered its dissatisaction with the record of the ruling party, the DMK, and preferred to vote for a 'new' formation — the Anna-DMK.

SERVING THE SMALL FARMER: POLICY CHOICES IN INDIAN AGRICULTURE

Edited by Guy Hunter and Anthony Bottrall

This volume contains research reports which cover three important aspects of the subject: the input services (credit, co-operatives and fertiliser supply), and marketing and management systems; the experience of traditional and advanced areas; the working of the panchayat system and its effectiveness as a political system and a development tool. These reports, prepared by researchers who have carried out field work in different parts of the country, discuss the roles which different administrative institutions can play in agricultural development.

Contributors to this collection are: Guy Hunter & Anthony Bottrall; B. Sarveswara Rao, T. V. S. Rao & D. S. Somayajulu; N. S. Jodha; Waheeduddin Khan; D. V. Raghava Rao; A. S. Kahlon; A. C. Sharma & P. C. Deb; P. R. R. Sinha & S. P. Jain.

Parry's Confectionery Limited

Statement of the Chairman, Mr H V R Iengar

THE Nineteenth Annual General Meeting of the Company was held on 18th March 1974 at Madras. In his circulated Statement, the Chairman, Mr H V R Iengar, made the following points.

The results for the year show a profit of Rs 9.13 lakhs. The profit after tax is Rs 4.12 lakhs compared with Rs 2.43 lakhs last year.

The Board has recommended the same dividend of 14 per cent this year also, absorbing Rs 3,92,000.

The profit available for appropriation including surplus brought forward from the previous year is Rs 4,13,205 out of which Rs 42,350 has been set aside for Development Rebate Reserve, leaving a balance of Rs 3,70,855. Drawing a sum of Rs 22,000 from the General Reserve and after meeting the proposed dividend, a sum of Rs 855 is left surplus to be carried over.

Manufacturing and Trading Conditions

Although sales amounted to a record figure of Rs 4.41 crores compared with Rs 3.31 crores last year, the margin of profit remained low owing mainly to frequent increases in the prices of the major raw materials and packing and wrapping materials. Only a partial increase in selling prices to offset the higher cost was possible to prevent any adverse reaction on sales. The power cut imposed by the Government of Tamil Nadu from October 1972 affected the working of the factory to its full capacity until we went in for our own generators at a cost of Rs 3.06 lakhs.

Machinery for replacement and rehabilitation worth Rs 8.46 lakhs was installed during the year.

Malaysian Factory

Following the changes in marketing arrangements carried out in 1971, only a low level of domestic sales was achieved during the transitional period resulting in a loss of M$ 447,000 for the year ended 31st December 1972. Contrary to expectations, the operations of the Company in 1973 too have resulted in a substantial loss, the exact quantum of which will be known when the accounts of the Malaysian Company are finalised for the year ended 31st December 1973. There is no question but that the quality of our sweets is acceptable. Unfortunately, with the best of efforts, the volume of domestic sales achieved in 1973 was not commensurate with the selling expenses. In order to diversify the Company's activities, a project to make chocolate-coated wafers was sanctioned. The machinery has arrived and it is hoped to start manufacture shortly. The management of the Company has been made over to the Malaysian Directors for convenience of taking quick decisions. Only technical staff from India are provided by us, as stipulated in the Royalty and technical knowhow agreement, in order to ensure that the quality of the product sold under "Parry's" name is maintained.

Prospects

In the Central Budget presented on 28th February the duty on confectionery has been raised from 30 paise per kg to 10 per cent *ad valorem* equivalent to an average of Rs 1.15 per kg. This steep levy on top of the ever increasing cost of raw and packing materials pushes up the price of sweets to a level at which, it is feared, there will be consumer resistance. In the first few months of the current year the demand for Parry's sweets has been keen but there may be a fall in offtake affecting the whole industry.

Note: This does not purport to be a report of the proceedings of the General Meeting. (The full text of the Speech has been sent to all Shareholders.)

A SERIES OF TRADE FAIRS FOR 1974, IN BOMBAY.

An excellent opportunity for buyers to see the latest from the various Indian industries...under one roof

INDIAN OFFICE FURNITURE AND BUSINESS MACHINES TRADE FAIR:
April 23 and 24, 1974.
India produces good steel office furniture, inexpensive filing and information systems and hardy copying and calculating machines. A wide array of office and business machines equipment will be on display and more than 20 manufacturers will be participating. The latest and the most extensive developments in the field of office equipment will be on display.

FIRST INDIAN AUTOMOBILE SPARE PARTS TRADE FAIR:
August 16, 17 and 18, 1974.
Sparkplugs, tyres, carburettors, gear boxes, speedometers, differentials, fuel gauges, windscreens etc., will be among the many other items on display.

SECOND INDIAN ELECTRONICS TRADE FAIR:
September 6, 7 and 8, 1974.
Items on display will be in the following categories:
a. Consumer and entertainment electronics.
b. Professional and industrial electronics.
c. Medical electronic items.
d. Measuring instruments.

SECOND INDIAN READYMADE GARMENTS TRADE FAIR:
September 20, 21 and 22, 1974.
(In collaboration with the Clothing Manufacturers' Association of India.)
A variety of garments will be on display—of cottons, silks and synthetics—of millmade fabrics and handwoven fabrics. There will be shirts, trousers, safari jackets, ladies bell-bottom suits, guru shirts and what not—a collection representing the cross-section of the current trends in international clothing styles.

FIRST INDIAN KNITTED FABRICS, HOSIERY AND COTTON MADE-UPS TRADE FAIR:
September 24, 25 and 26, 1974.
A vast array of the latest jersey, twinkle jerseys, knitted synthetics of various textures, hosiery items, towels, sheets, pillow cases etc., will be on display.

FIRST INDIAN FABRICS TRADE FAIR:
September 27, 28 and 29, 1974.
India's first Fabrics Trade Fair will display samples of every fabric—cottons, handlooms and man-made fibres.

FIRST INDIAN INTERIORS TRADE FAIR:
October 4, 5 and 6, 1974.
On display will be the total Indian concept of Indian interiors including a range of carpets, floor rugs, furniture with brass inlay and decorative lacquer, lamps, paintings and Indian artifacts.

FIRST INDIAN SPORTS GOODS AND SPORTS WEAR TRADE FAIR:
October 28, 29 and 30, 1974.
Items on display will include footballs and other leather balls, hockey sticks, racquets, leather goods, cricket bats, sportswear, sports shoes, fishing rods and other new items.

SECOND INDIAN SEAFOODS TRADE FAIR:
November 1, 2 and 3, 1974.
A range of seafood items including prawns, lobsters, shrimp, oyster, smoked eel and hundreds of other items, frozen, canned, dehydrated and fresh.

SECOND INDIAN LEATHER AND LEATHER GOODS TRADE FAIR:
(In collaboration with the Leather Club of Bombay.)
November 8, 9 and 10, 1974.
Items on display will include a range of processed leather, leather apparel, hand bags, travel goods, fur-skin articles, leather furniture, footwear and particularly harness and saddlery.

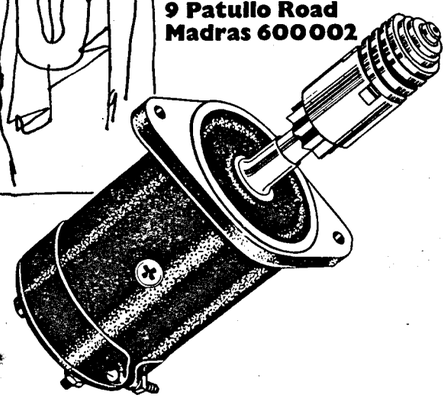
PARTNER FOR LIFE: YOUR LUCAS-TVS STARTER ONLY STOPS WHEN YOU DO

Each day, over 7,00,000 quality Lucas-TVS starters spring to life. Starting cars, commercial vehicles, tractors, earth-movers, stationary and marine engines.

Available in a range of 6, most of these 7,00,000 starters are fitted as Original Equipment.

With Lucas-TVS reliability built into each, your starter is a partner for life.



And should one of the many components of a Lucas-TVS starter ever need replacement, ensure that you fit only a genuine Lucas-TVS part.

Because when you buy from Lucas-TVS, you buy a total integrated electrical system. Perfectly matched to the needs of every make of vehicle.

Yes, a Lucas-TVS starter proves that not all marriages are made in Heaven.

FREE FOR YOU!
Informative leaflet on profitable vehicle maintenance.

Investment Is Always Expendable

THE government's response to the gathering clouds on the balance of payments horizon has been typical. Emissaries have been despatched in all directions to scrounge for aid. All the brave resolutions about managing without the charity of other countries have been forgotten in a moment and it is as if the Fifth Plan's commitments on the subject of self-reliance had never been made. The government will beg for as much aid as it can get, from whoever will give. At the same time, however, consider the import policy for the current financial year announced this week. No sense of emergency, comparable to that motivating its aid-raising efforts, informs the government's approach to allocating foreign exchange, already scarce and likely to get much scarcer, among competing demands for imports. It is to be business as usual on the imports front. True, it has been decided that import licences will be issued initially to cover only the first half of the year. But, in the absence of any attempt to tighten the norms governing the issue of import licences, this decision may actually have the perverse consequence of inflating the premium on imported items and exaggerating the demand for imports during this period. Clearly, the decision to issue import licences for only six months is not intended to enable the government to frame an import policy more in keeping with the tight foreign exchange situation. If the government had wanted to attempt such a tightening up exercise; it has had all the time in the world to do so. The six-month stipulation is really intended to buy time till the results of the many missions sent out to look for aid become known. If these missions are less than successful and if demand for imports in the first half of the year gets artificially exaggerated (something which can be easily camouflaged as the result of the launching of the Fifth Plan), then the fat will be really in the fire.

That the foreign exchange situation was going to be difficult this year had been known for a long time. This should, therefore, have been the occasion for the government to review its import policy which has been operated for the last few years in conditions of relatively easy availability of foreign exchange. What has been done in fact is simply to continue last year's import policy with some further liberalisation at a few points. The import policy announcement is, of course, replete with references to priority and non-priority industries. But here — as in other spheres of economic policy such an industrial licensing or taxation — the priority sector is defined most expansively. Thus motorcycles, scooters, all automobile ancillaries and man-made fibres rank on par with capital goods industries such as industrial and mining machinery, electrical machinery and machine tools in the category of priority industries. What is more, a variety of excuses are found for permitting liberal imports by industries which do not manage to find a place in the priority list. Thus, units engaged in non-priority industries are to be given priority treatment if they export 30 per cent of their production. No questions are to be asked whether, after they have received priority treatment with regard to imports, these non-priority industries earn any net foreign exchange at all. Similarly, small-scale industries are entitled to special treatment simply on the ground of their being small-scale. Under the latest import policy announcement, they have been allowed to straightaway arrange for imports to cover their requirements for the first half of the year. For this purpose, import licences issued to them for 1973-74 are to be made automatically valid for repeat imports to the extent of 50 per cent of their value. Here, again, it is considered irrelevant to ascertain how dispensable are the activities in which these so-called small-scale units are engaged; or how many of them are genuine small-scale units and how many are owned and controlled by large industries and business houses, having been set up as small-scale units only to take advantage of the many concessions extended by the government to the omnibus category of small-scale industries; or, finally, how much of the imports allowed to the small-scale industries actually gets used by these units and how much gets diverted to other units which, even in terms of the government's liberal import policies, would not have qualified for these imports.

It has been generally recognised that the system of issue of import replenishment licences to exporters has been widely used as a device to divert imports to a variety of blatantly low-priority uses. Yet the government in its wisdom has now decided to allow a 10 per cent increase in replenishment levels across the board to all exporters whose replenishment rates are below 50 per cent. This has been done supposedly to offset the disadvantage that exporters might face due to higher prices of imported materials or inadequate availability of certain domestically-produced inputs. However, even

maly accordingly develops. The government is often responsible for the production of the commodity; it however fails to exercise control over its distribution and the emergence of abnormal profits cannot hence be prevented. But no part of the excess profits flows in the direction of the government: it is appropriated entirely by the intermediaries.

Ever since the Raj Committee deliberated on the issue more than a decade ago, the alleged irrationality of price and distribution controls for essential commodities has been the staple of many debates. A particular point of view has increasingly come to the fore. If, in view of the scarcity of the commodity in question, there are consumers who are prepared to pay a high price for it, the government itself should feel no compunction to appropriate the extra profit associated with this price; the middleman could thus be squeezed out. In case some users find it difficult to pay the high price, special subsidies could be arranged for them. In pursuance of this point of view of moving closer to market realities, prices of most steel products in the country were increased across-the-board in October last year. By raising the prices in this manner, Hindustan Steel and its associated units, it was assumed, will be enabled to improve their finances and, at the same time, traders and other intermediaries will at long last be deprived of the privilege of making easy money from resale of scarce steel items. The picture at the end of six months following the rise in steel prices is however altogether different. The price adjustment has certainly helped Hindustan Steel to present at least a marginally better income and expenditure account. But the other major hope, namely, the elimination of traders' profit, has been thoroughly belied. The explanation for this is not far to seek. Even as the JPC prices were raised, the premium offered by the market for each category of steel products was also instantly adjusted upwards, and to a proportionate extent. The steel items continue to be scarce in the market and the users are more than prepared to pay the increased prices for obtaining the necessary supplies. The consequence has been a certain general increase in steel prices, which has merely fanned the flames of inflation. Traders' margins remain what they were. And since steel enters into the production of many of the inputs of the industry, the improvement in the income-expenditure accounts of the steel units is likely to prove altogether illusory too.

This chapter of price fixing in accordance with market signals should teach the decision-makers a crucial lesson, namely, that by attempting to narrow the gap between the official price and the market price of a scarce commodity through raising the level of the former, you never really succeed in the objective, for the market price itself is pushed up by the same proportion by which the government price is increased. There is such a thing as the state of expectations with respect to commodities which are in short supply in an inflationary situation. The operators in the market are aware that end-users are prepared to pay a premium — either specific or *ad valorem* — over the government price irrespective of the level of the latter. To assume that by increasing the official price one could lower the traders' margin is thus altogether unrealistic. If the shortage persists, such a stratagem might actually embolden the traders into further enlarging their scale of profits. And this consideration should be about as relevant for foodgrains as for steel. It does not however seem that there are many people in New Delhi ready to buy such home truths at this particular moment.

'Leftist' Parties

Lost Credibility

THE so-called Leftist parties' periodic attempts to justify their existence are truly pathetic. One such will be the meeting proposed to be held in New Delhi this week of leaders of nine parties — the CPI(M), the Socialists and the CPI being the major ones among them — supposedly to work out a joint programme of action.

What has forced this effort on these parties is clear enough. During more than two years of acute and growing economic hardship, when the prices of basic necessities of life have doubled and employment has stagnated, none of these parties has had anything much to show by way of organising the people to protest against their economic distress. Their feeble antics in Parliament and the state legislatures have not had the least effect on the Congress governments at the Centre and the states which have reneged on practically every election promise made by the party in 1971 and 1972. Outside Parliament, such mass protest actions as have taken place have owed nothing to these parties, even on their own admission. On the contrary, at least some of these parties have come quite close to joining the Congress in debunking these movements — such as those in Gujarat and Bihar recently — as the work of reactionaries, communal parties and what have you. Be that as it may, the fact remains that the Leftist parties themselves have, by and large, slumbered through what has been perhaps the gravest economic crisis since Independence. This week's meeting in New Delhi is an attempt by the parties concerned to reiterate their reason for existence — for the benefit of the general public as well as their own cadres, such as they are.

It would have been one thing if the parties had been active in organising popular movements in different parts of the country and were coming together to discuss ways of co-ordinating these movements. This, of course, is far from being the case. The meeting in New Delhi is in fact intended to cover up the participants' total failure to mobilise the people. This being so, the preoccupation of the participants will be with excuses for inaction — past, present and future — and with forms of symbolic protest like bandhs whose only merit lies in the newspaper publicity they get for their sponsors. The occasion, one may be sure, will be used to air the well-rehearsed polemics between the CPI(M) and the CPI about whether the opposition to the Congress should be total or whether good Congress governments should be distinguished from bad ones and 'progressive' Congressmen separated from the 'reactionary' ones. The very fact that the CPI — whose political survival depends on its links with the ruling party — is one of the principal participants should be enough to expose the hypocrisy of the proposed meeting.

But what is true of the CPI is substantially true of the other so-called Leftist parties as well, their holier than thou postures notwithstanding. Their passionate avowals of opposition to the ruling party could be taken a little more seriously if there had been any evidence of active political work among the people. In the absence of such evidence, their pretence of launching a "joint offensive" against the Congress must appear as fatuous as the CPI's talk of organising a "mass dehoarding campaign" directed at "monopolists, hoarders and landlords".

Irrelevance of Licensing

Hansavivek

ELECTRIC CONSTRUCTION AND EQUIPMENT's installed capacity, as revealed in the latest annual report, far exceeds the licensed capacity in respect of a number of items, as the following figures show (the licensed capacities are given in brackets): single phase meters 3,00,000 (1,80,000); poly phase meters 1,50,000 (54,000); transformers 10,50,000 kVA (7,50,000 kVA); electric motors and pumps 3,36,000 HP (2,88,000 HP); lifts and industrial lifting platforms 500 (280). The installed capacities of fractional and rayon pot motors and welding transformers are stated to be "under assessment" and of starters, switches and cut-outs "under re-assessment". Even the figures of licensed and installed capacity given in the report are not precise, for a note appended to the table says that in cases where licences were not available or did not indicate quantities, the licensed capacity has been given on the basis of applications/returns to the government and relevant correspondence. The company began trial production of GLS lamps and fluorescent tubes during the latter half of last year. The licensed and installed capacities are 6 million and 1 million, respectively. Production during 1972-73 was only 0.13 million GLS lamps. Installed capacities of both the items are expected to be reached this year.

During 1972-73, ECE spent Rs 45 lakhs on new buildings, plant and machinery, a substantial portion of which was for the lamp project. Production of transformers at the Cossipore, Vizag and Sonepat plants totalled 664,999 kVA against only 393,511 kVA in the previous year. Production of electric motors at Barrackpore, Cossipore, Ghaziabad and Visakhapatnam was 9,136 motors of 64,198 HP against 3,950 motors of 27,587 HP a year ago. The switchgear division of Budge Budge is still not out of the woods and has yet to achieve economic working with an oil circuit breaker and its mechanism of improved design. Meter prices continued to rule low, while raw material prices shot up. Nevertheless, ECE's share of sales, production and profitability in the country's meter industry "continues to grow satisfactorily". Commenting on future prospects of the company, the directors say that while scarcity of essential raw materials and shortage of electric power are adverse factors, the growing demand for the company's products is expected to lead to improved working results.

CAMPHOR AND ALLIED PRODUCTS is going ahead with expansion of its activities. It expects to commission the terpene resin plant by June or July next and the PMHP plant some time in the beginning of the next year. Some

delay has occurred in the latter case, since some of the imported equipment will arrive only by the end of this year. Along with this expansion, the company has undertaken installation of the new distillation column for purpose of obtaining better recovery of alpha pinene and separation of beta pinene, which is a basic chemical for the perfumery industry. Equipment is also being installed to bring about changes in the process of manufacture of camphor and utilisation of by-products and throw-out on more economical basis. This is also expected to be completed by around the middle of this year. Total cost of the expansion is estimated at Rs 117 lakhs, of which capital expenditure of more than Rs 50 lakhs has already been incurred. Further finance to the tune of Rs 40 lakhs is intended to be raised by way of term loans or by issue of debentures. The company has once again turned out good results, with higher sales and profits. Dividend is maintained at 15 per cent on the capital as enlarged by a one-for-two bonus issue. Even so, it is covered nearly four times. At the end of 18 years of its existence, the company's equity capital stood at Rs 90 lakhs. Of this, as much as Rs 40 lakhs comprised gift shares. The company is looking ahead to further growth in the coming years. The present expansion apart, the research centre built at Baroda at a cost of Rs 115 lakhs holds out promise of widening the company's product-range and diversifying its activities.

FIT TIGHT NUTS AND BOLTS has expanded fast. It has already set up a second plant at Porbandar in Gujarat and has been on the look-out for a suitable piece of land to shift the Bombay factory at Andheri-Kurla road where scope for further expansion of activities is limited. Land has now been purchased at Kandivli, a suburb of Bombay, for this purpose. Meanwhile, licences have been obtained to import balancing equipment of the value of Rs 28 lakhs. ICICI has granted foreign exchange loans of US $ 282,000 and DM 654,425 for this purpose. Once again, the company has produced good results with higher sales and profits, though gross margins have been slightly lower compared to the previous year. The ratio of inventories to sales was brought down, but that of wages to sales rose. Since 1960-61, when the company became public, paid-up equity capital has gone up from Rs 21 lakhs to Rs 96 lakhs and gross block over 60 times. Sales have expanded over 100 times and reserves have risen from Rs 2 lakhs to Rs 101 lakhs.

LAKSHMI MACHINE WORKS is seeking an industrial licence for manufacture of open end spinning machines in collaboration with Rieter Machine and has also applied for doubling the licensed capacities of combers and lap machines. It also proposes to step up production of all items and reach the licensed capacity in two or three years. Moreover, a second unit is intended to be established in a 'backward' area to undertake manufacture of certain new items, such as precision cone/pine-apple cone winders and circular winders in collaboration with Schweiter Engineering of Switzerland. This programme is estimated to cost Rs 3 crores, of which Rs 75 lakhs on additional machinery and equipment were spent last year, another Rs 80 lakhs will be spent this year, and the balance during 1975. With this investment, the company's turnover will go up to Rs 11 to 12 crores per annum. A sister company, 'Lakshmi Automatic Loom Works', is being floated to undertake manufacture of 'C' type automatic loom in collaboration with Ruti Machinery of Switzerland. A 'letter of intent' has been received and industrial licence and approval of the collaboration agreement, import of capital goods, etc, are expected very soon. The unit is expected to go into production before the end of 1975 or early 1976. During 1973, the company's profit declined perceptibly from the previous year's level in spite of a small increase in turnover. Contraction of margins was caused by loss of production as a result of power-cut and labour unrest, coupled with increase in prices of raw materials and components. Nearly half of the dividend, maintained at 12 per cent, is short-earned. Part of the dividend will be exempt from tax. LMW exported machines, spares and castings worth Rs 28 lakhs. Contracts worth Rs 975 lakhs have been finalised for export of machinery, spare parts and castings to the far-eastern countries for delivery from 1974 to 1976.

RAMKISHAN ISPAT is entering the capital market on April 15 with a public issue of 3,10,000 equity shares of Rs 10 each at par to raise part of the finance required for its Rs 107-lakh mini-steel project at Taloja in Kolaba district of Maharashtra. The plant will have a capacity of 10/12 tonnes and is expected to go into production by May or June next. Construction of the factory building is nearing completion and major equipment for the plant with an annual capacity of 18,000/20,000 tonnes has started arriving at the site. The company has been promoted by the Aggarwal family owning ferrous and non-ferrous re-rolling mills and conductor factories. The factory has the advantage of location near Bombay, which is both a large collecting centre for scrap, the essential raw material, and a ready market for the company's products. The management expects the company to pay a dividend of 15 per cent out of the earnings of the first year of production and to raise it to 20 per cent from the third year. The subscription list will close on April 26 or earlier, but not earlier than April 19. The public issue is managed by FICOM.

DECCAN FARMS AND DISTILLERIES, a new company, is setting up an agro-based chemical complex in the sugarcane-growing area of Karnataka. The company has drawn up plans to manufacture 10 lakh litres of Indian-made 'foreign liquor', 25,000 hecto litres of beer and 3,000 tonnes of open-pan sugar. Besides, it will manufacture Sorbitol and Manitol (the former is required for making vitamin C and the latter for explosives), cattle and poultry feed, potash (fertilisers), carbon dioxide, etc. The project is estimated to cost Rs 165 lakhs, including Rs 33 lakhs for land and buildings, Rs 65 lakhs for plant and machinery and Rs 65 lakhs for working capital. It is proposed to be financed by share capital (Rs 50 lakhs), term loans (Rs 60 lakhs), loans from banks (Rs 40 lakhs) and sundry creditors (Rs 15 lakhs). Commercial production is expected to commence in September next. The management expects the company to pay a dividend of 12 per cent for the first year and to gradually raise it to 20 per cent in the fourth. The company expects to export part of its production of alcoholic beverages and has, in fact, already received enquiries from UK and USA. A public issue of 3 lakh equity shares of Rs 10 each is being made to finance part of the project cost. The subscription list opens on April 8 and will close on April 22 or earlier, but not before April 15. The public issue is managed by the stockbroking firm of Lewis and Jones, D B Pawar Desai, former Deputy Minister of Agriculture, Karnataka, is the company's chairman, and A B Patil Alaskar is the managing director.

Calcutta Diary

A M

THE glory lies in the size of the grab. And there is a certain catholicity in taste: discrimination of any sort is frowned upon, our leaders cringe for money before each and all, before big and small countries alike. The hoity-toity days of the late 1950s are gone. Then, it was only the Americans who mattered. There has been a secular growth of learning since. Beggars are not supposed to be choosers; our leaders cannot any longer be accused of choosing. In other seasons — or in the same season, given a different forum — these same persons would preach the morality of self-reliance. Chameleons are not bred, they are born. At this specific moment, the leaders are engaged in cringing for funds. Just watch how newspapers display the proud headlines. Our begging missions are increasingly gathering alms: the Japanese are going to assist at Bhatinda; God bless the thousand-year rule of the Pahlevis, the Shah of Iran has promised continuing help for the refinery at Madras; Iraq has taken kindly to us; for the first time, Ireland has made budgetary provisions to offer us aid. There is no mistaking the smirk of satisfaction: we have emerged as the champion touch artists in the world, there could be no greater salvation for the great Indian people.

Indignity, where is thy sting! A certain imperviousness has spread its domain. That to beg in this manner could be demeaning beyond words, hardly occurs to the operators in New Delhi. Till the other day, the Government of India used to maintain a patronising, sneering superior attitude toward the Arab sheikhdoms. All that is gone. There could be no greater cultural revolution. We now stoop to beg from each and all. Whoever has a buck to spare will be pursued by India. The individual and collective images are on the point of getting merged. A sight, fairly common in Europe as much as in North America, is that of hordes of slightly seedy-looking compatriots, clustering together at a travel agent's or at a discount shop, avarice writ large across their faces, higgle-haggling for an extra bit of concession, or for another 5 per cent cut in the price, for the goodies they are wanting to buy. The official image of the country is by now scarcely any different. The Government of India's shifty-looking emissaries are all over, buttonholing the rich, the reputed-to-be-rich and the not-so-rich with equal fervour. Make no mistake, whoever can be embarrassed into giving us a few morsels of extra aid will be embarrassed. Our embassies will cringe before them, pester them, bully them, cajole them. But the sanctimony will still be there. A virtue will still be made of the act of begging — as if the foreign governments should actually be beholden to us, as if it is they who should be proud of the fact of having been permitted to offer assistance to India, the great India, the country of such noble culture and tradition.

The country of such noble culture and tradition will stretch its palm and seek money from practically everybody. If Chad has money to offer, India will take it. If Fiji has, ditto. If perchance Zulfiqar Ali Bhutto, in a fit of malicious generosity, will offer New Delhi a couple of million dollars of aid, trust our politicians to accept that too: some subterfuges will be worked out to call the proffered aid by another name, but that will merely prove the point of a strong positive correlation between the art of panhandling and that of hypocrisy.

Stripped of Pride

One has a thousand complaints against the administration ensconced in New Delhi. Some of them are substantial, some are lightweight, some are superficial, some are sentimental. But the most serious complaint putting into the shade all the rest, is this one: namely, stripping the nation of its pride. The British were here, ruling over the land, more or less with an iron hand, for more than a century and a half. It was alien rule, there was that ignominy of total disenfranchisement. Not even the feudal overlords, nor the small group of industrialists, nor the commercial pretenders, could claim to be their own decision-makers. An English or Irish or Scottish brat would descend on four thousand square miles of a district — perhaps inhabited by as many as a crore of people — and administer it in the manner of an absolute oligarch. It went on for decades. This was a subjugated, emaciated, trodden upon nation. But, by and large, we retained our composure. Scars of deprivation were writ large across the countenances of countless poor men. The wounds of not being free may have been invisible, but the indelible marks of that state of being were scarred across the heart. There was no surrender of dignity, however. The people were not dispossessed of their pride. Inevitably, there were a handful of cringers. But the nation, considered as a whole, did not give in. It accepted the fact of its misfortune; it accepted the fact that subjugation by an alien power calls for a particular restraint in manners. Indian society had its cruelty and heartlessness; it had its built-in inequities and absurdities. The residual attributes however formed a substantial core. Poverty, the nation taught itself, was reconcilable with dignity as long as you were prepared to live within your means.

It is soon going to be twenty-seven years since August 15, 1947. And look where we have arrived. Champion panhandlers, running after whoever has the cash, our eyes glisten as the stray passer-by, impatient to get away, drops a careless penny into the pan. We have begun to scrounge before the Iraqis and the Yemenis; very soon, it might be time to beg accommodation from the Nepalese and the Burmese, who are hardly better off than us. The pattern of behaviour will also be completely reversible — in that, those who have no cash to spare, we will treat with appropriate disdain. Ethics will come to have a new set of parameters attached.

And this, after all the torrent of frothy, wearisome talk about self-reliance. Self-reliance is a pre-condition to an internal system of discipline. You resolve that you are going to manage within your means. Having made the resolution, you go about it remorselessly, rearrange the distribution of goods and resources which you have strictly on the basis of nationally-determined priorities; and there the matter ends. Remorselessness in this instance represents the highest form of empathy and pride, for it allows you to stay away from the indignity of cringing before others.

The arithmetic is actually simple. You can do without foreign food and yet have no famine, only if you arrange to collect the food from where it is plentiful in the country and distribute it, equitably, in those areas where it is relatively short. You can do without foreign petroleum products — or at least cut down drastically the extent of your dependence on them — if you can enforce a strict system of rationing, re-align the pattern of your

energy utilisation, and get the maximum out of your internal capacity. You can severely reduce your requirements of foreign equipment, spares and raw materials if you agree to enforce a moratorium on a whole range of consumer goods industries whose output caters exclusively to the demands of the top fractile of the community. You can get more production out of your existing industrial system, if you rationalise your power grids, be ruthless with those elements who deliberately restrict output for boosting their rate of profit, and take a few honest steps to check the spiralling up of prices so that your labour feels somewhat less grumpy. You can discipline your balance of payments and yet ensure a satisfactory rate of growth if exports are forced up through an internal disciplining of prices. If your foreign policy is not deliberately pushed along the wrong rails, external trade relationships might actually develop with countries which are in a position to offer you, for example, fertiliser and oil. If, again hysteria were eliminated as an important adjunct of foreign policy, the nation might end the insensate diversion of precious resources into the *cul de sac* of mounting defence expenditures, away from economic development. If sixty crores of rupees were not offered this year as tax concession to the rich, we might be spared the indignity of begging for an extra sixty crores of rupees worth of foreign aid.

But all this is folly to the Government. Decisions are taken on the basis of what is preferred and not preferred by that thin section of the population at the top. This fraction has evidently preferred national indignity to national discipline. Measures toward disciplining the economy would mean depriving these people of a large chunk of their current command over goods and services — which, if re-distributed, might allow the nation to do without dependence on foreign resources. But material comforts count above all; this section of the population would not mind cringing before others. They constitute a gross, vulgar sample. And while the masses are made to share the national ignominy of begging from others, they receive no part of the consequential dispensation.

Whether or not one subscribes to the theorem that there has been an absolute immiserisation of the majority of the population since Independence, it would be difficult to controvert an even simpler proposition — that, whatever improvement in levels of living, that has taken place in the case of the majority of the nation, it could have taken place even without foreign aid, and hence without the massive surrender of dignity brought about under the auspices of the ruling elite.

Newspapers, meanwhile, talk of another breakthrough: Is it Cyprus, now, which has kindly agreed to offer assistance to us?

CAPITAL VIEW

What Is "Popular"

Romesh Thapar

IF Indira Gandhi thinks that the major correction on food distribution, announced last week following a much-publicised 'debate' among chief ministers, is a pointer to her willingness to take unpopular decisions, she is much mistaken. The public sector foodgrains distribution had failed miserably. The return to the private trader was inevitable, considering the disastrous state of the public sector now at the mercy of charlatan managers, corrupt trade unionists, and cynical politicians. The decision on food distribution is 'popular', if anything can be so described these days.

However, the trouble with popularity these days is that it soon passes. The private traders are not innocents. They will soon locate the opportunities for the quick rupee in the new arrangements. Reports reaching quarters other than the Food Ministry suggest a shortfall of anything upto 5 million tonnes in the winter crop. Until the traders see steps taken to meet this shortage, they will hold back from the market. The knowledgeable do not see any relief until after a good monsoon.

Ostensible Retreat

What is going to happen to the urban work-force as the food market is played, is anyone's guess. At the moment, there does not seem to be any coherent thinking on the subject of organising strict rationing at this level. We seem to be confident that the hoards are huge and prices will show an appreciable fall. It is inexplicable why a more comprehensive exercise is not done, an exercise which could even embrace what are known as 'vulnerable' sections — sections which have to fill their bellies with wheat or rice or coarse grain.

It is absurd to talk of 'popular' and 'unpopular' decisions when the country is on the verge of terrible shortages and dislocations. What is needed is the political will to carry through the policies upon which survival depends, whatever the campaigning of the economic and political lobbies. To this extent, Indira Gandhi has moved on food distribution with intelligence, even though belatedly. The lapses are due to the incredible stupidity of some of her colleagues.

Now, we are certainly entering a phase where the Government of India will have to take the lead in justification of policies which might at first appear to be a retreat from that magic word, 'Socialism'. Vital raw materials for industry and agriculture have to be obtained in difficult international markets, and even through the assistance of unpalatable allies. What's more, if the highly skilful dislocation of industry and power continues at the level of various categories of railway workers, the economy will become even more exposed.

Take a pertinent example. Bombay High. The oil find is extraordinary. If the prospecting and consolidation of the oilfields is conducted with energy and without hitch, a vast investment will have to be made — an investment which will mean the entry of foreign capital and knowhow on a scale hitherto unknown. There can be no playing around for time, because such resources are now scarce and much sought after by many nations — including the Soviet Union. We have already lost five years in this exploration. We could remain paralysed for another five if Indira Gandhi and her talkative Oil Minister conduct the game as they would a faction fight in the party — by committee and sub-committee. A new kind of stamina will be required to safeguard our interests.

Holding Operations

We are relying too much on the generosity of the Russians and the Americans, and now of the Iranians and the Iraqis. This non-stop begging is always paralleled by bombastic lectur-

ings on self-reliance. The two performances are interlocked. It is about time we got down to first principles. Get those damned resources organised with whatever technical assistance, local and foreign, is available. Preserve sovereign control over the resources. Sack the men who are incapable of delivering the goods. And chain the wreckers, whether they are officers or workers, unionised or otherwise. Indira Gandhi has her cards laid out. Every move has been discussed and debated threadbare. Errors can now only be deliberate, rooted in stupidity, in weak political will.

Oil and food are going to haunt this country in the years ahead. We cannot hope to get our own resources into operation in anything less than three hard years. As for food, the situation will remain serious, for population figures are outrunning production, whatever the perambulations of our experts in the GOI. More and more, attention will focus on the 50 million acres being brought under cultivation in the US. Maybe the USSR and Africa may begin one day to yield surpluses, but not within the foreseeable future. The kind of economic planning we need to do is very different from the present exercises at Yojana Bhavan — that is, if we want to salvage our sovereignty in the quickest possible time.

But not a thing will happen unless Indira Gandhi takes a real swipe at her corrupt and incompetent colleagues, so numerous today that they have infected the entire government process. Credibility is needed to act, to persuade, to motivate. And credibility is almost zero. It need not be. Here is a 'popular' decision waiting to be taken.

And, in passing, a footnote. The Fifth Plan was launched on April 1 — as 'a holding operation'!

April 1

FROM OUR CORRESPONDENTS

INTEREST RATES

Some More Tinkering

(From a Special Correspondent)

THE Reserve Bank has raised the interest rates payable by scheduled commercial banks on savings and fixed deposit accounts from April 1. The major changes effected are: (i) one full percentage point increase, from 4 per cent to 5 per cent, in the rate on savings deposits; (ii) increase of 0.25 percentage point in the rates on fixed deposits of less than 9 months' maturity and 0.50 to 0.75 percentage point on the rest, with the highest rate at 8 per cent on deposits for more than 5 years; and (iii) reintroduction of fixed deposit accounts of two maturity slabs of nine months to one year and two to three years which had been thoughtlessly abolished when the deposit rates were last revised from April 1, 1973.

Reserve Bank to Share Bounty

Simultaneously with the increase in deposit rates of commercial banks, interest rates on post office savings bank deposits, on other small savings media, and on provident fund accumulations of Central government employees have been raised. The treasury bill rate, which had been raised from 3.50 per cent to 4 per cent in May 1973, along with the increase in the Bank rate, has again been raised to 4.25 per cent; at the same time, the buying and selling rates for Central government securities, which had been retained unaltered at that time, have now been so changed as to provide a yield of 6.25 per cent against the present 5.75 per cent. Market loans of the Central government may have to offer higher yields and there will occur consequential changes in the yield rates on state government loans too. These higher yields will largely go to fill the coffers of the Reserve Bank, which will share some of the bounty with the scheduled commercial banks whose cash reserves with the Reserve Bank in excess of 3 per cent will now fetch an interest of 5.25 per cent instead of the present 4.75 per cent.

There might be some differences about the appropriateness of the changes made in particular rates. For instance, it could be argued that savings accounts are no different from current accounts and that, therefore, there is no case for allowing the same interest rate on them as on fixed deposits of 3 to 6 months. On account of the liberal withdrawal facilities allowed, over 85 per cent of savings deposits get classified as 'demand' deposits in the Reserve Bank's own data. A high interest rate on savings accounts may be justified on the ground that rural savings, deposited in saving accounts with banks, deserve a better return. But, then, small deposits from just 10 per cent of total savings deposits, though in the rural areas they do account for almost 40 per cent of total deposits of commercial banks (RBI *Bulletin*, January 1974). That apart, it is reasonable to argue that savers should be encouraged to keep their savings increasingly in the form of fixed deposits, leaving only minimum balances in savings accounts. For this purpose, the interest rate on savings deposits should be kept relatively low. The 3 percentage point difference between the new savings deposit rate of 5 per cent and the rate of 8 per cent on fixed deposits of over 5 years is too small.

Then there is the question of parity between the interest rates on commercial bank deposits and on comparable post office savings accounts. However, considering that postal savings accounts cater to the needs of a specific class of savers in the rural and urban areas and the total exemption from income-tax of interest earned on them, it is unnecessary to aim at complete parity between the interest rates on savings deposits of banks and on postal savings accounts.

Peripheral Issues

Finally, it may be suggested that the difference between interest rates on fixed deposits of short and long durations is not large enough. For instance, fixed deposits for over five years earn 8 per cent whereas deposits for three years earn as much as 7.50 per cent.

But all these are really peripheral issues. The major issue is that the monetary authorities apparently persist in their failure to recognise the importance of interest rates both for a more rational application of scarce capital and for achieving larger savings in the form of commercial bank deposits. Their policy measures are so *ad hoc* that, far from giving the lead to developments in the money market, they lag behind market trends.

To begin with, the entire premise on which the present interest rate policy is based has been proved wrong. The low interest rate policy has been

defended on the ground that since investment is sensitive to interest rates and deposits are not particularly so, high interest rates will discourage investment without much gain in the form of larger savings.

Series of Distortions

In fact, low interest rates have caused a series of distortions. First, they have inflated the demand for bank funds from organised industry. According to the Reserve Bank's study of the finances of large and medium public limited companies in the private sector, their short-term bank borrowings were 20 per cent of their inventories in 1950; the ratio rose to 34 per cent in 1955-56, 48 per cent in 1960-61 and 59 per cent in 1970-71. Surely, in the case of public limited companies, it cannot be suggested that this was the result of funds taken from usurious moneylenders being replaced by advances from commercial banks! What has apparently happened is that availability of liberal bank credit at relatively low interest rates has encouraged industrialists and traders to use their own funds elsewhere. Together with quantitative restrictions on bank credit, the cost of credit could have been used as an instrument to bring about a more rational pattern of use of funds.

Similarly, the ready availability of loans from the term lending institutions at low rates of 9-9.5 per cent has encouraged investment in capital-intensive techniques. The widening of the gap between the cost of term finance and working capital finance, as a result of the recent increase in the commercial banks' lending rates, is likely to further encourage investment in labour-displacing machinery and equipment.

The ready availability of loans and advances from the financial institutions has encouraged promoters to keep their reliance on equity to the minimum and underrate the importance of paying satisfactory dividends. It has also enabled companies to be tightly controlled by business groups whose returns from the business take a variety of forms other than dividend payments. If loan finance, both short and long term, were made really costly as well as relatively scarce, company managements would have to rely more on equity capital. And to attract equity capital they will have to improve their declared (as opposed to concealed) profitability.

Coming back to the premise on which the current low interest rate policy is based, it has been now established beyond doubt that bank deposits are interest-elastic at certain ranges. To quote the Banking Commission, "Academic exercises, including those commissioned by the Banking Commission from independent research institutions indicate that the interest rate is an important determinant of the demand for deposits. In particular, the demand for time deposits shows a high elasticity with respect to the interest rate on such deposits." To have an impact on deposits, the changes in interest rates have to be substantial enough; more important, they have to be related to the changes in other monetary and price variables. For instance, going by the consumer price index, the value of the rupee today is just 42 per cent of what it was in 1960 (to put it very crudely). In 1973 alone there was a depreciation of as much as 17 per cent. Compared to this, the rise in the maximum deposit rate from 6 per cent in 1960 to 8 per cent is totally inadequate.

In this context, it is interesting to see how inflationary conditions have brought about changes in interest rates in a country like the UK. The prime lending rate of commercial banks in Britain has been raised from 9 per cent in July 1973 to 14 per cent in February 1974 and the rate for three-month deposits from 7.97 per cent to 14.80 per cent. The same has been the case in Japan and other countries faced with inflation. Though conditions in these economies are different from those obtaining here, the point still remains valid that to have a positive impact on savings interest rates have to have some relationship with commodity prices. There is, for instance, every case for a sharp push to the deposit rates of commercial banks, raising the maximum rate for deposits of 5 years and above to 12 per cent.

There is similarly a strong case for stepping up the banks' lending rates on large advances of Rs 1 lakh and above, which account for about 80 per cent of total bank credit outstanding, to, say, 16-17 per cent. For the rest, the Reserve Bank should operate a really effective differential interest rates policy, depending on the purpose of the loans. This is bound to have a healthy effect on the commodities market. Likewise, the prime rates for long-term capital should be raised to around 15 per cent instead of the present 9 to 9.5 per cent. Today interest cost in total costs of production is so negligible — 2 to 4 per cent for the major industries — that industrialists have no incentive to save on capital. In addition to raising the cost of funds, the term-lending institutions should restrict their total assistance to 20 to 25 per cent of the cost of a project. This will compel companies to attract more equity capital — with wholly beneficial effects on their operations.

It is incredible but nevertheless true that a major factor that always weighs against even marginal increases in interest rates is the cost of borrowing for the government. The market for government securities is an almost wholly captive one; besides, practically the entire revenue from the interest on government securities is earned by one segment or another of the government itself. In the case of the Central government, in fact, even today its interest receipts are more than its interest payments. If the state governments have to absorb some additional interest costs as a result of a rationalisation of the interest rate structure, the Centre could allow some debt rescheduling. What is important is that the state governments as well as public sector undertakings realise what the real cost of the capital that they raise and use (or misuse) is.

To summarise, there is a case for giving a sharp push to the entire interest rate structure in the country on the following lines: (i) a maximum deposit rate of 12 per cent for deposits for 5 years and above; (ii) a prime lending rate of 16 to 17 per cent for commercial banks with a structure of differential rates for small borrowers; (iii) a Bank rate of 10 per cent; (iv) a term-lending rate of 16 per cent with a further restriction that assistance by the term-financing institutions will not exceed 20 to 25 per cent of the cost of projects; and (v) consequential charges in the yield rates on government securities.

Jyoti Switchgears

JYOTI SWITCHGEARS has turned out good results for 1973, the eighth year of its existence, which have enabled it to not only wipe off the accumulated deficit, but also pay a maiden dividend of 10 per cent, wholly exempt from tax. Sales advanced from Rs 91 lakhs to Rs 121 lakhs and gross profit was up from Rs 5 lakhs to Rs 9 lakhs. The company has undertaken manufacture of cam switches on a mass scale. There is good scope for this product and the company's profitability is likely to improve further.

MAHARASHTRA — I

The Fight Is On

THE revolt against Chief Minister V P Naik in the Maharashtra Congress has come out into the open with this Tuesday's requisitioned meeting of the Congress Legislature Party. At the meeting, eight legislators made a savage attack on the Chief Minister and held him responsible for the government's failures on many fronts. Although Naik's critics still constitute only a small group, they are backed by a powerful anti-Naik faction of the leadership, headed by Vasantrao Dada Patil, number two in the Cabinet, and P K Sawant, Pradesh Congress President.

Tuesday's meeting had been requisitioned by 136 Congress legislators who had submitted a memorandum to the Chief Minister nearly a month ago. Naik's opponents had recently scored a victory by securing the withdrawal, through the Prime Minister's personal intervention, of the nomination of N K Tirpude, a close friend and political associate of the Chief Minister, to the Legislative Council. The requisitioned meeting of the Legislature Party was thus the second blow in quick succession aimed at the Chief Minister.

The Corruption Issue

The attack on the government and on the Chief Minister at the meeting was on many grounds. Corruption was perhaps the issue most emphasised by Naik's critics. Besides, the Chief Minister was accused of encouraging casteism and of failing to fulfil the party's election promises, particularly the 15 point 'garibi hatao' programme. Speakers at the meeting also pointed to the ascendancy of the bureaucracy under Naik's regime. Civil servants, it was alleged, treated even legislators with contempt.

The attack on the Chief Minister was opened by Eknath P Salve, a Harijan member from Chanda district, and a leading light of the Maharashtra unit of the now-defunct Socialist Forum and a close associate of Minister of State for Home, Sharad Pawar. Salve listed various failures of the state government and pointed to the government's total deviation from the party's policies and programmes. He also accused the Chief Minister's followers of spreading the 'virus of casteism' to sustain themselves in power. He condemned the propaganda launched by Naik's supporters that the demand for a change of chief ministers had been inspired by the numerically, politically and economically powerful Marathas. The 'ganging up' of non-Maratha politicians against Shankarrao B Chavan, one of the aspirants for the chief ministership, was, Salve pointed out, also "casteist" and was detrimental to the harmonious working of the party and the government.

Salve received strong support from V G Prabhugaokar, a legislator from Ratnagiri and a known camp-follower of the Pradesh Congress chief, P K Sawant. Prabhugaokar charged that there was an all-pervading atmosphere of feudalism in the state, with ministers and the top echelons of the administration behaving like feudal kings. The state, according to Prabhugaokar, faced a 'crisis of leadership' and the government was suffering from a 'crisis of confidence'.

K B Mhaske, a senior legislator from Ahmednagar district, followed with charges of corruption against the administration, asserting that the Chief Minister and his group in the cabinet had failed completely to check 'rampant corruption at all levels of the administration, from top to bottom'. Even more forthright was the attack by Baburao Kotwal, a nephew of the Union Finance Minister, Y B Chavan. Kotwal alleged that Naik had completely lost control over the administration and that government officers had scuttled the policies and programmes of the party and the government. Kotwal told the Chief Minister that he was the head of the government "only in name" and that officers in the secretariat were the real masters. If "this situation continued for some more time, the Congress party in Maharashtra would be doomed". Sadashiv Shinde, MLC from Kolhapur and a protege of Vasantrao Dada Patil, said that under the present leadership the Congress party and its government had completely lost touch with the people. The Congress dared not go to the people — so corrupt had the administration become. The offices of the state government, zilla parishads and municipalities had become veritable salary distributing centres. The corrupt administration had failed to implement even the much-publicised guaranteed employment scheme in the rural areas. The government provision of Rs 10 crores annually on the scheme was just 'a drop in the ocean'; by contrast the government spent hundreds of crores of rupees on the salaries of its employees every year.

All these speakers — Salve, Prabhugaokar, Mhaske and Shinde — alleged that the ministers of the government and officers, from Secretary to District Collector, treated legislators with contempt. Naik was accused of 'spoiling the administration'.

V K Tembe, member from Greater Bombay and a protege of the BPCC President, Rajni Patel, attacked Naik not only for 'rampant corruption' and for the government's failures on the agricultural and other fronts but also for his alleged alliance with the Shiv Sena. Tembe alleged that it was at the instance of the Chief Minister that the BPCC had entered into an alliance with the Shiv Sena for the recent Lok Sabha by-election from the Central Bombay constituency. Tembe pointed out that the people scoffed at Naik's denial that he had anything to do with the Shiv Sena.

Naik's supporters listened in silence as the attack on the Chief Minister continued. The charges against the government and the Chief Minister were, they knew, another move in the game to oust him. The meeting on Tuesday was inconclusive and the discussion will be resumed on April 9. Perhaps Naik's supporters may return the fire then.

No Quitting without Fight

Meanwhile, the Chief Minister is reportedly going to use one of the last weapons available to him, the expansion of the cabinet. He has nine vacancies in the council of ministers and he will use the opportunity of filling them to divide his opponents. At any rate, it is clear that despite the attacks on him within the party and the many hints dropped by the Prime Minister herself, Naik has no intention of quitting without a fight.

But whether Naik leaves or stays, the hitherto solidly united Congress in Maharashtra is becoming, like its counterparts in other states, faction-ridden. Y B Chavan is no more the supreme boss. Either of the two groups, Vasantrao Patil's or Naik's, may seek the support of the Prime Minister — some thing which Maharashtra Congress leaders had, as if by common consent, avoided doing so far. This is a development which will be definitely to the liking of the Prime Minister.

Many Loose Ends

P R Panchmukhi

THE year 1974-75 is the first year of the implementation of the Sixth Finance Commission's recommendations. It is also the first year of the Fifth Plan. The budget proposals of the Maharashtra government for 1974-75 have to be analysed against this background.

The brief survey of the economy of the state preceding the budget proposals points out that the year starts with a heavy deficit on the previous year's account of Rs 20.73 crores according to the revised estimates as compared to a small surplus of Rs 0.13 crores indicated in the budget proposals. This was caused, *inter alia*, by the following factors:

(a) Ways and means assistance from the Central government towards scarcity relief expenditure was not available.

(b) The Central government's assistance for continuing relief works was also not available.

(c) Centre's assistance during the year was Rs 102 crores as against Rs 111 crores claimed by the state.

(d) The state had to incur an unbudgeted liability of about Rs 34 crores towards payments of additional dearness allowances to its employees. (Part of the amount was credited to their provident fund accounts, leaving about Rs 20 crores to be met by the government during the year.

(e) The Central Plan assistance was reduced by about Rs 7 crores to Rs 57 crores.

These unbudgeted liabilities (with some 'economy' in expenditure resulting in a saving of about Rs 26 crores) converted the surplus budget of 1973-74 into a deficit budget, the deficit of Rs 21 crores being nearly two-thirds of the total proposed revenue mobilisation in 1974-75.

The resources position of the Maharashtra government before taking account of the effects of the 1974-75 Budget proposals is indicated below:

	(Rs crores)
(1) Finance Commission Grants	622.97
(2) Net receipts on capital account after meeting capital expenditures	44.61
(3) Open markets borrowings	10.03
(4) Central Plan assistance	49.98
(5) Small savings	39.60
(6) Provident fund	11.87
(7) LIC loans for Plan	1.10
(8) RBI Loans for Plan	2.00
Total	785.16

Against this resources position the state government is committed to incurring the following expenditures in 1974-75:

	(Rs crores)
(1) Committed expenditure due to the Fourth Plan (non-Plan account)	591.88
(2) Non-Plan new expenditure	26.45
(3) Unbudgeted non-Plan expenditure	10.00
(4) Plan expenditure	209.82
Total	838.15

The excess of total expenditures, both Plan and non-Plan, over total receipts is likely to be of the order of Rs 52.99 crores. This deficit is likely to be reduced by discontinuation of some of the non-Plan expenditure programmes, likely increases in open market borrowings and Central assistance, and economies in expenditure. The budget proposals are estimated to fetch Rs 31.21 crores, still leaving Rs 21.78 crores as the uncovered deficit.

Mixed Record

Has the state exploited its revenue sources fully? If per capita tax revenue is any indication of tax effort, Maharashtra is found to have the second rank among the states with a figure of about Rs 49 next to Punjab with Rs 55. Taking tax revenue as per cent of state income, Maharashtra is first among the states, with a figure of about 9 per cent currently as compared to around 6.2 per cent in 1965 when the state was in the third place. However, if we take increase in the state's tax revenue as per cent of the state's income, Maharashtra slips to third place. Income elasticity of tax effort also gives the state the third rank. Per capita tax revenue as per cent of per capita income takes the state to the fourth place.

Taking both tax and non-tax revenues, Maharashtra has mobilised around 17 per cent of its income. While the state tops the list with regard to exploitation of its tax resources, with regard to the exploitation of its non-tax resources its performance is less satisfactory. About 27 per cent of its total revenue receipts at present come from non-tax resources; if Central grants are excluded, the percentage comes to nearly 18. Poorer states like MP, UP, Karnataka, etc, do better than Maharashtra in respect of their non-tax resources. While a detailed examination of the non-tax resource potential of the state is called for, one can say that there is much scope for improvement in the performance of the state's irrigation schemes, electricity generation programmes and commercial enterprises run by government departments. The state's irrigation schemes in particular present a picture of very low efficiency of operation.

The performance of the state has been generally satisfactory with regard to tax resources. Sales taxes, which fetch nearly one-third of total revenue and more than 58 per cent of total tax revenue, are the most productive tax source. The per capita sales tax collection is the highest among all the states. Nearly 4 per cent of consumer expenditure in the state is found to be towards payment of sales taxes. The figure is the highest among all the states.

However, with regard to two important tax sources, taxation of agriculture and state excise duties, the state's tax system leaves much to be desired. Direct taxation of the agricultural sector consists of land revenue and agricultural income taxation. Maharashtra gets more than 90 per cent of its receipts from agricultural taxes through the land revenue. It ranks eighth among all the states in respect of the burden of land revenue per hectare. It is about Rs 8.50 as compared to Rs 21.20 for Andhra Pradesh, which tops the list. Poorer states like Tamil Nadu and Bihar perform better in this respect. The performance of Maharashtra with respect to agricultural income taxation is very disappointing. With very high exemption limits, which exclude practically all normal agricultural incomes from taxation, and with low rates, this tax is as good as non-existent. A particularly disturbing feature of this tax is that the tax revenue has fluctuated very widely over the years, between Rs 3 lakhs and Rs 106 lakhs. In 1965-66 the receipts were Rs 25 lakhs; they fell to Rs 3 lakhs in 1968-69, rose to Rs 106 lakhs in 1969-70 and then again fell to Rs 25 lakhs in 1971-72. These fluctuations are a sufficient indication of lack of rigour and seriousness in the enforcement of the tax.

State excise duties have not been fully exploited in Maharashtra. Increase in state excise collection as per cent of increase in state income is among the lowest for all the states. It is around 0.05 per cent as compared to around 1.5 per cent for Andhra Pradesh, Punjab and Rajasthan. State excises are limited to narcotic drugs and alcoholic drinks. With the abolition of prohibition, it should be possible to exploit this source better.

Apart from the above sources which have to be tapped more fully, there is urgent need to rationalise the entire tax system of the state. Particularly, taxation with regard to the flow of goods from one part of the state to another needs a thorough overhauling as it is found to be obstructing the production process without proportionate gains to the state's coffers.

Budget Proposals

The Budget for 1974-75 contains around 25 major proposals consisting of measures for revenue mobilisation and for rationalisation of the tax system. Out of these 8 are measures of fresh taxation in terms of introduction of new tax bases. There is an attempt at rationalisation of the system with regard to nearly 8 types of taxes. Rationalisation consists of both restructuring of the base and redefinition of the rates of levies. With respect to 12 types of taxes, mostly sales taxes, the existing rates are raised.

The new levies are (i) a tax on accommodation tariff in posh hotels; (ii) tax on large residential buildings; (iii) sales tax on entertainment followed by cabarets or floor shows; (iv) transport fee and export fee on spirits; (v) education cess on irrigated crops other than those already subjected to such a cess; (vi) agricultural holdings surcharge; and (vii) and (viii) nutrition surcharge on entertainment fees and on passenger fares. All these levies are estimated to fetch around Rs 9 crores, which is more than one-fourth of the entire revenue effect of the budget.

Rationalisation is attempted generally in terms of merging the scarcity relief levies with the regular levies and also in terms of making the levies vary with the socio-economic position of the tax-payer. For example, the various scarcity relief surcharges on entertainment, passenger fares and cesses on irrigated crops are proposed to be merged with regular duties under the respective heads. With regard to the electricity duty, the present anomaly of low rates for high consumption and high rates for low consumption is corrected by making the rate structure progressive with reference to the number of units of electricity consumed. Similarly, there is a higher tax on motor vehicles — double the normal rate — owned by companies. In the same way, the goods tax on public goods vehicles is made progressive with respect to the carrying capacity of the vehicle. The nutrition surcharge will be higher on higher value entertainment tickets. The surcharge on passenger fares, which is high for urban transport and low for mofussil transport, also aims to adjust the incidence according to the socio-economic circumstances of the tax-payer. The education cess on urban property is also made as a graded levy depending upon the annual letting value of the urban property.

Also, with regard to the new levies mentioned above, an attempt has been made to make the rate structure progressive. For instance, the burden of the tax on accommodation tariff in posh hotels is made an increasing function of the tariff. The tax on large residential accommodation also varies progressively with the area. Another direction in which rationalisation is attempted is the levy of some taxes at higher rates in businesses as compared to individual consumers (as in case of motor vehicles taxation and education cess on urban property) and on the urban sector as compared to mofussil and rural areas (as in the case of the surcharge on passenger fares). The above rationalisation measures are estimated to fetch about Rs 10.15 crores. About Rs 12 crores are expected to be realised by rate increases, particularly with respect to the remaining sales taxes and stamp duties.

Three aspects of the budgets tax proposal deserve to be noted:

(a) the heavier incidence of the tax proposals on the consumer rather than the producer;

(b) the heavier burden on the urban sector than the rural sector; and,

(c) the inflationary potential.

The number of levies on the consumers is larger than that of those on producers. There are 18 taxes on consumer items (both durable and non-durable) such as accommodation, residential buildings, coffee, toilet articles, electricity, urban property, etc. The taxes on the producer such as the increased sales tax on refrigeration plants, tabulating machines, industrial raw materials, timber, tax on motor vehicles of companies, etc, are very likely to be shifted to the consumer.

Light Burden on Agriculture

A more glaring anomaly is the heavier incidence of the tax proposals on the urban rather than the rural sector. For example, the taxes on accommodation tariff, big residential buildings and industrial raw materials, the education cess on urban property, the motor vehicles tax, the sales taxes on timber, air-conditioning plants, computers, etc, hit the urban industrial sector the most. As against this, the levies specific to the agricultural sector are only two — the education cess on irrigated crops and the holdings surcharge. While the levies on the urban industrial sector bring about two-thirds of the total tax receipts from the new proposals, the levies on the rural-agricultural sector fetch less than one-tenth of the total tax revenue. A beginning has been made towards increasing the taxation of the agricultural sector with the holdings surcharge. However, the total receipts of Rs 1.50 crores from these levies coupled with about Rs 18 crores from land and agricultural income taxation would be hardly sufficient to attain the objective of inter-sectoral equity.

The tax proposals also have a mild inflationary potential. For instance, the rise in the rate of sales tax on industrial raw materials, high taxes on motor vehicles of companies, upward revision in the goods tax rates on goods vehicles, etc, on the one hand, and increases in the rates of straight levies on consumer items like coffee, furniture, etc, on the other, might provide some fillip to the inflationary forces. Of course, it is difficult to find a tax which does not have any impact on prices, especially in an inflationary situation.

There are two aspects of the Budget — one relating to expenditure and the other to taxation — which are disappointing. It is stated in Part I of the Budget Speech (p 15) that in order that as much as Rs 194 crores out of total Fifth Plan outlay for the year of Rs 280 crores is earmarked for the core sectors of agriculture, irrigation, power and industry, the provision for social services is being reduced. With regard to the basic social services such as primary education, medical care and clean water supply there are many unfulfilled tasks before the state. The second factor which is disappointing is that the Finance Minister has lost yet another chance to rationalise the tax system for inter-regional flows of goods. The octroi duty is an unprogressive levy causing hindrances to trade and production and giving vast scope for corruption and malpractices. The Committee appointed by the government had recommended its abolition a long time ago. However, no action seems to be contemplated in this direction. A properly restructured sales tax system can effectively replace the octroi duty.

NORTH

Bounty to Farmers

BOTH farmers and traders in Punjab and Haryana have heaved a sigh of relief at the Centre's decision to end the government monopoly in wheat trade. The system had not only led to a string of malpractices in these surplus states and brought ridicule upon the administration but had also proved a hindrance to wheat supplies flowing into the market. Last year's procurement price of Rs 76 a quintal had also disheartened the growers who felt that the returns from the wheat crop were not remunerative enough and hardly covered the costs of production. Some growers in fact switched over to potatoes and oilseeds which have proved far more profitable. As a result, according to an unofficial estimate, the acreage under wheat in 1973-74 is about 10 per cent less than last year. The subsequent bonus of Rs 5 for every quintal of wheat sold to the government improved the procurement prospects in the latter half of the season and enabled the authorities to achieve about 90 per cent of the procurement target. Of the Rs 13.5 crores paid as bonus to farmers, the state government's contribution was one-third.

The Rs 19 increase in the procurement rate recommended by the APC early in March came as the first ray of hope to Punjab-Haryana farmers that market realities were being belatedly recognised. But in both these states, farm inputs not only became scarce but also costlier. Thousands of farmers had to pay black market prices for diesel and fertiliser which further pushed up their costs of production. Finding that even the APC's revised price range had failed to satisfy the growers, the Punjab and Haryana Chief Ministers strove hard during and after the Chief Ministers' Conference, held in the middle of March, to persuade the Centre to improve upon its recommendation. With the highly influential and fast expanding farmers' lobby in Punjab, any Chief Minister who fails to ensure sizeable profits to the landlords cannot hope to survive politically.

The enhanced price of Rs 105 does not satisfy all the farmers who consider a larger profit margin indispensable for sustaining the Green Revolution in general and for boosting wheat production in particular. The farmers demanded Rs 115 as the minimum price; and the state government is still thinking of ensuring a higher return to growers somehow. The consumer in the two states, who have had to pay at least 50 per cent more for wheat in the winter season, fear that fixation of Rs 150 per quintal as the maximum price at which wholesalers would sell wheat actually opens the way for charging a much higher price for atta in the open market. The administration's enforcement machinery being in poor shape, traders who exceed the prescribed price range are unlikely to suffer in any way. Past experience shows that they will get away with it and profiteering will be rampant.

While the ruling party in Punjab has scored an economic victory through the enhanced wheat price and thereby won the farmers' goodwill, it has suffered a political setback through the Akali-backed Jan Sangh candidate Baldev Prakash's triumph in the Amritsar by-election. The Jan Sangh was completely routed in the 1972 Punjab Assembly elections, and a solitary victory now does not by itself signify restoration of public confidence in the erstwhile ministerial partner of the Akalis. But it is the active revival of the Akali-Jan Sangh combination and the drive it has planned to oust the Congress ministry that is far more significant. The Akali Dal (the 23-strong second largest group in the state assembly) and the Punjab unit of the Jan Sangh (understandably eager to refurbish its tarnished image and stage a comeback) have now planned a joint front.

Even with all the non-Congress elements in the assembly (the CPM, once an ally, now has no spokesman there), the Akali-led front cannot hope to match the Congress majority of 66 in a 104-member House. But a Jan Sangh leader, though disinclined to specify the precise shape of the renewed alliance, feels sure that the Amritsar success "will lay firm foundations of a democratic alternative to the ruling Congress". The first step planned in this direction is "a massive agitation" by the two parties to remove the ministry.

Disowning the small faction that has been demanding a Sikh homeland, P S Badal, the opposition leader, said the Amritsar verdict had "closed the matter for ever". The candidate who fought the by-election on this slogan received only 86 out of the 48,200 votes polled. Badal also pointed out that the Congress bid to exploit this separatist demand to discredit the Akalis had misfired. The disclaimer is evidently designed to shield the Jan Sangh from critics who question the party's bonafides by pointing to its close association with the Akalis. However, the revival of the Akali-Jan Sangh front may herald a new phase in Punjab's stale and stagnant politics.

Himachal Pradesh's 1974-75 budget, presented on March 25, marks the end of the long tax-holiday which this small entity has enjoyed since its establishment. The sizeable budgetary gap (in 1972-73 it was Rs 6.10 crores and in 1973-74 Rs 9.98 crores) has all along been bridged through massive Central subventions. Even when Himachal became a full-fledged state on January 25, 1971, financial viability was nowhere in sight, though by referring to several untapped resources and claiming a substantial share from Bhakra power generation as royalties, etc, the state government sought to establish its claim of financial viability. This year's balanced budget is, therefore, a refreshing change.

The Sixth Finance Commission has been instrumental in enabling Himachal Pradesh to fulfil its aim of becoming largely independent of Central assistance. But for the Commission's largesse — the statutory grants have been stepped up from Rs 8 crores to Rs 32 crores — the state's financial transformation could not have been possible. The Commission has, in fact, been over-generous; it has allowed an additional Rs 1 crore annually for giving enhanced emoluments over and above last year's level. On the capital account also, only a small gap has been left uncovered, much less than the quantum of market borrowings considered appropriate by the Planning Commission for this small state. The net result is that extraordinary and unforeseen expenditure necessitated by natural calamities apart, there should be no uncovered gaps in the state's non-Plan resources for the next five years — a truly remarkable improvement.

The additional tax effort which the Planning Commission expects of Himachal in view of its limited capacity to raise resources is only Rs 15 crores over the next five-year period. This year's tax package is estimated to yield Rs 2.60 crores. The Chief Minister has promised that if the present calculation of netting Rs 14 to Rs 15 crores through these taxes materialises, as is quite likely considering the natural buoyancy of revenues, the people would be spared further imposts. Apart from the usual levies resorted to in other states — higher sales tax, especially on luxury goods, enhanced bus fares and higher duty on liquor — a notable levy is on agricultural holdings with a rateable income of Rs 6,000 a year.

ECONOMISTS

Blind Man's Buff

THE proceedings of the two-day annual meeting of the Business Economists' Group in Bombay last month were akin to the labours of some 50 blind men trying to describe the proverbial elephant. The similarity was most in evidence in the discussion (presumably organised to mark the 250th anniversary of the birth of Adam Smith) of the role of the 'liberal economist'. The liberal economist was described variously as one who believed that both public and private sectors should be allowed to operate side-by-side and accepted planning as a desirable tool for accelerating development (C Rangarajan); as one who agreed to state intervention only when it was considered to be unavoidable and was thought to be effective in attaining desired economic goals (H Ezekiel); as one who considered as the primary objective the achievement of everyone's right to a job and a minimum standard of living (P B Medhora). It was also suggested somewhat haughtily that the function of the economist was to evaluate alternative ways of attaining any given objective and that he should not worry if in doing this job he was labelled liberal or non-liberal (S S Marathe).

The game continued in the discussion of the economic prospects in the current year. S Venu opined in his paper that the economy was going in for another bout of inflation, with a price rise of 20 per cent. Output of industrial commodities such as steel, fertilisers, coal, paper and aluminium was not likely to show any increase during the year and, despite expectations of a good harvest, prices of foodgrains were likely to remain high. N Shankar thought that because of the compounding effect of the budget for 1974-75, the price-rise was likely to exceed 20 per cent. He pointed out that the estimates of excise revenue, sbom of rate changes, contained in the budget assumed almost nil growth in industrial production during the year.

F A Mehta saw the economy moving towards a qualitative structural change if a 20 per cent increase in prices was to take place over and above the steep rise last year, simultaneously with a payments gap of around Rs 600 to Rs 700 crores and the related slowdown in the rate of capital formation in the public and private sectors. In his opinion, agricultural production was still the king-pin in the overall growth of the economy and he regretted that there was not enough reliable data on the trends of marketable surplus. In Medhora's view the economy was developing many rigidities: the stickiness of agricultural prices, the dependence of all sectors on the government's policy decisions and the complete lack of autonomous responses to difficulties faced by the economy.

C Rangarajan was of the opinion that it was a fallacy to relate changes in the price level to the money supply; one had to take account of factors such as expectations and desire to hoard to understand the mechanism of inflation. Medhora also stressed the handicap of inadequate information on the extent of commodity hoarding and inventory stock-piling in the economy. In the absence of reliable information on hoarding of commodities, it was not possible to measure the impact of possible cuts in imports necessitated by the balance of payments crisis on the level of production in the economy. The character of demand for credit had undergone a change, according to A C Shah. There was credit hoarding, he pointed out.

The horrifying impact of the oil crisis on the balance of payments of the nation was indicated by T P Subramonian. Petroleum and fertiliser imports together would cost the country around Rs 900 crores and, including other commodities, the total import bill was likely to reach a staggering figure of about Rs 3,800 crores. Assuming that the country was able to export to the extent of Rs 2,700 crores, this still left a payments gap of around Rs 1,100 crores. However, non-trade items in the balance of payments, amounting to Rs 500 crores, would broaden the gap to make it Rs 1,600 crores. Even assuming that oil-credits to the tune of Rs 260 crores were in the pipeline, the economy still faced a gaping hole in the external payments with no prospects of getting additional foreign aid. F A Mehta wondered whether a balance of payments gap of Rs 600 to Rs 700 crores would not have a deflationary effect on the economy. The likely deflationary impact of the deficit would depend on the commodity-composition of exports. Nitin Desai felt that the impact of the oil crisis on the Fifth Plan was not likely to be as drastic as was generally expected mainly because coal could be substituted for fuel oil in a number of industries, thus releasing fuel oil for the fertiliser industry. This would enable the economy to economise on naphtha and produce more of middle distillates.

The discussion on the Draft Fifth Plan focused on the desirability or otherwise of the continuation of the same investment strategy followed in the previous Plans. H Ezekiel maintained that a large part of the available pool of resources would be appropriated by the capital goods industries or the heavy sector with a low employment generating capacity. Thus the Plan would fail to generate enough employment opportunities. F A Mehta feared that if the Fifth Plan was implemented in full, in terms of the envisaged outlays, the economy would be launched upon the road to hyper-inflation. One of the reasons for this, according to him, was the lengthy gestation period of the sort of strategy envisaged in the Fifth Plan.

In Medhora's view the country was self-sufficient in the production of consumption goods for attaining the minimum subsistence objective set in the Fifth Plan. What was lacked was a proper distribution system. He even wondered why the size of the Plan had to be kept at Rs 53,000 crores. It could be raised to Rs 60,000 crores, even if this meant that the additional outlay of Rs 7,000 crores had to be financed through deficit financing of Rs 1,500 crores or so per annum. This additional expenditure, he suggested, should be devoted to building up social capital.

In defence of the Fifth Plan strategy Nitin Desai argued that producing the additional consumer goods required to meet the basic consumption needs of the population did not need additional investments in the Plan. Desai pointed out with pride that the Fifth Plan contained inter-sectoral consistency exercises, scientific project phasing and fixation of output targets on the basis of feasibility reports of projects. But of what avail is all this if the objectives of providing employment opportunities and a minimum level of living are to be relegated to the background?

Israel and Africa

Rahul Burman

THE isolation of Israel from Black Africa has been one of the more important products of the October war. A year and a half ago, Israel had diplomatic relations with all the members of the Organisation of African Unity, except the eight Arab and/or Muslim countries in the north, and Guinea, which had severed relations after the June war in 1967. Now Israel has diplomatic relations with only four small countries, all almost entirely dependent on South Africa — Malawi, Lesotho, Swaziland and Mauritius.

Israeli exports to Africa, for example, had grown from $ 27.7 million in 1968 to $ 45.1 million in 1972, and its imports from Africa had also shown a steady increase, reaching a level of $ 32 million in 1972. Furthermore, although Israel's trade relations with Africa represented only a small part of Israel's total trade, Africa served as a market for industrial and processed goods which Israel might have had difficulty in selling elsewhere. Israel's major export commodities have been polished diamonds and citrus, whose markets are largely in the industrialised countries. Its most important exports to Africa, however, were chemicals, at the level of $ 10.9 million in 1972, followed by transportation equipment worth $ 6.9 million, and apparel and textiles worth $ 6.4 million. These are export industries which Israel would like to develop, but which face strong competition in other markets.

Israel's four major African markets have been South Africa, Nigeria, Zambia and Ethiopia. It is not clear whether the break in diplomatic relations will mean a lessening of the volume of trade between Israel and the African countries. For instance, after Uganda broke off relations in early 1972, trade levels dropped off significantly, furthering $ 2.4 million decrease in Israeli exports to Africa between 1971 and 1972. Exports to some countries, such as South Africa, diminished since 1971 because of import restrictions. But there is a chance that South Africa might make an exception in the Israeli case, if it finds that Israel is suffering at the hands of Black Africa. Following the 1967 war, South Africa dropped its restrictions on export of currency to permit South African Jews to contribute to Israel. More important perhaps than Israel's economic relationships with Africa, although surely related, have been its military assistance programmes in African countries. For instance, in an interview after he had announced that Zaire was cutting off diplomatic relations with Israel, General Mobutu spoke of the personal difficulty of the decision for him and other members of his ruling group. General Mobutu, trained as a paratrooper by Israeli advisers, added that the diplomatic break should not be conceived of as an end to the friendship.

Ethiopia's Strategic Position

Israel has particular strategic interests in Ethiopia because of the latter's closeness to the straits of Bab-el-Mandeb, the southern opening to the Red Sea. Israel's relationship with Ethiopia has allowed it to have use of naval facilities along the Eritrean coast. Through Ethiopia Israel also aided the secessionist movement in southern Sudan. In the economic field, joint ventures have been set up between the Ethiopian government and Israeli companies. One of Israel's major investments is the Incode meat-packing monopoly in Asmara, the capital of the province of Eritrea.

Important for Israel, Ethiopia is also considered crucial by the US. Between 1964 and 1972 the US gave $ 187.1 million in military grants to Ethiopia, almost seven times as much as to any other African country. The next favourite was Zaire with $ 28.1 million. Only four other African countries — Liberia, Mali, Senegal and Nigeria — received more than $ 1 million each in US military aid during this entire period.

One of the major reasons for US and Israeli aid to the autocratic regime of Emperor Haile Selassie in Ethiopia was to help suppress the Eritrean liberation struggle. An Italian colony from 1899 through the Second World War, and then administered by Britain, Eritrea was joined in federated status to Ethiopia by the Western powers in 1952. In 1962, Haile Selassie annexed Eritrea, eliminating the meagre form of autonomy the area had enjoyed till then. The Eritrean liberation struggle, carried on for years against Italian and then British domination, has since 1952, and particularly since 1962, been directed against the Ethiopian overlords. From 1960 onwards Israel has helped operate Ethiopia's counter-insurgency campaign against the Eritrean liberation movement.

Despite the counter-insurgency — perfected by Israeli experience gathered against the Palestinians in earlier years — the Eritrean Liberation Front (ELF) has liberated large portions of Eritrean territory, and has reportedly carried the struggle into the towns of Eritrea. The threat to Ethiopian power and US domination has never been greater. Near the Eritrean capital of Asmara, the US maintains a military base with over 1,500 American personnel. The Kagnew communications centre staffed by these Americans serves an a monitor for radio broadcasts throughout East Africa and West Asia, and as one of the key centres for the US global military communications system. The ELF in the past has received support from various Arab countries and it has been hinted that one of the reasons for Ethiopia's severing of ties with Israel in support of the Arabs was to minimise or eliminate such Arab support.

In addition to military training and advice, Israel has been deeply involved throughout the continent in many other technical advice programmes. At the end of 1972 it maintained 63 aid programmes in Africa in areas such as fisheries, roads, traffic and ports, hotels and blood-banks. Cameroon had five on-going programmes of which the most important concerned urban youth clubs and pioneer youth agricultural settlements. Dahomey, Ivory Coast, Malawi and Togo had four programmes each, while Liberia and Upper Volta each had three. Other programmes were operating in Botswana, the Central Africa Republic, Gabon, Gambia, Ghana, Lesotho, the Malagasy Republic, Mauritania, Nigeria, Rwanda, Senegal, Sierra Leone, Swaziland, Zaire and Zambia. Of these countries only Malawi, Lesotho and Swaziland still have diplomatic relations with Israel.

In most of these countries Israeli aid has favoured a para-military model for agricultural development inspired by the Israeli experience with the *kibbutzim* as a means of agricultural penetration, and more recently by the *nahalin* set up in the Golan area and along the River Jordan on the West Bank. Furthermore, Israel has encouraged a *moshav* type organisation for agricultural and rural co-operation as an alternative to more collectivist models of Russian or Chinese style. It is not clear whether the break in diplomatic relations between African countries and Israel will mean the end of these programmes of technical aid.

State Bank Chairman's Speech

Need for Effective Rural Intermediaries:

Criticism of Banks answered

Speaking at the Nineteenth Annual General Meeting of the Shareholders held in Madras, on Friday, the 29th March 1974, Shri R K Talwar expressed satisfaction at the progress made by several States in introducing legislative and administrative reforms to simplify the process of giving loans to agriculturists. He stressed the need for intermediaries to canalise the flow of commercial bank assistance and offered the State Bank's full support to the Farmers' Service Societies.

In the small industries sector, the Chairman said, the State Bank's effort was to secure orderly progress for the units financed. Facile lending on the basis of half-baked schemes was fraught with grave peril and would give a set-back to the much desired socio-economic transformation.

Replying to the criticism levelled against banks after the recent credit squeeze, he stated that banks had no option but to emulate the macro-pattern of the Reserve Bank's directive in relation to their own customers.

Shri R K Talwar

Shri Talwar said:

IT gives me great pleasure to welcome you all to the nineteenth Annual General Meeting of the State Bank of India. This is the first opportunity I have had of meeting the shareholders in Madras. It was in 1970 that the Board of Directors felt that it would be useful if these meetings were held in different cities as often as practicable. On the first such occasion we held the meeting at Ahmedabad in 1970 and on the second at Calcutta in 1972.

Working Results

The annual report, including the balance sheet as on the 31st December 1973 and the profit and loss account for 1973 is already in your hands. You will have observed that although there has been a fairly high increase in operating expenses, a more than corresponding increase in income has enabled us to present a marginally better net profit.

Credit Stringency

At this time exactly a year ago, I had occasion to refer to the then prevailing keen competition among banks for advances, flowing from excess liquidity in the banking system. Paradoxically, demand for funds thereafter picked up and the momentum it gained remained unabated even in the traditional May-October slack season. Simultaneously the serious inflationary pressures in the economy began to cause concern. The Reserve Bank acted by clamping a series of credit curbs, notable among them being a progressively higher cash reserve ratio, in three stages, and a quantitative ceiling on the level of credit expansion for the busy season from October 1973 to the end of April 1974.

In December 1973, as the banks proceeded to comply with the Reserve Bank's quantitative ceiling, they faced the most vehement criticism from their customers. The protests from many, if not all, I must acknowledge, were not without force. Bankers could see the Reserve Bank's rationale. They also had sympathy for customers plunged in dire payments difficulties, specially those who had been lured in the days of competition barely a year before, and those who had exercised discipline and caution in drawing funds. Yet, for the banks the choice was small. The sheer novelty of the quantitative ceiling had caught them unawares. Without commenting in any manner on the propriety or otherwise of this macro-approach in our conditions, I think it should be permissible to say that by its very nature it becomes arbitrary, hitting all and sundry alike. Banks might conceivably have tempered its steam-roller effect with a micro-approach, showing consideration for particular cases. Each bank could have estimated its own quantum of expansion in the light of its potential resources, and differentiated between customers genuinely needy and professedly so. Unfortunately, however, the time needed for this vital exercise was just lacking. Many banks in turn, therefore, had to emulate the macro-pattern in relation to their own customers, inviting their wrath and rebuke to boot that they were harsher than necessary, practising a freeze when a mere squeeze was indicated. A misconception also seemed to prevail that banks should have redeployed their funds, i e, recalled advances from some borrowers and passed them on to others higher in the scale of priority, the assumption being that this could be done at short notice. All I can say is that this does not work in practice.

We in State Bank found, perhaps along with other banks, that even before the imposition of the quantitative ceiling, part of our permissible limit of expansion had already slipped from our hands. In our anxiety to redeem the situation we found no alternative but to impose a rule of thumb restriction on drawals against sanctioned credit limits. At the same time, conscious of our responsibility to keep the wheels of industry and commerce moving without detriment to the credit policy, we proceeded to call for cash budgets from all our major borrowing customers with a view to appraising the irreducible minimum credit need of each up to the end of April 1974. Unfortunately, not many responded in the first place, and the response of those who did was halting. Many of the cash budgets received failed to prove the claims made that they represented the irreducible minimum needs. The degree of co-operation sought by us was not forthcoming. We are still doing our best in the way of a selective (or micro) approach, but I think it is pertinent to repeat the warning I have sounded at other forums, even in days of plenitude of funds, that temporary swings apart, credit stringency has come to stay and larger borrowers might do well to so plan their financial structure as to progressively reduce their reliance on the banking system.

Two concessions given to banks and to certain other approved financial institutions, I feel constrained to point out, militate against the spirit of the credit curbs, and extend a special favour to one set of large depositors in the matter of obtaining higher return on short term surpluses. Take the rediscounting of bills with these institutions. Even when covering the sale or purchase of sensitive commodities, banks can offer such bills to financial institutions with impunity. The funds which the banking system thus obtains are the same as they would have had even otherwise in the shape of deposits, and advances from these would in that case have been subject to selective credit control. Another instance is that of participation certificates; here too, the funds obtained by banks from financial institutions steer clear of the discipline imposed on regular bank deposits. While a bank may lend not more than 60 out of every 100 rupees of its deposits, it remains unhampered in lending the entire amount of Rs 100 derived through participation certificates.

The net effect of the cited transactions thus merits close scrutiny.

Inter-Bank Money Market

In respect of banks' resources, one point for consideration relates to the roundabout and expensive accrual of funds which should have flowed directly to them and at normal cost. The surpluses of the Life Insurance Corporation and the Unit Trust awaiting investment used to be available to the banking system as deposits. But a sizeable chunk of these surpluses got diverted in 1970 when the monetary authorities permitted them to operate in the inter-bank call money market. The point I made then seems more valid now. The gains accruing to Life Insurance Corporation and Unit Trust from the call money market are in the nature of a windfall from a special concession at the expense of the banks. I would not have objected to the two institutions participating in the inter-bank money market if they had taken the rough with the smooth, as banks do. I feel sorry that I am forced to revert to this point, but three years' experience has shown that they have been perpetual lenders and I wonder whether they have borrowed even once. To permit intrusion by outsiders for the purpose of skimming the cream amounts to preferential treatment. There can be no question but that they are large depositors given a benefit denied to other depositors.

Small-Scale Industries

As you are aware, we have been operating our liberalised scheme of assistance to small-scale industries with a fair degree of success for well over a decade now. Apart from several modifications made to this scheme, new schemes such as the "Enterpreneur Scheme" have also been evolved. A significant step we took last year in this field, namely the restructuring of interest rates, reflected our concern for the smaller of the small-scale units. Small units with total limits of less than Rs 10,000/- are now charged interest at 7 per cent. The rates are progressively higher as limits rise, the highest rate being 10% per cent.

The application of this reform in itself brought into relief the variety in size, sophistication, profitability and growth potential of small units, bringing home the lesson that the same set of policies and attitudes may not be appropriate for the whole gamut. I do not think that the larger units require the same kind of nursing as the small ones which suffer from certain handicaps in their struggle for viability. As the units grow, they should reconcile themselves to stiffer discipline and normal cost of borrowing. We, therefore, propose to review all cases of small industrial borrowers enjoying limits of over Rs 10 lakhs to see whether the financial structure of each is appropriate to its scale and nature of operations. It is by no means being suggested that these units would be denied need-based assistance, but the intention is that they should be subject to better discipline which is inescapable from the point of view of their transition to the medium of large-scale sector.

In the process of financial restructuring, we are in a position to offer comprehensive advisory services through our Merchant Banking Division. We have identified some units as needing such assistance but their response to our efforts to assist them has been disappointing. I would like to take this opportunity to reiterate to these clients that our eye is not on the immediate future. We are interested in their progress in the long run.

As for the Entrepreneur Scheme, from the experience of the past 4/5 years we had found that interest cost was indeed a burden for this class of borrowers, excepting a few engaged in highly profitable lines. In the context of our objective of nurturing the growth of entrepreneurship, we realised that these units required special support. It was for this consideration that we decided to reduce the interest rate to a flat 8½ per cent for the first three years. The Reserve Bank's directive prescribing a minimum rate of 11 per cent on advances with aggregate limits of over Rs 2 lakhs has, in my view, hurt these borrowers. Quite a few entrepreneurs have exceeded this limit for their borrowings and yet I feel they continue to merit special consideration.

Our effort in the small scale sector, I need hardly say, is to secure orderly progress for the units financed so that they may become models for others to emulate. Facile lending by banks on the basis of half-baked schemes might perhaps show them in better statistical light as far as creation of job opportunities is concerned. Such a course, however, is fraught with grave peril. Ultimately, small scale units have to stand on their own legs, and their failure to do so will lead to frustration giving a set-back to the much desired socio-economic transformation.

Agricultural Finance

On previous occasions I had referred to the legal disabilities facing commercial banks in the field of agricultural finance and urged State Governments to remove them. I had also expressed concern over their lack of appreciation of the role of commercial banks. I am happy to record that since then, the response of several State Governments to our pleas has indeed been heartening. Many states have made satisfactory progress in introducing legislative and administrative reforms to simplify the process of giving loans to agriculturists. They have also been helpful in making available the services of technical staff for work connected with loan appraisal, follow-up and supervision. The favourable climate created by these steps should help us in planning a more vigorous effort in agricultural finance.

I had mentioned three years ago our plan to open, over a period of time, about 150 special branches in various parts of the country to promote agricultural development. This has been done.

Most of our Agricultural Development Branches are situated in areas covered by development schemes for small farmers, marginal farmers and landless-labourers; others being in areas where schemes such as multiple cropping programmes or tribal development schemes are in operation. Our loaning programmes at these branches are preponderantly in support of small farmers. Credit disbursement follows the formulation of specific schemes covering minor irrigation, land development, storage and processing, and ancillary activities such as dairy and poultry — in short, all aspects required to make agriculture a viable business occupation.

The induction of commercial banks into direct agricultural finance was meant to supplement the efforts of the other agencies in the field, particularly the co-operative banks and societies. It is common knowledge that there are severe limitations to widespread expansion of agricultural credit through commercial bank offices. At the same time, we are deeply conscious of a sense of void at the lack of our presence in each village. All this brings home to us, in sharp relief, the need for effective intermediaries to canalise the flow of commercial bank assistance.

The importance of such institutional framework lies, first of all, in reaching the villages themselves, particularly those where the prospect of banks' entry is remote, and in evolving locally any plans of economic uplift. It is then that finance for agriculture will become fruitful. This is why we would like to see the primary societies gaining in strength in terms of coverage of households and viability, with the aid of the financial and managerial resources of the commercial banks. As each society grows, it could emerge as a multipurpose agency, not only meeting the diverse needs of agriculture but also those of village industries, artisans and others in gainful economic pursuits. I believe that this agency can thereafter be helped to become the hub of the village, providing the basic organisational unit for initiating and implementing any form of economic or social development.

I am glad that an increasing number of State Governments have accepted this point and have decided not to stand in the way of linking primary co-operative credit societies with commercial banks. Many hurdles still remain to be crossed in the process of establishing this relationship and, where this relationship prevails, developing it on sound, healthy and stable lines. It is our responsibility to demonstrate in the chosen areas that the tie-up of primary co-operative societies with commercial banks is not only mutually beneficial, but will benefit the people whom both institutions strive to serve.

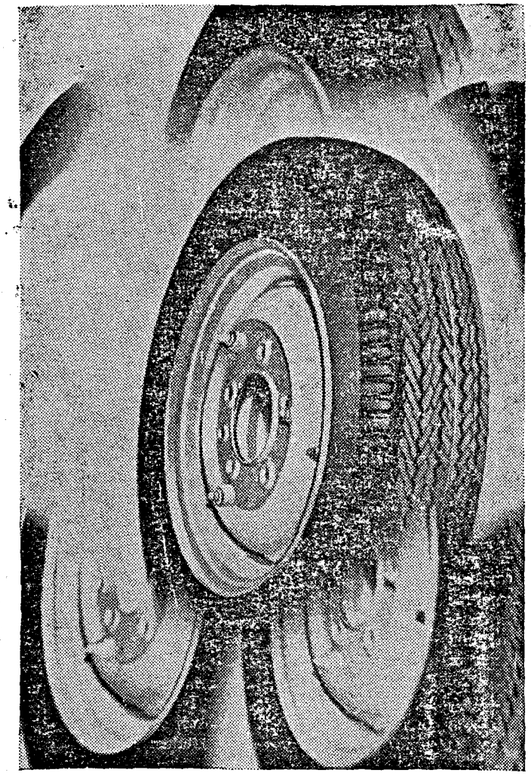
For the purpose of routing commercial bank finance, the Farmers' Service Societies that are being launched on an experimental basis in certain parts of the country will be another important vehicle. I fully support the concept and we are prepared to collaborate in all possible ways with any well conceived venture in the form of such societies. I have earlier expressed the view, which bears repetition, that these agencies will need effective local participation and leadership. We look to the State Governments which have opted for this experiment, to help bring this about. For our part, short of ourselves creating or sponsoring such agencies, we would be only too happy to associate ourselves even in designing their financial organisational and administrative structure so that we can work with these societies in close harmony.

International Banking

In the area of international banking, the diversification of the business operations of our London Office has now come to stay. With a view to increasing our deposit resources in London, one more branch was opened last year and we have plans to open two more this year. The business of our New York office was further stabilised and we have a proposal to establish an offshore branch at Nassau to support our New York and other overseas operations. Much of the preliminary work connected with opening of our branches at Frankfurt and Dacca has been completed and we hope to commence operations at these centres before long.

We have given considerable thought to our overseas expansion in the context of the growing volume of the country's foreign trade and, more particularly, as a measure to support our export effort. Branches in the major cities of the world are quite costly and more so in the wake of spiralling inflation. We will need specially trained staff to man them. It is also not as though our objectives in international banking can be met by having a few offices in isolated pockets serving some specific purpose or the other. We will have to frame a co-ordinated plan with a well established order of priorities. For example, worthwhile opportunities are opening up for Indian industrialists for exporting complete industrial units in the intermediate technology range on a turn-key basis as also supporting consultancy services. Such exporters and other Indian joint ventures abroad require, apart from necessary bank facilities in India, strong banking support at the overseas centres for meeting local costs, arranging remittance of funds, and other bank services for day-to-day transactions. Comprehensive domestic and international banking services could be provided by us if we were established in the importing countries either directly or indirectly. Secondly, regions like the Middle East have emerged as major reservoirs of foreign capital resources. Our presence in such regions can help to attract much needed investment capital for our country. Branches established for such specific purposes will require avenues either for investing their surpluses or for borrowings in the course of their banking operations. This will mean our presence at the key financial centres of the world. It is thus that a network of overseas offices will have to develop more or less simultaneously. We are, therefore, drawing up a three to five-year plan taking into account these factors, the availability of competent staff and the need to take advantage of emerging business potentialities as quickly as possible.

Staff Relations



In the field of staff relations, I have described in the past our corporate philosophy based on the conviction that our employees are our greatest resource and it is their individual growth that will perpetuate and nourish this institution's successful functioning. The job enrichment plan we have adopted for this purpose is now being experimented at 18 branches of the Bank.

In our relationship with the staff unions, an important development during the last year was the reiteration of our mutual desire to avoid work stoppages arising from industrial disputes. Differences between management and unions will arise, but we believe that these can be resolved through discussion without causing inconvenience to the public. With this conviction we have set up management-union councils at the Circle and Central Office levels. All matters likely to cause industrial unrest will be discussed at these forums and no party will resort to unilateral action while the matters are under such discussion. There is some evidence to show that this machinery is proving useful. A feeling of mutual trust and confidence has been generated, not merely through talking about it, but by the actions taken by both sides in all things big and small.

Reorganisation and Performance Budgeting

One phase of the total plan of reorganisation, connected with a more rational allocation of functions and responsibilities was completed during the year with the appointment of Deputy Managing Directors at Central Office. Efforts are continuing at stabilising the new executive roles at various levels and these are now integrated with our

WE DON'T MANUFACTURE TYRES
BUT WE HELP MAKE THEM STRONGER

Our 'GRIFFIN BRAND' ZINC OXIDE is an essential activator in the manufacture of rubber based products, particularly where mechanical properties are important. Zinc Oxide reinforces tyres, fan belts and conveyor belts, thus ensuring their greater durability.

regular training programmes at the State Bank Staff College.

The performance budgeting system introduced in the Bank completed the first full year of operation on a whole-bank basis. The experience has been very rewarding and we are convinced that we are on the right path of improving our methods of business planning and management control.

Change in Directors

The composition of the Central Board and the Local Boards underwent substantial changes during the year. Bhopal and Patna Circles now have representative Local Boards in line with those in the other Circles. I would like to place on record our thanks to all those who have ceased to be on the Boards for their valuable association with us and welcome those who have newly joined us. Shri B D Garware, a senior member of the Central Board long associated with the Bank, has been appointed as Vice-Chairman. We are happy to have his continued guidance and support.

REVIEWS

Enslavement and Pundit Pride

Sudhir Chandra

Historians and Historiography in Modern India edited by S P Sen; Institute of Historical Studies, Calcutta; June 1973; pp xxviii + 464; Rs 80.

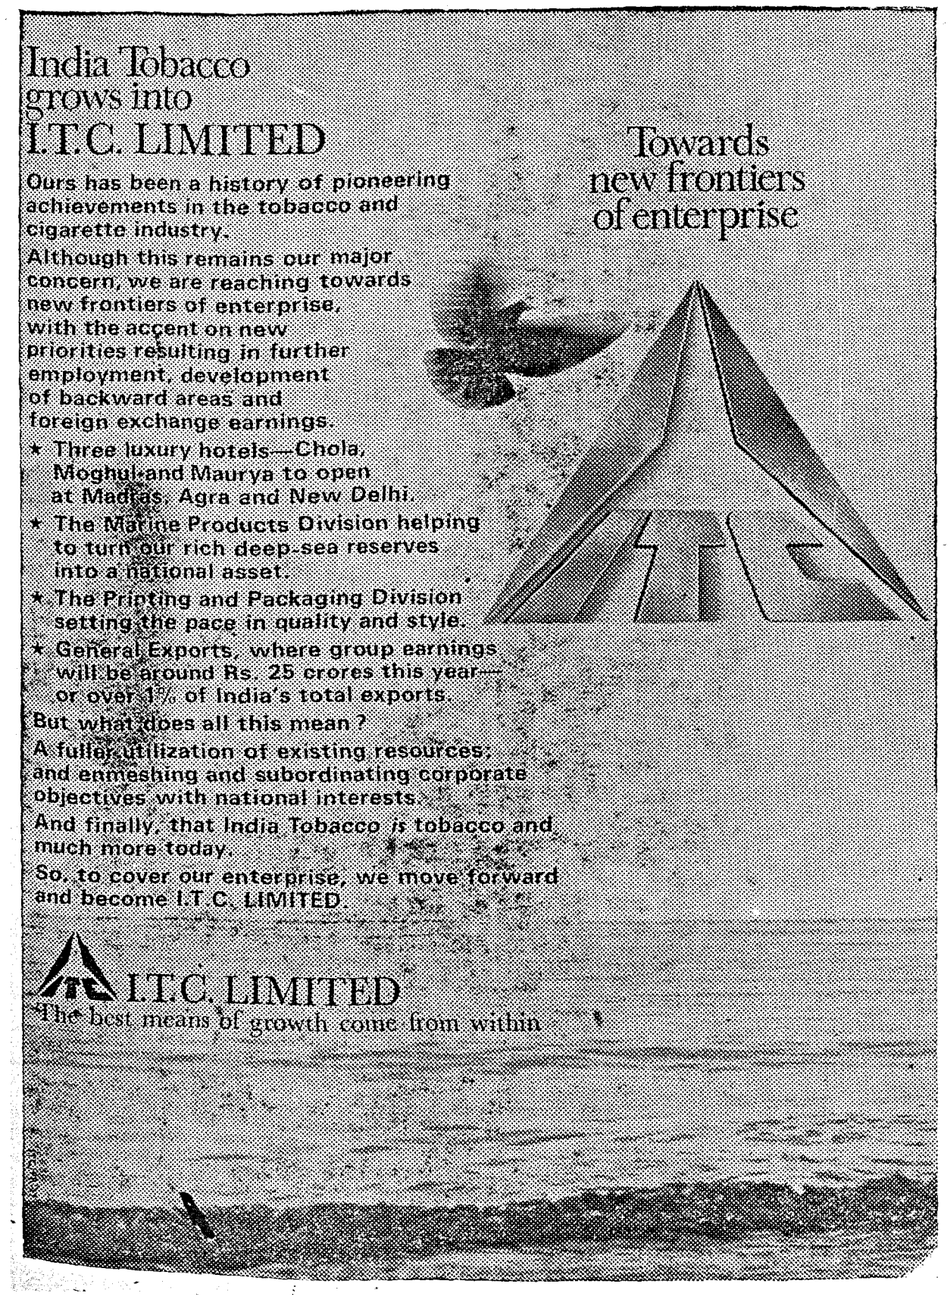
"EVERY new entrant to a craft or every practising craftsman should know not only the general principles of the craft but also the actual practices of the mastercraftsmen of the past". This is the editor's justification for collecting 40 papers which attempt to survey the development of historiography in India, from the time of Raja Rajendralal Mitra to that of D D Kosambi and K M Panikkar.

Useful Venture

A useful venture, no doubt. But not significant enough to justify the editorial claim that the contributions made during the first 100 years of historiography in modern India were "not of any lesser importance than those in other countries in the corresponding period of development". The fact is that neither in terms of new ideas of history nor in terms of application of new historical methods has a major breakthrough been achieved by an Indian historian. Modern Indian historiography always remained what it is even today: essentially derivative. Not merely historiography but modern Indian scholarship as such has tended to be conceptually frigid. Undoubtedly, we have perceived a good deal during the last century. But the process of perception itself has rarely received any penetrating treatment from us.

That such a palpably exaggerated claim should have been staked on behalf of modern Indian historiography by someone who is supposed to have studied it in depth is, indeed, symptomatic of the failings of modern Indian historiography. It is symptomatic of a basic unconcern for accuracy of expression — a tendency that operates not only at the level of description but also at the level of investigation. As should be evident, this single defect leads to a total distortion of perspective. Not only is modern Indian historiography unoriginal, in ideas and methodology, but it is alarmingly unwilling to face this fact.

The complexity of the entire process of historical perception seems to have eluded the most eminent of our historians. Thus R C Majumdar, often described as the doyen of Indian historians, complains in the volume under review that "the end of British rule has led to a steady deterioration in that critical method of historical studies which we Indians learnt from our contact with the West during the last half of the nineteenth and the first half of the present century". He feels — and hopes that he may be proved wrong — that "we are gradually losing sight of the fundamental object and principles of writing history and a lot of confusion of ideas has crept in on this subject". But when it comes to defining these ideas, objects and principles, Majumdar makes complete nonsense of logic and reason by pronouncing:



> Moral judgment as well as various inferences are welcome and even necessary, only when the facts are established with a scrupulous regard for truth alone, without any influence of preconceived judgment, and afford sufficient materials for forming a judgment.

Once can only wish that reconciliation between valuational and value-free approaches to history were in practice as easy as Majumdar makes it out to be.

Latest Attempt

History is constantly used to legitimise present efforts. It is invoked with equal avidity by those who want to retain and by those who want to change what exists. Reactionaries, conservatives, reformers, and radicals of all hues seek its sanction. And all of them, interestingly enough, appeal to true, objective history. For years Indian history has been used, among other things, to invest the communalism of the majority community with the aura of nationalism. From the Bharatiya Vidya Bhavan's "History and Culture of the Indian People" to 'Professor' Madhok's "Indianisation", many efforts, varying in the degree of sophistication and crudeness, have been made to secure this end. The latest attempt in this direction, it seems, has come from S P Sen, Director of the Institute of Historical Studies, Calcutta, and editor of the present volume. In fairness to him it may be added that the motivation behind the views enunciated by him may not be sinister, though the presuppositions which yield his conclusions are very similar to those on the basis of which the supposed nationalist character of Hindu historiography rests. This is a serious charge, no doubt. Should Sen's views be even slightly misrepresented in an attempt to summarise them, a longish quotation to illustrate the charge is called for:

> Some motivated criticisms have been raised in recent years against what has been termed as an undue concentration on the ancient (or Hindu) period in the first phase of historical studies in India. The critics contend that this had led to a spirit of Hindu revivalism, creating a split between the Hindus and the Muslims. It is a most unjustified charge, prompted no doubt by a contemporary desire to emphasise the composite character of Indian society and cultural heritage. The critics, however, ignore that in every country when there is a revival of consciousness of national identity, people invariably turn back to what they consider as their Classical Age and seek to derive new inspiration from that heritage. They do not view other periods of their history in the same light. So in India if historical studies in the modern period turned to the Classical Age for inspiration,

there is no justification to call it a deliberate attempt at Hindu revivalism. Nor is there any justification to ignore the palpable fact that for 99.9 per cent of those who follow other religions than Hinduism today the Classical Age is the same as for the Hindus. A change of religion does not alter the fact that the epics, the literature, the philosophy and the entire culture of ancient India constitute the common heritage of all Indians irrespective of their religious differences today.

Exaggerated Defence

Incredible though it may appear, it is not a spurious but a genuine 'Professor' of history who has ascribed unanimity of emotional adherence by Indians to a single 'Classical Age'. Perhaps it is in the fitness of things that, in these days of quantification, Sen should have decided to be so specific in his assertion as to talk of 99.9 per cent of the entire population of India.

It should be clear to any student of modern Indian history that the concentration of early historical scholarship on ancient India was due to a variety of reasons, and that it was productive of a variety of effects including Hindu revivalism. That, instead of analysing the problem in its totality, Sen should have attempted such an exaggerated defence of that early concentration is revealing. Equally revealing is the clear lack of empathy which alone could have emboldened Sen to attribute to Muslims, Parsis, Sikhs, and Christians as also to all Hindus themselves, such involvement with the heritage bequeathed by ancient India.

It is more than merely saddening — as it also has practical import — that, after having been practised for more than 100 years, history-writing in its modern incarnation should have made such a discouraging advance in this country.

A Tautology Has Its Uses ...

Say's Law: An Historical Analysis by Thomas Sowell; Princeton University Press; $ 8.50.

WHAT are called seminal ideas are sometimes the products of serendipity, so much so that greatness seems to have been thrust upon, if not naivete, at least innocence. Perhaps precisely because of that, over time, they begin to mean all things to all men. Say's Law has an apparent straightforwardness in what it conveys. It has nonetheless not been able to escape the fate of periodic obfuscation. Controversies have reared their heads for more than a century now on whether what it says makes sense, and whether what it says, even when it makes sense, does or does not controvert reality. Inevitably, at certain stages of the debate, intellectual predilections and class emotions have tended to converge. Doubts and questions have kept crowding. Even if what Say's Law says is approximately correct, what particular bias does it reveal or conceal? Should not one proceed beyond the Law? What is it, after all? A mere identity, the statement of an obvious, tedious reality? Supply, true, ought to create its own demand, but it does so only under certain conditions. Would these conditions hold good for all times? In case they would not, what emendations must one add to the Law?

Ricardo-Malthus Controversy

A tautology has its uses to make pedants of even otherwise sensible men. Economists in successive decades have attempted to grapple with the inner core of the identity which J B Say, absentmindedly or not, enunciated and that utilitarian, James Mill, took it upon himself to propagate. Interregnums of quiet have been there, but it has never been really left alone. In each generation, aspiring contributors to the corpus of knowledge have gravitated toward the concept, either to defend it or to belabour it. Their purpose has differed, but somehow they have still managed to discover some specific function in the Law. This attractiveness is perhaps the quality which helps a concept to make the transition from run-of-the-mill drabness to classical grandeur. Consider, for example, the famous polemics between Ricardo and Malthus over the issue of gluts: one almost gets the feeling that in case Say's Law were not already born, the occasion would have called for a caesarean birth. 'Demand', argues Ricardo in his famous letter of June 26, 1814 to the parson, "has no other limits but the want of power of paying for the commodities demanded. Everything which tends to diminish production tends to diminish this power." No dichotomy is conceivable in the Ricardian system between aggregate demand and aggregate supply. Malthus's concern over 'effectual' demand appears to Ricardo as an obsession wholly uncalled for. There could be no such phenomenon as excess savings; on the contrary, "the desire of accumulation will occasion demand just as effectually as a desire to consume, it will only change the objects on which the demand will exercise itself". And, further, "we all wish to add to our enjoyments or to our power. Consumption adds to our enjoyments, — accumulation to our power, and they equally promote demand". (Letter to Malthus, September 16, 1814.)

Having thus appropriated, lock, stock and barrel, Say's Law, Ricardo could see little point in idle theories of overproduction. He was willing to concede that now and then a decline in the level of activity could occur but, in such an eventuality, both supply and demand in the community would fall proportionately. Equilibrium, in other words, is equilibrium; its level may shift, but not its basic property: "the demand must essentially depend on the price at which [commodities] can be afforded, and the prices of all commodities must increase if the price of corn be increased". (Letter to Malthus, October 23, 1814.)

Malthus could not differ more. The distinction between *ex ante* and *ex post* phenomena had already begun to cast its shadow. Even if there was the will to consume, the capacity to consume could not expand unless the intensity of demand was raised to the required degree by enlarging purchasing power. It is not enough to argue, as Ricardo does, that the 'value' of an output cannot fall below the 'value' represented by the quantity of labour embodied in it. Accumulation would of course add to the national dividend since the outlay on a certain quantity of labour would, in all circumstances, at least produce its own embodied value. Even so, problems of adjustment remain. Savings, says Malthus, in case carried too far, may impinge on the correct balance between production and consumption; an excess of savings may hamper the formation of 'effectual' demand. In case a country expands the quantum of funds for the upkeep of labour at a rate faster than the increase in population, the growth of the economy, instead of being stimulated by such additional savings, could in fact be checked by the relative inelasticity of labour supply even before the limit of the stationary state is reached. In other words, the savings necessary to maximise social income may turn out to be less than what are required to maintain all the available labour in

'productive' employment. To put it the other way round, in the short run the labour supply may fail to increase sufficiently so as to absorb the additional output of wage-goods; savings directed towards the expansion of the latter could thus result in a glut. The greater the diversion to savings of the surplus income of landlords and capitalists — the surplus income which should in the normal course have been used, through conspicuous consumption, for creating employment and purchasing power —, the greater will be the intensity of the consequential depression.

Gluts Controversy

In the standard histories of economic thought, the Ricardo-Malthus controversy has continued to pre-empt an impressive number of pages, and Say's Law accordingly has held the centre of the stage. Perhaps there has been an excessive airing of the obvious on either side. What still stands out is the explicit introduction by Malthus of the concept of the short term and his emphasis is on the point that, given a finite time-horizon, the adjustment mechanism implied in Say's Law may fail to click. The rest of the excitement, it may well seem at this interval of time, was much ado about nothing: you get out of an identity what you put in it. This sceptical note notwithstanding, Say's Law is likely to survive in the literature, if only as a cliche. As an innocent tautology in a closed system and where the time factor is not brought in the picture, so much so that economic processes are subject to instant adjustments, the Law is infallible. It would belong to that species of abstraction which economists love to expiate upon for their selfish intellectual pleasures. You do not quite believe in the abstraction, but you try to work out what its implications could be in case the assumptions on which it is based were to turn true.

The gluts controversy marked the high noon of Say's Law; the intellectual battle lines were drawn, economists divided themselves, much cerebral energy was expended by the followers of Ricardo and Malthus in defence of their respective positions. John Stuart Mill felt a filial responsibility to refurbish the theory with which his father's name was associated, and, while doing so, to take some cognisance of the Malthusian doubts: "Although he who sells, really sells only to buy, he need not buy at the same moment when he sells; and he does not therefore necessarily add to the *immediate* demand for one commodity when he adds to the supply of another. The buying and selling being now separated, it may very well occur, that there may be, at some given time, a very general inclination to sell with as little delay as possible, accompanied by an equally general inclination to defer all purchases as long as possible." (J S Mill, "Essays on Some Unsettled Questions of Political Economy", London: John W Parker, 1844, p 70.) Here is at least a faint recognition of the possibility of a short-run disequilibrium, but, as he proceeds, Mill is inclined to place most of the liability for this on monetary factors: money may happen to be unevenly distributed over time and over sectors, and thus retard or stimulate demand in particular sectors disproportionately to available supply. There could however be no such thing as a general or permanent excess of production: if some 'process' declines, some other 'process' must rise. One need not worry about the phenomenon of excess savings either, for if the resulting new capital stock were duly distributed among 'many varieties' of employment, demand for the produce stemming from this new capital would be ensured, and there would be no cause "why any part of that produce should remain longer on hand than formerly".

And so it went. Minor bruises were minor bruises; till as long as Keynes did not appear on the scene, Say's Law more or less held its own. The Walrasian Law of General Equilibrium presented a dolled-up version of the Law in a multi-commodity setting. Leontief's mechanistic exercise, the basic frame for which was ready even in the late 1920s, was a reassertion of an enduring faith in the identity. It was left to John Maynard Keynes to resume the siege in his "General Theory", and thus to revive the Malthusian tradition.

Marxist View

Meanwhile, the only discordant note had been struck by the Marxists. Say's Law, that tautology, is an epitome of vulgar economics: it conceals the reality of the economic process. A plague on both your houses, those who advocate Say's Law as well as the Malthusians: the genesis of the capitalist crisis is not in the tendency for chronic gluts, but in the fact that the working class receives too small a portion of its own product. The evil could be remedied by giving them a larger share of the quantity, for example, by raising their wages. In the Marxian schema, the limit to production is set by capitalists' profit. Production comes to a standstill at a point determined by the rate of realisation of profit and not by the criterion of satisfaction of social needs. While Say's Law is sheer fetishism, to explain the capitalist crisis in terms of under-consumption, as Malthus has done, is hardly better — it is sophistry of the most degenerate kind.

The passing of time is a great aid to clarity. It has lent a certain perspective to the issues central to Say's Law when it was first formulated. The distinction between the long and the short runs is now more clearly understood; that there can be a certain lack of proportionality between 'prices' and 'values' of commodities is at present freely admitted; that the Law can have different implications for closed and open economies is also widely recognised. Moreover, now that the controversies are quietened and one is able to analyse the theorem in tranquillity, an extra bonus comes one's way. The neo-classical position notwithstanding, an essential point derivable from the classical model of value is that the process of production is inseparable from that of demand and therefore from the structure of income distribution. This becomes strikingly clear as one reads the correspondence between Ricardo and Malthus, or rummages through the painstaking annotations of Say's Law by John Stuart Mill. That this is the heart of the matter should have been evident even to Keynes as he acted as master of ceremonies for Malthus. Keynes, however, was a congenital anti-socialist, and perhaps did not want to let the cat out of the bag.

Thomas Sowell's "Say's Law" covers the ground for well beyond two hundred pages. It begins with the early development of the Law in James Mill and Ricardo, wades through the pools of doubt raised by Malthus and Simondi, deals in great detail with the general glut controversy and faithfully presents the reformulations to be found in John Stuart Mill. It also has space to refer to the Marxian position and to what the cautious neo-classicals have to say in rebuttal. If one wants to know who said what on the identity and when, Sowell's book would be excellent as a reference. But it is more an annotation than an analysis. It is, in addition, verbose, and faithfully reflects some of the worst features of present-day run-of-the-mill American scholarship. In this one instance, supply, one hopes, will not create its own demand.

Neglected Opportunities in Irrigation

K William Easter

This article considers two different programmes which attempt to improve water use and management in eastern India. One concerns the Hirukud project, which irrigates 282,000 acres in the Sambalpur district of Orissa; the other is in the Raipur district, just west of Sambalpur in Madhya Pradesh. Both projects attempt to improve water use and management of existing irrigation, by installing field channels to give farmers better control over the water in each field.

The two projects represent the two ends of the cost spectrum. The Raipur project is capital intensive and costly relative to the Sambalpur project which consists of a simple system of village field channels installed at minimum cost. This article reports on the internal rates of return from these projects and highlights the importance of technically trained people and alternative project designs in making projects viable.

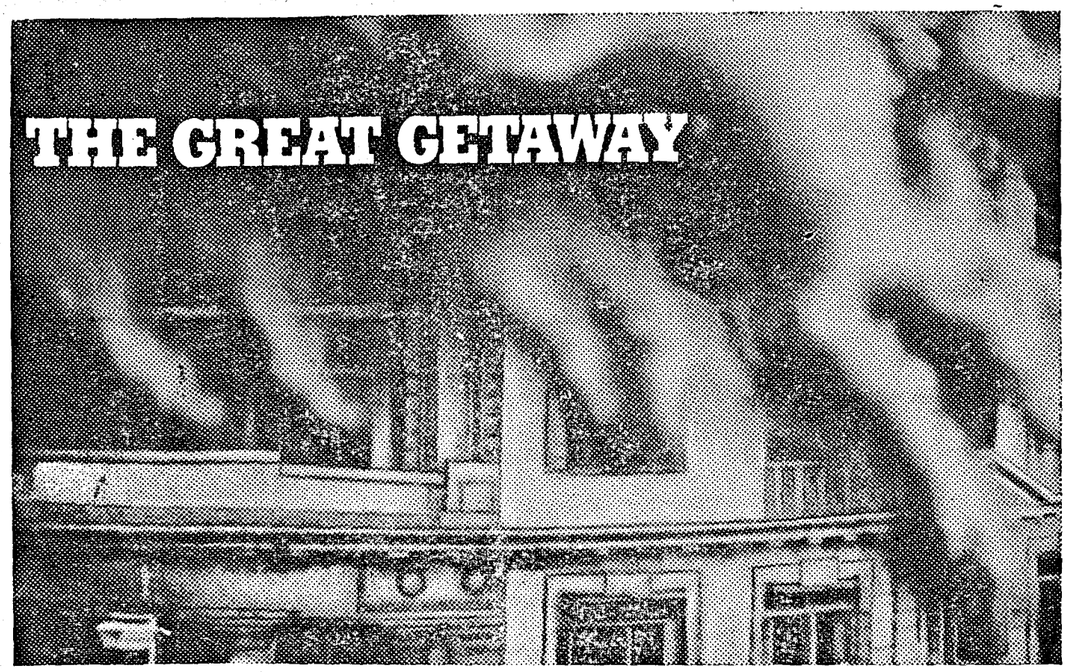
OVER the centuries, sizeable investments have been made in India to develop the irrigation potential; and these investments have continued during more than the quarter century of independence. By 1968-69, the net irrigated area was 71 million acres or about 21 per cent of the net area sown. The 1968-69 level of irrigation is 17 per cent above the 1960-61 level and 38 per cent greater than in 1950-51. However, there is wide variation in the type and quality of irrigation. Over a third of the irrigation comes from government canals, 17 per cent is from small reservoirs (tanks), 8 per cent from tube-wells, and the remainder from other wells and private canals.

With the advent of high-yielding varieties (HYVs) of wheat and with the increased use of fertiliser, the returns to irrigation increased sharply, leading in turn to rapid expansion of private tube-well irrigation, particularly in north-western India. The more recent spread of HYVs of rice and the continued population pressure, have pushed up the returns to irrigation in many of the high rainfall areas of eastern India. Here, the irrigation is used to supplement rainfall during the wet season (kharif) and to allow production of one or two dry season (rabi) crops.[1]

In eastern India, canal irrigation is dominant, with water flooding from field to field where farmers have little control over the flow of water. Once the water is in the main channel, the outlets are usually never closed; consequently, the water flows continuously through the fields and the water distribution is quite uneven. In fact, water may not always reach those at the end of the service area or at the end of the canal.

Although the future opportunities for building additional reservoirs and for extending canals are limited, one important mode of extending irrigation remains largely untapped. This is the improvement of existing irrigation projects. In 1972, the Irrigation Commission of India reported a large potential for utilising current irrigation potential more fully through installation of field channels [1, p 399]. Don Williams has reported similar findings in his work in India[2].

In this present article two different programmes are considered which attempt to improve water use and management in eastern India. One concerns the Hirakud project, which irrigates 282,000 acres in the Sambalpur district of Orissa; the other is in Raipur district just west of Sambalpur in Madhya Pradesh. Both projects attempt to improve water use and management of existing irrigation, by installing field channels to give farmers better control over the water in each field.



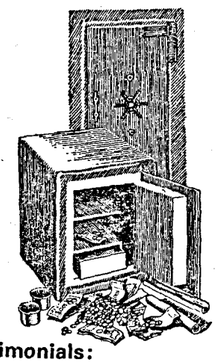
The two projects represent the two ends of the cost spectrum. The Raipur project is capital intensive and costly relative to the Sambalpur project which consists of a simple system of village field channels installed at minimum cost. This article reports on the internal rates of return from these projects, and highlights the importance of technically trained people and alternative project designs in making projects viable.

Project Design

In the case of Sambalpur, the Intensive Agricultural District Programme (IADP) staff introduced a programme for installing field channels and demonstrating their use in two villages. The basic idea was to provide a small unlined channel from the canal outlet along the field levees to each farmer's plot, thus giving each farmer control over the flow of water onto his fields. Placing the channels along the levees minimises the quantity of land taken out of production. Initially, a major extension effort was needed to get the approval of the entire village, because just a few farmers nearer the canal outlets could prevent the installation of the field channels by refusing to allow their passage along or through their fields. When several villages were thus improved, other villages became interested; now village approval is not difficult to obtain.

Once a village agrees to the programme, IADP provides the technical assistance needed to design the complete village system; it also provides the materials (rock, concrete and pipe) needed to instal the field channels. Drop structures are required to prevent erosion in places where there are significant changes in elevation, while pipes are needed under road crossings. The IADP staff also demonstrates the use of HYVs, fertilisers, and pesticides; further, it assists in maintaining the newly constructed village irrigation systems. The villagers contribute the labour for digging and maintaining the channels. At the time of this study in 1971, four village systems had been completed, nine more were in progress, and a number of others were waiting for assistance.

The Raipur project, a co-operative project between the Ford Foundation, IADP, and the State Agricultural College, is much smaller than the average Sambalpur project and involves only 26.6 acres in a small reservoir (tank) irrigated village. It included lining a 2000-foot main channel with bricks and cement as well as 10 feet of each of 10 lateral channels. Unlined field channels were constructed from the 10



Godrej safes and vaults make it with all the valuables intact—surviving fire, water and steep falls.

In the fires that razed the **Central Bank of India** (Calcutta) and **Alice Building** (Bombay) to the ground—Godrej Security Equipment once again proved its mettle. Hurled from a height of 70 feet, buried for days under smouldering debris, Godrej safes came through with the valuables intact.

★ A remarkable feat, especially as the safes in Alice Building were over 50 years old. But safes of 'reputed' foreign makes had their contents destroyed!

Valuables worth many crores of rupees were recovered from the vaults of the Central Bank, as also valuables from safes.

People who got back their valuables intact have this to say about Godrej Security Equipment and Godrej Service:

Testimonials:

1. *"It's a tribute to the Godrej system of lockers that no locker was found damaged in this devastating fire...*
   "At a critical point Shri Dhatigara had to get behind the door to work on it from within in utter disregard of his personal safety."
   Chairman, Central Bank of India.
2. *"...all the precious articles were found intact. Even wrist watches were in working order. I would not dream of using any other safe...,"* writes N.B. Jeejeebhoy, 3rd floor, Alice Building, Bombay.
3. *"...though the safe fell down in this conflagration from a height of about 70 feet and was dented and damaged on the outside, I found the safe...in locked up condition...Both the keys could be worked. Valuable records, documents, securities...were in a good legible condition,"* writes M.J. Sanzgiri, 4th floor, Alice Building, Bombay.

What makes Godrej Security Equipment so safe

Godrej are constantly innovating to design the safest security equipment. And in their 75 years in Security Engineering Godrej have *pioneered* many safety features. These have effectively resisted daring burglaries and dacoities as well as some of the worst fires and falls including those that followed the catastrophic wartime ammunition explosions in the Bombay Docks.

No wonder that the Reserve Bank of India and leading banks and institutions—in India and other countries—rely on Godrej.

Godrej®

GB.7230(A)

laterals to each of the farmers' fields within the 26.6-acre project area. Two surface drains, each 2,500-foot long, were constructed to drain the excess water to the main drain, which runs along the eastern boundary.

The Raipur project is far more expensive than the ones in Sambalpur; but it is a more complete system which includes drainage. The Sambalpur projects do not include the lining of any channels, while this is one of the major costs of the Raipur project. The Sambalpur projects represent the lower bounds for the cost of improving a village irrigation system while the Raipur project approaches the effective upper bounds of cost; indeed, had the field channels been lined or land levelling been required, the costs would have been even higher.

Natural Resources

The Raipur and Sambalpur projects are in the rainfall zone, which generally permits the production of a wet-season rice crop. The irrigation water supplements the rainfall and assures the production of a wet-season rice crop, while during the dry season crops cannot be grown without irrigation. When the rainfall is short, adequate water may not be available for the dry season, particularly in Raipur.

For over 10 years, the Sambalpur farms have irrigated two crops of rice each year. Currently, the dry season crop is the more productive: insect damage has cut down on the use of HYVs and has reduced production in the wet season. In contrast, Raipur village is assured of only one rice crop, with a second crop being possible in a limited area every two or three years A small reservoir provides water for the Raipur project village, along with several others; depending on the quantity of water in storage after the first crop, water may also be available for a second crop. However, the criteria used by the Irrigation Department, to determine which villages get the remaining water, are not clear.

The climate is not significantly different in the two areas. Both experience hot, dry, weather from April to June, followed by the monsoon, which brings heavy rains during June to September and sometimes in October. At least 90 per cent of the rainfalls during the monsoon, and it is critical for the wet season crop as well as for filling the reservoirs.

Sambalpur has four types of soils which are determined by the land slope. The upland soil is generally difficult to irrigate and is restricted to crops requiring less water than rice. The two middle-level soils are suited to growing most crops and produce a good rice crop when irrigated. The bottom land has the best rice-growing soil, but with the seepage caused by irrigation it is now restricted almost exclusively to rice production. Within the Raipur project there is only one type of soil and it is suited to growing rice or other crops, such as pulses, millets, or vegetables. In all cases, water is the limiting resource — not soils.

During the survey in the crop year 1970-71, the rainfall was adequate for a good crop of rice in both areas. In addition, enough water was available to irrigate a dry-season rice crop. However, in Raipur, a second crop was not grown in order that the water management project could be started. Only one of the six villages surveyed in Sambalpur experienced a water shortage during the dry season and all villages produced a second rice crop.

Impact of Field Channels

To measure the economic impact of the improved irrigation systems in Sambalpur and Raipur, three surveys were conducted. In Raipur, a complete village survey covered all landowners (with the exception of six absentee landowners) and accounted for 95 per cent of the irrigated land in the village. This survey provides a base against which comparisons can be made once the new irrigation system is in operation in the village. In Sambalpur, three types of villages were surveyed twice (once after each crop season) in order to examine the current impact of the irrigation project and to provide a basis for future study. The three types surveyed were: (1) two villages with field channels and a demonstration (*improved* villages), (2) two villages with the channels being installed (*improving* villages), and (3) two villages which needed to instal channels (*control* villages). The *improved* villages can be compared with the *control* and *improving* villages, to measure the differences in income and input-use resulting from the field channels. Then, in several years, the *improving* villages can be resurveyed to measure their improvement over time due to the field channels.

In the Sambalpur study, a random sample of 195 farms was taken from the six villages so that approximately 20 per cent of the owner cultivators were included from each set of two villages. Each farmer included was interviewed twice, so that the information concerning each crop was still fresh in his mind. The sample was also drawn so that it was representative of small, medium, and large farms.[2] The Raipur study involved the survey of owner-cultivators — 70 in all. Since, in both cases, owner-cultivators accounted for almost all the land cultivated, the results are representative of the villages. However, the sample in Sambalpur was drawn in such a way as to be representative of each set of two villages.

Cost of Improvement

In India, where most of the farm land is privately owned, the improvement from irrigation must be financially attractive to the farmers if it is to be widely adopted. If the cost is too high relative to the returns, the project will not spread. The expansion of tube-well irrigation in northern India is an example of what can happen if profits are high from private irrigation investment [6]. Of course, there are additional problems, associated with improving flood irrigation, which do not plague tube-well irrigation. Foremost among these is the need to organise farmers and provide them with technical assistance. In the case of tube-wells, one individual can make the decision to instal the irrigation facility; but improving a flood irrigation system requires a group decision within one village or among several villages, as well as the support of the Irrigation Department and the agricultural officials. In Sambalpur, both the Irrigation Department and the IADP were involved in providing field channels. The Raipur project had the support of IADP but was not fully supported by the Irrigation Department. In all cases, the villages fully supported the projects.

The cost difference between the two projects is striking, with the Raipur project costing 26 times as much per acre as the projects in Sambalpur. The total cost of the Raipur project was Rs 24,000 — only Rs 1,000 less than an average Sambalpur project which covered about 750 acres. The pilot nature of the Raipur project, and the fact that it is a complete irrigation system with drainage, explain some of the differences. For the Sambalpur projects, costs were held to a minimum in the hope that drainage and the lining of some channels could be done at a later date, once the benefits from the field channels had been experienced by the farmers.[3]

The Sambalpur IADP divides improvement of irrigation into three stages: (1) approach and survey of interested

villages, (2) installing field channels and (3) repair and maintenance of the field channels. Once the village has been selected, the IADP water management staff starts to plan the field channel system from each canal outlet. The size of the village determines the number of outlets to be installed, as each outlet is capable of supplying water to irrigate 25 acres or more. The IADP staff works with the farmers in deciding the location of the field channels and helps install the necessary structures. The cultivators are required to dig the channels, which are generally one foot deep, one and one-third feet wide at the base, and two feet wide at the top. Every year, the field channels need repair while the land is being prepared for planting — at an estimated average cost of about Rs 6 per acre. On many of the smaller farms, the labour for channel repair and maintenance appears to have a low opportunity cost. Thus the above estimate based on average wage rates may be high.

The original cost estimate for installing the improved irrigation in Raipur was Rs 27,000, while the actual expenditure for constructing the main channel, the 10 lateral channels, and the two surface drains was Rs 22,000 [3]. Although this was partly a training project, Rs 2,000 should be added for technical assistance and for installing the field channels. The maintenance cost should be about Rs 5 per acre, which is slightly lower than the cost in Sambalpur because the lateral channels are partly lined in Raipur and should require less maintenance.

Another striking difference between the two projects, besides the cost per acre, is the capital labour ratios (see Table 1). The Sambalpur approach is less demanding of non-labour inputs, particularly capital. Slightly less than 30 per cent of the Sambalpur project costs are construction materials as compared to over 62 per cent for construction materials in Raipur.

TABLE 1: COST OF IMPROVING IRRIGATION

	Sambalpur	Raipur
	Rupees/acre	
Construction materials	10	564
Labour	6	225
Technical assistance	18	75
Other	—	38
Total	34	902

BENEFITS FROM IMPROVEMENT

Currently, the only measure of benefits from field channels is a comparison between the Sambalpur villages, since the construction of the Raipur project was just started at the time of the survey. Both the *control* villages and the *improving* villages provide a base against which the *improved* villages can be compared. Yields, input use, proportion of high-yielding varieties, cropping intensity, area irrigated, and net returns, all give an indication of the impact of the field channels on the village crop economy.

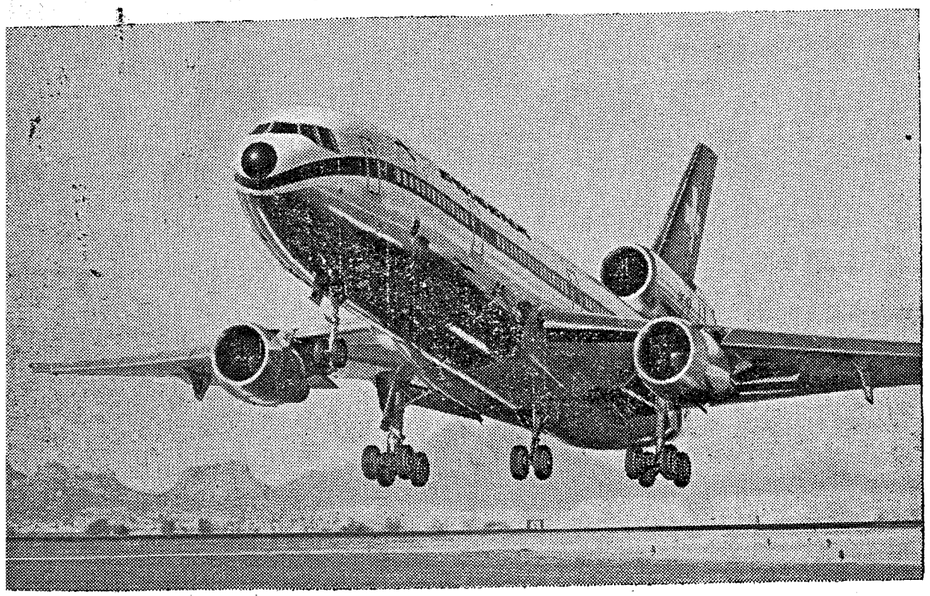
Installation of field channels could increase the area irrigated and the cropping intensity within the village by improving the efficiency of water use through reduced over-irrigation and reduced wastage of water near the outlet. Better control over the quantity of water applied would allow changes in the cropping patterns and improve the timeliness of irrigation as well as other farming operations. Better control could, moreover, increase the use of nitrogen fertiliser by reducing the amount lost in the flooding. Under the field-to-field irrigation system, all but the uplands must be planted under rice or face the problem of flooding. The more efficient application of water, by improving production possibilities, could increase the returns from using HYVs fertiliser, and other inputs. Both the adoption of relatively more labour-intensive crops and higher cropping intensity would increase the opportunities for employment in agricultural occupations. In addition, the construction and maintenance of the field channels would increase labour requirements.

A note of caution should be observed in this comparative analysis. There are always subtle differences among villages, which cannot be controlled. These differences, such as better leadership, can equip one village far better for economic improvement than the other. Thus, some of the changes observed in the *improved* villages may be due to uncontrolled variables which are not duplicated in other villages and cannot be attributed to the field channels. However, adoption rates before and after the installation of field channels indicate that the villages had very similar potentials.

Based on the limited amount of historical data collected for the *improved* villages, the cropping intensity and irrigated area did increase after the field channels were installed. The proportion of the village cropland irrigated increased from 84 per cent to 97 per cent, while cropping intensity rose from 187 per cent to 196 per cent. The irrigated area in the *control* and *improving* villages was only 84 per cent and 75 per cent, respectively, while cropping intensities were 185 and 157 per cent.

The proportion of rice grown is not significantly different among the villages, except for the *improving* villages during the dry season (see Table 2). But the acreage of high-yielding varieties is significantly greater in the *improved* villages during the dry season, 72 per cent as compared to 54 and 41 per cent. This is very important, because the average yields of HYVs are 5.2 and 5.5 quintals per acre more than the local varieties[4] (see Table 3).

Even within seasons, and by varieties, the *improved* villages have higher rice yields. During the wet season the yield difference ranges between 3 and 5 quintals an acre, while in the dry season the difference is between 2.9 and 3.5 quintals per acre for local varieties, and 2.6 and 3.2 quintals per acre for high-yielding varieties.[5]



As would be expected, the use of purchased inputs is also higher for the *improved* villages. The difference in fertiliser applied per acre is between 5 and 11 kg per acre during the wet season, and this increases to between 12 and 17 kg per acre in the dry season for local varieties and to 14 to 18 kg per acre for the higher-yielding varieties (see Table 4). In terms of percentage increases in fertiliser use on local varieties, the largest increase — of 33 to 55 per cent — came during the dry season, followed by the wet season — 17 to 46 per cent. Although the absolute increase is the greatest on the high-yielding varieties, the percentage increase is only 21 to 28 per cent.

The other major annually purchased input — *viz*, plant protection materials — exhibited similar differences in use. The big difference occurs on the high-yielding varieties during the dry season, where the *improved* villages used slightly over twice as much (see Table 5). There is no difference for local varieties in the dry season; but during the wet season the *improved* villages again use about twice as much.

In addition, the *improved* villages employed 80 per cent more credit than the other villages, with 70 per cent of this difference being accounted for by two large farmers who borrowed a total of Rs 41,000 to purchase tractors. Much of the remaining credit

Now begins a wonderful new experience.

Swisscare aboard the splendid DC-10-30s.

The most wonderful thing about our new DC-10s isn't just that you enjoy more elbow-room (the body is almost as wide as the 747s, but each row has one less seat!). Nor the fact that you can rent earphones and listen to eight different stereo programmes... or watch the latest colour films... or gaze dreamily out from those extra-large windows.

It's all this, combined with Swisscare. Our world-famous Swiss hospitality is yours all the way, with choice of tempting Continental cuisine or delicious Indian vegetarian meals.

Experience it for yourself. As you may be knowing, we have six flights westbound and six eastbound, from Bombay every week. Our new DC-10s operate on three westbound and three eastbound flights—on the others, our tried-and-true DC-8s.

SWISSAIR

TABLE 2: DISTRIBUTION OF CROPS BY SEASON, 1970-71*

	Local Rice Varieties	High-Yielding Rice Varieties	Other Crops**
	(Percentages)		
Wet Season			
Improved villages	92	5	3
Control villages	94	1	4
Improving villages	90	6	4
Dry Season			
Improved villages	27	72	1
Control villages	44	54	2
Improving villages	48	41	10

Notes: * Percentages may not add to 100 per cent due to rounding.
** Other crops included wheat, pulses, oilseeds and vegetable crops.

TABLE 3: RICE YIELDS BY SEASON AND RICE VARIETY, 1970-71

	Improved Villages	Control Villages	Improving Villages
	(quintals per acre)		
Wet season local varieties	10.0	7.1	5.1
Dry season local varieties	13.7	10.2	10.8
Dry season HYVs	18.9	15.7	16.3

went for fertiliser and labour with smaller amounts going for plant protection materials and seed. Almost two-thirds of all the credit went for fertiliser while non-agricultural uses accounted for only 3 per cent of the total.[6]

INTERNAL RATE OF RETURNS

If these differences in high-yielding varieties, yields, and input use, are translated into costs and returns, the improved villages have significantly greater net returns for both seasons. The net returns for the year were Rs 300-350 higher in the *improved* villages than in the *improving* and *control* villages.[7] With the costs as low as they are in the Sambalpur project, it is not critical whether the net returns per acre are Rs 100 or Rs 300. In either case, the internal rates of return are very high and exceed the rates on most other agricultural investments. Only 10 to 15 per cent of the difference in net returns during one year is needed to cover project costs.

In contrast, even if the same types of benefits occur in Raipur, the amount of the net returns stream is very critical. Assuming a 10-year project life, the net benefits per acre must exceed Rs 150 per year for the internal rate of return to reach 10 per cent, while the internal rate of return will be 17 per cent if the annual net benefits are Rs 200 per acre. Although the Sambalpur experience might be transferred to Raipur for the wet season, the same is not true for the dry season. Even with the improved irrigation system, water would be available for dry season irrigation only every second or third year. Thus, annual net returns of Rs 200-250 per acre are probably the upper limits for the Raipur project. For acres with only a wet-season crop, the annual returns, based on the Sambalpur analysis, would be in the range of Rs 140-150 per acre.

This suggests the need for a less capital-intensive project than the Raipur project. If costs were cut by half, by increasing the area served by the main channel, and if benefits were Rs 150 per acre, the internal rate of return would be almost 30 per cent.

PROSPECTS FOR IMPROVEMENTS

The two studies in eastern India point out very forcefully the possibilities for high returns from improving many of the existing flood irrigation systems in India. Several problems are also apparent. One is the technical assistance restraint, which limits the Sambalpur programme to only nine villages a year. At this rate, it will be at least 40 years before all the irrigated villages in Sambalpur District can be reached by the programme. Farmers themselves cannot do the necessary engineering and surveying work to design even the simple Sambalpur irrigation system. Currently, in India, there are unemployed engineers, but most of them neither have the desire nor are trained to do this type of irrigation work. In addition, except in a few cases such as the ones mentioned above, programmes are not available on the shelf to employ engineers to design improved irrigation systems. Thus, India could benefit greatly from: first, increasing the number of technicians who can design and maintain village irrigation systems; and second, creating the positions and employing the technicians in irrigating rural areas.

A further problem is the need for some new institutional arrangements, within villages, for maintenance of the new irrigation systems. This will be particularly critical in India, where low levels of farm income do not leave much for maintenance of irrigation systems. An improved means of allocating water among the villages is also needed. Many of the villages in Sambalpur, near the head of the main canal, waste water even as those near the end are able to irrigate only half their land during the dry season. Water charges are based on a farmer's acreage, so excess water does not cost the farmer any extra. Pricing of water on the volume used, and a better policing of actual water-use, would greatly improve the efficiency of on-farm water-use. In fact, it might encourage villages to devise better ways of distributing water both within and among the villages.

Due to the cost and difficulty of measuring the volume of water delivered to each farmer, the village could be used as the point of measurement. The government would set the charge per volume of water used, but the individual farmer would still pay a rate based on the acres irrigated. The rate would vary, however, depending on the amount of irrigated acres in the village and the volume delivered to the village. Thus the more efficiently the village farmers use water, the smaller would be the charge per acre. This, or some variant, should at least be tried to see if economic incentives working through the village could improve water use.

Although nothing conclusive can be said about the optimum type of village irrigation, several important conclusions may be drawn from the projects reviewed.

First, the Sambalpur programme should now include drainage as a key element in the irrigation system. The farmers clearly understand the benefits from the field channel, and it is time to provide a more complete irrigation system.

Second, the farmers should pay the full cost of installing the field channels, since their increased returns cover costs in the first year.

Finally, the Raipur project points out

TABLE 4: FERTILISER USE BY SEASON AND RICE VARIETY, 1970-71

	Improved Villages	Control Villages	Improving Villages
	(kg per acre)		
Wet season local varieties	35	30	24
Dry season local varieties	38	36	31
Dry season HYVs	82	64	68

TABLE 5: PLANT PROTECTION EXPENDITURES BY SEASON AND RICE VARIETY, 1970-71

	Improved Villages	Control Villages	Improving Villages
	(rupees per acre)		
Wet season local varieties	6	4	2
Dry season local varieties	2	2	2
Dry season HYVs	15	7	7

the danger of building a project which is too capital-intensive and too costly. One must always keep in mind that, for these projects to spread, the costs must be low enough to afford high net returns to the farmers, and if the construction and maintenance are labour intensive, the farmers' actual rupee expenditures will be low. The expansion and interest in the Sambalpur programme is a clear indication of what is possible.

Notes

1 The wet season is the monsoon or kharif season which starts in June and ends in December. The dry season is the winter or rabi season which runs from January to May.

2 The farm size was based on land holdings which included land rented in but excluded land rented out. The different size categories are as follows:
Small farms
3.5 acres and under
Medium farms
3.6 acres to 7.5 acres
Large farms
above 7 5 acres

3 The field channels have also improved the surface drainage during the wet season. However, a complete drainage system including some main drainage outlets could add between rupees 10 and 100 per acre to the project costs.

4 One quintal equals 100 kilograms or 4.9 bushels of rough rice.

5 Not enough high-yielding varieties were grown during the wet season to provide a valid comparison.

6 This is quite different from the Raipur village, where 20 per cent of the total credit went for non-agricultural uses and 27 per cent for fertiliser.

7 The net returns do not include anything for the additional acreage irrigated in the *improved* villages. Therefore, the net return may understate the total village returns.

SEMINAR ON
EXPORT PROMOTION

ORGANISED BY

INDIAN INVESTMENT CENTRE

IN CO-OPERATION WITH

MINISTRY OF COMMERCE
19th & 20th. April 1974,
Vigyan Bhavan, New Delhi.

MAIN SUBJECTS FOR DISCUSSION

1. Policy and procedures for export-oriented industries.
2. Identification and assessment of products and services for exports during the Fifth Plan Period.
3. Dynamic strategy for exports during the Fifth Plan.

Registration Fee Rs. 100/- only

For participation please contact :

Secretary, Indian Investment Centre,
Jeevan Vihar Building, Parliament Street,
New Delhi. Phones : 312110, 311959.

The Credit Authorisation Scheme

Some Problem Areas in Its Implementation

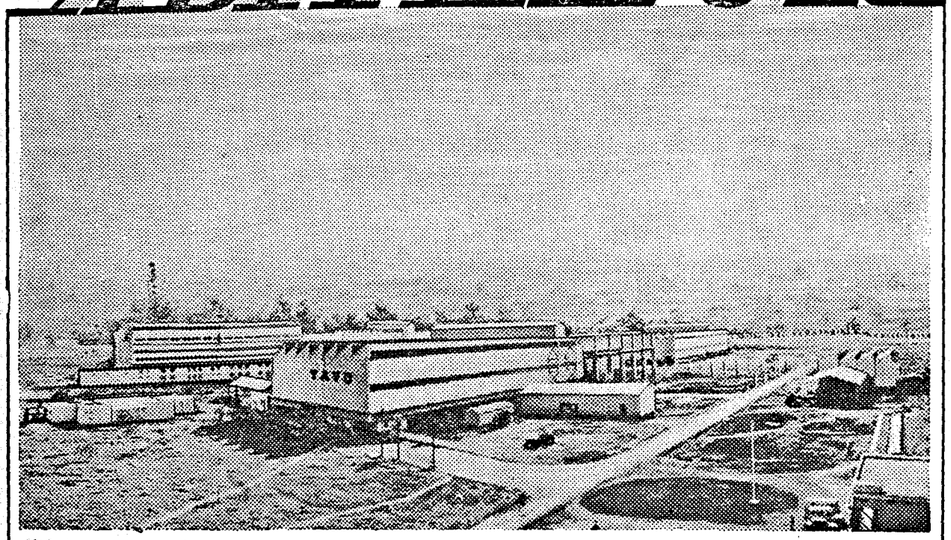
B G Shah

This paper seeks to define and discuss some of the problem areas in the effective implementation of the Credit Authorisation Scheme operated by the Reserve Bank of India. These are :

(a) effective communication of the objectives of the scheme to the borrower groups;
(b) delays in decision-making on loan proposals submitted under the scheme;
(c) development of an acceptable standard or basis for determining genuine working capital requirements of the borrowers; and
(d) evolving a follow-up system that will effectively accomplish the objectives of the scheme.

THE Reserve Bank of India took the first major step towards bringing credit activities of banks in alignment with planning policies when it introduced the credit authorisation scheme[1] in November 1965. Under the scheme, scheduled banks are directed to obtain prior authorisation of Reserve Bank before sanctioning any fresh credit limit(s) of (or additional credit limit(s) that will increase the total limit to) Rs 1 crore or above to a single party.[2] In respect of certain categories of borrowers and types of credit, prior approval of the Reserve Bank is not necessary.[3, 3a] On June 30, 1970 the Reserve Bank introduced, as an integral part of its credit authorisation scheme, a set of *pro forma* statements.[4] Borrowers applying under the scheme are required to furnish their financial data on these forms. These forms are designed "to place the credit appraisal in banks on an organised footing and introduce a measure of financial discipline on borrowers."[5] Introduction of these forms, therefore, marks an important development in the scheme insofar as its original objective of "aligning bank credit with planned priorities" came to be broadened to include the two collateral objectives of: (1) improving evaluation of loan proposals in banks, and (2) relate the quantum and duration of credit to carefully assessed genuine working capital requirements. These objectives are unexceptionable, and should be acceptable both to bankers and borrowers. However, the Reserve Bank has been experiencing some resistance to the scheme as modified in June 1970. This paper attempts to define and discuss some of the problem areas in its effective implementation. Four problem areas can be identified. These are : (1) effective communication of the objectives of the scheme to the borrower groups; (2) delays in decision-making on loan proposals submitted under the scheme; (3) development of an acceptable standard or basis for determining genuine working capital requirements of the borrowers; and (4) evolving a follow-up system that will effectively accomplish the objectives of the scheme.

EFFECTIVE COMMUNICATION OF OBJECTIVE



As stated earlier, the principal objective of the scheme, as modified in June 1970, is to provide a mechanism for proper dispersal and use of bank credit. This aspect of the credit policy has also been emphasised in the numerous official pronouncements that no credit will be denied to any sector for productive purposes or planned growth. What is it, then, that explains the borrowers' resistance to the scheme? It is explained, to some extent, by the borrowers perception that the scheme will impose on them an unwarranted degree of financial discipline in raising funds for their productive operations and planned growth? To quote :

> "Although the discipline sought to be imposed by calling for full information (on the *pro forma* statements) may not be appreciated by the borrowers, and possibly might even be resented by them, it would be in the interest of the banking system that steps be taken in this direction so that credit appraisal may be placed on a more organised footing." (RBI Circular DBOD No CAS 952/C 446-70 dated June 30, 1970)

This raises a doubt if the objectives of the appraisal drill prescribed under the scheme are effectively communicated to the bankers/borrowers groups. It is conceivable that the timing of the introduction of the *pro forma* statements has, to some extent, contributed to such a perceptual block to the objectives of the scheme. Several major banking developments took place in the period between November 1965, when the scheme was originally introduced, and June 1970 when the *pro forma* statements were introduced as an integral part of the scheme. Social control was introduced in 1968 with "the main objectives of achieving a wider spread of bank credit, preventing its misuse, and directing a larger volume of credit to flow to priority sector".[6] Social control also involved severance of big business from the boards of banks. Later, in July 1969, banks were nationalised primarily with a view to making the banking system an effective instrument of economic development. Much more relevant to our discussion is the publication of the Dehejia Committee Report[7] in September 1969. This report pointed to the widespread practice of unauthorised diversion of working funds to non-current uses, double financing of inventories and making no distinction between the core and temporary components of working capital in the absence of any fixed repayment schedule under the cash credit system of lending. The *pro forma* statements introduced in June 1970 are designed to control and correct some of these and other undesirable practices.[8] It is quite conceivable, therefore, that borrowers have come to regard the scheme as intended to squeeze out 'inflated credit' so far availed of by them.

How is this barrier to the communication of the scheme's objectives to the borrowers to be broken? One effective way would be to organise a series of banker-borrower seminars at different places for a free and frank discussion of the scheme. If properly organised, these seminars can be extremely helpful in explaining the policy guidelines followed in appraising proposals, promoting a better appreciation of mutual difficulties with regard to the operational aspects of the scheme, and in building a mutually trustworthy relationship between banks and borrowers.[9] These benefits can be especially derived if the discussions at such seminars are based on case-studies depicting real-life situations, showing how decisions under the scheme have resulted in provision of adequate credit

ADITYAPUR

city of the sun and India's growing ancillary industrial development complex

Adityapur—once a dream, now a reality. Today Adityapur forms the core of the great ancillary movement actively supported by Tata Steel. Support which embraces the availability of Tata Steel's advanced and sophisticated expertise, a ready market for ancillary products and prompt payment. These are the ingredients of the "Let's all grow together" theme, envisaged by Tata Steel. And Adityapur's tiny plants are growing into prosperous industries, attracting the skilled—and unskilled—to learn, to work, to excel—to find a secure place under the sun.

TATA STEEL

to borrowers at the same time as they are required to set their 'financial houses' in order. Such case studies are a powerful means of demonstrating the operational content of the scheme and breaking the perceptual block to a real understanding of its objectives.

Delays in Decision-Making

There are complaints of delays in taking decisions on the loans submitted under the scheme. These delays are attributable to : (1) inadequate organisational capabilities amongst banks and borrowers for preparation and analysis of data required under the scheme; (2) submission of incomplete (and incorrect) data or omitting to provide explanatory comments wherever warranted by the data; and (3) the multiplicity of tiers that intervene between borrowers and Reserve Bank and through which the loan proposals have to pass.

Except for few heads of information like industry average (Form IIIE), the bulk of other basic data required for completing these forms are available in the usual annual statements of financial accounts. Compilation of such data does not require any specialised skills. Borrowers however experience difficulties in preparing reliable forecasts of operations (sales) and funds flow for a future period and working out proposals for improving their weak or unbalanced financial position. It should not be difficult for borrowers, though, to build the requisite skills or expertise in their organisations. By the same token banks do not have adequate organisational capabilities for credit analysis, decision-making and follow-up. They are also not adequately equipped to guide their customers in filling up these forms. This is not surprising. Not long ago, the bulk of advances of most banks were concentrated in a few branches in metropolitan cities, port towns and commercial centres, and the skills of credit appraisal (not decision-making) were concentrated at these few offices. Not only is the dispersal of credit appraisal skills within a banking organisation too restricted, but qualitatively also these skills are in collection of market informations and evaluation of tangible securities, rather than in analysis of financial (and non-financial) data for decision-making and follow-up. Banks are today operating with an inadequate pool of credit officers trained in the use of techniques of forecasting of funds, funds flow and cash flow, breakeven analysis, etc. The result is that many banks are content merely with the collection of data and submitting undigested material to the Reserve Bank, resulting in protracted and avoidable correspondence and consequent delay in regard to the processing of applications for authorisation of the limits.[10] The answer to the shortage of trained credit officers is to expose a large number of them to well-designed training courses and also import into the organisation the requisite skills. [11]

A second important reason for delay is that either the data submitted are incomplete, or no explanatory comments are made on aspects of loan proposal which call for such comments. It is not enough that banks and borrowers furnish all the data on the forms. They should also give explanatory comments on such aspects of loan proposals as: diversion of funds to inter-corporate lending or investment, or to acquisition of fixed assets, payment of guarantee commission by companies on fully secured facilities, corrective steps for improving imbalances noticed in the financial structure inadequate working capital margins, excessive finance from suppliers, etc. It seems it is not adequately appreciated by the banks and borrowers that the appraisal process is used not only to assess borrowers' financial viability but also to enforce public policies on concentration of economic power, managing agency system, expenses pattern of companies, etc. Much of the delay on this account is avoidable. The Reserve Bank has, in fact, advised banks to follow its general instructions for compiling data to be submitted under the credit authorisation scheme.[12] These are however not observed in all cases. Further, the Reserve Bank has also circularised to the banks certain deficiencies which it has frequently noticed in the data submitted by the banks. The banks should in turn communicate these to the borrowers so that they might correct these deficiencies at the time of compilation of data for the loan proposals.

Yet another reason for the delay is the multiplicity of tiers between the borrowers and the Reserve Bank, whose prior authorisation is necessary before the loans could be sanctioned to the borrowers. Three suggestions can be made to reduce delay in obtaining prior authorisation of the Reserve Bank: (i) raise the limit(s) to an individual party requiring prior authorisation from the present amount of Rs 1 crore (or a single long or a medium loan exceeding Rs 25 lakhs) to a suitable higher amount; (ii) explore the possibility of delegating the powers to authorise limits under the scheme to all offices of the Reserve Bank; and (iii) exempt certain further categories of loans/borrowers from the purview of the scheme. From data available with it, the Reserve Bank can work out the frequency distribution by amount of loans referred to for its prior authorisation and suitably increase the credit limit(s) to a single party that needs its prior authorisation.[13] The relevant question to ask before suggestion (i) above can be considered is: have the banks built capabilities of appraising the loans in a manner that could achieve the objectives of the credit authorisation scheme? Most banks have been making serious efforts at building these capabilities and have gained some useful experience in operating the scheme. In order that the purposes of the scheme are fully achieved, the Reserve Bank could give detailed guidelines so that the banks could appraise the proposals strictly within the framework of such guidelines. One could also design a suitable system of reporting to the Reserve Bank and institute sample audit by Reserve Bank's credit authorisation cell to ensure quality of appraisal to delegatee banks. Implementation of the objectives of credit authorisation scheme must ultimately be made the responsibility of the banks making the loans and the energies of the credit authorisation cell should be spent more on the more difficult and complex task of developing a credit plan involving allocation of credit to the different sectors in accordance with the planned priorities. This latter task seems to be the more appropriate responsibility of the Reserve Bank.

Standard for Determining Working Capital Needs

The entire purpose of the credit authorisation scheme is to relate the quantum and duration of the credit to the genuine funds needs of a borrower. For that reason, it is important to develop an acceptable basis or standard for determining the genuine working funds need of any enterprise. Traditionally, bankers have been relating quantum of loan to the value of 'acceptable' assets. If a prospective borrower had an unencumbered stock of 'acceptable' assets to hypothecate, mortgage, or pledge, the banker, other things being equal, granted him the loan after retaining the usual margins. It is now well known that this practice of relating the quantum of credit to the

gross[14] value of 'acceptable' assets has encouraged double financing of inventories and unauthorised diversion of funds to acquisition of fixed assets, inter-corporate investment, payment of dividends, or even financing operating losses.

Further, a purely security approach to loans inherently encourages inefficient working capital management in the sense that a borrower maintaining excessive inventories (or assets) can get away with more credit than is optimally required to maintain a given level of operation. Therefore, security as the sole or principal basis for determining the quantum of credit has been rightly discarded. Instead, the quantum of credit is estimated, under the scheme, by a careful assessment of inventory levels required to support a projected level and mix of production. There are several drawbacks in using trend ratios and 'industry average' as a standard or basis for determining the genuine funds needs of any enterprise. It can hardly be disputed that a good deal more work needs to be done before a satisfactory basis for an inter-firm comparison can be evolved. Apart from lack of uniformity in accounting methods and conventions, there are the problems of widely differing product-mix, levels of technology, and manufacturing processes among the different firms in an industry. There are also problems in using trend ratios of a firm as a standard. In an economy that is characterised by uncertainties of availability and prices of raw materials, communications, imports, government policies, etc, use of trend ratios of a firm as a basis for determining its optimum funds need has very severe limitations. This point can be illustrated by reference to a textile mill. Its product-mix and distribution channel (and therefore funds needs) can change rapidly, depending upon the outlook for supplies and prices of raw materials or patterns of demand and prices for cloth. Thus, its funds need can vary not only from year to year but between different periods in a single year.

Another good reason for discouraging the use of trend ratios or 'industry average' as a norm for funds needs is the tendency amongst those who appraise credit to look upon these as providing a set of 'automatic rules' or an 'invariable guide' to determination of funds need, thereby hampering a flexible and dynamic approach to the *unique problems* of an enterprise.[15]

The banker-customer relationship is, in its essence, a unique relationship in the sense that no two firms in an industry are identical and therefore must be treated as *unique cases*. For example, think of an enterprise that for some reason is facing severe competition in marketing its products. It can however become competitive by offering longer credit terms than are offered by its competitors. Liberal credit terms will not only enable that firm to utilise its excess capacity and improve its profitability, but also contribute to social output. If in such a case the credit sanctioning authorities were to look upon the trend ratios or the industry norm as a guide to desirable accounts receivable period, the enterprise will be denied the much wanted credit which otherwise meet the cost-benefit criterion. It is not contended that bankers do not consider such unique problems of an enterprise. What is contended however is that 'industry norm' may be looked upon as something 'objective' or 'normative' and therefore any deviation from it being considered 'unhealthy', 'undesirable' or 'speculative.' This danger is particularly real when the ultimate authority (Reserve Bank) 'authorising' the loan is so far removed from the branch financing it. Further, a major objective of the scheme is to relate the quantum of credit to an amount required to support optimum levels of inventories for maintaining a given level and mix of output. How far does an industrial norm or trend ratio help in determining optimum level of working capital? If a firm (or an industry) has maintained excessive inventory in the past, its trend ratio (or industry average) will reflect sub-optimal inventory management and therefore will be misleading as a standard for determining genuine (optimum) funds need for inventories. Therefore, an optimum level of inventories in any firm can be determined, taking into account such factors as uncertainties of demand for its products, uncertainties of prices and availabilities of raw materials and consumable stores, level of ordering and carrying costs, lead time for procurement of materials, and stock-out costs (penalties). It is not suggested that banks should themselves determine such optimum inventory levels for borrower firms. They can however satisfy themselves that the borrowers whom they are financing have capabilities of determining optimum inventory levels and have installed a reasonably satisfactory system of inventory control.

Effective Follow-up System

The scheme as modified in June 1970 would certainly upgrade the appraisal process in banks and impose financial discipline on borrowers in raising funds. The scheme also seeks to control unauthorised diversion of funds by considering the total funds needs of a borrower in relation to total funds flows. The question that might be asked is: has the scheme designed follow-up procedures that will effectively achieve these objectives? The follow-up procedures of banks continue to remain basically security-oriented. They consist of periodic stock statements and inspection of borrowers' godowns. These follow-up procedures will not generate the data necessary to enforce *the wider objectives* of the scheme. It seems therefore there is a need to design and institute a follow-up system that not only verifies and protects the bank's security (important as it is) but also controls the working capital management and funds flow on a *continuing basis*. With this purpose in mind a working capital control chart is designed. This is shown in Appendix I. The preparation of such a control chart will involve little additional work. It only seeks to re-arrange the accounting data in a form that aids decision-making and follow-up by banks and borrowers. It should be stated however that this chart is designed mainly with a view to initiating a process of thinking on designing an effective follow-up system. The statement together with a monthly cash budget will give more effective means of control over use of funds, and level of investment on working capital and its liquidity. Ideally the follow-up must be uniquely designed to control the variables (maybe product-mix, costs, profitability) that are identified as critical to the productive and profitable use of the loan.

also certain types of facilities depending on their nature, e g, packing credit and post shipment credits, limits for distribution of fertilisers, limits against fixed deposits, purchases/discount of inland documentary bills, etc, need not be subject to prior authorisation and that sanction of such limits should only be reported to us subsequently" *vide* Reserve Bank of India circulars DBOD CAS C 446 (1) No 1185 dated July 22, 1968; (2) No 194 dated January 27, 1969; (3) No 733 dated April 8, 1969; (4) No 969 dated May 12, 1969; (5) No 1486 dated August 19, 1969; and (6) No BC 89/C 446-71 dated July 22, 1971.

3a Banks are now required to obtain Reserve Bank's prior authorisation under the scheme for sanctioning to Public Sector undertakings, including State Electricity Board, any fresh credit limits (including commercial bills discount) of Rs 3 crores or more or any limit that would take the total limits employed by such a party from the Banking System to Rs 3 crores or more, secured or unsecured basis. Individual medium or long-term loan of Rs 1 crore and above to this category of borrowers also require prior authorisation under the scheme. (DBOD No Sch BC 21/C. 96-73 dated March 17, 1973; DBOD No CAS BC 25/C 446-73 dated March 21, 1973; DBOD No CAS BC 33/C 446-73 dated March 27, 1973)

4 The *pro forma* statements comprise five forms. Form I records the particulars of existing limits enjoyed by the borrower from the banking system. Form II is a statement of assessment of working capital requirement and bank finance permissible. Form IIIA is a comparative statement of the financial position of the borrower during the last three years. Form IIIB is a statement of analysis of the last years' balance sheet. Form IIIC shows the income statement for the last three years. Form IIID is a statement of balance sheet reconciliation. Form IIIE computes and makes trend analysis of operating ratios, liquidity ratios and leverage ratios and also gives industry average. Form A is specially designed for sugar mills — *vide* RBI Circular No DBOD No CAS-652/C 449-70 dated June 30, 1970. Form IV gives cash flow statement for three years including a projected cash flow statement for the year following the immediately completed financial year. Form V is a statement showing total costs of the project and sources of finance (applicable to medium-term loans).

These forms were designed by a study group set up (January 1970) by the co-ordination committee of public sector banks.

6 Banking Commission Report, Para 2.65, pp 38-39.

7 Report of the study group on the extent to which credit needs of industry and trade are likely to be inflated and how such trends could be checked; summary. *Reserve Bank of India Bulletin*, November 1969.
"Working Capital requirements and availability of bank credit (Indian Processing and Manufacturing Industries)" by Nalini Ambegaokar, *Reserve Bank of India Bulletin*, October 1969.

8 In regard to the balance sheet analysis to be furnished to us, you (Banks) are requested to please give your (Banks) specific comments in regard to certain aspects such as intercorporate lending/investments, excessive inventory build-up, diversion of short-term funds for acquisition of fixed/non-current assets, payment of guarantee commission by the companies in spite of the secured nature of the facilities and/or the relatively low worth of the guarantor(s), etc, Further steps, if any, proposed to be suggested to the company to improve the accounting ratios, which adversely reflect on the position of the company may also be suitably indicated. Besides, whenever concessional margins, rates of interest, etc, are proposed to be allowed, the reasons therefore should be given. Where guarantees of directors, etc, are taken, the reason therefor may be given alongwith information regarding guarantee commission, if any, being paid to the guarantors. Reserve Bank of India Circular DBOD No CAS 952/C 446-70 dated June 30, 1970.

9 The Delhi Management Association organised such a banker-borrower seminar on April 14-15, 1972. The Ahmedabad Management Association organised a similar seminar on credit authorisation and bill market schemes on February 21-22, 1972. The Bombay Management Association also organised seminar on the new bill market scheme on December 18, 1971.

10 "Finally we would like to impress upon you (banks) that we do not consider the collection of data in the enclosed forms as an end in itself, but merely as a tool for taking judicious decisions on proposals for credit facilities. The forms are thus not substitutes for analysis and judgment based on the financial acumen and expertise acquired in the operational field. It should therefore be clearly understood that the purpose of the forms is to help in analysis, decision-making and follow-up." (*vide*, RBI Circular of June 30, 1970.)

11 The Bankers Training College, Reserve Bank of India, Bombay, has organised several programmes for training credit officers of banks in credit appraisal. These programmes seek to help the participants gain an understanding of and skills in use of financial techniques such as ratio analysis, cash and funds flow, cash budgeting, forecasting and assessment of funds needs, evaluation and follow-up of loans, etc, through use of real life case studies or problem situations. The Bankers Training College is actively considering a proposal to associate some participants from borrowing companies with the course in order to promote a better understanding each other's policies and data needs. (RBI Annual Report and Trend and Progress of Banking in India, para 232, p 70, 1971).

12 RBI Circular of June 30, 1970.

13 Parties who are considered to be enjoying a large share of the total bank credit may be excluded from the purview of the proposed exemption.
Also from time to time, RBI has introduced flexibility in the operation of the scheme. Relaxation takes the form of allowing banks to sanction additional limits upto a certain percentage of the existing or specified limits/outstandings as in the case of sugar, cashew, coal industries facing acute financial strain. (DBOD No GCS BC 142/C 483-71 dated December 11, 1971; (2) DBOD No CAS BC 49/C 446(U)-72 dated May 26, 1972; and (3) DBOD No CAS BC 29/C 446(CA)-73 dated March 27, 1973.) Similarly it exempted from the purview of credit authorisation scheme temporary accommodation by purchase of local cheques, drafts, etc, in the event of a prolonged suspension of local clearing (DBOD No Sch BC 12/C 95-73 dated February 13, 1973).

14 Gross of Suppliers Credit (also see footnote no 10 above).

15 The set of forms introduced in June 1970 seem to place an almost mystic faith in the financial statement analysis (ratio analysis) and funds flow for finding all answers to the questions of sound appraisal in banks and sound financial management by borrowers. There is room for modifying these forms. For example, it can be argued that annual cash flow statements should be accompanied by short-period forecasts of cash receipts and disbursements. Such short-period (monthly) forecasts will be a useful tool for answering the questions: how much funds does a borrower need, when, and how long? Such a cash budget should be based on carefully prepared sales budget, production budget, purchase budget, manpower budget, etc. It is not the purpose of this article to examine at length some of these questions of modifying the design and content of the forms.

Socialist Development in China

A Comment

Premen Addy

FEW would disagree with Ajit Singh's contention ("Political Economy of Socialist Development in China since 1949" November 24, 1974), that China's social and economic progress in the almost 25 years of liberation has been remarkable; neither would his observation that, "apart from the intrinsic interest of what is happening to 800 million people, a quarter of mankind, the story of Chinese economic development has important implications for today's underdeveloped countries" be a subject of grave dispute. It is when he steps on to altogether thornier ground by asserting that China is well on the way to creating a 'socialist man', that the Maoist model of society is worthy of emulation not only in the backward Third World but also in Western Europe and North America, that he lays himself open to challenge.

For a start, it may be useful to state that the socialism under discussion is Marxist in its assumptions and world outlook, particularly as one is obliged to acknowledge the existence of other varieties based on Tolstoy, Gandhian, or Islamic values. What then gives the Marxist *weltanchauung* its distinctive stamp? In brief, surely this: that man is the measure of all things; that in order to make himself the sovereign of his circumstances he must struggle with his fellowmen to create a society free of social and economic oppression. In the course of this struggle he must endeavour to train himself in the arts of reason, to free himself of the shackles of mystification; for ultimately his best energies find their most fruitful expression when transcending the debilitating impediments of religious dogma and national egoism.

In what way has Chinese practice, especially in the last few years, enabled Ajit Singh to harbour comforting illusions about the new 'socialist man'? On the contrary, such facts as are commonly known would seem to belie this: a dynamic, vibrant, China, yes; but also a China moved by an intense self-centred nationalism whose needs are the yardstick by which individuals and nations are either praised or condemned.

The atavistic passions of race and nationalism which activate much of China's current hatred of Russia (the fact that this is more than reciprocated by Moscow is beside the point); the grotesque spectacle of the Mao Tse-tung cult, evocative of China's imperial past when the Son of Heaven assumed to himself a semi-divine status; the mindless chants from the Little Red Book, provided a spectacle of national egotism, of paralysing conceit, such as would be difficult to equal, let alone surpass, even in this age of assertive nationalisms.

Following from this, may one draw Ajit Singh's attention to some of the more unsavoury items of Chinese foreign policy of which I am sure he is aware, but which in his enthusiasm for the New China he has chosen to ignore. The following samples should suffice: Peking's sympathy and understanding for Numiery when he chose to murder in cold blood, the leaders of the Sudanese Communist Party who also happened to be pro-Moscow; its support for Yahya Khan and Sirimavo Bandaranaike (one has to go back to Goebbels to find such a concoction of lies and half-truths as were in Chou En-lai's letters to the Pakistani and Ceylonese leaders) against their domestic opponents, or its sudden expressions of love for the Shah of Iran and others of his ilk. That such policies are invariably supported by ponderous rationalisations from the liturgy of "Marxism-Leninism-Mao Tse-tung Thought" hardly makes them any the more acceptable; if anything they are rendered offensive by their insensitivity to the political integrity and intelligence of the public in general and of socialists in particular. It needed I F Stone, scourge of successive US Administrations, to place these developments in their proper setting (*New York Review of Books*, June 29, 1972), as when he observed that, "On the very day that Secretary Rodgers urged the annual Conference of the Central Treaty Organisation Powers — Turkey, Iran, Pakistan, Britain and the US — to guard against new Soviet thrusts in that area, news broke from Islamabad (*New York Times*, June 3) that Peking and Washington were united against Delhi and Moscow in support of those responsible for the Bengal massacres. The world has seen strange bedfellows before but rarely in a stranger or bloodier bed."

Other distinguishing traits of Chinese thinking relate to developments within the Soviet Union. One has yearned to be enlightened by a structured analysis of the genesis and evolution of "social imperialism"; the relationship between its class character and its policies: instead, have come copious extracts from the mullah-ridden Press of the Middle East and Pakistan, from the Conservative *Daily Telegraph* in London, and from the speeches of two such deep students of socialism as Alec Douglas-Home and Minoo Masani. And on this enlightening evidence is the dreaded spectre of "social imperialism" based! Neither is Peking's history of the rise of revisionism in Russia less bizarre. The Maoists would have us believe that all was well under Stalin (still an honoured member of their pantheon), but that after his death a clique led by Khrushchev effected a coup; and that they and their successors have, ever since, been restoring capitalism. As the Soviet Union is now described as a fascist state (10th Congress of the CPC) this capitalism must have grown, matured, and started declining, in the remarkably short space of a decade and a half.

The Chinese leaders are these days the very soul of tact toward the Americans. In a conversation with C L Sulzberger of the *New York Times* (the interview being reproduced in the *London Times* of October 31, 1973) Chou En-lai revealed that one reason why his country's Press had refrained from reporting the Watergate scandal was that that might infringe the principle of non-interference in the affairs of another state. With such a mind-boggling definition of peaceful coexistence, the permitted level of cultural or political activity in a Maoist haven would either be reduced to the cultivation of one's garden, or be confined to participation in carefully orchestrated mass campaigns against hapless individuals from whom the protective grace of the Chairman had been withdrawn.

For the rest, the circumstances and causes leading to the decline and fall of people like Liu Shao Chi, and Mao's heir apparent, Lin Piao, are still wrapped in a miasma of mystical assertion, confusion and doubt, for any conclusive pronouncement to be made on their supposed sins. Numerous charges, for instance, are made against Liu; in addition to being a "capitalist roader", he is also described as a "hidden renegade scab and traitor" who had been betraying the revolutionary struggle of the Chinese people since

the 1920s. (It is curious how the Christian doctrine of original sin has found a Maoist form.) Ajit Singh, by implication, accepts the first of these charges, but prefers ignoring the second. Why this selectiveness? Regrettably, we have to press these questions strongly, if we are to avoid becoming the victims of a confidence trick, in the manner of so many people who blandly accepted the official versions of Stalin's show trials nearly 40 years ago. Bitter experience has shown that the ideological rationalisations of class struggle are apt to become a convenient ploy for summary trials, executions or political disgrace. Maoism in the context of Chinese history and social development has its own rationale; outside its native soil, in Europe, America, or even India, unless refined a hundred times over, it is liable to assume the most unshapely and grotesque of forms. The prospect of seeing in power such trusted yeomen of Mao Tse-tung Thought, as the likes of the late Charu Mazumdar in India, or Reg Birch in Britain or E F Hill in Australia, not to speak of Major Ishaq in Pakistan and votaries of "Muslim Bangla" like Maulana Bhasani and his tribe of Maoist mujahids — and even of being ruled by them — is daunting in the extreme.

The following passage from Harrison Salisbury's "To Peking — And Beyond" (a largely sympathetic account of present-day China) underlines certain aspects of contemporary Chinese society which must be understood, if at all a rounded picture of the People's Republic is to emerge or the titanic problems of building socialism in a backward country are to be fully appreciated: "The students, to be sure, were idealistic. To be sure, they were motivated — by motives of patriotism, service to their country, service to their fellow countrymen and, at a somewhat greater range, service to the cause of revolution (although this was quite plainly a cloudy concept that did not really seem to go much beyond support for those countries closely allied to China — Albania, Vietnam, Cambodia and North Korea). They were obviously chauvinistic, without really understanding the nature of their chauvinism. So far as culture was concerned, their definition could hardly have been narrower. It recognised only that culture which was deemed useful to the Revolution or to Chinese patriotism. The idea of a more general culture was alien, and seemed to them threatening. They were ignorant of conditions beyond the frontiers of China, and only weakly interested in learning about things that did not directly touch them. They had no hostility toward the United States, but no special curiosity about it. The Soviet Union was another thing. They were violently hostile to Russia and to anything they even in the periphery of their knowledge seemed to be identified with it — rock and roll, for example. Their mores and morals fitted the pattern I had already seen, a code as rigid as that of the Puritans. Not only did they not indulge in activity that might bring boys and girls into close physical contact — they did not even like to talk about such a thing. It was an embarrassment just to think about dancing two-by-two" (pp 138-39).

This picture is not greatly at odds with Ajit Singh's own definition: "socialist consciousness, which in simple terms stresses elimination of self-interest and exalts the public good."

Now, after a century of civil war and social decay, to witness at first hand, the practice of such recognisably Jesuitical values as poverty, chastity, and total obedience to superior authority, may be a strangely moving experience. Nevertheless, Jesuitical ideals defended with Stalinist casuistry do not accord with the sounder traditions of Marxist thought and analysis.

In sum, though China has undergone an immense social and economic transformation she has still a long, long way to go before she can boast of the socialist society of our dreams; dreams which some fifty years ago were being turned into reality. The spirit and achievements of the early Bolsheviks in the first decade of the infant Soviet Republic may today be a half forgotten ideal, but it is one worth rescuing from oblivion and given new life. That surely must be our task.

Associated Bearing

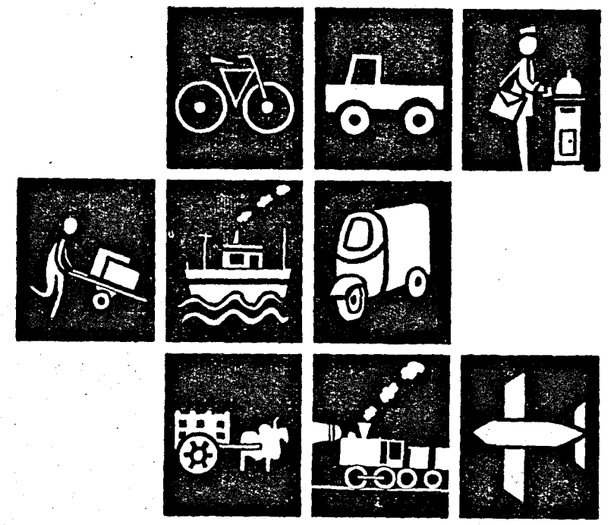
ASSOCIATED BEARING earned a higher gross profit on increased sales, but experienced contraction of margins. Even so, dividend has been stepped up from 17.5 per cent to 22 per cent and is covered barely 1.35 times. The company has received government consent for issue of bonus shares on a one-for-four basis. It will thus have to service a bigger share capital and also shoulder an increased tax liability, since 1973 was the last complete year with the benefit of development rebate.

Efforts are being made to seek conversion of the 'letters of intent' for substantial expansion into industrial licences. The company's liquidity position improved considerably and borrowings from banks were at a lower level last year. For certain periods, the company actually had surplus funds, some of which were loaned to other companies and some were deposited with a bank. The ratio of inventories to sales was considerably lower compared to the previous year. But the directors' remuneration increased from Rs 2,64,219 to Rs 4,75,707. Auditors were paid Rs 30,557 for other work and out-of-pocket expenses, besides their usual fee of Rs 20,000.

INSTITUTE FOR SOCIAL AND ECONOMIC CHANGE, BANGALORE

APPLICATIONS are invited for the award of a few research fellowships in Economics, Sociology, Human Geography with special reference to regional planning and Education. The scholarships will be Rs. 300/- p.m. plus an annual contingency grant of Rs. 1,000/-.

The fellowship is tenable for 3 years only, during which period the scholar is expected to complete his research work. Selected candidates will be registered for the Ph.D. course in one of the three universities in Karnataka to be determined by the Director and will be required to successfully complete a Research Methodology and Subject Orientation course during the first year.



AGE: Normally below 25 years.

QUALIFICATIONS: Either 1st class Master's degree of a recognised Indian University or its equivalent or if high second class with one or two years' teaching/research experience.

Requests for application forms must be accompanied by a crossed postal order for Rs. 5/- drawn in favour of the Registrar ISEC, Bangalore 1 and addressed to the Registrar, Institute for Social and Economic Change, P. B. No. 5120, Carlton House, Palace Road, Bangalore 560001. Completed forms must reach him *before* 15th May 1974.

Medicines on the way

In a country the size of a subcontinent, getting medicines to far-flung places is a considerable task. India's drug industry distributes medicines to over 70,000 retail outlets, 14,600 hospitals, over 5,000 primary health centres and numerous private clinics in all the states.

The manufacturing units have multiplied their distribution points in the country in recent years, to ensure quick and efficient distribution through a network of branches, depots and stockists. This has meant steady supply; stocks are replenished at short notice all over the country. Good distribution thus completes the four-fold job of the pharmaceutical industry, after development, production and quality control.

Indignation Is Not Enough

THE World Bank is now a sprawling bureaucracy, and India is its leading borrower. Neither can manage in the absence of the other. Without a widespread acceptance of the principle of multilateral, institutionalised assistance, the Bank will lose its clientele, and its bureaucrats their profession. And without the Bank organising its annual charade of the Consortium meeting, where India's aspiration for economic development under 'democratic' auspices is duly approved of and certain general sentiments are expressed on the desirability of channelling, if you can, some extra funds to this country, New Delhi will be in deep trouble. The sensitivity which some of our politicians, including members of Parliament, have developed to even minor notes of criticism emanating from the direction of the Bank has therefore an aura of irrationality about it.

The Bank's latest study, which in any case ends up with a thundering recommendation for debt relief to India, has nonetheless attracted a whole lot of adverse comments, since it incorporates some gloomy comments on the country's economic prospects in the immediate period, and particularly emphasises the unlikelihood of the goal of self-reliance being reached within any finite time horizon. An identical exercise could have been undertaken and publicised by a local contingent of economists; it would not have caused even the faintest ripple. It is only because the commentary has come from the World Bank that the politicians have got worked up in this manner. The conclusions in the report they implicitly accept, debt relief must come India's way, but the premises on which the conclusion is based are not acceptable; even if these were otherwise acceptable, they are not acceptable since they come from the World Bank, which should seemingly just arrange the debt rescheduling, and, for the rest, keep mum.

This is all slightly hilarious, for, in the past, occasional laudatory remarks on India's economic performance made by the World Bank in its confidential documents were purposely leaked out by the government itself; the same set of politicians were then found to lap them up. There should be a certain symmetry in these matters. If plaudits coming from foreign agencies are not to be scoffed at, one or two brickbats coming from the same addresses need to be tolerated too. Since little reluctance has been shown by the politicians in accepting assistance from and organised by, the World Bank, occasional words of advice from it have to be lumped. The government should have the honesty to concede the point that rejection of advice from external agencies should be accompanied by rejection of aid from these sources.

All this is however symptomatic of the fact that the nation's options in economic as much as political matters are getting progressively narrower. In case the basic internal reforms and social disciplining essential for economic stability and growth are not found to be politically feasible, there is inevitably a repercussion of that on the country's external accounts. Despite not undertaking any of the essential reforms, one can still continue to enjoy degrees of freedom in the domestic sector provided the system is kept afloat through the availability of foreign funds. Our trade with, as well as aid from, the East European countries has increased severalfold in recent years; we are also busy currying the favour of the oil-rich Middle East countries. But, quite clearly, the arithmetic cannot match unless the Western countries agree to be somewhat more munificent towards us than they have been in recent years. The bygones of 1971 are bygones; the Government of India is trying hard to resume bilateral understanding with the United States administration, so that aid from that extraordinarily rich country could flow once more. A pall of uncertainty will however hang upon this particular prospect till as long the Watergate fog does not lift. Willy nilly, therefore, New Delhi will have to fall back on what the World Bank and Robert McNamara can organise through cajoling the other members of the Aid-India consortium, the Arab Sheikhs and the Shah of Iran.

The meeting of the Consortium, just concluded in Paris, was faithful to this script; a figure of as high as $2.4 billion was mentioned as aid to India during the ensuing year, to be contributed equally by the Consortium group and the Arab countries. This may be all a pipedream; still, if members of Parliament and other assorted politicians object to the principle itself and take umbrage at the World Bank's activities, this is the occasion for them to speak up. If they would not want any busybody role on the part of the Bank, they must be equally firm in their resolve that aid under the auspices of the Bank should be unwelcome too. There are certain implications of rejecting the inflow of resources, howsoever dubious their source. A more rigorous management of

the economy, calling for a substantial encroachment on the living standards of the affluent sections, would in that case become absolutely necessary.

Those who want to indulge in the luxury of baying at the World Bank must hence agree to a phase of self-denial. If they are not prepared for the latter, they have little business to feign indignation over the allegedly condescending attitude of the Bank.

Bombay

Shah's Writ Here Too?

SOME 40-odd Iranian students marched in entirely peaceful protest to the Iranian Consulate in Bombay on March 23 to call for, among other things, an investigation into the repressive nature of the Shah's regime by the United Nations Human Rights Commission.

Amnesty International has documented the brutality with which the Shah's regime deals with any criticism of its policies. Not only is peaceful political protest forbidden but even mild intellectual criticism of the Shah's actions is considered subversive. Those who have dared to raise even slightly critical voices are known to have been dealt with viciously, prison sentences of 10 to 12 years accompanied by systematic torture being common.

Initially, the police saw nothing objectionable in the small demonstration. But two days later, Special Branch CID II of the Bombay police confiscated the passport of Nosrat Temoorzaddeh and arrested him on the minor technical charge of having come to Bombay from Bhopal (where he is a third year architecture student) without informing the police. Two other Iranian students, Asghar Nosrati and Latif Shoshtari, who had not even taken part in the demonstration, were arrested on subsequent days when they went to the police to make enquiries about Temoorzaddeh. On April 9, after nearly a fortnight in jail, the three students were released on bail and on April 10 the police withdrew all charges against them, obviously because there was nothing of substance to prove against these students. The very next day the three students were served with expulsion orders, signed by an Under Secretary of the Government of Maharashtra, to leave the country within 72 hours. When contacted about the expulsion orders, the Chief Minister and the Minister of State for Home professed ignorance about any such orders having been issued. However, attempts to persuade them to withdraw the orders failed and the Special Branch Deputy Commissioner insisted on arranging the students' flight bookings out of the country. They were surreptitiously booked on an Air-India flight which would be passing through Teheran. The students refused to avail of this facility to fly into 10 or more years of captivity and possible torture. For the moment they are still in Bombay.

Quite apart from the inhumanity of throwing these young men who have committed no offense out of the country, a number of other issues come to the fore. If the Maharashtra government and police are acting only on orders from Delhi, it may be surmised that some petty-minded bureaucrats in the Ministry of External Affairs have got it into their heads that the offer of three sacrificial lambs to the Shah will help oil Indira Gandhi's visit to Iran at the end of this month! But if the Maharashtra police and administration are being unduly zealous in dealing with these students due to pressures from the Iranian Consul-General in Bombay, it is about time that the Central Ministry of Home Affairs, which is so quick to see the hand of foreign agencies in mass movements directed against the government, began to curb the activities of such personages as the Iranian Consul-General or have them declared *persona non grata*. And if the much-vaunted Research and Analysis Wing is for the moment not too busy otherwise, it might begin to look into the connections between foreign emissaries and state governments, policemen, pressmen and others amenable to external influences.

West Bengal

Student Protest: A Beginning?

THE widespread student struggles launched by the CPI(M)-led Students' Federation of India (SFI) are a manifestation of a wider mass protest against the thoroughly discredited Congress regime in this state. About 50,000 students have so far taken part in a phased programme of demonstrations, gheraos and courting of arrest in about 30 cities and towns, including Calcutta, as part of the SFI's movement. The movement was started on April 4 on the demands for adequate supply of food and kerosene, cheaper writing paper and textbooks and changes in the educational system. About 1,000 students have been arrested so far. Though the mass defiance of prohibitory orders in Calcutta on April 8 passed off peacefully, similar action in some other cities and towns met with severe police repression, including firing in the sub-divisional town of Basirhat in the 24-Parganas district, though fortunately with no loss of life. The police resorted to heavy lathi-charge and bursting of tear gas shells at Bongaon in the same district and Chandernagore in Hooghly district. The student demonstrators in Howrah city and Chinsura town were also severely beaten by the police. In the latter place, according to one newspaper report, 91 students, including girls, were admitted to hospitals for treatment of injuries.

These acts of reprisal by the police were, in turn, followed by wider mass protests in the form of student strikes and bandhs in many places. The bandh at Chinsura, jointly called by the CPI(M), Forward Bloc, RSP and some other Left parties, was particularly successful. The SFI had called for a statewide student strike on April 9 and the CPI(M)-led CITU was scheduled to hold a mass rally in Calcutta on the same day to express its solidarity with the struggling students.

If these student struggles and the solidarity actions following them represent a sort of reconnaissance by the CPI(M), the government too, as appears from its varied responses over time and space, is engaged in probing actions — ranging from police-protected non-official violence against CPI(M) bases, as at Diamond Harbour, to firings by the police as at Basirhat. There are signs of nervousness in Writer's Building as the authorities recall that the beginning of the end of the Congress government in West Bengal in 1967 was marked by the very similar circumstances of a mass upsurge following the death of a student in police firing at Basirhat in 1966 during an agitation for supply of food and kerosene. Immediately on receipt of reports on the first day's agitation, the Chief Minister went into a huddle with top officials including the IG of Police and the DIG (IB). Quite a number of CPI(M) cadres have already been arrested all over the state. But the government has been forced on the defensive.

Though the SFI has launched this round of struggle on its own, the government's efforts to pit other sections of students against the SFI have so far failed. On the other hand, talks have been initiated for bringing about co-ordination among the student organisations led by some of the Left parties belonging to the nine-party Left front. Indeed, the demonstrations and law-breaking programme in Calcutta was jointly conducted by SFI and a number of other student organisations. Even the student organisations of the ruling party and the CPI have announced programmes for initiating student struggles on the same demands as projected by the SFI. The secretariat of the state CPI and the Yuba Sangha (Youth League) led by it promptly issued a press statement condemning the police repression of student demonstrations.

The perceptible change in the correlation of forces in this state is reflected also in the present mood of state government employees. The Co-ordination Committee of state government employees' organisations led by the CPI(M) had given a call for a one-day token general strike on April 9 as part of the programme announced by the All-India State Government Empolyees' Federation. A number of state government employees' organisations outside the Co-ordination Committee associated themselves with the strike call; even the Joint Committee, led by CPI, which has for the last four years been allied with Congress-led organisations, directed its members to take mass leave on April 9, to synchronise with the token strike call. Indeed, the changed and changing political climate in the state is reflected in the statement by the President of the ruling party's student organisation that "one must not oppose a movement just because it had been launched by the CPI(M)'s student wing".

It would, however, be the height of complacency to rule out a different turn of events. There have been many cases of provocation of and physical assaults on CPI(M) student ranks by elements who pass as Congress supporters, mostly under the protective umbrella of the police. If the movement now under way is to signal a new phase of popular advance in this long subdued state, much greater unity of the struggling masses at the base and wisdom and restraint on the part of the leadership will be called for.

Maharashtra

Gift from the Opposition

Our Maharashtra Correspondent writes:

THE Prime Minister's visit to Poona last Saturday had become an issue of prestige between the Congress party and a number of opposition parties and groups. Some four months ago, the Prime Minister had been forced to abandon a public meeting in Nagpur without completing her speech. Then, a second time, she had been persuaded to cancel a proposed visit to Bombay around the middle of January on account of fears of mass demonstrations and possible violence. Another reason for the cancellation of her trip on that occasion was that her visit would have coincided with the declaration of the result of the by-election to the Lok Sabha from the Central Bombay constituency and it is possible that intelligence reports had cautioned her about the likelihood of a Congress defeat in the election. Encouraged by these precedents, the opposition had declared that this time too the Prime Minister would be prevented from coming to Poona.

Poona city has never been a stronghold of the Congress. Though the Congress is currently the largest single party in the Municipal Corporation the city has a Congress(O) mayor. Among the opposition parties, the Jan Sangh has a strong volunteer force in the RSS which has always had a devout following in Poona. Despite this, the Congress decided to meet the opposition challenge at the party level rather than through the administration, though its control over the latter was fully exploited. It adopted two interesting tactics. First, it decided to take advantage of its own strength, and the opposition's weakness, in the rural areas of the adjoining districts. Thus it set about 'importing' a hundred thousand people from these areas to be present in Poona on the day of the Prime Minister's visit. For this purpose, vast resources in terms of trucks, buses, etc, were openly mobilised by the Congress. Vasantrao Patil, Irrigation and Power Minister in the state government, who camped in Poona city for days, even announced that Congress supporters coming from outside would come armed with 'lathis' to meet the opposition parties' threat of violence. Here, then, was a Congress adaptation of the Maoist dictum about the surrounding countryside overwhelming the city!

The other tactic employed by the Congress was to exploit the anti-Brahmin sentiment among the people. The opposition to the Congress in Poona has traditionally come from the Brahmins. An important element in the Congress propaganda, particularly in the districts adjoining Poona, was that the Brahmins were once again raising their head and trying to prevent the Prime Minister of the country from visiting Poona. This propaganda was patently false, but it was not ineffective.

A large part of the responsibility for their political defeat was that of the opposition parties and groups themselves. Their craving for publicity (a Dalit Panther leader even threatened to immolate himself) generally outstripped their ability for preparatory work to achieve their objective. Thus while long in advance of the Prime Minister's trip many brave statements were made about preventing the visit, to the very end there was little co-ordination among the opposition groups. The confusion among them was complete when the so-called all-party action committee announced at the last moment that no attempt would be made to obstruct the Prime Minister's motorcade and that the opposition parties would stage only peaceful demonstrations. In the event, the demonstrations turned out to be not merely peaceful but also purely symbolic — so feeble were they.

In fact, it was almost as if the opposition parties had conspired to enable the Congress party and the Prime Minister to claim a political triumph when in fact there had been none. For, among the people of Poona itself there was remarkably little enthusiasm for the visitation from New Delhi. The whole episode demonstrates once again how ill-considered action by highly disparate opposition groups can be severely counter-productive.

India-China Relations

Time for Fresh Initiatives

IF not a thousand, at least a fair handful of thoughts are evidently contending in China. The controversies raging over Confucius and Beethoven's Eight Symphony are proxies; it is the underlying currents and cross-currents which deserve closer attention. Leading personalities are still adopting, or adjusting, positions in support of, or in opposition to, types of ideological attitudes. In this sense, therefore, China has not quite emerged from the after-effects of the Cultural Revolution. Whether a second wave of the Revolution is now on is a matter of speculation; certainly many of the issues that reared their head six or seven years ago are having a second washing. The Lin Piao episode has left an awkward taste in the mouth, and while a num-

ber of fresh initiatives in the sphere of international relations would suggest that Chou En-lai's position remains reasonably secure, it would be altogether idle to pretend that China's domestic and foreign policies are moving along a consistently unilinear direction.

Such being the case, New Delhi should not yet throw in the towel. Complaints have been murmured by South Block that overtures to Peking in the more recent past have met with but faint response. This however is understandable, since, given the bitterness of a whole decade, a bitterness to which the Government of India itself had made substantial direct contribution, the Chinese too have to move in a somewhat gingerly fashion: they too will have their counterparts of the Swatantra party and the Jan Sangh. The issue has been rendered immensely more complicated by the signing of the Indo-Soviet Treaty and the developing trade and economic relations between the Soviet Union and this country. Given the present state of Sino-Soviet tensions, any seeming convergence between India and the Soviet Union, whatever the compulsions for it, would immediately raise Chinese hackles. The difficulties thus created cannot be untangled overnight. India in the long run has little to gain by a straitjacket of a foreign policy which condemns it to an uneasy shuffling within the co-ordinates of out-and-out pro-American and out-and-out pro-Soviet positions, and marked by a permanent anti-Chinese stance. The mileage that could once be obtained by playing the Soviet Union against the United States and *vice versa* is now a victim of obsolescence. And once both Washington and Moscow begin to take for granted India's hostility toward Peking, the failure of this nation's foreign policy could not be more overt, with consequential adverse impact on several other spheres of activity.

A certain room for manoeuvrability is thus badly needed. But just as Chinese policy toward us cannot move in a uniquely smooth pattern, so too the course of overtures to China has to be, at least initially, a little bumpy. It is not possible to tear asunder at short notice the constraints which stem from the arrangements entered into with the Soviet Union; similarly, it is not possible to brush aside the reality of the American presence in several distinct sectors of the economy. A few other rigidities have also threatened to freeze the contours of foreign policy — for example, a strongly entrenched establishment with a vested interest in an ever-rising defence outlay. Peking ought to appreciate that the scope of Indian initiatives cannot but be severely limited in the short period by the presence of such factors. The initiatives nonetheless should be there. And it is not altogether correct to suggest that till now the response from China has been totally blank. Chou En-lai, for instance, a few seasons ago made quite a display of his government's invitation to the Indian table tennis team to visit China. No similar overtures have been heard of from New Delhi. After an interregnum, the Chinese have now sent another invitation, this time to the Indian Kotnis Memorial Committee to attend the May Day celebrations in Peking. The Chinese would thus seem to be interested in keeping a line of communications open. It is time for the Government of India to announce a few initiatives from this end. If a team of Pakistani journalists could be permitted to visit this country, go round different centres and have an audience with the Prime Minister, there is little reason why a similar gesture could not be officially accorded to a similar group from China — or why, in our current dire economic difficulties, a trade delegation from Peking could not be invited for a preliminary exchange of views on the possibilities of a resumption of trade ties between the two countries. And if the inhibitory factor is the alliance entered into with the Soviet Union, the opportunity cost of the alliance should then be discussed in the open.

Indian Council of Social Science Research

SUMMER COURSES IN RESEARCH METHODOLOGY IN SOCIAL SCIENCES

The ICSSR announces four courses in Research Methodology to be held this summer. Two are Foundation courses open to all social sciences; two are discipline-specific — one for Economics and another for Political Science.

Following is the schedule:

Foundation Courses

1. A. N. Sinha Institute of Social Studies, Patna	May 20 through June 29, 1974
2. ICSSR Southern Regional Centre, Osmania University Hyderabad	June 10 through July 20, 1974

Discipline-Specific Courses

1. Economics

Sardar Patel Institute of Economic & Social Research Ahmedabad	May 6 through June 29, 1974

2. Political Science

Rajasthan University Jaipur	May 13 through June 22 1974

Students intending to register for Ph. D., those working for Ph. D., lecturers, and research workers are eligible to apply.
Selected candidates will be paid for their travel; boarding and lodging will be free.

For Application form write to:

Professor Yogesh Atal
Director (Trg)
Indian Council of Social Science Research
IIPA Hostel, Indraprastha Estate, New Delhi 110001

Send a stamped and self-addressed envelope (size 23 cm x 10.5 cm)

Note: Other courses will be announced later.

Calcutta Diary

A M

CONSIDER that much maligned category, labour in West Bengal. Mothers in comfortable bourgeois households all over the country must be still narrating to their young offspring hair-raising stories about the indescribably evil deeds perpetrated by the industrial working class in this state during 1967-71. Life then, the children would be told, was nasty, brutish, and short; civilisation had come to an end in this corner of the earth; the travails that the state is currently undergoing are the result of the brutalities indulged in by labour in those years — when investment cried off, replacement suffered, managers and industrialists otherwise imbued with a sense of mission to lift West Bengal to pristine economic glory found themselves played into an impossible corner. Organised labour in West Bengal was responsible for that abominable innovation of the *gherao*. Workers bullied proprietors and managers into conceding demands that were unreasonable to the core and were economically ruinous; they struck work whenever they felt like doing so; and they generally brought about an atmosphere of terror and claustrophobia which has been the major contributory factor in the untold sufferings of the people of West Bengal.

Script for Fairy Tale

Thus goes the script for the fairy tale. Now consider a few facts. The facts that are listed here are official, vetted by the Government of West Bengal, the *present* Government of West Bengal. Between 1968 and 1973, the number of man-days lost in West Bengal on account of *strikes* were markedly less than the number of man-days lost on account of *lock-outs* declared by the manufacturers and their managers. In 1968, 53 per cent of man-days lost were due to lock-outs; the corresponding percentages for 1970, 1971, 1972 and 1973 were 38.7, 62.3, 73.9, and 59.8, respectively. Only in 1969 were lock-outs responsible for a relatively minor proportion of the total man-days lost through industrial disputes, namely, 18.6 per cent. But this marked fall in the number of man-days lost on account of lock-outs in that year can be easily explained: 1969 was the year when the United Front Government was in power in West Bengal — and in full cry. It was apprehension of the new state government which kept the capitalist-producers away from the temptation to lock out labour. In each of the other years, it has been either President's rule or rule by the Congress; their kingdom come, the capitalists and their managers could not have felt freer to do whatever they liked with labour.

Certain other facts are equally revealing. Since 1966, the number of man-day lost *per* lock-out in West Bengal has been consistently higher than the number of man-days lost on the average on account of strikes. In 1966, the number of man-days lost per lock-out was 22,434, as against 5,113 per strike; in 1967, the corresponding figures were 16,910 and 6,605; in 1968, 22,932 and 11,779; for the subsequent years, they were 13,656 and 9,965, 28,502 and 8,521, 23,037 and 7,548, and 20,092 and 5,526, respectively. Finally, in 1973, 24,158 man-days were on the average lost because of lock-outs as against only 12,202 because of strikes. The average duration of a lock-out in the successive years, beginning with 1966, was 28, 48.2, 37.9, 24.9, 44.0, 47.6, 29.6 and 54.3, respectively. The average duration of a strike, on the other hand, for each of the years has been 9.5, 16.5, 18.6, 12.7, 15.6, 12.7, 8.0 and 4.2, respectively.

One could, if necessary reel off other figures, but the point ought to have been established by now. The working class in West Bengal, there can be no question, has been at the receiving end of a great campaign of calumny. If the industrial climate in the state has remained uncertain during all these years, only an insignificant part of the responsibility for that uncertainty can be laid at the door of labour. Units have been mismanaged in the state, funds have been filched, entrepreneurs have declared closures on the flimsiest of pretexts, and workers have been locked out whenever the owners and managers have considered it financially worthwhile to cease or interrupt production. It is not only in West Bengal that they have discovered that, by restricting output and thereby forcing up the price, both aggregate and per unit profit could be improved upon so long as they happen to enjoy some monopolistic advantages in the market. But in West Bengal's conditions they have found it easier to restrict output and blame it on labour. There have been other reasons for lock-outs and closures, too, such as the general industrial recession, the shortage of raw materials, and so on: the knowledge that prices and profits could be ensured in most scalings down of output would, however, underpin the decision-making on even such occasions in the case of several units.

But cast your mind back to those unreal days, five or six years ago. Very few were interested in sifting facts. The United Front had captured power in West Bengal; darkness had descended at noon. For the first time, the capitalists discovered, they could no longer take for granted that the forces of law and order would intervene on their side and beat up or arrest labourers whenever there was an industrial dispute. The world was on the point of collapse; the United Front government had asked the police not to take sides in the confrontations between the industrial owners and their workers. Till then, instruments of the state were supposed to be always at the beck and call of the capitalist class, to be deployed in whatever manner the latter would want them to deploy themselves. The rude interference with this natural law could hardly be tolerated.

Synthetic Panic

Therefore, a synthetic panic had to be created. The newspapers played along: their proprietors were as much scared by the abrupt emergence of the Leftists into positions of power as by others of the species. Mountains were made out of molehills. The relevant data concerning industrial disputes were suppressed, the problems posed by the recession and by such other factors as the steady draining of funds from the various companies through the managing agencies, were slurred over. Monosyllogism came to hold complete sway. Whatever closed in West Bengal closed on account of labour. Whatever unsavoury incident occurred occurred because of the boorishness of labour. Whatever unit faced difficulties in maintaining the tempo of production could blame it on the intransigence of the working class. If there were no raw materials, labour was at fault; if orders were not picking up, the workers were responsible for it; if coal was not reaching the plants, labour must be up to some mischief; if the trains were not moving, the workers were at the root of it; if power production was declining, labour must be sulking and not doing the assigned

work. Factories could be closed and labourers could be locked out because miserable proprietor-owners had done their fine calculations and satisfied themselves that this was an optimum solution because not only could they retain the size of profit by laying off labour and slashing production by a certain proportion, but, after having shut out the workers, they could yet put the blame for this squarely on the workers themselves — and the version would be accepted as unvarnished truth by the Press and the world.

In an unequal society, all assets, including those of the public media, are inequitably distributed. Such being the case, those who control the mass media can keep drumming the same untruths for weeks on end and so enforce a temporary suspension of commonsense as to facts. In the rest of the country, and even in West Bengal, there is a fairly widespread conviction that the steady ruination of the state in the course of the 27 years since 1947 has been entirely on account of what labour did during the two spells, adding up to 19 months, of the United Front.

Lack of Symmetry

Were one to make a comparison, industry by industry, the worker in West Bengal is paid less than his counterpart — not just in Maharashtra, but in at least five other states. What is particularly puzzling is the lack of symmetry in the manner in which certain propositions are formulated. The President of this Republic, who once upon a time used to label himself a labour leader, has been, in a sudden flurry of speech-making, pontificating up and down the country on the imperative duty of the working class to desist from strikes. Yet, at least in West Bengal, considerably more man-days — and hence industrial output — have been and continue to be lost on account of lock-outs than because of strikes. But Varahagiri Venkata Giri is not heard to exhort the industrial manfacturers on their duty not to indulge in lock-outs. From time to time, eminent men, including learned economists and newspaper editors, declaim that wages need be frozen at existing levels if inflation is to be curbed: none of these eminences, however, argue for a freeze in the rate of profit-taking. On the other hand, if, as in this year's Union Budget, more is planned to be given to those that have, they applaud — and not from the sidelines.

In this grim period of crisis, so the wise ones suggest, everybody should work together; as the Prime Minister and the Home Minister have urged so many times, the opposition groups should co-operate with the government. What does such co-operation mean at the operational level? That one must not harp on class biases in official policy-making, must not refer to the class biases in newspaper reports. It is not in the Indian tradition, you and I will be told, to dilate upon the theme of sharply delineated class alignments; 'unity in diversity', don't you know, is this nation's enduring principle. What however may appear as an obsession is in fact a reaction to the kind of attitudes that are adopted and the kind of acts that are performed on the other side of the barrier. If the country is rapidly moving toward a state of class confrontation, no small contribution to it is made by the avarice and shortsightedness of those who believe in using official machinery and mass media to spread canards about the working people.

JOAN ROBINSON

Selected Economic Writings

These papers drawn from *The Collected Economic Papers of Joan Robinson* are presented in this selection with a special concern for students of economics in underdeveloped countries.

The selection is divided into six sections dealing with: The General Theory of Employment under Capitalism; Marxian Economics; Economic Development; International Economics; Critique of New Classical Economics; Reconstruction of Economic Theory. *Paper covers Rs 18*

AMARTYA SEN

On Economic Inequality

This book based on Professor Sen's Radcliffe Lectures (1972) presents a systematic treatment of the conceptual framework as well as the practical problems of measurement of inequality. Alternative approaches are evaluated in terms of their philosophical assumptions, economic content and statistical requirements. The non-technical presentation of technical problems makes the book useful not only to economic theorists and statisticians but also to general economists and students of other social sciences. *Paper covers Rs 12*

IRMA ADELMAN & CYNTHIA T. MORRIS

Economic Growth and Social Equity in Developing Countries

The authors maintain that the conventional development programmes of the 1950s and 1960s have done little to alleviate human misery. Their findings are based on a careful analysis of economic and political data from 74 underdeveloped countries for the period 1957-68. *Stanford $10.00*

Oxford University Press

Recognising the New Mood?

Romesh Thapar

INDIRA GANDHI must be talking tongue-in-cheek. Surely, she does not believe her 'fascist' theory or the elaborations appearing in the communist press which compare the situation to the confrontation in Chile (what with the late Allende's wife in town!) and the balance of forces in Kerensky's time prior to the Bolshevik Revolution when 'black reaction' organised under Kornilov. Or is she exaggerating to sow confusion among the confused 'marxists', both here and abroad, on the eve of the critical railway strike.

The Prime Minister's performance becomes even more incomprehensible as the charge of corruption is questioned and rejected by her. She is obviously out of touch with the public mood.

And, yet, the PM's recent visit to Poona should have come as an eye-opener. Intelligence reports had been forecasting terrible commotion should she decide to set foot in the town, an assessment very similar to the one given earlier when Bombay city was expressing its anger and later when Gujarat was in rebellious posture. At one point, the betting was that she would "chicken out".

The visit has proved once again that the people, despite their terrible troubles, are demanding leadership, intelligent leadership, and that Indira Gandhi still appears as the only likely leader. Of course, the speeches of the PM at Poona were off the mark, unable to explain the crisis and without any leads. Warnings, threats, hunches, vague appeals do not tot up to much.

But, at least Indira Gandhi has got moving into the trouble spots. Gujarat is waiting. So is Bihar. And soon there will be other festering focuses. These visits are necessary for her, if only to get a flavour of the new mood, something very different from the *durbari* atmosphere of the Capital. Certainly, the security system will warn of possible mishaps. This is its job. But political leadership cannot become something dependent on security considerations. We have not reached that phase as yet.

Certain basic points have to be driven home into the consciousness of the Congress party's chieftains if they wish to avoid a situation where several explosions take place simultaneously and paralyse Central action. Let's face it, everything is going to pot. Public transport, water, electricity, telephones, postal services, conservancy, the distribution of essentials, medical aid, law and order, the collection of taxes, the administration of justice — yes, the whole lot are discussed and denounced. The public is being harassed. Only money makes things easy. The style is set by the top — yes, the absolute top. A cursory study of some land deals in Delhi involves the entire apparatus of government and administration, and now the Supreme Court will be passing judgment on these operations.

Indira Gandhi is repeatedly described as "heading" or being "surrounded by" some of the most corrupt Ministers and officials. This is the talk of the town. Facts and figures are advanced of sordid deals. In such a climate, what is the ordinary citizen, unable to get his bare needs met in the market, expected to do? Chant slogans mouthed by the political gentry who have dipped their fingers into the messy pie? Sit silent, waiting for the planets to change their inauspicious course? Or go on a rampage, chaotic, anarchic, to get some change out of an unchanging situation? Ask these questions of the young men on any campus and they will use the strongest language to express their disenchantment with this dishonest, disgraceful democracy.

Indira Gandhi has to shock herself out of the tautology into which she has driven herself with her fascist thesis. The people want clean, honest, intelligent government which will give them a fair deal. They are not expecting miracles. But, as always, time is running out. The railway strike, scheduled for April 15, will require decisive decision-making. Will the talks be handled by an incompetent minister with a much tarnished reputation? Will that bunch of ineffective men known as the Railway Board take a hand? How is it that at the most critical points in the national apparatus, we are saddled with thoroughly useless ministers and managers?

Coal and food and oil have to keep moving if this country is to overcome the disaster that will be on us if the railway workers paralyse movement. So far no one knows what issues are involved. What are the demands of the workers? Can they be narrowed down? Are compromises possible? The public knows nothing. One can only hope that those holding the reins appreciate that a railway strike is no "picnic", unlike when the doctors or the Indian Airlines go on strike.

The stakes are certainly bigger, political, even calculated to topple the government. But the mood that permits Indira Gandhi's opponents to attempt this was created by Indira Gandhi's government. It is not willed by Mao and Nixon, much as we would wish it were.

Yes, all this is urban stuff, sparked by the middle class and the 'privileged' worker. The rural base remains largely unaffected. But the spillover will begin. A prolonged railway strike, simultaneous student and teacher actions at several points, and a few other collisions of a communal character could in political terms spell a catastrophic upset. And sitting here in Delhi, there's no feel of the crisis.

In conclusion, let me recount a story that is going the rounds of 'fascist' golfing circles. For sometime now, the Lt Governor of the city, a retired, below-average bureaucrat with appropriate connections, has been golfing in the early hours of the morning. He always arrives with a posse of security men and what-have-you. The other day, one of the many balls he knocks into the bushes got lost. An eight-year-old caddy serving him couldn't find the Lt Governor's ball. He was immediately accused by a flunkey of theft. As if from nowhere, a large number of police descended on the golf course and began to "extract" the truth from the caddy. Meanwhile, the damn ball was found. The workers at the Golf Club went on strike. The members are content to gossip about their Lt Governor. And so our 'fascists' are born. But Indira Gandhi could transform the scene. A simple sacking of a real fascist, and then things would be better all around. If we could expect more sackings, even the railwaymen might decide to exercise patience.

Naive? Maybe. But I think not. We are sick of Parliament debating Coca Cola for 150 minutes at a cost of, I believe, Rs 10,000 a minute.

April 8

Ordeal by Fire

Nireekshak

BELYING the sembre prognostication of Home Minister Uma Shankar Dikshit, *Searchlight* and its Hindi counterpart, *Pradeep*, resumed publication less than two weeks after the attack on their offices and press on March 18. Dikshit, the wizard behind *National* Herald's finances and its Managing Director for years, knows his newspaper economics well. However, returning from an on-the-spot study he almost suggested that the two dailies might not see the light of day again. While replying to the Lok Sabha debate on the Patna incident, he even implied that *Searchlight* could have saved itself had it sought his help, as the rival *Indian Nation* is supposed to have done.

The attack on *Searchlight* and *Pradeep* was clearly premeditated and systematic. The two papers are owned by the Birlas through their sugar mills. *Searchlight* has in the past incurred the wrath of the Bihar government off and on. In 1965 the Chief Minister had editor T J S George detained under the Defence of India Rules because he did not like some of the paper's writings. The next editor too soon became *persona non grata* with the local political bosses. The present government could not have liked *Searchlight's fearless* exposure of the intimidation and other questionable practices that marked the Madhubani assembly by-election in February which ended in a famous victory for the Chief Minister. The paper had, for instance, reported that 6,000 policemen had been deployed in the constituency on special duty for polling day and that bus and train services had been ordered to be suspended on the day of the election, thus hampering the movement of voters and party volunteers in the constituency. The paper had also reported how polling booths had been systematically 'captured' by Congressmen where they were not too sure that the voting would go in their favour in normal course.

The first attack on *Searchlight's* offices, on March 16, was unsuccessful. When two days later the next attack began, frantic telephone calls were made to the Chief Minister and to the Police Headquarters but no help came. To go by Patna reports, the IAS and IPS brass, in consultation with the political bosses, had decided that the agitation by the students had to be discredited and deprived of public sympathy. For the same reason, when the March 18 gherao of the State Assembly went out of control, the police did not intervene. This enabled anti-social elements to take over and convert a political demonstration into an orgy of arson and violence.

The New Delhi bureau of *Searchlight* had no inkling of what had happened in Patna until late in the afternoon. The teleprinter link was dead and the paper's correspondent rushed to the *Indian Nation* bureau to check on news from Patna when a frantic message came on the wire: the *Searchlight* offices had been burnt down and the offices of *Indian Nation* were under attack. The staff was fighting back but there was no police help. The New Delhi correspondent of *Indian Nation* telephoned the Union Home Minister to implore him to intervene. Dikshit might justifiably take credit for saving *Indian Nation* because the police came on the scene in Patna after his long-distance intervention. Law and order is a state subject, but it would seem one has at times to look directly to New Delhi for protection. *Searchlight's* misfortune lay in the failure of its executives to dial New Delhi for help.

It was a touching gesture on the part of *Indian Nation* to have offered all help, including the use of its printing plant, to revive *Searchlight* and *Pradeep*. *Indian Nation* and its Hindi counterpart, *Aryavarta*, belong to the Darbhanga family and enjoy a larger circulation than the rival group. Ironically, the state government, which had allowed *Searchlight* to be reduced to ashes, has made available its textbook printing press to enable *Searchlight* and *Pradeep* to bring out emergency editions until their own press is re-established.

As the older of the two English dailies from Patna, *Searchlight* had recorded contemporary Bihar history over a long period. The files of *Searchlight* were thus a precious source of material for researchers. They have now been destroyed. It is impossible to replace these files as they cannot be got anywhere and had not been microfilmed by anyone.

Dikshit's memorable pronouncements on the *Searchlight* episode did not get reported in the newspapers because his speech was one of the casualties of the decision by the Parliament Press Corps not to report the day's proceedings in Parliament. This was done as a gesture of protest against the denial of medical attention to one of their colleagues, K Subramaniam of the PTI, who had had a heart attack in the Lok Sabha Press Gallery earlier in the day. After news came that Subramaniam had died, the Press Galleries in both the Houses were empty, except for the All-India Radio correspondents and Press Information Bureau officials. The AIR correspondents too had abstained for a couple of hours, but then they were ordered to resume reporting. Their predicament was understandable since the AIR staff comes under the Service Conduct Rules. The next day Speaker departed from convention when he made a reference in the Lok Sabha to K Subramaniam's death and the House observed a minute's silence.

Parliamentary reporting carries no special occupational hazards, if attracting the privilege of members or of the House is not listed as a hazard. On the contrary, it brings several fringe benefits — access to the subsidised restaurant meant for MPs and their guests, the facility of being able to buy unadulterated ghee and good quality coffee powder at low prices and the privilege of acquiring exclusive blends of tea meant only for MPs ('Parliament' and 'Sansad' are the rival brands). All the same, it is sad to be reminded that a reporter who had covered Parliament for years could not get medical aid for 35 minutes after a heart attack while on the job.

Dunlop India

THE Directors of Dunlop India have recommended a final dividend on ordinary shares at the rate of Rs 1.25 per share, subject to tax, for the year ended December 31, 1973. Together with the interim dividend of 75 paise per share already paid, this makes a total ordinary dividend of Rs 2 per share for the year, the same as for 1972. Dunlop India's total income for the year at Rs 102.58 crores was 6.4 per cent higher than the previous year's mainly due to higher sales volume made possible by increased production at both the company's factories, in spite of continuous power cuts. The balance from trading amounted to Rs 7.94 crores, an increase of Rs 2.18 crores over the previous year.

Diversification Pays

Hansavivek

CENTURY SPINNING, already engaged in manufacture of diverse items such as textiles, cotton, rayon and tyre yarn, sulphuric acid, carbon-di-sulphide, caustic soda, salt and cement, is exploring possibilities of further diversification. The management will inform shareholders about the plans when they take concrete shape. Meanwhile, the company's pulp project has not made any progress. The cement project, being set up at Tilda with a capacity of 6 lakh tonnes per annum, is now expected to go into production in the next few months. Some delay has occurred owing to the delay in delivery of the main equipment by AVB. A 'letter of intent' has also been secured for establishing a cement plant at Maihar in Satna district of MP for manufacture of portland cement with an annual installed capacity of 7,50,000 tonnes. The management is trying to get a mining lease for limestone. The project to set up a textile spinning mill as a joint venture company in Indonesia is progressing. Trial production is expected to start in about a year. With a change in the conversion rate of Indian currency, Century's participation in the equity capital of the Indonesian company will now be about Rs 39 lakhs. The total value of plant and machinery to be exported from India for the project is expected to be around a crore of rupees.

Century has turned out good results for 1973, with higher sales and profits. Margins have also looked up, with both ratios of inventories and wages to sales lowered over the year. The current year, which began with a 41-day strike in Bombay's mill industry, is also likely to be adversely affected on account of scarcity and high prices of cotton and other raw materials, stores and chemicals. Last year, 39 automatic looms, 25 plain looms and 14 ring frames and some other ancillary machinery were replaced. Further renovation of the textile mills is under way. The availability of various raw materials required by the rayon plant is causing concern to the management. The company exported last year 1,030 tonnes of rayon tyre yarn and fabrics to various countries, including Japan, New Zealand, Australia and Netherlands. Total exports of rayon yarn, tyre-cord, chemicals and fabrics amounted to about Rs 2 crores. Total exports of the textile section ag-

* 18 months.

gregated Rs 2.70 crores against Rs 1.01 crores in 1972.

BASF INDIA has turned out poor results for 1973. Although turnover increased by 50 per cent over the preceding 18 months on a proportionate basis, profit-margins were lower and the 12 per cent dividend is thinly covered. This outcome is ascribed to a higher proportion of low-margin goods in the 1973 turnover, coupled with 'substantial' increase in the cost of raw materials which was not always matched by increase in selling prices. The directors find it difficult to predict with any certainty the current year's prospects because of the difficult supply position of indigenous raw materials. They actually view the future "with some apprehension". The company has come under the purview of the Foreign Exchange Regulations Act, which came into force from January last, as the foreign collaborators' holding in the capital exceeds 40 per cent. Necessary applications are being filed with the RBI. The company has applied for recognition of its research and development unit.

UNITED CARBON INDIA is considering possibilities of diversification of its activities through research, as margins on carbon black are shrinking rapidly. Meanwhile, preliminary steps have been taken to expand capacity of carbon black to 35,700 tonnes per annum. The company's application for increase in the licensed capacity, made in mid-1970, was granted in January last after prolonged discussions. During 1973, the company produced 29,339 tonnes against the licensed and installed capacity of 17,850 tonnes. While sales were only marginally lower, gross profit plummetted by more than a third to Rs 149 lakhs. Both the ratios of inventories and wages to sales were considerably higher compared to the previous year. Dividend was reduced from 20 per cent to 12 per cent on the enlarged capital. Selling prices were increased by way of 'oil surcharge' following the phenomenal increase in the cost of feedstocks.

UNION CARBIDE INDIA is expanding the seafoods business and has secured an industrial licence to process seafoods at Visakhapatnam. In order to catch more shrimp, seven more trawlers of modern design are proposed to be procured indigenously. The company stepped up exports of shrimp last year by Rs 34 lakhs to Rs 73 lakhs although its total exports could rise by only Rs 17 lakhs at Rs 165 lakhs. Increase in shrimp exports apart, a sharp rise in production of electrolytic manganese dioxide towards the year-end also enabled the company to commence export of part of the output. If world-wide shortages continue, these exports are likely to show an upward trend. But exports of batteries have been lower. It is stated that increasing overseas competition, virtual closing of many markets abroad, and shipping problems affected export of batteries last year and that, with many countries embarking on local production, future export prospects are likely to remain uncertain. UCI's total sales could increase by only 8 per cent last year, because of difficulties in obtaining materials, a strike at Madras, and minor repetitive labour problems at other locations. Production of flashlight cases, zinc, and carbons, was maintained at levels required by their sales. Profit margins were slightly lower compared to the previous year because raw material costs increased considerably, though both inventories and wages in relation to sales were lower. The unchanged dividend, of 20 per cent, has a slightly better cover. The board has also recommended issue of bonus shares on a one-for-two basis and has declared its intention to pay a dividend of "not less than 14 per cent" on the enlarged capital.

TRADE-WINGS, the largest travel agency in India which is also engaged in clearing and forwarding, is now diversifying into the hotel business by setting up a 3-star hotel on the Bogmalo beach, 3 km from Dabolim airport in Goa. The hotel will have 126 rooms with 252 beds and will be operated by Oberoi Hotels (India) which has wide experience and an international reputation in the field. Having a network of 11 offices in India and with plans to open branches in New York and London, the company expects a high occupancy rate for the hotel. With the proposed modernisation of Dabolim airport, it may also be possible to bring foreign tourists in chartered flights directly to Goa. The capital outlay on the project, estimated at Rs 107 lakhs, is proposed to be financed by equity capital of Rs 41 lakhs and long-term loans of Rs 66 lakhs. The public is being offered 3 lakh equity shares of Rs 10 each at par to raise part of the finance required for the project. The subscription list will open on April 29 and close on May 11 or earlier, but not earlier than May 4. The company's business has been growing. It has built up reserves and paid dividends regularly since 1958. The total turnover last year was over Rs 7 crores and is expected to increase this year to Rs 9 crores. Although the hotel is expected to start operating from mid-1975, the management hopes that the company will be able to pay a dividend of 10 per cent on the enlarged capital from April 1974 and to step it up gradually thereafter. The company paid 14 per cent for 1972-73. The board is headed by Arvind N Kilachand.

GUJARAT MINISTEEL, a new company, is putting up a steel ingot casting plant with a capacity of 18,000 tonnes per annum at Ahmedabad, where it has the locational advantages of availability of scrap and adequate power and also has an assured market for its products. The company has got a COB licence. Mukand Iron, an established leader in the field, is supervising the erection of the plant which is likely to go on stream in May or June next. Total cost of the project is estimated at Rs 115 lakhs, which is intended to be met by share capital (Rs 40 lakhs) and loans and deferred-payments (Rs 75 lakhs). The company is entering the capital market on April 29 with a public issue of Rs 24 lakhs in equity shares of Rs 10 each. The subscription list will close on May 9 or earlier, but not before May 2. Since orders for plant and machinery were placed by promoters as far back as in July 1972 and prices have since increased considerably, the company stands to benefit by Rs 10 lakhs. Moreover, it will also be in a position to gain the benefit of a development rebate of Rs 15 lakhs. According to the management, the company's turnover should rise, from Rs 277 lakhs in the first year of production to Rs 333 lakhs in the third; and gross profit should rise from Rs 36 lakhs to Rs 43 lakhs in the same period. On this basis, the shareholders may expect the company to pay a dividend of about 10 per cent out of the earnings of the first year of production. The buildings and other facilities have been so designed as to provide for a second furnace and a continuous casting machine. The company is seeking an industrial licence for this purpose. Viren J Shah, chairman and managing director of Mukand Iron, is chairman also of this company. Other directors include V C Patel, Ramkrishna Harivallabhdas and M L Shrikant.

NEW DELHI

World Bank, Our Saviour

B M

A COMPLETE lack of credibility marks the working of the government. No one, therefore, takes seriously the denial by the Food and Agriculture Ministry that efforts are under way to arrange for imports of foodgrains. It will be recalled that reports from Washington had suggested that India was in the world markets for purchase of as much as 4 to 5 mn tonnes of foodgrains this year. These reports had further suggested that some purchases had already been made in the US market for shipment to India. There can be no escape for the government from importing foodgrains this year. This is the simple logic of the decision to abandon the take-over of wholesale trade in wheat and to hand it back to private traders.

Much has been said about the failure of the trade take-over experiment. But where exactly was the failure? The fact is that 7.6 mn tonnes of foodgrains were procured from the 95 mn tonnes produced in 1972-73. This was only 0.8 mn tonnes lower than the procurement in the previous year which was out of a much larger output of 105 mn tonnes. Besides, 1971-72 was a year of easy availability of foodgrains and steady prices. Of the total procurement of 7.6 mn tonnes in 1972-73, nearly 4.5 mn tonnes came under the trade take-over scheme. This was almost the entire quantity of wheat that normally comes to the market. Since the aim of the talk-over scheme was no more than to acquire the marketed surplus in wheat, the scheme should really be regarded as having been a success.

Even this order of procurement last year was found to be insufficient to satisfy the demands on the public distribution system. The off-take from the system was 11.4 mn tonnes in 1973. The stocks with the government had, therefore, to be supplemented by imports. Arrangements were made for import of 6.2 mn tonnes of foodgrains during the year, including the 2 mn tonne wheat loan from the USSR. Out of this, nearly 5 mn tonnes actually arrived in the country during the year.

What are the prospects of procurement from internal production in the current year after the decision to return the wholesale trade in wheat to the traders? From the bumper kharif crop of 67 mn tonnes, the procurement has been about 3.3 mn tonnes so far. The rabi crop, which is now coming to the market, is not rated very good. Total foodgrains production in 1973-74, which was planned to be 115 mn tonnes, had already been scaled down to 110 mn tonnes in the Economic Survey presented to Parliament in February. The Agricultural Prices Commission, in its report on the price policy for rabi foodgrains submitted in March, further lowered the estimate to 105 mn tonnes. And now the latest estimates place the figure at 100 mn tonnes, which means that the rabi crop will be no more than 33 mn tonnes. There are other, more pessimistic, estimates which put foodgrains production in 1973-74 at 95 mn tonnes or the same as in 1972-73. Wheat production is generally estimated between 22 and 24 mn tonnes.

In the circumstances, how much of this low output will the government be able to procure? Under the new wheat trade arrangements, the government has placed its main reliance on private traders, who are expected to hand over to the government one-half of what they purchase from the producers at the fixed procurement price of Rs 105 per quintal. The rest the traders will be allowed to sell in the market. It is naive to believe that the traders will hand over to the government anywhere near 4.5 mn tonnes, the quantity procured last year when the wholesale trade in wheat had been taken over. Past experience suggests that not more than about 5 mn tonnes of wheat comes to the recognised markets and purchase points. The maximum that the government may expect to get can thus be no more than 2.5 mn tonnes, assuming that the traders actually hand over to the government half of what they buy. This is, of course, an entirely unrealistic assumption. The fact is that total arrivals in the regulated markets, over which alone the government can keep some kind of close watch, amount to perhaps no more than 2 mn tonnes, of which the government's share will not exceed 1 mn tonnes.

A development of far-reaching significance which has been under way for some time and which has received an added momentum as a result of the partial and half-hearted take-over of wheat trade last year and its reversal in the very next year, is the collusion between the large producer and the trader in the marketing of foodgrains and of wheat in particular. In many cases, the producer has acquired the senior status in this partnership and has tended even to grow into an altogether independent trader. The effect of this is that the proportion of wheat which will arrive in the regulated markets may further shrink so that the farmer-trader can avoid having to part with a part of it to the government at fixed procurement prices. For all these reasons, what the government may expect to procure in the current rabi marketing season is unlikely to exceed 2 mn tonnes — it may turn out to be even less — compared to the procurement of 4.5 mn tonnes last year.

With this order of procurement and with opening stocks of no more than 2.8 mn tonnes, the government cannot possibly meet the demands on the public distribution system from domestic supplies. This will be true even if the scale of operation of the public distribution system is drastically cut down. The government clearly has no intention of undertaking public distribution of foodgrains on last year's scale. The indications are that public distribution will be restricted to consumers in large urban concentrations and sensitive industrial areas, leaving the rest of the population to fend for themselves. The total quantum expected to be distributed is about 7 mn tonnes as against last year's 11.4 mn tonnes. But even after chopping up the public distribution system so drastically, the government will still not have enough foodgrains if there are no imports. By its failure to take effective measures to procure foodgrains domestically, the government has made imports inevitable.

How is the import of foodgrain to be financed? It does not seem likely that the Soviet Union will come forward once again with another wheat loan. Even if it does, the quantity involved will fall far short of requirements. It is not surprising, therefore, that there has been a dramatic change in the government's attitude to foreign aid, particularly aid from the Western countries. All talk of self-reliance and progressive reduction in aid flows has been stilled. New Delhi is now awaiting with bated breath the outcome of the World Bank's efforts to induce the

members of the Aid-India Consortium to step up their aid to India.

The reaction outside the government to the World Bank's working paper on India's aid requirements is, therefore, completely off the mark. Some leftist circles have seen in the World Bank's efforts yet another assault on the government's commitment to self-reliance. This is truly ridiculous. A perusal of the working paper will show that it has been prepared in close consultation and collaboration with the Government of India and its officials. The government is, if anything, extremely gratified that its efforts to convince the World Bank of the enormity of its aid requirements have been so successful and that the Bank has lent such powerful support to its own efforts to get as much aid as it can. The government's reliance on the benevolence of the World Bank and the Consortium countries is total.

This is borne out by the import control policy for the current year announced by the Commerce Ministry. The Ministry has actually chosen to further liberalise imports. To the question how the liberal imports are to be financed, the Ministry's answer is simple: the aid situation is hopeful. The import policy is formulated on an *ad hoc* basis, for the first half of the financial year. The hope is that the aid position will become clear in the next three or four months. It is again the expectation of generous foreign aid which has persuaded the government to shelve proposals to reduce the inflow of crude oil.

No one seems to be bothered about what may happen if the expected aid does not materialise. Even more remote is any thought of the longer term implications of such total reliance on foreign aid. The government is concerned only with how it can avoid certain difficult decisions — such as formulating a more selective import policy or devising measures to cut the consumption of petroleum products or taking steps to procure enough foodgrains out of domestic production to keep the public distribution system going even on the present inadequate scale — through the generosity of other countries.

STEEL

Perverse Priorities

(From a Special Correspondent)

THE problems of steel have unfortunately become a question mainly of inter-personal relations in the agencies concerned with steel production. The chairman of the Steel Authority of India Limited (SAIL), who is also Secretary to the Ministry of Steel and Mines, has been put on a sort of probation by the new Minister, K D Malaviya. The combination of SAIL chairmanship and the secretaryship of the Ministry in one person was a last-minute decision of the late Mohan Kumaramangalam. Kumaramangalam's sudden death revealed the basic flaws in the concept. When T A Pai was *ad hoc* Minister for Steel for several months, he had a surfeit of difficulties with the SAIL set-up. K D Malaviya's instinctive approach, on taking over, was to delink the ministry and SAIL. Malaviya has not given up this idea and an IAS Steel Secretary is still on the cards. But, meanwhile, he wants the SAIL chairman to go ahead with some other structural reorganisation, especially the break-up of Hindustan Steel.

The main problems of the steel industry, over the past five years since the expansion of the public sector plants, have concerned production. However, perhaps reflecting the orientation of the organisation's top management, the SAIL's accent has been on the details of distribution. Distribution is, of course, of the essence in steel or any other commodity in short supply. It is vital whether a friend of a Rajni Patel or a follower of a Priya Ranjan Das Munshi gets priority permits for scarce items. The scarcer the items the better the deal. Last year pig iron too was a premium item. Not that previous ICS chairmen and general managers of the steel complexes were totally innocent of political motivations, but they did not have the mastery over craftsmanship needed for operations on a scale demanded, for instance, by the elections in UP or Orissa. One of the proposals being bandied about by SAIL is the appointment of agents, instead of establishing more public sector stockyards. Such a break with established practice may not be too difficult to push through after the major reversal of policy on wheat trading.

K D Malaviya has made a primary decision, which is to hasten the split-up of Hindustan Steel into separate units at Bhilai, Durgapur, Rourkela and the coking coal concern at Jharia. But autonomy for these units will be a myth if the present role of SAIL continues. As it is conceived now, SAIL will name the managements of the subsidiaries whose boards may be expected to be dummies. In recent years, except during the period of K T Chandy's stewardship of Hindustan Steel, the general managers of the various plants have had considerable autonomy in day-to-day operations. If these powers were not exercised fully, it was partly because of voluntary self-denial by the general managers.

There are other reasons, apart from the tight grip which the SAIL's present chairman wants to retain over them, why the current talk of autonomy for the steel plants cannot be taken seriously. In fact, there are not many things about which the steel plants can be autonomous. There is no question of competing for the best raw materials or transport facilities. Wages in the steel industry are fixed nationally and the product mix of each plant was built-in at the time of construction. What they will produce will also continue to be fed through a joint plant committee. And pity the Durgapur general manager dealing autonomously with West Bengal Ministers!

In the year ended March 31, 1974, the plants of Hindustan Steel are expected to lose between Rs 25 crores and Rs 30 crores, despite the hefty price increases granted in mid-September and mid-October 1973. The increases totalled Rs 300 per tonne of saleable steel on average. At the 1972-73 levels of production, the higher prices should have increased the cash flow of the plants by about Rs 100 crores a year. According to the calculations of the Finance Ministry, good operations in the mid-seventies should yield an extra Rs 200 crores a year to the public sector steel industry at the current prices, compared to the income levels of 1972-73.

Fortunately for SAIL — and perhaps even for TISCO — the labour problems of the railways in recent months have come as a convenient cover-up for the lapses of the steel plants. Past bad maintenance of coke ovens is now being camouflaged by cries of structural damages newly caused by asphyxiation as a result of the shortage of coal supplies. TISCO's steel plant

capacity was doubled to 2 mn ingot tonnes 15 years ago, but its captive mines (not nationalised) are still capable of feeding the Jamshedpur plant for only half its present capacity. Whether the Tatas neglected the expansion of the captive coal mines or whether it was the government which prevented the expansion is a matter to be closely investigated. Similarly, SAIL has neglected coal-raising programmes for several months, though Bharat Coking Coal was placed under it. The result is that the coal mines are incapable of digging up enough coal to meet the steel plants' needs.

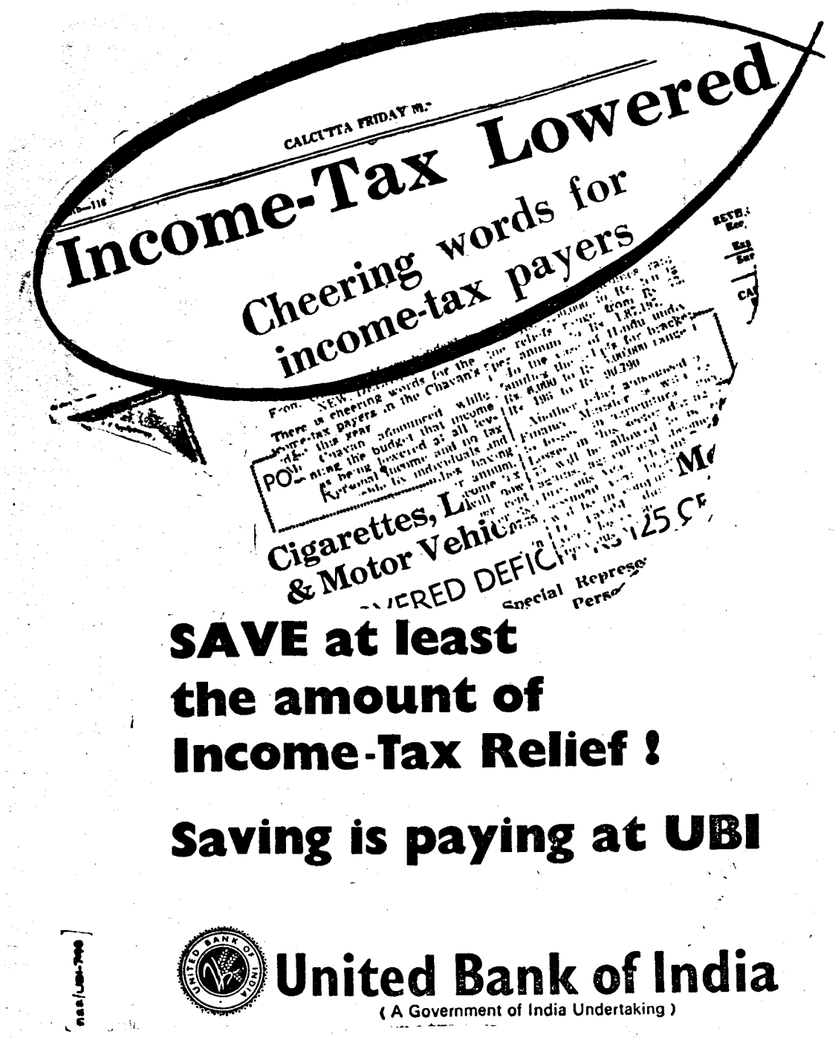
In the year ended March 31, 1974, the production of saleable steel by the five integrated steel plants was about 450,000 tonnes less than that in 1972-73 and about one mn tonnes below the original target for the year set by Mohan Kumaramangalam. The three HSL plants produced 2.8 mn tonnes of saleable steel (compared with nearly 3 mn tonnes in 1972-73), TISCO produced about 1.2 mn tonnes, a fall of about 300,000 tonnes, and IISCO 358,000 tonnes. Now there are reports that TISCO will need external supplies of coke to keep up production because one of its coke oven batteries needs restructuring. The government's first thoughts were to aim at 5.5 mn tonnes of saleable steel in 1974-75 but now the target is to be kept around 5 mn tonnes. This would mean a little over 60 per cent utilisation of installed steel-making capacity, excluding Bokaro. In two months of operation of its first steel melting shop, Bokaro has produced 20,000 tonnes of steel ingots. Bokaro produced more than 650,000 tones of pig iron in the past year.

There is no money for steel development or, for that matter, even for proper maintenance of the steel plants this year. The budget provides about Rs 160 crores for SAIL. At least Rs 10 crores a month are needed for continuing with the construction of Bokaro. Bharat Coking Coal is being given a paltry Rs 30 crores which is less than half of what it could profitably put to use. The Bhilai expansion programme needs around Rs 60 crores during this financial year, but there is no provision for it in the budget. If the plants of Hindustan Steel and Bokaro are not provided with funds for capital expenditure, the Heavy Engineering Corporation, Bharat Heavy Electricals, and other public sector fabricators in turn will be starved.

Meanwhile, SAIL seems to be concerned with obtaining higher prices for the smaller quantities of steel that are available. Arbitrary price hikes have become an accepted general policy of the government and the predatory instincts of the private sector are reflected in the new demands from SAIL for still higher steel prices. The Steel Ministry and SAIL should be really worrying about the problem of reducing the continued waste of steel. But this is obviously asking for too much. De luxe building construction and de luxe furniture making, among other activities, are essential to create the uncontrolled profits for selected sectors which in turn finance the country's parliamentary democracy

INDUSTRIAL DEVELOPMENT

Accent on Administrative Trivia



(From a Special Correspondent)

AS they were originally conceived of, the Annual Reports of the various ministries and departments of the Government of India, which are presented to Parliament before it takes up discussion of their respective budgetary demands, were expected to provide critical reviews of their working, of the policies and programmes pursued and of the success achieved and the shortfalls noticed. However, over the years, despite the induction of a large number of economists into the government and the creation of a separate Indian Economic Service, these Reports, particularly of the economic ministries, have been reduced to mere compendiums of administrative trivia.

Take, for instance, the Annual Report for 1973-74 of an important ministry such as that of Industrial Development, which has been just published. Among other things, the Report claims to present a review of the "trend in production" in 1973. However, it could not have done this in a more superficial, off-hand manner. First, the review is based on the index of industrial output for just the first six months of 1973 when data for later months must have been available. Last year's Report, for instance, contained data for the first nine months of 1972. And judging by the Economic Survey for 1973-74, the Ministry must have had available to it production data for individual industries upto September 1973. A thorough review of the performance of different industrial groups on the basis of these data should have been expected of the Ministry's Report. Worse, the Ministry is at times guity of complete misrepresentation of facts. Thus it says: "An adequate and timely monsoon has presaged a welcome revival in the production of a number of agriculture-based industries such as cotton textiles, jute manufactures, sugar and vanaspati." Contrast this with what the Economic Survey, 1973-74, had to say: "While it is difficult to generalise on the basis of data for six months alone, it is clear that the most important group, *viz*, textiles, suffered a setback". In fact, the output of 'textile manufactures' as a group declined by 4.5 per cent during January-June 1973. Likewise, the Economic Survey had pointed out, "shortages of oilseeds and oils, and power cuts in the northern parts of the country, affected the vanaspati industry". Later data available for 1973 as a whole show a fall in output of 3 per cent in cotton cloth, one per cent in cotton yarn, 7 per cent in jute textiles and possibly over 10 per cent in vanaspati. Among the agriculture-based industries, the only important one to show improved output was sugar. It is incredible that a ministry which is supposed to be responsible for industrial development should be so wide of the mark in its appreciation of the basic facts of the industrial situation.

After this it was only to be expected that the analysis of the causes of the stagnation of industrial output in the Report should be superficial. The Report talks of power shortage and lack of coal, pig iron and cement; it also refers to international factors and the steep rise in the prices of imported raw materials like petroleum products, steel and non-ferrous metals. While these surface issues are laboured there is not even a reference to the primary cause of the industrial stagnation — inadequate industrial investment, particularly in the public sector, stretching over the last eight or nine years.

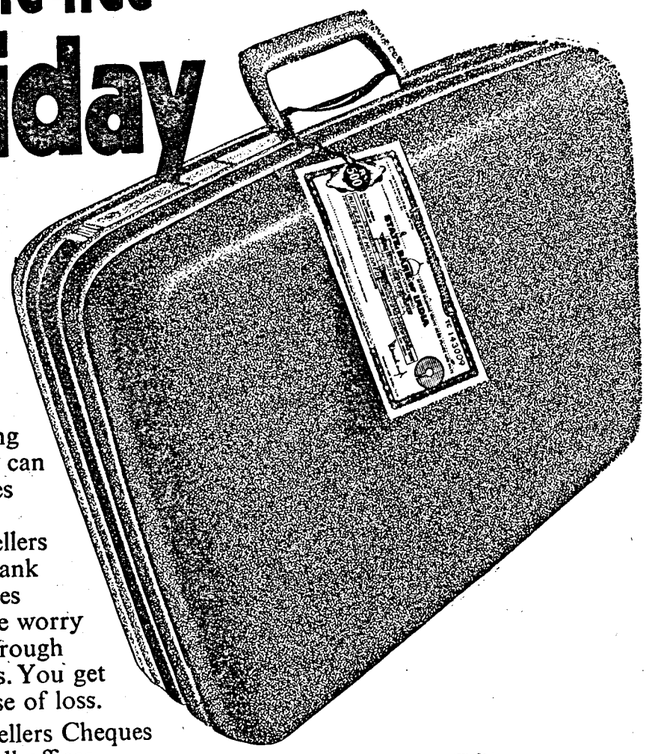
And what does the Ministry of Industrial Development propose to do about the problem? The report has a section dutifully titled 'The Prospect for 1974'; but neither in this section nor elsewhere is there a discussion of policies and programmes to step up industrial growth. What we have are vague ex-

pressions of hope. Thus, "in 1974 industrial production prospects appear, assuming a normal monsoon in 1974, to be better than in 1973". Similarly, the outlook for coal, steel and power is also deemed to be better because "a significant increase in coal production, from 79 million tonnes to around 95 million tonnes is being planned, and steel production is expected to improve from the low levels reached in 1973, by anything between half a million and a million tonnes". These are castles in the air. In the first place, the target of 79 million tonnes of coal production in 1973 is unlikely to be achieved. Second, even if it is a considerable part of the rise in coal output it is likely to be statistical because of, as the Economic Survey points out, "under-reporting of production in the period prior to take-over of non-coking coal mines in January 1973".

Apart from these vague hopes, for which there is no basis, the Ministry appears to pin its faith on the so-called streamlining of administrative procedures for licensing and the like. It has apparently still to dawn on the bureaucracy that the stagnation in industrial investment for the last nearly a decade has had very little to do with administrative procedures. Such restrictions as there have been on paper have in practice been disregarded by industrialists with the connivance of the bureaucracy. The number of industrial licences issued has risen sharply from 221 in 1969 to 363 in 1970 and further to 626 in 1971; in both 1972 and 1973 the number was 596. Similarly the number of letters of intent rose from 331 in 1969 to 438 in 1970 further to 1,015 in 1971; in 1972 and 1973, the number was 877 and 899, respectively. This smart spurt in the grant of licences and letters of intent made almost no difference to the picture of industrial investment — certainly not in real terms. In the circumstances, one would have expected the Ministry to look a little more closely into (i) what proportion of licences have remained unimplemented and why; (ii) who are the parties who have pre-empted the licences; and (iii) what have been the industrial priorities reflected in the licences issued and how far they fit in with the Fifth Plan's priorities. Similarly, it might have been revealing to enquire into the rationale of the over 500 foreign collaboration arrangements approved in 1972 and 1973 together and how they fit in with the objectives of import substitution, technological self-reliance and encouragement of indigenous research and development.

If the Industrial Development Ministry had looked into these matters, it would have found that the answer to the problem of stagnation in industrial investment did not lie in tinkering with administrative procedures. The key element missing was public sector investment though it is in the name of such investment that the Central and state governments appropriate over 70 per cent (about Rs 3,500 crores) of total domestic savings every year. In terms of purchasing power, their aggregate budgetary resources amount to over Rs 14,000 crores or 30 per cent of the national income at current prices. A vast proportion of these resources are dissipated on consumption expenditure. As long as this tendency continues, there can be no hope for industrial investment and employment.

Projects on Paper



It is perhaps too much to expect this degree of perception from a Ministry which gets mixed up over simple facts and maintains that the output of cotton textiles went up in a year when in fact it had declined. But the Ministry's Annual Report might have been a little more illuminating on the performance of individual industrial units under the Ministry. Even this it does not do. Take the instances of the Cement Corporation of India and the Hindustan Paper Corporation which were set up as the answer to the poor investment by the private sector in cement and paper. What has been the performance of these corporations?

Hindustan Paper Corporation was set up in May 1970 and the 1970-71 Report of the Ministry of Industrial Development had disclosed that three projects, viz, the Nagaland paper/pulp project, the Kerala newsprint project and the Assam paper/pulp project had been entrusted to it. The Report had claimed that: "The initial action on the implementation of the above projects has already been started by the Corporation and it is anticipated that appreciable progress would be made during the next year and the orders for the machinery would also be placed during that year. It is expected that the Nagaland and Kerala projects might go into production by the end of 1973-74." Now, three years later, in its Report for 1973-74, the Ministry says, without the slightest trace of guilt, that "the [Nagaland] project has been cleared by the Central Government and the Corporation has already placed orders for plant and equipment. The project ... is expected to go into production by 1977". The position of the Kerala project is worse still. Here the Report says: "The site has already been located and acquisition proceedings are in progress. The raw materials, viz, eucalyptus and reeds have already been tested through mill-scale trials runs and found suitable." This is how the Ministry's Report for 1972-73 had described the position of the project: "The site has already been acquired and preliminary steps have been taken ... Action to place orders for plant and machinery is being taken." In the case of the Assam project, the statements contained in the Ministry's Annual Reports for the two years are even more identical: "The investment decision in this case is expected to be taken very shortly. Necessary preparatory work is already in progress" (page 34 of the 1972-73 Report and page 31 of the 1973-74 Report). The Ministry apparently does not feel called upon to provide any explanation of why major industrial projects under its charge have lagged so far behind schedules. Here at least one hopes that the blame will not be pinned on industrial licensing.

What useful purpose, one wonders, is served by the Central Advisory Council of Industries, with as many as 30 members? Likewise, what is the role of its sub-committee which is supposed to review all industrial licences issued, refused, varied, amended or revoked from time to time and to advise the Central government on the general principles to be followed in the issue of licences, etc?

Finally, is it not time the government admitted the futility of the Sarkar Commission on Large Industrial Houses and wound it up? The Commission was appointed in February 1970 to look into instances of irregularities, particularly those committed by the Birla group, brought out by the Report of the Dutt Committee. The Commission was expected to submit its report in a year. That deadline expired three years ago and now the Commission's term has been extended up to 1975. In the meantime, all the irregularities, lapses and improprieties — such as pre-emption of licences by the large houses, appropriation of a disproportionate share of the assistance extended by the term financing institutions by these houses, etc — flourish with impunity. If nothing else, the pace of growth of the assets of the large industrial houses after the Commission's appointment should make A K Sarkar see the futility of his endeavours.

Take a care-free Holiday

When you're going on a holiday you can leave your worries behind by taking State Bank Travellers Cheques. State Bank Travellers Cheques free you from the worry of losing cash through theft or accidents. You get full refund in case of loss.

State Bank Travellers Cheques are accepted at all offices of the State Bank and at other leading banks. Also, thousands of convenient places all over the country—hotels, restaurants, shops, etc.—displaying this sign, accept the cheques.

WE ACCEPT STATE BANK TRAVELLERS CHEQUES

State Bank Travellers Cheques. The safe, convenient alternative to cash.

Non-Capitalist Path and All That

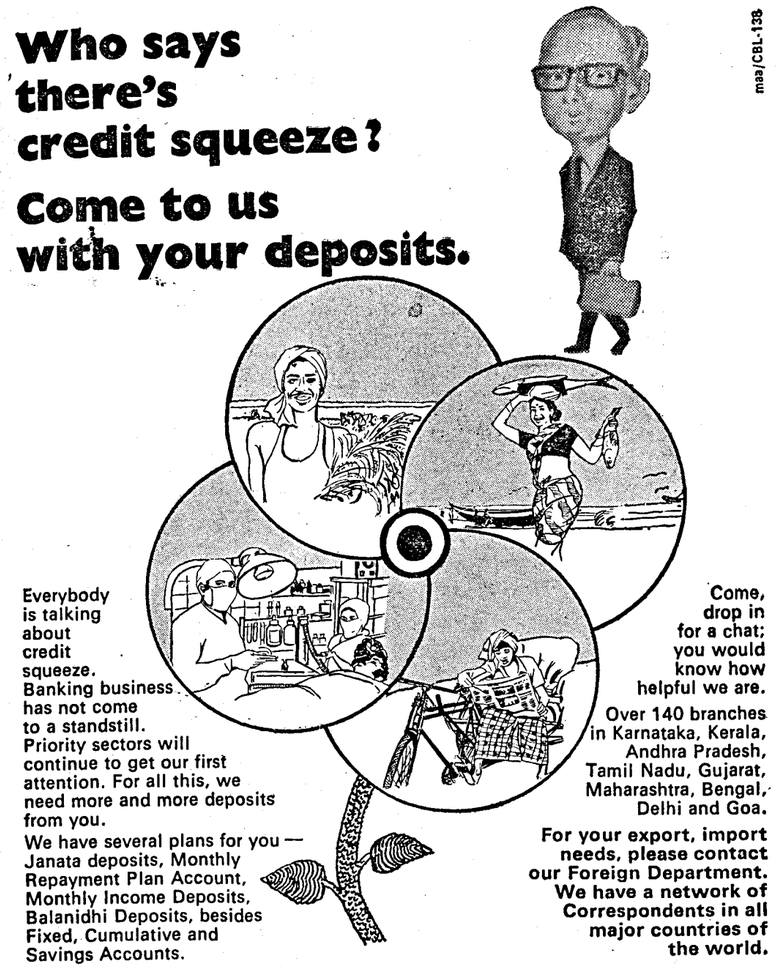
Ranjit Sau

Asian Dilemma: A Soviet View and Myrdal's Concept by R Ulyanovsky and V. Pavlov; Moscow: Progress Publishers, 1973.
Industrialisation of India by G K Shirokov; Moscow: Progress Publishers, 1973.

A TWO-SECTOR dynamic Leontief model for India would have provoked sharp controversy among Indian economists. An application of Samuelson's non-substitution theorem for planning of India's industry would have quickened their heart-beats far more. They would have lapped it up if it were yet another conjecture of Hicks. But the two books under review are not likely to stir even a minor ripple in the tranquil waters of our academic world. And yet these two books in due course may imperceptibly cast their influence on a wide circle of students, intelligentsia and politicians. You may dismiss these books as mere propaganda rubbish wrapped up in the veneer of serious research; but there are others who would canonise these works as the epitome of the correct application of the universal truth in concrete historical specificities. Like it or not, Ulyanovsky, Pavlov and Shirokov have made an interesting attempt to elaborate the line that originated in the 20th Congress of the CPSU in 1956.

Beneath the surface of rumbling details which are occasionally quite revealing there lie embedded pronouncements on such fundamental questions as the class character of the Indian state, the political-economic crisis in India during the late sixties, the split in the Congress party, and the path of transition to socialism for a country like India. These are sprinkled here and there amidst discussion of some other issues, now with the easy abandon of an axiom, now with the confident air of a rigorous theorem. In the first book, Myrdal in effect is but a peg to hang 'a Soviet view' on; and although the canvas in principle extends over the entire South and Southeast Asia it is India which the authors have particularly in mind for it is this country which they claim to "have studied most and know best". The other book is straightaway a study of India's industrialisation, but with an implicit intent to vindicate Soviet formulations with regard to developing countries in the Third World. The two books are mutually complementary. These are the recent harvests of the crop that was sown nearly two decades ago; all the Soviet literature cited there are dated post-1956.

Capitalism Cannot Develop



In the aftermath of the Second World War as colonial outposts fell, one after another, bourgeois intellectuals spun a dream that the Third World would become a reserve, a source of rejuvenation of capitalism. But in the present conditions capitalism is not historically inevitable for newly-free countries in Asia and Africa; nor are they doomed to become an appendage of the world capitalist system. The former colonial countries have opened for them the prospect of avoiding capitalist development during the general democratic stage of the national liberation movement. It is now *possible* for nations with a backward economy and poorly developed social structure to avoid, with the support of the socialist countries, the stage of capitalism in general or the stage of advanced capitalism in particular.

Countries of South and Southeast Asia have a multi-structural society consisting of pre-capitalist as well as capitalist modes of production that is deeply rooted in history. This pattern of society, where archaic traditional relations hold sway in a wide sphere, is not historically unique. Other parts of the world at other times have witnessed multi-structural societies in which economic development, especially on a new organisational and technical basis, was for a long time resisted by the conservative social environment, and was confined within the narrow zone of capitalist relations. In England, for example, prolonged and bloody internecine wars among feudal lords, the break-up of the feudal armed bands, the eviction of millions of peasants from the land, and, lastly, a revolution which beheaded the king were needed to give capitalist progress wide access to the sphere of traditional relations. The uniqueness of the current situation in Asian countries is not in the existence of a socio-economic environment in which the dynamism of the economy is hampered and finally stifled, but in the fact that the problem of pre-capitalist structures has to be solved now in an entirely different world economic context.

The way for the spread of capitalism in Western Europe was cleared with the utmost energetic co-operation of the state that resorted to the most cruel methods. The state went into wars to help establish trans-oceanic trade routes and to enslave millions of colonial people for exploitation; and furthermore at home it brutally forced wage workers to toil for the capitalist employer. Such was the road to primitive accumulation some 200-300 years ago. True, the direct participation of the state in private enterprise was smaller at the dawn of capitalism than what it is today. But this has its explanations. For instance, in those distant times the cost of running an enterprise was practically negligible, and the equipment, management and marketing were simple enough as compared to what they are today in the second half of the 20th century with its unprecedented concentration of industrial production spurred on by the current scientific and technological revolution.[1]

Ulyanovsky and Pavlov are convinced that capitalism can no longer flourish in the countries of the third world. For the state can no more repeat the performances of 18th-19th century Europe in the co-ordinates of today's time and space. The states of South and Southeast Asia cannot venture to colonise Europe and America; nor can they force the workers to toil for the capitalist at low wage rate. Workers are far more united and militant. Their wage rate is already much too low which cannot be reduced further without "a crippling deterioration in the conditions of its [worker's] reproduction". Moreover, they are under "the tremendous influence exerted by the 'demonstration effect', i e, by the achievements of the working people of the socialist countries and also by the democratic and social gains won by the working class in developed capitalist countries".

Believe it or not, Ulyanovsky and Pavlov are saying that (a) the lack of colonies and (b) the refusal of workers to accept lower wages are the two fundamental hindrances to the development of capitalism in South and Southeast Asia. But didn't Lenin prove that colonies are not an essential pre-

requisite for the development of capitalism?[2] Isn't it a fact that in countries like India the real wage rate of agricultural and industrial labourers has been declining over the years? Isn't it true that the share of wages in net output is sliding down? Irrespective of whether wage rate is going down in fact or not, the crux of the matter lies in the volume of surplus value that can be realised, which in turn depends partly upon the productivity of labour, that is, technology. To regard the workers' struggle for higher wages as an obstacle to the growth of capitalism, as Ulyanovsky and Pavlov have done, is tantamount to betraying ignorance of the actual data about wages in particular, and of the dialectics of development of capitalism, in general.

In South and Southeast Asia, the economy has fallen into the clutches of monopoly capitalism, domestic as well as foreign, and semi-feudalism.[3] This is the fundamental factor which stands in the way of the growth of independent, competitive capitalism. Ulyanovsky and Pavlov indeed would not concede this formulation, because in that case their entire thesis with regard to the class character of the state in the third world, and the corresponding path of transition to socialism would fall apart.

Class Character of the Indian State

One of the most controversial issues in the Indian left movement is related to the class character of the Congress party, the Congress government, and the state of India. The origin of the split in the Communist Party of India in 1964 can be traced back to debates over the nature of the Mountbatten Award in 1947 and the policy towards the Nehru Government thereafter.[4] Shirokov however flatly announces that "after the country [India] had won independence, the *national bourgeoisie* took over the reins of government" (emphasis added). To him it is an axiom; so he does not care to substantiate this proposition with an analysis of the then Indian situation.[5] This axiom is the prism through which he looks at India, and consequently ends up with a distorted view.

Having come to power on the morrow of independence the national bourgeoisie, continues Shirokov, immediately recognised the tremendous gap that existed between its political strength and economic weakness. Since so many landlords, rajahs and other representatives of the old feudal classes still remained and since the position of foreign capital was strong, the only way for the national bourgeoisie to consolidate its position as the ruling class was by accelerating the development of modern capitalism. This then brought industrialisation to the fore. Such an aim could be accomplished with the help of extraordinary and long-term measures, including first and foremost the delegation of exceptional rights to the government in the development of the economy and direct control of social reproduction. Thus state capitalism in its present form was born in India. In addition to direct investment in an extensive area of economic activity the state came to exercise controls over private investment through licensing policy and other means. Shirokov is sure that all this was intended to serve the interests of the national bourgeoisie. But alas, between intentions and implementation the gap kept on yawning. The big bourgeoisie reaped what the national bourgeoisie had sown, agrees Shirokov. But he does not bring himself up to ask: why and how could this happen if the national bourgeoisie alone is fully in power?

We are told that "the Indian government intended to harness the influx of foreign capital in the interest of national entrepreneurship". Mid-fifties is a sort of watershed in respect of foreign capital and foreign aid to India. It is claimed that the agreement with the Soviet Union marked the beginning of a new phase. This agreement boosted industrial construction and, in addition, compelled the capitalist countries to revise the principle on which their economic aid to India was based. Soviet aid was interpreted as a challenge to capitalist countries and a specific form of struggle between socialism and capitalism. For this reason all the leading capitalist countries began in the years following 1956 to extend economic aid to India. The terms were made easier, interest rates reduced and the time limits for repayment of credits extended.

Meanwhile there was also a qualitative change in the operation of the foreign monopolies in India. Their position in the Indian market was threatened by the opportunities of assistance from the socialist countries in the construction of enterprises in the public sector and in supply of equipment to the private sector. The economic recovery in some capitalist countries including West Germany, Japan, France and Belgium, sharpened the competition in the world market and forced them to seek new ways of penetrating the Indian economy. But India's foreign exchange reserves were exhausted and, besides, in 1958 the Indian government introduced rigid controls over imports. Foreign monopolies had thus to review their policies towards India. They gradually reduced exports and started the production of commodities within India. The average annual sum of foreign investments rose from Rs 233 million in 1948-1955 to Rs 266 million in 1956-61. The targets of investments also changed: in 1956-1961 industry accounted for 92.4 per cent of the overall foreign investments as compared to only 46.6 per cent in 1948-1955.

Shirokov then argues that the Soviet aid triggered off the process which led to sharpening contradictions among the Indian bourgeoisie. The foreign firms and governments were mostly interested in setting up large enterprises, particularly in the new industries where the capital intensity was high. Their partners were therefore in the main representatives of the local monopolies or of big business. Most mixed companies were founded jointly by foreign and Indian monopolies. This collaboration was most advantageous to both. The concentration of capital and production in India was thus considerably stimulated. The nature of competition in the domestic market thereby underwent a basic change. Previously, competition had been between foreign and Indian entrepreneurs, but thenceforth it involved the local as well as foreign monopolies on the one hand, and the weaker section of the national bourgeoisie on the other. That is to say, the contradictions in the ranks of the Indian bourgeoisie got aggravated, thanks to Soviet aid to begin with.

Here is another instance where Shirokov merely asserts a point of view without adequate supportive evidence; and does not care to mention that the issue yet remains open to controversy. There is, for instance, a rival 'Chinese thesis' that after 1958 the Indian Government, i e, the Indian bourgeoisie began to lose its independent character.[6]

The national bourgeoisie in India is trying to strengthen its economic base in proportion to its political supremacy. Aid from socialist countries is paving the way for the success of the national bourgeoisie in its struggle against the monopolies, domestic as well as foreign. As a concomitant to this grim battle, the contradictions between these two antagonistic classes are becoming all the more acute. This is how Shirokov portrays the Indian scene. But in fact there are objective indicators to the contrary: the 'middle' bourgeoisie

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS.
PROGRAMME HEREUNDER IS BEING ISSUED IN COMPLIANCE WITH THE PROSPECTUS AND APPLICATION FORMS FROM THE REGISTERED OFFICE OF THE COMPANY OR FROM THE BANKERS, BROKERS OR UNDERWRITERS TO THE ISSUE LISTED IN THIS ANNOUNCEMENT.
PUBLIC ISSUE OF 10,000,000 FULLY PAID 8½% FIFTH CENTRAL SHARE DEPARTMENT AT 36-38, BANK STREET, FORT, BOMBAY 400-023 OR FROM THE
OF Rs. 100 EACH AT A PREMIUM OF Rs. 100 PER SHARE AGGREGATING Rs. 20 CRORES
ANNOUNCEMENT REGARDING THE ISSUE OF 10,000,8½% FIFTH DEBENTURES OF Rs.1,000 EACH OF A TOTAL VALUE OF Rs.1 CRORE
(DECLARED BY THE GOVERNMENT OF MAHARASHTRA AS 'PUBLIC SECURITIES' UNDER SECTION 2 (12) (d) OF THE BOMBAY PUBLIC TRUSTS ACT, 1950).

THE ANDHRA VALLEY POWER SUPPLY COMPANY LIMITED

(Incorporated as a Public Company on 31st August 1916, under the Indian Companies Act, VII of 1913).
REGISTERED OFFICE Bombay House, 24 Homi Mody Street, Fort, Bombay 400 023 [illegible]

EXISTING AND PROPOSED ACTIVITIES:
The Company was formed in 1916 with the object inter alia of acquiring, taking over and working the Andhra Valley (Hydro-Electric) Licence, 1919 and of establishing an Electric Power, Light and Supply Company in all its branches.

The three Tata Electric Companies, viz. The Tata Hydro-Electric Power Supply Company Limited, The Andhra Valley Power Supply Company Limited and The Tata Power Company Limited function for all practical purposes as an inter-connected grid and the Tata Electric System is one of the principal electric power systems in India. Energy in bulk is supplied to textile mills, railways, the suburban area and local authorities including Bombay, the surrounding areas. The generating capacity of the three undertakings at the hydro generating stations is 73 MW, 72 MW and 132 MW respectively.

In addition, in order to meet the growing demand for power in the area of supply, the Companies have, from time to time, constructed a modern Thermal Generating Station consisting of three units of 50/62.5 MW each and a fourth unit of 150MW capacity. A new Receiving Station at Carnac was also brought into service in 1967 in order to feed Southern Bombay, which greatly facilitated the distribution of power in this area. The Electric System has thus a total installed capacity of 454 MW and the electric energy sold during 1972-73 was of the order of 8,709 million units. The said Trombay Thermal Station and the Carnac Receiving Station were jointly financed by the three Companies in the ratio of 20 : 30 : 50 respectively partly with the assistance of loans from the International Bank for Reconstruction and Development (World Bank) and the U.S. Agency for International Development (AID).

The Three Companies have been undertaking a continuous programme to improve, rehabilitate and modernise their receiving, distribution and transmission facilities with a view to ensuring efficient, reliable and economical supply of electricity at reasonable rates to their consumers in the area. The demand for electricity in the area served by the Tata Electric System has been increasing steadily and the increased demand is being met by the Companies through the purchase of a larger quantum of power from the Maharashtra State Electricity Board. In order to provide the maximum generation, transmission and distribution of which the system is capable, the Companies have undertaken a constant programme of rehabilitation and modernisation of their generating, transmitting and distributing facilities. They have to remodel their existing receiving stations so as to enable them to meet the present day requirements.

The Companies have therefore taken on hand a capital expenditure programme for a four year period from 1972-73 to 1975-76. The total expenditure during the said period is likely to be of the order of Rs. 1,381 lakhs of which the share of the Andhra Valley Power Supply Company Limited would be approximately Rs. 389 lakhs. The proceeds of the present debenture issue will be utilised for financing a part of the capital expenditure incurred and planned to be incurred during the said period.

LOCATION OF THE GENERATING STATIONS:
The Company's hydro-electric undertaking is located at Bhivpuri, Dist. Kolaba, Maharashtra. The thermal generating station is located at Trombay near Bombay.

BOARD OF DIRECTORS:
Mr. Naval H. Tata *(Chairman)*
"Tata House", Waudby Road, Fort, Bombay 400001.
Industrialist

Mr. K. M. D. Thackersey
"Menka" Block 'A', (Pelit Hall Compound), 15th Floor, Flat No. 151, 66, L. Jagmohandas Marg, Bombay 400 006.
Millowner & Merchant

Mr. C. H. Bhabha
49, Cuffe Parade, Bombay 400 005.
Banker & Company Director

Mr. Ramkrishna Bajaj

OPENING AND CLOSING DATES OF SUBSCRIPTION LIST:
THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON TUESDAY, 23RD APRIL 1974 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON THURSDAY, 2ND MAY 1974 OR EARLIER AT THE DISCRETION OF THE DIRECTORS, BUT NOT EARLIER THAN THE CLOSE OF BANKING HOURS ON WEDNESDAY, 24TH APRIL 1974.

APPLICATION FOR DEBENTURES:
Applications for debentures now offered for public subscription may be made only by residents in India and must be for a minimum of Debentures of Rs. 1,000 (Face Value) and in multiples thereof. Applications must be made in single names only and not in joint names and an applicant should submit only one application for the total number of Debentures required. Applications in joint names and multiple applications are liable to be rejected. Application forms duly completed must be delivered together with the full amount payable at any of the following offices of the Bankers to the Issue:

STATE BANK OF INDIA at its main offices at Bombay, Calcutta, Madras and New Delhi.

CENTRAL BANK OF INDIA at its main offices at Ahmedabad, Bangalore, Bombay, Calcutta, Hyderabad, Indore, Madras, Nagpur, New Delhi, Panjim, Poona and Surat.

PROJ/151/74

in India is extremely weak, and is constantly losing ground to the monopolies. The process of *differentiation* of the bourgeoisie is on; but the middle bourgeoisie is falling more and more into the hands of the foreign monopolies for shelter and protection.[7]

To continue with Shirokov, his third major point is quite interesting. It is in relation to the economic crisis in mid-sixties and the power struggle of 1968-69. By contrast with his two earlier propositions which are essentially axioms as it were, it is as if he now has a *rigorous theorem*. The economic crisis which overtook India since 1965 was due to two things: first, the multi-structural pattern of the economy where a large sphere such as agriculture is under the sway of pre-capitalist production relations, and hence cannot respond to the demands of an increasing tempo of industrialisation; and second, the capitalist path followed by the national bourgeoisie in industry which has inevitably resulted in uneven, disproportionate growth among various sectors of industry. Mining, for instance, is lagging behind manufacturing; within manufacturing again, metallurgy is way behind other branches. If you want proof, see the annual growth rates of output; Shirokov has provided a table on this for your ready reference.

Now, the power struggle and finally the split of Congress. The course of economic development in the second half of the 1960s signified that in conditions of a mixed economy state entrepreneurship had in a way reached its qualitative peak. Further progress could be made only at the expense of the big bourgeoisie and such development depended on the balance of class forces. With the general rise of the democratic movement the contradictions and political struggle between the various sections and groups of the bourgeoisie had become more intense. In the showdown which lasted from 1967 to 1970 the monopolies suffered a setback. The biggest commercial banks and insurance companies were nationalised, and foreign trade, the import of raw materials in particular, was gradually taken over by the government. These measures tend to reduce the capital accumulation of monopolies and their influence in the economy, and at the same time create far more favourable conditions for the development of the lower sections of the bourgeoisie. So believes Shirokov.

In short, the national bourgeoisie in India is marching ahead on the road of independent capitalist development, independent from the domestic monopolies and foreign imperialism. This class has proved its mettle in the fire of the acute crisis as of 1967-1970. This is the cardinal premise, assumption, or if you like, conclusion, of Shirokov. But he hastens to add that such a path of development is bound to be uneven and prone to periodic ups and downs. On the one hand, he welcomes the policy measures adopted by the Indian National Congress since 1969-70; to him the Congress is a party of the national bourgeoisie which is engaged in promoting capitalism from below. The government support of small-scale capitalist enterprises in industry and agriculture, he argues, is a way of encouraging the development of capitalist relations. The petty capitalist entrepreneur is quite willing to adopt relatively modern techniques; the same is true of the capitalist farmer involved in the "green revolution", though not to the same extent. In the circumstances government support of petty capitalist enterprise will raise the national level of labour productivity, boost the domestic demand for producer goods and widen the opportunities for industrial development. So the process of capitalist integration will be intensified and the present weak sectors will catch up with the large-scale industries. Shirokov is confident that this will be better for national economic development. But then he also has some words of caution as follows.

Against the background of sharp competition from the modern big capitalists and monopolists, the large scale of relatively independent operations of the lower forms of capital (that is, trade-and-money-lending-capital) which expropriates a big proportion of small-scale production, the policy of quickly forming a wide layer of petty capitalist entrepreneurs involves great government expenses. The funds for the purpose can be raised only by the redistribution of the incomes of millions of direct producers in town and country. So the formation of the second echelon of India's ruling class of national bourgeoisie is a heavy burden on the mass of the population. The redistribution of material and financial resources in favour of small-scale entrepreneurship can temporarily slow down the technical and economic progress in large-scale industry, whether private or public. The result of this may well be that the standards of India's industry will increasingly fall behind world levels, thus leading to a drop in exports which, in turn, would cause a deficit in the balance of payments. Hence this policy can be conducted only if there is an influx of foreign resources. On balance, Shirokov therefore appears to recommend a "neither-big-nor-small capitalist path", that is a "middle capitalist path", for India's economic development. Or, is it the "non-capitalist path"?

Non-Capitalist Path and Intermediate Regime

The concept of so-called non-capitalist path continues to remain hazy in its operational content as well as theoretical foundation. Reportedly the Soviet Central Asia, the Mongolian People's Republic and the Democratic Republic of Vietnam have already travelled along this path; but the journey was under the guidance of the ruling Communist Party. It is claimed that the idea of non-capitalist development has been applied and has become a promising political trend mainly in the African countries and partly in Asia. As for the Asian countries which are approaching the average level of capitalist development and, even more so, Latin America, where many countries have already reached that level, the idea of non-capitalist development is hardly if ever advocated and, as a rule, has quite a *different connotation*. In India capitalism has already developed to a significant extent; hence there is no longer any question of by-passing capitalism. The task is now to regulate, contain and channelise, the advance of capitalist relations. However, the transition of India to *socialism is predicated* upon its following its own specific version of the non-capitalist path.[8] This is 'a Soviet view', which is energetically shared by some in India.

The non-capitalist path of development is proclaimed to be the essence of 'national democracy', economically, politically and culturally, in order to reach the goal of socialism. The national-democratic revolution is not the same as the bourgeois revolution because it is led by middle intermediate strata, with the *support* of the working people. It would work wonders in the poor, developing countries. So we heard as early as 1957, and have heard ever since.

One may immediately come to the conclusion that perhaps the concept of national democracy with its non-capitalist path of development can be identified with what Kalecki in 1964 called the 'intermediate regime'.[9] But certainly it would be unwarranted. For Kalecki clearly sounded the note of warning

that an intermediate regime, if anything, tends to be rabidly anti-working class, anti-communist; he referred particularly to the blood-bath of September 30, 1965 in Indonesia as an example. Kalecki categorically pointed out that a powerful communist party is an "anomaly" in an intermediate regime. The champions of the national democracy and non-capitalist path should note carefully that the middle stratum is a vascillating class with many a link with the big bourgeoisie.

In the concrete situation of India is the middle class anti-feudal, anti-monopoly as well as anti-imperialist; and at the same time are the class interests of this group in contradiction with those of workers and poor peasants?[10] Or, is it opposed to the feudal remnants, monopoly and imperialism, but potentially an ally of workers and poor peasants?[11] Or, does it subserve the vested interests of feudalism, semi-feudalism, monopoly and imperialism, in sharp opposition to the cause of the working class?[12] Well, how significant and strong is this group? Where does the middle class stand in relation to the exercise of state power? Questions such as these are to be objectively analysed, before the non-capitalist path of transition for India towards socialism can be meaningfully discussed. The two books under review are relatively strong in putting forward 'a Soviet view', but weak in respect of the required analysis.

These two additions to the list of books on India's economic development are nonetheless welcome, primarily because of their bold attempt, no matter however mistaken, to view the process of economic growth in the perspective of class relations.

Notes

1 A rough calculation suggests that the average cost of total capital in a single typical industrial operation in France during the nineteenth century was about the same as six to eight months' wages of an average worker; in England it had been even less. The corresponding figure in the developing countries today is of the order of three hundred and fifty months' wages. This is to say, the cost has gone up by over fifty times. Optimal Targets for the Family Planning Programme

S K Satia

C Rangarajan

Benefits and costs associated with family planning programmes of underdeveloped countries in general, and of India in particular, have been a subject of intensive investigations. These studies have been primarily used as a means for the justification of family planning programmes.

In this paper, we have applied benefit-cost analysis to derive the economically justifiable targets for Indian family planning programmes. The targets are defined in terms of desired declines in general fertility rates (GFR). A demographic and economic model similar to Coale-Hoover is constructed to evaluate the economic consequences of different GFR paths.

The cost-equations based upon the past data are used to estimate the costs of achieving various GFR paths. Benefit-cost analysis is used to compare these paths and derive optimal targets.

The study shows that the benefit-cost analysis results are very sensitive to the type of economic benefits considered. Interest rates and horizon periods also effect the optimal targets.

The analysis is then used to discuss the interactions among per capita consumption distribution, measures used and suggested to achieve declining fertility rates and financing of family planning programmes. It is stressed that a massive programme to reduce fertility rates may not achieve credibility unless steps are taken to achieve a greater equality in per capita consumption distribution.

I

Desirability of Birth Control

THE desirability of national birth control programmes for the developing countries has been established beyond doubt. India's family planning programme is expected to play a crucial role in the nation's development. The benefits resulting from these programmes and the costs incurred by the programmes have been a subject of intensive investigations.

Coale and Hoover,[1] in one of the pioneering attempts, investigated the effects of different rates of fertility declines in India. They constructed a demographic and econometric model for India. Using the model, they showed that declines in fertility rates will significantly affect the per capita income.

The case for 'Birth Control Programmes' has been made by Enke[2] who has supported the case by constructing a set of increasingly sophisticated models of a typical underdeveloped country to evaluate the economic consequences of declines in fertility rates. The investments in these programmes are shown by him to be superior to other investments, in terms of their resulting effects on per capita income.

Attempts have been made by Simon,[3] Repetto,[4] Simmons[5] and others to evaluate the discounted value of a birth averted in India.[6] These estimates range from Rs 1,000 to Rs 8,000 per birth averted. Such a wide variation, in the estimated value of a birth averted, is due to differing assumptions regarding the measurement criterion of the benefits and the parameters used in the models such as discount rates and the time horizons considered.

Myrdal,[7] and Liebenstein,[8] argue against the benefit-cost analysis of family planning programmes. Liebenstein raises the question of whose viewpoint should be used in the benefit-cost analysis. The usual benefit-cost analysis looks at the national economic consequences, whereas the actual decisions and their consequences are felt by the individual families. The possible conflict between social and private benefits and disbenefits needs to be resolved. Discounting further complicates the issue by linking present generations with future generations. Myrdal argues that it is very difficult

to specify the exact amount of benefits. The attempts to construct quantitative models were abandoned by him in favour of qualitative discussions.

The Government of India uses an estimate of Rs 1,500 as the discounted value of a birth averted.[9] Past experience indicates that the average cost per birth averted is approximately Rs 125. This would imply a benefit-cost ratio of 12 at the present level of family planning programmes.

While it has been established beyond doubt that the family planning programmes are desirable, the optimal targets of these programmes have not received much attention. We investigate, in this paper, the economically justifiable targets for the Indian family planning programme using benefit-cost analysis. The targets are defined in terms of desired declines in general fertility rates.

The methodology of investigation is described in Section II. A reworked Coale-Hoover model is used to evaluate the economic consequences of different paths of declines in general fertility rates in Section III. The estimates for the births that need to be averted under these paths are derived in Section IV, using a demographic model. Section V discusses the discounted economic value of a birth averted. The sensitivity of this estimate with respect to the measurement criterion, interest rates and horizon length are discussed. Cost equations based upon past experience are presented in Section VI. Section VII compares the benefits and costs of the differents paths. The implications of the results obtained by benefit-cost analysis are discussed in Section VIII. Finally, a summary is presented in Section IX.

II

Methodology of Investigation

Definition of Different Targets:

The targets for a family planning programme are usually defined as the desired 'general fertility rate' (i e, number of births per thousand of population between the ages of 15 and 44) or GFR at the end of a certain period. But the benefits and costs also depend upon the path taken to reach the targets. Therefore, a targeted fertility decline path should specify GFR for each year t in the planning horizon. There are an infinity of such GFR paths. However, we limit ourselves to the GFR paths with the following characteristics:

(a) The fertility rate stabilises by the year 1985.

(b) The fertility decline occurs at a linear rate.

TABLE 3 : POPULATION ESTIMATES, 1986 TO 2001

GFR Path	Birth Rate Per Thousand		Total Population in Year		Equivalent Consumer Population	
	1971	1986	1986 (million)	2001 (million)	1986	2001
195-195 Uncontrolled fertility	41	40	836	1299	682	1059
179-179 Present rate	38	37	804	1202	661	987
179-160 Very high fertility	38	34	783	1117	648	927
179-142 High fertility	37	31	763	1039	637	871
179-120 Medium fertility	37	27	738	948	622	805
179-100 Low fertility	37	23	716	867	608	747
179-80 Very low fertility	37	19	694	790	595	690

Notes: (1) The uncontrolled fertility level is assumed to be 195 per thousand and the available evidence indicates that the GFR has declined to 179 per thousand by year 1971.

(2) The Registrar General has also made population projections but these projections were made prior to 1971 census and use a higher figure of 561 million as the initial population in 1971. Besides, we need population projections for each year for several GFR paths. Hence, we constructed this model. The projections made by this model and the comparable projections made by the Registrar General agree closely after providing for the initial population correction.

Method of Comparison between Alternative Paths:

Each GFR path k implies different national income projections $Y_t(k)$ and different numbers of consumers, C_t (k) sharing these benefits in each year t. A lower GFR path, as is well known, leads to a higher level of income and a smaller population. In discussing the effects of family planning programmes, two types can be distinguished: Those arising from increased availability of aggregate consumption — the aggregate consumption effect — and those arising from increased consumption being shared by fewer consumers — the per capita consumption effect.

The measurement of these benefits would be as follows: Consider two GFR paths A and B. The national income differences between these two paths in year t is $Y_t(B) - Y_t(A)$. However, some portions of this increased wealth is reinvested and consequently only the remaining portion is available for consumption. We have estimated[10] that 25 per cent of the national income will not be available for private consumption. Hence[11] the aggregate consumption effect in year t is 0.75 $[Y_t(B) - Y_t(A)]$. The per capita consumption effect is 0.75 $[Y_t(B) - (Y_t(A) \times C_t(B)/C_t(A)]$.

Different GFR paths also imply different amounts of family planning programme effort necessary to avert the births — and consequently different expenditure levels. As it takes several years for benefits to be realised after expenditures have been incurred, we have to discount benefits and costs. The discounted benefits and costs can thus be evaluated for each linear GFR path as compared to 'uncontrolled fertility'. Whereas investments will be justified if the benefits exceed costs, the optimum level of investment can only be determined by comparing marginal benefits and marginal costs of successive GFR paths. Marginal costs increase and marginal benefits decrease with increasing family planning programme efforts. The GFR path, for which the marginal costs equal marginal benefits, is the optimal GFR path. Figure 1 is a schematic representation of the methodology.

The discounting procedure, and the rates are controversial issues. Our attitude here is that the value of rates should be determined by 'cost of capital' depending upon current borrowing costs and 'opportunity cost of money' as measured by the returns from other investments. The analysis is performed for several values of interest rates. Another issue in evaluating the benefits and costs is the planning horizon which should be considered. As the planning horizon gets longer, the benefits of a GFR path also increase. Since it is difficult to decide on a value for this horizon, we carry out the analysis for several values ranging from 20 to 50 years.

III

Economic Model

In this section, we describe a reworked Coale-Hoover model to evaluate economic consequences of differential fertility patterns. First, the Coale-Hoover model is described.[12] The model structure and parameters are then compared with the actual data for the period 1956 to 1966.[13] Based upon this comparison, new values of parameters are estimated. This reworked model, in conjunction with a demographic model, is then used to estimate national income and economic effects of different GFR paths.

Description of Coale-Hoover Model:

The Coale-Hoover model is built on the assumption that the major cause of income growth is investment or as they call it the 'equivalent growth outlays' which is a measure of total investment adjusted for the varying degrees of productivity of its components. The two major components are investments in capital goods and welfare type outlays, the former being more productive than the latter. The capital-output ratio determines the income growth given the equivalent growth outlays. The size of the population and its rate of growth are introduced as two specific variables which have an impact on the composition and level of investment — and, therefore, on rate of growth of income. A low fertility rate leads to a faster increase in income due to two factors. One, it leads to a larger volume of saving and investment; two, a greater proportion of the investment is directed to high productivity capital goods type as opposed to the welfare type expenditures.

The basic structure of the Coale-Hoover model is as follows:

Total public expenditures plus net monetised private investment (F) in any year is assumed to depend upon national income (Y) and the equivalent consumer population (C)[14]

$$F = aY - bC$$

The F-expenditures consist of two components: direct development expenditures (D) and welfare-type outlays (W). W outlays are assumed to contribute less directly (and hence less strongly) to raising national income as compared to D-outlays.

$$F = D + W.$$

The welfare-type outlays, or W-outlays, will meet the needs of both the existing population (W_C component) and the needs of current increment of population (W_I component).

$$W = W_C + W_I$$

W_I expenditures involve setting up expenses to continue to maintain the welfare level implied by W_C expenditures. The W_I-expenditures will depend upon the ratio (p) of annual population increment to current population.

$$W_I = (10\ p)\ W_C.$$

Over a long period, the demand for welfare-outlays (W_C) will be based upon what people can afford and are hypothesised to absorb a constant percentage of national income, i e,

$$W_C = 0.0725\ Y$$

The equivalent growth outlays (G) are the sum of direct development outlay (D) and the effect of W_C and W_I expenditures. Since W-outlays are

TABLE 8: PER CAPITA INCOME INDICES PROJECTIONS

TABLE 10: PER CAPITA CONSUMPTION BENEFIT PER BIRTH AVERTED AT 10 PER CENT DISCOUNT RATE, AT 1961 PRICES

GFR Path	Average Benefit over Uncontrolled Fertility Path (195-195) Per Birth Averted for a Horizon of				
	10	20	30 (Years)	40	50
179-179	710	1660	2700	3680	4560
179-160	650	1510	2500	3560	4490
179-142	620	1450	2470	3520	4470
179-120	600	1400	2430	3500	4480
179-100	580	1380	2420	3500	4490
179-80	570	1370	2420	3520	4500

shared by total population, only that portion expanded on current labour forces will cause a change in productivity and consequently an increase in Y. Therefore,

$$G = D + (e_C W_C + e_i W_i)_t L_t + (e_C W_C + e_i W_i)_{t-15} (1-L)_{t-15}$$

Where e_C and e_i respectively, are the weights assigned to W_C and W_I outlays. The capital-output ratio R is assumed to depend linearly on t giving.

R=m + nt, where m is the initial value and n is the rate of change of capital output ratio.

Finally, $Y_{t+1} = Y_t + G/R$.

Validation of the Model:

The robustness of the Coale-Hoover model was tested by comparing the actuals of the national income with the values predicted by the model for the period 1956-1967. The actual population figures and the following values of the parameters were used to predict national income,

e_C =0.5, e_i =0, m=3.0, and n=0.02.

The comparison is presented in Table 1. The comparison reveals that the actual and predicted values agree well for the first five years. But, for the subsequent years, the model consistently underestimates. We therefore compare actual direct developmental expenditures with the predicted developmental expenditures in Table 2. Since the actual F-outlays and D-outlays are substantially higher than the values projected by the model, the parameters need to be re-estimated.

Modification of the Model:

While retaining the basic structure of the Coale-Hoover model, we have made some changes in deriving the equivalent growth outlays. The F expenditures were defined by Coale and Hoover to include total public expenditures and net monetised private investment. We felt, however, that, from total government expenditures, we should exclude all administrative expenditures as these could be said to contribute directly to increased national income. We also follow a slightly different procedure for making an estimate of direct developmental expenditures and welfare type expenditures.

The total government expenditure and the net monetised investments were estimated as a proportion of the national income.[15] An examination of these outlays during 1956 to 1971 shows that these expenditures increased to 25 per cent of the national income. We make an assumption that it will stabilise at this level. The welfare and administrative expenses do not seem related to the national income. For instance, in 1966, the national income declined, whereas welfare and administrative expenses showed an increase. Therefore, we regressed welfare (W) and administrative expenses (A) on the equivalent consumer population (C). The equation is estimated to be

(W + A)=49.11C, where W and A are measured in 1952 prices.

Since the direct developmental expenditures (D) are equal to the total governmental expenditures plus net monetised private investment less welfare (W) and administrative expenses (A), the equation[16] relating D to Y and C is given by

D=0.25Y — 49.11C.

Since welfare expenditures are treated as purely a function of equivalent consumer population, we regress W on C to obtain the following relationship:

W=18.14C.

Using the values of welfare outlays W and population increment p, the W_C and the W_I components can be calculated using Coale-Hoover relationships. The weight e_i assigned to W_I expenditures used in computing equivalent growth outlays was assumed to be zero as in the Coale-Hoover model. The predicted and actual national income was compared for several values of e_C, the weight assigned to W_C expenditures. The best value of the parameter e_C was derived as 0.2.

Regarding the capital output ratio,[17] we use the Coale-Hoover formulation that it will be 3.0 + 0.02t. Thus, the model we used to estimate the economic benefits arising from different rates of population growth is as follows:[18]

$$D_t = 0.25\ Y_t - 52.577\ C_t \quad (1)$$

$$W_t = 19.424\ C_t \quad (2)$$

$$W_t\ (W_C)_t + (W_I)_t \quad (3)$$

$$(W_I)_t / (W_C)_t = 10p_t \quad (4)$$

$$G_t = D_t + e_C\ (W_C)_t\ L_t + e_C\ (W_C)_{t-15}\ (1-L)_{t-15} \quad (5)$$

$$R_t = 3.0 + 0{\cdot}02t \quad (6)$$

$$Y_{t+1} = Y_t + G_t/R_t \quad (7)$$

IV

Population Model

In projecting the population levels under various GFR paths, we have followed the component projection method which was the basis of Coale-Hoover projections also. The life tables need to be estimated for this purpose. We have modified the life tables used by Coale-Hoover. They assume that the survival probabilities of the age group 0-5 will increase and that the survival probabilities of other age groups will remain constant during 1971 to 1981. This leads to an estimated mortality rate decline from 13.4 in 1971 to 12.5 in 1981. However, projections made by the Registrar General of India imply a decline in mortality rate from 13 to 10 during that same period. To reflect this reduction, we have assumed that this decline will occur by a proportionate increase in survival probabilities for all age groups and have modified the Coale-Hoover life tables accordingly. The 1971 Census estimates population in that same year to be 546 million and we have used this as an estimate of the initial population.

Table 3 shows the projections made by using the model. It can be noted from this Table that even a high fertility reduction from GFR of 179 to 80 will lead to an increase in population from 546 million in 1971 to 694 million in 1986. The reduction in GFR to 40 by year 1985 is necessary to stabilise the population at 650 million by that time.

Births to be Averted:

Undoubtedly, an increasing number of births must be averted as a higher decline in fertility rate is desired. However, the number of births to be averted in a year between any two GFR paths is not obtained by taking simply the difference between the population levels in that year according to the two paths. The calculations of births averted in each year between two GFR paths involves three steps. First, the age-sex composition of the population at the beginning of the year, for the lower GFR paths, is estimated. Second, the number of births with the higher GFR and the lower GFR is estimated for this population. Third, the births averted is the difference between these two estimates of the number of births.

Following the above procedure, we have indicated in Table 4 the number of births that will have to be averted by the family planning programme in India for various GFR paths.

Notes: Sterilisation = 1.7 births prevented over 10 years.
IUCD = 0.7 births prevented over 5 years.
Conventional contraceptive couple year of protection = 0.15 births averted.

V

Benefits

In this section, the economic benefits of different GFR paths is examined. The basis for estimating the benefits is the model already outlined in Section III.

Income Projections for GFR Paths:

The national and per capita income for different GFR paths are presented in Tables 5 through to 8. Figure 2 is a graph of national income and per-capita income over time for present fertility rate (GFR path 179-179) and very low fertility rate (GFR path 179-80).

The difference in national income between the highest and the lowest fertility paths is only Rs 2.5 billion by 1981. This difference increases to Rs 23 billion or 5 per cent of the national income by 1991. Thus, the effect of family planning programmes on the national income is not significant for the next 20 years. These effects become significant only at the end of 40 years.

However, the impact of a successful family planning programme on the per capita income is striking. The per capita income due to a fertility decline of 55 per cent over the next 15 years (i e, GFR path 179-80) is higher by 12 per cent in 1981, 50 per cent 1991 and 90 per cent by 2001 over the per capita for uncontrolled fertility rate. Whereas, in the absence of any further decline in fertility rate, the per capita income only increases by 85 per cent during 1971-2001, a successful family planning programme will increase it by 200 per cent during the same period.[19]

Benefits Per Birth Averted:

Several estimates have been made of the benefits or value of a birth averted in the Indian context. (S Enke and R Zind,[20] Repetto,[21] Simon,[22] Simmons[23].) These estimates range from Rs 1,000 to Rs 8,000.[24] Obviously, benefits per birth averted depend upon the GFR path, the discount rates and the time horizon chosen. Further, these benefits can be measured either by using the increase in aggregate consumption or income or the increase in per capita consumption or income. There is no consensus either on the procedure used for measurement of the benefits or the value of parameters used such as interest rates and horizon. These differences largely explain the wide variations in the estimates of the value of a birth averted. While the justification of the family planning programmes can be achieved by comparing the lowest of these benefit estimates with the present cost estimates, a more rational allocation of funds will require a precise estimation of the total and marginal benefits of GFR paths. Indeed, as we shall see later, the justification of schemes such as monetary incentives, designed to increase the participation in family planning programmes depends upon how the benefits are measured.

FIGURE 1: SCHEMATIC REPRESENTATION OF ANALYSIS PROCEDURE

179-80	0.28	2.80	9.80	19.00	24.00	26.00	27.00

Given two GFR paths, A and B, the aggregate consumption effect and per capita consumption effect can be measured as given in Section II. The births that need to be averted can be computed by the procedure described in Section IV. The benefit per birth averted due to the GFR path B over A is given by the ratio of discounted present value of the benefit in each year t to the discounted present value of the births averted in each year t i e:

$$\sum_{t=1}^{N} [\text{benefit (B)} - \text{benefit (A)}]_t \, (1+i)^{-t}$$

$$\sum_{t=1}^{N} [\text{births to be averted (B)} - \text{births to be averted (A)}] \, (1+i)^{-t}$$

Tables 9 and 12 present the estimate of benefits per birth averted for various combinations of interest rates and horizons. From these Tables several observations can be made.

(1) The per capita consumption benefits per birth averted at 10 per cent discount rate and 30-year horizon are Rs 2,500 (at 1961 prices), or Rs 3,900 (at 1970 prices). But the effect of horizon and discount rates are significant. This estimated value increases by 80 per cent when a 50-year horizon is considered. For a time horizon of 30 years, the estimated benefits are only half of its value at 20 per cent as they are at 10 per cent interest rate.

(2) At 30 per cent interest rate, the per capita consumption benefits stabilise at Rs 750 at a 30-year horizon. A consideration of longer periods has a negligible effect.

(3) As is generally agreed, the per capita consumption benefits are higher than aggregate-consumption benefits. It is worth mentioning, however, that these differences are very significant. For a discount rate of 10 per cent and a horizon of 30 years, the per capita consumption benefits are approximately five times the aggregate consumption benefits. If we consider a time horizon of 20 years, the difference is even higher. In other words, of the total

FIGURE 2

179-80	45.9	33.8	6.5	9.6	85.4	37.7	12.5	10.3

benefits received due to the family planning programme, only about 20 per cent are due to the faster growth of the economy. The other 80 per cent arise because there are fewer people to share this income.

VI

Costs of GFR Paths

The procedure for estimating the expenditures necessary to achieve a particular GFR path is as follows. We first estimate the cost of averting a given number of births in any year. Since the number of births that need to be averted can be calculated by the procedure given earlier in Section IV, the cost of a GFR path for each year can be derived. The discounted present value of these costs, then is the cost of achieving a GFR path.

Cost of Births Averted in a Year:

There are two components of the total cost of a family planning programme: direct cost of providing services and non-direct costs of education and motivation.

The difficulty in estimating direct costs stems from their dependence on the type of method used to avert births.[25] The methods used depend upon the demographic characteristics of the population and the availability of services. The non-direct cost of motivation will increase as the family planning programme increases in scope.[26] The cost of a birth averted in India has increased from Rs 40 in year 1968 to Rs 100 in year 1970 (Table 13).

We shall use two procedures for estimating the cost functions using historical data. In the first procedure, we directly relate the total cost to the number of births averted. The second procedure considers the direct and non-direct motivational costs separately.

First Procedure:

The past cost performance of the Indian family planning programme is shown in Table 13. An examination of the relationship leads us to believe[27] that a quadratic function would best express the relationship between births averted and cost. Three points (0.35, 20), (2.0, 88), and (3.25, 2.55), were chosen to fit a quadratic function.

$$T = 29.8 - 42.5\,X + 35.8\,X^2$$

where T=total cost at 1961 prices, Rs million. X=number of births averted in millions. The marginal cost of a birth averted is given as $dT/dx = -42.5 + 71.6\,X$, which implies that the marginal cost of a birth averted after 7 million births have already been averted is Rs 458.

Second Procedure:

Assuming that the direct cost is Rs 20 per acceptor,[28] the non-direct costs of motivation, etc, are related to the number of acceptors. Table 14 shows the past data in terms of number of acceptors and the non-direct costs. Once again a quadratic curve is fitted using the three points (0.4 12), (1.5, 40) and (3.4, 195). The relationship[29] is estimated as

$$TND = 13.04 - 10.09Y + 18.70\,Y^2$$

where

TND = total non-direct cost at 1961 prices, Rs million.

Y = number of acceptors, million.

To estimate the total cost, it is necessary to evaluate the number of acceptors needed to avert a desired number of births. We assume that the ratio of acceptors to births averted as in 1970 will continue to hold in the future, (i e, 3.125 births will be averted by 3.5 acceptors).[30]

Hence,

$$T = 20.0Y + 13.04 - 10.09Y + 18.70Y^2$$

$$Y = (3.5/3.125)\,X.$$

Under this procedure the marginal cost of averting a birth after 7 million births have been averted is Rs 380. Up to 5 million births averted, the first procedure results in a lower average cost estimate than the second procedure. Beyond this range, the average cost estimates using the first procedure are higher. As will be seen later, the choice of the cost-procedure does not significantly affect optimal targets.

Estimating Costs of GFR Paths to Government:

It is perhaps worthwhile to examine the annual expenditures to be borne by the Government of India for various target GFR paths. These are presented in Table 15. The Fourth Five-Year Plan aimed at reducing the birth rate from 39 per thousand (in year 1969) to 25 per thousand by year 1981. This would imply a GFR path of 179-80. The Fourth Five-Year Plan expenditure of Rs 3,150 million tallied well with our cost estimates for the same period. However, to ensure this rate of fertility decline (i e, GFR path of 179-80), the total amount of expenditure called for during the Fifth Five-Year Plan is Rs 16,000 million.

VII

Benefit-Cost Analysis

In Section III, we constructed an economic model to derive the economic benefits by different GFR paths. In the subsequent sections, we outlined the procedures for deriving the costs attached to different GFR paths. Now, we make a comparison of the benefits and costs for different GFR paths with a view to choosing the optimal path. For choosing the optimal path, we need to look not only at the total benefits and costs of each path but also at the additional or marginal costs and benefits of each path compared to the previous path of smaller declines in fertility. Tables 16 to 23 list these benefits and costs using both aggregate consumption and per capita consumption effect for interest rates of 10 and 20 per cent and time horizons of 30 and 40 years. The most desirable GFR path is the one at which the marginal benefits and marginal costs are equal. Assuming that other developmental outlays can be made to yield a given rate of return, equating marginal benefit with marginal cost will maximise the net present value. Any further expenditures beyond this level will not give that return. Table 24 shows the most desirable paths for different interest rates and horizons.

We observe from this Table that using the aggregate consumption effect, the present national targets of a GFR path 179-80 are economically justified only if an interest rate of 10 per cent and a horizon of 40 years is used. At higher interest rates and/or smaller horizon periods, such an effort is not warranted. At 20 per cent interest rate, the horizon values of 30 years or beyond do not affect the analysis. However, this value seems high.[31] At interest rates of 10 per cent to 15 per cent, a GFR path of 179-120 will perhaps be most desirable. However, using per capita consumption effects, a massive reduction in fertility rates can be justified.

When the aggregate consumption effect is used, the benefit-cost ratio at optimum GFR path is approximately two. This implies that approximately 50 per cent of the higher benefits due to family planning will have to be spent on the family planning programme. When the per capita consumption effect is used, the present targets imply a benefit-cost ratio in the range of four to six. A major consideration that emerges is which of the two effects — aggregate consumption effect or per capita consumption effect should be used to measure benefits. Many writers have chosen the latter. The choice of this criterion, however, raises other issues which we discuss in the next Section. If the aggregate consumption effect is treated as the appropriate criterion, then the choice of the values of interest rates and horizons becomes an important issue.

TABLE 17: BENEFITS AND COSTS OF GFR PATHS IN RS BILLION; AGGREGATE CONSUMPTION BENEFIT AND COSTS OF GFR PATHS, RS BILLION

VIII

Implications of the Study

The benefit-cost analysis carried out here is not intended to directly compare family planning programme outlays with the other developmental outlays. One of the principal difficulties in making such a comparison is that different types of benefits are desired from these investments. The family planning programme outlays are made to decrease the population growth so that the consumption thus freed up could be directed towards increased developmental outlays which would subsequently increase the consumption level of the population. The developmental investments, on the other hand, are made to increase the output directly. Also, many non-eco-

nomic considerations are involved. Since both these types of outlays complement each other in a nation's goal of economic development, a much larger analysis incorporating many dimensions of economic development will be necessary to study the trade-offs between these two investments. Our analysis, by using a discount factor, implicitly assumes that other opportunities are available for investments earning a return equal to the discount rate used.

This study was intended to answer a specific question — what family planning programme targets are economically desirable for India. Our study shows that there is no unique answer. As already stressed, the benefits and costs depend upon the interest rates, length of the planning horizon and the criterion used to measure benefits.

A major consideration that arises in this context is the criterion used to measure benefits. The benefits using per capita consumption effects are about 5 times the benefits using aggregate-consumption benefits. The use of aggregate consumption benefits as a criterion causes no particular problem. However, the use of per capita consumption benefits to justify massive family planning programme efforts needs further examination. There are two issues involved: The distribution of per capita consumption and the identification of the types of expenditures. The latter issue becomes pertinent even when aggregate-consumption effects are used.

It is only under conditions when the benefits flowing from family planning programme efforts are distributed equitably, there is a justification for using the criterion of per capita consumption effects. There is no evidence to indicate that this has been the case so far. Thus, while the per capita increase in consumption due to family planning programmes will be realised, the benefits are unlikely to be equitably distributed over all income groups, unless specific steps are taken towards such a redistribution of increased income. In the absence of such steps, it is questionable if per capita consumption benefits can be used.

It has been argued[32] that since a portion of the expenditures involved in the family planning programme are transfer payments, they should not be considered as part of costs in the benefit-cost analysis. To examine this contention, we need to identify the measures suggested for enlarging the scope of family planning programmes and the related expenditures.

The costs of family planning programme expenditures can be analysed in terms of three components: expenditures that reduce the available consumption, expenditures that distribute the released aggregate consumption and the expenditures that redistribute increased per capita consumption.

Most of the direct costs of the family planning programme reduce available consumption. Some of the non-direct costs for purposes of education and motivation also fall in this category. A significant portion of the present family planning programme efforts are of these two types. It is expected that these costs will rise at a faster rate as the number of births that need to be averted increase. Since our cost estimates were an extrapolation of the past experiences, we have compared these types of costs to the increase in aggregate consumption benefits. These are real costs (opportunity costs), and our analysis has indicated that at the optimal level of operation of family planning programmes, this type of expenditure will approximately be 50 per cent of the aggregate consumption effects, thus making it possible to use the other 50 per cent for transfer payments. A portion of the non-direct costs distributes the aggregate consumption released by family planning programmes. Many financial incentive schemes[33] that involve payments at the time of birth prevention fall into this category. It is interesting to note that such a proposal made by Sirageldin and Hopkins[34] agrees with the results of our study. They suggest cash payments on an ongoing basis with frequent examinations of women participating in the birth control programme. The cost of such a scheme is estimated to be approximately 50 per cent of the benefits. Therefore, these types of measures may be used to distribute the other half of the aggregate benefits.

It may be recalled that the increased per capita consumption results is due to two factors: increased availability of aggregate-consumption and fewer consumers sharing it. The latter accounts for approximately 80 per cent of the total effect. These benefits can be used to justify the incentive schemes resulting in delayed payments of a large magnitude. Several such proposals have been made such as issue of bonds. A weakness of these proposals is that they do not include explicitly how such a measure would help redistribute the increased consumption due to a smaller population equitably. This study points out why such an equitable redistribution is essential. It should be noted that by year 2001, the magnitude of the amount of consumption to be redistributed is approximately one-third of the total consumption in that year. Also a more detailed analysis of the ways of raising money for these schemes without causing more inequities in the per capita consumption is required Further research is needed in this direction.

If per capita consumption effect is used to justify a massive family planning programme measures for redistributing such benefits must be instituted. Unless these are done, the family planning programme may not achieve credibility.

IX

Summary

In this paper, the benefit-cost analysis is used to investigate the optimal targets for Indian family planning programme. An economic and demographic model, similar to that of Coale-Hoover, is constructed and validated to measure the benefits of fertility declines. Two types of effects are used to estimate benefits: aggregate consumption effects and per capita consumption effects. The costs of achieving the fertility declines are estimated using equations based upon the past data. The benefits and costs of successive higher declines in fertility are compared to derived optimal targets.

The analysis points out that the benefits and costs are sensitive to interest rates and horizons of analysis. Therefore, the optimal targets depend upon the values selected for these parameters. But the most significant factor is the type of effect used to measure benefits. The aggregate consumption effects are estimated to be only 20 per cent of the per capita consumption effects. It is concluded that a decline in general fertility rates from 179 to 120 (approximately 30 per cent) by 1985 is justified based upon aggregate consumption effects. However, a much higher decline in fertility is indicated if the per capita consumption effects are used to measure benefits.

The study, therefore, reveals the interactions among per capita consumption distribution, measures suggested for fertility declines, and the financing of these measures.

TABLE 24 : MOST DESIRABLE GFR PATHS

Interest Rate	Aggregate Consumption Effect				Per Capita Consumption Effect

10 See Section III.

11 We are ignoring the effect of different welfare outlays of the government on the aggregate consumption. This effect is given by $W^t(B) - W^t(A)$. Since welfare outlays are assumed to be proportional to the equivalent consumer population and the consumer population is smaller under GFR path B, we are slightly overestimating the aggregate consumption effect. However, the per capita consumption effect remains unaffected.

12 For a detailed discussion of the arguments leading to this model see Coale-Hoover.

13 The comparison is limited to 1966 because of the economic disturbances in 1967 and 1968. This period covers the Second and Third Five-Year Plans and is, therefore, expected to be representative of the economic situation beyond 1970.

14 The population is adjusted by assigning children of under 10 years a weight of 0.5, females 10 and older a weight of 0.9, and males 10 and older a weight of 1.0, to arrive at the equivalent consumer population.

15 Our efforts to directly relate F-outlays to the national income and equivalent consumer population had to be abandoned as national income and equivalent consumer population are collinear during this period.

16 These relationships can be compared to the relationships used by Coale-Hoover. According to them, $D=F-W_C - W_I - 0.80Y - 49.27C - 0.0725Y - (0.0725)Y(10p)$, for a population increment of $p \leq 0.02$, $D = 0.226Y - 27C$. Thus for the same equivalent consumer population C, our model will predict higher direct developmental outlays.

17 Some authors have estimated this ratio to be around 2.7. For instance, see, "Estimates of Incremental Capital Output Ratio for the Indian Economy, 1950-51 to 1973-74", Planning Commission, Perspective Planning Division, September 1969, Government of India. Using a higher capital output ratio underestimates the benefits of the fertility declines.

18 The initial conditions for year 1971 are set as follows:
$Y_o = 179.55$ Rs billions.
The values of L_t and (W_C) expenditures at five-year intervals for the period 1956-1971 are given by 0.398, 0.392, 0.385, 0.38 and 6.42, 7.07, 6.84 and 7.66 Rs billions, respectively. In equations 1 and 2, the co-efficients of Ct are higher than the figures cited earlier because they have been adjusted from 1952 prices to 1961 prices.

19 The effect of fertility decline is still significant when a correction is made for the age-distribution of the population. Per-equivalent consumer income increase by 180 per cent during the period 1971-2001 for a GFR path 179-80.

21 *Op cit.*

22 *Op cit.*

23 *Op cit.*

24 Simmons felt the best estimate of the current marginal value of a birth prevented due to a 20 per cent to 30 per cent reduction in fertility was Rs 7,800 or about 14 times India's per capita income in 1967-1968.

25 These costs vary considerably. For instance, Enke, S, "The Economic Aspect of Slowing Population Growth', gives the following estimates of direct cost:

Method	Cost$
Zero Control	0.00
Withdrawal	0.25
Rythm	0.50
Condom	12.00
Foam Tablet	12.00
Diaphragm	4.50
Pills	90.00
Vasectomies	3.00

(These estimates may need to be revised.)
All of these costs are not borne by the Indian family planning programme. For instance, condoms are subsidised by foreign aid.

26 There is almost unanimous agreement that these costs will rise. It was observed in a recent report on the national family planning programme of Korea and Taiwan that, "Both countries have become increasingly aware that, to keep the birth rate going down, they must invest more money than before", Ross, J A, Dee Woo Han, Keeny, S M, and Cernada, G, "Korea/Taiwan 1969: Report on the National Family Planning Programmes", *Studies in Family Planning*, June 1970, 1, Numbers 54, 15. The monetary incentive schemes suggested by several persons have costs ranging from Rs 200 to Rs 600. See Ridker, R G, 'Synopsis of a Proposal for a Family Planning Bond', *Studies in Family Planning*, June 1969, 1, Number 43, pp 11-16. Siragel-din, I, and Hopkins, S, 'Family Planning Programmes: An Economic Approach', *Studies in Family Planning*, February 1972, Volume 3, Number 2; Rogers, E M, 'Incentives in the Diffusion of Family Planning Innovations', *Studies in Family Planning*, December 1971, Volume 2, Number 12.

27 It has been assumed that a sterilisation averts 1.7 births. However, these births are averted on an average over 10 years. By assuming that all these births are averted in the same year, we are overestimating the births averted and consequently underestimating costs. This effect is partially offset by ignoring the number of births already averted due to sterilisation performed in the previous years.

28 The direct cost is estimated as Rs 30 per vasectomy, Rs 11 per IUCD, and Rs 8.5 per conventional contraceptive acceptor. A weighted average of these costs gives us the direct cost per acceptor.

29 This and the earlier fit are subjective and can be questioned. Unfortunately, better base for cost estimation is not available. As noted earlier, costs are expected to rise as the scope of family planning increases. Micro comparison of various experimental studies have been carried out by Mack, Newell B, "The Cost of Control', "Mass Communication and Family Planning", Editor Bogue, Chicago University Press, 1967. He postulates an S-curve relating births averted to the cost. Since we are approximately only in the range where marginal costs are increasing, a quadratic curve fit agrees with the postulates.

30 Another possible assumption is that the sterilisation and IUCD acceptors will stabilise at 1.3 million and 0.5 million level of 1970. The remaining number of births will be averted by acceptors of "conventional contraceptive couple years of protection". This will result in an increase in the acceptors per birth averted.

31 Chakravarthy, P S, "Capital Formation and Economic Development", Rosenstein-Rodan (Editor), Cambridge, Mass, MIT Press, 1964, pp 66, estimates shadow rate of interest to be between 8 per cent and 12 per cent with a mean of 10 per cent.

On the Latin American View of Underdevelopment

Vinod Vyasulu

The theory stemming from the work of Latin American, mainly Chilean, economists is here examined from various points of view.

The paper is divided into four sections. The first part presents the Latin American perspective by discussing the ideas of eminent scholars. Building upon this, the second part deals with what may justifiably be called the Latin American Theory of Underdevelopment. The third section attempts to place this Latin American Theory in the more general background of the history of economic ideas. The study makes it unnecessary to point out what a promise the work of the Latin American, especially Chilean, scholars holds out for students of society everywhere. Therefore, in section four, only a brief evaluation is attempted and some conclusions are drawn.

I

The Latin American Perspective

THIS work has its starting point in the work of some Latin American social scientists. It is necessary, then, at this point to present a cross-section of their views. No attempt is made to present a complete picture of each writer's theories. What we examine are some of their ideas, ideas that are representative of the trend of thought in the underdeveloped countries in general, and Latin America in particular. In the ferment that these countries are undergoing, it is possible to discern many trends; it must be recognised that the one we have picked is only one such. But it is one that has a long and respectable history, and one which seems to hold great promise for future research.

Early Writings

The perspective that we have picked for study is Marxian. Marx has been an impressive though vague figure in Latin America. Marx's son-in-law, Paul Lafargue, was Cuban by birth, but neither Marx, nor Engels, (nor, for that matter, Lafargue) paid much attention to Latin America. The little they wrote about the region is remarkable for its lack of valid information.

Jose Marti, who in the last century sacrificed his life for Cuba's freedom, best explains the idealism that Marx inspired in the Latin Americans. "Because he sided with the weak, he deserves honour" (Aguilar, 1968, p 68). Marti looks for the positive in Marx. He "studied ways to place the world on new foundations ... was not only a titanic arouser of the European workers' anger, but also a profound analyst for the reasons for misery and of human destiny. A man consumed by the desire to do good, he projected into everything that which was actually within himself: rebellion, a way forward, struggle" (p 69). This feeling is as true of today as it was of 1883. Marx offered hope to the coming generations.

This idealism for the future is also reflected in Tejera, who was concerned with (the present) "simple task of preparing", but also with the social problems that would appear in the future. "... while the party is taking all the overt, public action, do not overlook the vast underlying task of moral and intellectual education. Do not forget that, during this transformation that is to take place in our society, it is important in striving to maintain equality, that we do not merely allow those who are now on a higher plane to step down, but instead ensure that those who are now below will move ever upward" (Aguilar, 1968, pp 73-74). And in a final rush of idealism, "... socialism will not and should not intimidate any person. The bourgeoisie must be called upon to deal with the party cordially and courteously, and then perhaps, through mutual respect, we will achieve the final victory of justice". (The experience of Allende is a sad commentary in this context.)

This idealism disappeared in part by the next generation. The analysis of Luis Emilio Racabarren, a self-taught typographer and a deputy in the Chilean Parliament, is stronger and more pragmatic. By the early twenties of this century, the social and political conditions had also changed considerably. Racabarren's analysis shows that by then Chilean labour was active and sophisticated. He believed that the proletariat had the right to seize power, and that Chile's political history affirmed this right. Yet the revolution that he hoped for was a "revolution of folded arms, a general strike to force the powerful classes to be moral and just in all aspects of social life, but principally in their dealings with working men, with those who desire to better themselves culturally, with those who want to become more useful, better citizens, an integral part of society. His utopian dream is a forerunner of Allende's. [But it has resulted in modern Chile in fascism.] Racarbarren also cast his net wider. He knew that revolutionary sentiments are fostered by the rising aspiration levels fostered by the bourgeois revolution. He knew that, in the economic sphere, national frontiers are illusory. "No capitalist can criticise our international sentiments, since nothing is more international than capital. Capital has no flag — none, that is, aside from the pound sterling" (Aguilar, 1968, pp 92-3).

The most prominent early Marxist in Latin America was Jose Carlos Mariategui, a self-educated Peruvian worker of acute perception. In his view, the USA had not arrived at the crisis that European capitalism had faced by the early 1920s. In a Keynesian vein, he saw industrial development in the USA as entirely dependent on a vigorous rate of consumption by the native population. He foresaw the USA's need for external markets when its production would begin to exceed its consumption level. Noting the accumulation of gold in America, he noted prophetically in 1927 that that country's industrial development could no longer absorb its financial returns. Pushed on by her internal production problems he saw the USA embarking upon a vast imperialistic adventure that would shoulder the responsibilities of, and also accept the contradictions of, the global capitalist system. Recent studies in economic history show how amply his predictions have been fulfilled (Magdoff, 1969).

Prebisch Revolution

Raul Prebisch, and the Latin American Economic Commission (ECLA) which for a long time he headed, occupy a unique place in the Latin American world of ideas. Prebisch goes back to the world of Ricardo-Heckscher-Ohlin in his analysis of trade. Yet, paradoxically, he has invigorated the

Marxian tradition in Latin America.

He did this by accomplishing in the field of trade policy what Keynes accomplished in the field of employment policy. Keynes had a profound influence on Prebisch, founder and retired director of the Argentine Central Bank. A little known fact about Prebisch is that he authored one of the first Keynesian textbooks ever written — certainly the first one that was written by an economist who was outside the geographical and linguistic mainstream of Keynesian developments. And this metaphor becomes complete when we consider the *modus operandi* of Keynes and Prebisch. Both, by switching a crucial assumption, made an important policy prescription in the context of an important, contemporary and national problem. Keynes, by questioning the downward flexibility of wages, recommended increased government expenditures as a cure for unemployment. Prebisch, questioning the assumption of unconstrained competition in the dynamic setting of technological progress, recommended protection and import substitution industrialisation as a cure for economic backwardness. The work of each has had a tremendous impact in his world yet neither did anything violently new or original. One may justifiably wonder why no one has spoken of a Prebischian revolution?

The world, to Prebisch, is made up of Centre and Periphery: the advanced industrial areas and the backward agricultural ones. Classical theory, *ceteris paribus*, suggests that comparative advantage would lead to an optimal situation in which trade will benefit both parties, in relation to the terms of trade between them. Prebisch argues that in adynamic setting when technological progress is constantly taking place in the Centre, the terms of trade move progressively against the Periphery, and the benefits accrue step by step to the Centre, even though increases in output take place in both areas. Further, the Periphery itself is composed of two sectors, the external (export) sector and the domestic (production) sector. The rate of return is higher in the external than in the domestic sector, where, in addition, the gestation lag is long. The result is a malallocation of investments. The implications are clear: peripheral governments have to protect their economies in order not to deprive them of the benefits of foreign trade and investment; the rate of return has to be equalised in the two sectors, *via* subsidies to the domestic sector; given the infant industry argument, import-substitution industrialisation is the answer to the problem of development. Then, when the backward economies have caught up, they can take their equal place in the trading community of nations. Laissez-faire is most certainly Prebisch's ideal.

Prebisch has acquired a large following among peripheral economists. His work too has been intensely dissected (Flanders, 1959). ECLA has done valuable theoretical and empirical work. But signs of dissatisfaction began to appear among his junior colleagues in the 1960s. In the light of their own official findings, they have broken away from the rigid Prebisch mould. They find the earlier Marxist tradition more useful for analysis. And though they have gone on to develop a new theoretical perspective, Prebisch has had nothing to say about them. And this can be clearly seen by the nature of the essays that have been written in his honour (Di Marco, 1972).

Recent Writings

The break from Prebisch has received direction, and gathered momentum, from the work of Andre Gunder Frank. After receiving his Ph D from the University of Chicago, he travelled extensively in Latin America. He found that he had "to shed the scientific and political stereotypes which most of us, Marxists and non-Marxists alike, in the metropolis and in the colonies, have largely inherited from metropolitan capitalist development in the era of liberalism" (1967, xviii). He was forced to re-examine underdeveloped society from a new perspective, and found that many useful insights could be obtained by working on the lines suggested by Baran (1957). In order to understand this group of writers, it is essential to understand Frank.

In essence, Frank provides a vision for the analysis of the processes of development and underdevelopment. He throws out insights, ideas and hypotheses, many of them supported by historical evidence. His influence cannot be overestimated.

Frank published his basic work in the form of a research proposal in 1966. His starting point is the distinction between the *state of underdevelopment* which is the historical situation in which most parts of the world found themselves before modern capitalism, and the *process of underdevelopment*, which is the actual experience of the Periphery after it came into contact with the aggressive capitalism of the Centre. Underdevelopment, then, is a process in which economic conditions not only go from bad to worse but a trap from which escape is impossible within the existing framework of institutions, for these institutions sustain the underdevelopment process (Hayter, 1971).

Secondly, Frank rejects in the strongest possible terms the dualist interpretation of underdeveloped societies. According to this interpretation, these societies are economically schizophrenic: on the one hand, there are primitive, traditional sectors based on agriculture; on the other, most of them possess small, dynamic industrial sectors based on "rational" (market price) criteria. The two are, in an essential sense, independent of each other. The problem is one of dynamising the economy by letting the modern sector grow fast enough to absorb surplus labour that subsists in the traditional sector. This, in skeletal form, is the famous Lewis model, and holds even for the extensions of Fei, Ranis, and Jorgenson.

Frank's objections are the following: the dualism models are a-historical and run counter to fact. The capitalism of industrialised Europe and North America is not confined within national frontiers. It is a global system encompassing both the now-developed and the presently underdeveloped regions of the world (with the exception of the socialist camp). It has penetrated even the most remote areas of primitive society (Frank, 1969; Griffin, 1969; Stavenhagen, 1964). Capitalism is a system whose dynamic is the law of uneven development: using its own criterion of efficiency (profits) it builds upon the best elements in the system to the exclusion of all others. This leads to increasing disparities in the system. This is made more complex by the fact that this tendency to inequality is continually changing its form. Dual economies are simply the result of one such disparity manifesting itself. The two sectors are, in an essential sense, related to each other.

And, finally, Frank argues that this dynamic, in the context of expropriating the surplus in an international setting, creates a whole spectrum between Centre and Periphery. Thus, local centres come into being which are in the global context peripheries. The growth potential of these sub-centres is limited by their peripheral status.

From this framework, Frank derives a whole series of hypotheses: (i) the development of sub-centres is limited by their global peripheral status; (ii) the peripheral areas experience their greatest growth when their links with the centre are weakest; (iii) if, after a period of growth as in (ii) above, these links are restored, the peripheral impetus to growth disappears; (iv) the presently underdeveloped regions are precisely those that were most tightly linked to the centre in the past; (v) the latifundia, which were originally capitalist enterprises, themselves created the enterprises which enabled them to respond to growing national and international demand by expanding the aggregate of their capital, land and labour to increase the supply of their product; (vi) the latifundia which are today isolated and engaged in subsistence agriculture were not always so, but were sectors that underwent a drop in the demand for their product, or in their productive capacity.

After a discussion of many other facets of underdeveloped capitalism, Frank concludes that the national middle classes are inextricably linked to metropolitan interests, and that, as a consequence, it now has no role to play in the betterment of the presently underdeveloped countries. The national bourgeoisie is the "immediate enemy". Frank's views have been proven to be tragically correct so far as Chile is concerned, by recent events.

The others, taking the cue from Frank's seminal work, have written in similar vein. (Bodenheimer, 1970; Cordoso, 1969; Furtado, 1972; Sunkel, 1967; Veliz, 1967; 1969; Dos Santos, 1970; Rodney, 1972; to mention only a few.) The object here is only to show that there is a whole new school of Latin American thought developing. These scholars are not all agreed among themselves. One example of this is Ernesto Leclau's (1971) debate with Frank.

Leclau submits that Frank is correct in saying that the dualist interpretations of underdeveloped countries are false. But does it then follow that Latin American societies are capitalist? Leclau argues that Frank's categories are too broad, and that the error in the schema lies in the fact that Frank neglects the relations of production. "To affirm the feudal character of the relations of production in the agrarian sector does not necessarily involve maintaining a dualist thesis" (p 19 ff). Frank's error arises in part from his anxiety to show the irrelevance of the bourgeois-democratic stage in the development of Latin America. Frank and some of his followers, "by trying to situate the fundamental contradiction in the field of circulation rather than production ... can go no more than half-way towards an explanation of why development generates underdevelopment".

Enough has been said to establish the point that we have here a tradition of scholarship and also a school of thought. We turn now to this theory. It is pertinent to note that this work has not yet been assimilated into the current doctrines on development (Higgins, 1969).

II

Latin American Theory of Underdevelopment

Current research indicates that the analysis and insights that emerge from this work may be brought together in the following manner. This synthesis is tentative; it does not represent exactly the views or opinions of any one of these writers, and is indicative only of the broad trend that this work is taking.

The Latin American countries achieved political independence in formal terms in the last century, but they did not achieve economic independence. Dos Santos explains this dependence:

> "By dependence we mean a situation in which the economy of certain countries is conditioned by the development and expansion of another economy to which the former is subjected. The relation of dependence between two or more countries and between these and world trade, assumes the form of dependence when some countries (the dominant ones) can expand and be self-sustaining, while other countries (the dependent ones) can do this only as a reflection of that expansion, which can have either a positive or a negative effect on their immediate development" (1970, p 231).

There are many forms of dependence. Present-day dependence is basically of a technological nature (Kidron, 1965; Merhav, 1969). The underdeveloped countries are finding themselves in a position where technology and know-how comes from abroad. In a recent article, Samuelson writes: "Under modern trends of comparative advantage, American management knowhow (and for that matter management knowhow anywhere) and American mobile capital may find that their most efficient use is increasingly to employ foreign labour as a substitute for traditional American activities ... So under floating exchange rates and relatively free trade equilibrium, the United States might in turn become a headquarters economy. Our emphasis in employment would shift to services and away from manufacturing ... it would become normal for us to enjoy an unfavourable balance of merchandise trade ... this trade deficit would normally be financed by our current invisible items of interest, dividends, expatriated profits and royalties ..." (1972, p 2). Samuelson acknowledges that the Latin Americans are correct in their fears that the United States is becoming the centre of a worldwide system where other countries become dependent on its "know how". But nowhere does he analyse the factors that bring this about. His only (minor) fear is that this might not happen because of rising nationalism that will ignore comparative advantage! It certainly does not strike him that this technology might not be suited to the needs of the underdeveloped countries, or that this situation might be inimical to their interest. In typical fashion, as the Latin American scholars claim, he is not concerned with that.

Dependence is a product of the development of the system of international capitalism. Sherman (1972, p 35) writes:

> "H K Takahashi, closely following Marx, emphasises that there are two roads to capitalism; *via* the master craftsman or *via* the big merchant. Takahashi argues that only the first was really revolutionary, because the craftsman represented a new class which made a real break with the feudal rulers ... As soon as the merchant accumulated some wealth, he bought land and intermarried with the land-holding class".

The merchant precipitated a commercial revolution, but not the industrial revolution that leads to the formation of an advanced economy.

Given the nature of the flow of technology, given the dynamics of trade, (based on the exchange possible within the reality of political power), a commercial revolution incorporates a country as a satellite into the capitalist system. The well known phenomenon of uneven development then leads to dependent development of the sort Dos Santos talks about in the peripheral regions of the capitalist economy world. Frank (1969) holds that this is a symptom of the perpetuation of underdevelopment.

An important qualification has to be made to this hypothesis, especially in view of Latin American experience. This relates to the size (suitably defined) of the satellite country. As Demas (1965, pp 3, 21) argues: "Underdevelopment and self-sustained growth cannot be considered in isolation from the size of a particular country." And "... it is my view that the question of

size is very relevant to the *character* of, if not to the *possibility of achieving*, structural transformation".

Certainly the concept of size presents a tricky problem. Yet, small countries, by their very nature, will be dependent in the sense that they will tend to have a high ratio of exports to GDP as well as a concentrated composition of exports and a diversified structure of imports. Dependence must be clearly differentiated from inter-dependence. This point merits further study. But Frank's thesis seems irrefutable, given his historical evidence.

Frank (1969) and Griffin (1969) hold that dependence can have only a long-term negative effect. This turns on the question of whether the dominant country is a geographical, political or economic unit. For it is not necessary that these spaces (in the mathematical sense) coincide. As Demas (1965, p 31) says:

"... we must admit that in order to understand many of the phenomena of the world economy over the last two hundred years, we have to concede that there are units of economic activity which either transcend or ignore national boundaries."

Is trade a relationship that opens up contacts between two independent economies in equilibrium, as the theory of comparative advantage would have us believe, or is it an internal structural feature of a system of international capitalism? In other words, to what extent is the politics of power relevant? If it is relevant, and a dominant/dependent relationship results, what would be the effect of a reduction/elimination of trade upon the satellite? The theory under discussion would suggest that this would benefit the satellite. It would also suggest that a weakening of trade links in the past would represent times of satellite growth. It would suggest that the centre would follow the kind of policy that would strengthen bonds between itself and the satellite, and that this would not be in the interests of the latter. And so on. These are testable propositions; and in its implications this theory is directly at odds with accepted doctrine. Available evidence goes against accepted doctrine.

The lessons of history seem to be this: the forces of capitalism changed a world that was undeveloped, but in a state of decline and decay, into a world that experienced a tremendous growth in its productive potential. The fruits of this process were, however, very unevenly distributed, in accordance with the basic law of uneven development that characterises the capitalist system (Emmanuel, 1972, p 262). The orthodox concepts of development and underdevelopment need re-evaluation. Some efforts at such a re-evaluation will be made in the following sections.

III

Underdevelopment and the History of Economic Analysis

There is no mention of *underdevelopment* in such authoritative works as Schumpeter (1954) or Seligman (1962). This does not mean that the phenomenon was unknown to these economists; Schumpeter made seminal contributions himself. It need be of no surprise that the modern concept of underdevelopment is the consequence of the work of earlier scholars, going back to Ricardo, Malthus and Marx.

Rosa Luxemberg, following up the work of Marx, writes (1913):

> "... capital accumulation as a whole, as an actual historical process, has two different aspects. One concerns the commodity market and the place where surplus value is produced — the factory, the mine, the agricultural estate. Regarded in this light, accumulation is a purely economic process, with its most important phase a transaction between capitalist and wage labourer ... Here, in form at any rate, peace, prosperity and equality prevail, and the keen dialectics of scientific analysis were required to reveal how the right of ownership changes in the course of accumulation into appropriations of other people's property, how commodity exchange turns into exploitation, and equality becomes class rule.
>
> "The other aspect of accumulation of capital concerns the relations between capitalism and the non-capitalist modes of production which start making their appearance on the international stage. Its predominant methods are colonial policy, an international loan system, — a policy of spheres of interest — and war. Force, fraud, oppression, looting are openly displayed without any attempt at concealment, and it requires an effort to discover within this tangle of political violence and contests of power the stern laws of economic process.
>
> "Bourgeois liberal theory takes into account only the former aspect: the realm of peaceful competition, the marvels of technology and pure commodity exchange: it separates it strictly from the other aspect: the realm of capital's blustering violence which is regarded as more or less incidental to foreign policy and quite independent of the economic sphere of capital.
>
> "In reality, political power is nothing but the vehicle for the economic process. The conditions for the reproduction of capital provide the organic link between these two aspects of the accumulation of capital. The historical nature of capitalism can only be appreciated by taking them together" (p 452).

This is what Latin American theory of underdevelopment does.

Rosa Luxemberg's reason for adding the second aspect of capitalist accumulation is her recognition of the international nature of the system. "Realisation of the surplus value is doubtless a vital question of capitalist accumulation. It requires as its prime condition ... a strata of buyers outside capitalist society" (p 351). Furthermore, "the second condition of importance for acquiring means of production and realising the surplus value is that commodity exchange and commodity economy should be introduced in societies based on natural economy as soon as their independence has been abrogated, or rather in the course of this process. Capital requires to buy the products of, and sell its commodities to, all non-capitalist strata and societies" (p 386).

She sounds like the first of the Latin American theorists. But her work was ignored by the mainstream of economic analysis. The major reason for missing the significance of this work seems to have been the fact that the discussion in economic theory at the time centred around questions regarding efficient allocation of resources. Whereas Luxemberg's work was a contribution to the debate on Marx's predictions on the breakdown of capitalism. Her conclusions did not satisfy any of the parties concerned (Arendt, 1935, p 33). The newly underdeveloping countries were far away. It was the heyday of neo-classical economics, with interest being focused on the long-run allocation of resources and the nature of equilibrium. Economic science was moving in a different direction.

Hobsbawm (1964, p 59 ff) in surveying Marxist discussion after the death of Marx and Engels, notes two tendencies. The first, "at variance with Marx's views", "reduces the chief socio-economic formations to a single ladder which all human societies climb rung by rung, but at different speeds, so that all eventually arrive at the top". "The unilinear approach ... leads to the search for fundamental laws of each formation, which explain their passing to the next higher form." The second tendency "led to a formal revision of Marx's list of socio-economic formations, by omitting the Asiatic mode", limiting the scope of the ancient, but correspondingly extending that of the "feudal".

The omission of the Asiatic mode occurred, broadly speaking, between the late 1920s and the late 1930s "... much after Luxemberg's work". Hobsbawm states, inexplicably (p 62), that the omission of the Asiatic mode eliminates "the error of regarding oriental societies as essentially unchanging or a-historical". This step seems to have been instrumental in the history of the underdeveloped countries being by-passed. At any rate, it is at the core of much controversy in India today.

The next important contribution to this line of thought is Baran's (1957) work. Coming nearly fifty years after Luxemberg's work, it provides the direct starting point for theorists like Frank. The reason why this work has been by-passed by orthodox doctrine lies in the direction to some extent, that the latter has taken. In another sense, the Latin American work is a reaction to orthodox doctrine, as we shall try to show below.

Mainstream theory still shows traces of the confusion between growth and development, even after Hicks' bald statement that "the theory of growth has nothing to do with the underdeveloped countries" (1964, Ch 1). Also it is studied on the basis of the neo-classical, general equilibrium, or orthodox Marxist paradigms, none of which the Latin American theorists accept.

The mainstream of the work on Latin America is represented by the two institutions that Raul Prebisch has headed: the CEPAL, or the Economic Commission for Latin America, and the ILPES, or the Latin American Institute for Economic and Social Planning. Many of the contributors to the Latin American theory have been connected, at one time or another, with these institutions, and it would seem that they are in a sense, rebelling against it.

The official (CEPAL or Prebisch) view is well known. In its most recent deals with dependance as a traditional statement, (Prebisch, 1971, p 154 ff) it deals with dependence as a transitional phase which can be helped by international co-operation in the field of trade. "What the Latin American countries should seek to do is to modify this dependence by gradual degrees, without waiting until they reach the stage at which they can be termed developed countries. If the process is to acquire certain attributes other than those of a strictly economic nature, the modifications in question must be introduced during the transition period itself, not after it is over. Hence the importance of multi-lateralism both in financial matters and in trade". Further on, Prebisch observes that the "United States continues to sustain the thesis of multi-lateral trade as against vertical arrangements. This is in accord with the long-term interests of the Latin American countries" (p 175). Obviously, Prebisch has in mind the concept of the harmony of interests that lay behind Classical trade theory, and which goes back to the philosophers of natural law. It is ironical that his followers, using the data that CEPAL and ILPES have unearthed, have come to diametrically opposite conclusions. It is interesting that there is no mention in the Prebisch report of the opposing point of view.

It is pertinent at this point to see why the same data have led to such divergent results. It relates to the basic underpinnings of the different points of view. Mainstream theorists believe something of the following type: the underdeveloped countries are poor today because of a shortage of capital and technology. This is a factor proportions problem of serious magnitude. In order to develop they have to make up this deficiency, and this capital can only come from the presently developed nations. Since these countries will repeat, in their own good time, the development process of the currently developed countries, a study of this history is of great relevance. And since the only economic system that they are familiar with is a market system based on relations of private property, it is only through this system that they can see any future progress coming.

The Latin American theorists differ completely from this perspective. To them the world is characterised by a conflict of interests, not by a harmony of them. The historical process they have studied leads them to different conclusions; and the historical conditions for a mere repetition of the growth process of today's developed countries do not exist any more. To them development is more than a problem of growth rates or the causes (chiefly economic) underlying them. To them, economic development is the following (Baran, 1957, pp 3-4):

> "Economic development has historically always meant a far-reaching transformation of the society's economic and social structure, of the dominant organisation of production, distribution and consumption. Economic development has always been propelled by classes and groups interested in a new economic and social order, has always been opposed and obstructed by those interested in the preservation of the *status quo*, rooted in and deriving innumerable benefits and habits of thought from the existing fabric of society, the prevailing mores, customs and institutions ... it has never been a smooth, harmonious process unfolding placidly over time and space ... this historical generalisation — probably one of the best established that we have — was quickly lost sight of in bourgeois economics".

The term "economic" qualifies not development, but those issues related to it that the economist singles out for study. Development is a holistic phenomenon that cannot be separated into economic, social and political categories each capable of independent achievement.

And in the same sense, underdevelopment is a holistic phenomenon. It is itself the product of the development of the capitalist system, and is then not in some sense the opposite of development. Development and underdevelopment are obverse sides of the same coin, and to those who lost the historical toss, history does not give another chance. These countries cannot repeat the development experience of today's developed nations. If the frustration, alienation and poverty that connote underdevelopment are to be eliminated, the solution lies in a total transformation, in the liberation of man. In this sense, the Latin American theory does not go far enough, but it is in this direction that the theory, if it is not to peter out, has to go.

IV

Evaluation of Latin American Theory

The most common objection to the Latin American theory of Underdevelopment is that it does not provide testable hypotheses. That is to say, it does not offer quantifiable theorems that can be put to econometric verification. This follows the Friedman methodology of Chicago. The point, however, is that the Latin American theorists, are most vehemently rejecting the Chicago approach. They are questioning the political and philosophical underpinnings of that approach, so that an objection on grounds that they so strongly refute is not in any sense an objective test of their theory. Besides, it can be shown that their theory *does* lead to testable hypotheses. Additionally, they work on the basis of historical evidence, not with the *a priori* deductive propositions of a so-called value-free science. Philosophically speak-

ing, their propositions have more *a priori* validity because they come from the *Tao*, that universal heritage of man which is common to all religions and ages, and which is outside of any one individual's own personal experience of time and space (Lewis, 1961). This is not to deny that much more needs to be done in this area; it is simply to point out that enough has not yet been done to reject these conclusions, and that when enough is done. If ever, it will have to be tested on a different set of criteria: correspondence with historical reality. The Latin American scholars insist that these will grow out of practical action as a result of the experience of putting their theories to practice. As things stand, then, we must suspend final judgment.

Another objection is that the holistic approach of these scholars is going against the grain of academic specialisation and thus leading to watered down results. This, however, is a narrow objection: the Latin American work is in the radical tradition of Marx and the Marxists. It has, it can be demonstrated, considerable epistemological appeal. All in all, one may be justified in expecting that further work in this area will be fruitful, in that a clear-cut result either way will certainly represent progress both scientifically, and in terms of the problems of a majority of mankind.

Conclusion

This paper has dealt exclusively with analytical issues at a high level of abstraction. The only validity for such analysis lies in the meaningfulness of the generalisations that form its starting point. I have been through, in a cursory way, the economic history of some of the Latin American countries, and this preliminary reading has reassured me that, historically speaking, the Latin American theory starts off in a meaningful way. But much remains to be done. I have also seen the results of work by mainstream economists that supports specific results that the Latin American theorists come to for very different reasons. It is interesting that general acceptance of specific results has yet not resulted in an attempt other than the Latin American one to tie them together in a general framework.

There is further a personal reason that is somewhat extraneous to the main theme of this paper. My reading of Indian economic history leads me to believe that the Latin American theory of Underdevelopment might provide some pointers towards a theoretical explanation of the Indian scene. Recent work (Kidron, 1965; IESHR Symposium 1969; Frankel, 1971; Weisskopf, 1972; Jhunjhunwala, 1973) all are tending in the same direction, though none, except, perhaps, Weisskopf and Jhunjhunwala, go far enough. A preliminary attempt to re-interpret their data led me directly to the Latin American theory of Underdevelopment. This lent the theory unexpected if limited support from a totally different area; from a geographical and cultural milieu that has significant differences from the Latin American one. The importance of these differences should not be underestimated. In a sense, then, even though I have not undertaken the research necessary for a thorough study of this theory in all its aspects, I feel confident in working with it because in the context of the one area I know well, it has provided fruitful initial results. Certainly I have no grounds at this point for rejecting the theory *in toto*.

Postal Deposits

POSTAL deposits in India, comprising savings bank deposits and time deposits, increased to Rs 1,978 crores in November 1973 from Rs 1,803 crores in June 1973, or by Rs 175 crores. In June-November 1972, postal deposits increased by Rs 130 crores to Rs 1,573 crores.

During June-November 1973, total scheduled commercial bank deposits increased by Rs 865 crores to Rs 9,788 crores. In the corresponding period of 1972, they increased by Rs 639 crores to Rs 8,075 crores.

Time deposits of banks increased by Rs 610 crores to Rs 5,731 crores in June-November 1973 against Rs 431 crores to Rs 4,647 crores in June-November 1972.

The specialist stands alone.

The specialist is not content with mediocrity. He remains immersed in his lonely search for perfection. Like we are, with transformers. ☐ This is the surest way of creating confidence in a basic product that industry and agriculture must depend upon. Transformers. And we make the most reliable range, to the designs of Siemens—a rare combination of proven skill and technical prowess. **BHARAT BIJLEE LTD.**

Futility of Tax Incentives

ONE of the stock explanations trotted out by businessmen for the low level of investment in the private corporate sector is high corporate taxation which allegedly does not leave enough after-tax profits to make possible a satisfactory return to shareholders and plough-back for fresh investment. To reduce the tax burden on the corporate sector, the government has of course extended a number of tax concessions or incentives — development rebate, partial tax holiday for new industrial undertakings, priority industry allowance, export market development allowance, tax concessions for setting up industries in backward areas, tax credit certificates, deductions in respect of intercorporate investment, etc. These notwithstanding, at its recent annual session, the Federation of Indian Chambers of Commerce and Industry adopted a resolution seeking further tax concessions for stimulating investment. In particular, the resolution pleaded for the continuance of the development rebate and the tax holiday which the government has proposed to abolish shortly.

What has been the overall benefit to the private corporate sector from the tax concessions? Have these concessions achieved their purpose of stimulating investment? Data from the Reserve Bank's latest study of the finances of public limited companies, published in the January and February 1974 issues of the Bank's *Bulletin*, indicate that while the benefits derived by the private corporate sector from the fiscal concessions have been enormous their beneficial effects of investment have been rather questionable.

The difference between the statutory rates of corporate taxation and the effective rates that companies actually pay is indeed striking. The combined statutory rate of tax for public limited companies earning a profit of more than Rs 50,000 works out to 58.7 per cent. In addition companies have to pay capital gains tax. Besides, in respect of some items of expenditure, such as entertainment and maintenance of guest houses, advertising, travelling, perquisites to staff, etc, that part which is considered 'excessive' and 'unreasonable' is disallowed for tax purposes. If it is assumed that the additional burden on these counts is equal to the benefit, in the form of the lower income-tax rate, available to companies making a profit of less than Rs 50,000, then the statutory tax rate on all public limited companies would not have been less than 58 to 59 per cent till 1971-72; for 1972-73, the rate would work out to over 60 per cent on account of the 5 per cent surcharge on basic income-tax. Against this, the effective rate of tax on large and medium public limited companies in 1971-72 was only 42 per cent. On the basis of total corporate tax collections of Rs 472 crores in 1971-72, it may be roughly estimated that the loss to the exchequer as a result of the various tax concessions was over Rs 190 crores. For 1972-73 the loss would work out to about Rs 220 crores on a conservative basis.

While the private corporate sector has thus benefited very handsomely from the series of fiscal incentives offered to it, net asset creation by it has been poor. Thus the growth in net fixed assets of the large and medium public limited companies figuring in the Reserve Bank's study was 3.9 per cent in 1969-70, 2.7 per cent in 1970-71 and 3.3 per cent in 1971-72. Part of the growth in assets is explained simply by rise in prices of land and buildings and plant and equipment. Besides, a preponderant part of it has been financed by loans from the financial institutions. What purpose have the huge tax incentives as such served?

That the extent of fiscal concessions enjoyed by the corporate sector does not appear to have any relation with the new investment undertaken is illustrated by the cases of the cement and paper industries. In both these industries fresh investment and expansion of capacity have been tardy for the last many years. Yet, with the exception of aluminium and shipping, tax provision as a percentage of profits before taxation is the lowest for cement and paper among the 33 industry groups identified in the Reserve Bank study. The ratio was 21.2 per cent for cement and 18.6 per cent for paper in 1970-71 against 39.2 per cent for all industries; in 1971-72, the ratios were 33.6 per cent for cement, 23.3 per cent for paper and 41.8 per cent for all industries. The low incidence of taxation on the cement and paper industries is observed also in the Reserve Bank's study of large public limited companies with paid-up capital of Rs 1 crore and above.

Despite the vast tax benefits enjoyed by them, there was practically no growth in net fixed assets in either industry. The rate of growth of net fixed assets in 1970-71 was 1.3 per cent in cement and —0.8 per cent in paper against an average of 2.7 per cent in all industries. The rates in 1971-72 were —1.6 per cent for cement, 3.5 per cent for paper and 3.3 per cent for

all industries.

The profit-making cement companies in the Reserve Bank's sample made pre-tax profits of Rs 16.86 crores in 1970-71 and 16.96 crores in 1971-72. If they had paid tax at the statutory rate, they would have had to pay about Rs 10 crores in each of these years whereas their tax provision was only Rs 3.58 crores in 1970-71 and Rs 5.70 crores in 1971-72. In just these two years, therefore, these companies gained nearly Rs 11 crores from the tax incentives. Against this, their net fixed assets declined from Rs 127 crores in 1970-71 to Rs 125 crores in 1971-72. Likewise, the paper units made pre-tax profits of Rs 18.98 crores in 1970-71 and Rs 23.01 crores in 1971-72. If they had had to pay tax at the statutory rate, they would have had to provide Rs 11.2 crores in 1970-71 and Rs 13 crores in 1971-72 whereas their actual tax provision was only Rs 3.53 crores and Rs 5.13 crores, indicating a tax benefit of Rs 15.5 crores in the two years. By contrast, their net fixed assets rose from Rs 119 crores in 1970-71 to Rs 123 crores in 1971-72.

Tax incentives are calculated to improve post-tax profitability. According to the Reserve Bank's study, profits after tax as per cent of net worth for paper companies were 15.5 and 15.6 in 1970-71 and 1971-72, respectively; for cement companies the percentages were 11.6 and 9.5 and the average for all companies 10.5 and 9.5. The profitability of both industries, and paper particularly, was thus satisfactory; yet neither attracted significant investment. Of course, certain industries, especially those making luxury goods, may be more profitable than cement and even paper. But this only underscores the point that in an economy such as ours allocation of investment cannot be left to be determined by relative profitability. All that fiscal policy can aim to do is to ensure a reasonable level of profit in the industries in which it is considered desirable to have investment; for the rest, allocation of investment has to be achieved through physical controls.

The importance of factors such as the structure of industry in determining the pace of investment has also to be recognised. Thus in industries which are dominated by a relatively small number of producers who are in a position to bar entry by new producers, high profitability — a large part of which may not figure at all in the accounts of the companies — may go together with lack of fresh investment and stagnation of capacity and output. Both cement and paper fit this description rather well. In such circumstances, tax incentives serve little purpose other than to deprive the exchequer of revenues. Before the government gives in to the latest demands of the FICCI, it therefore needs to reconsider carefully the whole rationale of the tax incentives hitherto made available to the corporate sector in the light of the actual impact they have had on investment and growth.

Security Forces

Rape and Order

IT is fortunate that the Deputy Speaker of the Lok Sabha, G G Swell, was in the chair when Jyotirmoy Bosu read out a detailed list of atrocities committed by security forces in Nagaland and Manipur. If Swell, who is from Meghalaya, had not been presiding, it is more than likely that the behaviour of the 'forces of law and order' would once again have been swept under the carpet on the usual patriotic plea of national interest. The Union Home Minister's promise to inquire into Bosu's allegations as directed to by the Deputy Speaker is no guarantee that the lawless behaviour of the security forces will not be hushed up once again as it has been for the last 18 years.

Thoroughly documented charges of atrocities by the army, the BSF, the CRP and other numerous para-military formations operating in the eastern hill regions have repeatedly been made. Last November, the Minority Rights Group, a London-based organisation which documents the maltreatment of minority groups all over the world, published its Report Number 17, "India and the Nagas". Appendix III of the Report lists 65 distinct instances of brutality, giving names and dates. Though the Appendix is compiled from data supplied by the Naga underground, the charges are so specific and detailed that they call for investigation and the severest punishment of offenders. Among the many instances of torture and rape, four are reprinted below:

On February 25, 1973, the C Coy, 4th Kumaon Regt of the Indian Army commanded by one Capt Jasbir Singh came to Hebolimi. The Indian Army went straight to the Church and committed sacrilege inside the Church. They also used the Church as their overnight camp. During the night, the Indians started their savage attack on women who were by that time in bed. They raped Mrs Pukhalu, after knocking down her husband unconscious. In another house, they ordered Mr Yetovi to get them alcohol. While he was away from his house, they raped his helpless wife. Similarly the Indians attacked Mrs Miyeli and Mrs Hosheli.

On May 9, 1973, the 9th Gurkha Regt of the Indian Army seized the following persons from Mima: 1. Mr Kezethi; 2. Mr Neisazo; 3. Mr Vitsochuno. They were all taken to 8th Mountain Div HQ of the Indian Army of occupation, at Jakhama. All of them were brutally tortured. Electric current was used to shock and burn their sensitive organs at the time of tortures. They are still being held by the Indians.

On May 11, 1973, the Indian Army seized Mr Buden, aged 40 and Mr Bongyau, aged 50, both of Dangha village. They were taken to Yonshei Indian Army post and brutally tortured. The Indians suspended them up-side-down and in each case applied powdered chillies on their genital organ and anus. Thereafter they were kicked and beaten. To this day, they are being held by the Indians.

On May 12, 1973, the Dogra Regt of the Indian Army issued an ultimatum to Yonshei village, threatening dire consequences unless they produce the following members of the Women Society. The girls are, namely: 1. Miss Wongngoi, aged 20; 2. Miss Bauuh, aged 19; 3. Miss Wanje, aged 20; 4. Miss Longngoi, aged 18. They were forced to "surrender" after taking into account the consequences especially on the children and old people. The Indian Army commander in charge of the occupation post refused Miss Wongngoi to leave after their "surrender". She was later savagely raped by two Indian Army Captains. Miss Wongngoi is a tall and beautiful girl with a strong moral character. She is still being held by the Indians . . .

Laos

Struggle for Peace

THE latest coalition government in Laos has evoked mixed responses. The familiar argument has been advanced that the agreement between the Pathet Lao and Souvanna Phouma was the natural outcome of the decision by North Vietnam and the United States to stay away from Laos. This, it is suggested, made it possible for the 'traditionally peace loving' Laotian people to sort out their differences amicably. Others have seen in the peace agreement the degeneration of the Pathet Lao. By this compromise, it is argued, the Pathet Lao has thrown overboard the principle of armed struggle.

The history of the Pathet Lao's struggle does not support either of these interpretations. Since the fifties the Pathet Lao has signed a number of agreements for formation of coalition governments. The first such agreement was in 1956 and allowed the Neo Lao Haksat to emerge as an open political party. This agreement over a neutral coalition thwarted US efforts to instal a puppet regime. Since then the Pathet Lao has entered into many agreements with the Vientiane regime:

one in June 1961 under which Souphanouvong, Souvanna Phouma and Boum Oum agreed to set up a provisional coalition; another one later in the same year providing for the same three agreeing that Souvanna Phouma would be the Prime Minister of a government which would include eight neutralist, four Pathet Lao and four Boum Oum nominees; the third, at Geneva, in January 1962 on the specific composition of the cabinet; and the fourth, the 1962 Geneva agreement on Laos.

All the agreements followed the same pattern: the initiative for peace invariably came from the Pathet Lao and as invariably the agreements were flouted by the Vientiane regime with the connivance of its US mentors. Every one of these abortive peace agreements has been followed by further communist gains on the battlefield. Elsewhere in Indochina too national liberation struggles have followed the same course. For instance, Vietnam communists' control of virtually the whole of the Central Highlands today makes it possible for them to take advantage of the politics of peace.

Whether the present agreement will be aborted like its predecessors it is difficult to say. However, one should not overlook the current balance of forces in Indochina before pronouncing judgment. For one thing, the communists' control over the countryside is now decisive. Equally important, the US cannot be very anxious to directly intervene in the conflict. Though the United States' ability for mischief-making through its various agents should not be underestimated, the effectiveness of such agents in the past has been rather limited, as is seen from the fate of the various special forces raised by the Americans to fight in Laos. In these circumstances, a ceasefire need not adversely affect Pathet Lao interests. It may be that Vientiane's eagerness for peace is just a cover to gain time for strengthening its armed forces. But the Pathet Lao has faced similar situations in the past and has been able to use the contradictions, both internal and international, to its advantage in war and in peace.

Agricultural Wages

The Long Haul

A Correspondent writes:

THE Maharashtra government has fixed the minimum wages of agricultural labourers by law. However, the minimum wages law will remain on paper unless agricultural workers are organised to demand the statutorily-fixed wages. Even when they are so organised, the landlords are unlikely to give in without a fight.

The first major clash over the enforcement of the minimum wages occurred in Karajkupa village in Nandurbar taluka of Dhulia district on April 8. The agricultural labourers in the area are mainly adivasis and the landlords are Hindus. The current wage rate for casual agricultural workers is Rs 2 per man and Re 1 per woman. Those employed on a monthly basis or for the whole year ('saldars') are paid Rs 40 to Rs 60 per month. The hours of work are not fixed, especially for the saldars who have to attend to the household chores of the landlords in addition to the work in the fields. And far from getting any holidays, the saldars have to work for 13 months to fulfil their annual contract with the landlords for which they are paid 12 months' wages.

After the announcement of the statutory minimum wages, an agreement was arrived at in Karajkupa among representatives of the Adivasi and Agricultural Workers' Sangh and the landlords and the chairman of the gram panchayat on the wages and other terms of employment of agricultural labourers. The wages of daily workers have been fixed at Rs 3 for both men and women, of saldars at Rs 1,200 per year and of monthly workers at Rs 100 per month. The wages are to be paid partly in cash and partly in kind. Daily workers are to be paid Rs 2 in cash and 1 kg of foodgrains. Saldars are to be given 6 quintals of foodgrains per annum at the rate of Re 1 per kg. The monthly workers will get 2 paid holidays in a month and the saldars 24 holidays in a year. Working hours for all types of agricultural workers have been fixed at 7.

On April 8 the CPI organised a meeting in Karajkupa to demand the implementation of the wage agreement. An adivasi boy went to the house of a prominent landlord of the village, who owns 150 acres of land, to ask two agricultural labourers who were working there to go to the meeting. The boy was allegedly slapped by the landlord's son. He went back to the meeting and returned to the landlord's house with his father. By now there was a gathering of landlords there. The landlords went to the terrace of the house and fired iron pellets from guns at the boy's father, injuring him. On hearing the sound of the shots more labourers rushed to the spot. The landlords continued to fire, injuring 27 persons, including three women. The landlords initially lodged a complaint with the police alleging that they had fired in self-defence and that the adivasis had broken into the house and looted foodgrains. The complaint was found to be baseless and the police finally arrested 19 landlords.

After this incident, the Nandurbar taluka panchayat samiti president arranged a series of meetings of agricultural labourers and landlords to secure the implementation of the minimum wages. For this purpose he has grouped the 90 adivasi villages into 12 divisions. One may be sure, however, that there will be many more confrontations between the agricultural labourers and the landlords before the latter actually begin to pay the higher wages.

How deeply the landlords resent the attempts to organise the adivasi agricultural labourers was demonstrated by another incident in Shamsherpur village in Nandurbar taluka. Angered by a group of adivasi women singing militant songs composed by the late Ambar Singh, the well known adivasi leader, two landlord youngmen tried to run down the women with their motor cycles on April 16. Later some 40 landlords, many of them mounted on horses and armed with guns and sticks, charged into the adivasi 'busti' in the village. Among their grouses was that one of the adivasis staying in the busti had organised a successful campaign against the trade in illicit liquor and 'matka' gambling which had affected the earnings of the landlords and their kith and kin.

An important issue raised by both the incidents referred to above is that of the arms, including guns, in the possession of the landlords. P K Patil, landlord leader of the area, has been trying to raise what is virtually a private army on the plea that the landlords have to take steps to protect their crops. The actual situation is very different. It is the agricultural workers and the rest of the rural poor who have to be protected against the use of the guns and other arms that the landlords already have. In the last one year alone, and only in the Dhulia district of Maharashtra, there have been innumerable incidents in which landlords have used guns and other arms. As agricultural workers organise themselves to demand their rights — such as the government-fixed minimum wages — the incidence of violence directed at them by the landlords is bound to mount. It is important, therefore, that a campaign be launched to force the government to cancel licences for firearms issued to landlords and to sequester these arms.

Scheduled Castes

The Fire This Time

VIOLENCE erupted again last Saturday night in the BDD Chawls in Bombay which were the scene of protracted clashes in January this year between the scheduled caste converts to Buddhism, owing allegiance to the Dalit Panthers, and Hindus. In a single spell of firing the police killed four persons and injured over 25. Thus in terms of loss of life and injuries the latest incidents have been more tragic than even those of January.

Particular attention needs to be drawn to two aspects of the latest incidents. The first is the suppression of news of a singularly provocative action on the part of the police which was subsequently raised in the Lok Sabha. The police allegedly stripped a young Buddhist of his clothes, blackened his face, attached a tail to him and paraded him around the Chawls. In assessing the gravity of this act it has to be remembered that for the last many months there has been continuous tension between the Buddhists and the Hindus in the BDD Chawls. Nothing could have been more calculated to provoke the Buddhists and trigger a fresh round of clashes than the humiliating treatment of the Buddhist youth by the police. The clashes, in which four persons were killed and more than 25 injured in police firing, inevitably followed this incident.

Second, the police has claimed that the firing was justified by the severity of the clashes between the Buddhists and the Hindus. Even according to the official versions of the incidents, both sides were equally involved in the clashes. Yet three out of the four killed and most of those injured in the police firing were Buddhists. This together with the incident of the Buddhist youth once again casts grave doubts on the police's manner of handling situations involving Buddhists and Dalit Panthers. At the time of the clashes in January, charges had been made — and never satisfactorily answered — that the police had done much to provoke the Buddhists.

Many factors apparently contribute to the police attitude to the Buddhists and their organisation, the Dalit Panthers. The microscopic representation of Buddhists in the police force is certainly a relevant factor. Also there is the attitude of the Maharashtra government. The government has obviously set itself the task of putting down the Dalit Panther organisation. Towards this end it is pursuing a series of court cases against the leaders of Panthers. It has also thrown its weight behind the Republican party whose utter failure to redress the grievances of the scheduled castes was responsible for the formation of the Panthers. Against this background it is hardly surprising that the judicial enquiry announced by the government into the clashes in January has yet to get off the ground after three months.

LETTER TO EDITOR

Dear Money, Indeed!

THE main point of your article "Dear Money, Indeed!" (March 23) is that a large volume of outstanding bank credit is provided at interest rates of less than 6 per cent. A clarification is required here as you have not fully taken into account the type of credit facilities that go into this interest range group. You have said "the only two important categories of commercial bank advances which should normally attract such low interest rates are export credit and credits under the differential interest rate scheme". However, two other important relevant components are export bills purchased and inland bills purchased. Purchase of bills, whether inland or export, do not attract a rate of interest as such. However, bill financing is a part of bank credit and as such the credit extended through this facility has been included in the 'less than 6 per cent' interest range.

The distribution of outstanding credit according to type of account given in the BSR publication shows a total credit limit of Rs 2,064 crores and amount outstanding of Rs 844 crores in respect of inland and export bills purchased and discounted. Obviously, this is higher than the credit limit and amount outstanding in the 'less than 6 per cent' interest range. This is because bills (inland and export) discounted do carry specific interest rates which are higher than 6 per cent.

Incidentally the total amount outstanding in the 'less than 6 per cent' category has been printed as Rs 4,615.8 crores in the table appearing in the article. The correct figure is Rs 461.58 crores.

C S RAMACHANDRAN
Committee of Direction on Banking Statistics,
Reserve Bank of India,
Bombay

[*Our Correspondent writes*: In attempting a clarification, C S Ramachandran has unwittingly exposed a serious flaw in the Reserve Bank's classification of bank credit by interest rates. Commercial banks levy a charge for purchasing bills; this charge is called by different names, one of these being 'hundian'. Calculated at an annual rate, the charge will work out to much more than 6 per cent. Yet the Reserve Bank has, according to Ramachandran, included the entire amount of bills purchased in the category of bank credit bearing less than 6 per cent interest — apparently on the ground that since what the banks charge for purchasing bills is not *called* 'interest', advances by way of bills purchased may be deemed to carry zero rate of interest!

Had Ramachandran indicated the amount of bills purchased, it would have been possible to know how much of the Rs 462 crores, shown as credit extended by banks at less than 6 per cent, really represents advances at less than 6 per cent and how much is the result of the Reserve Bank's whimsical classification. If half the amount is taken to represent bills purchased, it still leaves an amount of Rs 230 crores to be explained. Why should banks have advanced such a large amount at less than 6 per cent interest?

In any case, our criticism of banks for advancing money at very low rates of interest did not refer only to advances at less than 6 per cent. As we had pointed out, "Over 40 per cent of all credit limits extended by banks were at interest rates of 9 per cent and less. If the data are at all reliable, then it is clear that even as recently as in December 1972 the banks were allowing large borrowers to appropriate a big chunk of advances at interest rates which did not cover their costs, so that they were in effect subsidising these borrowers." To what categories of borrowers and for what types of activities had the commercial banks extended credit limits of over Rs 3,900 crores and advanced more than Rs 1,500 crores at interest rates of 9 per cent and less? It is a pity that C S Ramachandran does not even attempt to answer the question. In the circumstances, one must be grateful for small mercies; so let us thank Ramachandran for pointing out the foot-loose decimal point in the table.]

Calcutta Diary

A M

THE old order changeth, yielding place to old. Bank chairmen, nearly the whole lot of them, are now part of the nationalised sector. Has it made the minutest difference to their style of functioning? In their annual statements, these chairmen now-a-days have to add one or two mandatory paragraphs on what they are doing, or propose to do, for the 'hitherto neglected' sectors. Come hither, ye hitherto-neglected sectors, be at attention, we are, for the next twenty-two seconds, going to talk about you: nationalisation has made it necessary that we devote, additionally, two hundred eighty to three hundred five words in our annual statements extolling your several virtues. For the rest, 'responsible' banking demands that bank chairmen must continue to meet their obligations to the organised industrial sector, ensure that packing credits for exports are dealt with expeditiously, be solicitous of the whims and foibles of those of their clients whose deposits exceed, say, Rs 10 crores, look into the matter of obtaining a healthy return from their investment portfolio, see to it that the pet projects of key politicians in the different states are properly taken care of, make absolutely certain that those who subsidise ministers are in turn themselves duly subsidised. After all this, where does one find the time or resources for ushering in a credit revolution in the country? You scan the annual statements which are splashed, at fat cost, across the newspaper columns: even the format of the statements remains unchanged from days of yore, with the inevitable, slightly blurred, supremely complaisant-looking picture of the chairman and managing director at top, left — or is it top, right?

And now that the government has, once more, shuffled its economic philosophy, all the greater reason for the old order reverting to the old. The shibboleth of social justice is out, considerations of growth and efficiency are again in. In any case, it was puerile — and, should not one add, dishonest? — to assume that a social revolution could be brought about by simply transferring the equity of the banks through a statute. A social revolution has to start with the society itself, with the polity which governs this society, with the economic structure whose product this polity is. Banks cannot change this structure: a determinant variable is in no position to take charge of the determining one.

But one should present, as they say, a rounded story. A pluralist society is a jumble of contradictions. The authorities having decided to place a moratorium on its social commitments, more than a handful of good men, men with golden hearts, men who have dreamed dreams, are left in the lurch inside the banks. What is going to happen to them now? They could have hardly realised that the signals beamed across since 1969 were going to be switched off so soon. None of them are ideologues, but they are those who had taken the government at its face value, and who wanted to do a good turn, if it were ordinarily possible, to the ordinary men and women about whom the banks had not hitherto bothered. They have known for long — and at first hand — the irrationalities which flow from a skewed distribution of assets, including banking assets. Since the government had now taken over the banks, many amongst them had begun to tell themselves, maybe these stodgy institutions too could be taken by storm. True, in the nearly five years since July 1969, nothing of substance has been achieved toward shifting the bias in bank advances. True, the pretensions have overshadowed the actual acts of good turn to the poor and the weak. Still, were one an optimist, it was possible to take the position that since a few good men, armed with the government's declaration of intents, have started to bestir themselves, perhaps an 'incremental' revolution would indeed take place, perhaps over the long haul, following an interval of ten or fifteen or twenty years, things would alter, quantity would turn into quality; even if there were going to be no revolution between now and tomorrow, nonetheless, gradually, bit by bit, inch by inch, pace by pace, in the course of ten, fifteen, or twenty years, there would be crawling progress toward the millennium.

What will the good men do, now that the philosophy of to-those-who-have-more-hath-to-be-given has begun to ride again? The offensive against the nefarious practice of 'facile lending on the basis of half-baked schemes' to tramps and non-descripts is already launched. Hell has no fury to match the fury of satraps who have won back their kingdom. The well-intentioned men left in the banks must therefore run for cover. Could not they however still play a silent rearguard role? The once-and-past grandiose ambition to alter, by one massive stroke, the overall pattern of bank advances has of course to be buried seven fathoms deep. Even were the external circumstances favourable, the enthusiastic ones could have only succeeded at nibbling at it; since the polity continued to belong to them, the rich and the privileged would have known how to protect themselves. In the altered context, those who, in the past, harboured dangerous thoughts must appear in proper sackcloth and ashes, and repent. Having done that, could not they still concentrate on minor gestures, on little turns of helpfulness toward the poor and the weak?

Take just any of the nationalised banks. At a given moment, it must be carrying in its account books at least fifteen to twenty so-called book debts, dating back several years, on which repayment has been systematically defaulted and which are therefore as good as bad debts. The average size of such for-the-present-book-soon-going-to-be-bad debts could be anywhere in the range of Rs 5 to 10 crores; the total default might even exceed Rs 100 crores for some banks. Scotch your evil thoughts, let not one little finger be lifted to recover such debts; these were incurred by big parties, to ask them to return the funds could affect incentives in the system, and the wheels of production might even come to a stop. Do not, therefore, disturb the bad debts contracted by the rich. But what about allowing a special quota of bad debt for the poor and the weak? If the banks have not caved in where total outstanding bad debts are as much as Rs 100 crores, they ought to be able to withstand the shock of another Rs 5 crores or thereabouts advanced to the poor on which payment could, depending on circumstances, be somewhat uncertain.

Each year, with this small kitty of Rs 5 crores, the conscientious men left in each bank could do a whole lot of good to the weak and the poor. Provided the bank is not particularly choosy, particularly snooty, particularly suspicious of people who are down and out, it could, for example, decide to distribute this sum amongst 1,000 different individual parties or groups, none of whom however must receive more than Rs 50,000 as advances. You can do so many things with Rs 50,000, or even with a considerably lesser amount You can, for example, start a book

shop, run a publishing or bookselling firm, edit a literary or commercial journal, organise an amateur theatrical party, open a modest workshop, start a roadside tea-stall, begin a messenger service, create a catering organisation, organise a small-scale music and dance school, set up an artistes' colony, establish a smithy outfit, operate a small-scale transport network, found a rural marketing unit, expand a barber shop, and so on. Be a romantic, indulge yourself; imagine one or two mobile vans, belonging to the banks, which will not worry about collecting deposits, but will wind their way in small towns and the countryside, with a ready window to dole out funds. If there are 300 working days in a year, the bank — egged on by the good men left in it — can take the vow that, on an average, it must each day locate at least three different parties to whom it could lend Rs 50,000 or smaller sums. It would not ask too many questions; it would not raise the issues of security or collateral; it would have only a brief exchange of views with the person or persons at the other end, listen to him or them, form an intuitive judgment about the quality and character of the person or persons, and reach a decision.

Now and then, the judgment will be

rong, the trust that will be reposed will not be repaid, the money that will be doled out will not come back. But statistically it is altogether improbable that all of the one thousand and odd parties the bank would offer financial accommodation in one year would turn out to be bad eggs. Even were half of the total funds to come back, the experiment would be well worth undertaking. Here too, there is such a thing as learning by doing. With experience, the banks may discover that they are choosing less and less bad-risk cases. Even were this not to be so, does it really terribly matter? If the banks could afford to keep quiet on bad debts of the order of Rs 100 crores or more outstanding against rich, lush parties, could it not also carry an additional load of a paltry Rs 2 to 3 crores on account of non-descript, ordinary people?

The good men left in the banks could still thus fill in a role. They need not be ideologues, they need not even go against the general bias of the banking system, they may merely invoke some of the commoner decencies of life. It is not socialism, but a simple act of run-of-the-mill courtesy to risk a minuscule fraction of your total resources on the poor and the ones without connections; it will not hurt the bank chairmen, they will have still plenty left for the no-doubt-fully-baked schemes of their big depositor-customers.

CAPITAL VIEW

JP in Town

Romesh Thapar

I HAVE often asked myself why Indira Gandhi usually gets the better of her opponents. Maybe the recent JP episode has pointers. After a terribly stupid exchange with him, she gave JP the kind of halo he needed to pull off a most impressive demonstration of popular anger in Patna. From there, he arrived in Delhi the capital city to launch a new movement.

Seldom has one seen so much interest in his activities. And then, suddenly, it was all over. He had merely organised a boring meeting with the usual performers — the Chaglas, the Kripalanis, the Palkhivalas and such other spent bullets.

If the people are sick of what goes on in the name of government, they are equally allergic to the bunch of 'leaders' who have been with us for too long preaching *status quo*ist theory.

When will some of these good men retire — and finally — as their counterparts do in other countries? This is surely their time for writing memoirs; but even these are not written with much profundity if the temptation to re-enter the political battle persists. Is not Morarji Desai's recent autobiography severely damaged by this gnawing thought?

This country is saddled with too many old men who are now incapable of providing intelligent and coherent leadership to a population that is dominantly post-Independence. When will this simple truth sink in? If respected elders wish to be catalysts, let them show evidence on their platforms of more youthful thinkers and actionists. A young mob in a street is not enough.

This criticism can be levelled at the entire spectrum of our political life, may be with the possible exception of the emerging extremist radical groups (logically young and tempestuous) and the Jan Sangh. The communists and socialists of various alignments seem to be competing to hold on to their old *dadas*. And as for the Congress party under Indira Gandhi, the only youth to be located are in the shadowy and suspect areas of political power.

Unless our political parties begin to draw young men and women in their twenties and thirties, who can articulate the feelings of a subcontinent that is growing younger with the explosion of population, we will remain at the mercy of leaders who do not know what they are talking about.

JP's attempt to bring the present anger of the towns into some kind of focus, as a first step to amend a democratic system which has been bruised and battered by unprincipled politicians, has failed. It is a result that could have been forecast because adequate attention was not paid to preparing a national thrust on a meaningful alternative. The interim period could have been utilised for purging governments and municipalities of the openly corrupt by popular action. Maybe, everyone was railroaded by the charge of being a 'fascist' — hence the stressing of so-called democratic commitments by judges and lawyers (who alone among professionals are duty bound to defend the indefensible!)

The talk in the towns is not concerned with the prickly consciences of our legal luminaries. The thinking which sparks popular revolts is quite simple. Indira Gandhi must sack the corrupt politicians who now surround her both at the Central and state levels. No calling off of strikes and agitations until the wasteful extravagances and styles of the public sector managers are curbed, No punishment for incompetence until the highly placed are first removed. Following close upon these demands, the essentials of living must be made available. Luxuries should be removed for export, to pay for the essentials which are in short supply. And punishment at all levels for officialdom which indulges in harassment, which fails to realise that its job is to serve the people.

This straightforward programme packs a great deal of ideology, slogans, *mantrams* and what have you. But it would be best to present it in down-to-earth formulations. Otherwise, the pontificators will get to work, talking endlessly, doing nothing, fanning the anger of a basically patient people. If our thoughtless government continues in its present ways, the happenings in Gujarat and Patna will pale before others, fascists or no fascists. The railway strike has been headed off, but every sector of government employees bides its time.

Credibility, it must be repeated, is what is lacking at this moment of crisis. And it is credibility which has to be established whatever the cost. There is little point in Indira Gandhi reassuring herself in the rural hinterland. It is in the towns, the ugly, twisted towns of this subcontinent, that credibility has to be won. In the final reckoning, power rests in these towns.

It is strange to have to stress these rather obvious truths, but the Congress party, ravaged by corruption and conceit, is becoming insensitive to precisely these fundamentals. Indira Gandhi cannot sit over this mess imagining that some magician will come along and do the trick. Those days are gone, never to return.

Otherwise, it's warming up. A dry, dreary summer is ahead. The capital is once again the breeding ground of a vicious kind of mosquito. Municipal facilities deteriorate from week to week. Perhaps, Delhi will be like the rest of India, given this pace of deterioration, by the end of the year. Could be that such a development brings us closer to realities.

As for the armed intruder in Parliament the story has yet to unfold ...

Fresh alternatives for industrial enterprise:

AN OPEN OFFER TO INVEST IN ORISSA.

If you are planning to set up a large or medium scale industry, you would do well to establish it in Orissa. The facts prove that Orissa has all the essential pre-requisites for healthy, profitable enterprise :—

Abundant natural resources : a vast concentration of mineral ores, a large agricultural area, valuable forest land, a long coast-line and numerous rivers. Factors ideal for a broad spectrum of industries.

Responsive labour : technically qualified personnel from the engineering colleges, polytechnics and industrial training institutes augment a large, responsible work force.

Ideal infrastructure : abundant electric power; easily available water; ready-and-waiting industrial estates and developed land; a developed communication network, plus the economic advantages of the country's deepest port, Paradip.

Attractive incentives : Orissa's industrial and financial corporations—IDCOL*, OSFC*, OSIC* and IPICOL*—offer attractive credit facilities and competent services to set up and run large or medium scale industries profitably.

This advertisement can only serve to highlight the advantages of investing in Orissa. For details of investment opportunities, contact the Corporations mentioned below. You'll find these professionals speak the same language as you—profitability.

INDUSTRIAL DEVELOPMENT CORPORATION OF ORISSA LTD.
P. O. Box No. 78, Bhubaneswar-1. (participation in joint sector projects)

ORISSA STATE FINANCIAL CORPORATION
Barabati Stadium, Cuttack-5. (finance for small and medium industries)

ORISSA SMALL INDUSTRIES CORPORATION
Killa Maidan, Cuttack-1. (assistance to small industries)

INDUSTRIAL PROMOTION & INVESTMENT CORPORATION OF ORISSA LTD.
35 Satyanagar, Bhubaneswar. (finance and services to all industries)

KIRLOSKAR BROTHERS fared very well during 1972-73 to show a net profit of Rs 35 lakhs against a loss of Rs 25 lakhs in the previous year. This outcome was made possible by the stepping up of production of all products, except hermetically sealed compressors. Increase in turnover apart, what helped the company to reverse the previous year's picture was the substantial widening of margins. This becomes clearer when viewed in the light of the fact that gross profit, as shown in the accompanying Table, was arrived at after making full provision for gratuity liability of Rs 50 lakhs against a mere Rs 3 lakhs provided last year. Dividend was stepped up 4 points to 12 per cent, which was covered nearly 1.5 times. Even this did not please all the shareholders, for some of them had an eye on the reserves and had been expecting a gift of shares. Recently, there have been rumours in the market that, instead of bonus shares, the management might come out with a proposal to issue 'rights' shares at par in a small proportion. The scrip has been quoting at around twice its par value. The company's turnover during the current year has been rising, although demand for diesel engines and pumps has been affected by the steep increase in prices of crude oil and scarcity of diesel oil. The supply of electric motors has also been inadequate on account of shortage of essential raw materials required for their manufacture. Export demand for small pumps has been rising in recent months and this may partially offset the fall in home demand. Demand for hermetic compressors, which was poor last year, has also improved considerably. At the same time, efforts are being made to secure higher prices for the products to partially neutralise the effect of cost increase. Kirloskar Tractors, which made a public issue of Rs 150 lakhs in January last, ceased to be the company's subsidiary.

AMERICAN UNIVERSAL ELECTRIC (INDIA) is planning major diversification of its product range for wider application and also modernisation of plant facilities to ensure a high growth rate for future. The company has obtained a 'letter of intent' for manufacturing press tools, jigs, fixtures, and special accessories to the value of Rs 70 lakhs per annum. In addition, it has registered with government of India a capacity of one lakh numbers of domestic pumps for use in scientific laboratories, room-coolers, machine-tools and booster pumps. AUE has entered into partnership with DLF United by subscribing to one-fourth of the total capital of Rs 10 lakhs of 'Kool-hire Corporation' engaged in the business of hiring out electric fans and room-coolers. Also, as one of the promoters, AUE has invested Rs 18 lakhs in equity capital of Willard India, which is setting up a plant at Sikandrabad in Bulandshahr district of UP for manufacture of lead acid storage batteries in financial and technical collaboration with ESB of US. AUE turned out good results for 1972-73, the tenth year of its existence, with considerable increases in sales and earnings. The recommended dividend of 6 per cent, wholly exempt from tax, is covered fourfold. No provision for tax has been made in the accounts as the total benefits and concessions are expected to exceed the year's profits. Also, no provision has been made in respect of the liability for future gratuity. The method of charging depreciation has been changed from written-down value to straight-line. The excess depreciation provided in the preceding years amounting to Rs 16 lakhs has been reversed. The charge for depreciation, therefore, has been reduced by Rs 7 lakhs.

DYNAMATIC HYDRAULICS is a new company which is setting up a plant near Bangalore to produce industrial hydraulic systems required by the tractor, earth-moving equipment, fork-lift truck, hydraulic press and machine-tool industries. A technical collaboration agreement has been entered into with Dowty Hydraulic Units of the UK. The licensed capacity in value terms is Rs 1 crore, but the management expects that it will be enhanced to Rs 2 crores. The project cost, esti-

mated at Rs 79 lakhs, is intended to be financed by share capital of Rs 24 lakhs, deferred payments of Rs 11 lakhs and the balance by borrowings. The public is being offered 1,44,000 equity shares of Rs 10 each at par to raise a part of the finance required for the project. The subscription list will open on May 9 close on May 20 or earlier, but not earlier than May 13. The plant is expected to go on stream by October next. According to DGTD estimates, demand for hydraulic systems is around Rs 8 crores, of which Vickers Sperry, another company in the field, supplies about Rs 2.5 crores to Rs 3 crores and some other units about Rs 50 lakhs. The principal promoters of the company are J K Malhoutra and Hari L Nichani, who are chairman and managing director respectively. The public issue is managed by FICOM.

HARYANA ELECTRO STEEL, which made a public issue a year ago to raise part of the finance required for its project, expects to commence production next month. The construction work is in the final stages and machinery is being erected. The State Electricity Board has sanctioned a load of 6 MVA for the project, which is considered to be adequate. The board has been strengthened with the addition of five new directors.

NEW DELHI

Making a Scapegoat of Labour

B M

THE organised sector of industry and business, represented by the Federation of Indian Chambers of Commerce and Industry (FICCI) which held its annual session this week, reflects a new mood of confidence over the direction of government policies. This confidence appeared to be fully justified in the light of what the representatives of the government, from the Prime Minister downwards, had to say at the session. The Industrial Development Minister, C Subramaniam, himself articulated the sentiments of the captains of industry and trade most forcefully when he said that the 'investment climate' was no longer a 'mysterious' problem and should not be made an excuse for lack of effort on the part of private industry. The Prime Minister was equally forthright on this question in her inaugural address.

The mood of the FICCI session was probably best reflected in the reference in the address of its outgoing President, Charat Ram, to the decision to give up state trading in foodgrains. Charat Ram interpreted the decision as demonstrating 'the highest level of political and economic confidence' which was possible only under a 'fearless and national-minded leadership' such as that of Indira Gandhi. These remarks were greeted with thunderous applause. The Prime Minister, for her part, reassured the FICCI that in the formulation of government policy the profit motive would receive full consideration and that a proper pricing policy for the products of industry would be pursued.

Given this rapport between government and industry, so well expressed on both sides, the leaders of the FICCI understandably found the occasion suitable for pressing home their advantage. After welcoming the government's decision to abandon the take-over of wholesale trade in wheat, the Federation moved on to the demand that "a review has to be made of the policy of nationalisation". Many thought that this demand was rather superfluous. They were convinced that the phase of playing with nationalisation was over and that the political leadership was now too shaken to make any more experiments in that direction. The more relevant demand of the FICCI was, therefore, that for greater support to private enterprise. The stress was on creating conditions under which obstacles in the way of generation of internal resources by private business and industry would be removed. The suggestion made towards this end included a review of the government's policies on debt-equity ratios, conversion of loans by public financial institutions into equity and inter-corporate investment.

The FICCI's most important demand in this context, with which the government seems to be in agreement, was in regard to the pricing of the products of industry. The demand was not for lifting price controls; instead it was that the prices of controlled commodities be brought into a 'proper relationship' with costs so as to attract investment. The FICCI demanded: "Taking into account the sharp increase in the prices of capital goods and other costs, the various alternatives for consideration are differential excise duties, dual price system as in the case of sugar and direct incentives like tax holiday, development rebate, etc." Dual pricing, it was clear, had become a great favourite with private industry. The commodities proposed to be covered under it, as mentioned at the FICCI session, were textiles, cement, vanaspati and other mass consumption goods.

The approach to pricing of industrial products signifies a general understanding between the government and industry on the question of price stability. Once the government has chosen to follow a policy of high-cost foodgrains, in deference to the demand of the producers of the marketable surplus of foodgrains, it is inevitable that price stability can be arrived at only at a level of prices far higher than the present ones. The attempt is no longer to hold the price line at the present level, much less to lower it, but to stabilise it at a level which will correspond to the level to which foodgrain prices have already been pushed up. The suggestions incorporated in the FICCI's resolutions are all already under the active consideration of the government.

*

K D Malaviya made quite a spectacle of himself while winding up the debate on his Ministry's demands for grants in the Lok Sabha. For the poor performance of the vital steel and coal industries under his charge he laid the blame squarely on the trade unions and on the political influences allegedly operating on workers. This came as a surprise to many. Malaviya was trying to find an alibi for a situation which he has so far found beyond him. But the manoeuvre is not going to help him.

What is surprising is that he chose to take this position against the internal assessment of his own Ministry with which he was fully associated. At a conference of chief executives of steel plants and the coking coal mines organisation, held in the third week of March, the unanimous view was that during 1973 workers in all the steel plants had suffered a direct loss in earnings because of the fall in production — particularly from May onwards when prices began to rise sharply. The workers had no responsibility, direct or indirect, for the production losses; yet their earnings in the form of incentives and rewards schemes were slashed. Having taken note of this development, the conference went on record to say that "It is noteworthy that despite this large loss in earnings, for which neither the management nor the workers directly or indirectly are responsible, there has been NO industrial unrest or work stoppage in any of the plants" (emphasis in original). The implication was that the government and the country should appreciate the great restraint and forbearance that the workers and the unions had shown in a difficult situation.

Malaviya found himself in the excellent company of the Federation of Indian Chambers of Commerce and Industry and the All-India Organisation of Employers which, in their annual sessions at about the same time as his diatribe against the trade unions, were loudly bemoaning the deterioration in industrial relations 'notwithstanding what the statisticians might say'. This last qualification is inserted because according to statistics the loss of man-days on account of industrial disputes during 1973 was less than in 1972. However, there is an important distinction to be made here. Unlike in the private sector where officers and the supervisory staff are well taken care of, in the steel and coal mining industry in the public sector under

Malaviya's direction, the officer cadre too is having a raw deal.

In the case of the steel plants, for instance, the middle level staff is not entitled to revision of DA following rise in prices without the prior permission of the Union Cabinet — and such permission is not given easily. As a result, officers in the pay range of Rs 550-775, drawing about the same emoluments as a good many skilled workers, are at present getting about Rs 75 by way of DA as against the DA of about Rs 150 paid to workers who are, besides, entitled to overtime. The officers' take-home pay is thus much smaller than that of many workers. The steel plant managements have not been able to correct this anomaly.

Similar is the case of the officer cadre of the nationalised mines. After nationalisation a cut was made in their emoluments. This has caused considerable frustration. The conference of chief executives referred to above posed the question: "It is to be considered whether the amount of money we save by large-scale changes resulting in downward revision in the take-home pay of officers was worth it." The mine managements have been warning against the frustration building up on this account but there has been no positive response so far from the government.

NORTH

Last Year's Lovely Lesson

JUDGING from the latest indications, Punjab's performance on the procurement front this year — and hence its contribution to the Central pool — would be far below expectations. Though precise figures of the rabi output are not available, both official and unofficial spokesmen fear a 15 to 20 per cent fall in the marketable surplus. This is thought to be the cumulative result of several adverse factors — failure of winter rains (except for the couple of light showers in several districts at the fag end of the season), and acute shortage of fertilisers, diesel oil and power. According to official estimates, the Centre is unlikely to get more than 15 lakh tonnes of wheat from Punjab under the new system of collection compared to the 24 lakh tonnes the state government would have contributed had monopoly trading been maintained on the lines it had suggested. Even this estimate of 15 lakh tonnes is based on the presumption that wholesale traders and official agencies, operating side by side, will procure about 30 lakh tonnes — half of which would have to be turned over to the Centre. Chief Minister Zail Singh has made it clear that official agencies would compete with private traders in purchasing wheat from the farmer: in a talk with newsmen he posed the ironic question: "Why should not the government earn a profit when traders can?".

There is fear, too, that in the absence of any compulsion to market a major part of their produce the medium and large farmers would go in for large-scale hoarding. The shrewd farmer's calculations are supported by last year's experience when prices had risen sharply in the winter months enabling him as well as the retailer to reap handsome profits. Besides, the Punjab government has announced its intention this year to build up a buffer stock of about 4 to 6 lakh tonnes — to which the Centre has agreed. It is anxious to avoid a repetition of the last season's dismal experience, when the country's granary itself fell short of foodgrains and Central allocations came in driblets.

The farmer's hopes and the consumer's fears have in recent weeks diverted attention from other pressing challenges. Outstanding among these is the virtual bankruptcy of the State Electricity Board and the imminent prospect of increase in electricity tariffs. And it is not only the unduly heavy and persistent deficits in its budgets which cause concern. There are also the continual fall in operational efficiency, the endless and expensive delays in completing new projects, the countless wasteful practices, and the totally disproportionate interest payments that eat up the major portion of its revenue. The interest charges on government loans alone rose from Rs 8.79 crores in 1969-70 to Rs 16.33 crores in 1973-74. The Board's total interest burden in the current year is Rs 20.37 crores; for 1974-75 it is estimated at Rs 23.77 crores. As against this, the revenue receipts in 1972-73, for instance, were only Rs 22.16 crores.

That the broad financial picture was the same in 1971 is clear from the fact that, out of the total revenue of Rs 19 crores, Rs 13 crores had to be paid as interest charges — Rs 10 crores on loans for the Bhakra complex alone. Of the many scandals associated with the Power Board, those stemming from serious irregularities in accounts, corruption, persistent leakage of revenue including the heavy line-losses, have been frequently aired on public platforms and in the Press. A stage has now been reached when a higher tariff is considered the only way out if the Board is to operate on even keel.

Haryana, too, may have to raise its electricity rates to augment its revenues — though Congress legislators are opposing such a move in view of the recent enhancement of the land tax. The state's 1974-75 budget, which was rushed through the Assembly early in January to enable Chief Minister Bansi Lal to devote all his energies to the UP elections, disclosed a Rs 17.97-crore deficit left uncovered "for the time being". Since then, the Chief Minister has from time to time warned the people that more taxes were unavoidable to meet the mounting expenditure, especially on the payment of higher salaries and additional DA to government employees — the all-too-familiar price of peace on the domestic front.

At a joint meeting of the Haryana Congress Legislature Party and the Provincial Congress Committee held on April 8, several Ministers underlined the need for enhanced fiscal receipts if the state's urgent development requirements were to be adequately met. The very next day, the Chief Minister announced the government's intention to impose new taxes and duties, estimated to yield over Rs 5 crores. The tax package includes a 20 per cent increase in bus fares, 100 per cent increase in the market fee (which would now be Rs 2 for every Rs 100 worth of commodities purchased), a higher purchase tax on sugarcane (from 50 paise to 70 paise) payable by sugar mills, higher sales tax on diesel and petrol, and a one-paise per unit increase in the duty on power used by industries which would mostly affect power-operated furnaces. The higher duty on power would imply a further contribution of about Rs one crore by the industrial sector. Yet, the main consumer of electricity in Haryana — the agriculturists — have been left alone. The incidence of the higher market fee too will be largely on the consumers and not on the agricultural classes.

Although the Himachal Pradesh Chief Minister has announced that taxes over and above those levied in the budget are unlikely to be imposed during the remaining Fifth Plan period, Haryana may have to mobilise more resources during the coming years to meet the Centre's objection against the series of deficit budgets and the recurring demand for Central grants. On January 18 last, the Haryana Assembly had approved the government's bill to double the court fees. The measure, which the Revenue Minister said would affect only the propertied classes, is expected to net an additional Rs 35 lakhs from registration and Rs 3 lakhs from copying fees. Since the expenses on establishment have soared during the last two or three years, it is doubtful whether even the sizeable yield from the new tax package would help the state to shake off its economic stagnation of the past three years.

Meanwhile, there has been in recent weeks a new political development — the emergence of the Arya Sabha — Chief Minister Bansi Lal has gone out of his way to win over state employees of various categories and abandoned his rigid attitudes to buy a strike-free climate. But the Arya Sabha, a curious combination of Rightist and obscurantist elements, threatens to exploit the unrest in large pockets of the state by adopting radical slogans. The Sabha's chief figures are two youthful, enthusiastic, well-educated, saffron-clad figures who advocate the philosophy of Vedic socialism and seek revival of ancient culture. The Sabha is the political wing of the Arya Samaj. Its sustained attempts to mobilise people of various professions, both rural and urban, have yielded some fruit, though progress is admittedly slow. Recently, Swami Agnivesh, the Sabha leader, urged all those — including the Jan Sangh — who had faith in socialism and the national heritage to join hands to oust the present decadent regime. To illustrate what united student power can achieve, the Swami quotes the Gujarat and Bihar episodes. Already, the Sabha has established small cells in several rural areas and in urban educational institutions. Much political propaganda is carried on at religious gatherings arranged by the Sabha. Although the movement has not yet made an effective dent in the hold of the major political parties, it does hold a potential threat to many of them.

The Gujarat Struggle and Its Vilifiers

A R Desai

THE powerful struggle launched by sections of the urban population of Gujarat under the leadership of the Navnirman Samiti, headed mainly by students and young teachers, has achieved two of its three goals. First, it has succeeded in exposing and eliminating the discredited Chimanbhai ministry in the state. Second, it has compelled the Central government to dissolve the state Assembly. However, the third goal, and the most important one, has yet to be achieved. This is that of eliminating corruption, arresting the rise in prices of items of essential consumption and putting an end to the manipulation of their distribution by private traders.

The achievement of the third objective demands a better understanding of the working of the economy, especially of the forces which corner commodities and exploit shortages to make profits, a correct assessment of the enemies and allies in the struggle to achieve the goal, and a carefully thought-out organisational plan of struggle. It is heartening, therefore, that the leadership of the Navnirman Samiti is seriously debating the ways in which the third phase of the struggle should be organised. The leadership is not clear on this issue and is also divided. As a result, there is a lull in the movement. But it is a hopeful sign that it has not allowed itself to be deluded into thinking that the struggle is over with the dissolution of the state Assembly.

The vigour, unity and resilience with which the people of Gujarat faced the brutal repression by the government and the skill shown by the leaders of the movement in evolving different forms of struggle have evoked respect and sympathy all over the country. So much so that a new expression, 'Gujarat style of struggle', has been coined. The movement has unnerved the ruling party. It has also disconcerted the other political parties which are afraid of facing the basic issues raised by it. They, therefore, want to freeze the movement at its present stage and exploit the sacrifices of the people for narrow electoral objectives.

The Congress party and its pseudo-Left supporters have launched a massive propaganda offensive to slander the movement and belittle its achievements. It has been insinuated that the movement was inspired by certain foreign agencies. It has also been suggested that it was master-minded by reactionary Right and extremist Left parties and that it has been dominated by anti-social, goonda elements who launched a reign of terror, violence and looting. The movement has been attacked as being fundamentally undemocratic because it encouraged disrespect for democratic institutions and obstructed the functioning of the democratically elected Assembly and the Government chosen by the elected representatives of the people. The movement has also been criticised on the ground that it has not adhered to Gandhian non-violence. Finally, it has been condemned for having been led by students and youth who are immature and who should not be indulging in politics.

The campaign by the Congress and its camp-followers to slander the struggle in Gujarat has mounted as mass discontentment about the Congress party's pro-rich policies has grown. The people have begun to see through the sham of the 'garibi hatao' slogans. The reversal of the nationalisation of wholesale trade in wheat, the retreat from the egalitarian objectives of the Five-Year Plan and the 1974-75 Budget which has further stoked inflationary pressures have spread disillusionment and sown the seeds of revolt in more and more regions and states. The Gujarat struggle may thus have opened Pandora's box. Congress leaders like Indira Gandhi, S D Sharma, V P Naik, Siddhartha Shankar Ray, Abdul Gafoor and others have, therefore, set up a shrill cry against the Gujarat struggle and proclaimed their determination not to permit such struggles in other parts of the country.

To understand why the ruling party has launched its campaign to malign the Gujarat struggle, it is necessary to understand the main features of that struggle and the important issues it has raised. Basically, it has been a popular upsurge, enveloping almost all urban centres in Gujarat and involving a few million people. And the upsurge has been deeper and broader in scope than either the 1942 movement or the Maha Gujarat movement.

It has been a popular struggle in another sense as well. People of all castes and communities, and of various age-groups, have participated in it. Communal, caste, regional and other considerations were not allowed to disrupt the united struggles. The movement thus stood in sharp contrast to the practice of the Congress as well as the other parties which are continuously exploiting casteism, communalism and regionalism for manipulating the electorate and for preventing the poor from uniting. The Gujarat movement remained amazingly secular and kept itself united.

To suggest that such a popular upsurge could be engineered by a foreign agency or by some reactionary

Right or extreme Left parties is to deliberately misrepresent the mainsprings of the mass upsurge. One remarkable feature of the struggle was that none of the political parties with opportunist intentions was permitted to worm its way into the leadership. The allegations of the Congress are intended to divert attention from the true causes of the upsurge, *viz*, the intolerable price rise, the pro-rich policies of the government and the rampant corruption and sickening inter-group strife within the Congress party and government.

The charge that the movement was undemocratic because it demanded the dismissal of the ministry and the elected legislature is similarly misconceived. The movement raised one of the issues most basic to a democratic polity: that of the people's right to recall representatives who have gone back on the promises given at the time of election. This issue is of crucial significance in a country like India where manipulation of electorates by exploiting communal and caste sentiments and by large-scale use of money is so common. The Congress has specialised in this game: it has toppled ministries and imposed President's rule whenever it has suited its purposes; it has kept assemblies in suspended animation and then revived them and formed ministries according to its convenience; it has advanced or postponed elections according to its will; it has used President's rule in the states to promote the party's fortunes; it has fiddled with the allocation of developmental funds to woo the electorate of one state or the other.

The charge that the movement in Gujarat has not adhered to non-violence is so hypocritical that it deserves to be treated with contempt. The ruling party has been practising violence on the people on a growing scale. It has detained thousands of young men without trial and cold-bloodedly annihilated hundreds of them in jails. It has now made a regular practice of using bullets, batons and tear gas on unarmed people. It feels no compunction in regularly using sections of the Indian Penal Code which used to be described by the same party as 'unlawful laws' during British rule. The Congress has lost all right to preach non-violence to the people.

Even a casual study of the Gujarat struggle will, however, reveal that it was on the whole peaceful. It was forced to resort to violence at some places only in response to the brutal repression launched by the government. Out of the hundreds of bandhs organised in the course of the struggle, only a few took a violent turn and that too only as a reaction to the worst type of provocation by the government. In fact, the Gujarat struggle has taught a very important lesson — the country's rulers are closing all avenues for peaceful struggle by the people.

'The Gujarat style of struggle' deserves to be properly appreciated. It is true that the struggle had many limitations — for example, it was restricted to urban areas and it lacked clarity about the basic causes of the evils, such as inflation and corruption, against which it was directed. But discussion of its limitations should be carried on from the standpoint of making the movement stronger for realising its basic objective. Those who vilify the movement should be exposed as enemies of the people and agents of the exploiting, propertied classes.

Pacifier — for Some

J V Deshpande

THE new salary structure for college and university teachers announced recently by the Central government will be immediately effective in the Centrally administered universities and their colleges and in the IITs. Although the state governments have been tardy in the past about implementing the recommendations of the UGC, after the recent demonstration of teacher-power in Gujarat they too may be expected to act more promptly.

When the present pay-scales were introduced in the early sixties, the Education Commission had tried to link them with some long-overdue reforms in colleges and universities. In particular, it had suggested that financial compensation for examination work should be discontinued. The-then new scales were proposed as a partial compensation for the loss to the teachers on this count. It was recognised that the system of examinations, apart from being academically indefensible, provided opportunities to a few bigwigs in every university to distribute patronage to their cronies. The affairs of Poona University in the past two or three years — to name just one instance — have again bared this aspect of university life.

A decade has passed since the submission of the Education Commission's report, but neither the UGC nor the universities have shown any enthusiasm for reforming the examination system. Yet, the pay-scales proposed as a partial compensation for the expected loss due to such reforms have been introduced by almost all universities in the country. This time, the UGC has not even bothered to link the two issues.

Under the present scales, the difference between the lowest and the highest salary in the universities is Rs 1,400 p m whereas in the new scales it will be Rs 2,300. The gap will be substantially widened in colleges also. This is certainly a curious way of moving towards an egalitarian society. The difference between the incomes of a 'professor of eminence' and a primary school teacher will be about the same as that between the incomes of an ICS official of old and his peon. Even in an avowedly capitalist country like the USA, the ratio between the incomes of a school teacher and a professor is rarely more than 1:6. After the introduction of the higher secondary course in 1975, it is expected that some of the present colleges will have to be converted into higher secondary schools. With the disparity in the incomes of school and college teachers widening, one can easily visualise the resentment such a conversion would cause.

The standard reason trotted out for the higher emoluments for the academic community is the need to attract better people. By the same argument, however, it is equally important that a person should be tempted to be a peon in a bank or a sweeper in a drug company. In the absence of an overall incomes policy for the entire country and for the entire field of education, the introduction of the new pay-scales in colleges and universities will merely add to the prosperity of a privileged group in a poor country. It should surprise no one if the public begins to bracket college and university teachers with commercial pilots and insurance officials.

Finally, a word about the methods of selection to the higher grades in the new scale — particularly to the so-called 'professorships of eminence'. When, in the sixties, the UGC invited nominations for senior professorships from university authorities, all those nominated by the executive council of Patna University were, it turned out, members of the council! Is there going to be any better procedure for selection this time?

New Fashions in Indian Airlines

(From a Special Correspondent)

EVER since the former chief of the Indian Air Force took charge as Chairman and Managing Director of Indian Airlines, economy-mindedness has proceeded at a sizzling rate in the airlines. The new chief executive became an instant hero with the establishment by virtue of the tough line he adopted to beat down the employees. The toughness was justified, with much nodding of approving heads from the sidelines, on the ground of elimination of 'wasteful' practices. Other modalities for eliminating 'wasteful' practices have followed. In the past, Indian Airlines had proclaimed that it would serve the cause of national integration by connecting places in backward regions as well as those with poor means of surface communications with the other parts of the country, even though such connections might not be justified in commercial terms. Pursuant to this declaration, many services were opened to remote and out-of-the-way centres, including, for example, the service to Port Blair. Since, under the new dispensation, 'wasteful' practices are to be shorn, there is no longer any talk of social responsibilities and the need to open up backward regions. Fashion has changed with the Union Government, so it has with Indian Airlines. Beginning with the new fiscal year, many of the long-established connections, including the one to the Andamans, have been suspended.

Skimpy Biscuits

Apart from closing down connections, and denying the employees their demands, the other major 'wasteful' practice that has been eliminated is the serving of meals to passengers. In the current year, Indian Airlines is expected to carry 3.5 million passengers; at the rate of Rs 10 per passenger meal, the aggregate savings on this score would therefore be of the order of Rs 3.5 crores. This again is a unique kind of saving, since Indian Airlines will now certainly hold the world's record in showing the least consideration to passengers as far as provision of victuals is concerned. There are more than one hundred airlines operating around the world which, while not serving regular meals in the domestic sectors, nonetheless provide refreshments much more substantial than the insipid tea or coffee and the skimpy biscuits currently being offered by Indian Airlines.

The IA authorities have effected some more savings by passing on to the passengers the liability of paying the private contractors the charge for lifting the personal baggage on arrival at, and departure from, the airport lounge. The pattern is by now familiar: to restrict the role of the public sector and to introduce a system of private commission agents; between the passenger and the Airlines, a private contractor is accordingly introduced, and no doubt the same considerations that prevail elsewhere for the proliferation of intermediaries also apply here. Further savings have been ensured by depriving the passenger of the facility of transport to and from distant airports, even as the energy crisis should have made such a facility all the more necessary.

This has not been all. A few weeks ago, the Airlines authorities suddenly announced a rise in passenger fares across-the-board by 25 per cent. This increase was of a considerable order; taking into account the increases which took place in the preceding two years, the overall rise in air fares in this country since 1972 is about the highest in the world.

Given this combination of efficiency-boosting, ruthless economising and fare increases, Indian Airlines could have been expected to show a very large order of profits this year. No such thing is likely to happen. The Minister of State for Tourism and Civil Aviation was recently heard to mention in Parliament that the various measures notwithstanding, the Airlines are projecting a profit of barely Rs 5 crores for 1974-75. What does one make of the Minister's statement? With the beginning of the fiscal year, the utilisation of aircraft, it is being claimed, is completely normal, that is, the level of performance is supposed to be what it was a year ago. This, together with the fact that four new Boeing 737s are being added to the fleet in the latter half of the year, should have assured an aggregate revenue of at least Rs 100 crores at the fare and freight rates which prevailed last year. On this basis, the announced increase of 25 per cent in the rates should have meant an additional revenue of Rs 25 crores. If the saving of Rs 7 crores anticipated from the elimination of 'wasteful' practices is added, the aggregate generation of extra cash to the Airlines ought to have been around Rs 32 crores during the year. Before the holocaust of worsened industrial relations struck it, the Airlines had hoped for a profit of Rs 4 crores in 1973-74, and that too after making a provision of Rs 1.2 crores for a special obsolescence reserve. With the additional cash made available through the elimination of uneconomical routes, depriving the passengers of meals and other facilities, and raising the fares by 25 per cent coming to Rs 32 crores, on the basis of the level of costs prevailing last year, profit in the current year, assuming normal operations, should have been close to Rs 37 crores. Even granted that the rise in fuel cost would call for an additional outlay of Rs 7 crores, there still should have been scope for a clear profit of Rs 30 crores. The Minister of State is however hoping for a bare profit margin of Rs 5 crores. Given the past discrepancies between what is predicted and what is realised for most public sector undertakings, it would not be at all surprising if, as the year ends, even this projection of modest profit is converted into a loss.

Illusory Gains

This is anti-climactic. The sabre-rattling of the IA authorities could have been put up with provided it had led to any substantial difference in the performance of the Airlines. As it is, the actual gains from the rise in air fares by a quarter is largely illusory. All but a fraction of the revenue earned by the Indian Airlines is charged to expense accounts, a large part of which comes from the coffers of the Union and state governments and of the public undertakings. Insofar as the draft on private expense accounts is concerned, again, since the expenditure is tax deductible, given the existing rates of company taxation, 50 to 60 per cent of what passengers belonging to private units would be called upon to pay additionally would be at the cost of corporate taxation. The companies, besides, are bound to pass on the burden on account of the rest of the extra cost on to their product prices, so that the general public will be saddled with it. Thus the cumulative achievement of the new regime in Indian Airlines will be to increase the burden on the public, to discourage tourism, to neglect the backward regions and to treat the passengers with disdain. But, for some sections, the game is obviously worth the candle.

Alignments in Tamil Nadu

Mohit Sen

THE elections in Pondicherry and Coimbatore, the Rajya Sabha election, and the dissolution of the Pondicherry Assembly, have all been contemporaneous with important changes in political alignments in Tamil Nadu. The coming together of the two Congresses in the state is only the most important manifestation of this change; but it is not the only regrouping that has taken place.

It is interesting that the Goenka-TVS-Chettiar trinity, which had placed its hopes on a reoriented DMK, has now abandoned the idea. The petty bourgeoisie, the urban poor, and even the lumpen supporters of the DMK were dismayed to find the shift in the position of their representatives when Karunanidhi began to hit at the working class and curb the peasantry. What is somewhat new is the rapid loss of mass support that has resulted from this shift. A point that is often missed by commentators, who are focusing attention almost entirely on the coming together of the two Congresses, is the way in which the ADMK has walked away with the DMK mass base. It is utterly frivolous to suggest that this is because of M G Ramachandran's glamour. After all, why is it that Shivaji Ganesan has been unable to achieve even a tenth of the mass pulling power of MGR? The latter has consistently established an image, through a large number of successive films, of being a champion of the downtrodden. Films have been followed by real-life actions of contact and donations that help this image. And, apart from a large measure of wish-fulfilment, it is this image that attracts. Any truly radical party has to take this fact into full consideration.

This is not to say that the ADMK does not suffer from serious, and even fundamental, limitations. Almost typically petty-bourgeois, according to copybook specifications, the ADMK has a most amorphous ideology which it chooses to call 'Anna-ism'. It certainly is a mixed bag, but through the confusion emerges the same radical aspiration that has given MGR his huge mass base. This confusion, together with the highly personalised politics of the ADMK, can lead to aberrations and mistakes — e g, the Ranganathan case. These limitations would obviously have to be borne in mind, as also the fact that quite a number of the converts to the ADMK have certainly not left behind them their rather reprehensible propensities at the DMK offce. Nevertheless, in the name of limitations, the basically healthy and promising character of MGR's party should not be overlooked on any account.

The exactly opposite remarks would apply to the Congress and Syndicate get-together. The Goenka-TVS-Chettiar combine, which had deserted the DMK, has now veered around to the concept of reconstructing the Congress in Tamil Nadu through the conversion of Kamaraj as its leader. The fact that it did not plump for the ADMK speaks volumes for the latter's character and potential. It was TTK who was eventually used by the trinity to push through the scheme, using his influence with both Indira Gandhi and Kamaraj. The former could not accommodate herself to the idea of playing second fiddle to the ADMK in the ADMK-Congress-CPI alliance — which could have been another logical form of Congress recovery.

This would have greatly facilitated the acceleration of the advance of the democratic forces in the state and pushed Tamil Nadu in the political direction of Kerala. It is interesting to remember that, with the ADMK and the CPI forming an alliance, the Congress joining in would have meant that the monopoly sections of the Indian bourgeoisie would have had to accept a position of equality and not predominance. Its representatives have — for the time being at any rate — preferred to attempt reunification of the entire capitalist class in which it believes it would be in a better position to preserve its exclusive leadership. That by such manoeuvres it increasingly displays its loss of national hegemony, and that by this method it is the Right that regains some of its lost ground, is not recognised by the leaders of the Congress — above all the Prime Minister.

Whatever might be the subjective predilections of Indira Gandhi and Kamaraj, there is no doubt that the Congress and Syndicate *rapprochement* means the formation of a new authentic representation of the monopolists in the state. In this formation, the representatives of the non-monopoly-bourgeoisie cannot but play a subordinate role. Moreover, its all-India repercussions should not be overlooked. It is one of the prongs of the Rightist offensive in our country to push this government to the Right as an integral part of the effort to establish a government of the Right.

It is a great pity that, faced with this situation and despite the fact that allying with the ADMK-CPI coalition would not now tread on its anti-Congress corns, the CPM has chosen to plough its lonely furrow. If only it had been a little more reasonable, there is little reason to doubt that Ramamurti would by now have been the representative of Pondicherry in the Lok Sabha. It is quite clear that it was treated by the working class in Coimbatore as an agent of disruption and punished not only by the loss of its deposit but by a sharp diminution of its vote as compared to the 1971 poll. It need not go further down the same disastrous path. It can retrieve its position by taking its place alongside the ADMK and CPI, and make a worthwhile contribution to strengthening the Left in Tamil Nadu.

What is now required in this state is the invigoration of its politics by means of mass actions around policy issues. Neither the remainder of the influence of the DMK nor the undoubted strength of the new Syndicate-Congress formation can be eroded without such mass actions and struggles. It certainly cannot be done merely through electoral exercises and through exclusive reliance on the excitement of poll campaigns. It could be that the common programme worked out by the meeting of the eight Left parties in Delhi, recently, could form the basis of such action in Tamil Nadu. In any event, this is the only way by which a shift to the Left can be achieved in the state and the ground cleared for fresh approaches towards building the extended Left and democratic unity, which both this state and the country as a whole so urgently require.

GOVERNMENT OF TAMIL NADU

Stationery and Printing Department, Madras-1.

TENDER NOTIFICATION

Sealed Tenders will be received upto 3-00 P M on 9.5.1974 for the supply of Machinery for the Regional Press, Madurai. Full particulars may be obtained from the Asst. Works Manager, (PROCUREMENT), Office of the Director of Stationery and Printing, Mint Buildings, Madras-300001.

SCHEDULED CASTES

Beyond the System

Moin Shakir

THE Dalit Panthers have emerged as a force to reckon with in Maharashtra. The challenge they pose takes the form not so much of politicisation of the scheduled castes or dalits as of highlighting the failure of the political system to achieve the objective of social equality and economic justice proclaimed in the Constitution. The Dalit Panthers have served to re-emphasise the importance of the social infrastructure for the political and economic system.

The situation of the dalits in Maharashtra is not very different from that in other parts of the country. The incidence of violence and atrocities directed at the scheduled castes throughout the country has been on the increase. This reflects the social intolerance of the 'haves' and their determination to maintain their hegemony in the political and economic spheres. The Union Home Ministry's statistics show that cases of atrocities on scheduled castes rose from an average of 177 per month in 1971 to 199 per month in 1972 and 231 per month in the first eight months of 1973. During the first six months of 1973, 2,038 complaints were made by persons belonging to the scheduled castes in UP; the figures for some of the other states were: Maharashtra 1,084, Orissa 233, Punjab 219, Kerala 108, Gujarat 158, Karnataka 126, Haryana 122, Himachal Pradesh 45 and Andhra Pradesh 15 *(Hindustan Times,* October 30, 1973). According to one estimate (Shankar Rao Kharat, *Sadhana,* October 7 and 14, 1972), during 1967-1970, 1,100 untouchables were killed by caste Hindus. Incidents of rape, refusal of water from community wells and humiliation and insult, particularly in the rural areas, are too common to be mentioned. Since the scheduled castes constitute the bulk of the 'have-nots' in the rural areas, and the political and economic power is monopolised by caste Hindus, neither the police nor the administration come to their rescue. In the urban areas, discrimination takes a subtler form. The recent incidents in the BDD Chawls in Bombay show that policemen instead of protecting the scheduled castes join in the assaults on them.

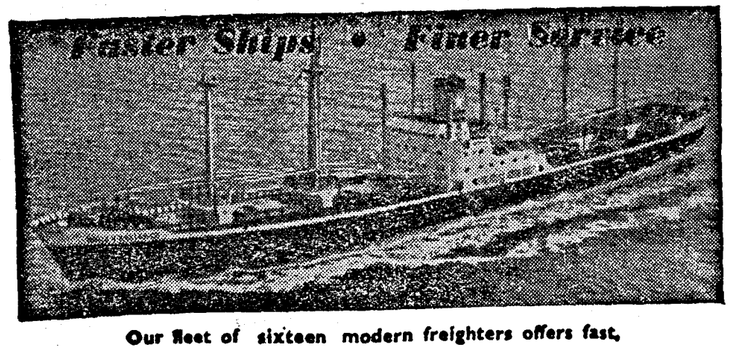
The government is supposed to play an important role in improving the condition of the scheduled castes. However, expenditures on educational schemes and welfare programmes for the scheduled castes and scheduled tribes in the states sector have continuously lagged behind the provisions which themselves have been grossly inadequate. In the Second Plan, out of the Rs 760 lakhs allocated, only Rs 649 lakhs were spent. In the Third Plan the provision was Rs 1,301 lakhs and actual expenditure Rs 1,166 lakhs. During the period of the so-called annual plans there were similar shortfalls in expenditure, particularly in the states of Maharashtra, Karnataka, Orissa and Tamil Nadu. In the Fourth Plan, as against the demands of Rs 2,701 lakhs and Rs 2,611 lakhs for education of scheduled castes and scheduled tribes, respectively, the actual provisions are only Rs 2,460 lakhs and Rs 2,403 lakhs. The expenditure on programmes like award of post-matric scholarships and girls' hostels regularly falls short of the provision. There is a conspicuous fall in the percentage of enrolment of scheduled castes in the middle school and higher secondary stages. The Committee on the welfare of Scheduled Castes and Scheduled Tribes of the Fourth Lok Sabha (1970) concluded that the problem of educational development of scheduled castes and scheduled tribes has not been given the attention that it deserves by the Central or state governments as well as by the Planning Commission during the 23 years of independence. The fact that a vast segment of the population continues to be educationally backward as compared to the general population goes to show that no serious efforts have been made in the Plan periods to accelerate the pace of educational development of scheduled castes and scheduled tribes.

The progress with regard to provision of employment opportunities for the scheduled castes have been equally tardy. According to the Report of the Commission for Scheduled Castes and Scheduled Tribes in 1959, the percentage of Scheduled Castes in senior administrative posts was 1.18, in other administrative services 2.38, in clerical services 6.95, and in the category of the attendants and peons 17.24. In 1966 the percentage in the senior administrative service was 1.77, in other administrative services 3.25, in the clerical category 8.86 and in the category of attendants and peons 17.94. In public sector undertakings the percentage of scheduled castes in Class I jobs was 0.2, in Class II jobs 1.07 and in Class III jobs 0.92 in 1966. There has thus been hardly any improvement in the representation of scheduled castes in government and public sector employment, especially in responsible decision-making positions.

The land reforms programmes have not helped the landless scheduled caste population in the rural areas. They have added to the tension and violence of which the untouchables have invariably been the worst victims. Democratic decentralisation and the green revolution have also left the mass of the dalits untouched. The small section which appears to have benefited is the one which was already 'sanskritised' and was economically well-off.

The scheduled castes have not been able to articulate their many problems on the political plane as they have lacked an effective organisation. Other political parties have been either indifferent to their problems or have adopted an opportunistic posture in order to capture their votes. Moreover, no strategy has been formulated for tackling the question of social inequality and economic injustice. The approaches adopted so far have had inbuilt limitations. Gandhi attempted to solve the problem within the framework of the caste system and Hindu religion. But he could neither change the attitudes of the caste Hindus nor satisfy the scheduled castes. The other approach was that of B R Ambedkar. Ambedkar was aware that the root of untouchability was the caste system and the root of the caste system was the religion attached to Varanashram. He did not advocate the abolition of religion, but aimed at what he believed was a true religion. Ambedkar also attached great importance to liberalism and law. However, both Gandhi and Ambedkar sought to solve the problem within the purview of religious systems and the existing social set-up. Notwithstanding his dynamic and perceptive mind. Ambedkar could not systematically formulate his schemes for the upward mobility of his community. He gave up his emphasis on nationalisation of agriculture and state socialism after his failure to get them incorporated in the Constitution. Instead of fighting against the reactionary heritage of religious obscurantism, he resorted to another religion rooted in Indian culture to fight an unsuccessful battle against Hindu tradition.

After the death of Ambedkar, the



dalits found themselves leaderless. The opportunism of the so-called leaders of the Republican Party and the mounting atrocities on dalits have bred discontent, frustration and disillusionment among the educated Scheduled caste youth. Raja Dhale, one of the Dalit Panther leaders, has described August 15 as a 'Black Day' for the suppressed and the oppressed people in this country. This bitterness and frustration along with the tendency of revolt find expression in the writings of Shankar Rao Kharat, Narayan Surve, Raja Dhale, Namdeo Dhasal, Baburao Bagul, J V Pawar, Waman Ingle, Datta Pawar and others. The connection between dalit literature and the Dalit Panther movement runs very deep. As a matter of fact, the movement is the political expression of the spirit of protest and rebellion being consciously developed through the medium of literature. The source of inspiration of dalit literature is real life, the experiences of the dalit community, in its totality. Believing that the entire socio-economic structure has to be overhauled, it refutes and rejects Hindu religion and its legacy, but not the humanist tradition. What is central to all activities is man, and man alone is the measure of everything. He is greater than God and religion.

Dalit Panthers have succeeded in raising the questions and issues which have remained unresolved for the last 25 years. All the political parties have been preoccupied with electoral politics and the resultant opportunism at the cost of real political participation and cultural enlightenment. Consequently the political system has degenerated into a mechanism for maintaining the *status quo* and perpetuating exploitation. What is needed is not reform but basic structural change. The Dalit Panthers have rightly perceived that what the oppressed in India need are not concessions, facilities and reservations, but the establishment of Dalit Raj. They have declared in their manifesto: "We have a clear perspective of our allies and enemies. Scheduled castes and scheduled tribes, workers, landless labour, poor peasants are all our allies. Left parties and all those forces which fight against caste and class oppression are our friends ... All those who are the victims of political and economic suppression are our co-workers ... Power, money and prestige are our foes. Landlords, capitalists, moneylenders and their agents and the government are our enemies. We stand for total emancipation and political domination.

"We want to rule the entire country. We aim not at individuals but at the system. A mere change of heart or liberal education will not end injustice or exploitation. We shall rouse the revolutionary masses, and organise them; the flame of revolution will emerge through the struggle of these vast masses. The social system cannot be revolutionised by mere demands for concessions, elections and satyagraha. Our rebellious idea of social revolution will germinate in the soil, grow in the minds of the people, and ultimately flash into existence like hot burning steel."

The Dalit Panthers have for the first time exposed the gap between the haves and the have-nots within the scheduled caste community. The three factions of the RPI seemed content with caste politics and the concessions given to the educated sections of the scheduled castes. They have in the part joined hands with a variety of parties from the Congress to the Jan Sangh. The Panthers constitute a serious threat to the political survival of the RPI leaders. It is not surprising, therefore, that the three factions of the RPI, which could never unite on the question of atrocities on the dalits, have now patched up their differences to put down the Dalit Panthers.

The RPI leaders will exploit the Panthers' weaknesses. The Panthers have yet to reach the rural areas. Out of the total Buddhist population of 33 lakhs in Maharashtra, 24 lakhs are in the rural areas. The Panthers cannot, therefore, become effective unless the the rural folk accept them as their leaders. Further, Buddhists form only 6.47 per cent of the population in Maharashtra. In only eight districts—seven in Vidharba and one in Marathwada—is their proportion in the population more than 10 per cent. These figures are quoted to emphasise how important it is for the Dalit Panthers to take up the issue of alliance with their 'friends' as described in their manifesto. Unless unity is forged with the non-scheduled caste dalits and their leaders and movements, there is little possibility of converting the forceful movement into an effective organisation. In their public speeches Dalit Panther leaders have been often very critical of their manifesto 'friends'. This betrays their political immaturity which they will have to overcome. Anti-system movements have so far not lasted long in this country. The instruments of state coercion are capable of suppressing them through democratic means if possible, and by fascist ways if necessary. One should learn from the fate of the Telengana and the Naxalite movements in post-Independence India.

Israel's Communists

Surendra Bhutani

IN the complex panorama of communist factionalism the split in the Israeli Communist Party stands out as a unique phenomenon for it was not the product of the Sino-Soviet schism or of revisionist-dogmatist conflicts but of differences over the attitude which the Israeli Communists should adopt toward the State of Israel and the Arab countries.

Even before the formal split of the Communist Party into two groups in 1965, the issue of Arab versus Jewish interests had threatened to cause a break. The process had started in 1964, particularly after the Arab summit in Cairo.[1] A Jewish wing led by Moshe Sneh and Shamuel Mikunis was much impressed with Premier Eshkol's policy of "moderation" towards the Arabs and the Soviet Union. Towards the end of 1964, Eshkol made an appeal to the Knesset (Parliament) members of the Communist Party to persuade the Soviet Union to take a positive stand on Soviet Jewry and particularly on the emergence of the Palestine Liberation Organisation (PLO) and its future activities.[2] This appeal was not wholly lost, for in the party organ, *Kol Haam*, Moshe Sneh wrote an article entitled "Dayan vs Eshkol" in which he defended the moderate policy of the Eshkol government. At the same time he vehemently criticised Nasser and Ben Bella for "calling for the annihilation of Israel".[3] The mixed Arab-Jewish group led by Toufiq Toubi, Emile Habibi and Meir Vilner took exception to Sneh's "deviation" from the accepted Marxist line. Members of this group tried to remove Moshe Sneh from the editorship of the party organ, but the attempt came to nothing, although interestingly Moshe Sneh was an easier target for them than Mikunis because of Sneh's background as a leader of the Haganah (the Zionist military command) and his activities as an active General Zionist in Poland and in Palestine before the birth of the State of Israel.

Moshe Sneh on his part tried actively to persuade the Party to change its old line towards the Arabs. In another article he argued: "If because of generally positive development in the Arab states we would remain indifferent or insensitive to the tendency of wanting to annihilate Israel, we would be guilty of national nihilism, of a sterile cosmopolitarianism which has nothing in common with proletarian internationalism."[4] This diagnosis was accompanied with quotations from Lenin denouncing national nihilism.

Soviet Silence

The debate went on in both the groups. If on the one hand, Toufiq Toubi held that a solution of the Arab-Israeli conflict solely depended on the Israeli government and that Nasser had emerged in a much more positive light. Moshe Sneh argued, on the other, that the Communist Party could not identify itself with the Arab nationalist movement "because the movement was replete with reactionary tendencies".[5]

Finally in June 1965, the Communist Party split into two groups. The one led by Moshe Sneh and Mikunis retained its original name, Mifalaga Qomunistit Israelit (MAQI), and the other led by Toubi, Vilner and Habibi styled itself Reshima Qomunistit Hadasha (RAQAH). The Soviet delegates who came to attend the 15th Party Congress in Tel Aviv tried their best to stop the split but in vain. Initially, the Soviet press remained silent for fear that recognition of either group would mean acceptance by the Soviet Union of one or the other of the two opposing concepts of Israel, namely, Israel as the home of the Jewish people or Israel as a geographical anomaly in an Arab area. A slight Soviet inclination towards the MAQI became apparent when Moshe Sneh branded his opponents as the "Chinese deviationists".[6] Later, *Pravda* completely ignored the "Toubi-Vilner Party conference" and carried the text of the "Sneh-Mikunis resolution" which accused the rival group of "factionalism".[7] However, the MAQI dissociated itself from the Soviet move in the United Nations to equate Zionism with Nazism and neo-Nazism. "How could one link Zionism with Nazism which was unparalleled in history for its crimes against humanity?"[8]

In November 1965, representatives of both the MAQI and the RAQAH were invited to Moscow to resolve their differences. They met Mikhail Suslov, a member of the Politburo of the Communist Party of the Soviet Union, who pleaded with them to work unitedly.[9] In January 1966, the RAQAH issued a four-point proposal as a step towards unity.[10] The MAQI rejected the possibility of unity so long as the RAQAH maintained its anti-Israeli State posture. At the same time, it advocated joint activity and propaganda against the Zionists.[11]

Refusing to recognise the split officially, the Communist Party of the Soviet Union addressed an invitation to the Israeli Communist Party to attend its 23rd Congress in March-April 1966. The MAQI and the RAQAH decided to send a joint delegation to Moscow. And there the delegation issued a common message which avoided mention of the conflict within the Party.[12] It was around this time that Golda Meir (as the Secretary-General of Histradrut) broadcast the idea of forming a roof organisation for all of Israel's various friendship leagues with the Soviet Union under the auspices of the pro-government leadership of the MAQI.[13] The Soviet leaders rejected the suggestion.

In October 1966, representatives of both the parties again went to Moscow to hold talks on reunification, obviously on the insistence of the Soviet Communist Party. Again the latter did not succeed in patching up their differences. The two parties agreed only on one point: they both condemned the resolutions of the 11th plenum of the Central Committee of the Chinese Communist Party, which had criticised the Soviet Union.[14]

Until the crisis and the war of June 1967 both the parties shared some objectives so far as the Soviet Union was concerned. Both pledged their solidarity with Moscow and gave vigorous support to the CPSU in the Sino-Soviet ideological conflict. The CPSU in return adopted an attitude verging on impartiality. Occasionally, however, the MAQI took a stand different from that of the Soviet Union as, for instance, on the Israeli-Syrian border clashes. The MAQI pleaded: "It is necessary to warn both sides to abstain from acts of aggression if such a clash is to be prevented, it is necessary that the government in Damascus too should be influenced to stop the acts of sabotage and murder against Israel conducted by the al-Fatah organisation, and not only to censure Israel."[15]

The June War

The war of June 1967 aggravated the differences between the two factions of the Israeli Communist Party. Up to the outbreak of hostilities each advocated a peaceful solution of the Arab-Israeli conflict. The MAQI called for the "withdrawal of Israeli and Arab contingents from the border areas, for abstaining [from] the use of force by both sides, for strict observation of existing armistice agreements".[16] It also called on the Arabs to stop making sabotage raids into Israel and it asked Israel to abandon its methods of reprisal.[17] On the other hand, RAQAH, which claimed to represent the "voice of Arab protest" in Israeli politics, praised the Soviet Union for its efforts to "frustrate the war-mongers" and warned the government of Israel "not to pull the chestnuts out of the fire for the imperialists". It also insisted that Israeli policy should not ally itself with "imperialism against the Arabs, but with the Arabs against imperialism".[18] When the war broke out, the MAQI regarded it as "a war of defence" on the part of the Israeli people and justified it by saying that their actual physical existence and the sovereignty of the State of Israel were in danger. In the Knesset, Mikunis declared it a "just war". He said: "The question of who fired the first shot was irrelevant; Leninism taught that what mattered were the plans and intentions of each State".[19] On the other hand, the RAQAH charged Israel with committing "aggression" on the Arab states and regarded the conflict as the war of an anti-national government.[20]

From the beginning of the crisis, the RAQAH supported Soviet policy and held that the Soviet action in severing diplomatic relations with Israel was not directed against the Israeli people but against the policy of the government of Israel which had sacrificed the national interests of Israel at the altar of the interests of the Anglo-American oil companies in the region.[21] But the MAQI criticised the Soviet support for "pan-Arab anti-Israeli chauvinism". It charged the Soviet Union with adopting a one-sided position. It also maintained that the Soviet action in calling upon Israel to retreat unconditionally had not helped reduce tension in the area. Nor had the Soviet action sobered the Arabs and made them see the futility of all talk about "annihilating" Israel.[22] In a sense, it had aggravated the situation.

Early in August, a RAQAH delegation, including Meir Vilner and Toufiq Toubi, went to Moscow and expressed its full support for the "consistent steps" of the Soviet government and the CPSU to "uphold the just case of the Arab peoples".[23] In return, the CPSU proclaimed that the RAQAH was truly an international party and that it was the only true representative of the Israeli proletariat. At the same time it charged the MAQI leadership with "nationalist deviationism". *Pravda* wrote: "The Sneh-Mikunis group while supporting Israel's aggressive war had betrayed the basic principles of the workers' movement — peace, proletarian internationalism, genuine patriotism, the brotherhood of peoples and socialism".[24]

When the Soviet support for the RAQAH became apparent, the MAQI accused the Soviet Union of deviating from the policy of non-interference and asked "whether it was against the principles of Marxism-Leninism to support one's country and its people on a position of war with other countries". By way of illustration, the MAQI referred to the Indian example of support extended by the Dange group of the Communist Party of India, with Soviet approval, to Nehru when India was attacked by Communist China. "If he [Dange] was right, how can we be wrong in this context?"[25] Obviously, Moscow had no affection for the "Hebrew Communism" of the MAQI, since it did not fit in with its Arab policy.

After August 1967 most of the Communist Parties of the world (notable among the exceptions being the Rumanian Communist Party) recognised the RAQAH as the only Israeli Communist Party. It is no exaggeration to say that from then on the CPSU virtually ignored the existence of the MAQI. It underlined its disapproval of the MAQI later by its decision not to invite it to send a delegation to attend the Golden Jubilee of the October Revolution. The omission was enhanced by the welcome given to the RAQAH delegates in Moscow.

In sum, the split in the Israeli Communist Party did not create much anxiety for the CPSU. This was partly because both the factions initially looked to Moscow for directives and partly because the Israeli Communist Party did not figure much in the shaping of Soviet policy on West Asia. It is also a fact that, paradoxically, Soviet influence in West Asia has always been greater in those countries where it does not have a cadre of faithful Communists.

A Matter of Period

Vinod Mehta

The Soviet Union and the Emerging Nations: A Case Study of Soviet Policy Towards India, by Harish Kapur; Michael Joseph, London, 1972; pp 124; £3.50.

SINCE the signing of the Indo-Soviet Treaty of Peace, Friendship and Co-operation, a spate of books have been written on Indo-Soviet relations. Most of them trace amiable relations between India and the Soviet Union since the times of Russian traveller Afansi Nikitin! But none of them has tried to study the development of Indo-Soviet relations in the context of international politics.

This grave gap has now been filled by Harish Kapur's book. Kapur's main thesis is that Soviet policy towards India has not always been friendly but has been determined in each period by a particular set of international political developments. During the inter-war period, the Soviet Union had two different policies for Asian countries — one was diplomatic and directed against politically independent countries, and the other was revolutionary applicable to colonial areas. India fell under the second category. This policy was dictated by the belief that, by threatening British power in India, Russia would seriously undermine British power in the world. It is not surprising, therefore, that open support was often extended to the Indian nationalist movement.

However, during the Second World War, the Soviet Union was too preoccupied to devote any attention to any revolutionary activities in the colonial countries. As Kapur points out, one Soviet writer even went to the extent of sympathising with the British position when he rejected India's demand for Independence. The Soviet author is quoted to have said that it was not the time for Indian Independence but for full mobilisation of India's forces against fascism.

But after the war, Soviet interest in Asia began to revive. Nationalist movements in Asia were gaining strength, and it was difficult for the Soviet Union to ignore them. However, it endorsed armed resistance against the nationalist governments as well as against the colonial powers as the only effective method of introducing viable changes in Asia.

After Independence, Kapur points out, when Nehru declared that India would adhere to the policy of non-alignment, it was denounced by Stalin as reactionary. However, this attitude of the Soviets changed in the course of time. Nehru's attitude towards the Chinese revolution, towards the Korean war, on the Suez issue; his anti-imperialist posture; and the isolation of communist parties in Asia — all these were mainly responsible for the change in Soviet attitude to India. The Soviet Union on the other hand reciprocated, by supporting India in the UN on the Kashmir and Goa issues, and by assuming a neutral stance during the Sino-Indian war. During Khrushchev's era, relations between India and the Soviet Union became even warmer.

But a little estrangement came into Indo-Soviet relations when the Soviet Union started to supply arms to Pakistan to woo it from America. In spite of the Soviet Union's clarification that it would not do so at the cost of Indo-Soviet friendship, the estrangement remained.

Kapur's book, though published in 1972, does not take into account the Indo-Soviet Treaty of Peace, Friendship and Co-operation. Therefore, one is inclined to disagree with Kapur's conclusion when he says, "It is, therefore, most unlikely that she (India) would become a marginal factor in Soviet policy towards Asia, though it is also unlikely that she (India) would ever reacquire the same important position as she had during the Khrushchev period." With the signing of the Fifteen-Year Economic Agreement, the relations between India and the Soviet Union have assumed a new dimension. It is hoped that Kapur would revise his book to include and analyse the new developments. Yet, any serious student of Indo-Soviet relations would lose if he ignored this book.

The Arab Cause in Modern Terms

A G Noorani

United Nations Resolutions on Palestine, 1947-1972; compiled and classified by Sami Musallam; Institute for Palestine Studies; P.O. Box 7164, Beirut; $ 12.
Report of the Secretary-General under Security Council Resolution of April 20, 1973; Institute for Palestine Studies; $ 4.

FOR long, the Arab case in the Arab-Israeli debate went by default — and not in the West alone. Israeli spokesmen argued in the modern idiom and in the accents of their audience. Arab publicists who could match them in this could be counted on the fingers of one hand. Scholars like Edward Atiyah were all too rare. Consequently, Walter Lacquers had hardly any rivals in the debate.

There was, doubtless, a small band of Western scholars who knew and felt deeply about the gross injustice being done to the Arabs, especially over the last six decades. But cogent Arab exposition for non-Arab audiences was rare. The Institute for Palestine Studies, a research organisation, set up in Beirut in 1963, fills the void most ably. It has published monographs on the genesis of the Palestine question: 'The Balfour Declaration' by J N M Jeffries, 'Jerusalem: Its Place in Islam and Arab History' by A L Tibawi, and the 'Partition of Palestine'. Studies like Sami Hadawi's "The Arab Israeli Conflict" have become minor classics by now. There is a spate of literature on aftermath of the wars like "The Judaisation of Jerusalem 1967-1972", on the Arabs in Israel, and Israel's attitude to the despatch of UN Missions to those areas.

They all express the Arab viewpoint, undoubtedly, but the important point is that they do so with a wealth of documentation and a marked cogency in argument, which was hitherto lacking in Arab presentations.

The two volumes under review reflect the Institute's emphasis on documentation and its faith in the justice of its cause. The collection of UN resolutions on Palestine during a quarter century is a boon to students. It comprises the resolutions of the organs of the UN, the General Assembly, the Security Council, the Trusteeship and Economic and Social Councils, as well as UNESCO and WHO. Maps and statistical tables of voting, detailed re-

ferences to sources of texts, and classified indexes make it an excellent reference work.

On April 20, 1973, significantly at Egypt's instance, the Security Council unanimously resolved to ask the Secretary-General to submit "a comprehensive report giving full account of the efforts undertaken" by the UN regarding the situation in West Asia since June 1967. The Report, submitted on May 18 and reprinted by the Institute, is an impartial survey of the peace efforts during a crucial period; it reveals fully Israel's obstructionist attitude. It is a pity that awareness of this should have dawned as a result of the Arabs' military effort in October 1973 and not because of this Report.

Perhaps the most damning indictment of the Israeli case has come from none other than Moshe Menuhin, father of the famous musical genius, Yehudi Menuhin. His classic "The Decadence of Judaism in Our Time", has been reprinted by the Institute with his consent ($ 7). He quotes chapter and verse in support of his views and writes, movingly: "As a conscientious Jew, I feel it necessary to set forth my views on Jewish history after studying and observing for many years the lofty and dignified Judaistic past of pure ethics, philosophy and religion, on the one hand, and the current decadent, tragic and revolting perversion of it into boisterous 'Jewish' nationalism — Judaism turned into rampant Israelism — on the other".

He has established a new organisation, Jewish Alternatives to Zionism, Inc, and his plea to his co-religionists is simply this: "Go back to the country given to you in 1947 by the United Nations at the expense of indignant Arabs of Palestine, and lead a constructive instead of a destructive life. That 1947 country is more than enough to take care of the really persecuted Jews of the world. Everybody will be glad to help them as Levantine Jews who have a State of their own."

Satellite TV Revisited

B D Dhawan

This paper seeks to bring out the inadequacies and the irrelevance of the INSAT TV system for India.

In view of the great diversity of languages and life styles, we must plan for a highly decentralised TV system in which the satellite plays a small role of providing a national hook-up. In such a system the limited rebroadcast transmitters are part of state-level sub-systems; that is, these receive TV signals from the mother or the central TV station of each sub-system, and not from the satellite.

What then is the great point in persisting with the thrice-postponed satellite TV experiment? The futility of half of the experiment — test trial of TV reception by 2,400 community TV receivers fitted with front-end converters and chicken-mesh antennas — is beyond doubt. The investment of about Rs 72 lakhs, with a foreign exchange component of about Rs 5 lakhs, in 2,400 augmentation devices would be a dead loss. And since the test trial is to take place in the UHF band in which ISRO is no longer interested, a successful test trial of satellite technology does not mean anything worthwhile for ISRO's INSAT plan designed in the S-band of the radio spectrum.

In short, the experiment can be scrapped forthwith, thus saving about Rs 9 crores.

THIS writer has been trying, through these columns specially, to argue that satellite technology, contrary to the claims of the Indian Space Research Organisation (ISRO), has a rather very limited and unexciting role to play in the establishment of a nation-wide TV system in case we want to build one for our country.[1] However, a careful reading of the Draft Report of the Fifth Five-Year Plan, released recently, indicates that Yojana Bhavan has, subject to some qualifications, accepted the claims of ISRO. While ISRO's forceful pleas for triggering off a communications revolution *via* satellite TV in the seventies have been turned down by the planners, handsome provisions have been made in the Draft Report for preparatory work as a prelude to a full-fledged satellite TV network, possibly in the Sixth Plan period. Notwithstanding that the Fifth Plan is in the doldrums for a variety of reasons, a fresh appraisal of the place of satellite technology in developing television in India in the future may not be an unrewarding task.

Place of Television

It has been — if press and radio reports are any indication — a rather agonising task for the planners to determine the place of television in the Fifth Plan. Whatever allocations for television have finally emerged are the outcome of a series of confabulations and confrontations among the Planning Commission, the Ministry of Information and Broadcasting, ISRO and the principal TV user ministries of Education, Agriculture and Family Planning. The two leading promoters of the TV idea — ISRO and AIR — have themselves to blame for the protracted discussions in Yojana Bhavan. On the one hand, the two confronted each other, each with its own blueprint for ushering in a communications revolution during the Fifth Plan period. On the other hand, they committed the folly of not putting the principal users of educational or developmental TV in the forefront while approaching the Planning Commission. The TV promoters' inability to associate the user ministries in seeking funds for TV broadcasting intrinsically weakened their case for television.

The first hurdle to be crossed was the familiar image that TV is a luxury in a poor country. This hurdle, it was thought by the promoters of the TV idea, could be surmounted in two ways: (1) the image of TV could be refurbished and (2) community TV receivers could be provided for the masses who could not afford to buy their own TV sets. Here, the past and the present stared the planners and the promoters of TV in the face.

Past Performance

Television has proved a remarkable medium for entertainment and information dissemination. However, as a medium of instruction, its *ex-post* record abroad has been that it is no better than conventional methods of teaching. The late Vikram Sarabhai looked upon television — especially television *via* a satellite that beams programmes directly on to TV receivers — as an instrument of development of the country. This enlightened view of the medium, however, is at variance with the past record of television in our country. What we have witnessed is the emergence of a degenerate television, a far cry from either educational or developmental television. Not to speak of its developmental or educational impact, it has provided a perverse "window on the world". It has turned out to be more of a window on the cinema world; the inert world of politicians, bureaucrats and academics; the still world of TV studios; the world of urban elites — but far from the sociologists' world that socialises the young and the grown-up. Why? The simple answer is that there is no money to fund TV stations sufficiently to exploit its developmental potential, if any.

And where are the community TV sets for the have-nots and the TV sets for schools? Barely one thousand such sets are functioning and that too mainly in schools for school students. The rich have received another bounty from the exchequer and found a very low-cost means of spending their leisure time. The masses within the range of the existing five TV stations have been left in the cold. Why? It is expensive to instal and maintain community TV sets. There is probably no point in sinking money into community TV receivers if one has not produced the expensive developmental or educational TV programming material in the first instance.

A further complication on the TV question arose from the planners' own side. This stemmed from the specific egalitarian goals propounded in the Fifth Plan Approach Paper. The massive expansion of TV broadcasting, as originally sought by ISRO as well as AIR, did not square well with the planners' posture on egalitarian objectives. In the Draft Plan these objectives have been sufficiently diluted to enlarge the Planning Commission's degree of freedom *vis-a-vis* TV as well as many other things (such as the Maruti car) which are meant for the top 30 per cent of the population. But the planners are not particularly well placed to solve the problem of paucity of funds for annual operating cost of TV stations. While they can earmark capital outlays for installing community TV sets — as they have rightly done in the Draft Report — they are not in a position to provide either for the adequate repair and maintenance of community TV sets or the production of expensive programmes needed for making an educational and developmental impact in the rural areas. These are current outlays which have to be funded annually in Central budget (or state budgets in case the Centre wants the states to foot the bill). In Parliament, annual demands for grants for TV stations have to compete with many other pressing demands for grants for developmental and educational programmes in action, not to speak of periodic grants for distress relief. Until the TV user ministries press for such funds when the Minister for Information and Broadcasting places before the Lok Sabha AIR's demands for grants for TV stations, adequate funding for maintaining a developmental TV system cannot be ensured year after year.

The dilution of the Fifth Plan's egalitarian goals did not however mean the end of the planners' travails. They had still to indicate their preference for the pet plan of each of the two contenders, namely, AIR and ISRO. Though it was a simple technical matter, the powerful pleas of ISRO and its past commitments had to be reckoned with. In particular, ISRO's agreement with the National Aeronautics and Space Agency (NASA) of the United States, enshrined in a Memorandum of Understanding signed in 1969, made the choice between its and AIR's proposals somewhat difficult for Yojana Bhavan. In my view, ISRO's commitment for satellite TV experiment has distorted the whole thinking on television in India. It is a pity that even Yojana Bhavan has not escaped from the pernicious grip of ISRO's satellite TV experiment.

TV in the Fifth Plan

The final outcome of the rather prolonged confabulations between the planners and the promoters of TV is a compromise solution. An outlay of Rs 80 crores is indicated in the Draft Plan. (To this may be added part of the reported spillover from the Fourth Plan period.)[2] While this allocation implies a substantial step-up in the priority for television in the next Plan, it is substantially below the claims staked by ISRO as well as AIR. However, it would have to be scaled down substantially in the light of unfolding ramifications of the oil crisis and the widespread shortages of necessities of life such as foodgrains, edible oils, domestic fuels, clothing, etc. In fact, the case for freezing the expansion programme for TV broadcasting and the TV sets making industry is now very strong.

The detailed breakdown of the proposed outlay on TV broadcasting is not available. The lion's share would certainly go for the construction of TV stations and TV relay stations. The rest is earmarked for (i) provision of community TV stations and (ii) setting up a TV training institute in Delhi. There is no provision for hoisting a satellite of our own for bringing TV to all nooks and corners of India during the seventies. Instead, there are the following provisions for preparatory work in this regard:[3]

(a) Rs 16.75 crores on research and development work on the application of space technology to telecommunication, television, meteorology, remote sensing, navigation and geodesy;

(b) Rs 93.50 crores for development of launch vehicles with capacity for launching synchronous satellites needed for television, telecommunications, etc; and

(c) an unspecified amount for conducting the satellite TV experiment called SITE.

These provisions of the Fifth Plan reveal that the planners essentially accept that the satellite has a definite and important role to play in Indian TV development, possibly after the end of the Fifth Plan period. Their wholehearted endorsement of SITE — that it would provide "a system test of broadcast satellite for national development" — speaks for their predilections for satellite technology as compared to terrestrial technology of microwave and TV towers. If the experiment is successful, one may expect the deployment of our own synchronous satellite for TV broadcasting in the eighties. It is in this context that I propose to reappraise once again the usefulness of satellite technology for TV development in India in the following paras.

Role of Satellite

I have been arguing in my writings

that satellite technology is ill-suited for a national TV system based on the bold concept of direct reception of TV signals from satellite to TV receiver. (This is technically known as broadcasting satellite service.) In sharp contrast to this exciting role, its possible role is limited to just providing a national hook-up, or inter-connection, in the TV system for half an hour or so every day. (This is technically known as fixed-satellite service system.) In this rather conventional role, the satellite acts like a microwave relay system carrying one TV programme to all regional, programme-producing or 'mother' TV stations only.

In arguing that satellite technology is not suited for direct reception type of television in India, I had based my assessment solely on technical considerations. In this rapidly advancing world of technology, we may take a fresh look at the technical assumptions to see for ourselves whether there is need for a revision in my earlier perception. Also, the economics of such a satellite-based system *vis-a-vis* conventional TV system is probed afresh.

International Constraints

Telecommunications require strict control and regulation so as to avoid mutual interference of radio signals, both in the domestic and international spheres. In case of telecommunications *via* satellite the problem of international interference of signals has become very significant because a single geo-stationary satellite, deployed in TV broadcasting directly to TV receivers, can 'illuminate' (i e, reach) 40 per cent of the globe.[4] Thus, a TV signal emitted by a transmitter on a satellite can easily spill over to many countries in the neighbourhood of the one country which has hoisted the satellite for domestic telecommunications and TV broadcasting. While the use of reflectors on a satellite can narrow the radio signal to a surface area much less than 40 per cent of the globe, the geometrical shape of most countries is far from strictly circular so as to enable beaming strictly within the international boundaries of a country. To illustrate this point for the particular case of India, a synchronous satellite, emitting a TV beam pointed to Nagpur as its central point, would give rise to spill-over effects as follows:

As the beam is widened to cover the whole of Gujarat and Rajasthan in the West, West Bengal in the East, and UP in the North, the TV signal would spillover to (i) the border areas of West Pakistan, notably Karachi and (ii) the whole of Nepal and parts of Tibet and Bangladesh. Such a beam, however, would not cover Assam, Meghalaya, Tripura, Manipur, Nagaland, Jammu and Kashmir, parts of Punjab, Haryana, Madras and Kerala. In attempting to reach such excluded areas our satellite TV signal would get into Sri Lanka, Burma and Afghanistan as well.

The World Administrative Radio Conference (WARC), an international body that tries to regulate international telecommunications, met in Geneva in June 1971. In view of the widespread apprehension of interference from satellite telecommunications in domestic terrestrial telecommunications, WARC imposed certain constraints on telecommunications *via* satellite.[5] These constraints, which are given in Table 1, consist of (a) specific allocations of radio spectrum for various types of telecommunications *via* satellite in different regions of the globe; and (b) power of radio signals or power flux density limitations. It is sometimes asserted that WARC constraints nullified a good deal of spade work on satellite TV done by ISRO between 1967 and 1971 — a period known for publicity of ISRO's grand TV plans for India. There is indeed truth in this assertion but I must hasten to add that whatever was nullified was misconceived in the first instance, as would become evident below.

Three Options

So far as India is concerned the WARC has left us three options in respect of the frequency bands for satellite television for domestic use. The first is in the lower part of the radio spectrum, viz, 620-790 MHZ in the UHF band. The second is in the middle part of the radio spectrum, namely, 2,500-2,690 MHZ, or 2.50-2.69 GHZ, in the S-band. And the third is in the upper GHZ band, 11.70 to 12.20 GHZ. My oft-repeated argument that no more than 5 TV channels can be available from a satellite has rested on the two following assumptions:

(a) A bandwidth of 40 MHZ is needed for one TV channel in FM mode of broadcast to be employed in TV broadcast *via* satellite.

(b) The radio bandwidth of 500 MHZ in the upper GHZ band, which is capable of yielding almost 13 TV channels in FM broadcast — given assumption (a) — is currently little exploited for telecommunications. Suitable telecommnication equipment for propagation and reception of radio signals in this little-used part of the radio spectrum has to be evolved, and the cost of such equipment would be substantially above the corresponding equipment for the conventional UHF band. Therefore, generous provision of frequency allocations at this tail-end of the radio spectrum is of little value in overcoming the TV channel constraint posed by the allocations in the lower and middle bands.

Now, there is need for taking a dynamic view of bandwidth requirements per TV channel as well as availability of telecommunications equipment for the upper GHZ band. The time-frame for the INSAT plan is no longer the Fifth Plan period. In short, assumptions (a) and (b) are valid if INSAT plan were to be on the agenda during the Fifth Plan, for which ISRO has been pleading since the beginning of the seventies.

Radio Spectrum

The radio spectrum is a natural resource whose scarcity is very much akin to that of the natural factor of production, land. The fixedness of this resource partakes the character of flexibility as well. Mankind's progress in exploiting land for agricultural production bears a close parallel to the last one hundred year's exploitation of the radio spectrum for telecommunications. The more 'fertile' part of the lower end of the spectrum (viz, VHF and UHF bands) is being exploited more and more intensively to yield more and more telecommunications per unit width of the spectrum. At the same time, the 'barren' parts of the spectrum have come to be exploited through spectacular advances in knowledge and technology, thereby enhancing the useful part of the spectrum for telecommunications. In this process, however, the marginal cost of telecommunications has tended to rise as we moved from the lower end to the upper end of the spectrum.

Telecommunications *via* satellite would be naturally more economical in the lower parts rather than the upper parts of the radio spectrum. Since the VHF band is already congested and well-exploited, the less-exploited UHF band could be quite economical for telecommunications *via* satellite. Thus, joint studies between ISRO and the General Electric, USA, in 1969 revealed that the UHF band would prove the most cost-effective in Indian conditions. Likewise, the joint studies between ISRO and Lincoln Laboratory, MIT, USA in 1970 — the first detailed design of INSAT proposal is in this ISRO-MIT report — found 800 to 960 MHZ section of the UHF band very relevant for us. In point of fact, the SITE experiment is designed for test trial in the 800-900 MHZ band.

Table 1: WARC Constraints for TV Broadcasting via Satellite in India

Part of the Radio Spectrum	Bandwidth Allocated	Power Flux Density Limit
UHF band	620-790 MHZ	49.5 dBW
S-band	2500-2690 MHZ	62.0 dWB
Upper geigahertz band	11.7- 12.2 GHZ	None

Source: E V Chitnis (convener), "Report of the Study Group on Communications", Indian Space Research Organisation, Ahmedabad, July 1972.

ISRO is no longer inclined to use the UHF band for satellite telecommunications. There is the problem of scintillation of TV signals (like the phenomenon of twinkling of stars) in UHF band, which has been lately noticed in some experiments abroad. Then one encounters the unfavourable WARC decision in respect of power flux density for this band.[6]

Ever since the publication of the WARC regulations in July 1971 ISRO has shown keen interest in the S-band for its INSAT plan. Since its time horizon for INSAT was limited to the late seventies, its scientists concurred with the following expert view:

> "Although 11.7 to 12.2 GHZ is promising for the future, in the next five years India is not in a position to have an operational direct broadcast satellite system in that band. However, since this band has no flux density limitations, it will be worthwhile to investigate the possibility of using this band in the future".[7]

In view of (a) the handsome provision of 500 MHZ bandwidth and (b) the absence of power flux density limitations, the upper GHZ band for TV broadcast for satellite appears indeed a very attractive prospect. The problem of regional diversity can be tackled more adequately in this band rather than in the 2.5 GHZ band. Granting that 20 MHZ (instead of 40 MHZ) is enough per TV channel, almost 25 TV channels can be carved out of the available bandwidth without any worrying about spillover effects from our TV system onto our neighbours, of which at least two may be hostile to our endeavours in space. But the tantalising prospect is shrouded in uncertainty at the moment.

In this era of fantastic feats in outer space I have no doubt that a full back-up of research and development effort can certainly produce the needed hardware for telecommunications in the 11.7 to 12.2 GHZ band most suited to our domestic requirements. But the economic feasibility of the INSAT system in this band would require reconsideration. As noted earlier, telecommunication devices become more and more expensive as one moves up in the radio spectrum. Take the case of the augmentation device for a conventional TV receiver, known as front-end converter. The Electronics Corporation of India, Hyderabad, is reported to have agreed to produce one front-end converter for SITE experiment for Rs 2,000.[8] The cost of the front-end converter for the 11.7 to 12.2 GHZ band may be up by a factor of two or more. Given the large number of community TV receivers needed in our TV system, the system cost may rise by hundreds of millions of rupees, as shown in Table 2.

Likewise, the cost of a satellite (including the launching cost) rises substantially as one mounts on it more transponders to get more TV channels. For example, a small satellite with one TV channel capacity in UHF band may cost about Rs 20 crores compared to Rs 41 crores for a big satellite of 4 TV channel capacity in the S-band. It is mainly the launch cost which rises sharply as the payload on the satellite increases. To illustrate, the average and the marginal launch costs per kg weight are as follows:

Average cost per kg of a small satellite of 340 kg: Rs 150,000 per kg

Marginal cost for the next 250 kg: Rs 310,000 per kg

In short, the economics of a direct broadcast satellite, operating in the 11.7-12.2 GHZ band, is indefinite at the moment. Therefore, any claim that the INSAT system for the upper GHZ band (instead of the 2.5 GHZ band) would be cost-effective is premature at this stage.

Let us look at our third option, the S-band, for the INSAT system. The number of TV channels that can be carved out of the available bandwidth is constrained by (i) the bandwidth chosen per TV channel and (ii) the upper-limit of 62 dBW power flux density for TV broadcasts in the S-band. The Study Group on Communications, constituted in November 1971, was of the view that about 3 TV channels can be obtained with polarisation diversity and 3 more TV channels can be obtained with increased cost in ground segment. After the week-long deliberations at the Ahmedabad Seminar on Indian Programme for Space Research and Applications, the above assessment was re-appraised and it was decided that INSAT system should have 5 TV channels, implying the use of about 38 MHZ per TV channel and an EIRP of 51 dBW per TV channel. But according to one assessment, only 20 MHZ bandwidth per TV channel would suffice, with a 10 MHZ separation for each TV channel as set out in Table 3.

Number of TV Channels

During a recent visit to Ahmedabad it was brought to my notice that because of recent technical progress a bandwidth of 10 MHZ could suffice for a TV channel in FM mode of broadcast *via* satellite.[9] The use of such a narrow bandwidth could conceivably enable us to carve out much more than 5 TV channels from the S-band. But why don't we do that? Given a bandwidth of 190 MHZ available for satellite TV, as many as 19 TV channels could be provided for in the INSAT design — enough to take care of our significant diversity of languages and life styles. Instead of doing so in a straightforward way, why is ISRO adopting the questionable course of providing 5 audios for each TV channel to tackle the problem of regional diversity in the country? Is it because the TV system of 19 TV channels would become prohibitively expensive? Or is it because both the capital and the current costs of the INSAT system of 19 TV channels would get escalated so substantially that such a system would no longer be cost-effective when compared with a purely terrestrial TV system of comparable design?

I am not in a position to provide definitive answers to these questions. To begin with, I am not able to figure out if the power flux density of a 19 TV channel satellite would not exceed the WARC limit of 62 dBW for the S-band. Presuming we could technically conform to the WARC regulation, I am not in a position to cost up such a system. The following components and segments of the INSAT system would rise substantially as we add 19 instead of 5 TV channels in the system:

(i) the front-end converter,

(ii) the launch vehicle and the satellite,
(iii) R and D work, and
(iv) software production

My considered view is that such an INSAT system would turn out to be as expensive as a purely terrestrial TV system. It is, however, a hypothesis, not a conclusion.[10] The view is indeed shared by well-informed scientists within ISRO itself, though it is at variance with ISRO's own claim that satellite technology would cost a fraction of the total cost of terrestrial technology of microwave and TV towers in case India wants to build up a really nationwide TV system. But since ISRO's claim rests on comparisons of doubtful value, we might as well look at the basis of this claim.

It was in 1967 when NASA and ISRO (then under the aegis of the Department of Atomic Energy) did a joint study on the scope for deploying a satellite for TV service in India. The study examined the broad alternatives available to India for national TV coverage. It recommended that a 'hybrid' system, employing a synchronous broadcast satellite for direct reception by TV sets in most parts of India and receive-rediffuse TV stations for densely populated urban areas, was most economical for us. For the estimated cost of such a system would be one-third of the cost of a conventional terrestrial system. In my view, the genesis of the ISRO claim under investigation is this finding of NASA-DAE study. Ever since then ISRO is, so to speak, hooked on deploying a satellite, among other things, for direct TV broadcasting in India. It has neither bothered to question the economic basis of its claim nor cared to look into the relevance of the satellite TV system in meeting the communication and educational needs of the country. That its comparison between satellite-based TV system and conventional TV system pertains to two non-comparables needs to be brought out. This is shown in what follows.

Non-Comparable TV Systems

A purely terrestrial TV system can be a highly decentralised one as well as truly oriented to regional needs. Each TV tower in such a system can meet the regional constraints of language, general life style, cultural traits and beliefs of the local population within its range of 50 to 80 kilometres. In other words, we can have as many TV channels as we need to take care of our regional diversity, thereby enhancing

Table 2: Total Cost of Front-End Converter for Different Number of TV Sets and at Different Prices of Converters

No of TV Receivers \ Price of a Converter	Rs 2,000	Rs 4,000	Rs 5,000
0.5 million	Rs 1,000 million	Rs 2,000 million	Rs 2,500 million
1.0 million	Rs 2,000 million	Rs 4,000 million	Rs 5,000 million

Table 3: Radio Bandwidth Allocation for Satellite TV (Downlink) in INSAT-S Plan

Channel Number or Spot Beam Number	Radio Frequency (MHZ)	Remarks
1	2530-2550	1 The bandwidth approved by WARC (1971) for satellite TV for India (Region 3) is 2500-2690 MHZ.
2	2560-2580	2 Radio frequency allocations for the downlink satellite telecommunications are other than those for television.
3	2590-2610	
4	2620-2640	
5	2650-2670	

Source: Pramod Kale, "INSAT-S: A Conceptual Satellite Design for INSAT", ISRO, July 1972, (Mimeographed), p 40.

the impact value of the medium. We can build meaningful interconnections among these stations. For example, all TV towers within a state can be interconnected with microwave or coaxial cables, thus building sub-systems at the state level. These sub-systems, each dedicated to the main language group of a state, can be combined into a national system to provide a national hook-up for a common TV programme in one language at a time. Since the two officially-recognised national languages of the country, Hindi and English, cannot be effectively understood in all parts of the country, the duration of the national hook-up in the TV system has per force to be short, as is currently being done on AIR whose nationwide morning and evening news bulletins in Hindi and English are broadcast over all radio stations simultaneously.

To compare this kind of terrestrial system with a satellite TV system of a few TV channels is unwarranted. Let us go over the satellite TV systems proposed by ISRO and others. Let us take up those systems with just one TV channel. Rosenberg (1966), the NASA-DAE study (1967), the NASA-sponsored 'Stride' study of the University of West Virginia (1967-68), and the General Electric (1970) made a provision of just one TV channel. Thus, the synchronous satellite would beam one TV programme all over India. Such a national TV system is neither needed by us nor is it comparable with the terrestrial TV system outlined earlier.

The Hughes Aircraft Corporation did a second study for India in 1971, providing for 2 TV channels in its proposed satellite TV system. But the authors of ISRO-GE and the ISRO-MIT studies were a bit more liberal as they provided for 3 TV channels (the latter, with one back-up TV channel). ISRO's current thinking is in terms of 5 TV channels; each oriented to one part of India but with built-in provision for national hook-up of one TV channel capability.

Only Prasad and Singh (ACME Report, 1969) and myself (1972) have argued that the best role for satellite in a TV system is for interconnecting regionally-oriented TV sub-systems. While Prasad and Singh found that 16 slow-moving aircrafts fitted with TV transmitters could serve as regional TV subsystems, I found conventional TV stations somewhat more cost-effective than such aircraft-based regional sub-systems.

ISRO has been trying to make its INSAT TV system superficially comparable to the purely terrestrial TV system by two routes: (i) the introduction of the idea of 5 spot beams, each carrying one TV channel plus five accompanying audio channels for each separate region of the country, and (ii) the increased hybridisation of INSAT system in favour of the conventional mode of TV broadcasting. Route (i) was opened up by a pioneer paper by Pramod Kale while route (ii) was strongly advocated by Wing Commander K R Rao. Let us examine in detail what is the present thinking of ISRO in respect of (i) and (ii).

Idea of Spot Beams

Instead of one common beam of 5 TV channels illuminating the whole of India, Pramod Kale has proposed 5 spot beams with the regional coverages (and non-coverage) outlined in Table 4. I have labelled the spot beams as follows so as to distinguish them properly:

(1) Far-Eastern Beam
(2) Eastern Beam
(3) Southern Beam
(4) Western Beam
(5) Northern Beam

The most noteworthy point is that no single spot beam covers one area which can be culturally deemed to be homogeneous. It is naive to imagine that cultural diversity of a region covered by a spot beam is fully taken care of once provision is made for language diversity *via* audio channels. To begin with, language diversity is not synonymous with cultural diversity: language is just one distinguishing element of cultural diversity. Unless a TV viewer in a rural area discerns some cultural identity with the TV characters and images, he may not appropriately get the message in education and development. Since the whole rationale for developing this visual medium rests on its communication potential *par excellence* for the illiterate and the unsophisticated, any attempt to downgrade the significance of the TV visual is to substantially curtail the impact value of the medium.

Secondly, one faces the formidable task of lip synchronisation in dubbing the visual in several languages. It is a time-consuming process. Evidently, TV news bulletins cannot be dubbed. So, these would have to be broadcast in all the languages of a given region, thus pre-empting a good deal of TV broadcast time everyday. In case of documentaries, the TV station managers can take a cue from the Films Division and offer running commentaries in several languages. But in case of dramas, skits, plays, school lessons, etc, the TV producers would have to carefully pre-plan the language scripts and the TV shots. For example, the problem of lip synchronisation can be minimised for a TV viewer by eliminating close shots of the TV characters whenever they are engaged in dialogue. But then these peculiar constraints would cramp the production style of TV producers, not to mention the possible loss of the impact value of TV programmes.

My apprehension is that the TV programmes of each regional beam are going to be dominated by the cultural tinge of the area having the mother TV stations. In that case, the INSAT system would cater well to the needs of five states only, while others would get a poor deal compared to what they could get in a terrestrial TV system. Even if all the states within a regional beam receive due attention in respect of cultural traits in programme production, the daily duration of time for effective viewing for each state would turn out to be a small fraction of what they could look forward to in a terrestrial system.

Table 4: Expected Beam-Wise Regional Coverage in INSAT-S System

S No (1)	Name of the Regional Beam (2)	States/Territories Covered (3)	Remarks (4)
1	Far Eastern Beam	1 Assam 2 Manipur 3 Nagaland 4 Meghalaya 5 Tripura 6 Mizoram 7 Fraction of West Bengal	1 Covers Bhutan and Bangladesh completely 2 Part of Sikkim, Burma and China also covered 3 Nicobar and Andaman not covered 4 No overlap with other Beams
2	Eastern Beam	1 Bihar 2 Orissa 3 Part of West Bengal 4 Central and Eastern UP 5 Eastern and Southern MP 6 Fraction of Maharashtra and AP	1 Marginal overlaps with Far Eastern Beam (in West Bengal) and Western Beam (in MP) 2 Significant overlap with Northern Beam in UP and MP 3 Spillover into parts of Nepal
3	Southern Beam	1 Almost whole of Karnataka 2 Almost whole of Tamil Nadu 3 Part of Kerala 4 Part of Andhra Pradesh 5 Pondicherry	1 No overlap with other Beams
4	Western Beam	1 Almost whole of Maharashtra 2 Better part of Gujarat 3 Part of Rajasthan 4 Western MP 5 A fringe of AP and Karnataka	1 Goa not covered 2 Significant overlap with Northern Beam (in Rajasthan and MP) 3 Marginal overlap with Eastern Beam (in MP and Maharashtra).
5	Northern Beam	1 Delhi 2 Western UP 3 Part of Punab and HP 4 Parts of Haryana	1 J and K not covered 2 Substantial overlap with Eastern Beam and Western Beam 3 Spillover to China and Nepal

Note: The expected coverage of each spot beam is figured out from the map given in the "Report of the Seminar on Indian Programme for Space Research and Applications", August 7-12, 1972, published by P D Bhavsar for ISRO. Therefore, the Table is only broadly indicative of state-wise coverage of INSAT system.

Hybrid TV Systems

The word hybrid has two different connotations in the context of TV systems. The conventional connotation is one of satellite technology being combined with terrestrial technology (or airborne technology of slow-moving aircrafts). The other connotation is when satellite is deployed in a dual

role of direct broadcast service and fixed satellite service. It is in this latter sense that the NASA-DAE study of 1967 considered its proposed INSAT system for India to be 'hybrid'. ISRO's current usage of the word implies a hybridisation of the two aforesaid connotations. Thus, INSAT is a hybrid TV system because it envisages the following:

(1) Installation of 150,000 community TV receivers, fitted with front-end converters, that can directly pick up TV programmes beamed by a TV transmitter mounted on a synchronous satellite;

(2) Installation of 200 low-cost limited re-broadcast VHF transmitters, which have capacity to receive TV programmes from the satellite transmitter and rediffuse them in a conventional manner to conventional TV receivers, including 410,000 community TV receivers, within their range of line-of-sight.

(3) Installation of 73 TV transmitters, interconnected with 8,700 kilometres of microwave relays.

The above INSAT proposal emerged out of the Ahmedabad Seminar (August 1972). It is noteworthy that hybridisation of diverse thoughts at the Ahmedabad Seminar had not only led to marriage of satellite technology with microwave technology but also resulted in diminished role of the satellite for direct broadcast to TV sets. More specifically, of the 560,000 community TV sets (presumably one each for all the 560,000 villages in the country) in the system, only 27 per cent were proposed to be augmented with front-end converters. This is in sharp contrast to ISRO's earlier thinking. Thus, K R Rao's persistent pleading that only a small part of the area of the country qualifies for direct reception from satellite were vindicated to a great extent at the Ahmedabad Seminar.[11]

This author is at a loss to figure out what the microwave links are supposed to achieve in the INSAT plan. What kind of regional or national interconnections are created by them? After all, each spot beam provides for carrying one TV programme to all parts of a region covered by the beam area. And satellite is capable of broadcasting one common programme to all parts of India. Maybe, inclusion of microwave links in the fold of the INSAT plan was a compromise solution with AIR and Post and Telegraph engineers who had been opposing satellite-based TV plans for India right from the beginning when the idea was mooted.

The foregoing critique of ISRO's thinking on the deployment of a satellite for TV broadcasting in India clearly brings out the inadequacies and the irrelevance of INSAT TV system for our country. Hence the nullification of its thinking in the wake of WARC recommendations should not distract us from the inherent weaknesses of its thinking right upto the time when the WARC constraints came. In view of the great diversity in language and life style, we must plan for a highly decentralised TV system in which the satellite plays a small role of providing a national hook-up. In such a system the limited rebroadcast transmitters are part of state-level sub-systems; that is, these receive TV signals from the mother or the central TV station of each subsystem, and not from the satellite.

What then is the great point in persisting with the thrice-postponed satellite TV experiment? The futility of half of the experiment — test trial of TV reception by 2,400 community TV receivers fitted with front-end converters and chicken-mesh antennas — is beyond doubt. The investment of about Rs 72 lakhs, with a foreign exchange component of about Rs 5 lakhs, in 2,400 augmentation devices would be a dead loss. And since the test trial is to take place in the UHF band in which ISRO is no longer interested, a successful test trial of satellite technology does not mean anything worthwhile for ISRO's INSAT plan designed in S-band of the radio spectrum. In short, the experiment can be scrapped forthwith, thus saving about Rs 9 crores.

Notes

1 See, (i) "Economics of Television for India", *Economic and Political Weekly*, March 10, 1973; (ii) "Development of TV in India: Retrospect and Prospect", *Economic and Political Weekly*, July 14, 1973.

2 The Draft Report is a bit confusing on the question of the Fourth Plan spillover in respect of broadcasting. At one place the Report mentions an anticipated expenditure of Rs 30 crores against a planned outlay of Rs 40 crores for both TV and radio broadcasting, yielding a total spillover of Rs 10 crores. But at another place it categorically states a figure of Rs 35 crores as the spillover from the Fourth to the Fifth Plan. Even though I know that the Fourth Plan outlay on TV was Rs 14 crores, I cannot figure out what is amiss here. Maybe, this is the side-effect of revising previous outlays to the new base year prices of the new plan. Or, are these tell-tale marks of the protracted battles on the TV question in the Yojana Bhavan? In point of fact, such elements of obfuscation are also noticeable when one encounters television elsewhere in the Draft Report.

3 The total outlay for ISRO's space programme in the Fifth Plan is placed at Rs 172.50 crores in the Draft Report (p 229).

4 A TV transmitter, mounted on a geo-stationary or synchronous satellite, acts as if it is a conventional TV tower of 22,500 miles height. Since the range of a TV tower is in proportion to its height, the area covered by a TV transmitter mounted on a satellite becomes fantastically large.

5 An additional factor causing anxiety to some countries was the intensification of 'electronic imperialism' *via* satellite.

6 In UHF band EIRP per TV channel is not allowed to exceed 49.5 dBW, or power flux density should not exceed the value of —129 dBW/m² for angles of arrival less than 20 degrees. The limit of 49.5 dBW is 5 dBW lower than assumed in ISRO studies prior to WARC decision. This is how WARC upset ISRO's apple cart.

7 Report of the Study Group on Communications 1972, p IV-9.

8 To this cost of the front-end converter has to be added the cost of the parabolic chicken-mesh antenna, which is placed by ISRO at Rs 300 for the UHF band. The Study Group on Communications put the same estimate in the range of Rs 500-750. My apprehension is that the cost of the chicken-mesh antenna (including its cost of installation) may work out to Rs 1000 when actually produced under commercial conditions.

9 Based on discussions with Pramod Kale and S V Deshmukh, both of Space Applications Centre, Ahmedabad, in late November 1973.

10 This hypothesis needs to be distinguished from my earlier conclusion emerging from my Ph D Work. That conclusion too pertains to two exactly comparable alternative TV systems, in which micro-wave relays are juxtaposed against a satellite for providing interconnection among the 16 regional 'mother' TV stations.

11 K R Rao was indeed a member of the ten-member Study Group on Communications whose report was considered at length at the Ahmedabad Seminar. It may be pointed out that Rao carried the other members of his Study Group, in the sense that the Group recommended no more than 50 to 70 thousand augmented TV receivers in the whole system.

Evaluation of Agricultural Development

An Alternative Approach

Ramindar Singh

Frank A Wilson

The main objective of this study is to carry out a benefit/cost analysis of the Intensive Agricultural District Programme (IADP) in Ludhiana district of Punjab state. Its more specific aims are (a) to estimate a benefit/cost ratio for the programme expenditure and (b) to see the effect of the process of adoption on the benefit/cost ratio over the programme period.

The assessment is carried out from the viewpoint of the Punjab government, which is the financing authority.

TO calculate the impact of the Intensive Agricultural District Programme in India at the district level, efforts made so far have been in the direction of comparing the yield rate of crops and application rates of important inputs such as chemical fertilisers with a 'Control Area' selected for each district in the beginning of the programme and with the state as a whole in which each district is situated.[1] Results of all these efforts suggest the partial success of the programme. Despite the fact that the programme has not been able to establish its superiority by showing improved growth rates over other areas, the basic technique of intensive agriculture has been adopted in the Intensive Agricultural Area Programme (IAAP) and the High-Yielding Varieties Programme (HYVP). The main objective of this study was to carry out a benefit/cost analysis of the Intensive Agricultural District Programme (IADP) in Ludhiana district of Punjab State. More specific aims were (a) to estimate a benefit/cost ratio for the programme expenditure and (b) to see the effect of the process of adoption on the benefit/cost ratio over the programme period. The assessment was carried out from the view point of the Punjab government, which is the financing authority. For the purpose of all calculations the district was taken as a single unit.

Methodology

In calculating the benefits directly attributable to the IADP a 'control area' approach has been used. This approach depends for its justification on the assumption that two or more not dissimilar areas in terms of climate, soils, and topography can be identified for comparison. The difference between the actual production in the programme district and the expected production for the same district on the basis of the production trend in the 'control area' (without the development programme) can be considered to be the benefits directly attributable to the development programme.

This approach has the merit of eliminating the effects on production in the programme area due to (a) the changes in the weather; (b) the indirect effects of crop prices on the cropping pattern: and (c) the effects of the normal development programmes.

In the case of IADP Ludhiana, the Control Area contiguous to Ludhiana district was established at the outset of the IADP. This Control Area consists of Moga Block (Ferozepur District), Ahmedgarh Block (Sangrur District) and Chamkaur Sahib Block (Ambala District now Rupar District).

In estimating the benefits and costs, only primary or direct benefits and costs were taken into account.

Direct Benefits and Costs

Primary or direct benefits are defined here as incremental gains that arise directly from the programme, that is the difference between the net value of crop production 'with' and 'without' the programme. To estimate the primary benefits only the output (main products) of crops, that is, wheat, gram, maize, cotton, groundnut and sugarcane is calculated. Most of the by-products of the crops are used at the farm to feed the animals, so their value is not added to the value of the output. To make up for the under-estimate of total value of products, cost of maintenance of bullocks, which provide power, is estimated after excluding the cost of home-grown wheat chaff, groundnut and gram bhusa, maize stalks and cotton seeds.

These costs are divided into two parts: government costs and farmers' costs.

Government costs include expenditure incurred by the Punjab government under the account headed Intensive Agricultural District Programme, Ludhiana. These costs are summarised in Table 1.

Farmers' costs are divided into two parts: (i) current costs of cultivation of crops and (ii) the capital costs of the farmers. Total farmers' costs are summarised in Table 2.

Costs of Cultivation

Cultivation costs of crops have been estimated at constant prices based on 1960-61.[2] Items of cost included in the estimate are: organic and inorganic fertilisers, small tools and implements, power and fuel, seed and seed treatment, plant protection, small farm improvements, land revenue and water charges, artisans, hired labour, purchased foodstuffs for bullocks and interest paid on medium and long-term loans for agricultural production (loans for irrigational facilities, tractors, etc). In the case of inorganic fertilisers only the quantity used for the crops under consideration has been charged,[3] but the prices include an element of interest as almost all the fertilisers consumed were provided through a short-term cooperative or government taccavi.[4] Cost of seed is calculated at a price 15 per cent higher than the price used for the product sales, because seed input is of better quality, needs extra care in storing and is used at a time of the year when the prices are higher than immediately after harvest. Extra cost of the new varieties of seeds used in

Table 1: Expenditure Incurred by the Punjab Government under the Head IADP Ludhiana

Year	Amount (Rupees)
1961-62	675,000
1962-63	1,061,000
1963-64	930,000
1964-65	2,770,000
1965-66	2,800,000
1966-67	676,000
1967-68	1,120,000
1968-69	1,486,000
1969-70	1,648,000
1970-71	1,609,000

Source: Intensive Agricultural District Programme, Annual Programmes, Ludhiana.

the later years of the programme is included. Cost of artisans, small tools and implements, power and fuel, small farm improvements, interest on medium and long-term agricultural loans, farmyard manure purchased and land revenue and water charges paid, has been calculated on the basis of area cropped each year. The cost of labour includes the wages paid (in kind and cash including food provided) to the hired labour and is calculated on the basis of area cropped each year. These costs are summarised in Table A1 and A2 of Appendix A.

In order to reap the benefits from the agricultural development programmes the farmers in Ludhiana district had been making capital investments in the form of creating additional irrigation facilities, buying farm machinery and land improvements. There are no estimates of these investments available. Two ways of arriving at an estimate of these investments were considered:

(a) The number of wells, tube-wells, pumping sets, tractors, carts, ploughs, sugarcane crushers, and bullocks and camels at different times in the district are now available. By putting a price at each item and then multiplying by the increase in its number, the amount of investment can be obtained.

(b) In Ludhiana district medium and long-term loans had always been advanced to the farmers by the government and the co-operative societies in the district. The amount of money advanced for the capital investments would give a measure of the farmers' capital investments.

The first approach was not used due to the non-availability of the prices of individual items of investment and doubts about the accuracy of the number of each item added each year.[5] The annual average figure of capital costs thus comes to Rs 2.61 crores.

In this study the second approach was used. This had the following serious limitations:

(a) It is assumed that the farmer did not make any capital investments or supplemented the borrowed amounts from his savings.

(b) It is assumed that the farmer used the loans for the purpose they were advanced and no part of them was consumed at home.

(c) Farmer did not borrow from any other source for the capital investment.

All the assumptions are brave ones made in the light of inadequate information. The farmers *had* been investing from their own resources (however small), they *had* been borrowing from other sources (money-lenders, friends and relatives) and there is *some* evidence that the loans were misused. However, to some extent the possible underestimate due to the first and third assumptions is likely to be balanced by the possibility of an overestimate due to the second assumption. The annual figures (total amount of loans) obtained by using the second approach (see Table A3 of Appendix A) when compared to the average annual figure obtained by the first approach seems to be gross underestimates. The figures obtained through the second approach were considered to represent annual repayments of total loans (from all sources including relatives, friends and money-lenders) more satisfactorily than to be the farmers total capital costs.[6] These figures are shown as farmers' capital costs in Table 2.

TABLE 2: TOTAL FARMERS' COSTS, LUDHIANA DISTRICT, 1960-61 TO 1970-71

Year	Costs of Cultivation	Capital Costs	Total Costs
1960-61	606.0	—	606.0
1961-62	601.2	56.8	658.0
1962-63	595.7	58.0	653.7
1963-64	757.5	55.8	813.3
1964-65	840.3	86.5	926.8
1965-66	884.4	97.4	981.8
1966-67	928.4	81.1	1009.5
1967-68	1179.7	63.6	1243.3
1968-69	1553.4	21.8	1575.2
1969-70	1562.4	113.5	1675.9
1970-71	1656.2	205.3	1861.5

TABLE 3: VALUE OF CROP PRODUCTION, LUDHIANA DISTRICT, 1960-61 TO 1970-71

Year	Gross Value of Production	Farmers' Costs	Net Value of Production
1960-61	1403.8	606.0	797.8
1961-62	1664.2	658.0	1006.2
1962-63	1403.0	653.7	749.3
1963-64	2112.2	813.3	1298.9
1964-65	2597.4	926.8	1670.6
1965-66	2599.9	981.8	1618.1
1966-67	2923.6	1009.5	1914.1
1967-68	3513.1	1243.3	2269.8
1968-69	3478.0	1575.2	1902.8
1969-70	3749.0	1675.9	2073.1
1970-71	3983.4	1861.5	2121.9

VALUE OF PRODUCTION

Total physical production of each crop was calculated by multiplying the area under the crop by its average district yield rate as derived from the Punjab government crop cutting statistical sample. Physical production has been multiplied by the constant average harvest prices for the years 1960-61 to 1962-63. The results are summarised in Table 3B of Appendix B.

To arrive at the net value of production of the crops the farmers costs of production were subtracted from the gross value of production (Table 3).

To compare the actual production in Ludhiana District since 1960-61 with the expected production for the same period on the basis of the production trend in the control area, an index of the gross value of production for the control area was constructed, taking the 1960-61 crop year as a base.

The gross value of production for each year was obtained by adding together the gross value of individual crops, that is wheat, gram, maize, cotton, groundnut and sugarcane (Appendix B). To obtain the gross value of each crop the average yield rate of the crop was multiplied by the price of the crop (constant average harvest price for 1960-61 through 1962-63) and an area weight (Appendix B).

The expected production figures for the district were obtained on the basis of the gross value of production index numbers for the control area. For example, the index number of production for the year 1961-62 is 101.8 (base 1960-61=100) in the control area and the actual production in Ludhiana for the year 1960-61 is Rs 14.04 crores. The expected production figure for Ludhiana district for the year 1961-62 on the basis of the control area index number would be $\frac{140,380,000 \times 101.8}{100}$ rupees.

TABLE 4: ADDITIONAL NET VALUE OF PRODUCTION, LUDHIANA DISTRICT, (DURING THE IADP PERIOD, 1960-61 TO 1970-71)

(Rs lakhs)

Year	Actual Gross Value of Production	Index Numbers of GVP Control Area	Expected Value of Production with Control Area Index Numbers	Difference between the Actual Gross Production and the Expected Gross Production	Additional Costs of the Farmers over the Year 1960-61	Net Value of Additional Production
1	2	3	4	5	6	7
1960-61	1403.8	100	$\frac{1403.8}{100} \times 100 = 1403.8$	—	—	—
1961-62	1664.2	101.8	$\frac{1403.8}{100} \times 101.8 = 1429.1$	235.1	52.0	183.1

1965-66	2599.9	111.8	$\frac{1403.8}{100} \times 111.8 = 1569.4$	1030.5	375.8	654.7
1966-67	2923.6	115.6	$\frac{1403.8}{100} \times 115.6 = 1622.8$	1300.8	403.5	897.3
1967-68	3513.1	156.8	$\frac{1403.8}{100} \times 156.8 = 2201.2$	1311.9	837.3	674.6
1968-69	3478.1	127.8	$\frac{1403.8}{100} \times 127.8 = 1794.1$	1683.9	969.2	714.7
1969-70	3749.0	132.3	$\frac{1403.8}{100} \times 132.2 = 1857.2$	1891.8	1069.9	821.8
1970-71	3983.4	118.6	$\frac{1403.8}{100} \times 118.6 = 1664.9$	2318.5	1255.5	1063.0

The expected production figures for the district are calculated for the years 1961-62 to 1970-71 and are summarised in Table 4, Column 4.

To obtain the additional gross value of production, expected gross value of production figures calculated above were subtracted from the actual gross value of production figures for the district (Table 4, Column 5).

To obtain the additional net value of production the farmers' additional costs over the year 1960-61 were subtracted from the gross value of production (Table 4, Column 7).

Additional net value of production for each year was considered to be the programme benefits. The allocation of money made by the Punjab Government, directly under the 'Intensive Agricultural District Programme, Ludhiana' was treated as the programme costs. To arrive at the total benefits and cost figures, annual benefits and cost figures were discounted to the base year 1961-62, first by using a 5 per cent and then a 10 per cent discount rate.[7]

The benefit/cost ratio was obtained by dividing the total 'present value' of the benefits by the total 'present value' of the programme costs. The results are summarised in Table 5.

It is conventional to calculate one benefit/cost ratio using benefits and costs over the entire life of the project. However, one ratio does not reflect the process of adoption of the new technology and thus the change in the benefit/cost ratio over time. To see the difference, if any, in the magnitude of returns in the initial periods of the IADP and in the later years when 'high-yielding varieties' were introduced, annual benefit/cost ratios were calculated. To compute benefit/cost ratio for each year additional net value of production for the year was divided by the money spent under IADP for that year. The results are summarised in Table 5, Column 10.

THE RESULTS

The benefit/cost ratio for the programme using a 5 per cent discount rate is 41.2 and the ratio is 39.6 if a 10 per cent discount rate is used. At both discount rates the benefit/cost ratios are quite high. The benefits of the programme in the form of additional value of crop production created thus appear to justify the direct costs of the programme. It is not however possible at this stage to say whether the IADP has a higher return than the other programmes of agricultural development (CD and NES, IAAP and HYVP) as a similar evaluation of other programmes has not been carried out.

The benefit/cost ratios calculated for each year range from 14.4 in the year 1962-63 to 132.0 in 1966-67. The 1962-63 crop year was particularly bad as crops were damaged by the locust attack in July-August and heavy floods in August-September. The 1966-67 crop year was again exceptional as the programme costs were low due to the budgetary reasons and the production was large due to the introduction of the high-yielding varieties of wheat and

1970-71	1063.0	—	14.8	—	—	—

Note: The programme costs are averaged over the whole period of ten years.

maize within the district. If these two exceptional years are ignored the benefit/cost ratios still range from 23.4 in the year 1965-66 to 66.1 in 1970-71. From the benefit/cost ratios for different years (Table 5) it is obvious that there is no definite pattern of change in the ratios over time.

To explain the variations in the annual benefit/cost ratios, we should examine the arithmetic of calculating these ratios first. The magnitude of the ratio varies with the change in the numerator (additional benefits) and the denominator (programme costs). Additional benefits are a function of additional production and the farmers additional costs of production. The benefits in the form of additional production increased as a result of:

(a) programme efforts;
(b) factors external to the programme and
(c) the introduction of the high-yielding varieties of wheat and maize.

The variations due to (b) can be reduced to some extent by taking a three-yearly moving average. The additional benefits due to (c) can be calculated for the year 1966-67 and onwards and on subtracting the value of these benefits from the total value of additional benefits, the expected benefits 'without' these variety improvements can be obtained. Thus two sets of three-yearly average figures for the additional benefits are calculated — 'with' and 'without' the high-yielding varieties (Table 6, Columns 3 and 5).

In the case of the programme costs no specific reasons for annual variations are obvious, so that a moving average is not likely to give satisfactory results. Therefore an annual average cost figure over the entire period of the study (10 years) is calculated (Table 6, Column 4). The benefit/cost ratios obtained by removing the annual fluctuations in the benefits and costs are summarised in Table 6.

The annual benefit/cost ratios, obtained after removing the annual fluctuations in the costs and benefits which are caused by the factors external to the programme, reflect the process of 'adoption'. The results obtained here (Column 5) establish the 'classical'[8] pattern. The benefit/cost ratio increases steadily each year for the first four years and then becomes relatively constant. The results obtained by removing variations due to the high-yielding varieties of wheat and maize (Column 7) indicate that in the absence of these varieties the benefit/cost ratios for the more recent years would have been lower and steadily declining suggesting the setting in of diminishing returns to the programme expenditure. It is interesting to note that in the absence of the high-yielding varieties the additional benefits in the year 1968-69 would have been negative (see Appendix C). The setting in of diminishing returns during the recent years can be partly explained by the fact that the increase in the farmers' costs of production have increased more rapidly than the gross value of production, thus giving a low figure for the net value of production each year.

CONCLUSIONS AND LIMITATIONS

In conclusion, the results of this study can be stated as follows:

(i) A single benefit/cost ratio calculated over the entire period of the study justify the expenditure on the IADP.

(ii) The annual benefit/cost ratios reflect the process of adoption of the new technology and suggest: firstly, that a peak for the returns in the present circumstances was reached as early as 1965-66 and secondly, that diminishing returns would have set in if the high-yielding varieties of wheat and maize were not introduced. These facts are important for the policy-makers when making decisions in favour of the 'intensive agricultural' approach over the more gradual agricultural development approach of the Community Development and National Extension Service programmes.

(iii) The benefit/cost ratio of 27.0 intuitively seems to be quite high for the very first year of the programme (unfortunately, there are no comparative figures available either in India or elsewhere). Part of the explanation lies in the fact that Ludhiana district has had extension education programmes going on since the launching of the first Five-Year Plan. After a few years of extension activities, any new items of technology in this case package of inputs and practice recommended under IADP and the HYV of wheat and maize are more quickly adopted.

(iv) There is a need for more satisfactory methods of evaluating agricultural development programmes than those based on purely technical approach which traditionally concentrated on such indicators as increased use of new inputs and the increase in the yield rate of crops.

The limitations of this study, only three of which are specified below, must be kept in mind in interpreting the results:

(a) It is assumed that the development activities under the normal development programmes were carried out at the same level in the district as in the 'control area'. There is some evidence available that the expenditure on the activities under the normal programmes were increased in Ludhiana district.

(b) During the programme period the intensity of cropping (index of multiple cropping) went up from 126 per cent in the base year to 149.2 per cent in the year 1968-69 mainly due to the large increase in irrigational facilities. A shift in the croping pattern from low value crops (wheat and gram mixture and gram) to high value crops (wheat and groundnuts) has also increased the value of production. Since 1964-65 the output/input ratio has been in favour of the farmer, thus indirectly pushing up the acreage planted and therefore, total output.[9] Attributing the effects of such factors as these to the extension programme only must be open to question. Although the use of a 'control area technique' is expected to eliminate the effects of weather and price changes on production the development of agricultural infrastructure such as irrigation facilities, and co-operatives for the supply of inputs and credit enables the farmers in the programme area to cope better in adverse circumstances and unfavourable weather situations. Liberal supply of scarce inputs enables the farmers to benefit more in a favourable price situation than the 'control area' farmers.

(c) The selection of a suitable control area is very difficult in itself. In the case of IADP the control area has been selected very carefully on the basis of surveys conducted for this special purpose. But still in the case of

Source: Intensive Agricultural District Programme, Ludhiana (Punjab), and "Role and Achievements of Co-operatives in IADP Ludhiana", (unpublished).

Ludhiana district the 'control area' was better placed in respect of consolidation of land holdings, irrigation facilities, rural electrification and improved approach roads.

Appendix B

The figures regarding the area under each crop in the Control Area were not available. To construct an index of production for the control area, area weights were thus calculated on the basis of the cropping pattern in Ludhiana district. This implies that the changes in the cropping pattern in the control area was in the same direction as in Ludhiana district. To justify this assumption changes in the cropping pattern for the whole of the Punjab state were examined. The changes in the cropping pattern for the Punjab state were found to be in the same direction over time as in the district of Ludhiana. The area under wheat, maize, sugarcane and groundnut was continuously increasing and area under gram and cotton was on the decline.

Two different sets of area weights were calculated, one for the period 1960-61 to 1965-66 and the second for the period 1966-67 to 1970-71. The reason behind using different weights for these periods is that the production estimate in the earlier years is not unduly pushed up by the significant changes in the cropping pattern in the recent years. During the period 1960-61 to 1965-66 the area under wheat, maize and groundnut increased at an annual average of 2, 4.4, and 13.4 percentage points, respectively. Area under the same crops increased 10.7, 8.2 and 19.3 percentage points annually during the period 1966-67 to 1968-69. The area weights for the first set were calculated on the basis of average area under each crop for the years 1960-61 and 1965-66 and the second set on the basis of average area under each crop for the years 1965-66 and 1968-69.

Notes

[The results and the calculations contained in this paper are based on the basic data collected for a research study "The Economic Evaluation of an Agricultural Development Programme — A Case Study of Ludhiana District, Punjab State, India" by Ramindar Singh.]

1 Among the major reports to adopt this approach are the First, Second and Third Reports published by the Expert Committee on Assessment and Evaluation, Ministry of Food, Agriculture, Community Development and Co-operation (Department of Agriculture), New Delhi established under the Intensive Agricultural District Programme. Some of the individual studies are:

(a) D K Desai, "Intensive Agricultural District Programme Analysis of Results", *Economic and Political Weekly*, June 28, 1969 pp A83-90.

(b) D Dorris Brown, "The Intensive Agricultural District Programme and Agricultural Development in Punjab", Economic Development Report No 79, Development Advisory Service, (Cambridge, Mass, Centre for International Affairs, *Harvard University*).

(c) C H H Rao, "Intensive Agricultural District Programme — an Appraisal", *The Economic Weekly*, November 28, 1964, pp 1887-1891.

(d) C A Robertson, *et al*, "The Package Programme — An Appraisal I", *Economic and Political Weekly*, August 27, 1966, pp 79-85.

All these studies are based on the data published in the three reports of the Expert Committee on Assessment and Evaluation and collected through the Benchmark and Assessment Surveys and Operational and Analytical Research units.

2 In the case of inputs for which the cost is calculated on the basis of area cropped, prices are not available for the year 1960-61 and cultivation costs estimated in (a) Benchmark and Assessment Survey, Intensive Agricultural District Programme, "Study of Agro-Economic Conditions of Cultivators of IADP Ludhiana conducted during 1963-64", (Ludhiana, April 1965); and (b) Benchmark and Assessment Survey, IADP, "Assessment and Evaluation of IADP Ludhiana", 1960-61 to 1965-66, Ludhiana", September 1966, have been arbitrarily adjusted downward for use in this study. In making the adjustment cultivation costs estimated for different crops in (a) Ajaib Singh, *et al*, "Studies in the Economics of Farm Management in the Punjab, Combined Report (1954-55 — 1956-57)", (Delhi, Government of India Press, 1963); and (b) The Board of Economic Enquiry Punjab (India), "Cost of Production of Crops in the Punjab for the Years 1951-52 to 1955-57", (Punjab Government); were kept in mind. Estimates are not likely to be on the high side as the prices of inputs have been more or less constant up to the year 1964-65. (Expert Committee on Assessment and Evaluation, Third Report, *op cit*, p 2.)

3 Expert Committee on Assessment and Evaluation, Second Report, *op cit*, p 219.

4 Operational and Analytical Research, IADP "Income-Expenditure Structure, Capital Formation and Production Credit Requirements of Farm Households", Ludhiana, October 1966, p 26.

5 Farmers Capital Investment in Ludhiana District Each Year Since 1961-62:

Item	Average Number Added Each Year	Approximate Price Per Item (Rs)	Total Value (Rs lakhs)
Tractors	466	25,000	117
Pumping sets	2800	3,000	84
Tube-wells	1263	3,000	38
Carts	1441	1,500	22
Total			261

Appendix C

ADDITIONAL NET VALUE OF PRODUCTION, LUDHIANA DISTRICT, WITHOUT HIGH-YIELDING VARIETIES; 1966-67 TO 1970-71

(Rs lakhs)

Year	Additional Gross Value of Production of HYV	Additional Cost of Production of HYV	Additional Net Value of Production of HYV	Total Additional Net Value of Production with HYV	Additional Net Value of Production without HYV (5—4)
1	2	3	4	5	6
1966-67	89.0	27.5	71.5	897.3	825.8
1967-68	714.3	219.7	494.6	674.6	180.0
1968-69	1379.4	514.4	865.0	714.7	—150.3
1969-70	1042.8	517.0	525.8	821.8	296.0
1970-71	839.4	624.6	214.8	1063.0	848.2

6 This issue was discussed with the officials at the IADP office Ludhiana in 1970. They confirmed the view that the government and Co-operative loans form only a part of the credit advanced to farmers. The amount borrowed from other sources such as friends, relatives and money-lenders is quite significant too but unfortunately no reliable figures are available.

The discount rates used in this study are to some extent arbitrary. A 5 per cent rate of interest has been used as a low rate and 10 per cent rate of interest as a high rate. These rates have been used in India to evaluate the major irrigation projects by the Programme Evaluation Organisation, (Planning Commission, Government of India), in "Evaluation of Major Irrigation Projects — Some Case Studies", Government of India Press, (New Delhi, 1965). Unfortunately no no reasons for the choice of 5 per cent and 10 per cent discount rates are given in the book.

In Pakistan a 4 per cent discount rate is used for evaluating irrigation projects, which is the interest rate charged by the international lending agencies. This is considered a low rate and rates up to 10 per cent and even higher are recommended because the opportunity cost of the capital in Pakistan is considered to be higher (see I D Carruthers, "Irrigation Development Planning — Aspects of Pakistan Experience", Agrarian Development Report Number 2, Wye College, University of London, 1968, pp 55-6, and W Eric Gustafson, "Introduction to Cost Benefit Analysis", Chapter 3 of "Cost-Benefit Analysis", (ed) A T Khan, National Institute of Public Administration, Lahore, Pakistan, pp 21-22).

8 Classically, in the case of an extension programme, the benefit/cost ratio is expected to rise gradually over time as more and more farmers participate in the programme, recommended inputs and practices are fully adopted and the extension staff is able to devote more time to help the farmer. In the early years of the programme extension staff have to develop an understanding of the particular circumstances of the area and the farming community before any pay-off is apparent.

9 Expert Committee on Assessment and Evaluation, Third Report *op cit*, p 2 and Walter, P F and Gotch, C H, "Agricultural Policy and Performance in the Punjab — A Comparative Study of India and Pakistan", Economic Development Report Number 96, (Cambridge, Mass, Harvard University, May 1968) p 25.

Krishna Steel

KRISHNA STEEL has set up its own billet making plant at the MIDC industrial estate off Thana Belapur Road in Maharashtra. The Rs 3.5-crore project comprises a steel melting shop and a billet rolling mill. Two 15-tonne electric arc furnaces will produce steel upto 50,000 tonnes a year and triple the company's present production of wire rods. The company started its career in 1950 by acquiring a steel re-rolling mill at Wadala in Bombay and put up an electric arc furnace and a steel foundry in the following year. Production was raised from 100 tonnes of bars and rods and 50 tonnes of castings per month to 5,000 tonnes and 350 tonnes per month, respectively, by continued modernisation and indigenous improvisation. Today the production capacity of the mill is about 1 lakh tonnes per annum. A Kocks continuous wire-rod rolling mill was commissioned in 1962. An indigenous twisted steel bar for concrete reinforcing was developed in 1970.

INDIAN COUNCIL OF SOCIAL SCIENCE RESEARCH
New Delhi

(An autonomous body set up by the Government of India)

Advertisement No 1/74

Applications are invited for the following temporary posts, to be continued on a year to year basis, in the ICSSR:

1. Name of the Post : Junior Research Assistant.
2. Scale of pay : Rs. 425-15-500-EB-15-560-20-700.
3. Qualifications : M.A., Second Class, in any field of Social Sciences.
4. Age : Not above 28 years as on 1st May 1974, relaxable upto five years in the case of Scheduled Caste/Scheduled Tribe candidates.

The post carries all allowances admissible to Central Government Employees in Delhi.

Preference will be given to Scheduled Caste/Scheduled Tribe candidates.

Applications accompanied by a crossed postal order of Rs. 4/- (Re. 1/- in the case of Scheduled Caste/Scheduled Tribe candidates) endorsed in favour of the ICSSR should be submitted along with the prescribed form (obtainable by sending a self-addressed stamped envelope of the size 25 cms x 10 cms and postage stamp bearing 0.40 ps.), so as to reach the Administrative Officer, Indian Council of Social Science Research Indraprastha Estate, New Delhi-1, latest by 25 May 1974.

Persons already in employment should submit their applications through proper channel.

Prescription for exchange earning

Modern medicines made in India—as good as the world's best—are being exported to several developing and developed countries. Foreign exchange earned has risen from under Rs. 1 crore in 1961 to over 10 crores today.

The United Kingdom, Switzerland, the Netherlands, Czechoslovakia, Yugoslavia and the German Democratic Rupublic import Indian medicines. So do Japan, Hong Kong and Israel, as well as many developing countries in Asia and Africa.

Our basic drugs and fine chemicals also enjoy acceptance and demand in international markets, thanks to the very great emphasis placed on quality control by the pharmaceutical industry.

India's pride: medicines to match the world's best

The world would be out of its element if India had not generated atomic thought

Today the world is in its element as it finds itself in the atomic age. But the discoveries of modern times echo the atomic theories of ancient India—theories that were brilliant explanations of the physical structure of the universe. An atomic theory was taught by Pakudha Kātyāyana an older contemporary of Buddha. Indian atomic thought thus originated before Democritus the great Greek philosopher—one of the founders of the atomic theory In physics and other spheres Indian talents have enriched the world. We at L&T continue the tradition by enriching life through industrial development. The source of our energy is the vast reservoir of technical know-how generated over 35 years It has spurred us on to manufacture equipment for India's nuclear power projects. The reactor vessel, fabricated for the first time in India, is an example. In order to foster the growth of nuclear power we have set up modern fabrication facilities; formed a specialist cell for handling design, fabrication, application of new techniques. We are a vast industrial complex designing, manufacturing installing plant and equipment for every vital industry. The secret of our success lies in the individual talents of over 10,000 people in our associate and subsidiary companies and our network of offices all over India.

Railway Strike

THERE is an air of unreality about the negotiations now going on between the leaders of railway workers and the Railway Ministry. Both sides have reiterated their anxiety to avert the threatened strike of railway workers; yet neither side seems to know how precisely this can be done. This is not because there is no room for compromise on the specific demands in support of which the strike has been mooted. The real reason is that neither side really enjoys the confidence of the railway workers who have good reason to suspect the *bona fides* of both.

For the All-India Railwaymen's Federation (AIRF), presided over by George Fernandes, the strike is primarily a manoeuvre, which has been forced upon it, to salvage its position among the railway workers. Over the years, the AIRF, as well as the National Federation of Indian Railwaymen (NFIR), the other recognised all-India body of railway workers, have paid scant attention to the problems of workers and have instead concentrated on building up a cosy relationship with the railway authorities with a view to securing all manner of privileges for their office-bearers at different levels. The government, for its part, has willingly co-operated with the AIRF and the NFIR which have been objects of the Railway Ministry's unstinted patronage. It is this persistent neglect of the workers' interests by the so-called recognised unions which has been responsible for the rapid emergence in the last few years of the category-wise unions as well as for large bodies of workers disaffiliating themselves from the AIRF.

Against this established pattern of management-labour relations, the activities of some of the newer unions have been very inconvenient to both the Railway Ministry and the recognised unions. The railway management has responded to this situation by taking recourse to deviousness and deception which has further lost it the confidence of the workers. The two federations of workers, and the AIRF particularly, have suffered the same fate because of their inability or unwillingness to protest against such actions of the railway authorities.

The 25-day strike of locomotive staff in July-August last year — organised by the All-India Locomotive Running Staff Association (AILRSA), among the best organised and most militant of the category-wise unions — was an excellent case in point. The strike was called off by the AILRSA after the railway authorities had signed an agreement containing specific assurances on the workers' demands. However, as soon as the agreement was signed, the Railway Ministry, with the help of the two recognised federations, set about sabotaging it. Under the terms of the agreement an *ad hoc* committee, headed by the Deputy Minister for Railways, was constituted to examine the locomen's demands, most important among them being the reduction of working hours from 14 to 10. It was specifically agreed that the manner in which the duty hours were to be reduced to 10 would be discussed by the committee and the details settled within six weeks. However, the first few meetings of the committee were enough to show that the government had no intention of settling any of the issues through the deliberations of the committee. The committee soon died a quiet death and the railway authorities have stuck to their own schedule for introduction of the shorter working hours for the locomotive staff.

Not only did the government go back on its undertaking to negotiate with the locomen on their substantive demands, but even routine assurances given to them about withdrawal of charges against those arrested in connection with the strikes in July-August and later in December were not implemented. As late as four-and-a-half months after the first strike, the AILRSA president had disclosed that there were still 200 cases pending against locomen under the DIR; in addition, more than 1,000 workers had been departmentally charge-sheeted and about 20 had been actually removed from service. A three-member committee, consisting of the Chief Labour Commissioner and a representative each of workers and management, has at last been constituted to look into the cases in respect of which the Railway Minister's assurances given way back in August last year have not yet been implemented.

The Railway Ministry's approach to the present threatened strike by the railway workers has been equally casual. It has taken shelter behind the plea that the workers' demands would impose a stupendous burden of Rs 400-500 crores which, it has been argued, the railways cannot bear given the parlous state of their finances. It is true that, despite repeated fare and freight rate hikes, the finances of the railways are in shambles. This is the outcome of poor management, corruption at the highest levels and lack of

medium- and long-term planning by the Railway Ministry and the all-powerful Railway Board. The Railway Minister, who is so concerned about the consequences of the workers' demands for the railways' economic health, has done nothing about these fundamental causes of the economic malaise in the railways.

It is typical of the Railway Ministry's approach that, among all the demands of the workers, the Railway Minister should have made a great show of accepting the one for supply of foodgrains through fair price shops to railway workers earning less than Rs 300 per month. No details of the scheme — such as the prices at which the supplies are to be made or the arrangements for making the foodgrains available to railway workers in far-flung places — have been disclosed. No doubt, the Railway Minister is counting on the fact that by the time these details can be worked out, he will be able to quietly forget about the scheme.

The government, it is clear, is not serious about discussing the railway workers' demands. Instead, it is preoccupied with building up public opinion against the strike through the large-scale cancellation of major passenger train services on the specious plea of conserving the railways' coal stocks and accelerating the movement of foodgrains, coal and other industrial raw materials so that the impact of the strike on the economy is minimised. One may be sure that when the information is available it will be seen that no significant acceleration of the movement of essential goods actually took place during this period. Should the strike materialise, the government will no doubt meet it with the familiar strong-arm methods. Already a number of railway workers have been arrested under the various preventive detention laws. It can be counted on to take the opportunity to crack down on the more inconvenient elements among the workers, especially in the independent unions such as the AILRSA. Yet nothing could be more calculated to further alienate labour in the railways.

Exchange Reserves

Costly Loyalty

DESPITE authoritative reassurances tha 1929-type world financial crises are a thing of the past — or that there is no prospect of one occurring in the immediate future at any rate — some of the major economic indicators point to some pretty grim developments. The UK, whose currency is next in importance to the dollar as a reserve currency and whose capital is still the most important world financial market, appears to be headed for a financial crisis of very serious proportions.

Britain has been plagued by staggering current account deficits almost since the beginning of 1972. The deficit was less than $ 1 billion in the first half of 1973; it was around this level in the third quarter of 1973 and in the last quarter it was almost equal to that of the entire preceding nine months. Hopes of an early improvement in the UK's external position vanished with the steep rise in the petroleum import bill in the current year. During the last three months alone, the current account deficit has amounted to around $ 2.4 billion, or well over two-thirds the total deficit in the whole of 1973. The monthly current account deficit has been rising continually from £ 185 million in November 1973 to £ 371 million in March 1974, the worst in the UK's history.

Forecasts made by bodies like the National Institute of Economic and Social Research (NIESR) or the OECD about the UK's balance of payments position in the 1974 are unanimously gloomy. According to the NIESR, for instance, the UK would be faced with a balance of payments deficit of anything between $ 5 billion and $ 7 billion in the first half of 1974 and about $ 7.5 billion and $ 11 billion in the whole of 1974. According to the OECD, which is generally very conservative in its forecasts about its member-countries' economies, the UK will have a current account deficit of about $ 8.4 billion this year. The latest indicators, however, suggest that the UK's deficit this year will be close to $ 10 billion and since its reserves are currently about $ 6 billion only, it will be forced to borrow substantially on the world markets. Because of the pound sterling's role as a reserve currency, the UK will have to maintain its foreign exchange reserves around the current level to meet any contingent demand arising from holders of sterling reserves switching to other currencies; it will also have to maintain minimum working balances, especially to finance its official repayment liabilities as and when they fall due.

The UK government appears to be fully aware of the balance of payments prospect facing it and has got ready a phased programme for borrowing. Sometime ago it announced that it intended to borrow enough funds abroad this year to meet the deficit on account of oil imports and to cover at least a part of its non-oil deficit. The oil deficit is estimated at over $ 4 billion and so the UK is likely to borrow at least around $ 5 billion. However, according to OECD estimates, the UK would have to borrow this year at least three times the $ 3 billion it borrowed in 1973 through various public sector undertakings — that is, about $ 9 billion — to finance its balance of payments deficit.

The UK can hope to get around $ 2 billion as standby credit from the IMF, provided it approaches the IMF in time. Because of the global nature of the present crisis, the IMF faces a rush on it for financial accommodation and, despite all its efforts to raise additional resources from the oil exporting countries, the funds at the disposal of the IMF will fall far short of the demands on it, as the queue of intending borrowers lengthens. Italy has already obtained $ 1.2 billion under the standby arrangements and some more requests for help are currently being processed by the IMF.

Even after it has got all it can from the IMF, the UK will still have to look to other sources for another $ 7-8 billion. Until recently the Eurocurrency markets were believed to be assured sources of supply of funds, though at high cost — the interest rates being 10-11 per cent for maturity periods upto 10 years. But the situation has changed drastically since the beginning of this month. Eurobankers are reported to be developing cold feet while lending to public sector undertakings and state authorities of even the developed countries which are in balance of payments difficulties. A case in point is Italy, which had borrowed heavily on the Euromarket last year. Italy was hoping to raise $ 4 billion this year in the Euromarket but a recent issue of $ 700 million was finally shored up only after great pursuasion by 110 participants out of some 400 bankers in all who had been approached. Italy, like the UK, is likely to have a stupendous trade deficit of about $ 10 billion this year.

The UK has, in addition, the sword of large sterling balances, which far exceed its total foreign exchange holdings, hanging over it. The sterling guarantee agreement as it operated upto the end of the last month did act as a sop to large holders of sterling; even so, some of them decided to opt out of the guarantee last year. The revised guarantee which is linked to a dubious index of 'effective exchange

rate' of sterling is unlikely to prove as attractive as the earlier dollar value guarantees. If the 'effective exchange rate' of sterling as computed by the Bank of England in the past is any indicator, holders of sterling will not be entitled to any compensation whatever may happen to the sterling's exchange rate on the markets. If in view of this, large holders of sterling begin to move out of sterling into other safer currencies like the German mark or the US dollar, the fat will be really in the fire.

The pound will then sink like a stone and faithful holders of sterling, such as India, will face a large capital loss on their reserves. It needs to be recalled in this context that while the rest of the world prepared itself well in advance for the sterling devaluation of 1967 by moving large funds out of London, India loyally suffered a sizeable capital loss by opting to keep its reserves in sterling despite the many warning signals hoisted by the world financial markets in anticipation of the sterling devaluation. Are we preparing for the same kind of debacle once again?

Portugal and Africa

No Quick Solutions

THURSDAY's coup in Portugal is directly related to the protracted fighting which has been going on in its African colonies for 13 years. The coup is a conclusive indication that the guerilla movements, particularly FRELIMO in Mozambique and PAIGC in Guinea (Bissau), have got the upper hand in the fighting. No colonial army seeks political compromises unless its will to continue fighting is finally broken. This now appears to have happened to the Portuguese army.

But it is yet to be seen whether there are segments in the armed forces, particularly in the African territories, who still feel that they can win a military victory over the guerilla movements. One of the first decisions of the coup leaders was to dismiss the general commanding Portuguese forces in Mozambique. This perhaps indicates that the coup leaders fear that elements of the armed forces in Africa might band together with white settler elements, especially in Angola which has a well-established European community numbering about 340,000 out of a total population of 5,800,000 (Rhodesia in comparison has 255,000 whites in a population of 5,700,000). In order to forestall any such eventuality the junta in Lisbon will be extremely wary about starting any direct negotiations with the guerilla movements who themselves might prefer to continue the fight rather than negotiate now that they have a firm sign that the Portuguese are cracking up.

It is much more likely that initially the new regime will take only some token measures like bringing more blacks into the local assemblies in the African territories and altering their rubber-stamp character to some extent. The junta would also have to consider the strong feelings of the Rhodesians and South Africans who are not going to look benignly upon any negotiations with the guerillas and who could foment settler revolts against Lisbon. There must of course also be some in the junta who would rather see friendly, nationalist governments established in the African territories rather than full-blown socialist ones which might come to power if the fighting goes on much longer.

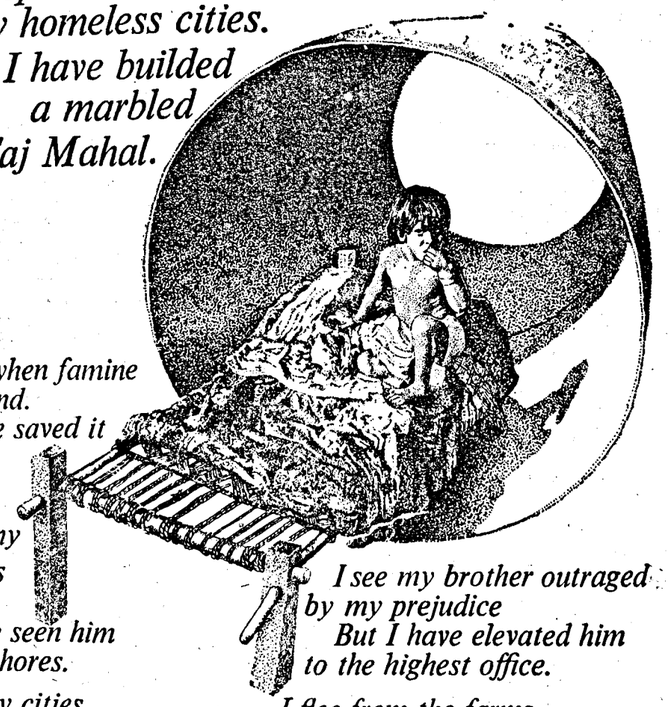
The main focus of interest for the next few months will therefore be the manoeuvres within the officer corps of the Portuguese armed forces. If General Spinola, the hero of the coup, has been advocating a political solution to Portugal's overseas liabilities there are others like General Arriaga who have continued to stress that a military solution can still be found to the troubles in Africa. And in a basically conservative force like the Portuguese army those who cannot stomach the thought of compromising with the despised enemy might be thinking in terms of a counter-coup.

Exports

No Long-Term Planning

THE Annual Report of the Ministry of Commerce for 1973-74 begins predictably, with an account of the spectacular performance of exports. It is pointed out that exports in the first nine months of 1973-74 indicate almost a continuation of the previous year's phenomenal growth rate of 22 per cent. There is grudging admission that steep increases in unit values of exports have contributed to the growth of exports. However, the contribution of the depreciation in the value of the rupee in relation to most of the major currencies in inflating the value of exports expressed in rupees is glossed over. Finally, how much reliance can be placed on the DGCIS's export data? The appointment of one committee after another to examine the compilation of export statistics is admission enough of the mess in which these statistics have been for quite a while.

An important organisational innovation in 1973-74 claimed by the Commerce Ministry is the creation of a separate Department of Export Production "to take care of export production, problems of facilitating the augmentation of capacity and for providing the required inputs, expeditious disposal of the applications of export-oriented units for sanctions under various governmental regulations". The Ministry is apparently preparing to take up its lobbying role with other governmental organisations even more seriously than in the past.



Lobbying has been the main function of the several organisations set up or encouraged by the Commerce Ministry to promote exports, like the export promotion councils and the commodity boards. The failure to generate stable and growing export surpluses in the primary and industrial sectors in the last two decades has forced the Commerce Ministry to try to push up exports of whatever items happen to be available at any moment. The Ministry has apparently yet to appreciate that the 'production' aspect is at least as important as the 'promotion' aspect in raising the rate of growth of exports.

In this context, the decision to do away with the so-called working groups charged with the task of "drawing up concrete export production plans with the assistance of other administrative Ministries concerned in respect of items having maximum export potential" deserves notice. Last year's annual report had mentioned that the working groups had identified about twenty product lines. They were further expected to estimate domestic and foreign demand, identify gaps in existing capacity in regard to ranges, specifications, and quality and plan at the macro and micro levels for creation of sufficient capacity to meet export targets. Despite these paper plans the working groups had achieved very little. But the Commerce Ministry should have tried to improve their working instead of doing away with them altogether.

The chapter of the report on the now-forgotten Export Policy Resolution passed by Parliament in 1970 makes interesting reading. It talks about everything except what the Ministry is doing to implement the Resolution. The discussion ranges generally over production of and demand for a number of commodities like cotton, jute, cashew, tobacco, tea, vegetables and handicrafts without setting out the steps that the Commerce Ministry has

Ours is a magnificent Land-1

I sleep in the sewers
of my homeless cities.
But I have builded
a marbled
Taj Mahal.

I hunger when famine
stalks the land.
But I have saved it
from plague
and pox.

I taught my
child the arts
of Science.
But I have seen him
forsake my shores.

I befoul my cities
because I will not plan.
But I have looked up
and discovered Quasars.

I see food hoarded
while my poor go hungry.
But I have made the
green revolution happen.

I never taught my children
to read nor write nor count.
But I have fathered
Nobel laureates.

I see my brother outraged
by my prejudice
But I have elevated him
to the highest office.

I flee from the farms
to the despair of my cities.
But I have held to the hope
of a hundred million jobs.

I was born to subsist
on a half-Rupee daily.
But I have died so my ashes
can enrich my loved India.

I am sad.
But I am glad.
I am.

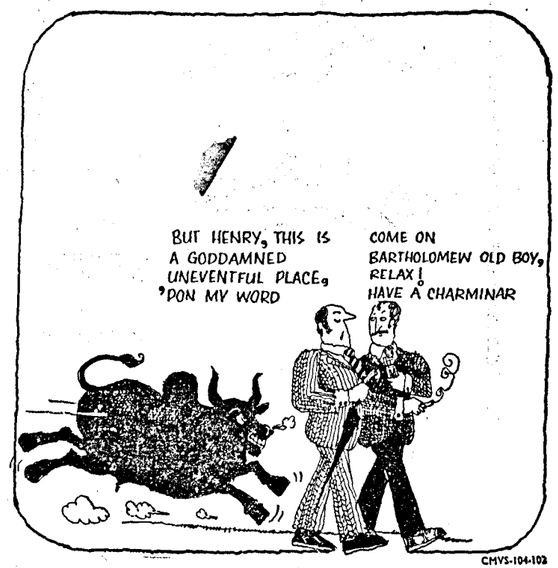
The Subcontinent

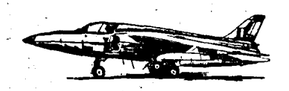
Weight of the Army

G P writes:

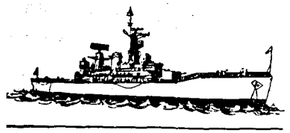


IN the midst of increasing instability and disorder in all the three countries, the tripartite talks between India, Pakistan and Bangladesh must have come as a relief to the politicians and bureaucrats concerned — or at least some of them — who now have something like an achievement to talk about. Besides, the agreement reached among them does alter the picture in the subcontinent. The 195 Pak prisoners of war have got their controversial, but inevitable, clemency. Persons who had been accused of fascist crimes only a couple of years ago have been magnanimously released. Aziz Ahmed, the Pakistani Minister of State for External Affairs and Defence, did apologise in a legal way — befitting the legalist traditions of our lawyer-politicians who have always looked upon Lincoln's Inn with so much pride and veneration. He expressed regret for such crimes "as may have been committed". With his Bangla counterpart in a generous mood he did not have to do more.

What is important to note in Aziz Ahmed's phraseology is his concern for the feelings of the Army. The democratically elected leaders of all the three countries have got to be increasingly careful not to step on their army officers' toes. Ahmed's legalistic apology and Kamal Hossain's acceptance of it, with Swaran Singh officiating as the presiding deity, have demonstrated the new image the Army has in our part of the world. The war crimes issue was not one between the peoples of Pakistan and Bangladesh, but between the Army of Pakistan and the people of Bangladesh. A civilian, democratically-elected regime should have come out with a forthright apology (as Japanese Prime Minister Tanaka did in Peking). Bhutto's government claims to represent the people, and not the armed forces, of Pakistan. The issue was not one of clemency. Statesmanship and the situation demanded that clemency be granted. But it was not necessary to play down what the Pakistani armed forces have done in erstwhile East Pakistan. That Bhutto found it imperative to do so and Kamal Hossain agreed to go along with him on that point brings out how heavy the military brass weighs in Islamabad and presumably in Dacca and New Delhi as well.



Perhaps this erosion of liberal values is not a matter of great concern to anybody in the subcontinent. Had it been otherwise, Aziz Ahmed's clever apology on behalf of the Army Headquarters in Islamabad would not have gone so completely unnoticed in this country, or for the matter, in Bangladesh. Maybe President Bhutto is not the only one who has to keep his Generals in good humour. This is the reason why the discussion on the agreement has centred more on 'clemency' than on 'apology', forgetting the simple fact that 'clemency' was hardly an issue and that, in any case, by the time the tripartite talks had begun, the issue had already been informally settled. More concretely, Aziz Ahmed's 'apology' has raised a pertinent question: are the honour of the Army and the honour of the people identical? Ahmed's answer to the question seems to be a clever and cautious 'yes'; cautious because the pride that Bhutto takes in being the first popularly elected civilian Prime Minister of Pakistan cannot be hurt. At the same time, he has to carry his army with him. What is interesting is that Sheikh Mujib has so willingly decided to go along too.



These quibbles over civilian democratic rule and its prestige apart (who is worried about such issues anyway?), the tripartite talks have been a sort of curtain-raiser. One does not know if the full implications of the Pakistan-Bangladesh relationship have been grasped. The agreement provides the first opportunity for Bangladesh to emerge as an international entity in the true sense of the term. No power can be internationally significant unless it has some basic manoeuvrability in the region to which it belongs. The Pakistan-Bangladesh impasse was very naturally against the interests of Bangladesh. It made that country excessively, almost exclusively, dependent on India and the Soviet Union. Now, for the first time, it has established a communication link with another important state of the area. One might as well say that with the tripartite talks in Delhi, Bangladesh foreign policy has made a beginning.

It is imperative that Bangladesh now becomes independent of India. In our liberating zeal we might construe independence to mean hostility to India. It is important to see that this does not happen. Time and again we shall, hereafter, encounter a situation in which the independence of Bangladesh may not be exactly in keeping with our notions of that independence. A part of our problem with Nepal arises from the rather simple fact that we are not quite used to Nepal's sovereignty. It is more than likely that something similar might happen in the case of Bangladesh. Nobody can be sure whether we shall ever have a 'durable peace' to which there were such frequent references during the Delhi talks, in this area. What seems certain, however, is that the peace will be a rather noisy one.

INDIANOIL SERVICE TO SERVICES

India's Defence Services, no doubt are our valued customers. But we do not look at it that way. As a leading public enterprise, we deem it our prime responsibility and our duty to rally round the Services and help keep round-the-clock vigil across the national frontiers.

Army, Navy or Air Force—Indianoil is there to meet all the requirements of petroleum products conforming to correct specifications wherever they are needed.

The recent Indo-Pakistan hostilities posed a challenge to provide the logistic support. Indianoilmen accepted the challenge and met it squarely, irrespective of the odds, risks and costs, thus earning the nation's gratitude for their efforts in war and no less in times of peace.

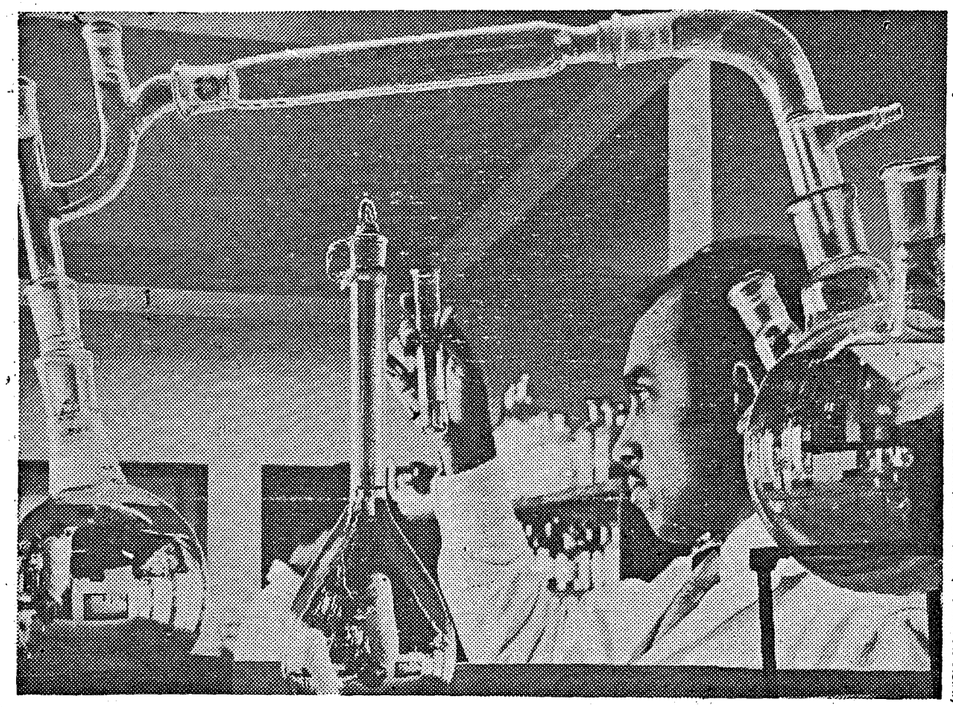
Calcutta Diary

A M



WHAT might have been and what has been point to one end, which is always present. So many passages, which we did not take, lead towards doors we never opened. Elementary lessons in economics were never learned, a hundred opportunities were allowed to waste. In those relatively tranquil years, spanning between 1968 and 1971, voices, here and there, even inside government, had implored, pleaded, almost whined, in order to reach the ears of the political leadership: voices that tried to tell the authorities that if you burn the candle at both ends, once the season of carnivals is over, it will be death. Ironically, other echoes have now begun to inhabit the garden: Of all people, it is the Prime Minister who is talking of the folly of burning the candle at both ends; but alas, she has got the context all wrong.

Do we even dare to commisserate with her? What is the point of following any more the deception of the thrush? A poor country cannot afford a bunch of epicureans at its helm. When there was time, the future was reckoned to be subject to an infinite rate of discount. It was the present, the head-turning present, which mattered. So, never mind what the wretched economists said, subsidise your near and dear ones, this will cause the spread of an ingratiating sweetness all over. Do not tax your near and dear ones. When, year after year, chief ministers, otherwise totally subservient to the Centre, indulged in the luxury of keeping their fiscal deficits uncovered and bullied the Reserve Bank into giving them ways and means accommodation, it was decided, not once but several times, not to reprimand them; even to give them more. The weird principle of offering special accommodation to the states was evolved to serve a narrow, sectarian objective. Other oddities abounded. The talk was in terms of containing the big industrial houses. Some amongst them obviously needed less containing than the others: the Goenkas in Calcutta were all right, the Goenkas in Madras were not. Elaboration of high falutin principles was combined with, for example, the benign tolerance of a Union Cabinet Minister who cheated on his income-tax. Brigandage was encouraged. Politicians who collected the loot were again divided into two groups: Those who handed over, say, ninety-five per cent of the total take and kept only five per cent for their individual pleasures, were the good ones; those who decided to keep back as much as twenty-five per cent or more were bad ones and retribution overtook them.

Consider some of the other realities. Till the middle sixties, good, bad, or indifferent, a beginning was being made to set up a permanent machinery for the public procurement of foodgrains; farmers were being gradually persuaded to appreciate the rationale of a producer levy and to accept implicitly their social obligations. If only the momentum were maintained, it would by now have been easy to procure at least 15 million tonnes of grains every year. That the logic of the public distribution system demands that the price at which the government purchases must be way below the prevailing market prices was on the verge of being generally accepted around 1965-66; that neither traders nor farmers could claim credit for the skyrocketing of prices when the crop failed, was not yet being seriously disputed; that where nearly two-thirds of the average family expenditure consists of the outlay on food the regulation of food prices was crucial for the nation's overall economic health, had a much larger custom then. The perception that what was all right for the American economy need not be all right for the Indian economy was certainly more acute then. In the US, barely 4 per cent of national income originates in agriculture; a programme of subsidy to agriculture, for instance, of the order of 25 per cent of income, would therefore mean only a transfer of 1 per cent of income from elsewhere. In India, by contrast, it would mean the transfer of exactly the same 25 per cent of the income in the other sectors — or about as much as the Union Government collected annually by way of tax revenue. At least some amongst the establishment figures would have the politeness then to listen when you badly wanted to make this particular point. In case one fell into the trap set by the American advisers, infesting Krishi Bhavan, and kept pampering the farmer-trader lobby, the terms of trade would shift so much against industry that industrial savings would altogether dry up: Such warnings had some takers in government then; today there are none. You could have gone on to explain that on the demand side, too, an over-indulgence of the kulak lobby would be fatal; for, if the majority of the population had to use up their income — and sometimes even to dissave — so as to buy the high-priced foodgrains necessary for subsistence, few would have the spare funds for acquiring industrial products. Five years ago, one could have argued along these lines; and one would have been tolerated by this or that minister. Today, the death wish is all-pervading: abandon commonsense all ye who want to enter here. Five years ago, there were many dreamers, even inside government, at least a handful who thought that the banks were being taken over to deny credit to the sharks and the crooks. Today, the sharks and the crooks have turned the tables: it is they who are in effective control of the government, preach from the pulpit, kibitz the Prime Minister, and tell her what to do and what not to do.

You sow as you preach. If you have to commisserate, commisserate with this nation's honest-to-God, trusting masses who have been taken for a ride. The government does not deserve any commisseration. Not one hard decision was ever taken, not one piece of advice was listened to. Stocks of foodgrains were frittered away, and clandestinely and not so clandestinely sold to private merchants. Instead of disciplining the ever-greedy kulaks, one of them was made chairman of the Congress party's *kisan* cell, another one chairman of the National Agricultural Commission. It was government by auction. Official decisions — each one of them — were up for sale to the highest bidder. You want sugar prices to be de-controlled? Pay up. You want this defence contract? Pay up. You want a Tariff Commission report on rayon prices to be killed? Pay up. You want to be saved the bother of a particular proposal for expansion of capacity being referred to the Monopolies and Restrictive Trade Practices Commission? Pay up. You want your unauthorised capacity and output to be winked at? Pay up. Pay to the party, pay to the party's bosses, pay to the intermediaries. If the price is right, the government was up for grabs.

Those who constituted the government scuttled all codes of morality; they scoffed at all norms of social discipline. And, while doing all this, they had the

THE NEW DIMENSIONS OF RESEARCH

Research holds the key to the nation's technological advancement. A growing number of Indian universities and research institutions are using modern techniques and tools—like computers—to bring the benefits of technology to more and more people.

Agricultural scientists are using computers to evolve high-yield seeds. Structural engineers are applying computer techniques to design economical, safer buildings.

Industrial researchers are developing new processes and import substitutes. And meteorologists can now predict weather conditions with greater precision.

Using modern computers like IBM System/360 and System/370, these institutions are imparting new dimensions to research and development in India.

Data processing machines are not only being used in India but are also being manufactured and exported. IBM's plant in Bombay, which produced India's first commercial computer in 1966, has pioneered the indigenous production of data processing machines.

At the Plant, over 350 Indian scientists, engineers and technicians are engaged in the development and manufacture of these machines. Their efforts are helping develop indigenous skills. And their products are winning foreign markets for sophisticated Indian electronic equipment. The value of exports of India-built IBM data processing machines to date exceeds Rs. 12 crores.

This marks for India a significant contribution to the electronic age—an age in which computers are helping people help people.

IBM

gumption to take the holy name of socialism. Now that that most famous law of thermo-dynamics is at work, there is a sham pretence of innocent wonderment, which is sought to be used as a *deus ex machina*. Who are the ones for whom the deception is intended? The so-called progressives notwithstanding the vast multitude, who are without food, clothing, fuel, power, shelter and transport, are bound to give vent to their wrath. And it is too late to warn them of the dangers of fascism. For, the likeliest retort will be that those who lived by fascism will also die by it.

But even these grim moments have their aspects of hilarity. A drowning person will catch at a straw. At the other end, business is business, and a street-walker does not cease her importuning even on a funeral ground. The strawmen engaged in public relations have now assured the government that all its current troubles are on account of a failure of communication. Corruption at the highest levels, runaway inflation, sectarian policy-making, the failure of public distribution, none of these matters — all the authorities have to do is to sub-contract the assignment to the cocktail circuit of public relations experts. They will build for you the solidest phalanx of defence against the spirit of violence now abroad. They will set up committees, work out projects, prepare slides and scripts, and so on. And a miracle will be wrought. Emissaries of the Union Ministry of Information and Broadcasting are currently doing the rounds of the metropolitan cities, confabulating with these miracle men from the world of media. The latter, once they get down to the job, will be able to explain properly to the countrymen the inner significance of the Prime Minister's iterative statement, namely, that the price rise as well as most of our other woes, are because of that thirteen-day war we fought and won with Pakistan in 1971.

At a street-corner meeting in Calcutta the other day, a young brat was heard to remark that the masses of Vietnam are engaged in a war for thirty-three years now, and yet there has been no price rise at all. The Prime Minister may fumble in tackling this one; but let her not even try, let her leave it to the whiz kids of public relations, many of whom are veterans of Madison Avenue. Once they do really get going, trouble will subside, as if in a magic. People might soon even start writing letters to newspapers demanding a minimum rate of price increase of 50 per cent per annum, for the image-builders are bound to succeed in dinning into their ears that the higher is the rate of inflation, the less is your state of misery, and let not their belly bear false witness. But maybe this again is part of the circus which has to fill in while the bread remains missing.

CAPITAL VIEW

No Way to Govern

Romesh Thapar

NOTHING highlights the bankruptcy of the political system as the politicians play it today than the handling of the Bihar events. Whether we are dealing with fascists or non-fascists, the conclusion is inevitable that the leaderships of the various parties are using the political system in the most cynical manner. The style was set by the Congress party and even today it remains a most advanced experimenter in this kind of cynicism. No alternative style is even attempted. The assumption now is that democratic functioning is incapable of variation.

The goings-on in Bihar help us understand the incredible misuse of the political system. The urban revolt against the Ghafoor ministry, organised by 'fascists' or not, did certainly have the effect of shaking the Central leadership out of its over-indulgence in playing corrupt factions and favourites. Soon, the need to reassure Congress 'dissidents' was seen. Ghafoor even consulted with JP about future arrangements. But the 'dissidents' — the quotation marks are necessary for obvious reasons — are only interested in exploiting the political system in the same way as the ruling group in the Bihar Congress.

Old warhorse Jagjivan Ram, openly critical of the way the political tangles are being handled in Bihar and very conscious of the intrigues against him by L N Misra, is unable to put the political racketeers in the dock because he is content to meet racketeering with more or less similar racketeering. Proper weightage in the ministry is sought so that the factional battles can be conducted on a more equal basis. The desire to analyse Bihar's crisis and to organise action for the resolution of the people's problems is very far from the consciousness of a faction-encrusted Congress.

Gujarat, where a more healthy and widespread revolt occurred, is in very much the same plight. The alternative programme or an alternative leadership, is nowhere in sight. Nor is Indira Gandhi apparently concerned with launching the hard work which will have to underpin this effort to revive a dangerously sick Congress party. The obsession with rusty ideas and discredited politicians is extraordinary, and terribly naive. If it persists, it will shatter what little hope still surrounds the much abused and misused political system.

The daily commentary on our present condition is becoming more savage. It reflects the increasing despair over the economic mismanagement of the country and the incapacity of the politician to control the destruction of public property and the sabotage of vital installations. The reluctance at governmental level to decide whether the strike wave is to be confronted or viewed as an inevitable result of delayed decision-making at a time of inflationary price booms creates deep confusion and disrupts the economy because every stoppage has wide repercussions. Without an agreed guideline, it will not be possible to halt the deadly drift.

So cynical and thick-skinned have the politicians of the ruling party become that they are still silent about the crisis which engulfs the country. There is considerable debate and speculation in private, even in secret, but not a word is uttered at any recordable level. There is a fear about expressing the truth. How does one cope with the unreality of such a situation at the very seat of power? The silence, the lack of discussion, even creates confusion where there should be none — as, for instance, on Sheikh Abdullah's future, the perspectives on the presidential election and extensions of

service and retirements in the Indian Army.

True, Indira Gandhi's 'style' has reduced once equal colleagues to servitude or angry frustration. After all, so many of them are holding portfolios for which they are not at all suited. The allocations, it is alleged, have been made deliberately — yes, that's the conclusion of so many seasoned observers of the scene who show conclusively how a change of 'seats' could transform the Union government's performance. When one takes a look at some of the incumbents and the jobs they are expected to do, the charge sticks. This is serious in terms of the political credibility which the Prime Minister has to establish among the thinking elements of this country. The explosive tensions which are building all over the land are autonomous of political personalities and their manipulations. The tensions can only be lessened by intelligent, sensitive government which is conscious of where the septic foci are. If there is anything which unites the people today, particularly at the urban level, and maybe at the rural level too, it is that the present way is no way to govern. At this moment, the feeling is philosophical, critical, but expectant of change. Mass psychology is such that it can be pushed to say: enough is enough. And then the fat will be in the fire.

The summer of Indian discontent is going to throw up a series of events which only the fool would attempt to forecast. But, if certain surface signs are to be taken seriously, maybe we will see both the USA and the USSR joining hands for 'Operation Salvage'. Feeling sick? So am I, but it may well be a privileged reaction in the context of the developing situation.

April 22

COMPANIES

Curdled Milk

Hansavivek

HINDUSTAN LEVER proposes to sell its undertaking for the manufacture of dairy products, situated at Etah in UP, to Polson for Rs 70 lakhs. It is stated that the viability of the dairy business has been eroded owing to the high cost of milk and other essential ingredients, which has not been adequately reflected in the controlled price of baby food. The other products from the dairy do not compensate this loss. The funds thus released are intended to be utilised for the programme of growth and diversification of the company's business. 'Letters of intent' have been received by the company for an industrial phosphates project and for expansion of capacity for synthetic detergents. Both the projects are in the core sector and will be located in 'backward' areas. Subject to satisfactory arrangements being made, these projects will involve an increase in Indian participation in the company's capital, over 85 per cent of which is at present owned by Unilever of UK. The company intends to intensify its research and development activity in animal nutrition. Last year the company spent Rs 90 lakhs on research and development. Exports at Rs 6.7 crores were lower than in 1972, partly owing to congestion in the docks towards the year-end, although exports of chemical-based detergent products to the USSR were higher. HL's sales and profits during 1973 were lower compared to the previous year. Gross profit has been arrived at after providing Rs 24 lakhs for the net incremental liability for gratuity for the year. A further sum of Rs 92 lakhs, representing the net incremental liability for 1972, has been charged to profit and loss appropriation account.

The management complains that shortage of raw materials and packaging, coupled with general inflation imposed a severe strain on the company. The outlook for the current year is also described as uncertain since, it is stated, many of the supplying industries face severe cut-backs in production. Production of soap was restricted last year on account of shortage of soap-making oils and a sharp rise in all elements of cost. Revision in soap prices in mid-year was "much overdue" and enabled restoration of production levels only temporarily. Efforts to increase production of synthetic detergents received a setback at the end of the year when a strike in the factory of the sole supplier of a vital ingredient interfered with output. Shortage of indigenous and imported oils resulted in lower vanaspati production. Fall in production of soap and vanaspati and increasing proportion of non-traditional soap-making oils with a lower glycerol content resulted in lower recovery of glycerine and lower production of catalyst. Cattle-feed sales were, however, substantially higher than in 1972. The auditors were paid, in addition to audit fees of Rs 1,40,000, Rs 26,000 by way of consultancy fees, Rs 23,375 as fees for other services and Rs 25,192 for out of pocket expenses. Dividend has been stepped up 2 points to 16 per cent, but at the cost of the earnings-cover. The company has not yet been able to secure consent of the Controller of Capital Issues for issue of bonus shares on a one-for-six basis. Shareholders' approval is now being sought to vary, if necessary, the proportion of the proposed issue of gift shares. The company also intends to undertake manufacture of plant and machinery of various kinds and industrial and scientific instruments.

MODI INDUSTRIES suffered a sharp setback in the year ended October last owing to fall in production on account of a severe power-cut and non-availability of certain raw materials. The company along with three other sister concerns, namely, Modi Spinning, Modipon and Modi Rubber, have acquired an old 20 MW power house in UP, which is being repaired and reconditioned to serve as a captive plant. Electricity produced by this unit will be in addition to the usual supply from UPSEB. The company's electric arc furnaces produced 44,580 tonnes of steel against the installed capacity of 90,000 tonnes. Meanwhile, the expansion programme of one of the steel units is nearing completion. The continuous casting plant, however, is expected to be erected by the end of 1974. A direct reading spectrometer has been erected which will help in production of special steel. One oxygen gas plant has been already commissioned and the other is to commence operation very soon. The company issued 'rights' shares at a premium of Rs 4 per share and also made a public issue at a premium of Rs 6 per share. Among the contingent liabilities not provided for is demand of employer's contribution by ESIC on the production bonus paid to employees of the vanaspati and gas units for the last several years. The company has disputed the liability and the matter is pending before the court. One of the notes appended to the accounts says that Rs 1,84,727, realised on sale of sugar last year in excess of the controlled price, has been kept in suspense in accordance with the interim orders of the High Court and not treated as company's income. The company's contention is that the price of sugar fixed is not in accordance with law. Another note mentions that in 1970-71 the company charged Rs 2,24,666 as interest on money invested in a tyre and tube project and had shown the sum as recoverable from Modi Rubber. On an objection raised by IDBI, the management has now decided to waive the interest.

ATLAS COPCO (INDIA) has been granted a 'carry-on-business' licence for manufacture of 720 compressors per annum and a licence to produce 3,600 rock drills and 780 pusher legs annually — the latter subject to an export stipulation — thereby bringing the licensed capacities in line with the installed capacities in both the cases. Last year the company produced 378 compressors and 3,518 rock drills and pusher legs against 310 and 2,436 respectively in the previous year. The company has also received a 'letter of intent' for the manufacture of tube-well drilling rigs at its factory at Poona. It produced good results for 1973, with higher sales and earnings. Dividend, stepped up by 2.5 per cent to 17.5 per cent, is well covered. The ratio of inventories to sales as also the cost of borrowings increased considerably over the year. The auditors have been paid, apart from the audit fees of Rs 28,000, Rs 7,400 for taxation work, Rs 1,500 for provident fund audit fees, Rs one lakh for handling of share records, Rs 3,548 for out of pocket expenses and Rs 11,700 for 'other remuneration'.

INDIAN VEGETABLE PRODUCTS has shown good results for 1973 as a result of better sales realisation and increased benefits of diversification undertaken during the past few years. Production of vegetable oils and vanaspati was 11,304 tonnes and of miscellaneous chemicals 3,516 tonnes against the previous year's production of 11,047 tonnes and 3,189 tonnes and installed capacities of 30,000 tonnes and 4,800 tonnes, respectively. Higher sales apart, what really pushed up profits was the sizeable widening of margins. The ratio of inventories/sales was also considerably lower compared to the previous year. Dividend, maintained at 17 per cent on the capital enlarged by a two-for-five bonus issue, found a slightly better cover. The management points out that rising prices of chemicals based on the petro-chemical industry and shortage of some other chemicals have clouded the outlook for the current year.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

ASSAM CARBON PRODUCTS LIMITED

(Incorporated under the Companies Act, 1956)

Registered Office: Industrial Estate, Bamuni Maidan, Gauhati-781021 (Assam)

ANNOUNCEMENT REGARDING THE ISSUE OF 2,60,000 EQUITY SHARES OF RS. 10/- EACH AND 7,500 9.8% REDEEMABLE CUMULATIVE PREFERENCE SHARES OF RS. 100/- EACH FOR CASH AT PAR.

Persons interested in full details may obtain copies of the Prospectus and Application Forms from Managers to the Issue. Principal Brokers, Underwriters, Brokers and Bankers to the Issue mentioned below.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON MONDAY THE 29TH APRIL, 1974 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON WEDNESDAY THE 8TH MAY, 1974 OR EARLIER AT THE DISCRETION OF THE BOARD OF DIRECTORS OF THE COMPANY, BUT NOT BEFORE THE CLOSE OF BANKING HOURS ON THURSDAY, THE 2ND MAY, 1974.

Application will be made to the Calcutta Stock Exchange for permissions to deal in and for an official quotation of the Equity Shares and Redeemable Cumulative Preference Shares of the Company.

HISTORY AND BUSINESS:

The Company was incorporated on 17th April, 1963 in the State of Assam as a Public Limited Company under the Companies Act, 1956 under the name "Assam Coke Oven & Briquette Co Ltd" and its immediate main object was to set-up a Coal Chemical Complex in Khasi and Jayantia Hills which however did not materialise.

By Resolutions passed on 5th April, 1966, the Company changed its name to the present name and its main objects entitling it to carry on inter alia the business of manufacturing of and dealing in Carbon Blocks, rods and slabs, Carbon Brushes, electro carbons, Cinema arc carbon, etc. The Company now has well established factories at the Industrial Estate, Gauhati (Assam) for processing and sale of various carbon materials and the manufacture of electrical Carbon Blocks, principally of Metallic Carbon Group and the manufacture of Electrical Carbon Brushes, and contacts of all types commonly used in electrical Machines. The registered capacities of the existing units are:-
(i) Metallic Carbon Blocks — 80,000 Kgs p.a. Silver Graphite Blocks — 500 Kgs p.a. Electrographitic & Hard Carbon Blocks — 15,000 Kgs p.a. (ii) Carbon Brushes — 6,00,000 Nos p.a. (iii) Mechanical Carbons — 20,000 Kgs p.a.

PROJECT:

The Company proposes to set up a new plant at Gauhati (District Kamrup, Assam) for the manufacture of Electrographitised and Resin Bonded grades of Carbon Blocks with an installed capacity of 1,00,000 Kgs per year at present. These products will be according to the specification at and standard of quality laid down by Morganite Carbon Limited. London, England, with whom the Company has entered into a Technical Collaboration Agreement.

The demand for Carbon Brush and other carbon components is literally universal and constantly growing. Every time a button is pushed or a switch is thrown there is a carbon component involved somewhere the consequent chain of events from generation of current in a massive 500 MW Turbo Alternator to such simple operations as starting a motor, sweeping a carpet or running a domestic fruit juicer or an electrical shaver.

There are over 120 Carbon Brush Manufacturing factories in India having a total registered capacity of over ten million Carbon Brushes per annum of all varieties and types. These factories, including Company's own Brush Manufacturing Unit at Gauhati, are largely dependent on imports in respect of their requirements of the Carbon Blocks proposed to be manufactured under the scheme.

FINANCIAL AND TECHNICAL COLLABORATOR:

Morganite Carbon Limited ('Morganite') of London is a subsidiary in the U.K. of the Morgan Crucible Company Limited, a British Company of International repute. In 1903 the Morgan Crucible Company Limited began to manufacture Carbon Blocks and Carbon Brushes and to sell these products worldwide. It established a factory in U.S.A. in 1910 and now has factories in many countries. Morganite was created in 1961 as a specialist carbon company and is now associated with sister companies in the U.K., U.S.A. Japan, Australia, Italy, Mexico, Brazil, Luxemburg and Venezuela.

SHARE CAPITAL:

		Rupees
Authorised:		
8,00,000	Equity Shares of Rs 10/- each	80,00,000/-
20,000	Redeemable Cumulative Preference Shares of Rs 100/- each	20,00,000/-
		1,00,00,000/-
Issued and Subscribed:		
2,40,000	Equity Shares of Rs 10/- each	24,00,000/-
7,500	Redeemable Cumulative Preference Shares of Rs 100/- each	7,50,000/-
		31,50,000/-
Paid up:		
1,60,000	Equity Shares of Rs 10/- each paid up in full (of these 1,17,500 Equity Shares have been issued and allotted credited as full paid up for consideration otherwise than in cash, including 40,000 Equity shares issued and allotted to Morganite Carbon Limited U.K. in terms of the Financial & Technical Collaboration).	16,00,000/-
80,000	Equity Shares of Rs 10/- each paid up at the rate Rs 5/- per share. (The balance of Rs 5/- on these shares will be called up along with the calls on the shares offered to the public in terms of the Prospectus)	4,00,000
7,500	9.8% Redeemable Cumulative Preference Shares of Rs 100/- each paid up in full	7,50,000
		27,50,000
Present Issue for cash at par:		
4,20,000	Equity Shares of Rs 10/- each	42,00,000
7,500	9.8% Redeemable Cumulative Preference Shares of Rs 100/- each	7,50,000
		49,50,000
Out of the present Issue:		
1,60,000	Equity Shares of Rs 10/- each have been reserved for subscription for Cash at par by Morganite Carbon Limited	16,00,000
Now offered to the public subscription for cash at par in terms of the prospectus:		
2,60,000	Equity Shares of Rs 10/- each	26,00,000
7,500	9.8% Redeemable Cumulative Preference Shares of Rs 100/- each	7,50,000
		33,50,000

TERMS OF PAYMENT:

The amount payable on respective shares shall be as follows:-

	Equity Shares	Preference Shares
(a) On Application	Rs 5.00 per Share	Rs 50/- per Share
(b) On Allotment	Nil	Rs 50/- per Share

The balance of Rs 5/- per Equity Share shall be payable in one or more calls as may be determined by the Board of Directors of the Company provided that no call shall be made earlier than three months after the date of allotment of the Shares and not less than three months shall intervene between two calls, if any.

APPLICATIONS:

Applications for shares must be for a minimum 50 Shares or multiples thereof in the case of Equity Shares and 5 Shares or multiples thereof in the case of Redeemable Cumulative Preference Shares.

EVERY APPLICANT SHOULD SUBMIT ONLY ONE APPLICATION FOR THE NUMBER OF SHARES REQUIRED. MULTIPLE APPLICATIONS AND APPLICATIONS IN JOINT NAMES ARE LIABLE TO BE REJECTED.

UNDERWRITERS:

The Shares offered to the Public for Subscription have been fully underwritten by the following Underwriters:-

Name of Underwriters	Amount Underwritten Equity Rs (in lacs)	Preference Rs (in lacs)
Place, Siddons & Gough (Private) Ltd, Calcutta	4.00	—

FROM OUR CORRESPONDENTS

CREDIT POLICY

Loss of Credibility

IT is amusing to see the Reserve Bank behaving as if it still had a credible credit policy. It called a meeting of the chief executives of the major scheduled commercial banks last week supposedly to review the trends in the busy season, which ends technically with this month, and to indicate the credit policy for the coming months of what is called the slack season. On the eve of the meeting, it circulated among the bankers an analysis of the expansion of bank credit in the busy season. The purpose was simply to justify the order of the credit expansion which has far exceeded the Reserve Bank's estimates —both the original ones and the hastily revised ones.

The Reserve Bank had a set a quantitative ceiling for credit expansion in the busy season. The ceiling was arbitrarily put at 10 per cent of the credit outstanding at the end of September 1973. Thus the permissible credit expansion, for purpose other than food procurement, was to be Rs 600-650 crores over the seven-month period October 1973-April 1974 or Rs 400-450 crores over the six-month period November 1973-April 1974. These limits were not based on any assessment of credit requirements; nor were the banks given any indication of the priorities and norms to be adhered to in restricting credit within the prescribed limits.

No wonder, then, that the ceiling was pierced in no time. The Reserve Bank's response to this was to raise the ceiling first to Rs 740-790 crores and then to Rs 950 crores. Actual credit expansion has, however, far outstripped even these successively revised ceilings. By April 12, with three weeks of the busy season still to go, non-food credit had expanded by Rs 1,173 crores. Including food procurement credit and bills rediscounted with the Reserve Bank, the expansion was Rs 1,305 crores. What makes this order of credit expansion particularly unjustifiable is that it took place during a period when industrial output was stagnant.

The other point that deserves notice is that the colossal expansion of commercial bank credit in the last six months was made possible by the active help of the Reserve Bank. The rise in commercial banks' borrowings from the Reserve Bank between end-September 1973 and April 19, 1974 was Rs 422 crores. In addition, the banks rediscounted bills of the value of Rs 276 crores with the Reserve Bank and also drew down their reserves by about Rs 150 crores. Thus in different ways the Reserve Bank provided a total of Rs 800 crores of accommodation to finance credit expansion by the commercial banks. Against this, according to the Reserve Bank's own busy season eve estimates, commercial banks' borrowings from it should have been just Rs 145 crores on April 1 (one-and-a-half per cent of demand and time liabilities).

Even more curious, the Reserve Bank has permitted banks to violate the statutory reserve requirements. Between February 1 and April 12, the banks' average aggregate liabilities were of the order of about Rs 11,000 crores and they should have kept around Rs 770 crores as reserves. Actually their reserves persistently fell short of this figure. On March 29, for instance, they had dwindled to Rs 610 crores. The Reserve Bank had raised the reserve *requirements to limit the resource-base* of the banks and, thereby, to check the expansion of bank credit. Its connivance with the commercial banks in violating the reserve requirements, therefore, shows its complete lack of *seriousness about implementing its own* credit policy.

This impression is strengthened by an examination of the justifications which the Reserve Bank has advanced for the runaway rise in bank credit. The first of these is that a large part of the additional credit has gone to finance exports which, it is claimed, is in keeping with the policy of providing all possible incentives to exporters. For one thing, as mentioned above, the exclusion of export credit from the overall credit ceiling was an afterthought. More important, given the stagnation in industrial output, increase in demand for export credit should not have added substantially to total working capital requirements. More than 80 per cent of export credit is production finance in the form of pre-shipment credit. To the extent there has been no significant increase in production, larger export credit should have been expected to result in at least some, if not a corresponding, reduction in the demand for credit to finance production to meet domestic needs. In fact, borrowers appear to have grabbed more of both types of credit to finance virtually the same volume of output.

That in order to take advantage of the concessional rate of interest borrowers from banks have drawn more export finance than justified by their actual requirements is confirmed by the Reserve Bank's belated move to restrict concessional pre-shipment export finance to three months. Exports are a priority sector; but it does not follow that all the credit which the banks claim to have extended to finance exports is justified. Before accepting it as justified, the Reserve Bank should have made some assessment of the actual export credit needs during the period and satisfied itself about the flow of export receipts and the like.

The Reserve Bank's second explanation is that the public sector undertakings have accounted for a significant proportion of the credit expansion. The estimate of additional credit to the public sector during September 1973-April 1974 is said to have been originally placed at Rs 100 crores and subsequently raised to Rs 140 crores in January 1974, whereas by March 1974 these undertakings had drawn Rs 166 crores. It is difficult to understand how the Reserve Bank could have failed to anticipate the credit demand from the *public sector undertakings. The total* credit limits of these units were of the order of Rs 2,015 crores in June 1973 and, according to the Reserve Bank's 'Basic Statistical Returns', their utilisation ratio in December 1972 was 40 per cent. The Reserve Bank should have been, therefore, prepared for outstanding bank credit of about Rs 800 crores to public sector units, against the actual outstanding of Rs 764 crores.

The most damaging reason advanced by the Reserve Bank for the uncontrolled credit expansion is that prices have risen faster than the rate assumed at the time when the credit estimates were framed in October 1973. Does this explanation not imply an abdication of responsibility by the country's central bank? During a period of rising prices, monetary policy should aim to bring down inventory levels all-round. Actually, the banks appear to have made it possible for their clients to maintain and perhaps even increase their inventory levels by providing additional funds to fully offset the rise in prices. And the Reserve Bank evidently sees nothing wrong in this. The ready availability of bank credit has played no small part in the rise in prices of even imported materials. There are instances of import replenishment licences being sold at exorbitant prices and commercial banks financing the deals — with the permission of the Reserve Bank — by granting loans at the unofficial values of these licences.

Another reason cited by the Reserve Bank is the increase in the disbursements of the term-lending institutions which, it is claimed, in turn led to larger requirements of working capital. In fact, it cannot be said that capital asset formation in 1973-74 was substantially larger than in 1972-73. While direct assistance by term-lending institutions went up by about Rs 30 crores during the year, there was a decline of Rs 20 crores in fresh capital raised through shares and debentures. There are, besides, a number of cases in which loans from the term-lending institutions have been used for short-term purposes, because they are cheaper than commercial bank credit which now bears a minimum rate of interest of 11 per cent. On the whole, private sector investment in the non-farm sector in 1973-74 can be said to have been only modestly higher than in 1972-73, if even that.

The next item on the Reserve Bank's list of explanations — namely, political disturbances, delay in wagon movement, shipping bottlenecks, inadequate return flow of funds because of delay in payment of bills by government departments — cannot be considered new since the Reserve Bank has itself described these phenomena as perennial problems. It may be argued that it is because credit has been readily available that there has not been much pressure, for instance, to expedite payment of bills by government agencies. What has the Reserve Bank done to remedy this situation beyond appointing a committee some years ago to look into the problem of payment of bills of small-scale units?

Finally, it has been argued by the Reserve Bank that credit to the so-called priority sectors accounted for a larger than expected share of total credit expansion. Credit to the priority sectors expanded by Rs 211 crores, of which as much as Rs 138 crores has gone to small-scale industry. A larger number of small-scale units, it is well known, are appendages of large-scale ones, having been set up mainly to get preferential supply of scarce raw materials and bank credit. Why should the credit needs of the so-called small-scale industrial units have gone up so sharply in the last few months? The fortunes of small-scale units are very much linked to those of organised industry; when output in the latter has been stagnant, the former are unlikely to have experienced a production boom.

Even after excluding the questionable expansion in bank credit to the so-called preferred sectors, viz, exports, public sector undertakings and priority sectors, the Reserve Bank has failed to explain an excess of as much as Rs 175 crores over the permissible limit for the 'residual' sector — consisting of large and medium industries and private wholesale trade. The Reserve Bank had estimated the permissible level of credit to this sector at Rs 370 crores whereas the actual credit expansion has been Rs 545 crores (upto end-March) — an overrun of nearly 50 per cent.

The lack of a coherent credit policy is reflected in the unbridled credit expansion which is completely at variance with the stagnation in real output and the sharp rise in prices. Bank credit expanded by Rs 1,338 crores (14.2 per cent) in 1973-74 on top of the increase of Rs 1,274 crores (15.7 per cent) in 1972-73 and Rs 998 crores (or 14 per cent) in 1971-72. The expansion in bank credit of as much as Rs 3,610 crores, or by over 50 per cent, in the past three years was accompanied by an increase in real national income of only 6 per cent.

In fact the monetary situation has gone totally out of hand. A large share of the blame for this must go to the ineffectiveness of the Reserve Bank's credit policy. Gross bank credit to the commercial sector (including that extended by the Reserve Bank) expanded by as much as Rs 1,412 crores in 1973-74 on top of the expansion of Rs 1,124 crores in the previous year. Net bank credit to the government sector amounted to Rs 954 crores in 1973-74 as against Rs 1,324 crores in 1972-73. The smaller increase was entirely because the commercial banks were extending much larger credit to the private sector and were therefore experiencing a shortage of funds.

Given this sharp expansion in credit, which has not been accompanied by growth of real income, employment or real savings, the currency component of money supply has expanded very rapidly. Of the increase in money supply of Rs 1,338 crores in 1973-74, Rs 862 crores (or about two-thirds) was accounted for by currency with the public. Currency had accounted for one-half of the increase in money supply in 1972-73 and earlier, for some years, the proportion had been 40 to 45 per cent. This sharp rise in the proportion of currency also indicates that the transactions demand for money has been on the increase because, among the financial assets, currency has the highest turnover ratio, demand deposits coming next and time deposits last.

Of the increase of Rs 617 crores in aggregate commercial bank deposits during the current busy season upto April 12, demand deposits rose by Rs 417 crores (67.5 per cent of the total rise in deposits) and time deposits by only Rs 200 crores. Time deposits (at Rs 424 crores) had accounted for 50 per cent of the increase in total deposits (Rs 730 crores) in the 1972-73 busy season.

The trends in monetary data point to two important developments. First, with the rapid depreciation in the value of currency, the deposit rates paid by banks have become absolutely unrealistic. One consequence of this is the rise in deposits with non-financial companies which, incidentally, have helped these companies to partially circumvent the Reserve Bank's credit policy. The Reserve Bank must, therefore, act to tighten the restrictions on such deposits. For instance, the amount of deposits that a company can take from the public must be limited to 5 per cent of its net worth, instead of 25 per cent as at present. Second, there has been a sharp and all-round increase in speculative holding of commodities. Everyone tries to move from holding money balances to holding commodities. This is facilitated by the grant of higher money balances to the property-owning classes which enables them to finance a rise in prices of commodities at every stage.

Considering the monetary trends referred to above and the price situation, the Reserve Bank might have been expected to seriously reconsider its credit policies. However, the policy it has announced for the slack season shows that it has learnt nothing from experience. Prescribing aggregative limits for credit expansion, it has been seen, is meaningless. Yet this is precisely what the Reserve Bank is proposing to continue to do. Thus banks have been told to keep credit expansion in the slack season down to 33 to 35 per cent of the increase in deposits. Similarly, the projection has been made that 12 months from now banks' credit-deposit ratio would be 71 per cent compared to 73 per cent currently. What has been, an continues to be, missing in the Reserve Bank's facile aggregative exercises is any indication of the priorities or any suggestion of the norms which are to govern the allocation of credit by the commercial banks. In their absence, scant attention will be paid to the credit ceilings prescribed by the Reserve Bank and such curtailment of credit as does take place will be totally arbitrary. In the circumstances, the Reserve Bank's role as the central bank will continue to consist primarily of inventing plausible and not-so-plausible justifications for *whatever* order of credit expansion that the free-for-all among commercial banks and their clients happens to result in.

MAHARASHTRA — I

Bullets for Job-Hunters

VASMATH is a taluka town with a population of about 20,000 in Parbhani district of the Marathwada region of Maharashtra. It was here that two young men, who had come to the town hoping to land themselves jobs, were killed by the police on March 27.

The Poorna river irrigation project required 150 Canal Inspectors. For these posts the local employment exchange forwarded interview calls to as many as 1,810 candidates who were all asked to present themselves to the executive engineer for interview on March 27. Large parts of Marathwada are almost perpetually drought-hit. Many of the candidates had to borrow money for the journey for Vasmath. Those from the surrounding villages had to walk miles and camp overnight in Vasmath to attend the interview.

On the 27th morning there was a large crowd of not less than 2,000 people at the executive engineer's office in Vasmath, but the executive engineer was not available. Later inquiries revealed that he was away from Vasmath, perhaps in Bombay, on some official work. On coming to know of the absence of the executive engineer, the crowd of candidates became restless; their enquiries were met with vague and arrogant replies. By now rumours had started circulating that out of 150 posts as many as 100 had already been filled. This made matters worse, and the young men, waiting impatiently in the scorching heat since the morning, soon became furious. They started shouting slogans and a few of them burst into the office and gave vent to their anger by scattering some files and upsetting furniture. Still no one responsible came forward to explain the situtation to them. Their anger increased and there was stone-throwing. But immediately some local leaders intervened and brought the situation under control. They appealed to the crowd to be disciplined and peaceful and managed to move the young men from the executiv engineer's office to an open shaded area near the bus-stand. A string of speeches by the leaders was followed by mass singing of 'bhajans'.

Some of the young men had gone to a restaurant near the bus-stand to get some water to drink. An argument took place between the group and the restaurant owner. The young men brought out the stock of ice from the restaurant and distributed it among themselves. Apart from the pieces of ice lying scattered, not the slightest damage was caused to property or people.

In the meantime, the police arrived at the place of the meeting near the bus-stand and threatened to open fire to disperse the crowd. The local leaders intervened and pleaded with the police that the crowd there was completely peaceful and under control and that any action on the part of the police would only provoke the people. The policemen were finally persuaded to leave. On their way back from the meeting the policemen came to the restaurant where the farcas about ice distribution was going on. It was here that the police opened fire, allegedly without any warning and before any attempt had been made to disperse the crowd by a lathi-charge or firing of tear-gas shells. The firing left two dead and one injured. Both the dead young men had come for the interview from a village about 8 miles away. Both were hit by bullets above their waist, one right between the eyes. The third person, who was injured in the shoulder, was hit in a nearby shop. Evidently, the shops in the area were open, suggesting that there had been no panic or fear of violence. It was only after the firing that life in the area came to a standstill.

When news of the firing reached the meeting, the atmosphere became very tense. The local leaders decided that the crowd should continue with its peaceful bhajans while they went and confirmed the news of the firing. On their return, the leaders decided not to disclose the news of the two deaths in the police firing and instead told the meeting that the firing had resulted only in injuries to some other people who were not connected with the young men who had come for the interview.

There may have been perhaps some justification for withholding the correct information from the young men in this case. But they had been deceived in other respects. For instance, the nearly 1,200 candidates called for the interview had not been told that the posts to be filled were for 'training only'. The training was to be at the candidates' expense. Nor had they been told that out of the 150 posts advertised, 40 were reserved for scheduled castes and tribes and 20 others for those who had worked on drought-relief projects, to be filled through the Social Welfare Board. Thus only 90 posts were to be filled by applicants forwarded by the employment exchange. Why, then did the employment exchange advertise for all the 150 posts and why did it call 1,810 candidates for interview — all at one time on the same day? Some days later there was a mysterious fire in the employment exchange which reportedly destroyed a number of files!

Provoked by the callous tratment of the candidates called for interview and the police firing, all the political parties and student organisations gave a joint call of a bandh which was a total success. They put forward a number of demands, including those for a judicial inquiry, suspension of the concerned officers, etc. These demands have been conceded by the state government; an enquiry commission has been set up and the concerned officers have been served with suspension orders.

This did not, however, appease the students who decided to boycott examinations in Parbhani district. The boycott movement gained momentum rapidly and spread throughout Marathwada. As a result, no examination at all are being held anywhere in Marathwada this year. The Vasmath incident has sparked a wider agitation which has taken up the issue of the economic neglect of the Marathwada region by the state government (see following report).

MAHARASHTRA — II

Politics of Backwardness

GEOGRAPHICALLY, Maharashtra can be divided into five regions: Vidarbha, Marathwada, Khandesh, Western Maharashtra and Konkan. Of these, before the linguistic reorganisation of states, Vidarbha used to be part of Madhya Pradesh and Marathwada of Hyderabad. As parts of Maharashtra, relatively speaking, Vidarbha has made good, whereas Marathwada has not.

Part of the reason for this is political. When Y B Chavan relinquished the chief ministership to move to the Centre in 1962, he picked Kannamwar from Vidarbha as his successor. After Kannamwar's death, he chose another Chief Minister from Vidarbha, V P Naik. This was Chavan's way of keeping his hold on the powerful Maratha caste.

That apart, Marathwada has been historically a backward area. The land is not fertile and less than 4 per cent of it is irriggated. Nor has the region an industrial-urban centre comparable to Nagpur in Vidarbha. And, unlike their counterparts from Konkan and Western Maharashtra, the youngmen who come out in their thousands with degrees from the colleges in Marathwada have little access to job opportunities in Bombay. For one thing, Bombay is much farther away; for another, they have no kith and kin in Bombay with whom they can live; finally, since it is people from Konkan and Western Maharashtra who are established in trade and industry in Bombay, the jobs are pre-empted by them for those from their own regions.

This is the background to the current agitation by students in the cities of Aurangabad, Parbhani and Nanded in Marathwada demanding speedy conomic development of the region. The agitation was touched off by the police firing at unemployed youth in Vasmath town in Parbhani district (see report above). The call given by the Students' Action Committee for a 'Marathwada bandh' on last Thursday in protest against the killing of four persons in police firing on last Sunday and Monday received a spontaneous response in all the five districts of the region.

The Marathwada University Students Association (MUSA), which has played an important role in the current agitation, has the backing of a powerful group in the Congress party in Marathwada. This group is led by Baurao Kale, MP, Balasaheb Pawar, MLA, and S K Vaishampayan, MLC, and has the blessings of Shankarrao Chavan, Minister for Agriculture and an aspirant to the chief ministership. MUSA has also received the support of Anantrao Bhalerao, Socialist party leader and editor of an influential regional newspaper, *Marathwada*, and Govindbhai Shroff, a veteran freedom fighter. Anantrao Bhalerao, Govindbhai Shroff, S K Vaishampayan, Baburao Kale and Balasaheb Pawar have sponsored a body called the Marathwada Development Conference which has been making representations to the state government demanding steps for rapid economic development of Marathwada.

Apart from the development of Marathwada, the Students' Action Committee has demanded the eradication of corruption in public life. For Shankarrao Chavan and his supporters the demand for a public enquiry into corruption in high places in government is welcome, and they have not hesitated to publicly support it.

Another faction of the Congress in Marathwada, which has the support of Chief Minister Naik and is led by Kal-

yanrao Patil, Minister of State for Industries, Manikrao Palodkar, MP and Vice-President of the Maharashtra Pradesh Congress and Rafiq Zakaria, Minister for Urban Development, has tried to link the students' agitation with the demand that the next chief Minister of the state be chosen from Marathwada. What is being suggested is that the movement is inspired by Shankarrao Chavan to promote his claim to the chief ministership.

Naik's supporters have also tried to make out that the agitation has been launched by sons of rich Maratha farmers having large irrigated farms and did not have the support of the poor. To substantiate this charge, they arranged for a deputation of Scheduled Caste students to come from Aurangabad to Bombay to represent to the Chief Minister that the Students' Action Committee was dominated by Maratha students who supported Shankarrao Chavan's claim to the chief ministership and that the whole agitation was being financed by Shankarrao Chavan and his aides. The deputation told the Chief Minister that the Scheduled Caste students were keen to take the examinations and wanted the state government to make arrangements to conduct the examinations as scheduled. Naik's supporters were hoping to exploit the deep antipathy of the Scheduled Caste students in the region to Hindu, and particularly Maratha, students.

However, because of the mass support it has received and the involvement in it of independent leaders like Bhalerao and Shroff, the attempt to dub the agitation as a creation of Shankarrao Chavan has not succeeded. Naik's supporters have, therefore, changed their tactics and are trying to take the wind out of the sails of the movement by making radical demands themselves. They organised a meeting of Congress MPs, MLAs, Zilla Parishad and District Congress office-bearers belonging to their group at the residence of Kalyanrao Patil in Bombay. The meeting decided to submit a charter of demands to the state government similar to that prepared by the Marathwada Development Conference. As part of a well-rehearsed script, at a meeting at his house later the same day, the Chief Minister announced a number of decisions. He declared that an institute of science would be set up in Aurangabad in 1974-75 and a medical college started in Ambejogai from the 1975-76 academic year. The state government would also press the Centre to take up immediately work on the Manmad-Parbhani-Paralivaijnath and Kurdiwadi-Latur-Mudkhed railway lines and on a new broad guage Ahmednagar-Bhir-Paralivaijnath line. The Centre would also be persuaded to start two large public sector projects in Marathwada and to sanction adequate funds for the second stage of the Jayakwadi irrigation project. The state government would set up a district subordinate services board as early as possible and a committee to implement housing schemes. The Chief Minister also sanctioned Rs 20 to every backward class student to meet his travelling expenses from his village to the examination centres. Thus Naik could claim that most of the demands made by the Student's Action Committee had been met. He also stated that all arrested students, except those held on charges of violence and arson, would be released.

Neither representatives of the Marathwada Development Conference nor the Students' Action Committee were invited to the Chief Minister's meeting. Baburao Kale, S K Vaishampayan, Anantrao Bhalerao, Govindbhai Shroff and others boycotted the meeting. Even the President of the Pradesh Congress Committee and Secretary of the PCC were not invited. The attitude of the Chief Minister and his principal aides in Marathwada has evoked strong resentment among the agitating students and spokesmen of the Marathwada Development Conference. The decisions announced by the Chief Minister did not satisfy the students who have dismissed them as "empty promises". Popular support for the students' agitation remains very strong. This became evident when the employees of the State Transport Corporation in the region observed a total token strike in response to the call for State Transport Bandh given by the Students' Action Committee.

The students have decided to launch a month-long agitation from May 1 which will involve non-cooperation, non-payment of taxes, peaceful demonstrations, demand of resignation by MPs and MLAs of the region, non-participation in and boycott of government functions, stopping of work in government offices, demand for employment under the employment guarantee scheme and, if work is not made available, stoppage of public transport. May 1 will also be observed as Martyrs Day.

POLITICAL PRISONERS

More Than Legal Aid

M R

IT is a conspiracy of silence on the part of the Press. The anti-repression fortnight observed in Andhra Pradesh, at the call of the Andhra Pradesh Civil Liberties Committee, has not earned even a casual mention in the national Press.

No doubt, Andhra Pradesh has far fewer political prisoners than West Bengal. But the onslaught on civil liberties and the repression of communist revolutionaries there has been no less intense. In Srikakulam district 7 of the 11 taluks were notified as 'disturbed areas' in 1969. Though the Andhra government claims to have contained the 'Naxalite' challenge, these taluks continue to be notified areas and at least 50,000 Girijans are still herded together in Vietnam-type 'strategic hamlets'. Similarly, some taluks of Khammam and Warangal districts of the Telengana area also continue to be classified as 'disturbed areas'.

Notification of an area as 'disturbed' confers sweeping powers on the police and paramilitary forces, which have fanned out in the tribal tracts as part of the government's anti-Naxalite operations. Whole areas of Srikakulam, East Godavari, Khammam and Warangal districts are dotted with special camps of police and paramilitary personnel. Movements of individuals are subject to severe restrictions. Anyone who looks an outsider is marked out, interrogated and harassed on suspicion and often held in illegal detention for indefinite periods.

In Srikakulam, Girijans living in the strategic hamlets have to return from work in the farms and the forests by sunset. They are not allowed to take any food with them when they go to work. This is the way the forces of law and order seek to ensure that the few communist guerillas still operating in the Girijan terrain do not receive food supplies from the people.

The Andhra Pradesh government has certainly not been averse to using the Defence of India Rules, the Maintenance of Internal Security Act and its own Preventive Detention Act, which is more draconian than the corresponding Central law. However, unlike the West Bengal government, the Andhra

government has also relied heavily on the 'conspiracy' provisions of the Indian Penal Code. Sections 104 and 107 of the Criminal Procedure Code have been used systematically to crush attempts to organise the peasantry and the tribal population.

The conspiracy provisions of the Indian Penal Code used to be a favourite weapon of the British colonial rulers. They can be as effective in dealing with the government's political opponents as the preventive detention laws are — as the Parvatipuram conspiracy case shows. Many leaders and functionaries of the Communist Party of India (Marxist-Leninist), accused in this case, have been undertrial prisoners for over four years. The prosecution would not complete the investigation and bring the accused to trial. Applications for bail were opposed on the ground that the trial would begin in a few weeks. Actually, the trial did not begin till a few months ago after, among other things, many changes of judges. The special judge in charge of the trial retired. His successor did not, it appears, relish the assignment and marked time until he got another posting. The third judge has now fixed the next hearing for May 13. The trial may take years to complete and, even if the accused are acquitted at the end of it, the government can go in appeal against the judgment. The government can, therefore, confidently expect to keep the accused in the case in prison almost indefinitely.

In addition to the conspiracy cases, communist revolutionaries have been implicated on specific charges of murder, dacoity, etc. Every relevant provision of the Indian Penal Code, the Criminal Procedure Code and the Arms Act has found perverse application against them. In Srikakulam district alone, about 450 people, mostly Girijans, stand charged in some 27 cases. These are, of course, in addition to the large number of revolutionaries whom the government has not had to bring to trial since they have been murdered. By the government's own admission, over 120 'Naxalites' have been shot dead in 'encounters' with the police forces. Most of these 'encounters' were fictitious and the revolutionaries were murdered in cold blood after they had been captured. Several others have simply disappeared. The police have denied all knowledge of their whereabouts.

Repression by the Andhra Pradesh government has not been directed only at political activists. Perhaps no other state has proscribed creative writing or harassed writers on the scale that the Andhra government has done. Three members of the executive of the Revolutionary Writers Association were held under the Maintenance of Internal Security Act in October-November 1973 for allegedly propagating the politics of armed struggle. Though the government tried to make out that their arrest had to do with their other activities, not their writing, the High Court held their detention illegal.

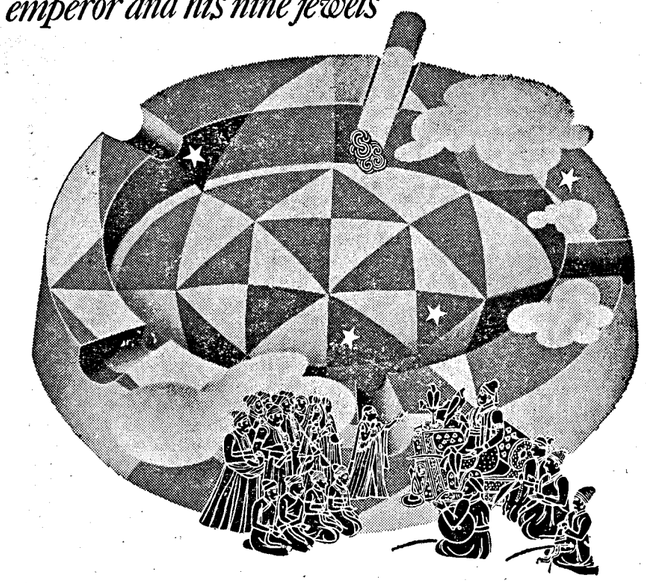
There are numerous other instances. An anthology of poems entitled "March" was proscribed and its editor, Pendayala Kishen Rao, was charged with sedition and convicted. M V Ramana Reddy, a physician and an undertrial prisoner in a conspiracy case, was out on bail when he was held under the MISA for allegedly anti-government writing in his journal *Prabhanjanam*. His detention was held illegal by the High Court. Three writers, Jwalamukhi, Cherabanda Raju and Nikhileswar, were detained under the Preventive Detention Act until they were ordered to be released by the High Court. The Khammam residence of Jeevan, a member of the Revolutionary Writers Association, was raided by the police who seized about 400 books and papers. After a whole day of interrogation in the police lock-up, Jeevan was freed on condition that he reported at the police station every day. The literature proscribed by the Andhra Pradesh government includes "March", "Khanjha", "Viplavam Vardhillali" and "Shankaravam" (collection of poems), "Ippudu Veestunna Gali" (collection of short stories), and *Srujana* and *Pilupu* (issues of journals).

The nature and scale of the repression in the state has thrown up a civil rights movement led by the Andhra Pradesh Civil Liberties Committee. Providing legal and monetary aid to the victims of institutionalised violence by the State and by the privileged classes is, of course, an important task of the movement, but it is primarily a mass political movement which provides an intermediate platform for *resistance* to such violence. Towards this end a series of district level conferences have been organised and a state-level conference was held in December last year in Guntur. The anti-repression fortnight, observed recently, is a part of the campaign to arouse the conscience of the people against the repression by the regime and to heighten their awareness of the reasons for, and the methods of, such repression.

SOUTH

Andhra Rests

Mohit Sen



IT is an indication of the complex character of the Indian revolutionary process that the turmoil and upheaval in Gujarat or Bihar go on in the same country where also Andhra rests. And when Andhra was convulsed, Gujarat had lain dormant. There is little point in bemoaning what seems to be one of the facts of Indian life. It should, of course, be remembered that nothing is absolute and this applies to Andhra's rest as well.

But at the moment the Chief Minister has been making a reasonably good job of administering the state. The earlier indecisiveness has been replaced by quick decisions on a host of detailed questions. The rice procurement target has been comfortably met and procurement may even go up to one million tonnes — the chief factor being an unprecedented bumper harvest, the like of which Andhra has seldom seen. The revenue collections have been excellent with the Chief Minister giving a degree of autonomy to the civil service which the latter has always longed for in these matters. Some steps are being taken which create the not necessarily unjustified impression that the long pause in all development activity is about to end.

What this means is that there is a certain return to administration as such, to the functioning of the creaking machine. And evidently Vengal Rao's idea is that if the system begins to work all would be well. He takes like a duck to water to the recent much advertised shift to 'pragmatism' in the top echelons of Congress leadership. Get things done — that is the *mantram!* And since literally nothing had been done for so many years, even this minimum of motion looks like momentum!

But this is precisely what it is not. And this is where all the trouble

The great Akbar invites you to confer amidst an emperor and his nine jewels

The Akbar experience.

An experience of efficiency and enjoyment. The finest guarantee of a successful conference.

With every facility you require, plus that unique blend of royal tradition and youthful exuberance which is our very own thing.

A choice of conference rooms. The Nauratan, named after Akbar's nine "jewels" or councillors, seats 150, and accommodates 200 guests for cocktails.

The intimate Birbal Room hosts smaller meetings and get-togethers.

You get attentive, personalised service. PA systems, secretarial services, telex, dictaphones, tape recorders. Plus ITDC Car Rentals & Tours.

And cuisine. We offer you two of Delhi's finest restaurants. The shimmering Sheesh Mahal, and our 24-hour coffee shop, Madhuban. Our catering and menu services can be tailor-made to your conference budget. So write to us. We promise you a conference service second to none.

begins to gather. Get things done is all very well, but in not too long a span of time one has to decide what things and how. For example, collection of revenues is a good morale booster for the administrators but what about land reforms? Or, procurement of rice is excellent not only for Andhra but also the nation but what about the unconscionable and utterly intolerable rise in prices? What about unemployment? What about development? What about the implementation of the Six-Point Formula? What about removal of regional disparities? On these and a host of other related and crucial problems the 'pragmatic' Chief Minister does not appear to have anything resembling a systematic approach. After all, the economic and political philosophy of pragmatism is essentially that of *laissez faire*.

The result is that two poles of disaffection are beginning to take shape. One is Congress factionalism. There is no active Congress dissidence at the present moment but the absence of dissidence does not in the least imply the presence of unity. Even in the Ministry many are just waiting for some things to go wrong in order to be able to begin the knifing game. Like all Congress Chief Ministers when the going is reasonably smooth, Vengal Rao has been able to extend the frontiers of his own rather small faction but the new cluster is clearly a conglomerate which would cluster in quite a different way and around quite different personalities should trouble signals begin to be heard. And these uncomfortable sounds are bound to be heard if pep has no purpose.

The other pole of disaffection is popular discontent. One of the more favourable results of the defeat of the Rightist campaign to bifurcate Andhra has been the possibility of a return to the saner politics of mass issues. The defeat of the Right, after all, opens up new possibilities of intervention for the Left and democratic parties and forces. Thus, one witnesses in Andhra a revival of mass activity on two as yet unco-ordinated fronts. One is the spread of joint anti-imperialist meetings and demonstrations. The reception accorded to the widow and daughter of the late President Allende saw a coming together of the Centrists and the Left in a variety of places. Earlier the conference of the peace and solidarity movement had produced the same phenomenon. The other front is the coming together on mass issues of the CPI and CP(M). The two parties are extending support to one another in the forthcoming elections to the Assembly and the Council. They are also the joint sponsors of a meeting of the representatives of all other Left parties and mass organisations to consider the form of action on the national protest day fixed for May 3. In Andhra, the CP(M) mass base has considerably shrunk as compared to 1964 but its coming together with the CPI helps to mobilise large sections of the exploited and oppressed in the rural areas, many of whom have not been able to decide between two parties both of which fly their loved Red Flag!

At the same time, the youth and student organisations in which the CPI members play the leading role and the youth and student organisations of the Congress have already held a joint convention on the problem of prices and chalked out a programme of mass action. A representative gathering of trade unions, including a section of the INTUC, has also arrived at a similar consensus.

These are, let it be remembered, still rather small efforts and the huge peasant mass in the state has yet to be drawn into the battle. Nevertheless, if these initiatives are consolidated, co-ordinated and followed up, the rest of Andhra may yet become ready for a mighty heave forward in the not-so-distant future.

NAGALAND

Why the NNO Lost

Harish Chandola

SPRING has brought a new government to Nagaland and a flood of hopes to the hearts of the people. Very simple hopes. Like villagers thinking that from now on they would be able to go to their fields down in the valley without fear of being arrested on the way and taken to police camps to be interrogated and beaten up to provide information about the 'underground' men.

In Angami country, where I spent three days, in the villages you can even now hear people sighing with relief because the government has changed. The village people did not feel that the previous government of the Naga Nationalist Organisation (NNO) was their own. And in the towns the Nagas called it the "Non-Naga Organisation (NNO) government", because the doors of its ministers and high officials were wide open for rich businessmen from outside Nagaland driving up to secure orders for the ever-widening variety of goods and services the state was constantly buying. But for Naga villagers, if ever they trudged up to the exclusive hill in Kohima called the Ministers' Hill, the big iron gates guarded by rifle-carrying sentries of the Assam Rifles who did not understand the Naga languages, remained shut. The Naga people had ceased to be the constituency of the NNO government.

Of all states, corruption per capita was perhaps the highest in Nagaland. After the elections in February, the state's main PWD godowns at railheads in Amguri and Dimapur, where Nagaland's construction materials were stored, were found absolutely empty because the scarce materials, like CGI sheets and iron rods and pipes, had all been sold in the thriving blackmarket by the previous government just before the elections. The new United Democratic Front (UDF) government has seized some incriminating documents and is preparing to prosecute persons responsible for the illegal sales.

Much of the money the Centre gave for the development of Nagaland went into the pockets of politicians of the ousted government, contractors and officials and very little of it reached the villagers. One has to travel in the state to see that roads have been built there which start from nowhere and go nowhere. They span isolated stretches and were built to help some contractors and their patron politicians obtain generous helpings of the plentiful funds provided by the Centre. An opposition member in the last assembly said during its proceedings that vehicular traffic on such roads would be possible only when helicopters lifted vehicles onto them!

From the results of the Nagaland elections one would find that the NNO got most of the seats from the major towns like Dimapur, Kohima, Mokokchung, Tuli, Phek, etc, and the UDF generally won in the rural areas. The reason for this is that the towns have

large concentrations of people who do not belong to Nagaland, like traders, construction and other workers, rickshaw-pullers and those who carry loads on their heads. Rumours were set afloat before the elections that if they did not vote for the NNO they would all be turned out of Nagaland. And they did not want to lose their means of livelihood.

Defeated Despite Advantages

The NNO also had a number of other advantages. It was in power continuously for 10 years, had total control of the state machinery at the time of the elections, plenty of resources and unlimited backing from the rich trading community. In spite of all these advantages it could not obtain enough seats to form a government.

Since the rural population by and large went against the NNO, let us see why it did so. In a little over a year, two battalions of the Border Security Force (BSF) were raised in Nagaland. Unlike other security forces in the state, most recruits for these two BSF battalions came from Nagaland itself. They used to be members of the private army of the former 'Revolutionary Government of Nagaland', a faction of the underground Nagas led by men from the Sema country who had broken away from their parent body following the assassination of their leader, Kaito, in Kohima in 1967, allegedly by some Angami members of the underground. (Kaito had been openly opposing the move to place the leadership of the negotiations which the underground was then conducting with the Government of India in the hands of Phizo.)

The breaking off of most of the Semas from the main body of the underground created a temporarily favourable situation for the NNO government. These breakaway elements trapped and handed over about 300 men returning from China, led by the chief of the underground army, Mowu Angami, to the security forces in 1968. The Nagaland government helped this Sema faction establish a separate identity and strengthened it against the main underground body.

The breakaway Sema group established an organisation called the Revolutionary Government of Nagaland and for five years tried very hard to assume the position of the main underground body by rallying other underground men in other parts of Nagaland to its side. Its attempt was to isolate the pro-Phizo elements. But it failed to do so.

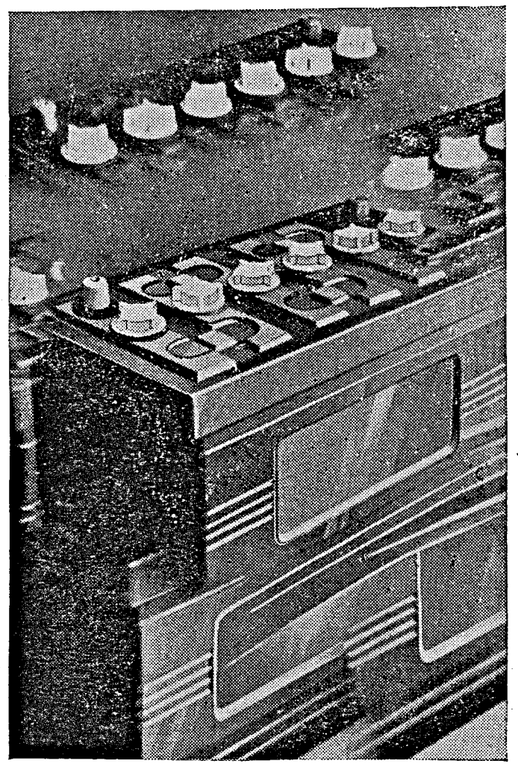
By last year, however, it was felt that maintaining the separate identity of the Revolutionary Government was becoming excessively expensive and politically counter-productive, because this group had failed to contain, let alone put an end to, the activities of the main body of the Naga underground. It was decided to dismantle the Revolutionary Government and rehabilitate its men. Two new BSF battalions were therefore formed to accommodate them and provide them with 'legal' activity.

BSF Turncoats

These rehabilitated men are now spread all over Nagaland as BSF soldiers. They know almost all the relatives and friends of the underground because until a few years ago the underground men were their fellow soldiers. Now, in the new circumstances, they hunt for their former comrades. An easy way of hunting was to go to the villages and try to secure information from the parents, wives, children and other relatives of the underground men about their whereabouts. This was done generally by arresting the relatives and interrogating them, which did not exclude the use of torture. The Naga villagers were terrorised by these BSF men who spearheaded the operations against the underground conducted by all elements of the security forces. After the elections, the hope of the villagers is that the new government may be able to restrain these men and save them from arbitrary arrests, detention and torture.

The UDF came to power under extremely adverse circumstances. The powerful trading community in the state and the higher-ups in the administration, themselves Nagas, who so far had a free hand, were all opposed to the UDF. They were afraid that their excessive profits and their arbitrary powers might be brought to an end by the UDF which while in the opposition was relentlessly exposing them.

I give just one example of the profits made by the trading community in Nagaland. By selling much of the sugar quota of Nagaland in the blackmarket in other states, the trading community makes a profit of over Rs 11 lakhs a month! Nagaland gets a quota of almost everything: wheat, rice, kerosene, fertilisers, galvanised iron sheets, pipes, steel, cars, scooters, etc, most of which are sold outside in the blackmarket at enormous profit. Who would want such a lot of easy money to slip through his fingers? It is said that the traders had offered each independent MLA Rs three lakhs to join the NNO to enable it to form the government. But most independents did not accept the bribe and joined the UDF.



Chief Secretary's Loot

I also give just one example of how some high officers in Nagaland managed to enrich themselves. A former Chief Secretary of the state, a Naga, now owns six large houses, including a bungalow built by the state government which he first got condemned and then helped himself to, a number of farms, including one which might be the largest in the state, created by appropriating village common lands, and a petrol pump in the name of his son, besides many other things. Money back home was so easy and plentiful that his son who was in the Indian Police Service in a faraway state, resigned, and on coming back was given a contract running into several lakhs of rupees for the construction of a temporary jail-cum-courthouse for the trial of Naga prisoners in Shillong by the Nagaland administration of which his father was then the Chief Secretary.

Delhi firms blacklisted by Delhi hospitals supply equipment and drugs to Nagaland government hospitals through offering enormous kick-backs to officers. Firms making sub-standard chemicals and drugs have come up in Nagaland under the bogus ownership of relations of top medical officers of the state. One could easily write a book on the easy ways devised by the Nagaland officials to help themselves to the bounty coming from the Centre.

And now to discredit the new government, rumours are being spread about plans to assassinate the former ministers of the NNO. The former ministers have ceased to be of any importance. And nobody wastes bullets on persons of no importance. What amazes the Naga people is that the Governor of the state should through his actions in February and March have expressed trust in the NNO which had been voted out of power by the people and have expressed open distrust of the UDF which had emerged as the majority party (in the Nagaland Assembly the UDF now has 36 seats and the NNO 24). The Nagas now openly ask if the Governor considers the process of democracy wrong?

WE DON'T MAKE BATTERIES BUT
WE HELP THEM PERFORM BETTER

Our 'GRIFFIN BRAND' basic chemicals—RED LEAD, LITHARGE and LEAD SUBOXIDE—applied as a paste on the negative and positive plates of a storage battery give it power. Manufactured to Indian standards as well as to customers' specifications, their superior quality ensures longer battery life with better performance.

Not-So-Hidden Persuasion

Nireekshak

THE credibility of a journalist cannot but have an inverse relationship with the extra-mural perquisites, patronage and rewards he enjoys. All the same, it is necessary to sustain the myth that all these do not compromise a journalist's independence. The relationship has to be elevated to the realm of metaphysics, like the one between aid-giving and aid-receiving nations. All aid is intervention *per se* but all aid is always described as 'stringless' by both sides.

Chief Minister Abdul Ghafoor of Bihar could not have been unaware of the issues of journalistic ethics involved when he decided to nominate an assistant editor of *The Searchlight* to the state food committee, without so much as consulting or informing the editor. Membership of the committee carries the status of a Minister with all perquisites and privileges that go with it, except the salary. And *The Searchlight* had been an uncompromising critic of the Bihar government's food policy. The editor put his foot down and this led to a confrontation with the government. The issue went to the Press Council and the Chief Minister entered the unconvincing plea that he did not expect the editor to object to the nomination of a colleague to the food committee and therefore did not consider it necessary to inform or consult him. The editor's contention was that the Chief Minister's action amounted to an attempt to corrupt the Press.

The Press Council does not take up issues *suo moto* and few care to raise issues like these with the Council. There should be scores of other instances of corrupt practices which have escaped public attention. Of late, such practices have been acquiring a measure of sophistication. Some dailies from Punjab have denounced that what they regard as an attempt by the Punjab government to build up a lobby for itself among Delhi-based correspondents. The Punjab government has an estate in New Delhi and a few hand-picked correspondents have been allotted living accommodation in the estate at nominal rent. This could be a dangerous precedent for other state governments to build up lobbies among New Delhi's Press Corps. In any case, the Central government has been dispensing with such patronage for years now.

The Press Association of India, despite its high-sounding name, has been little more than a real estate agency for the caste of journalists in the capital known as special correspondents. Membership of the Association is restricted to those accredited to the Government of India at the headquarters. The Association, though a voluntary organisation, used to maintain the seniority list for allotment of government accommodation to special correspondents at subsidised rents. Journalists' involvement in the Press Association was limited largely to getting government accommodation and, having got it, to defending it. No wonder, no special correspondent ever retires in New Delhi. A benami accreditation can always be found, what with the proliferation of newspapers in the country. An accreditation is a must to keep the government-allotted house.

Last year the government acted to end the Press Association's role as a real estate agency. Date of membership of the association used to be relevant for determining the seniority in the housing list; now the date of one's accreditation is the basis of seniority. The seniority list is maintained by the Principal Information Officer. Predictably, the Press Association has become a redundant body and many journalists have not cared to renew their memberships.

Out-of-turn allotment of houses by the government to chosen correspondents was a common practice even in the heyday of the Press Association's real estate activities. One needed to have access to the right minister to circumvent the Press Association and its seniority list. There is nothing very sacrosanct about the seniority list under the new dispensation either. Those in the bottom half of the list will not get government housing for the next, say, 50 years if they were to go merely by seniority. Of course, one is constantly assured that out-of-turn allotment of houses (whatever the grounds) does not amount to an attempt by the government to buy up the beneficiaries.

It is not in the least surprising that neither the Indian Federation of Working Journalists nor the rival National Union of Journalists has thought it necessary to speak out against the feudal patronage the Central and state governments have been extending to working journalists. The IFWJ has just mooted the idea of a code of ethics for journalists, but it is not known if the code would include rejection of all extra-mural rewards or patronage.

Radio and TV contracts are yet another form of government patronage. Working part-time for the government-owned media is indeed a status symbol and a measure of recognition among journalists.

No wonder, then, that the hastily-contrived theory that Janki Gaur, an assistant director in Delhi TV, jumped to death from his fourth-floor office because he was already a psychiatric case, found many takers among the capital's newspapers. His widow, Hope Gaur, was compelled to issue a statement refuting this theory calculated to cover up the fact that Janki was driven to suicide by his horrifying job condition. Suicide by a scientist a few years ago forced an inquiry into the affairs of the Indian Council of Agricultural Research; but there was no demand from the Press for an inquiry into the affairs in Delhi TV. Minister Inder Gujral's statement in Parliament would not admit that the suicide had anything to do with Janki Gaur's job. He was described as a sensitive, talented and a conscientious officer with an impeccable confidential record. A prize is to be instituted in his memory for the best TV documentary every year. The government's conscience is now clear. What does it matter if the TV staff is demanding a fuller inquiry into the circumstances of the suicide?

United Western Bank

UNITED WESTERN BANK opened 11 new branches last year and has now a network of 72 branches spread over the whole of Maharashtra. Its total deposits increased by Rs 6.35 crores to Rs 28.29 crores and advances by Rs 4.06 crores to Rs 17.31 crores. In line with the general trend, the bank had surplus funds in the first half of the year but experienced inadequacy of funds in the second half as a result of the credit squeeze imposed by RBI. During 1973, the bank earned a marginally higher profit of Rs 4 lakhs, of which Rs 2 lakhs were transferred to the statutory reserve fund.

Announcement regarding the issue of Equity Shares. — This is only an announcement and not a Prospectus. The Shares will be listed on Bombay Stock Exchange.

Persons interested in details may please obtain copies of the Prospectus and Application Forms from the Managing Brokers, Brokers and Bankers to the issue mentioned here under.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON MONDAY THE 29TH DAY OF APRIL 1974, AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON SATURDAY THE 11TH DAY OF MAY 1974, OR EARLIER, AT THE DISCRETION OF THE BOARD OF DIRECTORS, BUT NOT EARLIER THAN THE CLOSE OF BANKING HOURS ON THE 4TH DAY OF MAY 1974.

Trade-wings LIMITED

Registered Office: 6, Mascarenhas Building, Afonso de Albuquerque Road, Panaji, Goa.

(Incorporated as a Private Limited Company on 29th November 1949 under the Indian Companies Act, 1913 and converted into a Public Limited Company on 26th June 1973)

HISTORY, EXISTING AND PROPOSED ACTIVITIES AND PROSPECTS OF THE COMPANY:

The Company was started with a preliminary capital of Rs. 20,000/- in 1948 and progressively enlarged its activities and volume in steady strides. The Company was the first in the country to have organised Haj Charters to Jeddah in 1949 and Holy Year Charters to Europe in 1950 and was converted into a Public Limited Company in 1973, with Offices in Bombay, Baroda, Bangalore, New Delhi, Hyderabad, Madras, Madurai, Mangalore, Nagpur and Goa, employing a staff of over 350. The Company's turnover hit the mark of Rs. 7.50 crores and dividends at an average of 8% to 15% were declared continuously since 1948 to date. The Company has Travel, Clearing and Forwarding, Packing and Tour Departments for foreign tourists visiting India. The Company has excellent contacts with travel agents all over the world. Plans are on hand to open offices in New York and London. The Company is now building a 3-Star hotel with 126 double rooms which will be located on Bogmalo Beach near Dabolim Airport, Goa. The object of the issue is to provide part of the finance to build this hotel. Looking to the rapid growth of tourism and Goa being a tourists' paradise, the occupancy rate is expected to be very high. Considering the vast experience of the Company in travel business and its entering into a long-term management contract for operating the hotel, with the well-known Oberois, the Directors are confident of its success.

SHARE CAPITAL:

Authorised	Rs.
7,50,000 Equity Shares of Rs. 10/- each	75,00,000
2,50,000 Unclassified Shares of Rs. 10/- each	25,00,000
	1,00,00,000
Issued, Subscribed and Fully Paid up

Distribution of Urban Household Wealth in India—I

A First Approximation

V M Jakhade

S L Shetty

This paper seeks to explore the possibilities of presenting a method, albeit *a crude one, for observing the trends in wealth distribution among urban households.*

At this stage of the country's economic development, no official 'administrative' statistics would provide a correct picture of the reality regarding wealth distribution. The only method of obtaining such a valid picture is through systematic surveys.

However, till such surveys are undertaken, it may be worthwhile to attempt, on the basis of available official statistics, to frame a rough pattern of the distribution of wealth and to indicate broad trends over a period of time. The present study has this modest objective in view.

'DISTRIBUTIVE justice' has been one of the main objectives of planning in India. Considerable interest has been shown in recent years in the study of the distribution pattern of income and wealth in the community. Though the required data are not available for a detailed analysis of the pattern of income distribution,[1] some recent studies have provided useful data, which may broadly indicate the trends towards increasing inequality in incomes of rural and urban households.[2] These estimates have been made possible by the existence of — besides the regular CSO estimates of national income — such corroborative data as the results of the National Sample Survey (NSS) Rounds on *Consumer Expenditure* separately for rural and urban areas, estimates of household savings in these areas, and the *Income-Tax Revenue Statistics* on non-farm household incomes.

However, the distributional aspect of wealth ownership, which is generally the major source of non-salary income, has remained so far an unexplored field in India. This is understandable, for "it is generally difficult in any country to collect comprehensive information on asset holdings of different groups of the population as the households do not keep regular accounts and those that do would not normally reveal them. It is not surprising, therefore, that most countries do not have the required data for a systematic study of the annual or periodical changes in the distribution of asset holdings among the personal or household sector".[3]

In the United States, where fairly comprehensive estimates of household wealth distribution have been attempted of late, it is stated that two prerequisites for such estimates are (i) detailed data on household wealth in 'estate tax returns', which are used for estimating the distribution of wealth among living persons with the help of the 'estate multiplier method'; and (ii) the existence of a set of national balance-sheet accounts "for a limited number of bench-mark years".[4]

In India, neither of these sources is available in the scale and form which may facilitate the derivation of household wealth distribution. This is particularly true of the urban household sector. In respect of rural households, the information can be more readily got. For, detailed data on the size distribution (of physical area) "for a limited number of bench-mark years" are available for land — which forms the bulk of tangible wealth in the rural areas — through the Rounds of the National Sample Survey.[5] Besides, research bodies such as that of the Reserve Bank of India and the National Council of Applied Economic Research (NCAER) have conducted surveys on the distribution *inter alia* of tangible wealth among the rural households, though these survey results pertain so far to single years.[6]

As for urban households sector, the only bit of information available is with regard to distribution of wealth held in the form of owner-occupied homes in 1960, as revealed by the NCAER urban income survey.[7] These data were not originally published by the NCAER but they were made available to the Mahalanobis Committee.[8] As the Mahalanobis Committee has opined, "no data, not even scattered bits of information, are available for a direct study of the distribution of personal wealth in other forms such as bank deposits, shares, securities and commercial property, even at a particular point of time".[9] Faced with such a situation, the Committee has not attempted any analysis of the distribution of urban household wealth; they have, instead, confined their attention to studying the distribution of only one type of income from wealth, namely, dividend income based on *Income-tax Revenue Statistics*.

Purpose and Methodology of Study

The purpose of this paper is to explore the possibilities of presenting a method, *albeit* a crude one, for observing the trends in wealth distribution among urban households. Here it must be made clear that, at this stage of the country's economic development, no official 'administrative' statistics would provide a correct picture of the reality regarding wealth distribution. The only method of obtaining such a valid picture is through systematic surveys. However, till such surveys are undertaken, it may be worthwhile on the basis of available official statistics to attempt framing a broad pattern and so indicating broad trends over a period of time. The present study has this modest objective in view. It should be emphasised that this paper does not claim to have provided any conclusive evidence on the pattern of distribution of urban household wealth; at best, it provides a basis for discussion.

After estimating the total reproducible wealth of the country as a whole, the wealth held by the government sector and the corporate sector is deducted to arrive at household wealth. Household wealth is further divided into farm and non-farm wealth. Assuming, in a given year, all wealth-tax assessees to belong to the highest income brackets as revealed by the income-tax assessment data, the total wealth of such assessees is assumed to correspond to their income assessed to income-tax. A comparison of these two sets of data gives the *capitalisation rate* for that year. Assuming, further, that this *capitalisation rate* holds good for all the income-tax assessees during the same year, the income-tax assessment data are converted into data on distribution of urban wealth. Such an attempt is made for three reference years, 1949-50, 1960-61, and 1966-67.

The present study is based on three sets of data. First, on the basis of the estimates of a country's total tangible wealth for 1949-50 and for 1960-61,[10] the reproducible tangible wealth of urban households is estimated. And an attempt is made to derive the total reproducible tangible wealth held by certain sectors for a more recent year, *viz*, 1966-67, by assuming constancy in capital output ratios during the short period between 1960-61 and 1966-67; in turn, aggregate urban household wealth is estimated therefrom. The other two sets of data are from the *Wealth* and *Income-tax Revenue Statistics*, which are welded together in order to capitalise the income levels.

As stated earlier, these official statistics are subject to a number of limitations. First, the number of income-tax paying households form an insignificant proportion of the total number of urban households (about 4.1 per cent according to 1966-67 data). And, among the income-tax assessees, wealth-tax payers form an equally small proportion (about 4.6 per cent for 1966-67). Secondly, considerable tax evasion is reported; as a result, the margin of error in the official statistics may be significant. Thirdly, the data published do not give the income actually earned during the year; they provide the income (or wealth) assessed during the year of reporting. A study made by Gopal provides the details of actual assessments of individuals and Hindu undivided families for wealth tax for all the assessment years from 1957-58 to 1966-67; these data were obtained by him directly from official records.[11] We have employed the data given in his study. Fourthly, another drawback arises from the type of assumptions inherent in the methodology employed. The assumptions are: first, each tax-paying assessee is assumed to represent a household; secondly, income assessed during a given year is related to wealth assessed during the same year; and thirdly, every person assessed to wealth tax is also assessed to income-tax.

The only estimates of tangible wealth in some of the functional sectors are those given by Mukherjee and Sastry for 1949-50 and by the Reserve Bank of India for 1960-61. The methods employed by these studies are identical: estimates of reproducible tangible wealth in individual sectors are added up to arrive at the country's total wealth in the bench-mark years. Table 1 contains details of the results arrived at in these studies. As may be observed from this Table, the wealth data are available for only two years — 1949-50 and 1960-61. On the other hand, *Wealth* and *Income-tax Revenue Statistics*, which are employed for deriving the pattern of urban wealth distribution, are available upto 1966-67. Therefore, the possibilities have been explored of presenting wealth estimates for a more recent year, *viz*, 1966-67. For this purpose, the reproducible tangible wealth, estimated as at the end of 1960-61 by the Reserve Bank, at Rs 32,164 crores, is taken as the starting point. For deriving a similar estimate as at the end of 1966-67, two steps have to be adopted: (i) the capital stock at

TABLE 1 : REPRODUCIBLE TANGIBLE WEALTH IN INDIA, 1949-50 AND 1960-61

the end of 1960-61 should be converted into 1966-67 prices by some appropriate investment cost index; and (ii) the price-adjusted net capital formation achieved during the period 1961-62 to 1966-67 should be added. For these purposes, we have relied on the CSO's estimates of capital formation, as also on their implied index of investment cost. The data contained in Table 2 are self-explanatory. The country's total reproducible tangible wealth works out to Rs 63,773 crores for 1966-67.

The CSO's estimates of investment are not given in terms of functional groups such as farm and non-farm. On the other hand, the wealth estimates given above provide the sector-wise distribution which facilitates the regrouping of data for analytical purposes. In other words, such estimates of reproducible tangible wealth have to be worked out sector-wise for 1966-67. In the absence of sector-wise data on net capital formation, an alternative method had to be resorted to.

For this purpose, the wealth estimates for the various sectors in 1960-61 have been related to the net domestic output originating in those sectors. The average capital-output ratios, thus worked out, are presented in Table 3. Interestingly, these capital-output ratios get corroborated — though inferentially — by the estimates of sector-wise *incremental* capital-output ratios worked out by the Perspective Planning Division of the Planning Commission.[12] A close examination of these two sets of data reveal the plausibility of the assumption of constancy in the average capital-output ratio during a short period, between 1960-61 and 1966-67. The Planning Commission's study presents the incremental capital-output ratios upto 1964-65, on the basis of the actuals of investment data available with them. It is true that estimates of incremental capital-output ratios, made by them, show that the ratio has risen from 2.61 for 1955-56 to 1960-61 to 3.09 for the next four years 1960-61 to 1964-65. But their projection for the subsequent decade, 1964-65 to 1974-75, or for the Fourth Plan period (1967-68 to 1973-74), show considerable decline in incremental ratios. Besides, it is widely known that, during 1965-66 and 1966-67, because of the increases in consumption expenditure, there has been considerable slackening in the average investment-income ratio which declined from 13.8 per cent in 1965-66 to 12.2 per cent in 1966-67.[13] Therefore, the assumption of constancy in the capital-output ratio during such a short period may be tenable. Besides, the changes which have in reality taken place would necessarily have been marginal; the errors which they introduce in the ultimate estimates of tangible wealth may, therefore, not be significant. The resulting estimates of sectoral distribution of wealth for 1966-67 are presented in Table 4.

True, in the services sector — comprising banking and insurance companies and government, professional and other services — it cannot be said that there is a definite relationship between capital stock and income generated. In respect of banking and insurance companies and the government sectors, concrete data are available in published documents. Our examination of these data shows that, while the capital stock estimate in respect of the banking and insurance companies (Rs 304 crores) is broadly valid, those for the government services are underestimates by about Rs 2,000 crores.[14]

TABLE 4 : DERIVED ESTIMATES OF REPRODUCIBLE CAPITAL STOCK BY INDUSTRIAL ORIGIN

	Capital-Output Ratio at End of 1966-67	Net Domestic Output at Current Prices (Rupees crores)			Reproducible Capital Stock at End of 1966-67 (Rupees crores)
		1966-67	1967-68	Average	
1 Agriculture, animal husbandry and allied activities	1.26	11843	15235	13539	17059.14

Conversion of Rs 1,365 crores at the end of 1960-61 into 1966-67 prices (after adjusting for depreciation)	—	—	1660
Total public sector wealth in improvements in land, irrigation, etc	—	—	3146

Interestingly, the total capital stock based on aggregate investment data amounted to Rs 63,773 crores, whereas by the alternative method based on capital-output ratios an estimate of Rs 61,411 crores was arrived at. There is thus a close correspondence between the above two estimates, though the methods of estimation are independent of each other.

The country's total wealth is held by three sectors: government, corporate bodies, and households including non-corporate bodies. The data presented so far do not make such a classification. The Mahalanobis Committee had estimated the share of the household sector in the country's total reproducible wealth to be 60 per cent in 1960-61 as against 71 per cent in 1949-50. During the same period, the share of the government had risen significantly — from 17 per cent to 25 per cent — while the share of the organised private business sector went up slightly — from 12 per cent to 15 per cent (see Table 5).

Our estimates, details of which are given below, show that the share of the government sector in total wealth had gone up to 36 per cent by 1966-67.[15] We have assumed, on the basis of the investment trends during 1960-61 to 1966-67, that the share of the organised private business sector has remained static at 15 per cent. This gives us a share of 49 per cent in the country's total wealth for the household sector (see Table 5).[16]

As stated at the outset, the present study is devoted to urban household wealth rather than to total household wealth. The derivation of urban household wealth is made possible by the existence of wealth estimates for individual sectors. Wealth held in the first group 'agriculture, animal husbandry and allied activities' and 80 per cent of the wealth held in the form of 'house property' in the 'rural' sector, are assumed to belong entirely to the farm sector. The rest belongs to the non-farm sector. Many of the non-farm activities — in small enterprises, trade, and commerce, and even in factory establishments — are carried on within the 'rural' areas. It is observed that about 20 per cent of the rural households are engaged on non-farm activities.[17] We have taken into account all non-farm wealth (instead of urban wealth) for the obvious reason that wealth tax laws do not discriminate between wealth held in the rural areas and wealth held in the urban areas where non-farm wealth is concerned. Income earned from such wealth is also charged to income-tax, under the Indian Income-tax Act (covering non-farm incomes). Details of farm and non-farm wealth are given in Table 6. The farm sector's wealth is further sub-divided into the government and household sectors, assuming that no corporate sector wealth exists in the farm sector.

Earlier, we have referred to the estimation of total capital stock in the government sector, for 1966-67. Similarly, from total farm-sector wealth, wealth held in the form of improvement of land and irrigation works in the public sector has been deducted in order to arrive at the wealth of the household sector within the farm sector.

TOTAL GOVERNMENT SECTOR WEALTH

The following methods are employed for these two estimates of government sector wealth. According to Mahalanobis Committee Report, total wealth in the government sector in 1960-61 was approximately Rs 8,041 crores (or 25 per cent of the country's total reproducible wealth). This is taken as the starting point. The CSO's estimates of net capital formation at current prices are given separately for the public and private sectors for 1960-61 to 1965-66. These estimates for the public sector are reproduced in Table 7. For 1966-67, the net capital formation for the public sector is estimated from the Perspective Planning Division's study (referred to earlier), wherein investment made out of Public sector Plan outlays is given. This shows a fall of 2.8 per cent in 1966-67 over 1965-66. Using the investment cost index employed earlier, public capital stock of Rs 8,041 crores in 1960-61 has been converted to 1966-67 prices; to this, the price-adjusted investments made during 1961-62 to 1966-67 are added. Thus the total reproducible tangible wealth with the government in 1966-67 works out to Rs 22,985 crores. The details are given in Table 7.

In order to adjust the farm sector wealth for the wealth held in the form of improvements in land and irrigation projects by the public sector, we have employed the same method as was done in the original Reserve Bank study which estimated country's total wealth.[18] Data on capital outlays on irrigation, navigation, multi-purpose river valley schemes and other land improvements are obtained from the Reserve Bank periodical studies on Central and state government budgets. These figures for each year are scaled down for depreciation by assuming a life of 40 years, and they are also adjusted for the increase in the investment cost by the investment cost index given earlier. The Reserve Bank's study had placed the public sector wealth in this form in 1960-61 at Rs 1,365 crores, which has also been adjusted for the price increases and for depreciation. Combining these factors, the corresponding public sector wealth for 1966-67 works out to Rs 3,146 crores, which has already been indicated in Table 6. The details of these estimates are given in Table 8.

FINAL ESTIMATES OF HOUSEHOLD WEALTH

Table 9 gives the non-farm household wealth for the three benchmark years, 1949-50, 1960-61 and 1966-67. These estimates of the non-farm household wealth are to be distributed among different size groups.

TABLE 9: DERIVATION OF URBAN HOUSEHOLD WEALTH FROM TOTAL HOUSEHOLD WEALTH (REPRODUCIBLE)

(Rupees crores)

	Total Household Wealth	Farm Household Wealth	Non-farm Household Wealth
1949-50	12131	6416	5715
1960-61	19298	9604	9694
1966-67	31249	17389	13860

The derivation of the pattern of distribution of urban wealth is essentially centred around the wealth tax and income-tax statistics. While income-tax statistics are available for well over three decades, wealth tax is of a recent origin. The tax was imposed in 1957-58, and it is observed that the tax was effectively implemented only during the next year.[19] Originally, the exemption limit was Rs 2 lakhs which continued upto 1963-64; from 1964-65 onwards, the exemption limit was reduced to Rs 1 lakh. Originally, companies were also charged to wealth tax but the provisions for companies were so liberal that very few companies were actually assessed to tax. Thus, in 1961-62, for instance, only 8 per cent of the wealth assessed or 6 per cent of the wealth tax related to companies. Subsequently, in 1966-67, the companies were exempted from wealth-tax.

The latest data available, both in respect of wealth tax and income-tax revenue statistics, are for 1966-67. As stated earlier, Gopal's study gives the details of actual assessments of households for the assessment years 1957-58 to 1966-67, as obtained from official records, and we have employed the data given in Gopal's study.

Notes

[The views expressed herein are the personal views of the authors.]

1 The Mahalanobis Committee on Distribution of Income and Levels of Living had said thus. See their Report, Part I: Distribution of Income and Wealth and Concentration of Economic Power (New Delhi: Planning Commission, February, 1964), p 10.

2 The most important ones are: (a) P D Ojha and V V Bhatt: 'Distribution of Income in the Indian Economy', *Reserve Bank of India Bulletin* (Volume XVI, No 9, September 1962, pp 1348-1363); (b) K R Ranadive: 'The "Equality" of Incomes in India', *Bulletin of the Oxford University Institute of Economics and Statistics* (Volume 27, No 2, 1965) and 'Pattern of Income Distribution in India, 1953-54 to 1959-60', the same *Bulletin* (Volume 30, No 3, August 1968). Besides, NCAER have conducted field surveys to estimate the distribution of rural and urban incomes. Two comprehensive surveys of the NCAER are: (i) 'Urban Income and Saving (1962)'; and (ii) 'All India Rural Household Survey (1964)'. Towards end-1970, a seminar on the subject of 'Income Distribution' was held in New Delhi under the auspices of the Indian Statistical Institute, New Delhi.

3 See Mahalanobis Committee Report, *op cit*, pp 19-20.

4 See Robert J Lampman: "The Share of Top Wealth-Holders in National Wealth: 1922-1956" (Princeton: Princeton University Press, 1962).

5 Three such Rounds have been reported so far: (i) Eighth (1953-54); (ii) Sixteenth (1960-61); and (iii) Seventeenth (1961-62).

6 See (i) 'All-India Rural Debt and Investment Survey: 1961-62: Tangible Wealth, Capital Expenditure and Capital Formation of Rural Households', *Reserve Bank of India Bulletin* (Volume XIX, No 6, June 1965), pp 807-866; and (ii) NCAER: 'All India Rural Household Survey' (1965); Volume III, pp 11-16. The reference year in the latter study is 1962.

7 See references to these estimates in NCAER: 'Urban Income and Saving' (1962), *op cit*, pp 58 and 67.

8 See the Report, *op cit*, p 21 and also Table 3.25 on p 83 therein.

9 *Ibid*, p 21.

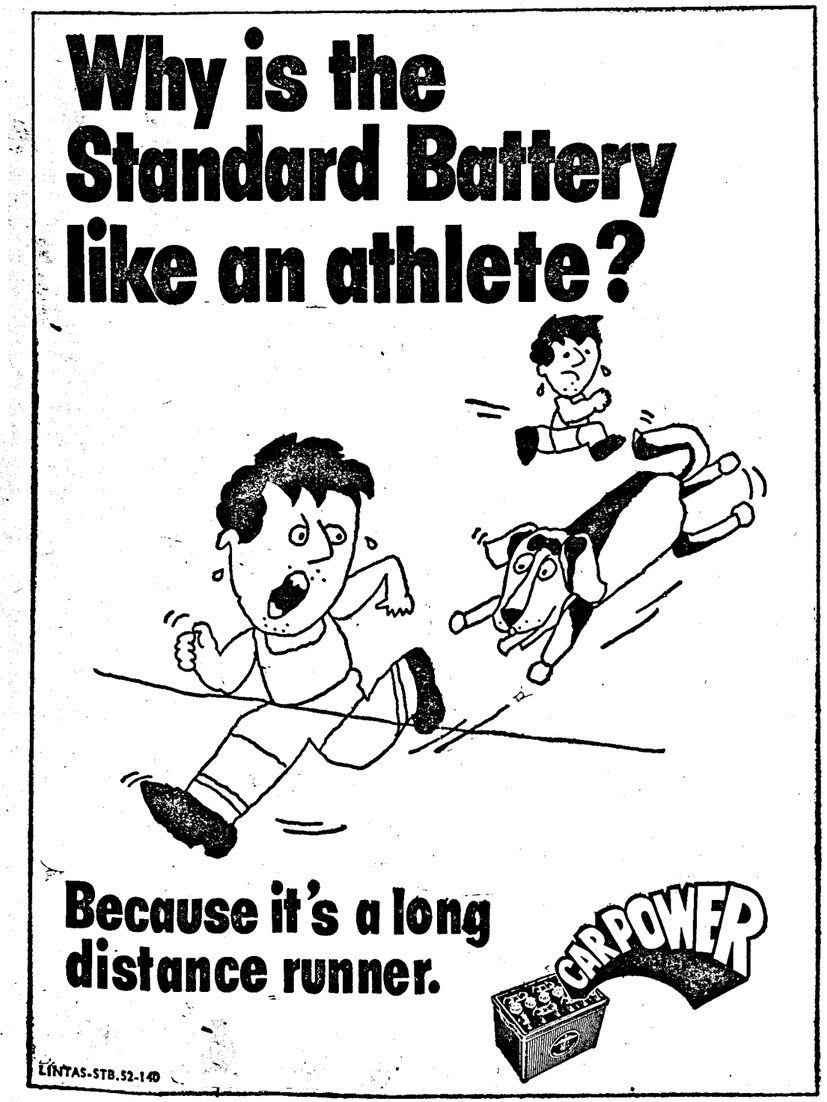
10 See 'Estimates of Tangible Wealth in India', *Reserve Bank of India Bulletin* (Volume XVII, No 1, January 1963) pp 8-19. See also M Mukherjee and N S R Sastry: 'An Estimate of the Tangible Wealth of India' in "The Measurement of National Wealth" (Income and Wealth Series VIII London: Bowes and Bowes, 1959), pp 365-387.

11 M H Gopal: "Wealth Tax in India: Its Burden and Impact", New Delhi: Economic and Scientific Research Foundation, (1970), Tables 1A and 1B on pp 101-102.

12 See "Estimates of Incremental Capital-Output Ratio for the Indian Economy: 1950-51 to 1973-74" (Mimeograph, September 1969).

13 See Annual Plans: 1967-68, p 6.

14 The methods employed for this purpose are the same as adopted in the Reserve Bank study. Briefly, their estimates for 1960-61 are taken as given and the additional capital stock created during the subsequent years are adjusted for depreciation and for price changes by an appropriate investment cost Index for construction, which is derived from CSO's estimates of capital formation, *op cit*.



15 That is Rs 22,985 crores out of Rs 63,733 crores. See Table 7.

16 Here, it may be necessary to add a caveat. There is a distinction between wealth possession and wealth ownership of households. A substantial part of government and corporate wealth possession is financed by 'borrowings' from the household sector and that part should legitimately belong to the latter sector. However, in the present study, this distinction is not taken into account and the concept employed is one of 'possession'.

17 See NCAER: All India Rural Household Survey, Volume II (New Delhi, 1965), p 10 (Table 1).

18 See *Reserve Bank of India Bulletin*, January 1963, p 11.

19 This is observed from the fact that the number of assessees went up from 12,908 to 18,452 (i e, by about 43 per cent) and wealth assessed from Rs 723 crores to Rs 1,031 crores. But, thereafter, there has been steady but moderate increases. See M H Gopal: "Wealth Tax in India: Its Burden and Impact" (New Delhi: Economic and Scientific Research Foundation, 1970), pp 1-13 and also Tables IA and IB on pp 101-102.

Planning for Growth, Redistribution and Self-Reliance

A Comment

B Nanjundaiya
K C Majumdar

IN a recent paper[1] Suresh D Tendulkar has made certain comments on the Approach Paper[2] for the Fifth Five-Year Plan. This paper is a shorter version of the author's Discussion Paper[3] presented earlier in a seminar. The purpose of this note is to point out that his criticisms are not at all valid, being based on serious conceptual and numerical mistakes. It is necessary to highlight these issues so that misgivings, if any, regarding the technical and numerical details[4] that have gone into the preparation of the Approach Paper are removed.

Tendulkar has raised a number of issues, partly economic and partly political. This note concerns itself with only the former, and that too only with those points which are connected with the internal consistency and feasibility of the rate and pattern of growth envisaged in the Technical Note and the Approach Paper. The points can be briefly stated as follows:

(i) The growth rate in gross domestic product (GDP) at factor cost for sustaining the specified levels of final demand in 1978-79 should be at least 6 per cent per annum and not 5.5 per cent as postulated in the Approach Paper.

(ii) The required growth rate of foodgrain output in 1978-79 is underestimated by one per cent, that is, it should be 5 per cent instead of 3.99 per cent as in the Approach Paper.

(iii) The imports in the Approach Paper have been underestimated in the case of raw materials and intermediate products.

All these are futile criticisms, as would be evident from the following few paragraphs.

Growth of GDP

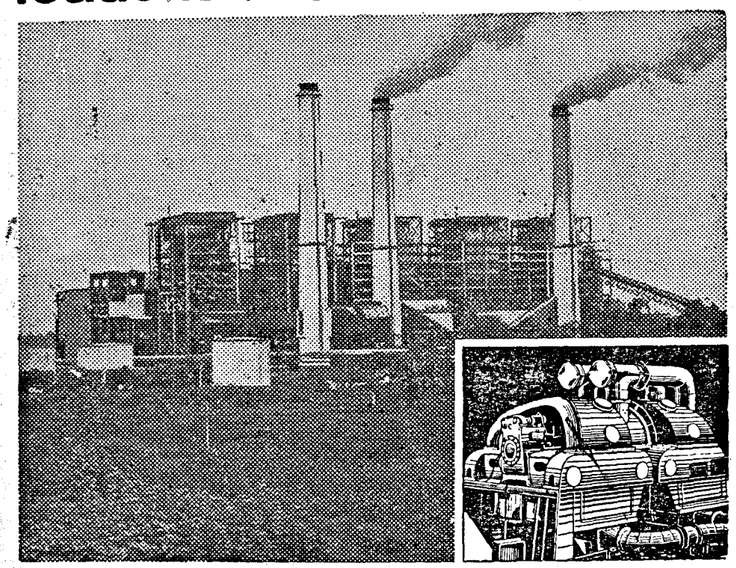
The author has claimed that, in order to satisfy the closed-loop consistency condition, the growth rate in GDP at factor cost should be at least 6 per cent per annum and not 5.5 per cent as postulated in the Approach document. He has arrived at this wrong conclusion due to some conceptual and methodological mistakes in his analysis. Firstly, he has adopted an incorrect definition of GDP; secondly, he has adopted an indirect method of estimating GDP by 'netting' out the gross estimates of disposable income, etc, and then adding a "higher" estimate of depreciation to his "net" estimates; thirdly, he has used a wrong methodology to estimate the depreciation. These points are further clarified below.

In his Discussion Paper, the author has defined GDP at factor cost as follows:

GDP = gross disposable income of the households + direct taxes
+ retained earnings of the corporate sector and the financial institutions
+ depreciation

In the above definition, depreciation has been counted twice because the gross disposable income of the household sector includes an element of depreciation. This obvious mistake was pointed out to the author in a seminar and he revised his definition later as follows:

GDP = net disposable income of the households + direct taxes
+ retained earnings of the corporate and co-operative sectors and those of the financial institutions
+ net retained surplus of the Central and state enterprises
+ depreciation



This latter definition, which appears in his paper, also suffers from certain serious omissions, namely, income accruing to the government sector other than Central and state enterprises, inter-sectoral current transfers from the government to the private sector as well as net factor income from abroad. The two annexures given in the chapter on "Investment and Savings" of the Draft Fifth Five-Year Plan[5] provide all the details of disposable income, savings, inter-sectoral current transfers, etc, of the various sectors at 1972-73 prices.

Apart from these omissions, the author, in order to derive the estimates of net disposable income of different sectors, has made his own assumptions for estimating the physical assets and the depreciation of the household sector. Similarly, he has estimated the component of direct taxes, net retained surplus of Central and state government enterprises, etc, for 1978-79 on his own assumptions from the data for the whole five-year period of the Fifth Plan given in the Approach Paper. The utility of such an indirect way of estimating the gross domestic product is highly questionable, especially when the estimates of gross disposable income, etc, are obtainable from the Technical Note and the Approach Paper and were also actually obtained and used by the author in his Discussion Paper. Perhaps the purpose was to use his own estimate of "high" depreciation so that his estimate of the GDP for 1978-79 becomes higher than the one provided in the Technical Note. In order to achieve this purpose, he has also adopted a wrong methodology to obtain the depreciation rate for 1978-79. He has derived a depreciation rate of 7 per cent at 1960-61 prices by extending the time trend of the past rates which are based on the data on depreciation and GDP at 1960-61 prices, but has applied the same to the GDP of 1978-79 at 1971-72 prices. This is absolutely incorrect. If he had based all his computations at constant prices, he would have arrived at a much lower value of depreciation than his present estimate. Thus, the omissions and commissions of the author have led him to wrong results and incorrect conclusions regarding the growth rate in GDP; had he estimated all the above components of the GDP correctly by adopting the correct definition of GDP and the proper methodology, and also used gross figures, he would not have found any closed-loop inconsistency in the macro-model for 1978-79 and at the same time would have obtained the same GDP for 1978-79 as in the Technical Note giving a growth rate of 5.5 per cent.

Growth of Foodgrain Output

The author has claimed that a growth rate of 5.5 per cent per annum in the gross domestic product, when taken together with the redistribution of consumption in favour of the bottom 30 per cent of the population, would require a 5 per cent per annum growth in foodgrain output instead of 3.99 per cent as in the Approach Paper.

One successful thermal power station leads to another...

After Santaldih, Chandrapura.

Just within 150 days, 2,40,000 KW of additional power has been made available in the eastern region of the country.
In October 1973 a 1,20,000 KW Thermal set was commissioned at Santaldih in West Bengal. In February 1974 another 1,20,000 KW set was commissioned at Chandrapura under Damodar Valley Corporation in Bihar
Santaldih set is for meeting requirements of power of metropolitan city of Calcutta and districts of Purulia, Birbhum and Murshidabad and some other areas.
The Chandrapura set is for feeding power, among others, to Calcutta city and Bokaro Steel plant.
Both the Generating sets were supplied, erected and commissioned by Bhopal factory—yet another feat of indigenous know-how; yet another achievement of Indian workers, technicians and engineers.
Both the power stations will be equipped with 5 more Thermal sets of 1,20,000 KW each—3 more at Santaldih and 2 at Chandrapura.

Thermal power stations at Parli in Maharashtra and Basin Bridge in Tamil Nadu are already rendering service with equipment supplied from Bhopal.
Thermal stations at Namrup in Assam, Ukai and Gandhi Nagar in Gujarat, Korba and Amarkantak in Madhya Pradesh and Nuclear power station at Kalpakkam in Tamil Nadu and Narora in Uttar Pradesh are also being equipped with Bhopal-built machines.

Power to the people

JAISONS-3429

He got a higher growth rate in foodgrain than that in the Approach Paper mainly due to gross errors in his consumption proportions, particularly for the top 30 per cent of the population, and also partly due to considering only three highly aggregate expenditure classes, that too differently in the base year (1973-74) and the terminal year (1978-79). These are brought out in the following paragraphs.

The author has estimated foodgrain consumption by (i) considering three expenditure classes corresponding to three fractile groups (0-30, 30-70 and 70-100 per cent) separately for 1973-74 and 1978-79, (ii) using foodgrain consumption proportions in these expenditure classes based on the data of 9th Round of NSS in one exercise, and the average of a few NSS Rounds in another exercise although the usefulness and justification for such averaging is not made clear. The foodgrain consumption proportions obtained by him from the data of 9th Round of NSS for three fractile groups in 1973-74 and 1978-79 (3D) are not presented in his paper. The same for fractile group 70-100 per cent are reproduced here in the Table from his Discussion Paper. The expenditure class limits (at 1971-72 market prices) corresponding to these fractile groups are also given in this Table. It may be seen from the Table that his foodgrain consumption proportion figures for the top 30 per cent of the population (fractile group 70-100 per cent) for 1978-79 (3D) are higher than the corresponding proportions for 1973-74, both for rural and urban areas, which can never be true. This is because (i) the foodgrain consumption proportions of the original data, whether or not converted to 1971-72 prices, gradually fall with the higher expenditure classes, so that (ii) average foodgrain consumption proportions for people lying above a higher expenditure level will be always less than that for people lying above a lower expenditure level. This follows from simple rule of weighted averaging as well as from commonsense. But, on the contrary, Tendulkar's foodgrain consumption proportion of 0.3537 (see Table) for the top 30 per cent of the rural population lying above the expenditure level of Rs 63.82 in 1978-79 (3D) is higher than that (namely 0.3311) for population lying above a lower expenditure level of Rs 56.50 in 1973-74. If, however, these are computed correctly they would be 0.2925 in 1978-79 (3D) and 0.3170 in 1973-74 (given in parenthesis in the Table) which are in perfect order. His foodgrain consumption proportions for the top 30 per cent of the population in the urban areas are also similarly wrong. It may be also mentioned that the foodgrain consumption proportions for the top 30 per cent of the population obtained by the author on the basis of the average of a few rounds of NSS data for the year 1978-79 (3D) are also similarly higher than the corresponding figures in 1973-74 and therefore incorrect.

TABLE: FOODGRAIN CONSUMPTION PROPORTIONS TO TOTAL PRIVATE CONSUMPTION, BASED ON NSS DATA OF 9TH ROUND (1955) CONVERTED TO 1971-72 MARKET PRICES FOR THE FRACTILE GROUP 70-100 PER CENT, WITH THE CORRESPONDING LOWER EXPENDITURE LIMIT

(1)	Rural		Urban	
	1973-74 (2)	1978-79 (3D) (3)	1973-74 (4)	1978-79 (3D) (5)
(1) Lower expenditure limit (Rs) of the fractile group 70-100 per cent	56.50	63.82	70.74	80.04
(2) Foodgrain consumption proportion	0.3311 (0.3170)	0.3537 (0.2925)	0.1771 (0.1765)	0.1859 (0.1660)

Note: Foodgrain consumption proportions given in parenthesis are estimated by us, while the others are those of Tendulkar provided in his Discussion Paper.

Besides the obvious mistakes in his foodgrain consumption proportions for the fractile groups 70-100 per cent for 1978-79 (3D), the foodgrain consumption proportions for the other two fractile groups furnished by the author for the two years in the Discussion Paper also appear to be incorrect.

Tendulkar has obtained a higher estimate of foodgrain consumption demand in 1978-79 mainly by using the incorrect and higher foodgrain consumption proportions for the fractile group 70-100 per cent. If one uses the correct foodgrain consumption proportions for the three fractile groups, the estimates of foodgrain consumption in 1973-74 and 1978-79 would result in a growth rate of 3.76 per cent in foodgrain demand as against 4.52 per cent obtained by the author.

The growth rate of 3.76 per cent in foodgrain demand is on the basis of estimates of demand at market prices using the actual data of 9th Round of NSS converted to 1971-72 prices and aggregated to three expenditure classes corresponding to three specific fractile groups separately for 1973-74 and 1978-79 (3D). One would get almost the same growth rate (3.8 per cent) in foodgrain demand even by using the consumption proportion data of the Technical Note aggregated to the same three expenditure classes but considering the estimates at factor cost. If, on the other hand, one uses the actual data of the 23rd Round of NSS (1968-69) on which the consumption proportions data of the Technical Note are mainly based and estimates the foodgrain demand at 1971-72 market prices in the same way as above, he would get a growth rate of 3.78 per cent in foodgrain demand. The above results show that the growth rate in foodgrain demand obtained either at market price or at factor cost would practically be the same. It also reveals that the essential adjustments made in NSS data for the Technical Note, in keeping with the official information on total availability of different commodities, has practically no effect on the growth rate in foodgrain consumption demand. It may be mentioned here that foodgrain consumption in particular is overestimated in practically all Rounds of NSS.[6,7] The slight difference between the growth rate in foodgrain demand as per the Technical Note and what would be obtained by the data of the author (when correctly used) is attributable to the use of different number of expenditure classes, viz, three classes by the author and 27 in the Technical Note.

There are also conceptual mistakes in the author's estimates. He has used two different groups of three expenditure classes, one for 1973-74 and the other for 1978-79, corresponding to three fractile groups in these years; this is not correct, because conceptually we can assume that the foodgrain consumption proportion in a fixed expenditure class would remain invariant over time for people lying in the same expenditure class with no change in price or food habits. By considering different groups of expenditure classes for 1973-74 and 1978-79 Tendulkar has, in effect, considered different foodgrain consumption proportions in 1973-74 and 1978-79 for the same expenditure class.

For example, in 1973-74 (rural) the foodgrain consumption proportion for people above the lower expenditure limit Rs 63.82 is 0.3311, whereas in 1978-79 (3D) for people above this same expenditure limit the foodgrain consumption proportion is 0.3537 according to his calculation. He should have used the same three expenditure classes for 1978-79 (3D) as in 1973-74 along with the corresponding foodgrain consumption proportions in these classes.

In such a case he would have got (using his foodgrain consumption proportions of 9th Round for 1973-74) a growth rate of only 3.7 per cent in foodgrain demand.

It is thus very clear that Tendulkar's conclusion that a higher rate of growth in foodgrain output is necessary to achieve redistribution of consumption in favour of the bottom 30 per cent of the population is absolutely baseless.

Estimate of Imports

The author has attempted to show that total imports of goods as well as the import requirement of intermediate inputs, particularly in some machinery sectors, have been underestimated in the Approach Paper, and he has attributed the underestimation to the use of the import co-efficients matrix. He has also stated that the extent of import substitution envisaged in some key sectors is unrealistic. He has, however, based his conclusion on such part of past information as happens to be convenient for his purpose. An appropriate analysis of past data on imports would not support his findings, as would become clear from the discussion below.

The author has claimed that the estimates of imports with a growth rate of only 3.5 per cent, would not be sufficient for sustaining the growth rate of 5.5 per cent in GDP and 7.5 per cent in fixed investment. This is not justified. Estimates of imports in the Approach Paper taken as percentages of GDP are quite in conformity with the past trend. For example, imports as a percentage of gross domestic product at factor cost has been showing a downward trend from 7.84 per cent in 1960-61 to 4.50 in 1970-71, whereas imports of goods estimated for 1973-74 and 1978-79 (as in the Technical Note) works out to 4.51 per cent and 4.12 per cent, respectively, of the GDP at factor cost, both in terms of 1971-72 prices. Also the share of imported raw materials and intermediate manufactures has risen from 43.2 per cent in 1960-61 to 53.7 per cent in 1970-71 and to 58.7 per cent in 1971-72, whereas this share has been further estimated to increase to 63.6 per cent in 1973-74 and to 72.7 per cent in 1978-79 which are consistent with the additional requirements of imported inputs needed for accelerated growth in domestic production of various products, including capital goods.

The author has also stated that the imported requirements of intermediate inputs for certain important machinery industries had been substantially underestimated. This criticism also has no basis because of the erroneous analysis of the author. The machinery items which had been taken by the author to correspond to our input-output sector does not cover all the products covered by our sector (refer Table IV.10, page 155 of the author's Discussion Paper). For instance, he has taken 'Agricultural Tractors' to represent the whole Input-Output sector of "Agricultural Implements" which actually covers many items of agricultural implements in the organised as well as unorganised sectors of production. Similarly, he has taken two items (air-conditioners and refrigerators, domestic and industrial) to represent the whole sector of "Office and domestic equipment". There is not only omission of so many other items like typewriters, sewing machines, calculators, etc, but also wrong inclusion of industrial refrigerating and air-conditioning plants in this sector. Again the input-output sector "Motor Cycles", etc, includes bicycles also, whereas the author has taken into account only motor cycles, scooters, etc, excluding bicycles. Similarly the sector "Rail equipment" includes all types of rail equipment like locomotives, passenger coaches, etc, while the author has taken "Railway wagons" alone to represent this sector. The import co-efficients in the input-output table represent the imported inputs of all the products of a particular sector and if this is compared with the import content of just one or a few items of that sector it would be definitely a defective and misleading analysis of the import structure, and it is no wonder that the author derives wrong conclusions. It may be mentioned that over the past one decade, the indigenous content of almost all the machinery and engineering industries has been steadily increasing and there has been a corresponding decrease in the import content of these industries. This trend is also expected to continue in future. There is, therefore, no justification for assuming that the import content of any particular industry should continue at the same level as in the past years.

The author has also commented that the degree of import substitution envisaged in certain key sectors has been too drastic. This criticism is not valid because the import substitution envisaged has been conditioned and analysed in terms of the feasibility of attaining the necessary domestic production levels in these sectors.

Tender Extension Notice IDA/TNEB/1 and IDA/TNEB/2

The due dates and time for submission of tenders against the above global Tenders, relating to the Third transmission and distribution project financed by IDA are hereby extended as shown below:

Tender No.	Name of Tender	Original Due Date	Extended Due Date
1) IDA/TNEB/1	Supply of 75 MVA & 50 MVA Auto Transformers with on load tap change gears.	**27.4.74** 12 Noon IST	**27.5.74** 12 Noon IST
2) IDA/TNEB/2	Supply of E.H.T. switchgear, current Transformers and Potential Transformers.	29.4.74 12 Noon IST	**29.5.74** 12 Noon IST

The tenders will be opened at 3.30 PM I.S.T. on the respective extended dates.

Reply

Suresh D Tendulkar

I AM grateful to Nanjundaiya and Majumdar (N-M for short) for their attempt to salvage three very specific numerical results of the Technical Note from my criticisms in [1] and [2]. They intend to show that my "criticisms are not at all valid, being based on serious conceptual and numerical mistakes".

I consider their attempt unconvincing for the following reasons. First, they do not even attempt to refute certain most basic criticisms besides many other substantive and classificatory points I made in [1] and [2]. They confine themselves, in their own words, only to "those points connected with the internal consistency and feasibility of the rate and pattern of growth". Within this very narrow spectrum, they do not try to refute substantive methodological points I raised but only attempt to contest three very specific numerical results of my paper. Even here, instead of meeting my contentions regarding the quantitative magnitudes with empirical counter-evidence, they unfortunately adopt a very counter-productive method of finding mostly non-existent faults with my computations and draw unwarranted and unsubstantiated conclusions on this tenuous basis. As a consequence, their observations have produced an unintended result, *viz*, instead of removing "the misgivings regarding the technical and numerical details that have gone into the preparation of the Approach Paper", they succeed in creating more misgivings that are bound to persist till the full details of the Technical Note are published. Let me then substantiate these points.

It is essential to emphasise to start with that N-M have not even attempted to refute my major basic criticisms (besides many other substantive points) regarding the appropriateness of the institutional specification of the model ([2], Part I, Section III, pp 29-33), the serious limitations of the exercises even within the adopted framework ([2], Part I, Section IV, pp 36-38) as well as the causes of and unwarranted conclusions drawn from the alleged "invariance phenomenon" ([2], Part II, Section V, pp 70-74; also see [3]) let alone the formidable problems connected with the policy-frame ([2], Part II, Section VI; also [1], Section VII) all of which appear, among other things, to have forced the Planning Commission to retreat from the levels of social objectives set out in the Approach document and make them more vague and wishy-washy in the Draft Fifth Plan [4].

N-M have taken up for examination my three numerical conclusions relating to (i) closed-loop inconsistency ([2], Part I, Section III, pp 33-34). (ii) demand for foodgrains ([2], Part II, Section V, pp 63-65) and (iii) estimation of import-requirements ([2], Part II, Section V, pp 65-70). Let us scrutinise their points in that order. I also wish to raise a few further substantive issues in connection with the Technical Note in the Process.

Closed-Loop Inconsistency

N-M claim that I have arrived at the closed-loop inconsistency in the Planning Commission's exercise "due to some conceptual and methodological mistakes" in my analysis. Let us examine their arguments.

First, they point out double-counting of depreciation in [1]. This was duly acknowledged and corrected in the published version [2] without changing my conclusions. Hence, it is not necessary to consider this point.

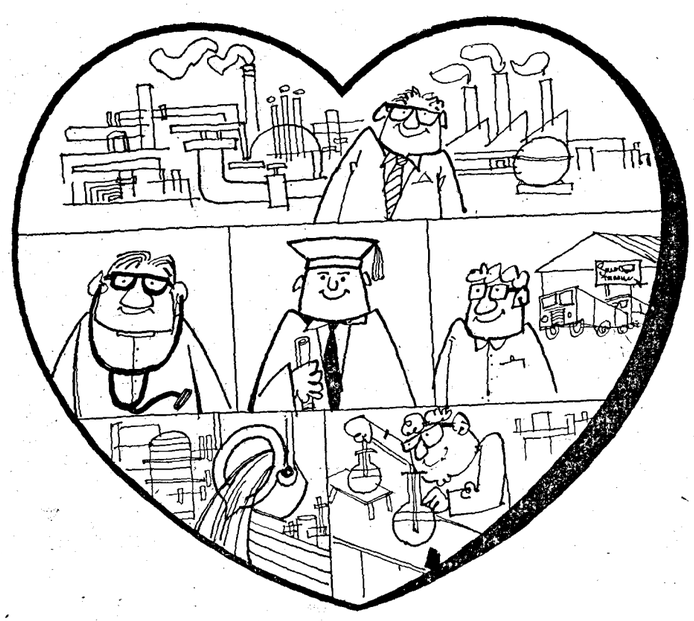
Second, in their view, I have adopted incorrect definition of GDP by omitting (a) income accruing to the government sector other than state and Central enterprises (b) inter-sectoral current transfers as well as (c) net factor income from abroad. Let me start by observing that (c) forms part GNP and not GDP as the authors claim. This is a conceptual error on their part. Next, I did not omit (b) as I stated very clearly in [1] (p 162): "Instead of making assumptions regarding the detailed adjustments [including items (b) and (c) above as is clear from relations (5) and (6) on pp 161-62 of (3)] to derive the private income from NDP at factor cost, we assume that the private income ... equals NDP at factor cost", because "in the Indian context, the private income and NDP at factor cost have been fairly close to each other over the years 1960-61 to 1968-69" (p 162 of [1]). If N-M feel that this relationship has changed in recent years, it is for them to establish it but they certainly cannot catch me for omission. I omitted component (a) from my calculations because I thought it to be quantitatively not very significant but its inclusion can be seen to strengthen my conclusion of inconsistency. Thus, the omissions N-M point out from the definition of GDP adopted by me are either not correct, or, in one case, strengthen my conclusions.

Thirdly, N-M claim (a) that I have made (my) own assumptions for estimating the physical assets and the depreciation of the household sector; and (b) that I have "estimated the component of direct taxes, net retained surplus of the Central and State Government enterprises, etc, for 1978-79 on [my] own assumptions from the data for the whole five-year period." As regards (a), I cannot claim originality for the assumptions as they were based on the data published by the Central Statistical Organisation (CSO) and the source was clearly cited [2] (p 38). As regards (b), I had no alternative except "making certain plausible assumptions regarding the missing information" when "neither the Technical Note nor the Approach document" furnished "complete information for checking the closed-loop consistency" ([2], Part I, p 33). Wherever I had to make these assumptions, I have done so on the basis of certain past trends and argued out their plausibility as well as the fact that they were being favourable to the Planning Commission (see [1], pp 165-66). Let me emphasise also that they are *identical* in the discussion paper [1] and in [2]. N-M are certainly not right in maintaining that "the estimates of gross disposable income, etc, are obtainable from the Technical Note and the Approach Paper and were actually obtained and used by the author in his Discussion Paper". If they find my assumptions implausible or unreasonable, it is their responsibility to point out why they think so and produce corroborative empirical evidence. They have not done this and hence the points they make in this context cannot be treated as established.

Fourthly, N-M claim that I have "adopted a wrong methodology to obtain the depreciation rate for 1978-79 ... by extending the time-trend of the past rates which are based on the data on depreciation and GDP at 1960-61 prices". Let us note to start with that the direction of the trend would be invariant to the price base be it 1960-61 or 1971-72. Moreover, from the CSO White Papers on National Income it is easy to verify that depreciation as a proportion of GDP (both at 1971-72 prices) rose from 4.54 per cent in 1960-61 to 6.04 per cent in 1971-72. Considering this trend and consi-

TIIC, the Premier State Level Development Bank in the Country Celebrates Its Silver Jubilee

Grants term loans assistance upto Rs. 30 lakhs to industries engaged in the manufacture, processing, preserving, etc, as also to shipping, transport, hotel industries, etc. Amount in excess thereof would be arranged in collaboration with state institutions like SIPCOT and TIDCO and/or with all-India institutions like IFCI, ICICI, etc. Also assistance by way of issue of guarantees for deferred payments, underwriting of shares, etc.



Has special schemes of assistance to industries in backward areas, small-scale industries, rural medical practitioners, technocrats, transport operators, etc. Also a liberalised scheme for small-scale industries under which assistance upto 90% of the fixed assets is granted. Foreign exchange loans under IDA Line of Credit up to Rs. 30 lakhs are also available. Total assistance sanctioned upto March 31, 1974 — about Rs. 88 crores.

Round 18: N Bhattacharya and G S Chatterjee.
Round 22: Quick tabulation.

dering the postulated acceleration in the rate of growth of gross investment, 7 per cent rate of depreciation adopted in [2] for 1978-79 would still appear to be on the conservative side and cannot certainly be regarded as being on the "high" side as N-M claim. It is, therefore, difficult to understand the unsubstantiated assertion of N-M that *if I had based all my compilation at constant prices (?) I would have arrived at a much lower rate of depreciation. In fact, since the rate of depreciation at 1971-72 prices has been observed to 6.04 per cent in 1971-72, the rates of depreciation adopted in the Draft Plan of 5.49 per cent for 1973-74 and 5.68 per cent for 1978-79 at 1972-73 prices (derived from [4], Volume I, pp 51-52) appear definitely on the lower side not only compared to the trend but even on the basis of the latest available estimate for 1971-72. Moreover, even granting a weak data base of the depreciation estimates put out by the CSO, when all other calculations in the Approach document (as also the Draft Fifth Plan), are made using the CSO estimates, the rationale for rejecting only the depreciation estimates of CSO is not at all clear.*

It can thus be seen from the foregoing discussion that the four points raised by N-M do not *in any way* invalidate my calculations of closed-loop inconsistency presented in the Appendix of [2] (Part I, p 38).

I may take this opportunity to clarify briefly the rationale behind the calculations under consideration. The closed-loop consistency calculations were designed to answer the following question: given (a) the savings assumptions made in the Approach document and (b) the other required information (such as the rate of depreciation, the rate of growth of direct taxes) consistent with the observed trends in recent times, is the income-generation resulting from the gross output-mix (that is derived from the prespecified levels of sectoral final demand through the open Input-Output framework) sufficient to sustain the final demand vector? If the income generated turns out to be not sufficient, it means that the prespecified final demand vector is unattainable on *a priori* grounds and so are the social objectives incorporated in the various elements of final demand. As I emphasised in [2] (p 33), the consistency condition is not conceived in purely arithmetical terms but in terms of certain observed past trends. And it is in this sense that my observations in the last but one paragraph regarding the plausibility of the rate of depreciation have to be considered. N-M appear to be incorrectly interpreting the closed-loop consistency in purely arithmetical terms. I may simply conclude by repeating what I stated in [2], (p 36). "... in the context of this [numerical closed-loop] inconsistency, we have highlighted the trade-offs between the accepted social objectives, though more substantively, the same trade-offs would arise if the domestic savings assumptions postulated in the Approach document prove overambitious and difficulties in their transformation into an appropriate composition of investment prove insurmountable".

ESTIMATION OF FOODGRAINS DEMAND

Here, N-M attempt to dispute my claim that the Planning Commission has underestimated the rate of growth of foodgrains demand under the postulated redistribution. According to them I have "got a higher growth rate in foodgrain than that in the Approach Paper mainly due to gross errors in [my] consumption proportions, particularly for the top 30 per cent of the population, and also partly due to considering only three highly aggregate expenditure classes, that too differently in the base year (1973-74) and the terminal year (1978-79)".

While admitting myself to be capable of committing gross errors in general, I wish to submit humbly to N-M that in this particular context it is they who have committed gross errors partly due to their lack of careful reading of Appendix-3 (and p 66) of [1] and partly due to their apparent neglect of the effect of redistribution on consumption proportions which seems to have escaped their attention in their attempt to find faults with my computations.

First, N-M are incorrect in presuming that I have estimated foodgrains consumption by considering three highly aggregated expenditure classes corresponding to three fractile groups. If they had read Appendix-3 of [1] carefully, they would have realised that I

We are silvern going on golden...

In our national endeavours, beginning independence, to build a better society we have contributed our mite to a highly successful present.

Now a brief on our growth...

The idea crystallises...A score and five years ago what crystallised as a small sugar factory—a daily crushing capacity of 600 tonnes—at Venkatarayapuram in Tanuku, Andhra Pradesh, today forms a corporate complex. Manufacturing such diverse products as sugar, industrial alcohol and organic chemicals, fertilisers, and inorganic chemicals. Soon, in pharmaceuticals and plastics. The vision of the men with mission...now a reality. Spreading prosperity around.

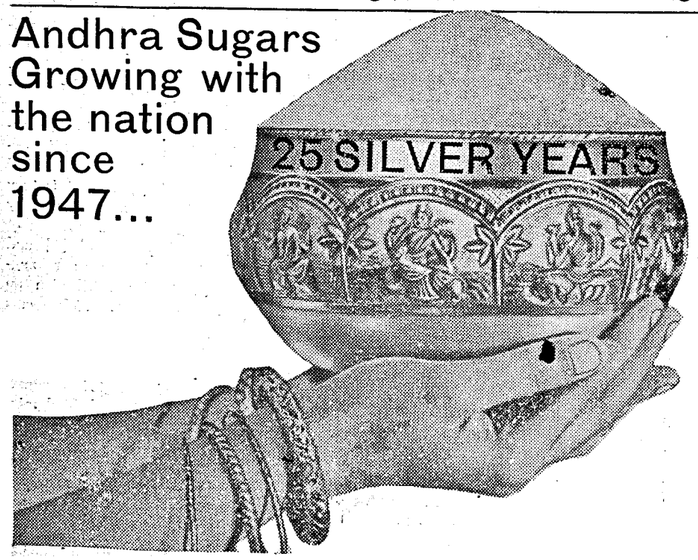
Pioneering spirit...

What has been achieved hitherto is only a part story. Carrying on with the traditional spirit, the present managerial force at the helm is planning ahead in the allied and a wider field. To contribute towards national growth.

Social responsibility...

Equally conscious of social responsibility, this complex has launched upon many social benefit schemes. Such as housing colony with recreation facilities, educational and medical benefits for the working force, etc.

Manufacturing facilities...



Andhra Sugars Corporate Group have manufacturing facilities at Tanuku and at Kovvur. The group's products include sugar, industrial alcohol, denatured spirit, acetic acid, ethyl acetate, acetic anhydride, superphosphate, sulphuric acid, chlorine, hydrochloric acid, caustic soda—lye, solid and flakes, chlorosulphonic acid.

Members of the corporate group:

- The Andhra Sugars Ltd.
- Sree Akkamamba Textiles Ltd.
- The Andhra Farm Chemicals Corporation Ltd.
- Andhra Foundry & Machine Co., Ltd.
- Hindustan Allied Chemicals Ltd.
- Sathyanarayana Spinning Mills Ltd.

Andhra Sugars ... Growing with the nation. Glowing with prosperity

Andhra Sugars Growing with the nation since 1947...

THE ANDHRA SUGARS LIMITED
Venkatarayapuram
Tanuku,

TABLE 2: PROPORTION OF TOTAL EXPENDITURE ON FOODGRAINS AT MARKET PRICES BASED ON THE 9TH ROUND OF NSS

	Bottom 30 Per Cent	Middle 40 Per Cent	Top 30 Per Cent	Total
(*a*) *Rural Population*				
(1) 1973-74	0.5688	0.4962	0.3311	0.4215
(2) 1978-79 (3C) without redistribution	0.5567	0.4679	0.3024	0.3953
(3) 1978-79 (3D) with redistribution	0.5073	0.4521	0.3537	0.4209
(*b*) *Urban Population*				
(1) 1973-74	0.4749	0.3333	0.1771	0.2651
(2) 1978-79 without redistribution	0.4464	0.3068	0.1617	0.2444
(3) 1978-79 (3D) with redistribution	0.3852	0.2868	0.1858	0.2568

Source: (2) Table VII 5, p 152, panel (a).

based my alternative exercises on the data for 12 fractile groups (the bottom and the top decile each divided into two 5 per cent groups and the remaining eight groups according to deciles) for the rural and the urban population separately.

There appears to be some misunderstanding regarding the method of projection used by me. Let me comment on the three alternatives available in this context and my choice in particular. I would illustrate with reference to the 9th Round of NSS for which N-M have supplied alternative estimates for the top 30 per cent of the population.

Notation:

Let y_i and f_i denote per capita total expenditure and per capita expenditure spent on cereals and cereal substitutes respectively for the ith subgroup of the population. This subgroup may be per capita expenditure class [methods (A) and (B) below] or the fractile group [method (C) below].

Definition:

(1) *Basic Engel Curve* used for projection is defined as a smooth curve passing through observed (y_i, f_i). This is derived for the rural and the urban population separately in all the methods.

(2) *Weighting Scheme*: the proportion of total expenditure spent on cereals and cereal substitutes for the ith subgroup is weighted by the appropriate share of the ith subgroup in total consumer expenditure and then aggregated to arrive at the proportions for the three broad groups of the population namely, bottom 30 per cent, middle 40 per cent and top 30 per cent. This weighting scheme is common to all methods.

(3) Case (3C) denotes the *status quo* in expenditure distribution whereas case (3D) denotes the redistribution postulated in the preferred variant of the Approach document.

Method (A): Adjust the observed (y_i, f_i) for the 9th Round of NSS (May-November 1955) to 1971-72 prices (the price base used in the Approach document) and then derive the basic Engel Curve in terms of 1971-72 prices. Use this basic Engel Curve along with the average per capita total expenditure levels (at 1971-72 prices) of different subgroups of the population for 1973-74 and 1978-79 [cases (3C) and (3D) separately] to derive the per capita expenditure (and hence the proportion of total expenditure spent) on cereals and cereal substitutes for 1973-74 and 1978-79 [cases (3C) and (3D)].

Method (*B*): Use the observed data for the 9th Round of NSS (May-November 1955) on (y_i, f_i) to derive the basic Engel Curve at 1955 prices. Convert to 1955 prices, the data on the average total expenditure per capita for each subgroup in the population for 1973-74 and 1978-79 [cases (3C) and (3D)]. Use the basic Engel Curve to derive the growth rate of demand over the five year period in the two cases separately. Apply this growth rate to the base year (1973-74) figure on the demand for cereals and cereal substitutes (at 1971-72 prices) to derive the projected demand for 1978-79 [cases (3C) and (3D)] at 1971-72 prices.

Method (*C*): Assume that the fractile-group-specific proportion of total expenditure spent on cereals and cereal substitutes observed for the 9th Round of NSS (May-November 1955) is applicable to the fractile-group-specific per capita total expenditure levels in 1973-74 (with *status quo* size distribution) to arrive at the basic Engel Curve for 1973-74 (at 1971-72 prices). Use this curve along with the projected fractile-specific levels of per capita total expenditure for 1978-79 [case (3C) and (3D)] to project the per capita expenditure (and thence the proportion of total expenditure spent) on cereals and cereal substitutes for each fractile group.

I may note that method (A) has been used by N-M, method (B) by Manne and Rudra [6] whereas I have adopted method (C). Let me hasten to add that I am fully aware of the unconventional nature of the assumption made in method (C) on the basis of the received theory of consumer behaviour. Its justification lies in the expediency permitted by certain observed regularities as would be clear shortly.

When we observed the fractile group-specific proportion of total expenditure spent on cereals and cereal substitues for as far apart rounds in time as the 9th (May-November 1955) and the 22nd (1967-68), we find the following regularities: (1) the overall proportion of total expenditure spent on cereals and cereal substitutes has been increasing over time; (2) fractile-specific proportions appear to be either increasing or remain stable over time for each fractile group of the rural population; (3) in the urban population for all the fractile groups except the top and the bottom decile (for which proportions seem to be declining) the proportions appear to have remained fairly stable; (4) in times of rising prices of foodgrains (which have been more common) proportions seem to be increasing especially for the bottom 30 per cent of the population. These regularities have been observed on the basis of fractile-group-specific proportions for all the available rounds. We have presented in Table 1 the results for four selected rounds to illustrate the regularities. It is on the basis of these empirically observed regularities that method (C) was adopted. Also, the rationale for averaging the fractile-group-specific proportions over various rounds in the variant (R) in [2] is based on the observed regularity (4) mentioned above, *viz*, it indicates a representative experience of consumer behaviour indicating their average adjustment to different sets of relative prices prevailing over the different rounds of NSS.

Notice that method (A) requires two price adjustments (one for y_i and the other for f_i), method (B) requires only one price adjustment (for y_i) whereas method (C) does not require any explicit price adjustment. It is well known that over time, changes in *relative* prices take place that affect not

only the real total expenditure per capita but also the consumer demand for individual commodity groups. Moreover, the *extent* of change in relative prices is also known to differ at different *levels* of total expenditure per capita. As such, price adjustments present many difficult problems besides being based on a shaky information base. In addition, this also brings out the fact that the mechanical conversion of the original data at 1968-69 prices to 1971-72 prices would completely neglect the adjustment of the consumers to changes in relative prices between the two periods and would not necessarily represent the behaviour of the consumers at relative prices prevailing in 1971-72. The justification for method (C) is derived from the fact that being based on observed regularities, it possesses the advantage of not requiring explicit price adjustment on the basis of shaky data.

Specifically with reference to the point raised by N-M, by adopting the fractile-group-specific proportions of the 9th Round of NSS, we are certainly erring on the conservative side in estimating the demand for cereals and cereal substitutes especially for the rural population as is very clear from comparing the proportions for the 9th and the 22nd Rounds from Table 1. This error on the conservative side is all the more so for the top 30 per cent of the population for which N-M are getting a figure substantially lower than mine for 1978-79(3D) in their table. Notice that for the top 30 per cent of the urban population, their proportion for 1973-74 is almost identical to mine [see their Table column (4), lines 3 and 4]. For the rural population also the proportion that they have arrived at for 1973-74 [see their Table, column (2), lines 3 and 4] is not very different from mine. Their price adjustments [following method (A) listed above] may have yielded a lower estimate of the proportion spent on cereals and cereal substitutes.

In the context of foodgrains demand, N-M note that my foodgrains consumption proportion figures for the top 30 per cent of the population for 1978-79 (3D) are higher than the corresponding proportions for 1973-74, both for the rural and urban areas: This, the authors assert, "can never be true" and this is my so-called "gross error". The assertion of N-M that the proportion spent on foodgrains cannot go down when the overall average per capita expenditure level increases from 1973-74 to 1978-79 is correct only if the size

TABLE 3: EFFECT OF POSTULATED REDISTRIBUTION ON THE PER CAPITA CONSUMER EXPENDITURE OF THE TOP 30 PER CENT OF THE POPULATION

Fractile Group (Per Cent)	Rural: Monthly Total Expenditure Per Capita (Rs) 1973-74	Rural: Monthly Total Expenditure Per Capita (Rs) 1978-79 (case 3D)	Rural: Index for 1978-79 (3D) with 1973-74 =100	Urban: Monthly Total Expenditure Per Capita (Rs) 1973-74	Urban: Monthly Total Expenditure Per Capita (Rs) 1978-79 (case 3D)	Urban: Index for 1978-79 (3D) with 1973-74 =100
(1)	(2)	(3)	(4)	(5)	(6)	(7)
70-80	61.59	67.23	109.16	78.16	85.54	109.44
80-90	75.73	76.17	100.58	99.14	100.33	101.20
90-95	94.80	87.26	92.01	128.26	119.24	92.97
95-100	136.58	108.20	79.22	196.30	157.49	80.23
0-100	49.27	56.59	114.86	62.08	70.06	112.85

Note: Columns (2), (3), (5) and (6) at 1971-72 market prices.

Source: [2], Tables 8 and 9 which were worked out from Tables 7.1 (Rural) and 7.2 (Urban) provided in the Technical Note (April 1973).

distribution of monthly expenditure per capita remains unchanged in 1973-74 as well as in 1978-79. N-M should have applied this rule to proportions in 1973-74 and 1978-79 (case 3C) with no change in the expenditure inequality. The proportions are reproduced for the benefit of readers in Table 2. In a correct comparison, therefore, the proportion spent on foodgrains can, indeed, be seen to go down from 0.3311 (1973-74) to 0.3024 [1978-79 (3C)] for the top 30 per cent of the rural population and from 0.1771 (1973-74) to 0.1617 [1978-79 (3C)] for the same subgroup of the urban population. There is no mistake in my computations when correct proportions are compared. What seems to have escaped the notice of N-M is the effect of drastic redistribution postulated by the Planning Commission on the consumption proportions of the top 30 per cent of the population both in the rural and the urban areas. I may draw the attention of N-M to Table 8 (p 71) and Table 9 (p 72) in [2] (relevant parts of which are also reproduced in Table 3 here for the benefit of readers). From Table 3, they would clearly realise that the drastic redistribution postulated by the Planning Commission seeks to reduce (by 1978-79) in absolute terms (in relation to their postulated base year level of 1973-74) the monthly expenditure per capita of the top 5 per cent of the population by as much as 20 per cent, and that of the next lower 5 per cent of the population by 8 per cent. The total expenditure per capita of the 9th decile is frozen to its base year level whereas that of 8th decile is postulated to increase by about 9 per cent when the overall average expenditure per capita is postulated to increase by 15 per cent for the rural population and by 13 per cent for the urban population over the five-year period. With this drastic redistribution, what else is one to expect except, the proportion spent on foodgrains to go up for the top 30 per cent of the population under case 3D which N-M wrongly assert "can never be true". Since my base year proportions are not substantially different from theirs, and the agreement of their proportions for 1978-79 (3D) with what I have derived for 1978-79 (case 3C) is very striking, it is thus apparent that if N-M had taken into account the effect of drastic redistribution on consumption, they should have arrived at roughly the same proportion as I have obtained. Hence, the "obvious mistake" on my part that N-M claim is simply not there.

Since N-M make a very weak and unsubstantiated assertion that "the foodgrains consumption proportions for the other two fractile groups furnished by the author ... also *appear* to be incorrect", it may not be unreasonable to assume that their calculations did not yield substantially different results from my own.

N-M argue on the basis of my non-existent "obvious mistake", that the growth rate of foodgrains demand obtained by me is "higher" and "therefore wrong". In this connection, N-M make two further unsubstantiated statements that call for comment: (a) "If ... one uses the actual data of 23rd Round of NSS (1968-69) ... and estimates the foodgrains demand at 1971-72 prices, ... he would get a growth rate 3.78 per cent in foodgrain demand." (b) Since this growth rate (mentioned in (a) is the same as the one that would be obtained "even by using the consumption proportions data of the Technical Note ... but considering the estimates at factor cost", they maintain that "... the essential adjustments made in the Technical Note in keeping with the official information

TABLE 4: PATTERN OF IMPORTS DERIVED FROM THE TECHNICAL NOTE

Description of Imports	1973-74 (Rs Crores)	Per Cent of Total	1978-79 (Rs Crores)	Per Cent of Total
(A) Use Pattern of Imports				
(1) Intermediate inputs	1237.50	48.84	1687.17	56.87
(2) Capital formation	352.33	21.81	477.58	16.10
(3) Private and public consumption	743.87	29.35	801.97	27.03
Total	2533.70	100.00	2966.72	100.00
(B) Commodity Composition				
(1) Raw materials and intermeoiate manufactures	1321.31	52.15	1765.33	59.50
(2) Capital goods	584.33	23.06	521.66	17.59
(3) Others	628.06	24.79	679.73	22.91
Total	2533.70	100.00	2966.72	100.00

Sources: Panel (A): Technical Note (April 1973): Annexures III-2 and IV-2 (last line).
Panel (B): Technical Note (April 1973): Annexure III-2 and IV-2 (last line).

Explanatory notes to panel (B): Sectors under Input-Output Classification for the broad groups are as follows.

(1) Raw Materials and Intermediate Manufacturers : 2 to 5, 7, 9, 10, 12, 15 to 35.
(2) Capital Goods: 36 to 57 except 49.
(3) Others: All others excluding those under groups 1 and 2 (see [3], pp 78-79 for the details of the Input-Output classification).

on total availabilities of different commodities has practically no effect on the growth rate of foodgrains demand".

As regards (a), if N-M have neglected the effect of drastic redistribution as they appear to have done in examining my computations, the rate of growth of foodgrains demand they have derived compares with what I have got without redistribution. My own experience on the basis of the data for the 9th and the 19th Rounds of NSS and preliminary investigations with the 22nd Round suggests that the rate of growth of foodgrains demand with the postulated redistribution cannot be lower than 4.5 per cent per annum. The results of other studies (summarised in Table 2 in [2] p 64) also indicate (when allowance is made for difference; in time horizon as well as the targeted reduction in the concentration ratio) possible underestimation in the growth rate of foodgrains demand adopted by the Planning Commission. We may also note that the resulting growth rate of foodgrains output remains unchanged at 4.00 per cent in the Draft Plan as well as in the original Approach document even though the rate of growth of overall average per capita expenditure was changed from 2.8 per cent per annum in the Approach document to 3.1 per cent per annum in the Draft Fifth Plan (Volume I, derived from p 7). Even more odd is the fact that this growth rate of gross output of 4.00 per cent (Volume I, p 34) does not square with the 4.20 per cent mentioned in Volume II, (p 7). All these considerations not only suggest mutual contradictions in Planning Commission's own exercises but also indicate that the growth rate of foodgrains demand amounting to 3.78 per cent claimed by N-M certainly appears to be on the lower side with the postulated drastic redistribution. I may, therefore, request N-M to come out with the primary data for the 23rd Round of NSS at least on the estimated percentage distribution of persons in various expenditure groups, the average expenditure per capita in each group and the corresponding proportion of total expenditure spent on foodgrains so that sources of differences can be settled on objective grounds.

Coming to (b), this is the first explicit admission that the consumption proportions given in the Technical Note (April 1973) were adjusted for "keeping with the official information on total availabilities of different commodities". As noted in [1], these proportions were also adjusted for factor costs and for conversion from 1968-69 to 1971-72 prices. It is well known that the data base for making all these adjustments even at the aggregate level is weak and unreliable. The Planning Commission has done these adjustments at such detailed levels as for 27 sub-groups of the rural population and an equal number of sub-groups of the urban population. Unless the Planning Commission has access to as yet unknown sources of data and unless they come out with full details, *prima facie*, it is quite clear that all these detailed adjustments would introduce errors of unknown magnitudes and would violate the basic principle of minimum adjustment to the observed data and that too only on the basis of reliable information. As it is, the originally observed NSS data are subject to some sampling errors. The process of detailed adjustments with unknown errors has further widened the gap between the observed reality and the consumption proportions given in the Technical Note. As a result, the growth rate of foodgrains demand emerging from these proportions would be right, if at all, only by a miraculous accident. At a more fundamental level, the justification for accepting the size distribution of expenditure from the NSS but disregarding its absolute overall level of per capita expenditure as well as the resulting commodity composiiton is not very clear. And even assuming that some (unexplained) rationale does exist, it is certainly preferable to adopt the Manne-Rudra method of projection (outlined above) that minimises tampering with the observed NSS data on the basis of a shaky informations base.

Finally, N-M appear to be making the point (though I must confess it is not very clear to me) that the proportion spent on foodgrains for the top 30 per cent of the population ought to remain invariant between 1973-74 and 1978-79. If I am right in this interpretation, the point is clearly not valid because as compared to 1973-74, both the overall average total expenditure per capita as well as the level of inequality change in 1978-79 in case 3D.

It is thus clear from the foregoing that the claim of N-M that my conclusion regarding the higher growth rate of demand for foodgrains under the postulated redistribution is "absolutely baseless" is without any substantive basis. We have, however, taken this opportunity to raise two substantive issues in this context.

ESTIMATION OF IMPORTS

Here N-M make an allegation that my conclusions regarding the underestimation of import requirements and the unrealistic nature of the envisaged import-substitution are based "on such part of the past information as happens to be convenient to [my] purpose". This is clearly wrong as will be clear from the following paragraphs.

To start with, readers who have glanced through [2] (Part II, Section V, pp 65-70) would realise that I had attempted to put together whatever direct as well as indirect evidence was

available to judge the numerical specification of the import structure in the base year 1973-74 for its closeness of approximation to the realised import-structure in the recent past, for its relative stability as well as its suitability in terms of the readily available data. To counter this, N-M have produced *only* two pieces of evidence and those too at a highly aggregative level, *viz*, (a) aggregate imports as per cent of GDP at factor cost, and (b) share of imported raw materials and intermediate manufactures in total imports. As for (a), GDP at factor cost is clearly too aggregative an entity on *a priori* grounds to judge the sufficiency of imports and that too at of the aggregate level. As for (b), not only was this evidence considered by me (see [2], Part II, Table A, p 66) but N-M have committed an outright blunder with reference to the Technical Note (April 1973) put out by the Perspective Planning Division. They claim that the share of imported raw materials and intermediate manufactures has been estimated to increase from 63.6 per cent in 1973-74 to 72.7 per cent in 1978-79. Table 4 compiled from the Technical Note clearly indicates that whether one considers the use pattern of imports [Panel (A) or the commodity composition of imports Panel (B)], N-M's claim is totally false. Conceptually, the commodity composition can be compared with the past trends and it is clear that the share of imported raw materials and intermediate manufactures is estimated to go up from 52.0 per cent in 1973-74 to 59.5 per cent in 1978-79. The target year percentage (with all the import substitution assumptions) conforms to what was realised in 1971-72 and that too after underestimating certain machinery imports as was argued in [2]. I have also provided in Table 4 the sectoral details I have used in the process of aggregation for the benefit of the authors.

Secondly, N-M contest certain parts of the imported intermediate input requirements of certain machinery industries presented in Table 5 of [2] Part II, p 67. Their argument is based on the discrepancies in the commodity composition of the Planning Commission's sectoral classification and that compiled by me on the basis of the DGTD data for the following items (1) Agricultural Tractors (their sector 41); (2) Air-conditioning and Refrigeration (their sector 40); (3) Motors, cycles, scooters, mopeds, scooterettes (their sector 52), and (4) Railway wagons (their sector 56). Let me note to start with that I was very clearly aware of their objection regarding "Agricultural Tractors" as was clear from footnote 13 on page 79 of [2] where I showed that, even after anticipating their objection, the Planning Commission's import co-efficient was on the lower side. Next, in the absence of any quantitative information on the commodity composition of the Planning Commission's sectoral classification, we may ask the following hypothetical question: Assuming that the omitted items from my classification have zero import-content [which is certainly not true about omitted items in (2) and (4) above], what is the implied percentage share of the items under my classification in total gross output so as to make the DGTD import co-efficients equal to those adopted by the Planning Commission for 1973-74? The extreme assumption made here, though unrealistic in at least two cases, is clearly favourable to the Planning Commission. The calculations are presented in Table 5. It is clear from this Table that by all the available evidence the implied percentage shares of the included items are definitely very low for sectors 40, 41 and 52 which by implication means considerable underestimation in the import co-efficients adopted by the Planning Commission. For sector 56, N-M have to supply the evidence whether the weight of railway wagons in total gross output of railway equipment in 1973-74 was of the order of 32 per cent or less to establish the adequacy of the import co-efficient besides showing with empirical data that the omitted items had in fact zero import content in the recent past. Since N-M have not mentioned any discrepancies in classification as regards "Other Machinery", "Electric Motors", "Cables and Wires", "Batteries (dry and storage)" and "Commercial Vehicles (including cars and jeeps)" that are included in Table 5 in [2], I take it for granted that they concede the underestimation by the Planning Commission in the imported intermediate input co-efficients of these sectors. All these comments are to be interpreted in the light of the definition of "indigenous content" adopted by the DGTD which implies buying from any "indigenous seller" who may have imported the commodity. This already provides a built-in downward bias in the import co-efficients calculated on the basis of the DGTD data.

Next, N-M maintain that considering the declining trend in the import content of various industries, there is no justification for assuming that the import content in any particular industry should continue at the same level as in the past years. I did not assume this. All that I maintained was that the import-structure for the base year 1973-74 was expected to incorporate the actual state of import-substitution observed in the recent past and as such was expected to approximate to the observed import-structure in the recent past. In addition, I may note that I used the above mentioned Table 5 in [2] also to illustrate that "the actual import-content, even at the aggregate level in any industry, using the procedure of the Planning Commission, fluctuates considerably even in two consecutive years, thus clearly confirming our earlier serious doubts on the stability of these co-efficients from year to years" ([2], Part II, Section V, p 66). N-M have preferred to remain silent on this crucial criticism of the import-structure adopted by the Planning Commission.

TABLE 5: IMPLIED PERCENTAGE SHARE OF THE INCLUDED ITEMS IN TOTAL GROSS OUTPUT OF THE SECTOR

Sector Classification	Description of Included Items	Implied Share (Per Cent) in Gross Output		Description of Omitted Items
		1970	1971	
(1)	(2)	(3)	(4)	(5)
40	Air-conditioning and refrigeration	4.16	4.93	Typewriters, sewing machines, calculating machines, etc
41	Agricultural tractors	0.81	1.13	Other agricultural implements in the organised and unorganised sector
52	Motor cycles, scooters, mopeds, scooterettes	4.14	3.04	Bicycles
56	Railway wagons	40.97	31.63	Locomotives, passenger coaches, etc

Method: Let m be the import co-efficient based on the DGTD data given in columns (5) for 1970 and (6) for 1971 in [2], Table 5.
and n be the import co-efficient adopted by the Planning Commission for 1973-74 and given in column (9) of Table 5 in (2).
then $(n \div m) \times 100$ is the implied share (per cent) in gross output.
For the rationale, see the text.

As regards my conclusion regarding the drastic nature of the postulated redistribution, N-M make a one line statement: "This criticism is not valid because the import substitution envisaged has been conditioned and analysed in terms of the feasibility of attaining the necessary domestic production levels in these sectors." Notice that this is a plain unsubstantiated assertion and hence does not deserve any consideration — serious or otherwise. However, I may draw the attention of N-M to p 36 of [2] (Part I) where I indicated the detailed contents of the empirical specification of the objective of self-reliance (which includes the relevent elements of their own statement) and referring to this on p 65 ([2], Part II), I stated: "Nothing of this type is spelt out either in the Approach document (where the chapter on self-reliance is conspicuous for the lack of quantification) or in the Technical Note". I had added in [1] (p 76): "It is hoped that the final plan document would be more illuminating on this count." It is only "in the absence of detailed analysis of this type, the criterion on the basis of which the numerical specification of the import-structure can be judged is its closeness of approximation (in 1973-74) to the realised import-dependence in the recent past". If the analysis was done, as N-M claim, why was it not indicated in the Approach document? We may go further and ask: why is it that even in the Draft Fifth Plan (Volume 1, Chapter 6), there appears no detailed analysis of import-dependence? Moreover, why is it that even the specification of imports in the Draft Fifth Plan is made in terms of only five considerably aggregated groups?

Finally, we may repeat substantive technical criticisms of the import specification that we made in [1] pp 77-78; "... there are no competing imports in the Planning Commission's specification of the import-structure. All imports are assumed to be competitive in nature. The demand for competing imports for all uses put together in the aggregate in each sector is governed by a large number of factors like the domestic production bottlenecks, the levels of accumulated stocks, the short-run variation in the demand for the final products as well as short run exigencies like the foreign exchange availability, tariff and quota restrictions, import-entitlements for exporters and so on. All these factors are most likely to change from year to year. So far as the use pattern of competing imports as intermediate input in various sectors and for each individual component of final demand is concerned these factors would operate in even more pronounced manner because of the substitution possibilities between different uses. It is the latter phenomenon that is bound to dominate in the specification of the M_1 and M_2 matrices indicated above and as a result these matrices are most likely to be extremely unstable and hence unsuited to the reliable projection of the import-requirements. Moreover, these are based on the commodity composition of imports for just one year, *viz*, 1969-70. Besides, the specific biases the import structure of this year may contain ... the M_1 and M_2 matrices based on just one year's data are even more likely to be affected by the factors mentioned above and hence more unstable than if they had been based on the average import structure over a suitable period. Add to this the conceptually doubtful appropriateness of combining the production structure of one year (*viz*, 1965) with the import-structure of yet another year (*viz*, 1969-70) which becomes all the more so in view of the exchange rate devaluation that took place during the intervening period, *viz*, June 1966. The story does not end here. The computation of M_1 matrix requires the conversion of the commodity-composition of imports by sector of origin into the end-use classification by sector of destination. To the knowledge of the present author, no reliable and detailed information on this aspect is available so as to construct the M_1 and M_2 matrices. In the absence of this information, the estimation of the matrices has most likely to take place on the basis of some *ad hoc* norms and arbitrary considerations thereby introducing errors of unknown magnitude. This, in turn, has been adjusted to 1971-72 prices and to take into account the estimates (not actuals) of commodity-wise imports for 1973-74 (which is yet to be over). It is not at all clear how far or close one is to the approximation to reality after making so many transformations on so scanty information base. One is thus forced to conclude that the specification of the import-structure adopted by the Planning Commission is conceptually unsound, founded in shaky information base and is operationally unwieldy. I did not stop at this point and suggested a "conceptually better, operationally simpler and from the data point of view more reliable specification of competing imports" (p 79). N-M have not attempted to refute these substantive technical criticisms of the import specification adopted by the Planning Commission.

It is thus clear from the foregoing discussion that the attempt made by N-M to salvage the numerical specification of the import-structure from my criticisms is not only based on unsubstantiated assertions and on the wrong reading of the Technical Note but also evades the substantive parts of my criticisms.

CONCLUSION

The foregoing discussion indicates that N-M have not succeeded in substantiating what they call "futile criticisms" on my part. This is particularly because of their counter-productive approach combined with assertions that are *non sequitur*. They have shown a regrettable aversion to providing empirical counter-evidence while contesting the three specific numerical details in my comprehensive critique of the Approach document and the Technical Note. This is not only inimical to fruitful debate but also singularly unfortunate because it is bound to create further misgivings in the minds of readers without clearing the existing ones that resulted from my critique. I may add that it is high time that the full details of the Technical Note are published and a free, frank and dispassionate debate takes place about all the details — technical specification, empirical verification and approximation to reality as well as the implied institutional premises — and the relevance of all these to the planning process in a mixed economy under a democratic framework. Till then, the misgivings are not only bound to persist but may most probably lead to a suspicion that the Planning Commission is interested not in clarifying the issues but in confusing them by hiding politically inconvenient and unpleasant factual evi-

dence. This is all the more so in view of the suspiciously vague nature of the very statement of the accepted levels of social objectives in the Draft Plan and the non-operational nature of the programmes for their achievement (see [3]).

ICICI

THE INDUSTRIAL CREDIT AND INVESTMENT CORPORATION OF INDIA LIMITED

ICICI needs professional staff in the areas of project appraisals, supervision of projects, market research, as also staff with professional training in regional economics and location theory, statistics and law. Candidates who are qualified Chartered Accountants/Cost Accountants or holding post graduate degrees in engineering, economics, law/statistics may apply for the following positions:

ENGINEERS
having a first or high second class degree in mechanical or chemical engineering. Candidates having a diploma in Business Management will be given preference. Experience in preparing or analysing feasibility reports will be an added advantage.

FINANCIAL OFFICERS
having a master's degree in Commerce and preferably with diploma in Business Management. Qualified Chartered Accountants may also apply. Candidates having experience in credit appraisal would be preferred.

ECONOMISTS AND MARKET RESEARCH ASSISTANTS
having a first or high second class post-graduate degree with specialization in economics. Market Research Assistants, having 2 to 3 years' experience in conducting commodity studies, would be preferred. For Economists, specialization in regional economics and location theory with experience in a research organisation or consultancy service would be an advantage.

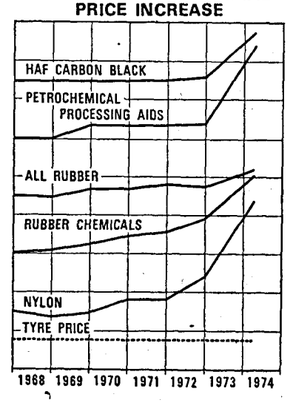
STATISTICIANS
having a first class post-graduate degree in statistics or mathematics. Knowledge of computer science would be an advantage.

LEGAL OFFICERS
having a first or high second class degree in law with ability in drafting legal documents and in preparing memoranda on legal subjects. Persons with experience in solicitors' firms would be preferred.

Applications will be considered for the Corporation's Offices in Bombay, Calcutta and Madras. Candidates should not be above 35 years of age. Salary will be commensurate with experience and capabilities. All posts carry benefits such as Contributory Provident Fund, Gratuity, Bonus, Medical Insurance, Leave Travel Concession, etc.

Applications stating (1) Name in full (2) Present and Permanent Addresses (3) Place of domicile (4) Date of birth (5) Educational qualifications with class and percentages of marks obtained in the aggregate in each examination from S.S.C. or equivalent to Graduation/Post Graduation (6) Up-to-date details of experience (7) Present salary, should reach the Joint Secretary (Administration & Personnel), ICICI, 163, Backbay Reclamation, Bombay-400 020, within 3 weeks of this advertisement. Candidates called for interview from out of Bombay will be paid first class return rail fare (by the shortest route).

AIYARS. ICICI. 16



World Oil Crisis: An Indian Opportunity

Excerpt from speech by Mr K M Mammen Mappillai, Charman and Managing Director, Madras Rubber Factory Limited, at the 13th Annual General Meeting of the Company held on March 29, 1974

TODAY the world is passing through a crisis, the like of which has never been faced before. It is unprecedentedly grave; and it has spared no country, developed or developing. The price spiral is on a dizzying lift and has reinforced the inflationary trends in India.

In a span of 12 months, industrial raw material prices have shown a 41 per cent increase and this trend is continuing. The foreign exchange crisis caused by food imports and the incredibly high import bill for crude and petroleum products, in addition has spelt bad news for industrial development and disaster for the automotive tyre industry.

INDEX OF RAW MATERIAL PRICE INCREASE

Opportunity in Crisis: Our Resources

Yet for all its gravity, the crisis also spells opportunity. An opportunity lies in our country's agro-based economy and vast natural resources that offer a ready substitute for petro-chemical products. The dimensions of the opportunity begin to emerge when we notice that in developed countries like Japan, industry almost totally depends on raw material imports and energy inputs, while in India 44 per cent of industry is agro-based. And in addition, there is an abundance of energy resources, however inadequately exploited.

The Indian tyre industry provides a specific example of the opportunity before our country. India not only has adequate natural rubber but even synthetic rubber production is from molasses. Such rich natural resources are not available to the international tyre industry. Fabric, another major raw material for tyre manufacture, also has an agro-base, although rayon grade wood pulp is imported. Indian enterprise can correct this situation and there is no reason why the existing fabric manufacturers should not establish total self-sufficiency with the integration of production of wood pulp, rayon filament and tyre cord fabric.

A similar opportunity exists with the third important raw material — carbon black — where technical expertise is available within the country for manufacture based on coal instead of petroleum feed stock.

In pursuit of such increasing utilisation of our own natural resources, special benefits accruing from import-oriented materials such as nylon should not be foregone.

Opportunity Spells Growth

Shortage of petro-chemical products and the uncertainties of future supplies have resulted in an international tyre shortage. Even a one to two per cent increase in India's share of the international market can lead to as much as a 50 per cent growth for the domestic tyre industry. Such a growth would significantly eliminate transportation bottlenecks and help in speedy distribution of essential commodities. And export earnings will contribute to the bridging of the balance of payments gap, aggravated by the oil crisis.

Opportunity Needs Exploitation

The exploitation of the growth opportunity is made difficult, if not impossible, by government price control for essential products, without due consideration of the increasing raw material costs. While the tyre industry was asked to maintain its prices for the several years from 1968, raw material costs have been uncontrolled and are constantly on the increase, particularly

Mr. K. M. Mammen Mappillai

since last September. In this situation of eroding margins, the tyre industry will not be able to implement rapidly the capacity expansions necessary to support the national and international market demands. This is a familiar situation already prevalent in price-controlled industries such as fertiliser, paper and cement. It is thus no wonder that government's licensing policy, though directed at encouraging expansion, has had little effect on industrial growth.

Opportunity Demands Action

I welcome, in this connection, our Prime Minister's statement in Parliament that all possible steps must be taken to stimulate production in all essential sectors. This provides an appropriate starting point for the bold actions demanded by the opportunity: removal of restraints to growth such as price control and concessional pricing to specified sectors.

Such a step would lead to revitalisation of industrial expansion through rapid implementation of licences. The scarcity situation would consequently improve, and the Indian tyre industry would be able to properly compete for a larger slice of the international market, and simultaneously fulfil local distribution needs.

MRF's Role in the National Service

Your company is already playing a

major role in the service of the nation and is well prepared to take up greater and greater responsibilities as demanded by the situation ahead of us. In the year under review, your company collected and paid directly to the government exchequer a sum of Rs 18 crores, equivalent to 65 per cent of the nett ex-factory sales value. If sales tax and excise duty on suppliers' bills are also included, the total rates and taxes paid could exceed the nett sales revenue. And such contributions to the government exchequer will continue to grow with the expansion plans on hand.

A major portion of the company's capacity has been concentrated on truck tyres irrespective of the comparatively better margin on smaller tyres. The capacity at the Goa plant is utilised fully to produce truck tyres, as also a very substantial portion of the Madras plant capacity. Secondly, a need-oriented distribution system has also been set up in the last two years and supplies to the markets of the Eastern and Western regions have nearly doubled. In keeping with its pioneering role in exports, your company will play a larger and larger part in the export market, with the progressive expansion of capacity.

I am happy to inform you that in addition to the 4 lakh sanctioned capacity under implementation in Goa, a letter of intent has been issued by government for substantial expansion to 10 lakhs from 6.1 lakhs. Total capacity will now be 18 lakh numbers plus 25 per cent permitted expansion.

Before concluding, I would like to thank all our retreader friends, tyre dealers, consumers, banking and financial institutions and suppliers for their continued close co-operation. I thank all members of the organisation and my colleagues on the Board, whose unstinting co-operation and assistance have made possible the growth and development of your company.

FROM THE CHAIR

Tamil Nadu Small Industries Development Corporation Limited

(An Undertaking of the Government of Tamil Nadu)

Kannammai Building, (7th Floor)

122, Anna Salai, Madras 600006

Speech of the Chairman and Managing Director, Thiru C N Raghavan, IAS

THE following is the text of the Speech delivered by Thiru C N Raghavan, IAS, Chairman and Managing Director, Tamil Nadu Small Industries Development Corporation Limited, at the Third Annual General Meeting of the Corporation held at Madras on February 27, 1974:

FRIENDS,

I have great pleasure in welcoming you all to the Third Annual General Meeting of the Company.

The annual accounts and audited Balance Sheet and the Directors' Report pertaining to the Company for the year ended 31st March 1973 have been circulated to all the Shareholders and with your permission I shall take them as read.

The Report of the Directors would reveal that the Company has expanded its activities in the fields of distribution of raw material, supply of machinery, construction of workshed, etc. The Scheme for the assistance for preparation of feasibility studies and the scheme for the development of ancillary industries add new dimension to the activities of the Corporation. The Company has achieved tremendous heights in the distribution of scarce raw material and has covered a few more scarce items like caustic soda, zinc, palm oil, etc, during this year. The company has distributed raw materials worth Rs 4.18 crores during this year. The company registered the demands of as many as 1,500 small-scale industrialists and 2,200 fabricators from all the districts of the state. The Company is taking all possible steps to mitigate the difficulties of small-scale industries arising out of short supply of raw materials. In order to ensure at least some quantity of the right type of material at the right point of time, we have made the system of *ad hoc* allotment against specific orders obtained by small-scale industries from leading and reputed industries and orders from the Railways, Defence Departments and other priority sectors more broad-based and new small-scale industries all over the state enjoy the benefit.

The Company recorded a commendable rise in the progress of its Hire-Purchase Schemes under which machinery required are procured and supplied and the workshed contructed and allotted. The number of entrepreneurs provided with machinery and the value of the machinery so provided under the scheme has increased twofold as compared to the performance in 1971-72. The Company has assisted 401 entrepreneurs with machinery worth Rs 169 lakhs, during the year under report as against Rs 75 lakhs worth of machinery for 154 entrepreneurs in the year 1971-72. The Corporation has built up the tempo within a short period of 2½ years by systematic and planned approach, taking advantage of the wind of change in the field of small-scale industry. We are well aware that our present problem is not the lack of entrepreneurial skill but lack of facility for identifying projects. We have hundreds of young entrepreneurs throbbing with enthusiasm and deep interest in starting new industries. In order to make best use of the entrepreneurial skill by giving them proper guidance and counsel on the suitable project, our Corporation has introduced a scheme during this year to give assistance for the preparation of project reports and feasibility of studies at the instance of the entrepreneurs, engaging reputed consultants. Special concessions are being given to technocrats.

Electronic Cell

Again seized with problem of the development in the everwidening field of electronics, our Corporation sparing no energy and losing any time constituted an Electronic Cell under senior officer for giving counsel and guidance and preparing project reports for the use of entrepreneurs. The cell is becoming popular and a number of entrepreneurs are availing themselves of the benefits.

Similarly under the workshed scheme also, the response has been heavy. The workshed designed and constructed by the Company, conforms to requirements of Factory Act and individual needs of the entrepreneur. Under this Scheme, the Company has taken up construction of 72 sheds at a cost of Rs 49 lakhs in the SIDCO Industrial Estate at Ambattur. Besides these sheds 26 sheds are being put up at Coimbatore. Further, the Corporation has put up Ancillary Industrial Estates at Tiruchirapalli and Ambattur to cater to the needs of Bharat Heavy Electricals Limited, and TI Cycles of India, respectively. We have taken up construction of 12 sheds at an estimated cost of Rs 24 lakhs at Tiruchirapalli. The Ambattur Ancillary Estate serves 19 ancillary industries. Consistent efforts are being taken to identify more ancillary industries. This striking development in small-scale industries has thrown open wider scope for the establishment of ancillary contact between large and small industries. The success so far achieved in the field has given us the courage and confidence to explore the possibilities of putting up more Industrial Estates in future.

The repayment of the instalments under Hire-Purchase Scheme commenced in respect of a considerable number of cases during this year. Taking a lesson from sister corporations, the Company did not lose time to take steps to pursue recovery work. Recovery cell has been constituted to attend effectively to collection of instalments then and there. Timely actions are being taken for recovery of instalments due to the Corporation. The progress made under this direction is satisfactory.

The Company launched a New Loan Scheme from 1-4-72 hitherto implemented by the Director of Industries and Commerce. The Company adopted a more simplified procedure and the terms of Company in regard to rate of interest, mode and period of repayment of loan, etc, are attractive. During the year, 386 entrepreneurs were granted working capital loans to the value of Rs 37 lakhs.

Shareholders would be glad to know that the company is in close liaison with the State Trading Corporation of India in regard to meeting the needs of imported raw materials of small-scale industries and in regard to finding export markets for the finished products of small industries. I have every confidence that these longstanding liaison arrangements with the State Trading Corporation of India would go a fruitful way to assist small industries of the state. In furtherance of these arrangements, specific studies of a few select sections like leather, processed foods and ceramics have been taken up.

SIDCO can also take legitimate pride in being one of the public sector organisations which have started earning profits right from the very inception. The profit for the year under review was higher than that for the previous one. If the past is of any indication there is no doubt that the SIDCO will embark on its voyage on aims and achievements for 1973-74 with cheer, courage and confidence.

Profound Gratitude

Before I conclude my speech, it is my privilege and pleasure to thank the Directors, Officers and Staff of the SIDCO for their zealous service and conscious dedication with which alone, the Company could carry out programmes with success during the year under review.

The Company conveys its profound gratitude to the Government of Tamil Nadu particularly to our dynamic Minister for Industries Thiru S Madhavan for the good counsel and assistance received from the government at every stage of implementing its assistance programmes. The company owes a large share of the dividend of its success to the Government of Tamil Nadu.

Note: This does not purport to be the proceedings of the meeting.

PUBLIC ISSUES OF DEBENTURES BY THE TATA ELECTRIC COMPANIES

The subscription lists for the following debenture issues will open on Monday 22nd April 1974 and close on Thursday 2nd May 1974 or earlier but not before Wednesday 24th April 1974:
(The issues have been declared by the Government of Maharashtra as 'Public Securities' under section 2(12)(d) of the Bombay Public Trusts Act, 1950).

1. THE TATA POWER COMPANY LIMITED — 20,000 8½% Sixth Debentures of Rs. 1000 each for Rs. 2 crores at par.
2. THE ANDHRA VALLEY POWER SUPPLY COMPANY LIMITED — 10,000 8½% Fifth Debentures of Rs. 1000 each for Rs. 1 crore at par.
3. THE TATA HYDRO-ELECTRIC POWER SUPPLY COMPANY LIMITED — 10,000 8½% Fourth Debentures of Rs. 1000 each for Rs. 1 crore at par.

Managers to the Issue:

Tata Consultancy Services (Financial Services Division)

Golden Tobacco Company Limited

Highlights of the Address by Shri Chatrabhuj Narsee

THE following are the highlights of the address by Shri Chatrabhuj Narsee, Chairman, Golden Tobacco Company Limited, at the Eighteenth Annual General Meeting held on March 30, 1974:

Food shortage, epidemic of labour unrest, power and fuel oil crisis, galloping inflation, zero growth or even retardation in many fields, have all combined to push the economy into a quagmire, the like of which free India has never witnessed before.

The cigarette industry's gratifying annual average growth rate of 7 to 8 per cent declined in a somewhat disquieting manner in the 70s. Such a trend is largely attributable to the erosion of the consumer's purchasing power by the soaring cost of living and the heavy incidence of steep and frequent excise levies on cigarettes. The Union Government's harsh excise policy as regards cigarettes will eventually prove self-defeating. Instead, a policy of moderation will help the government collect more tax and at the same time help the industry's growth.

During the period under review the Company, for the first time in the last 25 years, was afflicted by an industrial strife which later culminated in a strike in the Bombay factory. The wage bill alone has gone up from 90 paise in 1968-69 to Rs 2.36 in 1972-73 per thousand cigarettes produced, mainly due to loss of production and abnormal wastage of materials. As a result the performance was adversely affected and the cash-flow almost choked.

The union raised demands amounting to an additional Rs 120 lakhs which was hundred per cent more than the present wage bill of the Company. Though the Company has been paying emoluments comparable to those in the foreign companies in the cigarette industry, the union leader adopted the destructive activity of go-slow and gross indiscipline.

After four months of strike the Government of Maharashtra by a notification referred the dispute to the Industrial Tribunal and prohibited the continuance of the strike. Even after this, normalcy is not restored because of the attitude of the union and go-slow by the labour. If the situation continues to deteriorate, the management will not hesitate to ask the Government of Maharashtra to look after the workers and run the plant.

Baroda Factory

The Baroda factory with half the number of machines and workmen as compared with the Bombay plant is giving the same production as Bombay. But for the timely help from the Baroda plant, the labour trouble in Bombay would have crippled the industry more disastrously.

Foreign Companies

Even today the cigarette industry is controlled to the extent of 85 per cent by the companies having majority foreign shareholding ranging between 67 and 92 per cent. The share of the foreign monopoly alone is more than 75 per cent. This is alarming when viewed against the avowed government policy that only wholly Indian-owned companies will be allowed to expand in the cigarette industry. While no new foreign companies are allowed to enter the field of cigarette industry, no action is taken against the existing foreign companies which have gone on expanding without government's permission and thereby strengthened the monopolistic hold.

Instead of allowing the foreign monopoly to continue to have 75 per cent control on the production and market, it would be in the interest of the economy, the industry and the consumers at large to permit a larger number of foreign companies with foreign equity limited to 40 per cent and with much smaller share in terms of production capacity. Maybe the government will find the suggestion appealing.

Factories in Joint Sector

The production of cigarettes in India has increased from 20,000 million in 1947 to 65,000 million in 1973. Even assuming that the foreign companies had cent per cent monopoly in the industry in 1947, if their production was pegged at the then level, today their share in the local business would have been 33 per cent and Indian companies would have secured 67 per cent. To achieve an increase in the share of the indigenous sector, we mooted the idea of joint sector and in spite of obstructions from the vested interests and procedural delays, the joint sector is at last taking concrete shape, as foreseen by the Indian Cigarette Manufacturers' Association four years ago. Apart from the various benefits available to the industry in the backward areas, the new units in the joint sector will readily have state and Central governments' patronage, unlike the Indian companies in the private sector.

International Brand Names

The economists and policy-makers in this country are not alive to the colossal damage caused to the cent per cent indigenous products by the international brand names. In India in almost every class of consumer product we find various international brand names claiming foreign ownership to lure the consumers. Use of such names also means substantial drainage of foreign exchange by way of profits, royalties, etc.

Future Plans and Prospects

The soaring prices of raw tobacco and other inputs make any prediction of future a futile exercise. However, your Directors have taken steps to make the operations of the Company more profitable and growth-oriented. There are under consideration plans for diversification into some profitable manufacturing and trading fields. This will add to the overall profitability and result in the better utilisation of the Company's assets.

Assam Carbon Products

ASSAM CARBON PRODUCTS, engaged since 1962 in the processing of various carbon materials and manufacture of electrical carbon blocks and brushes and contacts of all types used on electrical machines, is setting up a new plant at Gauhati for production of electrographitised and resin-bonded grades of carbon blocks with an annual capacity of one lakh kgs. The project is being set up in technical-cum-financial collaboration with Morganite Carbon of the UK. The estimated cost of Rs 153 lakhs is proposed to be met by share capital (Rs 69 lakhs), term loans (Rs 69 lakhs) and subsidy for setting up the industry in a 'backward' district (Rs 15 lakhs). The company expects to commence process trial during the first quarter of 1975 and to go into commercial production by mid-1975. Equity shares worth Rs 16 lakhs have been reserved for subscription at par by the foreign collaborator. The public is being offered 2,60,000 equity shares of Rs 10 each and 7,500 redeemable cumulative preference shares of Rs 100 each carrying right to fixed dividend of 9.8 per cent, both at par, under a prospectus.

Productivity
Science fulfils its function only when it aims at the greatest good for the greatest number.

IOL continues its advance on the technological front

and here are the facts

*A Centre is being set up in Bombay for the production of a range of gases of ultra high purity and special mixtures for the electronic and other industries. Hitherto these were being imported.

*MIG 400, a more sophisticated form of metal inert gas welding set from IOL, will soon be in the market.

*IOL has won the first 1200 cubic metre/hour Oxygen Plant contract for a mini-steel project of the Maharashtra Government. This is the forerunner of a series to be manufactured by IOL in the near future.

*For the first time in India IOL will produce indigenous tubular hard facing electrodes—"Cobalarc"

*Also for the first time in India IOL has established facilities for producing special purpose automatic welding machines.

Meeting national objectives

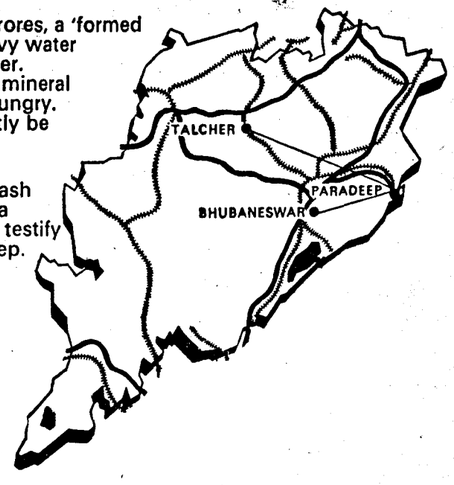
THE ECONOMY: GOVERNMENT ABDICATES

Orissa offers two new places of interest to industrial site-seers



Talcher and Paradeep

TALCHER :
An F.C.I. fertiliser plant worth over Rs. 100 crores, a 'formed coke' plant of N.C.D.C. and a Rs. 21-crore heavy water project will become familiar landmarks in Talcher. So ideally suited for engineering, chemical and mineral based industries and others which are power hungry. The coal-based 250 MW power plant will shortly be ncreased to 500 MW to feed new units.

PARADEEP :
An over Rs. 240-crore fertiliser plant, a soda ash plant costing more than Rs. 20 crores, besides a brewery and marine and chemical industries all testify to the growing industrial importance of Paradeep. Massive exports of iron ore are made from this strategic port—one of the deepest in India—possessing modern handling facilities.

Talcher and Paradeep will live up to all your expectations : an established industrial infrastructure that includes ample power, communication facilities and developed land; sufficient raw materials; a responsible work force; and finance. And above all, the motivation to get things done for a more productive tomorrow—today.

The Whipping Boy

A FEW years ago, the CPM ran an election campaign in West Bengal, riding the plank of alleged discrimination on the part of the Centre against the eastern states. New Delhi had then come down heavily upon the party. It was dubbed as divisive, sectarian, anti-national, parochial, bigoted, and so on. It is, therefore, altogether bizarre that the kind of statements which used to come from CPM quarters in West Bengal way back in 1970-71 are now being mouthed, in almost identical fashion, by spokesmen of the Congress in that state. The Chief Minister of West Bengal, about whose loyalty to the Centre not the least doubt is permissible, has come out with a thundering roster of complaints. Taking the cue from him, others have joined in.

The list of grievances includes allegedly unfair treatment in such areas as the issuance of industrial licences and letters of intent, import licences, investments and loans by public financial institutions including the nationalised banks and the Life Insurance Corporation of India, allocation of developmental expenditure, etc. To all this is added the supposed discrimination against the eastern region in the matter of supply of fertilisers, planning of power, provision of irrigation facilities and distribution of foodgrains. It is pointed out how the non-release of water from Farakka is ruining the port of Calcutta, and will soon ruin the prospects for Haldia too. Lurid stories are being spread about the manner in which both the projected shipyard as well as the petro-chemical complex are being taken away from Haldia. To complete the indictment, references are made to the pernicious system of retention prices for steel, coal and cement; these basic commodities, which are raised or produced in considerable quantities in the eastern region, are supplied at the same prices all over the country, but no reciprocity applies in the case of the supply prices of such raw materials as cotton, cotton yarn, soda ash, heavy chemicals, etc, in which the region is short. Thus while the locational advantages enjoyed by the eastern region are neutralised by the system of retention prices for steel, coal and cement, no compensatory gesture has been made to it.

Much of this may be weak alibi for lack of adequate initiative at the local level. Even so, as far as pricing and investment policies are concerned, the eastern states do appear to have a somewhat strong case. More than one-third of the total industrial output in the country still originates in this region, which is also marked by the predominance of the key industries of steel, coal and heavy engineering. There is a complex inter-relationship between the steel, coal and engineering industries; if the conventional advantages enjoyed by the eastern region in these industries have been taken away, that by itself could go a long way to explain their stagnant state in recent years. The difficulties encountered by one of the industries will be here intensified by those being faced by each of the others. Whatever the other underlying factors, the fact that pricing and public investment policies have underrated certain aspects of the problems besetting West Bengal is perhaps true. And it is futile to refer to the criterion of per capita income in this context, even though, on the basis of that criterion too, Assam, Orissa and Bihar, as much as Tripura, Meghalaya, Nagaland and Manipur, certainly deserved better.

The fulminations coming from West Bengal notwithstanding, it does not seem that clarity is gaining the upper hand. The Union Minister for Steel and Mines has, in recent weeks, spoken sorrowfully of the mess in the eastern region, which is heavily populated by steel plants, coal mines and the heavy engineering units. However, the malaise, according to him, is not any of the factors mentioned above, but the 'politicalisation' of labour in this region, which has affected the smooth functioning of industrial plants. Even were the Minister's words taken at their face value, one could still enquire about the reason for this rather extraordinary 'politicalisation' of labour in one part of the country. Did not such 'politicalisation' start with the Congress party's anxiety to control the trade unions in the area? Who can deny that, ever since 1947, because the ruling party wanted to have untrammelled suzerainty over each segment of industrial labour, it purposely went ahead and encouraged splits in trade unions? The lead was followed by others. Whenever the Congress as well as the other parties found that they were unable to capture the loyalty of the majority of the workers in an industrial unit, they went ahead and formed a rival union. In this matter, more often than not, the Congress has consistently shown the way. Given the fact that both the employers and the government have invariably backed such fly-by-night Congress unions, tension grew in the industrial field. It has happened in any number of cases that, for years on end, an INTUC union has been given formal recogni-

tion by the government and has been exclusively consulted by the employers in the matter of wage bargaining despite its not commanding the loyalty of even a small percentage of the workers. The most blatant example of this was in the Hindustan Steel unit in Durgapur, where the Congress union continued to be officially recognised for nearly a decade notwithstanding the fact that the evidence of elections to the works committee or the plant's cooperative society indicated that it did not evoke the support of even one-fifth of the workers.

During all these years, whenever suggestions have been made that union recognition should be determined through a secret ballot, both the INTUC and the Union Government have hummed and hawed. Which set of union leaders commands the loyalty of the majority can be most satisfactorily proved if there is a free, secret ballot. A government which resists this measure, and at the same time maintains a tilt in favour of that union which toes the establishment line, has little ground to complain about the growing 'politicalisation' in the trade union field.

EEC

Symmetry Across the Channel

LITTLE is being said at the moment about it, but President Pompidou's death has suddenly transformed the prospects for West Europe. Developments in France following the President's passing are now likely to get tied up with the unfolding of events across the channel in the United Kingdom. The failure of the Conservative Party there to clinch the elections last month would, by itself, have caused only a minor ripple. But, if in a subsequent poll that might take place in any of the coming months the Labour Party should receive a clear mandate for renegotiating the terms of Britain's entry into the EEC, the arrangements assiduously reached over the years will once more be in the melting pot. For, the man who might meanwhile be elected President of the Fifth Republic may not be a Gaullist, or for that matter a Right-winger. In the preliminary round of the presidential poll, due on May 5, the Left will have one common candidate — namely, Francois Mitterand, sponsored jointly by the Socialists and the Communists — while the Gaullists have failed to name an agreed candidate. The official candidate of the UDR is the former Prime Minister, Jacques Chaban-Delmas; but the non-conformist Gaullists belonging to the Independent Republican Party have decided to demur, and are backing the incumbent Finance Minister, Valery Giscard d'Estaing. There are several others in the field in the first round, and at least one belonging to the extreme Right: none of them is likely to prove much of a distraction.

In recent public opinion polls, Mitterand has performed considerably better than both Chaban-Delmas and Giscard d'Estaing. Even so, the general expectation till now has been that though in the preliminary round Mitterand would be ahead of either Gaullist candidate, he will fail to receive an absolute majority. Consequently, in the run-off between the two candidates who obtain most votes in the first round, the pooled aggregate votes of the Right are bound to be cast in favour of the Gaullist who remains in the field and who would thus easily outstrip Mitterand. But one can never tell. The presumption of ultimate victory for a Gaullist is based on two separate but related hypotheses, namely, (a) that political attitudes of the French electorate have remained frozen over the years, and (b) that the bourgeoisie's fear of the communist monolith remains as strong today as it was five or ten years ago. Neither of these assumptions may hold good today.

For one thing, the rupture of relations between the two communist giants is a fact of life. With the increasing *embourgeoisement* of the regime in the Soviet Union on the one hand and the growing trade links between France and China on the other, the spectre of communism might not possess the same terror as in the past. Besides, inflation is a great corroder of the faith of the middle class in the existing order, and some shift of loyalty is bound to have occurred on account of the current bout of spiralling prices. There is also the fact that the Gaullist fraternisation with the Arab world has alienated considerable sections of Jewish citizens. Other odds and ends could add up. A couple of years ago, Chaban-Delmas had to resign from the post of Prime Minister because of widespread doubts about the uprightness of his income-tax returns; middle class susceptibilities over this issue are well known, so much so that he might fail to poll the votes of a large segment of the electorate who might otherwise have voted Gaullist. In view of all this, and depending upon how many of the so-called negative Gaullist votes come his way, Mitterand might scrape through in the first round itself.

If that happens, the structure of politics in France is bound to be completely overhauled. Inevitably, there would be repercussions on the structure of the EEC too. Differences exist between the French Communist Party and the Socialist Party over France's membership of the EEC; the Socialists would be most reluctant to opt out of the European experiment — more particularly since the economic provisions of the Community arrangements have meant a bonanza to French agriculture. But even they have reservations about converting the EEC into a supra-national political entity. Thus, once the Labour Government in Britain returns to Brussels with a mandate for sweeping alterations in the terms of its membership, a parallel thrust might well develop from within France itself.

Iron Ore

Not in the Oil League

THE Minerals and Metals Trading Corporation (MMTC) is anxious to renegotiate the terms of its long-term contracts for sale of iron ore to Japan. Japanese steel mills import almost the entire quantity of about 125 mn tonnes of iron ore which they need under long-term contracts. These contracts specify the price of iron ore in dollars. This arrangement was satisfactory so long as the dollar enjoyed a high degree of exchange stability. However, with the two devaluations of the dollar and its fluctuating fortunes under the regime of floating exchange rates, the Japanese could not resist the pressures of the iron ore exporting countries to raise the dollar price of ore last year. The MMTC secured mark-ups in price ranging from 14 to 20 per cent for different types of ore. As a result, it benefited to the tune of $ 16 million in 1973-74. It took several rounds of negotiations, spread over more than 18 months, for the MMTC to persuade the Japanese to agree to the price mark-ups.

The MMTC is now again trying to secure a further price increase for iron ore. It has argued that a price-increase has become absolutely necessary on account of the sharp rise in transportation and other costs. At the current prices, export of iron ore has ceased to be an economic proposition. Further, while iron and steel prices have increased almost by over 60 per cent on average, there has been no commensurate increase in iron ore prices.

However sound the case for a rise in the price of iron ore, whether MMTC is able to secure a price rise will depend on a number of other factors. The Japanese have so spread their imports of iron ore that none of the exporting countries is in a very strong bargaining position. They have built up simultaneously several sources of supply in Asia, Australia and Latin America and are now doing the same in several African countries. In several cases they have themselves supplied the capital for development of mines and building of transportation facilities. Because of the location of iron ore deposits in a number of countries and in view of the fact that the Japanese are the major customers for this product, none of the exporting countries has been willing to take the risk of pitching its demands too high and in the process losing a big and expanding market for their ore. The Japanese have in fact stepped up their efforts to locate fresh sources of iron ore. They have, for instance, concluded long-term agreements with South Africa for supply of 12 mn tonnes of iron ore annually.

The MMTC at present contributes about 10 mn tonnes to the total Japanese imports of iron ore of about 125 mn tonnes. It, therefore, faces the threat of the Japanese shifting to other sources of supply should its price demands be unacceptable to them. That apart, MMTC's record as a supplier of iron ore is blotted by its failure, on several occasions, to keep to delivery schedules. The Japanese will not, therefore, shed too many tears for the MMTC should it try to push its case beyond a point.

Hopes of a significant increase in iron ore prices hang on joint action by the major producing and exporting countries. However, the outlook is not very favourable for such action. A number of exporting countries have abundant supplies of iron ore and are keen to step up their exports. Secondly, iron ore is not a major export-earner for most of the exporting countries. So they are unlikely to take up the cause of higher prices for iron ore with the single-mindedness which the OPEC countries have shown in the case of oil. To make matters worse, the sharp differences in the political positions of the iron ore exporting countries like India, Australia and Brazil have prevented them from coming together to build a united front against Japan. The Japanese can therefore afford to ignore the recent vague talk of forming a bloc of iron ore exporters on the lines of the OPEC.

Parliamentary Democracy

A Matter of Irrelevant Detail

NOW that the Assembly has been dissolved, at least a state of relative quiet has descended upon Gujarat. Prices remain high, essential goods continue to be in short supply, minor scuffles have not altogether ceased, but an emotional plateau appears to have been reached for the general mass of the people. A further phase of agitation, demanding fresh elections to the Assembly at an early date, therefore seems improbable at this stage. Present indications are that New Delhi in any case is not inclined to arrange these elections before August — when the President of the Republic is scheduled to be chosen by the combined suffrage of the members of the Union Parliament and the state Assemblies. Since there would be no Assembly *in situ* in Gujarat, that state would be precluded from participating in the choice of the nation's President.

A constitutional conundrum would thereby arise. On the face of it, it is patently unfair that a part of the electorate would not be able to participate in the Presidential poll and yet the election would not be considered void. The Government is evidently depending on the precedent of a judgment, handed down by the Supreme Court nearly 17 years ago, at about the time of the Presidential election of 1957. Some areas in Himachal Pradesh and Punjab were snowbound when the General Elections took place in the rest of the country in that year, so that, when the time arrived to elect the President, no MLAs or MPs were there to represent those few constituencies. A petition was filed and the Supreme Court was called upon to offer judgment on the validity of the Presidential poll given this lacuna in the electoral college; the court made the point, *inter alia*, that the casting of those odd votes from Punjab and Himachal Pradesh would not have made any difference to the outcome of the actual poll for the President and that it did not therefore matter that the Presidential election was not held in abeyance till the electoral body was complete. However, the government took fright all right, and an amendment was rushed through in Article 71 of the Constitution to forestall the possibility of similar references in future on this score.

If a second reference is made to the Supreme Court now — and particularly in view of Article 71(4) which states explicitly that the election of a person as President or Vice-President shall not be called in question on the ground of any vacancy in the electoral college — the court would perhaps arrive at the same kind of pragmatic judgment as it did in 1957 and ordain that the Presidential poll need not wait for the Gujarat elections.

But pragmatism has to be distinguished from propriety. The Constitution is a solemn and formal document which, going by the professions elsewhere in its text, supposedly gives corpus to a set of accepted principles and doctrines. Whatever the judgment of the Supreme Court, if Article 71(4) makes it possible to simply shut out the representatives of an entire state from the electoral process, the implications are far-reaching indeed. For, from then on, it would be easy to argue from the general to the particular. If, say, 20,000 voters in a particular constituency were deliberately prevented from exercising their franchise, but if the difference in votes polled between the elected candidate and his nearest rival happened to exceed this figure, it could be argued that no harm had been done, since even if these electors had voted, it would not have made any difference to the result.

There is no greater cynicism that can afflict a parliamentary democracy. The plea of the government could, in fact, be turned against it. Since, even were the Congress to lose heavily in any fresh elections for the Gujarat Assembly, it would have no impact on the result of the Presidential poll, the party runs no risk in holding the Gujarat Assembly elections at an early date. It may therefore be persuaded to agree to it. But there is the genuine possibility that the party might be decimated in Gujarat if elections were held in the near future. Evidently that prospect is unbearable to the decision-makers in New Delhi. They want to win the elections everywhere, and they are prepared to debauch the process of parliamentary elections if that is the price that has to be paid for such victories. After this, is not all talk of maintaining the democratic traditions in the face of the danger of fascism sweeping the country, so much poppycock?

Teachers Pay

Part of the Pattern

A Correspondent writes:

IN universities and colleges across the country, teachers are agog at the announcement of the new salary scales for them which are to be immediately effective in the Centrally administered universities and their colleges and in the IITs. The teachers have unreservedly shown their joy even though the Union Education Minister's statement maintains an enigmatic silence on what is to happen to dearness and other allowances once the new scales begin to operate. If the rate of inflation is maintained at 25 to 30 per cent per annum, much of this new accrual will be quickly eaten into. Their present euphoria, moreover, would considerably postpone the time when college and university teachers would consider mobilising their forces to mount another offensive for getting their wages improved.

What motives could have persuaded the government to announce, in almost piecemeal fashion, these improvements in the emoluments of teachers at the higher reaches? Certainly, it is easiest to meet the demands of this section of teachers because, in view of the relatively limited number of such teachers, the attendant financial implications are small. A less obvious reason may be that what the government has in mind is an adaptation of the Pakistan model, experimented with by the late General Ayub Khan in the 1960s. Ayub and his advisers had a meticulously prepared blueprint for permanently alienating the elite group of teachers in the universities and colleges from the rest of the teaching fraternity. Teachers are the opinion-builders in a developing society, and, given the hierarchical arrangements in the field of education, university and college teachers could well be the most influential among them. To ply them with special favours was, therefore, considered sound investment. At least in West Pakistan, Ayub's ploy succeeded enormously. The intellectual community, led by the university faculty, remained docile in Punjab, Sind and elsewhere, even as Ayub had to give way to Yahya Khan, and the latter to Zulfiqar Ali Bhutto. All through, the top layer of teachers maintained their unswerving loyalty to the establishment. The model did not, however, work as well in East Pakistan, although here, too, a section of teachers — thanks to the purposive munificence of the government — had never had it so good and many of them had money to flaunt and could build more than one house or maintain more than one car. The university intellectuals in East Pakistan soon learned that, while their plight had improved enormously in relation to that of the wretched school teachers in the immediate neighbourhood, their counterparts in West Pakistan were doing even better; it was this that further set fire to their aspirations.

The anti-egalitarian bias in the government's decision would rankle among other teachers. There has been no announcement simultaneously of any improvement in the wage scales of the primary and secondary school teachers. It has been established fairly firmly, moreover, that investment in improving the salary scales of primary and secondary teachers is likely to lead to a much higher rise in educational productivity — whichever way you define it — than if this investment were made elsewhere. But the latest announcement is part of the general pattern of the wretchedly poor being kept waiting while the moderately comfortably off are further taken care of. The government's stock answer to such charges of blatant inequity is by now well known, namely, that it takes a substantially greater lot of money to improve the scales of primary and secondary school teachers. It is by the same perverted logic that the 'socialism' currently practised in the country concentrates almost exclusively on catering to the needs of a limited few rather than of the poor many; from tax policy to public distribution to wages of teachers, the pattern remains unchanged.

Vision 731

Calcutta Diary

A M

PLEASE do come if you want to be regaled by the folk tales of Bengal. Calcutta's normal intake of power is close to 600 MW every day. For the past few weeks, it is getting only about half of that. Industrial production is on the verge of collapse, workers are being laid off in their thousands. The offices are still open, but nobody puts in any work, the lights and fans are out, the bosses' air-conditioners too. Clearing stops in the Reserve Bank, the electric trains halt mid-way, water cannot be pumped into the central reservoirs, the city, filthy in all seasons, is now confronted by the prospect of coping with the long, sultry summer *sans* water. Epidemic is round the corner; once it breaks out, the city, practically without any defences, will be a domino. Colleges and schools work listlessly, if at all, teachers and students come and go, they talk of the hell of the night, they talk of the hell of the day: dark, dark, dark, heat, heat, heat. Young people, who have to sit for their examinations, grope around in the dark, and the stop-gap arrangements for lighting, depending as they do on kerosene and gas, are equally chancy. Shops close early, and those vast sheets of darkness, the streets and thoroughfares, are taken over by the knife-wielding fraternity. Cinemas cancel their shows; the director, shooting a film, is left stranded in the midst of a crucial take; theatrical performances are ordained to unintended climacterics; even before Desdemona could be throttled to her death, the cut-off of power puts paid to Othello's demonic anguish. As economic activity droops here and there and everywhere, that awesome factor of inter-dependence comes to its own: x pulls y down, y pulls z down, z pulls something else down — down, down, down, it is, all the way, Yama the Pit.

Perhaps you nonetheless want to be regaled by the folk tales of Bengal. What ails power supply over here, you ask, and are treated to variegated stories, rich in imagination. The Calcutta Electric Supply Corporation, still a private outfit, has its captive plants; in addition, it draws from the West Bengal State Electricity Board's several units, and from the Damodar Valley Corporation. Each blames the other. Do go round and collect the alibis; it would be prelude to a debilitating sickness. The capacity to generate power is there, it cannot be commissioned in the short period. The capacity is not there, the decision-makers at the top had neglected power planning in the past. The cables are worn out; the cables have been stolen. The transmission line has not been laid; the transmission line has been laid, but anti-social elements have snipped away at the wires at several places; the transmission line is being laid, but foreign exchange is short, and some of the towers cannot be locally assembled. The equipment is all right, but there is some problem in 'marrying' it with imported equipment; the equipment is all right, but the engineers and technicians are not yet competent to handle the sophisticated machinery; there is nothing wrong with the technicians, they have however gone slow. It is a slander to say that the engineers are not working, it is the bureaucrats bossing over them, those who do not have a clue to the technical problems, who have messed everything up. Don't you see, it is sabotage, it is that private unit, the CESC, which, green with envy at the onward march of socialistic power, is at the root of it all; yes, it is sabotage, but no, not the CESC, it is the right reactionaries, teamed up with the radical Left, who are conspiring to get Indira Gandhi down by engineering this breakdown of power. Wrong again, it is sabotage all right, but it is the Left reactionaries who have taken the lead, the radical right is only making up the rear. The boiler has been damaged, because the ash content of the coal is high; the boiler has been damaged, because, it being a continuous process plant, the idiosyncrasy of coal supply has affected stoking operations. No, the boiler has not been damaged, it is the furnace oil which is not of the right specification, and Indian Oil must accept the responsibility. Did you say the coal supplied is of an inferior grade? Not quite, but the coal mills are not operating smoothly because they were not allowed to order spares. No, there are no problems in the coal mills; the Railways however are not moving the coal wagons, and stocks are low. How dare the DVC or the state government's Durgapur Project authority say that the Railways have slipped on the job? It is they themselves who have failed to turn the wagons around quickly. Tut tut, what is the point of shoving facts under the carpet? The fad of self-reliance is now running its course. Bhopal did not deliver in three years what it was supposed to do in six months, and the machinery now supplied is in any case way below standard. Did somebody seriously suggest that the BEL equipment is at fault, or that deliveries were behind schedule? Nonsense, we warned and warned and warned the government of West Bengal that it must allow for several trial runs before commissioning that Santaldih unit. But the chief minister of the state had a date with the Prime Minister on October 15; at his instance, the unit was opened at two in the afternoon on that day, and shut off at three, and has stayed shut since. What have you to gripe about, you didn't want the generation of power, you merely wanted the Prime Minister to commission the plant; well, she did do so, didn't she? You say that in several units, maintenance is poor, and spares have not been ordered in time. But I did my duty, I mentioned to the foreman, the foreman mentioned to the engineer in charge, the latter talked to the assistant general manager, the papers were passed on to the general manager, he transferred them to the managing director, but, what could be done, the Secretary of the Department didn't like his face, the minister had recently met a management expert who told him about inventory control, Finance didn't approve, the CWPC could not be bothered. No, we did send a representation to the CWPC; they relented, but it didn't pass the CCIE. Ah, well, the CCIE did in fact issue a licence, but it was not OCL, and North Block could not be persuaded to offer us some IDA credit. No, you are, each of you, wrong, the story goes back further, the basic deficiency lay in power planning. We are all all right; B C Roy, that great son of Bengal, that great visionary, was all right, Jawaharlal Nehru was all right, his daughter, Indira Gandhi, is a great socialist and a great Prime Minister; it is those wretched ones who belonged to the United Front, and held power in this state, in two spells, for a total of nineteen months during 1967 and 1969-70, who are the culprits: to the gallows, to the gallows, Jyoti Basu to the gallows.

So it is Jyoti Basu who killed cock robin. Unfortunately, diminishing marginal utility has set in, few are any longer impressed by such predictable

pieces of detection. One of the cardinal principles of survival is that if you have muffed production, at least display a modicum of tact and imagination in distributing whatever supplies you have; on the other hand, if you want to practise some sleights-of-the-hand in distribution, at least ensure that there is for the present enough to go round, so that the thieving does not invite too much comment. The powers that be over here do not believe in doing things by halves; they have messed up the generation of power, but the quality of competence they have exhibited in apportioning whatever power there is is even more bizarre. Unless you are one of those lucky ones who somehow always manage to call the coin correctly, your supply of electricity may be cut off any moment of any hour, any day and every day, night and day, mid-night and mid-day; it may not come back for thirty-seven minutes, or nine hours and thirty-seven minutes, or, were it to come back, it may go off again after a majestic interval of twelve and a half minutes. Other cities, Bombay and Madras, can have power rationed, but Calcutta — and West Bengal — are *sui generis*. The generation of power here follows a pattern of stochastic programming which flouts all bounds of system reliability; even the so-called non-parametric methods of solution are of little avail. Therefore while workers come to work, they are unable to do any work, because there is no power. Banks open, but no business gets transacted, power is playing hookey. You cannot pump water, therefore, bucket a rupee, you buy water: the choice is yours, to buy or not to buy water, to die or not to die. Shops cannot transact business, for darkness descends. Darkness, the summer heat, the perspiration, the agony of those, who already, reeling under the impact of inflation, now face the prospect of being indefinitely laid off, or otherwise are threatened with a sharp drop in earnings, since there is so little, not just of production, but of exchange too.

It is not a few paces from chaos, it *is* chaos. Does it matter though? The Congress Working Committee, that body possessed of extra-sensory perception, has asked its drafting committee to prepare a good, well-rounded essay, wherein the hardships of the people will be duly recognised, alongside with the elongated dilation on the theme that violence does not solve any national problem. The All-India Radio is working over-time, violence must be contained. The right to violence is a prerogative which does not belong to the masses. They can be denied their foodgrains. They can be denied their clothing. They can be deprived of their fuel and light. They can be deprived of their locomotion. Their children's education can screech to a halt. Their real income can be halved in the course of a bare two years. But so what, they are being offered *divertissements*. They can watch crooks become ministers, and watch how the profession of pilfering could be combined with the art of scapegoat-mongering. The prerogative of rushing to violence, like the prerogative of enjoying the fruits of democracy, however belongs only to a few. If the state of powerlessness makes you desperate, if the flesh threatens to weaken, if violent thoughts trespass the portals of your mind, read the text of the resolution drafted by the Congress Working Committee, or — since there is still a suggestion of left-over spring in the air — listen to the nightingale bellowing away.

This is an unhinged piece, but must not matter triumph over the mind? Who killed cock robin? Not I, says the Congress Working Committee. At the national plane, it is the fascists and right reactionaries. In Calcutta, it is still Jyoti Basu: the mileage you have been able to extract from that short-syllabic name is really fantastic. And given the frightening species of analysis making the rounds, one might as well forget about any qualitative improvement in the situation in the near future: demagogy is yet to be accepted as one of the fundamental laws of physics.

This is an unhinged piece. The emblem which the State Electricity Board here flaunts is explicit: Power to the People. After this Leninist invocation, what further evidence do you need that those who are blaming the authorities for the current series of woes constitute a fascist conspiracy, and deserve to be put down, mercilessly?

MANAGEMENT DEVELOPMENT INSTITUTE

(Sponsored by the Industrial Finance Corporation of India)

RESIDENTIAL ADVANCED MANAGEMENT PROGRAMME

'MANAGEMENT CHALLENGES : CONSTRAINTS AND OPPORTUNITIES'

At CHAIL (a hill station near Simla in Himachal Pradesh)
JUNE 2 - 15, 1974

The two-week programme is designed to meet the requirement of top and senior management of Indian industry and finance to enable the participants to obtain an up-dated perception of the concepts and tools in the different areas of Management Science. The programme, starting with a focus on the External Environment, traverses the broad areas of Planning, Business Operation, Organisation and Development, Management and Change : Tools and Techniques. The major objectives of the programme are (i) To help develop managerial styles for effective corporate strategies; (ii) To improve perception of trends in relevant aspects of external environment and internal elements of strength and weakness of an organisation; (iii) To up-date understanding of management concepts and tools; (iv) To identify potential problem-areas and to evolve alternative solutions in consonance with organisation goals.

The programme will be conducted by the core Faculty of the Institute assisted by eminent visiting specialists including Dr. D. P. ANTIA (Formerly of Union Carbide); SHRI JAGDISH CHOPRA (Hindustan Lever); SHRI C. D. KHANNA; SHRI BALDEV PASRICHA, SHRI T. M. SEN (I.F.C.I.); SHRI KULDIP PURI (Metal Box); Dr. K. B. RAO (N.I.D.C.); SHRI C. P. SHAH (Bank of Baroda); SHRI C. S. SHRIKHANDE (Philips India).

Standard fee — Rs. 3750/-
Jt. Programme Directors : M. L. Bery & K. Prasad
For brochure and further details, please write to :

The Revolt Enters the Congress

Romesh Thapar

THE inevitable has happened. The studied refusal of Indira Gandhi and her closest colleagues to react positively to the political and economic crisis, which is now spilling over into all areas of national activity, has nourished a rebellious mood in the leading echelons of the ruling party. A first demonstration was witnessed over the week-end in the Congress Working Committee. The debate was no longer on supposed ideological issues. The 'leadership' was in the dock for its inability to lead. 'Leadership' means, of course, Indira Gandhi.

Indira Gandhi continues to maintain her silent, detached, faraway posture. It is disastrous as a psychiatric gimmick because it damages morale throughout the Government of India, and at every level. "What will happen if we go on like this?" — that is the question which is invariably asked in the Capital. The extraordinary refusal to lead is naturally analysed and re-analysed by those who cannot accept simplistic surface signs. Interesting theories are being projected.

One group (oppositional, left-wing, radical) argues that Indira Gandhi is frightened by the forces and compulsions she herself let loose. To achieve a dramatic turn in the situation, she is permitting the political and economic crisis to develop in order to justify massive aiding operations and the entry of foreign capital. The recent story of Birlas and General Motors is seen as a kind of kite flying before all the other projected deals are announced. That such deals are being negotiated or "entertained" is generally accepted.

A second group (centrist, academic, professional, bureaucratic) is more political in its analysis of Indira Gandhi's stratagems. Drawing an analogy with the way in which the Naxalite threat in Calcutta was handled by getting the pulverised, exhausted population of the city to denounce its young "saviours", it is argued that the Prime Minister is carefully and deliberately allowing the political and economic situation to develop such deadly dimensions that a national emergency can be declared and the Constitution suspended. This theory is advanced by those who see Indira Gandhi as an undemocratic, autocratic manipulator of the present system.

A third group (trading, business, right-wing) is content to describe Indira Gandhi and her government as a bunch of irresponsible, unintelligent political operators. The thesis is that these wretched people have been living on the work done in the Nehru era and the economic inputs made at that time. Ugly comparisons are drawn between the old style and the new. Little confidence is expressed in the future unless "the lady" is thrown out.

And, finally, a fourth group (young, uncommitted, impatient, post-Independence) would like the present anger to build to a revolt which shakes the present system of political and economic management. The argument is that there is bound to be some improvement following such events. It is a numerous element and watches, often from the sidelines, for someone who makes sense.

Significantly, the supporters of Indira Gandhi and her government are silent. Occasionally, a fool stirs and makes a *durbari* remark which boomerangs. Do I have to list them? Not really. It is enough to say that the supporters are on the defensive, and for the first time since Indira Gandhi became Prime Minister.

It is necessary to record the Capital's thinking on the government, but the fact that this thinking is very much part of the whispered conversations of the Congress factions is significant. The revolt which stirs thinking in the towns of India and which is bound to find its way to the villages has now entered the ruling party. This fact is recognised and gives the critics within the party, whatever their exact ideological position, the strength to articulate their views.

For the moment, only angry criticism is heard. If Gujarat and Bihar inspire other states, then we may even see attempts to dissociate from the odium of the Congress party, corrupted, cynical, incapable of action. Of course, the tempo of the revolt is very much a matter dependent on Indira Gandhi's tactics and stratagems. This is acknowledged by her most bitter critics because the alternative to her does not crystallise.

All this speculation takes place against the back-drop of the threatened railway strike. At this moment of writing it looks very much as if the activists are being reduced to a minority. But one can never be sure of the end result with so much incompetence concentrated at critical points in the Government of India. The preparations for a confrontation, we are told, are well in hand. Keep your fingers crossed.

Indira Gandhi must be doing likewise as she expends four days in Iran. A major collaboration is being planned. But it will need more than sweet chatter and invocations. Too much power is in the hands of arrogant, unsure bureaucrats. Too little power is exercised by the men with expertise. We cannot afford to make mistakes and I hear we are, even in joint project estimates. More about that later.

HOW TO SAVE MONEY ON INCOME TAX

by R. N. Lakhotia

Rs. 35.

INDIA's top tax consultant shows you:

- Items of income exempt from tax.
- Deductions in computing income-tax.
- Maximum tax benefits from salary.
- Exemptions and deductions in securities; income from business, professions, property, capital gains tax etc.
- How to avoid clubbing and aggregation of income of family members.
- Use of losses to reduce tax liability.
- Reduce tax liability of firm and partners.

Plus numerous more tips you will treasure.

FROM OUR CORRESPONDENTS

THE ECONOMY

Abdication by Government

(From a Special Correspondent)

THE index number of wholesale prices (base: 1961-62=100) galloped by 64.4 index points in 1973-74 (from 218.5 to 282.9) compared with a rise of 26.2 points in the previous year. These two years together have added 90.6 points to the index or roughly equal to the rise (92.3 points) in the previous ten years from 1961-72. In percentage terms, the rise in prices works out to 29.5 per cent in 1973-74 on top of a rise of 13.6 per cent in 1972-73. The highest increase in any year in the past was 15.6 per cent in 1966-67. Taking the last two years together, the rise in the index comes to over 47 per cent. The average index for 1973-74 at 254 (which should broadly reflect the national income deflator) shows a rise of 22.7 per cent as compared with a rise of 9.9 per cent in 1972-73. In the previous three years, the annual average indices had shown modest increases: 3.9 per cent in 1969-70, 5.5 per cent in 1970-71 and 4 per cent in 1971-72. Thus, the Fourth Five-Year Plan saw an overall price rise of as much as 71 per cent on the basis of the weekly indices or 53 per cent on the basis of the annual averages of the base year and the terminal year, 1968-69 and 1973-74.

A few distinctive features of the price situation in 1972-73 and 1973-74 deserve attention. First, the behaviour of commodity prices in these two years, and in 1973-74 particularly, was marked by the absence of any post-harvest seasonal fall in the general index. The index was at 192.3 towards end-March 1972; it rose almost uninterruptedly to 207.6 by end-September 1972 on the eve of the kharif harvest of that year, unlike in 1971-72 when the index at end-September 1971 was 191.9 but declined to 187 in December 1971 and remained at 192.3 in March 1972; in still earlier years, there used to be a definite fall of 3 to 5 per cent in the index during the post kharif harvest period in October to March. By end-March 1973, the index had risen to 218.5. Thereafter, during the whole of the following one-year period, not only has the rise in the index been persistent but substantial — on an average 2.5 per cent a month.

Secondly, the price increases have been not only widespread but also large in almost every group and sub-group of commodities. The two major groups which contributed the most to the rise in the price index are 'food articles' and 'industrial raw materials', which together have 53.4 per cent weightage in the general index. Prices of 'food articles' rose by 28.7 per cent in 1973-74 on top of a rise of 15.5 per cent in 1972-73 and those of 'industrial raw materials' rose by 36.8 per cent on top of a rise of 32.4 per cent in the previous year. In these two years, the price index of 'food articles' rose by 49 per cent and that of 'industrial raw materials' by over 80 per cent. The weighted contribution of these two groups to the price rise of the two years would work out to over 60 per cent.

In the 'food articles' group, the index for 'foodgrains' rose by 28.4 per cent in 1973-74 and 17.4 per cent in 1972-73. Among foodgrains, rice prices recorded the highest rise of 35.2 per cent in 1973-74 in addition to an increase of 17.4 per cent in 1972-73, followed by pulses the index for which rose by 29 per cent and 24.2 per cent, respectively, in the two years. In these two years together, rice prices rose by 59 per cent and those of pulses by over 60 per cent. Jowar prices rose by 26.2 per cent in 1973-74 and 16.5 per cent in 1972-73 or by 47 per cent in the two years together. Among other food items, the important ones — edible oils, milk and milk products, fruits and vegetables, fish, eggs and meat — registered price increases ranging from 42 per cent to 92 per cent in the two years.

Among 'industrial raw materials', phenomenal price increases have occurred in raw cotton and groundnuts. The price index of raw cotton had risen to 338.1 by end-March 1974 from 166.3 at end-March 1972, recording a rise of 103 per cent in two years. The index for groundnuts rose from 189.6 to 376.8, i e, by 99 per cent.

In the rest of the commodities, be they agriculture-based or industrial, the price increase in 1973-74 has generally been over 20 per cent. Only a few commodities — wheat, sugar, leather products (shoes) and the minor group 'liquor and tobacco' — experienced price increases of less than 10 per cent. However, it is possible that in respect of wheat only the official quotations were included; if so, the index grossly underestimates the rise in prices. Only two important commodities, viz, gur and raw jute, showed a decline in prices, 6.5 per cent and 30 per cent respectively.

Thirdly, when the current spell of inflation began in early 1972, the major sources of pressure on the general price level were 'food articles' and 'industrial raw materials' — that is, largely agricultural commodities. This situation continued almost till the end of 1972-73; in that year, the wholesale price index of agricultural commodities (which have a weight of 33.2 per cent in the general index) rose by 21.2 per cent, while the general index rose by 13.6 per cent. As a result, there was a sharp shift of the crude domestic commodity terms of trade in favour of agricultural commodities. The ratio of the index of wholesale prices of 'agricultural commodities' to that of 'manufactures' rose from 114.4 in March 1972 to 130.8 in March 1973. In 1973-74, while the prices of agricultural commodities continued to rise, those of 'manufactures' also followed suit. The indexes for 'manufactures', 'machinery and transport equipment' and 'chemicals' registered increases of 27.6 per cent, 18.2 per cent and 26.2 per cent, respectively, as against increases of only about 5 per cent in each of them in the previous year. Even in 1965-66 and 1966-67, the earlier worst years of inflation, the price index of 'manufactures' had risen only moderately. But though prices of manufactures rose substantially in 1973-74, the crude terms of trade continued to move in favour of agricultural commodities. In February 1974, for which month data are available, the ratio of the index of agricultural commodities to that of 'manufactures' further rose to 134.3. However, the rate of increase had slowed down as the prices of manufactures rose quite sharply in 1973-74. This suggests that the rise in the prices of wage goods and industrial raw materials has begun to get reflected in the prices of manufactures. And among manufactures, those items relevant for investment have also started catching up. As a result, the project costs visualised two years ago might witness overruns of around one-third.

Lastly, the most important feature of the price situation in 1973-74 is that despite noticeable increases in output and overall availability of particular commodities or group of commodities their prices have not only failed to record any fall but have shown phenomenal increases. In foodgrains, the output of kharif crops, which had declined from 69 mn tonnes in 1970-71 to 63 mn tonnes in 1971-72 and to 57.1 mn tonnes in 1972-73 is said to have made a sharp recovery in 1973-74 to 67-68 mn tonnes. The output of kharif rice is estimated to have risen to 40.5 mn tonnes from 35.9 mn tonnes in the previous year; in the previous best year of 1970-71 output of kharif rice was 39.6 mn tonnes. Yet rice prices rose by as much as 35.2 per cent in 1973-74. Jowar (kharif) and bajra are estimated to have achieved an output of 6 mn tonnes each against 4.9 mn tonnes and 3.8 mn tonnes, respectively in 1973-74. The case of bajra, which registered a small price fall of 1.7 per cent in the year, is a special one: the fall occurred because of the imposition in October 1973 of informal price control by the Maharashtra government which, continued upto the end of January 1974 and the stoppage of trading in bajra following reports of bajra poisoning (wholesalers and retailers were asked in December 1973 to stop sale of bajra in Maharashtra). However, after the resumption of trade there has been a rise in bajra prices in the Bombay market; by mid-April they were 15 per cent above the end-January 1973 level.

The contradiction of rising prices despite higher output is best seen in raw cotton. Despite a reduced output of the crop in 1972-73 at 55 lakh bales compared to 66 lakh bales in 1971-72, the supply position of raw cotton in that season was relatively comfortable as a result of a large carryover stock of 24 lakh bales from the previous season. This was followed by a sharp improvement in output by at least about 5 lakh bales in 1973-74 (September-August). The carryover stock from 1972-73 season is expected to be 30 lakh bales. Despite imports being placed lower at about 1.4 lakh bales against 4.6 lakh bales, this would leave a stock of over 20 lakh bales of raw cotton. Despite such a comfortable supply position, prices of raw cotton registered a sharp increase of 73.2 per cent during the financial year 1973-74.

Likewise, the output of oilseeds is expected to go up by 2.7 mn tonnes to 9 mn tonnes, falling short of the peak reached in 1970-71 by only 0.3 mn tonnes. Groundnuts output is higher at 5.6 to 5.8 mn tonnes against 3.9 mn tonnes last year, a rise of over 45 per cent. Yet oilseeds prices were up by 41.4 per cent and those of groundnuts by 88.4 per cent in 1973-74 (April-March).

The behaviour of raw jute prices is the exception to this pattern in that they seem to have responded to the increase in output from 65 lakh bales to about 75 to 80 lakh bales. With recorded imports from Bangladesh of about 6 lakh bales and carryover stock of about 12.8 lakh bales, overall availability would be between 94 and 99 lakh bales against 84 lakh bales in 1972-73. There is also considerable smuggling of raw jute from Bangladesh which is now placed between 5 and 10 lakh bales. The market is thus flooded with raw jute. Against this, due to frequent disruption of power supply, consumption of raw jute by mills will not go beyond 72-73 lakh bales against 71 lakh bales last year. There is thus a considerable surplus of raw jute in the market and with the mills.

Wheat output last year, despite the crash programme and all that, was a disappointment. Official estimates had placed it at 30 mn tonnes in 1972-73 but subsequently scaled it down to 26.4 mn tonnes and further to 24.9 mn tonnes. It is very likely that part of this scaling down was intended to explain away the government's failure to procure the targeted quantum for public distribution. Despite the now widely recognised tendency of declining productivity in wheat, the output in 1972-73 was unofficially estimated at around 26 mn tonnes at least, the same as in 1971-72. This estimate is supported by the relatively easy availability of wheat in the open market. This is possibly why wheat recorded the lowest increase in price among foodgrains, 6.0 per cent in 1972-73 and 9.5 per cent in 1973-74. However, the lower order of increase in the wholesale price index of wheat in 1973-74 is obviously due to the inclusion of only the official price quotations following the government takeover of the trade in wheat.

Besides wheat, the output of coarse grains and pulses suffered a severe setback in 1972-73. Output of pulses was estimated at only 9.5 mn tonnes against 11.1 mn tonnes in 1971-72. Likewise, jowar output was placed at 6.4 mn tonnes against 7.7 mn tonnes in the previous year and the output of bajra at only 3.8 mn tonnes against 5.3 mn tonnes. In some of these crops, output since the inception of the new agricultural strategy has been consistently below the peak levels achieved as early as in 1960-61. This is the result of shift of acreage away from them. It could be said that because of such sharp declines in output in the previous year, the improvement in 1973-74 in the kharif output of coarse grains and pulses possibly did not make much of an impact on the price index.

On the whole, however, the supply of the key commodities was significantly better in 1973-74 than in the previous year. National income at 1960-61 prices is estimated to have grown by about 6 per cent compared with a decline of 1.7 per cent in 1972-73 and a rise of 1.7 per cent in 1971-72. The increase in the commodity output segment of national income should be still higher. The commodity composition of total output has moved in favour of agricultural commodities, overall agricultural output being estimated to have risen by over 12 per cent. Foodgrains output is likely to be around 108-110 mn tonnes, which will give a rise of not less than 14 to 15 per cent. Among foodgrains, rice output in 1973-74 is expected to be about 43.5 to 44 mn tonnes assuming that the summer rice output is 3 to 3.5 mn tonnes. There would thus be an additional rice output of over 5 mn tonnes, which is substantial by any reckoning. In wheat it is probable that the output may not exceed 26.5 mn tonnes due to the shortage of fertilisers and the declining trend noticed in productivity. Among coarse grains, bajra output is expected to achieve a sharp rise from 3.8 mn tonnes to 6 mn tonnes and output of jowar from 6.4 mn tonnes to 8.5 mn tonnes. Similar increases are anticipated in the output of pulses.

The latest *Economic Survey* has sought to argue that while the output of foodgrains in 1973-74 may have risen to somewhere near the earlier peak output of 1970-71 (108.4 mn tonnes), the population and the needs of society as also monetary outlays have also grown over the period. But therein lies the need for the public management of the food economy. If the needs of society are the criterion, the Fourth Plan had placed a target of 129 mn tonnes whereas we have not been able to cross even the 110 mn tonnes mark so far. Secondly, given the existing pattern of income distribution, a per capita availability

of 14 to 14.5 ounces per day is sufficient to ensure relative price stability in foodgrains. If the effective demand of the poor improves, the demand for food may go up. But the incomes of the poor have not seen any improvement. If there has been some semblance of a balance in between demand for and supply of foodgrains, as happened during 1967-68 to 1970-71, it is essentially the result of persistingly low effective demand of the poor arising from lack of growth of employment. Thirdly, there is reason for suspicion that foodgrains output is being considerably underreported for various reasons: by the surplus states to avoid obligations under public procurement; by the deficit states to secure larger supplies from the central pool; and by areas hit by distress to get larger financial assistance, including concessional assessment of land revenue.

The point that we have sought to make is that the unprecedented increase in the price level is the result by and large of factors other than the supply-demand balance. This is evident most clearly from the 'large increase in the price index of 'industrial raw materials', particularly of raw cotton and oilseeds, despite their vastly improved availability.

Industrial Stagnation

In the industrial sector, the performance with respect to both output and employment has been very discouraging. The CSO's average index of industrial production (base 1960 = 100) for the period January-October 1973 at 196.4 shows an absolute decline of 1.2 per cent over the corresponding period of 1972. Advance figures of certain key commodities like mill cloth, cotton yarn, jute textiles, cement, aluminium, etc, show absolute reductions during the calendar year 1973 ranging from 1 to 8 per cent.

It is true that a few industries in the engineering sector such as heavy engineering, heavy structurals, metal products and transport equipment have done better as the result of a few large projects getting under way. Diesel engines showed a phenomenal increase in output in the wake of the drought in certain areas and the general shortage of electricity. Electric motors and power transformers have received some impetus from increased outlays on power generation and transmission. Railroad equipment and motor vehicles showed only marginal improvement in output. The significant growth in the output of industrial machinery is partly due to the implementation of a few projects in the pipeline; for the rest the increase is fictitious arising from the increase in the value of the machinery, since for industrial machinery the value of output rather than the physical output is used for the index. In any case, these four sectors, showing improvement in output, have a weightage of less than 15 per cent in the general index and hence they could be hardly expected to make any difference to the otherwise all-round stagnation in the industrial sector. Besides, the increased output of these four items has not made any noticeable impact on their prices. Despite the existence of heavy under-utilisation of capacity, the price index of machinery and transport equipment has spurted by 18.2 per cent in 1973-74 (among them, non-electrical machinery by 22.6 per cent, electrical machinery by 12.1 per cent and transport equipment by 14.4 per cent).

Immediately, the discouraging performance of industry is attributable to the mismanagement of the four key sectors of the economy; railways, power, coal and steel. But in a wider context it reflects the cumulative impact of stagnation in aggregate investment and in industrial investment in particular in the economy. However, given the all-round stagnation in industrial output, the demand for products from the consuming industries should in the normal course have been low, as happened in 1966 and 1967 and 1970 and 1971, and hence their prices should not have risen so fast. In industry, again, the supply situation alone does not, therefore, explain the order of increase in prices.

The explanation to the price rise in the last two years has to be sought in more general factors. To summarise them:

(a) The government has failed completely in supply management. It has failed to implement even a minimum programme of public procurement and distribution in foodgrains. There has been no rational policy of building buffer-stocks of key industrial raw materials. Prices fixed for state procurement have been in excess of what would be warranted by cost and even market considerations. Rich farmers, traders and manufacturers have been left free to withhold stocks and sell in the 'unofficial' markets at exorbitantly high prices. Finally, rich farmers, traders and industrialists have realised, particularly after the failure of the state take-over of the wholesale trade in wheat, that the government can be pressurised into abandoning inconvenient policies.

(b) There has been total absence of demand management. There have occurred vast increases in money supply and aggregate monetary resources during the past three years as a result of large increases in net bank credit to government and credit to the commercial sector unrelated to the growth in productive assets or in real output. No effective measures have been taken to curb the scourge of unaccounted money. Non-functional, speculative demand has been augmented through the vast expansion in commercial bank credit which has also helped excessive inventory build up in different segments of industry. The absence of an effective interest rate policy in keeping with the trends in the commodity prices, etc, has not only not provided any incentive for rational inventory management but has also created a series of distortions in the capital market.

(c) Lastly, investment in the economy has been stagnant. The cumulative impact of this has been felt in the mounting scarcities of a series of key commodities like coal, steel, non-ferrous metals, basic and intermediate chemicals, dyes, cement, railway wagons, commercial vehicles, paper and paper products, and transport and power. This in turn is the result mainly of the fact that over a period of years a persistently shrinking proportion of total government expenditure has gone for development or for creating physical assets. As a result, private sector investment too has sagged. The financial resources mobilised over the successive Plan periods have far exceeded the original financial targets but the physical achievements have lagged far behind.

Failure of Supply Management

Let us take these points for more detailed consideration, beginning with the failure in supply management, especially in regard to foodgrains. The physical supply of foodgrains in 1973-74, we have seen, did not warrant the rise in foodgrain prices that took place. The explanation is the poor management of the food economy. The government has persistently failed to gain command over the critical minimum of 11 to 12 mn tonnes of foodgrains out of the marketed surplus to satisfy even the existing grossly inadequate public distribution system. From out of the 1973 rabi output, government could procure only 5 mn tonnes which not only fell short of the reduced target of 6 mn tonnes but also of the actual procurement of 5.1 mn tonnes in 1972. From out of the kharif rice output, it could procure just 3 mn tonnes against the target of 5 mn tonnes. Against the target of procuring 1.65 mn tonnes of coarse grains actual procurement was only 0.3 mn tonnes. Repeated increases in procurement prices have not helped the procurement drive. With the tardy progress of public procurement, stocks of foodgrains with the government declined to the low level as 2.8 mn tonnes at the end of December 1973.

Similarly, despite increases in sugar output, the government has deliberately reduced the quantum of monthly releases of sugar, pushing up open market prices. In the case of raw cotton, a major factor responsible for the sharp increase in prices is the permission granted by the Forward Markets Commission to trade in non-transferable specific delivery contracts in October 1973 in many important new crop varieties. Besides state agencies in Maharashtra and Gujarat have been vying with each other in offering higher prices to their respective growers. At a time when prices were rising the Maharashtra government withdrew the government monopoly in trade in Kapas which pushed up prices further. In addition, the Cotton Corporation of India also operates as a bulk buyer of raw cotton. Despite the galloping prices, the Textile Commissioner failed to impose stock restrictions on mills till the second week of April 1974. Similarly, in oilseeds, the procurement of groundnuts by a state trading agency in Gujarat has resulted in severe scarcity conditions outside the state.

Even in regard to industrial commodities output of which has not risen, there is no justification for the very sharp increase in prices. One reason for the rise in prices of industrial commodities is the tendency to pass on every cost increase to the consumer automatically. But the major cause is speculative holding of inventories of raw materials and finished goods. This is corroborated by the colossal expansion of bank credit far beyond what the growth of real output warrants.

Unchecked Monetary Expansion

This brings us to the second point, demand management. Data on aggregate demand as represented by total national expenditure are not available. Nor can the trends in any segment of it — consumption expenditure (public and private), investment expenditure (public and private) and net imports of goods and services plus net factor income receipts from abroad — be estimated accurately. But, certain trends in 1973-74 are discernible. First, aggregate national expenditure in money terms must have grown very substantially, as can be seen from the expansion of as much as Rs 1,339 crores (14.2 per cent) in money supply in 1973-74 against Rs 1,274 crores (15.7 per cent) in 1972-73. The national expenditure in a given year also gets augmented by the increases in money stock in the preceding few years. The growth in 'money supply' (demand deposits plus currency) has accelerated thus: 11.8 per cent in 1970-71, 14 per cent in 1971-72, 15.7 per cent in 1972-73 and 14.2 per cent in 1973-74. Inclusive of time deposits, the growth in aggregate monetary resources has been 13.4 per cent, 16.7 per cent, 17.9 per cent and 16.5 per cent, respectively, in these years. Against this, the rate of growth in real income had been declining upto 1972-73 thus: 4.3 per cent in 1970-71, 1.7 per cent in 1971-72 and — 1.7 per cent in 1972-73. The estimated increase of about 6 per cent in 1973-74 is a welcome reversal of the trend.

Secondly, the government sector has been appropriating a larger share of the increased national expenditure every year. There was some slowing down of this trend in 1973-74. In 1973-74 net bank credit to the government sector was Rs 970 crores against Rs 1,324 crores in 1972-73, while gross credit to the commercial sector amounted to Rs 1,386 crores against Rs 1,123 crores last year. The government also mobilised lower amounts of tax and other non-tax revenue in 1973-74 than in 1972-73. This is to some extent reflected in the slower growth of total expenditure of the Central government by Rs 452 crores (6 per cent) against Rs 1,139 crores (17 per cent) in 1972-73 and Rs 1,134 crores (20 per cent) in 1971-72. In sum, though national expenditure increased in 1973-74, the private sector appropriated a larger share of this expenditure than in the previous year.

Thirdly, of the increases in expenditure of both the public and private sectors in 1973-74, a larger share seems to have been earmarked for consumption than in the previous year. As a result, the share of investment in both the public and private sectors has dwindled, reflecting a decline in the proportion of saving and investment in national income in 1973-74.

The major sources of investible resources for the private corporate sector are: retained savings, loans from term-lending institutions and fresh share capital. Quick studies show that there was a decline of about 40 per cent in the retained savings of private corporate bodies. Fresh capital raised also declined by Rs 20 crores from Rs 90 crores in 1972-73 to Rs 70 crores in 1973-74. On the other hand, disbursement by the term-lending institutions has been stepped up, though a part of it was reportedly used for working capital. In sum, it is obvious that investment in money terms in the private corporate sector would have been only marginally higher than in the previous year. But in real terms, after allowing for the higher cost of investment, there is unlikely to have been any increase. Financial assets of the household sector also failed to grow in 1973-74 at the same rate as in the previous year. Indications are that in the wake of reduced cement, steel and other construction and investment materials, overall private investment was lower than in the previous year in real terms.

Likewise, there are indications that public sector investment too has lagged behind the growth in public consumption expenditure. For instance, developmental expenditure (Rs 3,848 crores) as a proportion of the total expenditure of the Central government was to rise from 51.3 per cent in 1972-73 (RE) to 53.1 per cent in 1973-74, according to the budget. Now it is likely to register a sharp decline to about 46 per cent. Again, though the total expenditure of the Central government expanded by Rs 452 crores, capital formation expenditure was estimated to go up by only about Rs 107 crores, or just 33 per cent of the increase in total expenditure, instead of 37.7 per cent visualised in the budget estimates. The budget had sought to keep consumption expenditure pegged at Rs 2,269 crores in 1973-74 but the revised estimates place it higher by Rs 69 crores at Rs 2,331 crores. But more important, total current transfers were to decline from Rs 1,841 crores in 1973-74, whereas now they would rise by Rs 247 crores to Rs 2,099 crores.

The share of development expenditure in the total expenditure of the Central government was as high as 59.4 per cent in 1964-65, but it had dwindled to 46.6 per cent by 1970-71; in

1972-73 it rose to 50.2 per cent; the budget estimates for 1973-74 had placed it still higher at 53.1 per cent, but the revised estimates now put it at 46.4 per cent. The share of capital formation expenditure in the total expenditure of the Central government was 48.3 per cent in 1964-65 but by 1971-72 it had dwindled to 32.2 per cent. In 1973-74 it was budgeted to rise to 37.7 per cent, but the revised estimates put it at 33 per cent.

Lastly, because of the decline in the proportion of resources mobilised by the government devoted to investment, while resource mobilisation for the Plans has exceeded expectations, Plan targets in the key sectors have failed to be achieved. The total public sector outlay visualised on the Fourth Plan was Rs 15,902 crores (at 1968-69 prices), but at current prices the actual outlay would come to Rs 16,201 crores. In real terms, however, the Fourth Plan would show a shortfall of about 20 per cent. Foodgrains output should have reached 129 million tonnes in 1973-74 but the actual achievement would not exceed 110 mn tonnes. Rice output was to be 52 mn tonnes but the actual production would be 44 mn tonnes. The sharpest shortfall has occurred in coarse cereals (estimated achievement of 28.5 mn tonnes against the target of 33 mn tonnes) and pulses (11.5 mn tonnes against 15 mn tonnes). In basic industrial goods, against the coal output target of 93.5 mn tonnes, the actual production is placed at 79 mn tonnes. The output of mild steel is estimated at 5.44 mn tonnes against the target of 8.1 mn tonnes. Steel castings were to be of the order of 2.25 lakh tonnes against the achievement of 0.8 lakh tonnes and forgings 2.20 lakh tonnes against 0.86 lakh tonnes. The cement target was 18 mn tonnes against the likely production of 16 mn tonnes. The output of commercial vehicles was targeted at 85,000 at the end of the Plan whereas it has just reached 48,000. Output of railway wagons was only 13,000 while the target for 1973-74 was 21,500 wagons and the industry's output capacity is over 40,000 wagons. The index of industrial output (base 1960 = 100) was to have risen to about 237 against the present index of 199, showing a rise of only 23.6 per cent against the anticipated increase of 47.3 per cent.

The foregoing account brings out certain key elements of the current economic scene. They are:

(1) Though on the face of it the imbalance between aggregate supply and aggregate demand had narrowed a little in 1973-74, the gap was still wide. Besides, the demand pressures of a given year get considerably augmented as a result of the additions made to monetary demand during the past few years. During the years 1970-71 to 1972-73 money supply increased even as real income growth had decelerated. Even so, the unprecedented rise in commodity prices in 1973-74 cannot be explained only by the imbalance between supply and demand.

(2) On the supply side, the overall supply as well as supply of individual commodities were noticeably better in 1973-74 than in 1972-73. Therefore it was not so much supply shortages as the speculative demand for commodities facilitated by the confluence of a series of circumstances that was responsible for the price inflation. Prominent among these circumstances are: (i) augmentation of the incomes of rich farmers, traders and industrialists as a result of the earlier increases in commodity prices, which has increased their holding power; (ii) large government disbursements, including by deficit financing, for non-developmental purposes, much of which has gone to the richer sections of the community; (iii) unprecedented expansion in bank credit that has further augmented the power of the rich to hold commodities; and (iv) above all, failure on the part of the government to implement its policy of public procurement and distribution, particularly for foodgrains. In foodgrains as well as in other commodities, state trading has operated in such a way that it has actually become detrimental to the objectives of price stability. These operations have prevented the economy from deriving the benefits of increased output as a result of the buying agencies themselves fixing higher prices than warranted by the market and cost conditions. State trading in farm commodities has failed to bring about any correction of inter-crop price variations. There is also no sign of a buffer-stock policy to even out price fluctuations in different seasons.

(3) On the demand side, financial mismanagement has taken place in the government sector and, with the government's connivance, also in the private sector. Certain ills of the management of the private sector are obvious: absence of cost consciousness, lack of disincentives for excessive build up of inventories, passing on of every increase in cost to the consumer, lack of any desire to save and undertake large investments in critical areas, heavy reliance on the term-lending institutions for finance, reluctance to widen the capital base of companies, pre-empting of industrial licences and finance, undertaking investment in low-priority, luxury goods industries, etc. For all these, one part or the other of government policy is responsible. In the provision of term capital, for instance, the term-lending constitutions have been generous with ready and cheap loans. Similarly, the licensing machinery has functioned as if it were unaware of Plan priorities.

(4) In the larger context, these ills in the private sector arise out of the failure of the public sector to sharply raise its savings and investment. About 70 per cent of the investible resources in the economy are appropriated by the governmental sector for defence, development and social welfare. Each one of these has got, over the past eight years, a lower proportion of total disbursements indicating that vast funds are being squandered away on current consumption. All such expenditures, in the absence of additional employment-generation, which is the only source of income for the poor, have benefited the richer tax-evading classes of society and have been responsible for the distortions in the demand as well as investment pattern in favour of luxury goods.

(5) The key to giving a push to industrial activity and investment, therefore, lies in a radical change in the finances of the government sector. Having allowed non-developmental expenditure to grow unchecked, the government will find it difficult to stop it from growing further. But unless the growth in it is stopped, there can be no hope of the economy reviving. For instance, financial resources transferred to state governments and other parties now form about 36 to 37 per cent of total Central expenditure compared to 25 per cent during the Third Plan period. If the transfers are now brought back to this level of 25 per cent, the saving could be about Rs 1,000 crores. Once such radical measures are effected, it will have a chain reaction. The state governments will be compelled to tax the rich farmers, to manage the state electricity boards better and earn higher revenues. In any case, without a revolutionary change in the management of government finances, the vicious circle of growing non-development expenditure and stagnant investment cannot be broken.

RAILWAYS

Pre-emptive Strike by Government

M R

THE government and the Railway Board had three whole months in which to negotiate with the unions to avert the strike called for May 8. But those in charge of the negotiations with the unions chose instead to make the absence of a formal strike notice the pretext for not holding substantive negotiations. When, however, the notice was formally served on April 23, it was promptly declared that such a strike would be illegal. The DIR was invoked for this purpose. And, even before the suspended negotiations could be resumed on April 27, a pre-emptive strike in fact came from the government in the form of cancellation of a large number of passenger trains.

The unions, on the other hand, had made it clear that they would like to avoid the strike if a negotiated settlement could be arrived at before the May 8 deadline. The unions did not seem averse to extending the deadline — more than once if need be — if there was a real breakthrough in the negotiations. The unions were even prepared to put off the strike until July, reckoning that the government would be more vulnerable to their demands eight weeks later. But the government seems to have been bent on forcing the strike on the unions at the time of its own choosing as it had made all the preparations to counter it — while, all the time, it has been placing the onus of it on the unions.

For weeks now, the Political Affairs Committee of the Cabinet has been discussing contingency plans to meet the strike situation. In the corridors of Rail Bhavan there has been talk of stoppage of all passenger trains for a whole month, if need be, to give priority to the movement of essential goods during the strike. The Political Affairs Committee was evidently more concerned with crushing the strike than with giving thought to the demands of railwaymen. Preparations to this end have been meticulous. A secret circular was issued, directing that no leave should be given to railwaymen. Retired railwaymen were being recalled and union functionaries were being detained — notwithstanding L N Mishra's assurance that there would be no such action during the negotiations.

The consensus on a charter of demands earlier this year had suggested that the first-ever all-India railway strike was a distinct possibility — especially as none of the assurances given to the railwaymen earlier had been fulfilled. But the government's response to the situation was to use strong-arm tactics. The negotiations were, therefore, bound to run aground.

The locomen's bitter experience had exposed that the government cannot be trusted to honour an agreement. The accord on their demands, following their strike in August 1973, was not honoured. There was thus another agitation in December 1973 and in 1974 a new agreement was reached. The sectional strikes of railwaymen in 1973 should have given the government sufficient indication of what was to follow. The Railway Labour Conference on February 4, 1974, provided it yet another opportunity to judge the railwaymen's mood. On February 27, the National Convention of Railwaymen, called on the initiative of the All-India Railwaymen's Federation, in which all the major unions (recognised or unrecognised) participated decided to serve notice on the government on a six-point charter of demands. The fact that some of the unions were not recognised ones was made the pretext for refusing to negotiate — though only last year the Railway Board had to eat humble pie by being obliged to negotiate for the first time with the 'unrecognised' union of locomen.

At last, much to the discomfiture of the Railway Minister and his Board, the Labour Minister initiated informal talks not only with the 'recognised' All-India Railwaymen's Federation but also the newly formed Indian Railway Workers' Federation dominated by the CPI and the category-wise (unrecognised unions) who were party to the six-point charter of demands. He also brought within the ambit of the talks the various central trade union organisations — among them the AITUC, the RMS, the CITU and the HMS. Only the Congress-dominated National Federation of Indian Railwaymen (another 'recognised' body) chose to conduct separate negotiations behind the scene.

These informal talks were meant to pave the way for the formal negotiations from April 15, between Member (Staff) of the Railway Board and the National Co-ordinating Committee of Railwaymen. The latter Committee included not only the recognised AIRF but also various unrecognised unions. The CPI and the CPI(M) leaders who have a hold over many of the unrecognised unions evidently persuaded the AIRF president, George Fernandes, to fall in line with them as the real strength lay with the unrecognised category-wise unions whereas the AIRF, like the NFIR, is little more than an ornate body. Thus indirectly, the unrecognised unions became party to the negotiations carried on with the Board through the co-ordination committee which had set up a negotiating committee.

But the Railway Board had the same reply to each of the six demands: they were not negotiable. Meantime, the government mounted the propaganda that the demands would cost the taxpayer another Rs 450 crores per year. In any case, the negotiations were irrelevant since the Member (Staff) of the Railway Board had no mandate and the government was in this way merely trying to wear the unions down. When it was clear that the negotiations had come to a dead-end, L N Mishra announced that the Board Member's word was not the last one. Negotiations were renewed, but without a breakthrough. The unions finally served notice of a strike.

Bonus is one of the demands. Even the NFIR agrees with all the other unions on the bonus issue. The Railway Board has contended that the Railways are not an industry (though even the ILO had held them to be so as early as in 1916) and, therefore, that there was no question of conceding the 8.33 per cent bonus demand. At the same time, the Board has taken the position that the unions should await the report of the Bonus Review Committee.

Another major demand concerns dearness allowance. Though the cost of living index has touched 260 points, the railwaymen's Dearness Allowance is based on the consumer price index average for 12 months.

The unions are demanding a need-based minimum wage, pending which their wages should be brought on par with those of other industrial workers. The Board's contention is that this is a complicated question as wages in railways are related to wages in other departmental undertakings such as Post and Telegraphs and that therefore the issue of any changes in them belongs to the realm of the wage policy of the government; in any case, the Finance Ministry would veto the de-

mand even if the Railway Ministry conceded it.

The unions are also demanding eight-hour duty. The workload of railwaymen has increased severalfold since the last classification of work in 1947. Moreover, of 17.5 lakh employees over 3.34 lakhs are casual labourers who have been getting just the daily wages for years; permanent jobs for casual labour is therefore one of the demands.

A crucial demand is that the railway staff should be treated as industrial workers. Where the provisions of general labour legislation collide with railway regulations, the latter are applied to railwaymen. This restricts normal trade union activity of railwaymen who can be penalised even for holding meetings.

It is in its attitude to these other non-financial demands (like trade union rights) that the authoritarianism of the government stands exposed. Far from taking a conciliatory attitude in keeping with its socialist protestations, the Railway Board and the government have opted for a tough line, as if to serve notice on one and all that there is no question of tolerating agitation in the public utility services or where the government is the employer. The unions have been charged with political motivations and with conspiring to paralyse the economy to undermine political stability.

NORTH

Powermen's Strike

SABOTEURS have been active in Punjab, and to a lesser extent in Haryana, demolishing electric installations, sawing and felling huge transmission towers and otherwise tampering with power supply. Suddenly, there is a demand for worn-out cycle chains. Thrown across live wires, they disrupt power transmission. The Punjab State Electricity Board Employees' Union has denied that the miscreants belong to its ranks. But the fact that such acts of sabotage can be performed only by persons having the necessary expertise indicates that, in the pursuit of their demands for higher emoluments, Punjab electricity workers have lost all sense of proportion.

Since the strike commenced on April 16, many areas have been plunged into darkness for long stretches of time. Several workers have been caught red-handed, with hacksaws, blades and other tools. The arrests in connection with the powermen's agitation already exceed 1,200 and the end of the agitation is not in sight. The Punjab government has adopted a firm stand and has refused even to initiate talks with the agitators until the strike is called off unconditionally.

The union's immediate demand is for interim relief of Rs 30 per month — a seemingly simple and rational plea. But the Punjab State Electricity Board has been incurring heavy losses in recent years. The annual revenue now is Rs 25 crores, but the expenditure is Rs 44 crores, the loss being Rs 19 crores yearly. Besides, the workers' emoluments have increased by 200 to 400 per cent in a decade.

Fearing a chain reaction, the State Electricity Boards of Punjab, Haryana and Himachal Pradesh have jointly decided not to sanction any further increase in emoluments to their staff. The layman has much reason to believe the description of the Electricity Boards as "dens of corruption" by a former Haryana Chief Minister.

An apparently ill-timed announcement of the increase in the maximum emoluments of Punjab Electricity Board members from Rs 2,500 to Rs 2,750, made when the strike was at its peak, has given another cause for provocation of the workers. From April 24 Haryana Electricity Board employees also started an indefinite strike, though the authorities have managed to avoid major shut-downs.

Higher Tariff

By an interesting coincidence, the Punjab State Electricity Board raised its tariff for consumers within hours of the commencement of the strike. A notable feature of the new tariff is the departure, at long last, from the old pattern under which the bigger consumers paid at a lower rate per unit than the smaller fry, both for domestic and commercial uses. The new slabs have made electricity costly for the upper slabs. Besides, there is a special surcharge on agricultural consumers who would henceforth be required to pay Rs 1.50 as a flat rate per hp. The revised tariff will yield an additional annual income of Rs 7 crores. It would cover less than half the Board's deficit.

This, however, is not the only new financial burden on the Punjab taxpayer. On April 18, barely a day after the power tariff revision, the Punjab government announced a Rs 13-crore tax package, to be imposed by ordinances and special notifications. The state's 1974-75 budget presented on February 27 sported a Rs 38.39-crore deficit, but except for 50 per cent enhancement of the market fee, no fresh tax was levied. The new imports are by no means light nor are they the sudden result of any emergency. The "shocks" came a month after the assembly's budget session had ended. This practice of taxation by ordinance is becoming quite the fashion in some states. It is quite obviously an abuse of the ordinance-making power. Some of the levies affect the masses directly and substantially — the 25 per cent increase in passenger fares (to yield Rs 3 crores), the increase in entertainment tax from 60 per cent to 100 per cent and in the water rate by 100 per cent (150 per cent on orchards), the 100 per cent increase in the token tax on buses and trucks, and the higher sales tax on petrol and diesel.

The opposition parties, and even a section of Congressmen, have reacted sharply to the new taxes. They have pointed out that, despite the government's frequent declarations that only the richer sections of the community would be taxed, it is the poor who have been hit hard. The 25 per cent increase in bus fares, they contend, is designed to benefit private operators whose goodwill is considered politically important. The CPI, Punjab Congress's electoral partner, has demanded withdrawal of all levies which hit the common man and has urged, instead, the mopping up of the surplus income of the rural rich and complete nationalisation of passenger transport (at present private buses run on several routes). The Akalis, the principal opposition group, have demanded a special assembly session before the new taxes are enforced. They have threatened "some other action" if the government resists this demand.

Even though the total output is stated to be higher than last year and the government has offered substantial price incentives to the growers, the arrivals of wheat in Punjab and Haryana markets are much slower this time. Up to April 20, only 6,613 tonnes of the grain had been brought to the markets against 28,323 tonnes in the corresponding period last year. The private traders are mopping up whatever they can get, at prices ranging between Rs 110 to Rs 130 — much higher than the official procurement price of Rs 105. At many centres the obligation on traders of turning over 50 per cent of the purchases to the government has not yet been legally imposed and the wholesalers are taking full advantage of the situation. The large landowners are, as usual, withholding stocks. According to reports, this time the medium and even many petty farmers are also holding on to their produce. Only those who have perforce to sell their produce to meet their financial obligations are bringing it to the markets. The Punjab Kheti Bari Zamindara Union (agriculturists' union) has been urging the cultivators not to take their produce to the markets unless they are offered Rs 125 a quintal. The Haryana Kisan Sangharsh Samiti has gone one better by insisting on Rs 135 as the minimum rate.

Indications are that this year there would be more hoarding of wheat than before, by growers and also by traders of various categories, either in scattered godowns or in farmers' houses to avoid seizures. Both the growers and traders, in fact, count on record profits in the next few months. The widespread fear among the consumers in the surplus states of Punjab and Haryana is that later in the season wheat would not be available at less than Rs 180-200 a quintal. There are also reports that smuggling of wheat from Haryana in 1974-75 would be on a larger scale than ever. Wheat prices in Delhi, UP and Rajasthan, all of which have long stretches of common border with Haryana, are much higher. Wheat bags and trucks seized by the Haryana government's anti-smuggling staff, which is being strengthened in anticipation, constitute only a fraction of the total quantity smuggled across the state's borders. Now the Himachal government has also decided to procure wheat from Punjab markets. This would further reduce this region's contribution to the Central pool. In fact, the Punjab government is now worried over the availability of stocks to meet the needs of its own people all through the year!

Dalit Panthers: Another View

(From a Special Correspondent)

THE Dalit Panthers have been generally accepted as a party of the Scheduled Castes of Maharashtra. Further, the hope has been expressed that in course of time they will bring within their fold all 'dalits', or downtrodden, including the poor among the caste Hindus. In their own manifesto, the Dalit Panthers have claimed to be an organisation of all exploited sections of the population, irrespective of caste or community, such as agricultural workers and small peasants, industrial workers, the unemployed and even women.

Yawning Gap

It is, of course, impossible to say how the Dalit Panthers will develop as a political organisation in future. But as things are there is a yawning gap between what the Dalit Panthers claim to be and what they actually are. Right now they are quite simply an organisation of the Mahars, which is one of the Scheduled Castes in Maharashtra.

The Scheduled Caste population of Maharashtra is around 35 lakhs, according to the 1971 Census. This population is composed of 57 subcastes, prominent among whom are Mahars, Mangs, Chambhars and Dhors. Mahars constitute 35 per cent of the total Scheduled Caste population of Maharashtra, followed by Mangs (33 per cent), Chambhars (22 per cent) and Dhors (3 per cent).

If we consider the history of earlier attempts to politically organise the Scheduled Castes in Maharashtra, two things become immediately clear. First, it is no accident that the Dalit Panthers have emerged as an organisation almost exclusively of the Mahars. Second, there is no basis for presuming that as they become stronger and better established as a political party, the Dalit Panthers will automatically come to represent the non-Mahar Scheduled Castes, leave alone the non-Scheduled Caste oppressed. These points need to be emphasised because if the Dalit Panthers want to build a party of all Scheduled Castes — and indeed of all the oppressed — a conscious effort will have to be made to reverse many of the tendencies now dominant in the organisation — both by the leaders of the Dalit Panthers as well as by their friends and sympathisers outside the party.

All attempts in the past to politically organise the Scheduled Castes in Maharashtra have been restricted to the Mahars. B R Ambedkar was a Mahar and, though he achieved all-India status as a leader of the Scheduled Castes, in Maharashtra his influence was restricted to the Mahars. When just before his death he called on the Scheduled Castes to reject the Hindu religion and become Buddhists, in Maharashtra the call was heeded only by the Mahars. As a result, the terms 'Mahars' and 'Buddhists' have become synonymous in the state. After Ambedkar's death, his Mahar-Buddhist followers formed the Republican Party of India (RPI). Though the RPI is nominally an all-India political party it is politically significant only in Maharashtra — and that, once again, as a party only of the Mahars.

Bitter Antagonisms

In retrospect, it does appear that, unwittingly and unfortunately, the impact of Ambedkar's leadership and of his approach to tackling the problems of the Scheduled Castes — culminating in the mass conversions to Buddhism — was to sharpen the differences between the Mahars and the rest of the Scheduled Castes. Thus Mahar-Mang and Mahar-Chambhar antagonisms are facts of life in Maharashtra's towns and villages. These antagonisms have got more bitter as the Mahars, by virtue of their political organisation, have appropriated the lion's share of the concessions and privileges extended by the government to the Scheduled Castes.

The existence of the RPI as the political party of the Mahars has had the effect of making the Congress, too, more solicitous of the interests of the Mahars. This solicitousness has been expressed often in competition with the RPI and as often in collaboration with it or with one or the other faction of it. Starting with G D Tapase in Morarji Desai's Cabinet in the former Bombay state, the Congress party has bestowed ministerships on prominent Mahars like N K Tirpude and D T Rupavate. Again, the seats reserved for the Scheduled Castes in the Lok Sabha from Maharashtra and in the Maharashtra Assembly have have been generally held by Mahars from the Congress party. In addition, the Congress has always accommodated Mahar candidates from the RPI for seats in the Rajya Sabha and in the state Legislative Council. The most recent instance is that of the RPI leader, N H Kumbhare, elected to the Rajya Sabha from Maharashtra with the support of the Congress. An even

more interesting example is that of the late B K Gaikwad, former President of the RPI, who was first elected to the Rajya Sabha with the support of the Leftist parties and then continued for a second term with the help of the Congress. The Congress has similarly supported Mahar candidates from the the RPI and got them elected to the state Legislative Council. For instance, Shantabai Dani and R S Gavai, prominent RPI leaders. owe their terms in the Council entirely to the support of the Congress.

The RPI broke into factions soon after its formation. Dominant among the factions has been the so-called Gaikwad group which aligned itself with the Congress in Maharashtra. Another faction, the Khobragade group, hobnobbed with the Congress at the Centre. Both benefited from their alliances with the Congress. Khobragade became Deputy Speaker of the Lok Sabha while, as mentioned above, many Mahar leaders of the RPI became members of the Rajya Sabha and the Maharashtra Legislative Council with the support of the Congress. Others, who left the RPI and joined the Congress, benefited no less. Prominent among them are R D Bhandare, N M Kamble and D T Rupavate. Bhandare was appointed Governor of Bihar; Rupavate became minister in the Maharashtra government after the 1972 elections; and Kamble has been just elected to the Rajya Sabha. By following a policy of simultaneous opposition to and collaboration with the Congress, the RPI has also secured rich dividends for its members in terms of seats in Zilla Parishads and other elective bodies as well as important posts in government departments and corporations.

Telling Fact

With the political leverage secured in this manner, it is hardly surprising that the Mahars have cornered a disproportionate share of the educational and other facilities extended by the government to the Scheduled Castes. Statistics on this point are not readily available, but one telling fact may be quoted here. According to the 18th Report of the Commissioner for Scheduled Castes and Scheduled Tribes for 1968-69, out of the total scholarship funds available for the Scheduled Castes in Maharashtra, Mahars appropriated 84 per cent in 1966-67 and 83 per cent in 1967-68. With greater political pull and better educational opportunities, the Mahars have inevitably outdistanced the rest of the Scheduled Castes in terms of the other indicators of economic betterment, such as the level and quality of employment, the degree of urbanisation, etc.

In sharp contrast to the competitive solicitousness for the interests of the Mahars on the part of the RPI and the Congress, there has been no comparable concern for the other sub-castes among the Scheduled Castes even though they comprise almost two-thirds of Maharashtra's total Scheduled Caste population. While the RPI has been, as mentioned earlier, quite openly a party of the Mahars, none of the other opposition parties have attempted to organise the rest of the Scheduled Castes. The result has been that the Mangs, the Chambhars and the other sub-castes among the Scheduled Castes have remained supporters of the Congress for want of any alternative. And for the same reason, the Congress has been able to count on their loyal support without having to offer them any rewards comparable to those extended to the Mahars. Not only have these castes not been organised for achieving a general social and economic transformation of their condition, but they have not had the levers for extracting even limited concessions from the government. The emergence of the Dalit Panthers has not made the slightest difference to this situation.

Writers and Poets

The Dalit Panther organisation sprouted from a group of young Mahar writers and poets — prominent among them being Namdeo Dhasal, Raja Dhale and J V Pawar — as a protest against the faction-ridden, self-seeking, corrupt and ageing leadership of the RPI. The Dalit Panthers made their appearance in cities like Bombay and Poona where there are large concentrations of Mahars. Partly because of the influence of the Left groups with which they came in contact in these cities and partly reflecting their own disgust with the opportunist politics of the RPI factions, the formal political programme of the Dalit Panthers as well as the language in which it has been expressed at public meetings, etc, have been distinguished for their radicalism. This together with their violent attacks on Hindu deities and popular heroes like Shivaji, their successful campaign for boycott of the by-election to the Lok Sabha from the Central Bombay constituency in January, and the persistent attempts by the state government and the police to repress them, have served to create the impression that the Dalit Panthers are a political force committed to the overthrow of the present social and political system. In the process, not enough attention has been paid to the organisational structure of the Dalit Panthers, the extent of the support they actually enjoy and the composition of that support.

The need for the Dalit Panthers, in terms of their own ends, to break out of the bonds of the Mahar community is too obvious to need elaboration. The broad political objective to which they are committed by their own manifesto — to fight against all forms of discrimination and oppression — cannot be achieved so long as they remain a party of the Scheduled Castes, not to talk of a party of only the Mahars. This apart, even for short-term survival, they need to extend their support base beyond the Mahars.

Large Following

Among the Mahars, the established RPI still has a very large following. Faced with the emergence of the Dalit Panthers, the different factions of the RPI are trying seriously to come together. Meanwhile, their mutual differences notwithstanding, all these factions have launched a violent campaign against the Dalit Panthers. In their public meetings, prominent RPI leaders like Shantabai Dani and R S Gavai call upon their followers to "crush the Dalit Panthers wherever they are". In this campaign, the RPI clearly has the complete support of the Maharashtra Congress and the state government.

Faced with this onslaught against it, the Dalit Panthers have only their limited following among the urban Mahar youth to fall back upon, apart from peripheral liberal and Leftist support. And they have yet to win the sympathy of the rest of the Scheduled Castes. When asked about their response to the Dalit Panthers, R A Khaire, Baburao Bharaskar and Namdeo Vatkar — Congress MLAs and leaders of the Chambar, Mang and Dhor communities, respectively — told this writer: why should we worry about the Dalit Panthers? They are a headache for the RPI leaders. In what way are we concerned with this internal fight within the Mahars?

If the Dalit Panthers are to survive as a party, they will have to beware of becoming in effect a fourth faction of the RPI, enmeshed in the caste politics of the Mahar community.

URUGUAY

Rule by Military Proxy

Lajpat Rai

THE September 1973 fascist military *coup d'etat* in Chile seems to have overshadowed two other coups which took place in the same year in Uruguay and Bolivia. While the National Stadium in Santiago where thousands of political prisoners are being held and tortured has become known all over the world, El Clindro Stadium in Montevideo where Uruguayan patriots and leftists are being tortured has remained relatively unknown. El Clindro acquired this sinister reputation after the coup d'etat of June 27, 1973, when Juan Maria Bordaberry established a dictatorial regime supported by the Uruguayan oligarchy, US corporate interests and the reactionary military. On this day President Bordaberry in order to save his faltering regime riven by dissensions, plagued by a 60 per cent per annum inflation, harassed by the Tupamaros and threatened by a countrywide general strike of industrial workers, dissolved the Congress and called in the military to take over the reins. The focal point of the struggle between the military and the Congress was the former's demand that the Congress lift the immunity of the leftist Senator, Enrique Erro, whom it accused of subversion and alleged links with the Tupamaros — a Fidelista urban guerilla organisation operating in the country since 1965.

The decree signed by Bordaberry dissolving the Congress gave the Senate's refusal to lift Erro's immunity as a reason. In his radio-TV speech on June 28, the President justified army intervention, condemned Marxism as "a manifestation of sedition", challenged the Tupamaros "traitors" and the student agitators "who took the law in their own hands". He also spoke of the "sinister shadow of international communism" and called upon the people to "resist anarchy and criminal conspiracy against the country". On the same day, Bordaberry moved to consolidate his control by introducing total press censorship, prohibition of public gatherings and manifestations, suspension of constitutional guarantees and a declaration of a state of seige in the country. On June 30, through a special decree, he banned the Communist Party and the Communist-led United Trade Union Convention or CNT (Convencion Nacional de Trabajadores). Later in the same day he dissolved all the 19 elected municipal councils and issued a threat to have all the parties of the Frente Amplio or the Broad Front (consisting of communist, socialist, Christian Democrat and some centrist bourgeoisie parties and groups) which had unsuccessfully opposed Bordaberry in the presidential election.

The first reaction to the decrees abolishing constitutional government and civil rights was swift. The two cabinet members resigned in protest. The powerful CNT called a general strike for the following day and ordered the occupation of the factories. The strike according to the Reuters despatch from Montevideo dated June 29 "paralysed the nation's major industries, such as the tyre and textile factories that provide Uruguay's main industrial exports. Several factories were taken over by strikers, and students at Montevideo University boycotted classes.

Breaking the Strike

On the same day Bordaberry ordered the army and the police to break the strike by force. This led to large-scale arrests, baton charges and shootings in the streets of the capital; the first batches of prisoners began to arrive at El Clindro. An undetermined number of political leaders fled to Argentina while many took refuge in some Latin American embassies, now being guarded day and night by government troops to intercept fleeing refugees. By mid-July El Clindro began to get crowded. Among those arrested by the military regime were General Liber Seregni, the former Presidential candidate of the Frente Amplio, Homar Murdoch, the President of the National Party (a conservative party till then a fierce opponent of the Frente), the well known writer Juan Carlos Onetti and the communist leaders Rodney Arismondy and Jaime Pereze, on charges of having contacts with the Tupamaros. Other arrested leaders of the opposition included Jose P Cardozo, the President of the Socialist party, General Victor Licandro and sixteen members of the dissolved Congress, all belonging to the Frente Amplio.

These arrests led to an agreement between the Frente and the National Party which until then had been bitter enemies. The two parties were later joined by an important group of dissidents from Bordaberry's own Colorado party. This broader front of political opposition issued on July 30, what was called its "six bases for resolving the present situation". They were according to *La Razon*:

1. Re-establishment of constitutional freedoms and guarantees.
2. Re-establishment of the right of political parties and union organisation.
3. Restoration of the purchasing power of wages.
4. *Agreement on* a minimum programme for economic and social change.
5. Dismissal of Bordaberry and setting up of a provisional government which could include the Colorados and Blancos (the two traditional conservative parties of Uruguay which had been ruling the country alternately through an agreement) as well.
6. The immediate holding of a popular referendum in the country.

Thus while the Frente Amplio became "Frente mas Amplio" and the opposition to the dictatorship increased in intensity, the CNT led by the Communists (who despite an official ban on their party functioned from underground unmolested) suddenly withdrew the general strike which had by the end of July embraced wide sectors of the industrial working class and the militant sectors of the peasantry. The ending of the strike, which had become the focal point of opposition to the coup, was a victory for Bordaberry. While the unions had been demanding the release of all political prisoners and the restoration of democratic liberties, the government insisted that it had agreed to no conditions during its secret talks with the leaders of the banned trade union federation. Minister of Interior, Colonel N Bolentini declared at a press conference that the banning of the CNT was "irrevocable". According to a despatch from the *New York Times* répresentative in Montevideo (August 7, 1973), "Colonel Bolentini announced a new labour policy meant to make the trade unions non-political. This implied the liquidation of the CNT and the formation of a new labour organisation, independent and outside the control of political parties which will not be permitted to intervene in political questions that distort the true sense of trade union associa-

tion". According to a UPI despatch published in the *New York Times* (August 8), "In spite of the illegal status of the CNT, the government representatives continued (during the strike) to hold talks with its leaders who had secretly agreed to withdraw the strike in exchange for the release of the imprisoned union leaders and activists". According to *La Opinion* (August 9), "the CNT called off the strike and acknowledged that it had not achieved the desired victory. The battle must continue but it is necessary to change the form of struggle". This sudden withdrawal of the strike led to widespread disillusionment, frustration and rage among the workers and students who had been braving the fascist repression of the dictatorship which got intensified after the calling off of the strike.

With the end of the general strike, Bordaberry quickly moved to consolidate his control. He met with the country's mayors to work out details for the so-called "neighbourhood councils" to replace the nineteen elected municipal councils that he had abolished along with the Congress. This was what he described as the "beginning of the restoration of democracy in Uruguay after the military takeover". He also named members of the Council of State, which was to replace the Congress. He proclaimed his intention to usher into Uruguay "a non-political, non-party democracy" which would be "protected by the military in the initial stages". Thus the disorienting reformist strategy of the Communist Party — the leading member of the Frente Amplio — failed even to achieve the limited aim of getting the release of opposition leaders and the removal of Bordaberry from office. The military even went back on its promise to withdraw the case against General Seregni who is now being tried for sedition.

Communist Appeal to Army

There was another noteworthy feature in the situation. Throughout the general strike the approach taken by the opposition led by the Communist Party was one of appealing to allegedly 'dissident' sectors of the armed forces to join the opposition and help overthrow the Bordaberry regime. This strategy was reflected in the special appeal addressed to the "patriotic majority" of the armed forces by the CNT and the Frente Amplio stating that the general strike, which was later brutally crushed by the troops, was not directed against the armed forces. The appeal said: "We respect the army and its patriotic traditions. We shall not turn out as the enemy of the armed forces which have always respected the constitutional laws violated by the dictatorship". Rodney Arismondy who now sits in El Clindro prison guarded by the military spoke about the army as the defender of the "letter and spirit of the Constitution throughout our history with only a few lapses". According to *La Opinion* (September 1) the communist leaders always distinguished between the "reactionary and the progressive wings of the military establishment" and tried "unsuccessfully to pit one section of the officer class against the other". All this, however, did not stop the army's crackdown on the leaders and the militants of the CNT and *Frente Amplio*, nor did it stay the hands of the army and the police from shooting down the demonstrators in the streets of Montevideo and other Uruguayan towns. The "progressive sections" of the army did not emerge, nor did the "patriotic sectors" of the armed forces assert themselves on behalf of the people. Soon it became obvious that Uruguay was following the Brazilian pattern, though some CNT leaders in the initial stage referred to the "Peruvian model taking shape in Uruguay". The military had the firm support of the United States and of the Brazilian generals who welcomed the coup for obvious reasons. The Vice-President of the ruling party in Brazil, the Alliance for National Renewal, Cantidio Sampaio, said in Parliament: "Uruguay is moving into the Brazilian schema. As long as the army did not go out in the streets to fight terrorism, as long as certain liberties upon which Tupamaros thrived were not suppressed, and as long as the Uruguayan press itself was not restricted by the government and the 'habeas corpus' remained untouchable subversion dominated the country ... with the military in command now order has been restored once again ..."

Philippe Labreveux of *Le Monde* (October 31), commenting on the developments in Uruguay wrote, "The Montevideo government did not work as fast as that of Santiago but in the end it reached the same result making *tabula rosa* of all the country's institutions". On October 31, the Bordaberry dictatorship closed and occupied the University of Montevideo. The Rector, nine of the ten Deans and about five hundred student activists were arrested and detained in El Clindro.

Reports of beatings, tortures and 'disappearance' of opposition leaders and militants continue to circulate in the Latin American press. The US Embassy in Montevideo hums with activity and economic and military aid has started coming in. The CIA is active and is co-operating with the local intelligence agencies in tracking down the opposition leaders. The much-lauded welfare state, the "democratic bastion" of Latin America is under unmitigated dictatorial rule headed by a civilian President.

Experience Teaches Nothing

One, however, keeps wondering at the utter stupidity of the traditional communists of Latin America who seem to have lost even the faculty of learning from bitter and costly experience. Learning nothing from their experience with the Uruguayan military, they sowed illusions about the "institutionalism" and the "democratic responses" of the Chilean armed forces. Even the Chilean tragedy could teach them nothing. Their "broad fronts" under the "progressive" national bourgeoisie, their theories of peaceful transition to socialism *via* the parliamentary road and their myth of the so-called "patriotic majorities" in the traditional armies of the bourgeoisie states have disoriented the national liberation movements in Latin America and elsewhere in the third world.

Recently speaking at a public reception to Hortensia Allende, the widow of Salvador Allende of Chile in New Delhi, N K Krishnan, the CPI leader, said in all seriousness, "what we are doing in India today is the same that Allende tried to do in Chile, that is, building socialism by peaceful means, and the same fascist forces that murdered democracy and the President in Chile are out to stop us from proceeding on our predetermined course".

Krishnan was thus equating the socialist government of Chile with the one that rules in Delhi and also President Allende with Indira Gandhi. Fidel Castro once called the traditional communists "political charlatans". But even charlatan behaviour should have some limits. This communist worthy did not realise that he was insulting the memory of President Allende and causing embarrassment to Indira Gandhi who has always taken pride in calling herself a pragmatist.

Bordaberry came to power on a populist programme after defeating the candidate of the Frente Amplio. The reforms he promised to the people included a programme of "Garibi Hatao" or "Lucha Contra la Pobreza" (struggle against poverty). He also promised to halt inflation, increase wages, strengthen the social security system for the workers, and the inevitable land reform. But in less than two years he had to call in the army to maintain his faltering regime in power — a regime which could not solve or even make a beginning towards solving a single problem of the people.

The manner in which the situation is shaping in this country (if odious comparisons can be made), Indira Gandhi is more likely to act as a Bordaberry of Uruguay than as an Allende of Chile. But the traditional communists, clinging to their outmoded theories like a drowning man to a twig, cannot learn even from the disastrous experiences with their figment of imagination — the "progressive" national bourgeoisie. Fidel Castro could not be more correct when he declared some time ago in reference to the traditional communists: "If anyone should ask me who the most important allies of imperialism are, I would not answer that they are the professional armies, nor even the Yankee marines. I would not say that they are oligarchies or the reactionary classes. I would say they are the pseudo-revolutionaries".

REVIEWS

Economics of Land Reform

Ahmad Raza

Economics of Land Reforms and Farm Size in India by A M Khusro; Macmillan India, 1973; pp xxvii + 159; Rs 26.50.

ECONOMIC theory provides the basic framework within which economic policies are formulated. Any discussion or analysis of policy, to be meaningful, has, therefore, to be within that framework. This is a point which is readily conceded but, unfortunately, such analysis is rarely attempted. A case in point is that of policy relating to land reforms in India. Volumes have been written on the subject; popular commentaries are plentiful. But, in most cases, the analysis is segmentary and the theoretical framework is missing. It is in this context that A M Khusro's "Economics of Land Reforms and Farm Size in India" differs from most other works on the subject. It is perhaps the first attempt "to cast the major issues of land tenure and land reforms in the framework of micro-economic analysis in order that more vigorous policy conclusions are obtained than are possible in the absence of such an analysis".

Khusro's main concern is to probe the complex nature of the twin problems of 'disincentives of tenure' and 'disabilities of size' which have frustrated the farmer's will as well as his resource-capacity to expand either to a minimum economically feasible size of to an optimum size.

Part I of the book concerns itself with the problem of tenurial disincentives. It describes the nature of the problem and undertakes an economic analysis of India's land reform experiment and seeks to evaluate its results. The starting point of his analysis is the serious and growing imbalance between the demand for and the supply of land in the tenancy market resulting in exploitation and proletarianisation of the peasantry. Under such a situation "the desire of land policy to control land rent then emerges as an exercise in the theory of price control and attempts to impose ceilings on land holdings ... can be observed as attempts to invoke the theory of rationing". It is thus that price control (through rent laws) and rationing of the use and ownership of land (through tenancy and ceiling laws) became the two major planks of land reform policy in India. It is also argued that tenancy "must not be regarded in all circumstances as an exploitative arrangement". In fact, "tenancy shorn of its exploitative nature must be supported".

If the facts were as simple as described by Khusro, one wonders why the results were so discouraging. As is well known, though the zamindari system was abolished, the intermediary interests still remain. Attempts to ration the use and ownership of land ended in a fiasco. The continuation and possible upsurge of share-cropping tenancy has made a farce of laws relating to security of tenure and fixation of fair rent. And if the number of evictions ('voluntary' surrender or legal eviction) is any criterion, the process of proletarianisation and impoverisation of the weaker section has, at best, been slowed down. One is tempted to attribute all this, as Khusro has done, to the strong landed interests in the legislature becoming the stumbling blocks, to administration not getting the full backing of the law-making bodies and to lack of concern for the prerequisites of good rationing. There is, however, another — and a more basic — reason. Price control and rationing may work only if the imbalance between demand and supply is marginal and/or temporary. But if land is in permanent short supply and there is fierce competition to grab any piece of cultivated land at almost any price, attempts to control the price or rationing are bound to fail, at least in a 'free', democratic set up. If introduced, these will only lead to the emergence of numerous informal tenancy arrangements with the acquiescence, albeit unwilling, of the tenants themselves. When tenants themselves are partners in the evasion of various provisions of tenancy laws, how can one hope to rid tenancy of its exploitative nature? It is this basic fact which explains why the various land reform measures adopted in India have failed in their objectives.

It appears that in his anxiety to provide a theoretical economic framework, Khusro has over-simplified the problem. Perhaps the only justification for land reform measures in India — and this has been conceded by him — is that "under conditions of severe shortage, some control is better than no control". As such, one should not expect revolutionary size-tenure changes.

In Parts II and III, attention shifts, though not entirely, from tenurial disincentives to size disabilities of farms — consideration of the minimum economically feasible size of holding in Part II and discussion of the optimum size of holding in Part III. Herein lies Khusro's main contribution, for it is rarely that an attempt is made to empirically determine these sizes and thus narrow the controversy and free the discussion of political under-currents and ideological overtones.

As regards the minimum feasible holding, it is rightly argued that the question relates to both welfare and efficiency. "From the welfare point of view, it would mean a farm which gives a minimum norm of output (or income) and employment to support the farm family. From the efficiency angle, it

could mean an *enterprise* which makes the most of the indivisible inputs such as a pair of bullocks and, by absorbing their services fully, keeps the short-run average cost lower than it would be with less than full utilisation of the individual resources". Khusro's conclusion, after a good deal of sifting of farm management data, is that, with the present technology which is still dominated by the use of bullock power and with a view to focusing on tomorrow's norms, the dividing line between incentives and disincentives and between efficiency and disability may be taken to be 5 acres. As such, a very large proportion of cultivated area is free from difficulties of size though a large proportion of holdings is subject to such difficulties. The conclusion, in itself is not very startling; it has been known. The significance of Khusro's work lies in quantifying what has been largely an unquantified area.

The discussion on optimum size of holdings is particularly relevant in the context of the need to ration the ownership of land, for ceiling ought to avoid the size range of declining long-run average costs. The relevant questions to ask in this connection are: at what size of farm do diminishing returns to scale begin to operate? Is there a range of sizes within which returns per unit of input are maximum or costs per unit of returns are minimum? What happens to farm efficiency as farm size increases? In this final part of his work, Khusro attempts to answer these vital questions. Having analysed the farm management data from different regions of India, he concludes that, above the minimum feasible holding, "there is nothing to choose between the large farms and small farms in respect of cost efficiency and productivity; that Indian agriculture is typically a scene of constant returns to scale; and that ceilings are size-neutral". These findings are revealing and have far-reaching policy implications.

While agreeing with his general approach and methodology, one is tempted to make a few observations. First, on the question of plough units: just because a great majority of the holdings operating with two bullocks or less are below a particular size and a great majority of all holdings below that size are operating two bullocks or less, one may not be fully justified in assuming that farms below that size are too small to absorb effectively the services of a pair of bullocks. One may also ask: are a pair of bullocks as indivisible a factor of production as it is generally made out to be? Second, as regards work unit: family labour which is hired out and which is used on the family farm is not necessarily co-terminus nor independent of the economic and/or social status of the households and social conventions. As such, there may not be a *size* of holding which would, under given techniques and soil-crop conditions, enable family labour to be more or less fully employed. Third, the farm management data used, at best, reflect the farming conditions of specified districts. Even otherwise, the sampling scheme of the surveys was not designed to permit aggregation of data or to arrive at even very approximate all-India averages. In any case, given varied farming conditions in different parts of the country, there cannot be one minimum economically feasible size for the entire country or even one state; it will have to be different for different soil-water-climatic complexes. Hence, the reader need not be accused of being "sceptical" if he refuses to accept the conclusions as valid for the country as a whole or, for that matter, the states in question (or even very substantial parts thereof). And, last, the data, after all, represent the farming conditions of the mid-1950s. Some recent unpublished research findings based on data for the 1960s notwithstanding, it is difficult to accept the view that there have been "no major changes in relative efficiency and productivity of farms so as to warrant different policy conclusions". But even if it were so, it would have been much more satisfying if Khusro himself had used data for the 1960s — preferably late 1960s — to arrive at policy conclusions.

Co-operatives in Japan

K K Taimni

Amalgamation of Primary Co-operatives: The Japanese Experience by Lionel Gunawardana; International Co-operative Alliance, Regional Office and Education Centre for South-East Asia, New Delhi, 1973; pp 117; Rs 15.

THERE have been two major watersheds in the development of the co-operative movement in Japan. Both were the outcome of government action and both had a decisive influence in shaping the movement to its present strength. First, during the Second War, the government imposed rigid control over production and distribution of agricultural produce. For this purpose, various organisations of farmers at the village level, such as industrial associations (which were agents of the government for collecting rice and other agricultural produce), livestocks raising associations, etc, were compulsorily amalgamated with the co-operatives to form agricultural associations. It was also made compulsory for all farmers to join these associations which were established in every village and town. These associations were to render all assistance to farmers to boost agricultural productions during the war. In 1947, the government once again made the co-operatives autonomous as before, but the new co-operatives inherited all the assets and liabilities of the agricultural associations. This gave a big boost to the co-operative movement.

Second, as Japanese industry took giant strides, there was a mass migration of agricultural labour to the towns. More and more land was acquired by industry and for housing, etc. This resulted not only in a shortage of farm labour giving rise to the demand for mechanisation in agriculture but also in the reorganisation of the countryside. The reorganisation took the form of larger areas of land, covering three to four existing villages, becoming the new basic administrative units, or the new villages, for provision of extension services by various government agencies. When the small village-level, multi-purpose co-operatives were found unequal to the new tasks, especially meeting the demands of modern intensive agriculture, the Japanese government enacted the Amalgamation Aid Law in 1961 to encourage and expedite the amalgamation of agricultural co-operatives and assist the societies so amalgamated to establish a solid foundation and to ensure effective business management. The Central Union of Agricultural Co-operatives (CUAC) was largely instrumental in prevailing upon the government to enact this law and also in issuing detailed policy directives for the amalgamation of the primary level multi-purpose co-operatives.

Gunawardana lists some of the problems in the process of amalgamation like unwilling directors, unwilling employees, lost of member-management contacts, resistance from the strong societies to amalgamating with weaker societies, etc. These were all predictable problems and are not proving insurmountable given the combined strength of the state machinery and the CUAC. At times, members of the co-operatives have been directly approached by representatives of the state and the federal units, promised some illusory benefits (higher prices, reduced rates of interest, etc) as a result of amalgamation and in this manner the pace of amalgamation has been forced.

Gunawardana points out several advantages of amalgamation to members and employees of co-operatives. However, independent studies conducted in Japan show that besides higher wages to employees (whose number is considerably reduced), there has been hardly any other significant advantage to the members, especially to those of old, large and strong co-operatives. Amalgamation has, as the author rightly points out, increased the viability of the new structure and to that extent it is bound to prove useful to the farmer ultimately.

The author sums up the problems faced by co-operatives after amalgamation as poor member and employer-employee relations, greater demands on management skills, difficulties in book-keeping and auditing, demands from members for maintenance of uneconomic facilities, etc. These are all transitory and will gradually disappear as the model matures to its full strength.

The obvious inferences which can be drawn (and which Gunawardana has not touched upon) from the Japanese experience of amalgamation of multi-purpose primary co-operatives are (i) a strong political commitment at the national level is necessary for initiating the process of amalgamation; (ii) the process of amalgamation becomes smooth in an environment of affluence and rising per capita income; and (iii) the process of amalgamation can make headway only if the state machinery is co-operative.

Gunawardana's primary aim in presenting his study in the form of a book is presumably to sell the idea of amalgamation of primary co-operatives to other countries in Asia. But in how many of these countries do the above conditions really obtain?

SPECIAL ARTICLES

Hidden History of the Sino-Indian Frontier

I—1947-1954

Karunakar Gupta

The negative role of the Historical Division of the External Affairs Ministry in keeping the Government of India and the public completely misinformed about the true history of the India-China border has been a major cause of the continued stalemate over the Sino-Indian frontiers. Ramsay Muir's dictum, 'bureaucracy is like fire; invaluable as a servant, ruinous when it becomes the master', is applicable to the officials of the Historical Division of the External Affairs Ministry, as they were able to hamstring Nehru's original diplomacy which sought to work for a modus vivendi *with China, solving the boundary problems on a compromise basis.*

The official decision to keep the records of the External Affairs Ministry dealing with the Sino-Indian frontier from 1914 to June 1954 out-of bounds for independent scholars has helped the Ministry to maintain till today a curtain of ignorance over the true border legacy of the British Raj. The history of the Sino-Indian frontier still remains hidden to most of us.

[The first part of this article, published this week, covers the period 1947 to 1954; the second, and concluding, part will deal with the years 1954 to 1959.]

"In international diplomacy, the habit of saying one thing and thinking another is as old as time."
— Lord Birdwood in "A Continent Decides"

THERE has been complete ignorance among large sections of the Indian public regarding the truth of the British legacy about the Northern frontier. The Survey of India maps published in free India during 1947-1952 depicted the North-eastern border of India eastward from Bhutan along the Himalayan high-crest-line as 'undemarcated', while the western sector and the middle sector of the Northern border beginning from the north-western end of Kashmir to the tri-junction of Nepal-Tibet-India were shown by a colour-wash with the word 'Boundary Undefined' imprinted thrice along the stretch. In the authoritative publication of the Foreign and Political Department of the British Government of India generally known as "Aitchison's Treaties" relating to Kashmir it was written explicitly, "The northern as well as the eastern boundary of the Kashmir State is still undefined". (Vol XII, Part I, pp 5, 1931).

The Indian public never bothered about the undefined frontier along the Kashmir sector, because the Government of India had been declaring from time to time since October 1947 that the future of Kashmir would be finally decided through a UN-supervised plebiscite after the withdrawal of the invaders coming from the Pakistan territory. The Indian attitude towards the future of Kashmir gradually hardened since the signing of the Pak-American military aid agreement in February 1954. But even then we find that in a resolution adopted on as late as December 2, 1957, the UN Security Council took cognition of the fact that the Governments of both India and Pakistan did "recognise and accept the provisions of its resolutions dated 17th

could mean an enterprise which makes the most of the indivisible inputs such as a pair of bullocks and, by absorbing their services fully, keeps the *short-run* average cost lower than it would be with less than full utilisation of the individual resources". Khusro's conclusion, after a good deal of sifting of farm management data, is that, with the present technology which is still dominated by the use of bullock power and with a view to focusing on tomorrow's norms, the dividing line between incentives and disincentives and between efficiency and disability may be taken to be 5 acres. As such, a very large proportion of cultivated area is free from difficulties of size though a large proportion of holdings is subject to such difficulties. The conclusion, in itself, is not very startling; it has been known. The significance of Khusro's work lies in quantifying what has been largely an unquantified area.

The discussion on optimum size of holdings is particularly relevant in the context of the need to ration the ownership of land, for ceiling ought to avoid the size range of declining long-run average costs. The relevant questions to ask in this connection are: at what size of farm do diminishing returns to scale begin to operate? Is there a range of sizes within which returns per unit of input are maximum or costs per unit of returns are minimum? What happens to farm efficiency as farm size increases? In this final part of his work, Khusro attempts to answer these vital questions. Having analysed the farm management data from different regions of India, he concludes that, above the minimum feasible holding, "there is nothing to choose between the large farms and small farms in respect of cost efficiency and productivity; that Indian agriculture is typically a scene of constant returns to scale; and that ceilings are size-neutral". These findings are revealing and have far-reaching policy implications.

While agreeing with his general approach and methodology, one is tempted to make a few observations. First, on the question of plough units: just because a great majority of the holdings operating with two bullocks or less are below a particular size and a great majority of all holdings below that size are operating two bullocks or less, one may not be fully justified in assuming that farms below that size are too small to absorb effectively the services of a pair of bullocks. One may also ask: are a pair of bullocks as indivisible a factor of production as it is generally made out to be? Second, as regards work unit; family labour which is hired out and which is used on the family farm is not necessarily co-terminus nor independent of the economic and/or social status of the households and social conventions. As such, there may not be a *size* of holding which would, under given techniques and soil-crop conditions, enable family labour to be more or less fully employed. Third, the farm management data used, at best, reflect the farming conditions of specified districts. Even otherwise, the sampling scheme of the surveys was not designed to permit aggregation of data or to arrive at even very approximate all-India averages. In any case, given varied farming conditions in different parts of the country, there cannot be one minimum economically feasible size for the entire country or even one state; it will have to be different for different soil-water-climatic complexes. Hence, the reader need not be accused of being "sceptical" if he refuses to accept the conclusions as valid for the country as a whole or, for that matter, the states in question (or even very substantial parts thereof). Some recent unpublished research findings based on data for the 1960s notwithstanding, it is difficult to accept the view that there have been "no major changes in relative efficiency and productivity of farms so as to warrant different policy conclusions". But even if it were so, it would have been much more satisfying if Khusro himself had used data for the 1960s — preferably late 1960s — to arrive at policy conclusions.

Co-operatives in Japan

K K Taimni

Amalgamation of Primary Co-operatives: The Japanese Experience by Lionel Gunawardana; International Co-operative Alliance, Regional Office and Education Centre for South-East Asia, New Delhi, 1973; pp 117; Rs 15.

THERE have been two major watersheds in the development of the co-operative movement in Japan. Both were the outcome of government action and both had a decisive influence in shaping the movement to its present strength. First, during the Second War, the government imposed rigid control over production and distribution of agricultural produce. For this purpose, various organisations of farmers at the village level, such as industrial associations (which were agents of the government for collecting rice and other agricultural produce), livestocks raising associations, etc, were compulsorily amalgamated with the co-operatives to form agricultural associations. It was also made compulsory for all farmers to join these associations which were established in every village and town. These associations were to render all assistance to farmers to boost agricultural productions during the war. In 1947, the government once again made the co-operatives autonomous as before, but the new co-operatives inherited all the assets and liabilities of the agricultural associations. This gave a big boost to the co-operative movement.

Second, as Japanese industry took giant strides, there was a mass migration of agricultural labour to the towns. More and more land was acquired by industry and for housing, etc. This resulted not only in a shortage of farm labour giving rise to the demand for mechanisation in agriculture but also in the reorganisation of the countryside. The reorganisation took the form of larger areas of land, covering three to four existing villages, becoming the new basic administrative units, or the new villages, for provision of extension services by various government agencies. When the small village-level, multi-purpose co-operatives were found unequal to the new tasks, especially meeting the demands of modern intensive agriculture, the Japanese government enacted the Amalgamation Aid Law in 1961 to encourage and expedite the amalgamation of agricultural co-operatives and assist the societies so amalgamated to establish a solid foundation and to ensure effective business management. The Central Union of Agricultural Co-operatives (CUAC) was largely instrumental in prevailing upon the government to enact this law and also in issuing detailed policy directives for the amalgamation of the primary level multi-purpose co-operatives.

Gunawardana lists some of the problems in the process of amalgamation like unwilling directors, unwilling employees, lost of member-management contacts, resistance from the strong societies to amalgamating with weaker societies, etc. These were all predictable problems and are not proving insurmountable given the combined strength of the state machinery and the CUAC. At times, members of the co-operatives have been directly approached by representatives of the state and the federal units, promised some illusory benefits (higher prices, reduced rates of interest, etc) as a result of amalgamation and in this manner the pace of amalgamation has been forced.

Gunawardana points out several advantages of amalgamation to members and employees of co-operatives. However, independent studies conducted in Japan show that besides higher wages to employees (whose number is considerably reduced), there has been hardly any other significant advantage to the members, especially to those of old, large and strong co-operatives. Amalgamation has, as the author rightly points out, increased the viability of the new structure and to that extent it is bound to prove useful to the farmer ultimately.

The author sums up the problems faced by co-operatives after amalgamation as poor member and employer-employee relations, greater demands on management skills, difficulties in book-keeping and auditing, demands from members for maintenance of uneconomic facilities, etc. These are all transitory and will gradually disappear as the model matures to its full strength.

The obvious inferences which can be drawn (and which Gunawardana has not touched upon) from the Japanese experience of amalgamation of multi-purpose primary co-operatives are (i) a strong political commitment at the national level is necessary for initiating the process of amalgamation; (ii) the process of amalgamation becomes smooth in an environment of affluence and rising per capita income; and (iii) the process of amalgamation can make headway only if the state machinery is co-operative.

Gunawardana's primary aim in presenting his study in the form of a book is presumably to sell the idea of amalgamation of primary co-operatives to other countries in Asia. But in how many of these countries do the above conditions really obtain?

Hidden History of the Sino-Indian Frontier

I—1947-1954

Karunakar Gupta

The negative role of the Historical Division of the External Affairs Ministry in keeping the Government of India and the public completely misinformed about the true history of the India-China border has been a major cause of the continued stalemate over the Sino-Indian frontiers. Ramsay Muir's dictum, 'bureaucracy is like fire; invaluable as a servant, ruinous when it becomes the master', is applicable to the officials of the Historical Division of the External Affairs Ministry, as they were able to hamstring Nehru's original diplomacy which sought to work for a modus vivendi *with China, solving the boundary problems on a compromise basis.*

The official decision to keep the records of the External Affairs Ministry dealing with the Sino-Indian frontier from 1914 to June 1954 out of bounds for independent scholars has helped the Ministry to maintain till today a curtain of ignorance over the true border legacy of the British Raj. The history of the Sino-Indian frontier still remains hidden to most of us.

[The first part of this article, published this week, covers the period 1947 to 1954; the second, and concluding, part will deal with the years 1954 to 1959.]

"In international diplomacy, the habit of saying one thing and thinking another is as old as time."
— Lord Birdwood in "A Continent Decides"

THERE has been complete ignorance among large sections of the Indian public regarding the truth of the British legacy about the Northern frontier. The Survey of India maps published in free India during 1947-1952 depicted the North-eastern border of India eastward from Bhutan along the Himalayan high-crest-line as 'undemarcated', while the western sector and the middle sector of the Northern border beginning from the north-western end of Kashmir to the tri-junction of Nepal-Tibet-India were shown by a colour-wash with the word 'Boundary Undefined' imprinted thrice along the stretch. In the authoritative publication of the Foreign and Political Department of the British Government of India generally known as "Aitchison's Treaties" relating to Kashmir it was written explicitly, "The northern as well as the eastern boundary of the Kashmir State is still undefined". (Vol XII, Part I, pp 5, 1931).

The Indian public never bothered about the undefined frontier along the Kashmir sector, because the Government of India had been declaring from time to time since October 1947 that the future of Kashmir would be finally decided through a UN-supervised plebiscite after the withdrawal of the invaders coming from the Pakistan territory. The Indian attitude towards the future of Kashmir gradually hardened since the signing of the Pak-American military aid agreement in February 1954. But even then we find that in a resolution adopted on as late as December 2, 1957, the UN Security Council took cognition of the fact that the Governments of both India and Pakistan did "recognise and accept the provisions of its resolutions dated 17th

January, 1948 and resolutions of the UN Commission for India and Pakistan dated August 13, 1948 and January 5, 1949 which envisage in accordance with their terms the determination of the future status of the State of Kashmir in accordance with the will of the people through the democratic method of a free and impartial plebiscite". This would at least partially explain why Nehru did not raise any point of dispute about the Kashmir frontier specifically either when he visited Peking in October 1954, or later in the winter of 1956-1957 when Chou En-lai paid visits to India. A close scrutiny of the Chinese maps* would show that since the thirties these showed the Karakorams as the border in the north of Kashmir, and this was not challenged by the Government of India till 1958 in an acute form. During 1946-1949, the period of the Republic of China headed by Chiang Kai-shek, the issue of the Northern border was not publicly raised by any side. But during the Asian Relations Conference in New Delhi in April 1947, the Chinese delegates strongly protested about the display of a Map of Asia showing Tibet outside the boundaries of China, and consequently the map was withdrawn. There were, however, several official Notes exchanged bearing on the border issue during this period. On October 16, 1947 the Government of Tibet sent a cable to the Government of India asking for the return of what were described as Tibetan territories from Assam to Ladakh, including such areas as Sikkim, Darjeeling and Bhutan. The Government of the Republic of China addressed four protest Notes to the British Embassy in China on the gradual encroachment by the British into Chinese-claimed territory south of the 'so-called McMahon Line' (July, September and November of 1946 and January 1947). The KMT Government protested on the same issue by note with the Indian Embassy in China in February 1947. On November 18, 1949, the Chinese Ambassador to India of the Nationalist Government delivered a Note to the Indian Ministry of External Affairs repudiating the Simla Convention which the Indian Government held to be valid. Since these Notes were kept confidential, the Indian public were unaware that they inherited from the British a vexing border problem in the North-East Frontier.

Soon after the recognition of the People's Government of China on December 30, 1949, the Government of India felt it necessary to make it clear to the public that they considered the McMahon Line as the legally valid boundary. In reply to a question by H V Kamath in Parliament on the international status of Tibet on February 8, 1950, Nehru said, "In the early years of this century, a Convention was held between the representatives of the then Government of India and Tibet and of China and at this certain decisions were arrived at. Roughly speaking, the decisions were about the boundary of Tibet and India called the MacMahon Line, that Tibet should be treated as an autonomous country, and subject to China agreeing to this, some kind of Chinese sovereignty should be acknowledged. This was agreed to by them. But later, the then Government of China did not accept this agreement and, therefore, did not sign it. In fact, although this agreement has been acted upon in India and Tibet, there has been no formal signature to it by the Chinese Government. So the matter stands there. Tibet is treated as an autonomous country and its exact relationship to China was not accepted by China."

On March 17, 1950, Debkanta Barooah revealed in Parliament facts which showed that Tibetan officials were forcibly collecting money from NEFA hill tribes, and also that the Assam Government was making an annual payment of Rs 5,000 to the Tawang Monastery in NEFA which was under Tibetan administration and that the bulk of this money was sent to the Drepung Monastery in Lhasa. So it came to be known that the Tibetans did not abide by the Simla Agreement 1914 and still continued to occupy the Tawang area east of Bhutan.

A dangerous situation suddenly arose in the Far East with the outbreak of War in Korea on June 25, 1950. In the beginning India thought North Korea to be responsible for launching an aggression against South Korea and supported the US-sponsored resolution in the UN Security Council recommending punitive measures against North Korea, a satellite of the Soviet Union. This resolution was passed in the absence of two Great Powers, viz, the Soviet Union and the People's Republic of China. (Due to the USA's opposition, the People's Republic of China could not take its seat as a permanent member of the Council and the Taiwan Government was allowed to represent China. The Soviet Union boycotted the proceedings of the Security Council as a protest on this issue during the period from January 13 to July 31, 1950.) There was resentment in China and the Soviet Union against India's siding with the West on a Cold War issue. K M Panikkar, the then Indian Ambassador to China, was able to provide a better appraisal of the facts about the Korean conflict and convince Nehru that there could be no settlement of the Korean conflict without bringing its next-door neighbours, the Soviet Union and the People's Republic of China, into the fold of the Security Council. On July 13, 1950, Nehru sent personal messages to Stalin and Acheson pleading for an early mediation to stop bloodshed in Korea, and stressed therein the necessity of the presence of the Soviet Union and the People's Republic of China in the Security Council. Though this peace overture failed due to American intransigence, it created a favourable atmosphere for India starting a dialogue with China to tackle bilateral issues such as Tibet.

'Liberation' of Tibet

In August 1950 there were several communications between Indian Ambassador K M Panikkar and Chinese Prime Minister Chou En-lai and the officials of the Chinese Foreign Ministry. In the Chinese press and radio at that time there were constant allusions to the immediate necessity of 'liberating' Taiwan and Tibet. In an Indian Note dated August 12, 1950, it was stated that "the Government of India never had nor do they have now any political or territorial ambitions in Tibet". In this note, the Government of India also represented to the Government of China that it was concerned at the possibility of unsettled conditions across the border and strongly urged that Sino-Tibetan relations should be stabilised through peaceful negotiations. The Chinese reply, dated August 21, 1950 stated that the Chinese Government is "happy to hear the desire of the Government of India to stabilise the Chinese-Indian border". It also expressed their willingness to solve the problem of Tibet by peaceful and friendly measures. On August 22, Chou En-lai called K M Panikkar for a general discussion. In this conversation, Panikkar took the opportunity of pressing home the desirability of restraint and moderation in regard to Taiwan, and also raised the question of Tibet. Panikkar wrote in his memoirs: "In regard to Tibet, I knew they were a little uncertain about our attitude. I expressed the hope that they would follow a policy of peace in regard to Tibet. Chou En-lai replied that while the liberation of Tibet was a 'sacred duty', his Government were anxious to secure their ends by negotiations and not by military action ....". ("In Two Chinas", p 105.) On August 26, K M Panikkar in an *aide memoire* to the Chinese Government recognised the fact that the regional autonomy granted to Tibet was an autonomy within the confines of Chinese sovereignty and added: "The recognised boundary between India and Tibet should remain inviolate". On August 31, 1950 the Chinese Ministry of Foreign Affairs informed the Indian Government through Ambassador Panikkar that the Chinese People's Liberation Army was going to take action soon in Western Sinkiang according to set plans and expressed the hope that the Indian Government would assist the delegation of the local authorities of Tibet so that it might arrive in Peking in mid-September to begin peace negotiations.

On October 7, 1950, when the UN Army under American Command decided to cross the 38th Parallel and invade North Korea. Nehru strongly opposed the action. Apart from his objections on moral grounds, Nehru was convinced that the invasion of North Korea was bound to result in Chinese intervention which might lead to an extension of the conflict in the Far East. The Chinese Army at this time launched an attack on Chamdo, a border town in the disputed area of Western Sinkiang. Chamdo fell on October 19 and the Chinese were poised for an invasion of Tibet. The Tibetan delegates called to Peking for negotiations for a political settlement had been nonchalantly procrastinating in India for more than six months on specious pleas, and apparently they received support from some high officials of the Indian External Affairs Ministry. On October 25, 1950, Peking Radio broadcast that the process of liberating Tibet had begun. On October 26, the Government of India sent a note to the Chinese Government protesting against the use of force in Tibet. On October 30, the Tibetan Government asked for diplomatic assistance in the dispute with China. In their second Note dated October 31, 1950, India again made strong protests to China on the issue of sending an army into Tibet, also made it an occasion to remind China of certain privileges in Tibet which the Government of India had inherited from the British Raj. (These related to the presence of an Indian Agent in Lhasa, existence of Trade Agencies at Gyantse and Yatung, maintenance of post and telegraph offices at a trade route upto Gyantse and the existence of a small military escort at Gyantse. The Indian Note did not mention that these privileges arose mainly out of the secret Anglo-Tibetan Trade Regulations of July 3, 1914, an offshoot of the Simla Convention of the same date declared illegal by Republican China.) Though the Chinese Government resented this diplomatic interference by India in the matter of Tibet, the Chinese Army made no further movement from Chamdo. On the other hand, the Government of India did not try for long to dissuade the Tibetan delegation staying in India from going to Peking, as they had implicitly warned in their Note to China dated October 26, 1950.

Differences within Indian Government

But in October-November 1950, there were sharp differences within the Indian Government as to how much support should be given to the Tibetan Government in maintaining *de facto* independence, which it had enjoyed since 1912. The Deputy Prime Minister, Sardar Vallabhbhai Patel was in favour of military intervention in Tibet and he had support from some members of the Cabinet and the Foreign Office. But the Army Chief, General Cariappa, poured cold water on the plan of military intervention in Tibet to save it from China. (B N Mullick, "The Chinese Betrayal", pp 80-81.) The Tibetan Government was encouraged by some official groups in India to submit a complaint of invasion and aggression against Communist China on November 7, 1950 to the United Nations. When the matter was raised in the General Committee on November 15, 1950, it was decided that the Tibetan question should not be included in the General Assembly agenda. The Indian delegate in the committee said that he was certain that a peaceful settlement could be made and Tibet's autonomy could be safeguarded, and that the best way to ensure this was to abandon the idea of discussing the matter in the General Assembly. Failing to receive any sort of military or diplomatic support from the major powers, the Dalai Lama left Lhasa on December 21, 1950 to escape from the Chinese attack and settled at Yatung near the Indian border. The Dalai Lama also wrote to the Government of India seeking political asylum but this was refused on the advice of K M Panikkar.

On November 7, 1950 Sardar Patel who was in favour of an interventionist policy *vis-a-vis* Tibet, gave vent to his feelings in a confidential letter to Nehru. Sardar Patel asserted in this letter, "... The undefined state of frontier and the existence on our side of a population with its affinities to Tibetans or Chinese have all the elements of potential trouble between China and ourselves ... Communism is no shield against imperialism and ... Communists are as good or as bad imperialists as any other. Chinese ambitions in this respect not only cover the Himalayan slopes on our side but also important parts of Assam." (Quoted in Kuldip Nayar "Between the Lines", p 218.) On November 9, 1950 Sardar Patel blurted out in a public speech that there might have been a world war on the issue of Tibet. In the context of sharp division within the Cabinet, Nehru thought it necessary to assure the members of the Indian Parliament that "Map or no map, McMahon Line was our definitive frontier, and no one will be allowed to cross that frontier". Nehru also assured the MPs in the same speech that "The frontier from Ladakh to Nepal is defined chiefly by long usage and custom" (November 20, 1950). In answer to a question by an MP whether this boundary was recognised by the existing Tibetan Government, Nehru admitted that parts of the Indo-Tibetan boundary had not been recognised. But he did not make it clear which parts of the boundary had not been accepted by the Tibetan Government. On December 6, 1950, Nehru repeated in Parliament an earlier statement (March 17, 1950) that the Himalayas formed India's traditional Northern frontier and that since Nepal was on this side of the Himalayas, any threat to the security of Nepal would be considered a threat to India's security.

In November 1950 the Indian Government decided to set up a Committee under the Chairmanship of Major-General Himmatsinghji, Deputy Minister of Defence, with representatives of Defence, Communication, Home and External Affairs Ministries to study the problems created by the Chinese invasion of Tibet. The North and North-Eastern Border Defence Committee was established in February 1951. The report of the Committee was submitted to the Defence Ministry in early 1953. The major recommendations of the Committee were "the reorganisation and expansion of the Assam Rifles, the extension of the administration in the NEFA, development of intelligence network along the border, development of civil armed police, development of communications and check posts."

* e g, The map attached to "The China Hand book (1937-43)", complied by the China ministry of Foreign Affairs; New York; the Macmillan Company.

("Prime Minister on Sino-Indian Relations", Vol I: In Parliament, p 251.) The Border Defence Committee must have also recommended a precise definition of the North and North-east border which it proposed to defend.

Due to the dangers of expansion of the Korean War in November 1950, the question of the Indo-Tibetan border was, however, relegated to the background for some time to come. The Chinese Army halted its march after the fall of Chamdo on the eastern border of Tibet. Nehru had been highly critical of the decision of the UN army under American leadership to cross the 38th Parallel to invade North Korea in October 1950. The collapse of General MacArthur's offensive in late November 1950 in the face of the massive counterattack launched by the ill-equipped Chinese Army and President Truman's talk about the possibility of dropping an atom bomb enhanced the danger of a World War. This also stimulated anti-Western feelings throughout Asia. Nehru became conscious by then about the shift in the world balance of power caused by the emergence of China as a formidable land power able to face the American challenge in Asia, as also the advantageous position gained by India in holding a middle-ground in the new power balance. Nehru and his advisers thought that, as Vijayalakshmi Pandit put it, "... a war is a greater threat to us than Communism in Asia" (*New York Times*, January 1, 1951). In this context it became necessary for India to avoid bickerings with China on the issue of Tibet so that it might act as an honest peace-broker between the warring parties. In a BBC broadcast from London on January 13, 1951, Nehru said, "China, in her new-found strength, has acted sometimes in a manner which I deeply regret. But we have to remember the background of China, as of other Asian countries — the long period of struggle and frustration, the insolent treatment that they received from imperialistic powers and the latter's refusal to deal with them in terms of equality. It is neither right nor practical to ignore the feelings of hundreds of millions of people. It is no longer safe to do so".

In January 1951 the Chinese and the UN Army led by the Americans were locked in severe battle in Korea in the wake of the Chinese counteroffensive, while India was busy leading Arab-Asian nations in the United Nations seeking a formula for peace based on *status quo ante bellum*. On February 2, 1951, the Government of India chose to take over Tawang, which though south of the McMahon Line continued to be an important centre of Tibetan administration. There was no protest by China to the Government of India on the issue of Indian occupation of Tawang, while the Tibetans staged a demonstration before the Indian Mission in Lhasa when the news reached there. The quiet acquiescence of Communist China on the issue of Tawang convinced the Government of India that it would be possible to establish Indian control over the whole of the NEFA area without any opposition from Peking. This was quite in contrast to the attitude of the Nationalist Government of China which had sent several protest Notes on the question of Indian incursion in the NEFA area. The North-eastern frontier was the only vulnerable area through which an attack might be launched by China against India — at least this has been the opinion of the Indian Army Headquarters since 1910, when General Chao Erfeng's army moved about the NEFA area in its march on to Lhasa. Since the mid-thirties, it has been an aim of the Foreign and Political Department of the Government of India to push the North-East frontier from the foothills of Assam to the crest line of the Himalayas. But due to the stiff opposition of the Tibetan Government with whom the British Government wanted to maintain the best of terms with a view to using it as a buffer state *vis-a-vis* China, the mighty British Raj failed to implement the so-called McMahon Line as the North-eastern boundary of India. The taking over of Tawang in the first week of February 1951 without any opposition from the Chinese was rightly regarded by the Government of India as indicating that the People's Republic of China was psychologically prepared to accept the McMahon Line as the *de facto* boundary. On February 1, 1951, India and Burma were the only non-Communist Powers which opposed the US sponsored resolution in the UN General Assembly declaring China as guilty of aggression in Korea. This led to a further improvement in Sino-Indian relations during this period. On February 12, 1951, Nehru told the Indian Parliament, "The House will remember that we were aggrieved at a certain turn of events in Tibet, but we did not allow that to affect our policy or our desire to maintain friendly relations with the People's Government of China. I am glad to say that our relations with the New China are friendly at present".

On March 28, 1951, B V Keskar, Deputy Minister for External Affairs, explained India's policy in regard to the Indo-Tibetan frontier in the Lok Sabha: "The Government is not unmindful of the protection of our frontiers adjoining Tibet. I may go further and say that the Government feels that the best way of protecting that frontier is to have a friendly Tibet and a friendly China. It is obvious that such a complicated and big frontier cannot be well-protected if we have a border country which becomes hostile to us. Therefore, we feel that in tackling the question of Tibet and China, we should always keep in mind that a friendly China and a friendly Tibet are the best guarantee of the defence of our country."

By the end of 1950, the Tibetan Government had realised that neither India nor the Great Powers were prepared to give them diplomatic or military support to bolster up their pretension of independence. In April 1951, negotiations started in Peking between the Chinese and Tibetan delegations and this resulted in a 14-point Agreement on May 23, 1951. This Agreement gave assurance of local autonomy, but provided for the gradual incorporation of the Tibetan Army into the People's Liberation Army of China and the exclusive handling of the foreign affairs by the Central People's Government of China.

From a speech delivered by Nehru in Parliament on November 25, 1959, we get a chronology of Sino-Indian negotiations on the question of Tibet in 1951-1952. "... in an informal conversation with the Indian Ambassador on September 27, 1951, Premier Chou En-lai expressed his anxiety to safeguard in every way Indian interests in Tibet on which matter "there was no territorial dispute or controversy between India and China". He added: "The question of stabilisation of the Tibetan frontier was a matter of common interest to India, Nepal and China and could best be done by discussions between the three countries. Since the Chinese Army entered Lhasa in pursuance of the Sino-Tibetan Agreement of 1951 to take up frontier posts, it was necessary to settle the matter as early as possible." On October 4, 1951, the Indian Ambassador in Peking informed the Chinese Premier that the Government of India would welcome negotiations on the subjects mentioned by Premier Chou En-lai.

Sardar Panikkar came to India in October 1951, and had consultations in the External Affairs Ministry about the attitude to be adopted regarding Tibet. Panikkar hoped that the Chinese would not move a considerable armed force into Tibet ... he further said that extra-territorial rights had no place in the relationship between two independent countries in modern times and India would put herself entirely in the wrong by insisting on the continuance of the rights which the British had forcibly extorted from Tibet. In any case China would not agree to their continuance and there was no way by which India could enforce them except by force of arms which India was not in a position to employ. So the best policy would be to give up gracefully all that was untenable and insist on economic and cultural rights which were of a more fundamental nature and were not necessarily based on treaties. Panikkar's views were shared by the Government of India." (B N Mullik, "My Years with Nehru", p 147.)

In February 1952 the Indian Ambassador in a meeting with the Chinese Premier gave a statement on the existing Indian rights in Tibet and reiterated India's willingness to arrive at a mutually satisfactory settlement. Premier Chou En-lai replied that there was "no difficulty in safeguarding the economic and cultural interests of India in Tibet". He did not refer to the frontier question in his reply; nor did the Indian Ambassador raise this question specifically then." (Nehru's speech in Parliament on November 25, 1959.)

In May 1952, before his departure from China, Panikkar had further conversations with Chou En-lai regarding Tibet. While accepting the legitimacy of our trade and cultural interests in that area, he suggested that the Political Agency in Lhasa, an office of dubious legality, should be regularised by its transformation into an Indian Consulate in exchange for a similar Chinese office in Bombay. So far as our other posts and institutions were concerned, some of them like telegraph lines, military escort at Yatung, were to be abolished quietly in time, and the trade agents and other subordinate agencies brought within the framework of our normal consulate relations. These were to be taken up when circumstances were ripe. ("In Two Chinas", p 175.) Neither side raised the issue of the boundary.

It has been brought to light by Neville Maxwell that in 1952 G S Bajpai, the first Secretary-General of the External Affairs Ministry, who retired in May and was posted as the Governor of the Bombay province, wrote a letter to his old Ministry, urging that India should take the initiative in raising the question of the McMahon Line with the Chinese Government. He warned that to China the McMahon Line might be one of those "scars left by Britain in the course of her aggression against China, who may seek to heal or erase this scar on the basis of frontier rectifications that may not be either to our liking or our interest".

Nehru discussed this suggestion with K M Panikkar, the Ambassador to China, who was in New Delhi for consultations, and Panikkar replied to Bajpai. He told him that the Prime Minister had decided that it was not in India's interest to raise the question of the McMahon Line. Nehru, he explained, had taken the view that since India had unequivocally and publicly stated that it regarded the McMahon Line as the boundary, it should be left to China to raise the subject. If India were to do so, "we should force the Chinese to one of two attitudes: either the acceptance of a treaty signed by us with Tibet, or a refusal of it coupled with an offer to negotiate. The first is not altogether easy to imagine, considering that every previous Chinese Government has refused in terms to accept an Indo-Tibetan treaty as binding on them. The second would not be advantageous to us."

If on the other hand, "China raised the issue", Panikkar went on, "we can plainly refuse to reopen the question and take our stand that the Prime Minister took in his public statement, that the territory on this side of the McMahon Line is ours, and there is nothing to discuss about it". ("India's China War", pp 76-77.)

After the departure of K M Panikkar from Peking, there were some bickerings between the Governments of India and China in July-August 1952 over the despatch of fresh Indian troops to replace the guards at Gyantse and Yatung, seizure of the wireless set of the Indian Trade Agent at Gartok, refusal to allow the Political Officer in Sikkim to visit Lhasa without a proper Chinese visa. (B N Mullik, "My Years with Nehru", pp 149-150.) But again, the issue of the Indo-Tibetan border was not raised by any side. On September 15, 1952 there was an official announcement in New Delhi that the Indian mission in Lhasa was henceforth to be designated as Consulate-General, and that three Trade Agencies at Gyantse, Gartok and Yatung were to be under the general supervision of the Consulate in Lhasa. In the press communique it was declared that the change in status resulted from the fact that the foreign relations of Tibet were currently conducted by the People's Republic of China.

Since October 1952, India's diplomatic activities were concentrated on bringing the Korean War to a close through devising a compromise formula on the vexed question of the repatriation of the prisoners of war. The question of POWs hamstrung the armistice negotiations for about two years. The coming to power of the Republican Party in the USA meant that the influence of the China Lobby, which was pledged to 'roll back the mud tide of Communism in Asia' was ascendent in American politics. The armistice in Korea was signed in July 1953, mainly on the basis of an Indian formula, but India was excluded from the membership of the proposed political conference on Korea in the voting of the UN General Assembly due to the hostile attitude of the USA towards Indian neutralism. India had also become aware of the negotiations going on between the USA and Pakistan about bringing Pakistan into a military alliance with the USA as early as September 1952. The aggravation of the conflict in Indo-China in 1953 also contained new portents of a widespread conflict in Asia. This danger of war in Asia due to the threat of American expansionism prompted the Government of India to mend their fence with China. In September 1953 the Government of India approached the People's Government of China for negotiations regarding the outstanding questions concerning Tibet.

In November 1953 there were further discussions in the External Affairs Ministry in New Delhi, in which it was again decided that the question of the Indo-Tibetan boundary was not to be raised in the forthcoming conference with China in Peking. According to B N Mullik, "... one view expressed during the briefing of our delegation was that the question of India's northern frontier should also be settled during the negotiations. But the general view was that we should not allow China to take this opportunity to take up the whole issue. In any case, China was not going to recognise the McMahon Line which we considered to be our northern frontier and so there could not be any negotiations on that score." ("My Years with Nehru", pp 155-156.)

The Conference opened in Peking on December 31, 1958. Premier Chou En-lai at the first meeting said that the relations between China and India were becoming closer every day and that from among the outstanding questions the two sides could settle questions which were ripe for settlement. The Indian Ambassador then pointed out that there were only small questions pending betwen India and China but he wished to see nothing big or small remaining outstanding between the two countries. Premier Chou En-lai replied that two large countries like India and

China with a long common frontier were bound to have some questions, but all questions could be settled smoothly. (See Note of the Government of India to the Chinese Government, February 12, 1960, White Paper No III, p 91.) According to B N Mullik, "... the conference started with the two sides speaking in two voices, the Indians insisting that all 'pending questions' should be discussed and settled and the Chinese holding the view that only 'such questions as were ripe for discussion' should be taken up leaving the rest for future settlement. In India's view the border question did not exist but the Chinese kept this issue open to be taken up when a suitable occasion would arise." ("My Years with Nehru", p 151.)

The Agreement "on Trade and Intercourse between Tibet Region of China and India" was signed on April 29, 1954. India gave up all the extra-territorial rights which the British Government in India had exercised in Tibet by virtue of the secret Anglo-Tibetan regulations of July 3, 1914. The central provisions of the Agreement dealt with the regulation of trade markets, routes and procedures for traders and pilgrims. The treaty provisions were supplemented by a Note dealing with the withdrawal of Indian military escorts and the handing over of Indian post and telegraph facilities and Indian rest houses to the Chinese. The most important elements of the treaty was contained in the title of the agreement itself in which Tibet was referred to as the "Tibet region of China". This was a definite assurance to China that India had discarded once for all the British policy of bolstering up Tibet as a buffer state. The preamble to the Agreement contained the five principles (1) mutual respect for each other's territorial integrity and sovereignty, (2) mutual non-aggression, (3) mutual non-interference in each other's internal affairs, (4) equality and mutual benefit, and (5) peaceful co-existence. Of these (1) and (4) are the basic principles declared by Chairman Mao Tse-tung on October 1, 1949 to be followed by the People's Republic of China in establishing diplomatic relations with foreign governments. Points (2) and (3) provided a sort of reassurance of China's peaceful intent towards India. Peaceful Co-existence was the common desire of both sides.

The boundary question arose only indirectly during discussions on Article 4. The Chinese side introduced a draft stating that the Chinese Government "agrees to open a number of mountain passes". The Indian side objected on the ground that this was a way of claiming ownership over what were in fact border passes. The Chinese then withdrew their draft by describing it as a concession. Finally, it was laid down that pilgrims and traders could travel through the following passes and routes: (i) Shipki La, (ii) Mana Pass, (iii) Niti Pass, (iv) Kungri Bingri Pass, (v) Darma Pass and (vi) Lipu Lekh Pass.

It is curious to note that the border passes regulating the flow of trans-Himalayan trade and pilgrimages mentioned in the 1954 Agreement belonged to the Central sector of the border only. There was no reference to border passes either in the Eastern sector where a potential dispute in regard to the Indian claim to the McMahon Line existed, or in the Western sector which represented the frontier of the Kashmir state. The Government of India must have deliberately avoided raising the issue of border passes in the Eastern sector of the frontier and the Chinese also kept silent on the issue denoting tacit acceptance of the McMahon Line. But it is now known from the authoritative source of the Indian, IB Chief B N Mullik that the Indian side did try to fix border marts in the Western Tibet for the benefit of Ladakhi traders. But, "... the Chinese delegate would not discuss the question of trade marts in Western Tibet on the ground that this related to Kashmir which was under dispute between India and Pakistan" ("My Years with Nehru", p 153.) B N Mullik also refers to "the refusal of the Chinese to recognise the customary trade mart in Rudak (Western Tibet) without ascribing any particular reason" and comments, "This was no doubt because the Chinese were building the road from Rudak to Sinkiang via Aksai Chin" (*ibid*, p 153).

Though both India and China were eager to reach agreement in the context of the worsening international situation caused by the policy of brinkmanship declared by the American Secretary of State, there was tough bargaining when the Chinese delegates insisted on having a trade establishment in strategic Simla. The Agreement was held up for six weeks over the proposal. Nehru succeeded in giving that right in Delhi instead. "Finally Peking agreed on Delhi because it wanted the fact of the agreement to become known about the time the Geneva Conference opened" (Insaf in *Hindustan Times*, May 7, 1954).

The Sino-Indian Agreement had mixed reception in the Indian Press. There was hope that in return to handing over the privileges enjoyed in Tibet due to the British legacy, India might be permitted to reopen its consulate in Kashgar (Sinkiang). But the Kashgar consulate could not be included in the agenda inasmuch as the People's Republic of China had declared Sinkiang a closed area. It was admittedly a great gain that India could establish a consulate in Lhasa — an ideal listening post for Central Asia — on a regular basis. The Indian Mission established by the British in Lhasa in the thirties was an office of dubious legality.

According to S S Khera, former Cabinet Secretary and Principal Defence Secretary to the Government of India, "Nehru, with his sense of history and of the need for long-term stability of friendly relations between the two great and ancient nations, had hoped for a 25-year agreement in the first instance. But the Indian negotiators succeeded in achieving only a comparatively short-term agreement for 8 years . . . .

"Jawaharlal Nehru was disappointed. Also late in the day as it was, his suspicions about the Chinese intentions were aroused. He stoutly defended the 1954 Agreement; but he also gave instructions to set up border posts, to safeguard the country's northern frontiers". ("India's Defence Problem", p 155.)

According to D R Mankekar, Nehru addressed a secret memorandum to the External Affairs Ministry, Defence Ministry and Home Ministry on the Sino-Indian border question in July 1954. "In this memorandum Nehru described the Agreement as the new starting point of our relations with China and Tibet and affirmed that both as flowing from our policy and as a consequence of our Agreement with China, the Northern frontier should be considered a firm and definite one, which was not open to discussion with anybody. The Prime Minister directed that a system of check-posts should be spread along this entire frontier, more specially in such places as might be considered." Along with this memorandum was issued a new version of Survey of India maps showing the whole northern frontier as clearly defined replacing the old official maps (e g, The Political Map of India 1950: Scale 1 inch = 70 miles), which showed the northern frontier extending from the north-west end of Kashmir to Nepal as 'undefined', and the McMahon Line as 'undemarcated'.

(To be concluded)

Distribution of Urban Household Wealth—II

V M Jakhade

S L Shetty

This paper seeks to explore the possibilities of presenting a method, albeit a crude one, for observing the trends in wealth distribution among urban households.

At this stage of the country's economic development, no official 'administrative' statistics would provide a correct picture of the reality regarding wealth distribution. The only method of obtaining such a valid picture is through systematic surveys.

However, till such surveys are undertaken, it may be worthwhile to attempt, on the basis of available official statistics, to frame a rough pattern of the distribution of wealth and to indicate broad trends over a period of time. The present study has this modest objective in view.

[The first part of this article was published last week.]

THE most crucial aspect of the attempt made here to estimate urban household wealth distribution is the juxtaposition of wealth tax data with income-tax revenue statistics. The following method is employed. Since the exemption limit under the wealth tax is high, it is assumed that the wealth tax assessees belong to the highest income brackets. That is, when income-tax assessees are arranged in an ascending order of the income scale, the number of income-tax assessees in the highest income brackets equivalent to the total number of wealth tax assessees are assumed to be corresponding each other so that the wealth held by them corresponds to their income assessed. Besides the three qualifications made earlier, it is found necessary to exclude from among the six classes of assessees, the pure salary earners and the companies — for the following reasons. Pure salary earners are assumed to have no other source of income and since their salary income is not based on the wealth possessed by them, their income-tax assessments cannot be juxtaposed against the wealth tax assessments. Pure salary earners are unlikely to have large wealth possessions. For the purpose of this study, it is assumed that pure salary earners have wealth possessions much below the wealth estimated for income-tax paying assessees. As for companies, the shareholders independently pay income-tax on the dividends earned by them and also wealth tax on the share held by them. Therefore, the question of including company assessments in this juxtaposition does not arise.

As may be observed from Tables 10A and 10B, there were 21,399 wealth tax assessees whose wealth assessed amounted to Rs 1,163.67 crores. Total income assessed in respect of these

TABLE 10A : NUMBER OF ASSESSEES (WEALTH TAX)

Year	Net Wealth between							Above Rs 1 crore	Total
	Rs 2 to 3 lakhs	Rs 3 to 5 lakhs	Rs 5 to 10 lakhs	Rs 10 to 20 lakhs	Rs 20 to 25 lakhs	Rs 25 to 50 lakhs	Rs 50 lakhs to 1 crore

BHEL announces a Rs. 22-crore error- with some pride

BHEL climaxed 1973-74 with a turnover of Rs.228 *crores* — that's Rs.22 crores more than the forecast. Keeping pace, profits — before taxes — doubled to Rs.27 crores.

It wasn't just a good year for BHEL. It was a great year.

A highlight of 1973-74 — an over 60% increase in BHEL's turnover:

1973-74 was BHEL's best year yet. Turnover and profitability both exceeded expectations; productivity increased significantly and power generation equipment manufacture reached an all-time high.

The turnover increased to Rs.228 crores from Rs.141 crores of the previous year — an increase of over 60%. Profits in the current year were Rs.27 crores, as against Rs.13.2 crores in 1972-73.

2,100 MW worth of power generation equipment was manufactured in 1973-74 alone — equal to the total output of the last six years!

Profits go up — but prices remain competitive:

BHEL offers power generation equipment at international prices — with, of course, the additional advantages of spares and after-sales service being available right here. Plus, equipment is also made available on a turn-key basis.

And for products like switchgears, transformers and boilers, BHEL has been able to secure orders against stiff international and national competition by quoting competitive prices.

In addition, BHEL has not availed of the 10% extra margin in pricing, which is available to all Public Sector Undertakings. In spite of this, profits have gone up and prices have remained competitive.

Not only have prices remained competitive but so has quality. That's why BHEL exports electrical equipment to Malaysia, Singapore, Ghana, Iraq, Malawi, Cambodia, Sri Lanka, Kenya, UAR and UK. BHEL has also sent its technical consultancy experts abroad.

1973-74 — a year of "Firsts" from BHEL:

During 1973-74, the first 100 MW generator and turbine were manufactured. Plus, the first 100 MW station and the first 120 MW station have all been commissioned.

As a policy, BHEL has sought to acquire the most highly sophisticated technical expertise available. This has led to collaboration agreements with reputed companies in USA, Sweden, West Germany etc., for manufacturing air pre-heaters, electrostatic precipitators and axial and radial fans.

As you can see, it wasn't just a good year for BHEL. It was a great year.

TABLE 11 : INCOME AND WEALTH TAX ASSESSEES (OTHER THAN COMPANIES AND PURE SALARY EARNERS), 1960-61

(Derivation of Capitalisation Rate from Wealth and Income Tax Data)

Range of Total Income (Rs)	Number of Assessees	Total Income Assessed (Rs '000)
3,001 – 5,000	1,89,177	7,95,356
5,001 – 7,500	1,63,885	10,26,681
7,501 – 10,000	88,193	7,64,359
10,001 – 12,500	51,665	5,80,116
12,501 – 15,000	34,255	4,69,977
15,001 – 20,000	40,641	7,03,187
20,001 – 25,000	21,462	4,80,185
25,001 – 30,000	12,589	3,44,459
30,001 – 40,000	13,008	4,48,675
	10840	484908
	195*	8788*
40,001 – 50,000	11,035	4,93,696
50,001 – 60,000	6,210	3,39,604
60,001 – 70,000	4,000	2,59,102
70,001 – 1,00,000	5,843	4,83,127
1,00,001 – 2,00,000	3,863	5,18,892
2,00,001 – 3,00,000	718	1,73,261
3,00,001 – 4,00,000	236	80,987
4,00,001 – 5,00,000	123	54,524
Over 5,00,000	211	1,88,297
(Total from * onwards) (i e, Wealth Tax assessees)	21,399	210,65,82
All Income tax assessees	647,114	820,80,08

Year	Wealth Tax Data: No of Assessees	Total Wealth Assessed
1960-61	21,399	Rs 1163.67 crores

Capitalisation rate : $\frac{\text{Rs } 1163.67 \text{ crores}}{\text{Rs } 210.66 \text{ crores}} = 5.52$

* For the division at this point, see the text.

21,399 assessees under the income-tax revenue statistics amounted to Rs 210.66 crores for the same year (see Table 11). When this income is compared with the wealth possessions, the capitalisation rate works out to 5.52. This capitalisation rate is assumed to hold good for all income-tax assessees for 1960-61.

On the basis of this multiple, the size distribution of income-tax assessments has been converted into size distribution of wealth, as presented in Table 12. As may be observed from the Table, the wealth of households assessed for income-tax works out to Rs 4,529 crores, as against the total urban household wealth of Rs 9,694 crores for the year 1960-61. The wealth distribution as presented in this Table takes the following shape:

Size of Wealth	Proportion of Households	Proportion of Wealth
Rs 16,561 and below	96.25	53.28
Above Rs 16,561	3.75	46.72
	100.00	100.00

COMPARISON WITH RURAL HOUSEHOLDS

At this stage, it is worth comparing our results for urban households with the distribution of tangible wealth in respect of rural households, as observed from the results of the All-India Rural Debt and Investment Survey: 1961-62 conducted by the Reserve Bank

of India.[20] The relevant data are reproduced in Table 13.

It may be seen from this Table that about 5.0 per cent of the top rural households possessed about 36.6 per cent of the total rural wealth in 1961-62. This includes the non-cultivating households in the rural areas. Among the cultivating households, about 6.4 per cent of the top households possessed about 37.8 per cent of the total wealth held by such households. These top households belonged to the asset size of above Rs 20,000, which is the highest size group given therein, whereas our *estimates represented so far do not give* such a size group. In order to facilitate comparison of the two sets of data, the size classes in the present estimates have been regrouped into wider class intervals and smaller numbers of classes, assuming that the distribution within an existing class interval *is uniform.* These data are presented in Table 14.

As may be observed from Table 14,

TABLE 12: DISTRIBUTION OF URBAN WEALTH, 1960-61

Size of Wealth (Rupees)	No of Households		Amount of Wealth	
	Number	Percentage	Amount ('000)	Percentage
Below 16,561	1,66,85,048	96.25	5,16,51,243	53.28

1966-67	38,928	Rs 1665.92 crores

Capitalisation Rate: $\frac{\text{Rs } 1665.92 \text{ crores}}{\text{Rs } 444.51 \text{ crores}} = 3.75$

* For the division at this point, see the text.

in 1960-61, 3.39 per cent of the urban households had wealth above Rs 20,000 per household and they possessed about 45.31 per cent of the urban household wealth. The corresponding estimates for rural households, as revealed by the Reserve Bank of India Survey for 1961-62, are: 5 per cent of the top households possess 36.6 per cent of total wealth, or 6.4 per cent of the top cultivating households possess about 37.8 per cent of the total wealth held by all cultivating households. While the top assets group, of Rs 20,000 and above, possessed an average household wealth of Rs 38.79 thousand in the farm sector in 1961-62, the corresponding group in the urban sector possessed an average household wealth of Rs 74.67 thousand in 1960-61. That the degree of inequality is greater in the urban sector than in the rural sector, may also be observed from the concentration ratios[21] worked out for the two sets of data. While, for the urban household sector, the ratio is 0.72, for the rural household sector, it works out to 0.66, and for farm household sector, it is 0.60.

It must be noted that the tangible wealth, as revealed by the RBI study, includes the value of land. In this regard, the NCAER, in their rural household survey conducted in 1962, give the distribution of only tangible reproducible wealth among the different size groups of rural household.[22] The relevant extract is presented in Table 15. Here, the highest size group is shown as Rs 10,000 and above. The households belonging to this size group were 0.9 per cent of the total rural households, and they possessed about 17 per cent of the total reproducible tangible wealth. For this group of households, the concentration ratio works out to 0.70 (see Table 15). This shows that, if value of land is excluded from the wealth possession of rural households, inequality gets widened — though it does not appear as skewed as in respect of urban household sector.

Here, a few general observations about the present results should be noted. The first observation is about the capitalisation rate of 5.52. It may be argued that there is no need to apply a uniform capitalisation rate, as it may in reality differ at different wealth/income scales. The possibility, as Gulati had observed, is that the rate of capitalisation may be higher at higher levels of wealth possession.[23] We have, however, adopted uniform rates of capitalisation instead of arbi-

trary, differential ones. It has to be conceded that if the principle of differential rates is accepted, the degree of inequality in urban wealth distribution would be wider. Secondly, the major limitation of the study is that it is based on administrative data such as wealth and income-tax revenue statistics which have many drawbacks.

As stated earlier, we have also attempted similar estimates for two more years, *viz*, 1949-50 and 1966-67, so as to find out, to the extent possible, the trends in wealth distribution of urban households. However, in the process, certain special problems have arisen and those problems have been solved as follows.

For 1966-67, the same method as the one employed for 1960-61 has been adopted for deriving the capitalisation rate. The details are contained in Table 16. The capitalisation rate works out to 3.75 only, as against the rate of 5.52 derived from 1960-61. A close reading of the wealth tax statistics reveals the possible reason for such a sharp decline in the rate. Over the period 1960-61 to 1966-67, the number of wealth tax assessees has increased at a faster rate than the rate of increase in wealth assessed. Thus, while there was a 82 per cent increase in the number of assessees between 1960-61 and 1966-67, wealth assessed increased by 43 per cent only (see earlier Tables 10A and 10B). During the same period, average wealth assessed per assessee declined from Rs 5.44 lakhs to Rs 4.28 lakhs. Wealth tax per assessee has come down more steeply from Rs 3,861 to Rs 2,795.[24] Since the number of wealth tax assessees is the crucial variable for determining the level of income (assessed) corresponding to the amount of wealth assessed, the relatively large increase in the number is reflected in the lower rate of capitalisation. It is conceivable that in India, the increase in the number of wealth tax assessees is partly dubious: in order to avoid tax laws, many a wealth holding has been subdivided, resulting in considerable increase in wealth-tax assessees. In order to make allowance for the possible underestimation of the rate of capitalisation, we have taken a range of possible rates of capitalisation: the minimum is 3.75, as it actually emerges from the data for 1966-67 itself and the maximum is the rate derived for 1960-61, *viz*, 5.52. While the degree of inequality for 1966-67 in legal terms is like the one obtained from Estimate I (with 3.75 capitalisa-

tion rate), the real distribution should tend towards Estimate II (based on a 5.52 capitalisation rate). Table 17A and 17B give the conversion of income-tax assessments into wealth holdings under Estimates I and II, respectively.

For 1949-50, too, in the absence of any wealth-tax data, the same capitalisation rate of 5.52 as revealed for 1960-61 is applied. Table 18 presents the data for 1949-50. A comparative picture of wealth distribution, as emerges from the orginal income-tax revenue statistics, is summarised in Table 19.

Summary of Results

Because of lack of homogeneity in the size classes of different years, the proportions given in Table 19 are not comparable. Therefore, regrouping of the data has been attempted, as for 1960-61, in Table 14 and comparative results for 1949-50 and 1966-67 have been presented in Table 20, which may be read with the data for 1960-61 shown in Table 14. A better view of the trends in distribution of wealth over the period 1949-50 to 1966-67 may be had in the following summary in Table 21.

The proportion of urban households with wealth above Rs 20,000 (at current prices) has increased consistently over a period of years, and the proportion of wealth held by them has also increased except in the case of Estimate I for 1966-67 which shows a decline in the proportion of wealth held by households which have wealth above Rs 20,000 each. Concentration ratios worked out and presented in Table 21 show that inequality in the urban household wealth distribution had increased between 1949-50 and 1960-61; however, the estimates for 1966-67 show that this trend has been reversed.

Notes

Guest Keen Williams Limited

Statement by the Chairman, Mr K C Maitra

THE following is the Statement by Mr K C Maitra, Chairman, Guest Keen Williams Limited, on the occasion of the Fortyfourth Annual General Meeting of the Company held in Calcutta on April 26, 1974:

It is my pleasant task to welcome you to this Fortyfourth Annual General Meeting of your Company. The Accounts and Directors' Report have been circulated and with your permission I shall take them as read.

Board of Directors

My first priority, both personally and on behalf of shareholders, is to offer very sincere good wishes to the three retiring members of your Board. Firstly I may mention Mr A K Roy, who joined your Board in October 1966 after a distinguished career in the Government service: he has consistently provided your Company with wise counsel based on his wide-ranging experience of industry and public life, and I am glad to have this opportunity to pay tribute to him.

From the executive team Mr M M Malkani retired on 1st October last year, and Mr K K A Ramachandran is retiring at today's Annual General Meeting and not seeking re-election. In their service as executives and latterly as Directors of your Company, both men have played key roles in the development of GKW from the relatively small private company which it was thirty years ago to the leading position it holds today. The importance of their contribution can hardly be overstressed, and again I am glad to have an opportunity to record our sincere appreciation of their services.

Your have already been informed of the appointment of Mr G M Ghosh and Mr L Hodges as whole-time Directors of your Company with effect from 1st September 1973. Both men have held executive appointments within GKW over a number of years, and are currently in charge of the Fasteners Division and Engineering & Forgings Division respectively. Their appointment to the Board maintains the executive representation of important areas of GKW activity, and I warmly commend the confirmatory resolutions before you today.

The non-executive Director strength of your Board has similarly been restored by the election of Mr S Ranganathan and Mr A Ray on 1st February 1974. We are fortunate in securing the services of men of their calibre and distinction, and again I warmly commend the confirmatory resolutions.

Operations during 1973

As usual, the salient details are given in the Directors' Report and my task is to highlight certain major themes. In each of my last three speeches to you, I have sought to place the GKW results for the year under review in a longer-term context: although I may repeat myself I believe it is necessary to take the same line today.

The improvement in your Company's fortunes between 1969 and 1971, and the plateau of prosperity we have had from 1971 to 1973, were governed by four essential inputs. The first of these is *capital investment*: our last round of major investment decisions were taken in the early sixties, financed as to foreign exchange by our majority shareholder providing substantial sterling loans. Such investment involves risk, as was shown with devastating clarity in our 1967/68 figures. The risk proved justified, however, when two more of the essential inputs began to go right in 1969/71: *demand* for our products, and *supply* of items we purchase — particularly raw materials and power. During that period, India experienced improved agricultural sector performance, an excellent rate of installation of power generating capacity and better availability of foreign exchange for materials not indigenously available or in short supply. These factors helped both product demand and consumables supply simultaneously, and industrial activity was buoyant. By common consent however, the performance of the agricultural sector was pivotal in the general improvement. The fourth major input is *labour*: this is never an overriding constraint in India given — as has been a feature of GKW throughout its history — willingness to train men in the necessary skills. But certain conditions are necessary for such trained labour force to be peaceful and productive. These include political stability, plus adequate availability of wage goods at reasonable prices — particularly food. Thus agricultural sector performance holds a second key to industrial output.

Both in 1972 and in the year under review, your Company has in essence traded on the enhanced asset base generated by the investment decisions of ten years ago, and indeed this phase is in a way marked by the repayment in 1973 of the largest single year's drawings on our sterling loan in 1966. By contrast 1973 capital expenditure — mainly on replacement and balancing plant, but with some useful improvement schemes within existing licensed capacity — has again been low. Dealing with the other crucial inputs I have cited, only product demand remained satisfactory in 1973. Throughout the year we could have sold more in virtually all our product ranges, had we been able to secure the necessary raw material and power: in both these areas, however, the position worsened and has been even more serious in 1974 to date. The Directors' Report comments on the fall in investment in stocks, mainly on account of raw material: given rising prices, the fall in tonnage is even greater. Clearly the production rates sustained in 1973 consumed material at a greater rate than replenishment, and with stock at or near zero at the year end in a number of categories either the replenishment rate has to rise or production will fall. The power situation has become particularly serious in Eastern region, affecting not only our Works but also the main steel producers, and we now have the added threat of oil shortage. To the credit of your Management and responsible Trade Unions with whom we deal, in 1973 GKW was again largely free of serious industrial unrest and completed peaceful negotiation of several major new agreements. Along with the country as a whole, however, we had to solve many problems arising from agitation in various States and key industries during the year, and the failure of the food supply and price situation to respond to the good 1973 monsoon must be recognised as a major contributory factor.

The 1973 picture, therefore, may be summarised as a problem year with the problems overcome. But the problems were looking more serious at the year end than at the beginning, and such cushions as we had twelve months ago have been largely used up. This clearly has implications for 1974, to which I now turn.

Outlook for 1974

I said in 1972 and repeated last year, that we have to run quite fast just to stay where we are and maintain our profit figures. Despite attacking cliches in a previous speech to you, I have no option but to repeat the same prognosis for 1974: it is indeed a corollary of inflation, which is currently afflicting the whole world. India is experiencing a rate of inflation higher than world average; and since our ratio of imports to GNP is comparatively low, we must look mainly for internal reasons. Neither in agriculture nor in industry over the last two years has there been any significant increase in real output; population and wage levels have risen, expectations have risen, non-plan expenditure has risen, and the equation has been balanced by increased money supply, not real output.

A company like GKW, broadly based on materials and components for industry generally, is a microcosm of the national picture. As for the nation, so for GKW, growth in real output offers the only scope for meeting the rising expectations of our employees and rising costs of our purchases, with minimum inflation of our own prices. This is why I have again outlined the factors favourable to GKW growth which led to the improvement from 1968 onwards, and observed that these factors are not present today. Your company is strongly placed by virtue of the quality of its product range, the quality of its productive capacity and personnel at all levels, and the respect which we enjoy in our various markets; but the lack of major new capacity coming on stream, and the handicaps to even maintaining achieved levels of output due to a worsening position of raw materials, power, and fuel oil, compel me to be cautious about 1974. The first quarter workings were satisfactory, but the second quarter is likely to be less so and the prospects for the second half are exceedingly difficult to forecast — some supply problems look like easing, others may get worse. I see virtually no chance of profit increase in 1974 therefore: some reduction is I fear more likely, but — given a reasonable level of essential inputs — I am confident that the GKW team can hold it within acceptable limits.

Exports

I am glad to be able to record a further improvement in exports, although the figure is not as high as we had hoped — and indeed looked like achieving, until certain problems arose towards the year end connected with the formula specifying minimum added value of engineering exports. Pending clarification some shipments were delayed; and the booking of shipping space became exceedingly difficult at the close of the year.

Given that steel is in overall short supply, any use of steel for export will entail additional import if the requirements of the domestic market are also to be met. Hence a target added value is not unreasonable; but I hope it can be tempered by practical considerations. One of the most valuable assets any exporter has in the eyes of his customer is credibility as a supplier: therefore frequent policy changes should be avoided, and when a change is made an exporter who has immediate deliveries due against a contract under the previous rules should be automatically exempt for (say) three to six months. More importantly, a particular product in a particular market, established by hard work over a number of years, may be found to earn less than the target added value. Any target percentage is arbitrary and governed wholly by Indian considerations: but both the imported steel price and the market price for the product are wholly outside Indian control, and the relationship between them will inevitably vary from time to time. The question is whether India should abandon an established market, and all the work that has gone into it, merely because it does not at a particular time fit an arbitrary figure. I think it is unwise to try and give a single answer to this question, I believe each case needs examination on its merits.

Meanwhile exports in 1974 have begun well, and provided we can maintain production I am confident that a new export record substantially in advance of previous levels will be achieved. First quarter export earnings were over Rs 50 lakhs, so we already have over half the 1973 figure in the kitty.

Bonus and Rights Issues

The 1 for 2 bonus issue was duly made last year, and the dividend for 1973 has been declared on the enhanced capital. You will recall that the consent for the bonus issue carried a condition that we should also make a rights issue in the sum of Rs 50 lakhs (inclusive of premium) to Indian shareholders only. The General Meeting on 31st October 1973 authorised the Board, subject to the consent of the Controller of Capital Issues, to issue 222,223 equity shares at a premium of Rs 12.50 per share; the resolution also gave the Board power to vary the number of shares and the premium to take into account the views of the Controller of Capital Issues. In the event, consent was accorded for an issue of 250,000 shares at a premium of Rs 10 per share, to be issued by way of rights in proportion as nearly as circumstances admit to the resident Indian shareholders of the company.

Your Board has accepted this revised proposal, and the shares will shortly be offered to resident Indian shareholders whose names appear on the Register of Members as at April 26, 1974.

Future Prospects

April 1974 marks the beginning of what should be India's Fifth Five-Year Plan 1974/79. I say "should be", because the actual draft Plan had come under considerable criticism even prior to the oil crisis, and subsequent to that crisis has been largely written off by many commentators. In the process, planning itself has come under criticism. I want first to observe that this reaction is misguided. Your Company annually updates a five year forward plan and uses it as the framework for investment and operating budgets for the immediate future: if this is essential for running a company, it is still more essential for running a country.

But plans by companies are subjected to certain rules. A review of past and present performance is essential, identifying policies which have proved successful in the past and seeing whether those successes can be repeated or reinforced; conversely, weaknesses must be identified and dealt with. Plans must be constructed within the resources available, or likely to be generated or brought in from outside: a plan which breaks this rule is not only not helpful, it is an active hindrance to taking necessary decisions on priorities simply because it does not reveal their necessity. The perspective review of GKW, which I have given earlier has, I think, some useful pointers towards conditions for growth in a national context. I have neither the space nor the economic expertise to cover the entire field, but there are three themes I feel may be useful and constructive.

The first concerns basic structure of growth projections. The Fifth Plan aims at 5.5 per cent, because even this rate — allowing for 2.2 per cent population growth — takes over 20 years to double per capita income. The average includes, as before, high rates of

general industrial growth, and this pattern in turn calls up still higher rates in capital-intensive basic industry. But four-fifths of our population live in the villages; agriculture has borne the brunt of the population increase including unemployment or underemployment. Even if foodgrain production had reached the Fourth Plan target of 129 million tonnes, it would have done little to raise agricultural productivity per head, and actual achievement is expected to be far below that target. This is surely the main cause of virtually zero increase over the last few years in the per capita income of the country as a whole measured at constant prices. It also limits marketable surpluses from the rural sector, with consequential lack of monetary economy and difficulty in releasing the demand which that sector could generate. At the same time, the food supply and price situation in deficit and urban areas poses a threat to political and industrial stability. Only improved agricultural production and productivity can reverse these trends, no realistic forecast of industrial growth can cope with the numbers. It therefore seems to me that any industrialist must advocate first priority to the agricultural sector, as a piece of enlightened self-interest.

The needs are well known, such as water and fertiliser inputs; transport; better storage, including silos, canning and freezing facilities to yield higher utilisation of already available output; and applied research and development directed at Indian needs and conditions. Action on these would in a number of cases generate industrial demand directly; and improved earnings in the agricultural sector would generate second order industrial demand. I also believe that success would carry two riders; firstly, the sector could and should then bear a greater share of the tax burden; secondly, as well as avoiding present or future imports, the sector could improve its already substantial export contribution. Merely on sectoral size considerations, a small percentage increase in the exportable surplus of agricultural products or manufactures could achieve foreign exchange earnings which smaller industries like engineering can only manage by massive increase in capacity or total abandonment of domestic needs.

The second main theme of comment I would like to offer concerns oil. The exact figures at which this problem will eventually be measured are not yet clear, but a common estimate is that OPEC countries will demand an additional $ 50/60 bn in 1974; the developing countries' share is around $ 10 bn, greater than the total aid flow. The important point is that the increased OPEC income is many times greater than their physical ability to absorb products in return. Government is right to look at export potential to the oil-producing states, but neither for India nor for the world will this cover more than a limited proportion of requirements; along with the rest of the world, India will have to run up debts for oil. If foreign debt for a consumable item is essential, it markedly steps up the requirement that foreign debt on capital account must generate import substitution or export potential: it must service not only its own debt but the oil debt as well. A substantial part of the debt servicing burden we already carry was incurred in pursuit of Plan objectives of import substitution and export payoff; yet (for example) we still have to import steel, and engineering exports are hindered by shortage of this vital material. This is a familiar line of criticism of our performance against objectives in previous Plans, yet we tend to continue with the same basic approach on an increasing scale. It is more than ever imperative that we make better use of capacity laid down in earlier Plans, and at the same time be prepared to examine alternative approaches.

My third theme is derived from the first two. Suppose Government does decide to allocate far more of available public funds to support agriculture, and infrastructure servicing agriculture and industry. Suppose it is also forced to commit more of its overseas credit to borrowing on account of oil purchase. At the same time, however, projected improvement in agricultural productivity sustains a forecast of rising industrial growth on a demand-led commercial basis, fortified by a better food supply and price situation and increased exportable surplus. In the service of economic growth overall, Government would be seeking to diminish rather than extend its commitments in the industrial field in order to provide additional outlays on agriculture within the resources available to it. It would therefore welcome very substantial private sector growth in a fully recognised and applauded national role: in particular, the larger houses would have most to offer, on the scale in which Government would be seeking private initiatives. Lastly, if borrowing abroad assumes a new respectability because of the dimensions of the oil problem, perhaps financing part of India's huge capital needs by foreign equity might regain respectability also: I do not believe foreign majority companies would object to export commitment sufficient to cover its dividend cost, and India cannot afford to ignore this substantial source of credit rating overseas.

I would like to end this section by according due recognition to the problems which Indian planners always face, and always will do even when external circumstances are favourable. When they have to deal with a crippling affliction like the oil price increase, the whole nation must rally with sympathy and support. I earnestly hope they in turn will not merely resort to larger doses of medicines which have proved inadequate even for less severe ailments both diagnosis and treatment need: to be dispassionately reviewed.

Our Associates

Your Company continues to benefit from the consistent support of Guest Keen & Nettlefolds Ltd, UK, and from the personal contribution of Mr H S Killick who has been a regular and most welcome visitor throughout the year. Early in 1974, we were also fortunate to have a team with us including Mr Emrys Davies, who had earlier played a leading part in the layout of GKW Steelworks in its present form. It is this sort of continuity in the GKN approach, whereby senior men in the UK company put in much time and effort over many years to know our problems at first hand, which ensures maximum effectiveness of the help we receive.

Conclusion

The problems of 1973, continuing in 1974, have imposed considerable stresses on people in GKW at all levels. With vital supplies irregular and uncertain, it has been necessary to chop and change on a daily or even hourly basis, and the implications of this for people in sales, production control, works management and shop floor are obvious. My traditional closing words of appreciation for the loyal and unstinted efforts of the whole GKW team are therefore more appropriate than ever. I am sure that shareholders will endorse these sentiments, and share with me the confidence that the combination of expertise and effort which has gone into the existing achievement will stand us in good stead in the evermore challenging future.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Joint Sector for Consumer Industries

THE public sector, as an offspring of State planning, comprises core industries, occupies commanding heights in our mixed economy and provides the infrastructure for further industrial development and diversification in the years to come. Of late, the Government of India has also realised the importance of the development of consumer industries in the public sector.

The joint sector is a logical sequence in the process of state economic planning as a golden mean between a completely free economy and a totalitarian one. As an instrument of socio-economic progress, the joint sector has its own commendable features.

First, it is a halfway house between public sector and private sector and can certainly combine the best from both sectors. Secondly, the joint sector is ideally suited to consumer goods, both durable and non-durable. Thirdly, it provides a better and effective check on the ever growing multinational corporations which flourish in very many of our consumer industries by the use of international brand names claiming foreign ownership. Finally, by helping to curb foreign domination in consumer industries, it will reduce the colossal drainage of foreign exchange caused by the foreign companies in diverse and devious ways.

The Union Government has done well to exclude foreign companies from the joint sector. Now as it is, they cannot use the joint sector for entry into fields in which they are otherwise precluded.

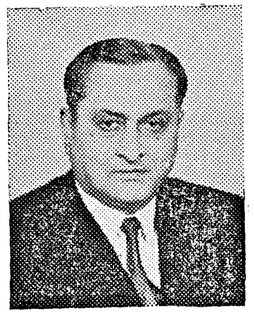
Balanced regional growth, larger employment, supply of mass consumption items at lower prices and according to the needs and tastes of the people in the various states or regions, diffusion of economic power and all-pervasive self-reliance in the true sense of the term are the economic and social benefits that can be achieved by effective implementation of the concept of joint sector.

The entry of the joint sector in the foreign dominated cigarette industry will act as a fillip to the indigenous sector inasmuch as the Union Government will now find itself under a compulsion to adopt a more favourable policy towards the joint sector companies than it used to be towards the indigenous companies. In this process, the government will also take steps against the foreign cigarette companies as warranted by its new and avowed policy which has till now remained only on paper. In addition to the implementation of the new policy of encouraging only cent per cent Indian companies to benefit by the increasing demand for cigarettes, the government must take immediate steps to peg the production of the foreign companies, particularly of the foreign monopoly.

Having mooted and initiated the joint sector concept for the cigarette industry, Golden Tobacco will play a worthy role in the sector. With the Company's equity participation and technical collaboration, joint sector factories will soon come up in Jammu and Kashmir, Assam and Madhya Pradesh. More such companies may come up in other states.

Suessen Textile Bearings Limited, Baroda

Address by the Chairman, Mr Arvind Narottam Lalbhai



THE following is the Address by Mr Arvind Narottam Lalbhai, Chairman, Suessen Textile Bearings Limited, Baroda, at the Sixteenth Annual General Meeting of the Company held on April 24, 1974:

Before welcoming you all to this 16th Annual General Meeting of the Company, as a mark of respect to the departed soul of Mr M D Mehta, Promoter Director of the Company, we all should observe two minutes' silence.

The sad demise of Mr M D Mehta on 25th October 1973 has caused irreparable loss to the Company. Mr M D Mehta was an active member on the Board of Directors and played a key role in laying a sound foundation for building up this Company and under his able guidance and wise counsel the Company grew in stages to its present position. He enjoyed a unique position and commanded spontaneous respect of all sections of business society — his other colleagues on the Board, Collaborators, other institutions connected with the Company and the industry at large and the members of the staff of all categories. He was kind and generous and a gentleman to the core, and was held in high esteem by one and all. As a businessman he was a shining example of shrewdness and acumen of high calibre and of the few self-made men of the now vanishing generation, who by dint of sheer hard work, perseverance and optimism have pioneered Industrial Development. His zeal for taking up new projects and manufacturing ventures to make India self-sufficient in textile machinery was responsible for his being awarded a gold medal by the Industries Association.

In his sad demise I feel myself and other colleagues on the Board have lost a guiding spirit. Mr Mehta's memory will be cherished for all that he did for the Company and the industry at large. The fittest tribute that we can pay to him is that we should cherish even more the ideals of dynamic entrepreneurship, philanthropy and social services that he propagated through his work during his lifetime and to follow his tradition by putting in hard and sincere work and complete dedication to the work entrusted for betterment of the Company's progress.

At this opportunity, I would like to inform you that your Directors have appointed Mr H G Dalal on the Board in place of Mr M D Mehta. Mr Dalal is also one of the promoters of the Company and was on the Board since inception of the Company till he retired in early 1968. Mr Dalal has also been responsible for the growth of the Company and I am sure that his valuable guidance, sound business knowledge and rich sales experience in the textile industry will benefit greatly the Company for its future progress.

Mr Arvind Narottam Lalbhai

The Company's performance and activities during the year under review, as revealed by the Accounts with the Directors' Report which have been in your hands for sometime past, have, you would agree with me, been satisfactory and encouraging. It is a matter of great satisfaction for your Directors and particularly I am very happy to be present here in person before you at this occasion when for the first time the proposal for issue of Bonus Shares in the proportion of 2 such shares for every 5 of the existing Equity Shares is before you for your consideration along with the proposal for maintaining Equity Dividend.

Though the sales turnover has increased to Rs 2,31,93,987 from Rs 2,21,14,254 previous year the profits for the year have declined from the level of the previous year, mainly owing to the comparatively lesser productivity during the first half of the year under review, as a result of labour unrest and consequent problems, apart from scarcity of raw materials and rapidly increasing prices of all inputs. After providing Rs 11,77,347 for Depreciation, Rs 6,40,000 for Development Rebate and Rs 7,50,000 for taxation and after other appropriations the balance of Rs 15,76,645 is transferred to the General Reserve. Reserves built up by the Company so far aggregate to Rs 78,91,619 mainly comprising of Rs 34,06,300 Development Rebate and Rs 44,80,065 General Reserve. With a view to bring the Issue Capital of the Company into closer relationship with the Capital actually employed in the business, your Directors have recommended capitalisation of a sum of Rs 18,66,400 and to apply the same for issue of Bonus Shares which would satisfy expectations of you all.

The gross block has substantially increased during the current year to Rs 203 lakhs from Rs 163 lakhs the year before and owing to this and the further investment planned for the current and the next years, your Directors have recommended extension of the period of redemption of Preference Shares.

Your Directors have, in their Report, comprehensively explained the bright future of the Indian Textile Machinery Industry which is poised for further rapid growth and substantial expansion. It is true that the Indian Textile Machinery Industry is at the crossroads of substantial growth and significant export spurt. The Development Council for Textile Machinery Industry and its High Powered Committee have stressed the urgency of the Textile Machinery Manufacturers doubling or even trebling their production within the shortest possible time, to meet not only the growing requirement of the indigenous industry, but also for exports. It is well known that the Company's products are even now, for the present capacity of the Textile Machinery Manufacturers, in substantial short supply, owing to the increasing preference of the Textile Mills to specify the Company's products, and therefore in this context, if the Textile Spinning Machinery Manufacturers are required to substantially augment the manufacture of new equipment both for expansion and modernisation, it is absolutely essential that our Company should take the necessary steps to even further expand our capacities to cope with the demands. The estimate of 5.8 million new spindles required during the Fifth Five-Year Plan period, apart from modernisation of at least 2 or 3

million spindles, assures a very bright future for the Company.

The year 1973 can be considered to be a remarkable year, particularly from the point of view of breakthrough in the overseas market both by way of securing very large orders for direct exports and indirect exports as well. Many of the developed Western European countries are finding their operations unremunerative and uneconomic because of the increasing inflationary trends in their economies and steeply rising wages. This presents a golden opportunity for our industry to exploit to the fullest the export market to the extent possible, both to bolster our country's foreign exchange earnings and to create a significant rise in industrial production which would ultimately lead to greater employment opportunities.

The Company secured from our Collaborators themselves very substantial orders for direct exports to them and in this context I must, on behalf of you all and on behalf of the Directors, express my deep gratefulness to them for the confidence that they have shown in initiating the Company's products in the sophisticated markets of West Europe. I must further commend the far-sighted decision of Mr Hans Stahlecker, Managing Director of our Collaborators, in agreeing to postpone and partial cancellation of our export supplies to them owing to realisation of the acute need of our own country to bolster our spinning production to ultimately augment the export earnings by way of Cotton Textile exports to meet partially the foreign exchange situation thrust on us as a result of the Oil Crisis.

I must also commend the efforts of Engineering and Marketing (Star) Development Consultants, our development consultants through whose efforts last year, at a time when the market situation was not this bright, that the Company secured very substantial orders by way of indirect exports through Indian Textile Machinery Manufacturers to many countries such as Korea, Taiwan, Indonesia, Thailand, etc. In fact it is a matter of great pride for our Company that more than 70 per cent of all exports of Spinning Frames and Fly Frames have been specified with our Company's products. This is in no small measure due to the technical assistance received from the Collaborators and the very hard work put in by Mr Suresh Mehta, our Joint Managing Director who has energetically pursued at all levels, particularly with the government authorities and the ancillary supplying units so that the latest designs of products as current in the West European market are today manufactured in the Company with almost total indigenisation.

As for the current year, target for sales turnover is set at Rs 350 to Rs 400 lakhs depending however upon the availability of raw materials in time. The Government of India having decided to give topmost priority to the Textile Machinery Industry is endeavouring to treat the requirements of raw materials, etc, with utmost expediency and I would like to take this opportunity to make a mention of the excellent support and assistance the industry has obtained from the Ministry and the Office of the Textile Commissioner which have both functioned more as development oriented departments than just regulatory wings of the Government. I, therefore, believe that nothing can hinder the further rapid growth of the industry in the coming years as a result of global opportunities for exports now unfolding before the Indian Textile Machinery, components and accessories manufacturing Industries.

I must however mention here your Directors' apprehensions as to the general unstable economic conditions prevailing in India today, and the effects of the severe credit restrictions imposed on the Industries. For this reason, in spite of the tremendous possibilities open before the Company, it would be incumbent upon your Directors to plan specific investment programmes with the utmost of caution and after very thorough and detailed study of the financial implications, both as concerns capital costs and working capital requirements. However, in view of the substantial gap between our presently licensed capacity and the increased demands as a result of the growing indigenous requirements as well as export requirements your Directors are seriously considering making further Industrial Licence application for substantial expansion of capacity for all our products.

Your Directors have, under these circumstances, you would all appreciate, taken timely decision in appointing M/s Aussenhandle AG as selling agents for the Company's products in the overseas countries. I would also like to take the opportunity of putting on record the excellent co-operation from the Collaborators not only in accepting the responsibility to render after sales service in respect of the Company's products exported by the Indian Textile Machinery Manufacturers but having spared services of Mr G W Golding for the Company. I am happy that Mr Golding, who has already resumed duties at the factory beginning last month, is here with us once again. Mr Golding, you are all aware and would agree with me, is an expert technician of proven abilities and his presence at Baroda ensures the continuance of excellent teamwork of both the Joint Managing Directors for a still brighter future for the Company.

I would also like to thank my other colleagues on the Board for their valuable guidance. I would also like to put on record the excellent co-operation received from the senior executives of the Company and the hard work and devotion to duty of all sections of our staff members and workmen. I am confident that the spirit of teamwork and co-operation at all levels would help the Company in implementing the expansion targets as scheduled. I also thank you all for gracing this Meeting with your presence and for patiently hearing me.

JAI HIND

Note: This does not purport to be the proceedings of the Annual General Meeting.

Indian Council of Social Science Research has sanctioned a scheme of financial assistance to doctoral Students in the field of Social Science to visit The Sardar Patel Institute of Economic and Social Research. Research Scholars, registered for a Doctorate degree in Social Sciences are eligible. At this centre preference will be given to Scholars working in Economics or related areas. Selected Scholars will be entitled to cost of travel from place of residence to the Institute both ways and daily allowances to cover board and lodging expenses. The period of stay of an awardee will be not less than 2 weeks and not more than 10 weeks. For further details and application form, etc, write to Administrative Officer, **Sardar Patel Institute of Economic and Social Research,** Post Box No. 4062, Navrangpura, Ahmedabad-380 009.

No two opinions about it

There is widespread agreement that India's pharmaceutical industry is very efficiently run. Its growth has been phenomenal: a thirty-fold increase in production in 25 years. In range of medicines manufuctured, India is second only to Japan, in Asia.

The inflow of technology and knowhow has been supplemented by sustained effort in Research and Development. Result: medicines discovered the world over are now being made in India with 90% indigenous material.

Most important, the high quality of Indian pharmaceuticals is unquestioned—strict quality control procedures at every stage of production have meant medicines of international standards which are winning for India coveted markets abroad, even in the most advanced countries.

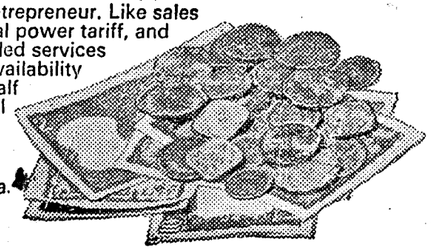
RAILWAYS: SUBSIDISING THE RICH

In Orissa you'll get more than just a pat on the back for a good idea.



You'll get credit for it.

If there is an industrial project that is feasible in Orissa today, there is a financial scheme to help transform it into a profitable unit. Good ideas are worth good money.

Assistanoe for investors covers direct participation in share capital, underwriting of shares, long and medium term loans, and financial assistance in the renovation of plant and machinery.

Numerous other benefits accrue to the entrepreneur. Like sales tax exemption on raw materials, concessional power tariff, and subsidised rates for land and water. Plus added services such as project and product identification, availability of project profiles and feasibility reports at half the cost, plant location advice, and technical guidance in project implementation.

Today if you've got a good idea for establishing an industry, there are a whole lot of good reasons for setting it up in Orissa.

What the Country Can Afford —and What It Cannot!

THE Prime Minister's long-awaited statement, made during the debate on the no-confidence motion in the Lok Sabha on Thursday, authoritatively sets out the government's position on the strike of railway workers. The government, the Prime Minister made it clear, will not negotiate on the two substantive demands of railway workers: those for bonus and for parity in emoluments with employees of public sector undertakings. This was not a matter simply of the merits of the railwaymen's demands; the issue was a larger one. The government was going to make an example of the railwaymen and expected the working class as a whole to take the government's handling of the railway strike as a warning. As the Prime Minister put it, "today we are not considering what more to give to the railwaymen. We are considering whether we go along giving more and more at a time when we have less and less." There was more than a hint in this to employers in the private sector that in resisting the demands of labour they could count on the support of the government since, in the government's view, an economic imperative of the present times was to stop "giving more and more" to workers, whether in the public or the private sector. There had been far more strikes last year than in any of the previous years, the Prime Minister said; the government had negotiated on them and in many cases had given what the workers had asked for. But, she asked, "did that create an atmosphere of co-operation, of greater production?" No, it had not; instead concessions made by the government had "only led to the next demand immediately". This view of workers as people who are always asking for more with total unconcern for production and productivity as well as the larger national interest — whatever that glibly-used expression may mean — would have done credit to any deep-dyed spokesman of the Employers' Federation and other cabals of private sector employers.

That the government's response to the railwaymen's demands has been determined by its larger objective of showing organised labour its place is confirmed by the viciousness of the measures taken to defeat the strike. Already over 10,000 railway workers have been arrested and nearly 1,000 dismissed from service. Before the confrontation is finally over, these figures may be doubled or trebled. Only a minute fraction of those imprisoned have been arrested on specific charges; the overwhelming majority are victims of the DIR, MISA and other preventive detention laws. And, probably for the first time, trade union leaders have been treated like notorious criminals with large rewards offered for their capture. Equally reprehensible have been the steps taken by the railway authorities, and the police and paramilitary forces assisting them, to compel striking workers to return to work. There is the case of the 41 motormen of the Central Railway's Bombay division who were allegedly held incommunicado by a senior railway official for a whole day and later handed over to the police when finally none of his threats persuaded them to keep away from the strike. There have been instances of railway officials going to the houses of striking workers accompanied by fully armed police personnel and threatening them that if they did not return to work immediately they would be arrested and dismissed from service. Then there have been the trumped up "people's morchas" — made up, for all one knows, of policemen in plain clothes — which have sought to harass the families of striking workers in railway colonies. Harassment of families of workers in hiding or in prison has also taken the form of threats to evict them from their quarters. Besides, of course, there has been the more straightforward use of third degree. In Bombay at least, a railway worker, bleeding profusely from the nose or from a head wound, being bundled into a police van or jeep has not been an unknown sight.

Yet, the Prime Minister would have us believe, it is not that she loves the railway workers less; only that she loves the country more. And the interest of the country apparently requires that the railwaymen be imprisoned in their thousands and dismissed in their hundreds and that they and their families be harassed by the police in a score of different ways. The railway workers' strike, the Prime Minister pointed out in her speech in the Lok Sabha, would aggravate an already difficult economic situation. What she understandably omitted to mention was that it was this difficult economic situation which has reduced the railway workers and the rest of the working class to desperation, driving them to resort to strikes and other such actions. In the face of a rise in the wholesale price index of 91 points — roughly equal to the rise in the entire ten-year period upto 1971-72 — in the last two years, not even the most liberal arrangements for linking dearness allowance to the

price level have been able to save the real wages of workers from declining sharply. In addition, in many industries — such as steel — where a part of the workers' earnings is linked to the quantum of physical output through production incentives etc, there has been a decline in even money earnings as a result of fall in production for which the workers have been in no way responsible.

It is a cruel joke to argue, as the Prime Minister did in her speech, that before the demands of the railway workers could be considered the government had to think of other sections, such as unorganised labour and the unemployed, who were worse off than the railway workers. In the first place, who maintains the unemployed and the inadequately employed in this country? Certainly not the government. It is the railway workers and the rest of those with jobs who sustain their unemployed brothers and nephews by sharing their earnings with them. In the circumstances, it is simply not correct to suggest that a little more for those with jobs means that much less for the unemployed. Secondly, even if it is argued that ultimately the hopes of the unemployed of finding jobs hinge on the level of investment in the economy, it can hardly be suggested that the levels of investment and, therefore, the pace of expansion of employment, have been dismal in the whole of the last decade because organised labour has grabbed a disproportionate share of the national cake. Both for the immediate economic situation as well as for the long-term stagnation of the economy, the blame lies squarely with the policies pursued by the government which, taken together, add up to the evaporation of all pretence of planning and the abandonment of the economy to the forces of the market-place.

The Prime Minister has argued that the country cannot afford to pay the railway workers more. The government presided over by the same Prime Minister has, however, adjudged that the country can afford to give a thumping 40 per cent price increase to rich farmers for their produce, to further upholster the salaries and perquisites of the upper bureaucracy in the public and private sectors, to gift away Rs 100-120 crores to tax-payers by way of a gratuitous cut in tax rates, to permit manufacturers and traders in a wide range of goods — from sugar and vanaspati to fertilisers and cement — to make super profits, most of it tax-free, by exploiting shortages which in the first place they have themselves created by speculative stock-accumulation (made possible by credit obligingly provided by supposedly nationalised commercial banks) and by deliberate restriction of output. The country can afford all this because the interests of the rich farmer, the upper bureaucracy, the professional elite and the industrialists and traders are close to the government's heart. Admittedly, in a situation of economic stagnation, as these sections are given more and more, others must get less and less. It is all of a piece with the government's political and economic orientation, therefore, that the Prime Minister should decide that, when it comes to the demands of railwaymen, and the working class generally, the country cannot afford to meet them. If the police, the paramilitary forces and the army itself have to be called in to teach the workers what the country can afford and what it cannot, the government will not hesitate to do so. That much the railway workers strike has demonstrated.

Food Policy

At the Traders' Mercy

IN both Haryana and Punjab, recorded arrivals of wheat in the *mandis* during the first few weeks of the marketing season are running at a rate not even one-third of what it was last year. As harvesting operations pick up by the end of this month, storage in the countryside could tend to get strained, and thus lead to some improvement in arrivals. But what matters is whether the rate of arrivals would forge ahead of last year's performance. This is most unlikely, for, on all accounts, a certain pattern has already been established. Even if the grain turns up the market, in quite a number of cases there would not be any record of it: the arrivals and departures would be surreptitious, so that the traders would be saved the bother of sharing with the government a part of the turnover.

The government's touching faith in the Graindealers' Association is understandable. Thoroughgoing reforms in trading institutions are out, the enforcement of producer levy is out: either step will tear asunder the delicate fabric of the Congress party: the authorities therefore have to fall back on the sweet reasonableness of farmers and traders. But now that the traders and farmers have got the government where they wanted, they would rather watch the fun. In terms of the benign agreement reached with the Prime Minister, traders were supposed to hand over to official agencies one-half of their market purchases. They would, no doubt, conform to the letter of the agreement. But who can fault them if market arrivals dip — at least in the records —, and the absolute magnitude of what they give to the state agencies also dips?

All things considered, Krishi Bhavan should consider itself lucky if total procurement of wheat this year touches 2.5 million tonnes, as against 4.5 million tonnes last year, and 5.5 million tonnes promised, once upon a time, to the Prime Minister — again, of course, 'informally' — by the Graindealers' Association.

As of now, there are barely 3 million tonnes of foodgrains in government stocks. Internal procurement and the left-over shipments from the Soviet Union would perhaps add another 3 million in the coming months, thus making up a total of 6 million tonnes to last the nation for the next six months. At least 1 million tonnes out of this aggregate can be considered as 'non-operational', because of the logistics of storage and transport and also partly because the quality would be such as to make the grains unfit for human consumption. Effectively, therefore, 5 million tonnes would have to be spread over a period of six months, which works out to a monthly average of 800,000 tonnes for public distribution. In the corresponding months of similar difficult years in the past, distribution through the ration and fair price shops had been as much as 1.5 million tonnes in a single month. Food riots are indeed a genuine possibility if not more than half of that is made available in the ensuing season. What is worse, with public distribution running dry, market prices are bound to shoot up further, and the distress of the landless and the small farmers in the countryside will become even more acute.

It is thus scarcely surprising that the government's emissaries are negotiating in the Soviet Union, the USA, Canada and Australia for further shipments of wheat. Given the minimum lead-time necessary to arrange for shipping, the purchases must be effected immediately if these are to provide any relief in the coming lean months. On the other hand, however, in the context of the bumper harvest forecast for both the USSR and North America, world prices of wheat have begun to tumble, and the rate of decline in prices could reach steep proportions by end of June or early July. The temptation to hold off sizeable purchases till then could indeed be great. A harassed government, short of food but equally short of funds, may thus indeed feel flustered in arriving at a decision. Its anxiety not to divulge the actual quantity being considered for import is understandable, since that could give a boost to speculators. But it is too late in the day now to play the role of a desiccated accountant either.

And the government must not expect any sympathy from the nation in its present predicament. The Prime Minister's favourite explanation of the price rise is that it is a world-wide phenomenon. In the case of wheat, this statement is already no longer true. Besides, the increase in procurement prices, to the extent of 40 per cent, hardly makes any sense if procurement, instead of being more, is going to be significantly less than last year. That this is how things were going to turn out was predictable, and was predicted by several quarters. The level of procurement prices is no longer a relevant factor at all for actual procurement: by raising the government's purchase price, you do not necessarily improve your chances to procure, just as, by lowering tax rates, you do not necessarily persuade more people to pay their taxes. It all depends on the climate: if it is altogether permissive, if the government would not involve itself in the task and would leave it to the sense of patriotism of farmers and traders, little is likely to be procured, irrespective of how much you may decide to raise the level of procurement price. In the present context, the government's decision to increase its own purchase price actually provides the signal to the operators in the market to raise *their* prices. And the more they raise their prices, the more their holding power goes up, and therefore the more they are able to hold back stocks and further raise prices. This phenomenon of spiralling market prices has nothing to do with the cost of production; at current prices, the return over cost would be more than 100 per cent in a large number of cases. But come the next season, the flop in procurement would be adduced as the reason for perhaps recommending a further rise in prices.

Railways

Subsidising the Rich

THE railway workers' strike has raised the question of the railways' financial ability to meet the demands of the workers, in particular those for bonus and for parity in wage structure with other public sector undertakings. The Railway Minister and other spokesmen of the railways have drawn attention to the losses incurred by the railways, though with a noticeable difference in emphasis. Normally the railways never miss an opportunity to make out that their financial insolvency is largely attributable to the 'social burden' borne by them in terms of the various subsidised services provided by them. Right now the railways do not want to draw attention to this aspect of their operation lest inconvenient questions be raised about who really benefits from the subsidised services provided by the railways and whether, in the light of that, there can be any justification at all for these services.

The following table, taken from the Explanatory Memorandum to the Railway Budget for 1974-75, gives the railways' estimate of the financial effect of the so-called 'social burden' carried by them:

		(Rs crores)
(1)	Loss on unremunerative branch lines	10.98
(2)	(a) Loss on suburban traffic	14.00
	(b) Loss on non-suburban passenger traffic and other coaching traffic	81.06
(3)	Loss on low-rated freight like coal, foodgrains, ores, etc.	115.40
(4)	Loss on freight concessions on export trade, relief measures, etc.	4.00
Total		225.44

The major sources of loss for the railways, it is evident from the above figures, are passenger and coaching traffic, both suburban and other, and low-rated freight traffic. With regard to passenger traffic, details are not available to indicate what types of services contribute in what proportion to the loss. It is not known whether at least the upper class services pay their way and whether some of the semi-luxury services, such as the air-conditioned trains and the super-fast trains introduced between the larger cities, are remunerative. Clearly, in regard to these services at least there does not exist the slightest case for any subsidy. The railways' loss on passenger transport comes to as much as about 23 per cent of their total earnings from such transport. It is difficult to justify a subsidy of this order on any kind of passenger traffic, including third class and suburban traffic.

With regard to goods traffic, the railways incur large losses on the so-called low-rated traffic which constitutes a preponderant and growing proportion of the total goods traffic, as the Table shows. The possibilities of the railways making good the losses by raising the rates on the high-rated items are strictly limited. In regard to many of these items the railways face keen competition from road transport and have perhaps been losing some traffic to the latter already. There is, therefore, no escape from raising, and raising substantially, the rates on the commodities on which the railways now charge rates which are far below their costs.

The major commodities transport of which is subsidised by the railways are coal, foodgrains, fertilisers, cement, mineral ores, pig iron and iron and steel. In examining the case for these subsidies, the most important consideration to be borne in mind is that the government is just not in a position to effectively control the prices or the distribution of most of these commodities. Even where formal price and distribution controls exist — as, for instance, in cement or fertilisers — these controls are in practice largely ineffec-

TABLE

Year	Total Revenue Earning Traffic (in million tonnes originating) (1)	Low Rated Commodities (2)	(2) as Per Cent of (1)
1965-66	162	124	76.2
1966-67	164	127	77.5
1967-68	162	128	78.7
1968-69	171	136	79.6
1969-70	174	138	79.4
1970-71	168	133	79.2
1971-72	170	133	78.4

tive. The prices as well as allocation of these commodities are substantially decided by market forces of demand and supply. In recognition of these facts, the government itself has levied or raised excise duties on many of the commodities the movement of which the railways quixotically continue to subsidise.

In the best of circumstances, it would be ridiculous for the railways to subsidise the movement of cement for building apartment houses and posh offices and factory buildings. Today the situation is truly farcical with cement — as well as other commodities subsidised by the railways like fertilisers and iron and steel — being sold in the 'open' market at two or three times the controlled price and with cement manufacturers and traders making money hand over fist. In the circumstances, who benefits from the subsidy — Rs 115 crores in 1972-73 — on the movement of these goods borne by the railways? Certainly, not the consumers of the products concerned; and most certainly not the type of consumers in whose case alone a subsidy at the cost of the public exchequer can be justified.

Given their present freight structure, the railways serve as a milch cow for private industry and trade and the rich. It is patently dishonest, therefore, to adduce the state of railway finances as the justification for denying the railway workers' demand for better emoluments.

Call Loan Market

How Exclusive?

A Correspondent writes :

THE Chairman of the State Bank of India has once again raised the propriety of LIC and UTI entering the call loan market. The main burden of his criticism is that this is a discrimination in favour of big institutional depositors. The contention that this also imposes a greater burden on the banks is based on the assumption that all the funds going into the call market from these institutions would otherwise have come to the banks as deposits.

The root of the problem, however, lies in the illogical interest rate structure that is sought to be maintained. Some kind of a dual market operates in the field of credit. The call loan market is a relatively free market and prices here are influenced more by the forces of supply and demand. It is no surprise, therefore, that participants in the controlled market such as LIC and UTI should be looking for an opportunity to enter the free market. (It needs to be added, however, that financial institutions are exempt from the maximum deposit interest rates stipulated by the Reserve Bank. To that extent, their position even in the controlled market is different from that of the other suppliers of funds.)

Each segment of the credit market is subject to its own special stresses and strains. Fluctuations in one market need not necessarily represent what would happen in the other segments of the market. However, the rates that prevail in the relatively free market are a good indication of the extent of tightness or easiness in the market. Thus what has been happening in the call loan market clearly points to the unrealistically low level at which the controlled interest rates are maintained. It also points to the meaninglessness of the terms structure that has been adopted. Perhaps one could justify different rates prevailing in the controlled and free markets if the discrimination were on the basis of some principle, such as catering to the weaker sections of society. But that is not the case.

It is true that in the United States institutions other than banks do not enter the Federal Funds market directly. But there are other markets which deal in very short term funds whose interest rates bear close correspondence to the rates prevailing in the Federal Funds Market. In fact, one of the reasons why institutions like LIC are anxious to get into the call loan market is the imperfect development of the short-term money market.

Thus the controversy over the entry of LIC and UTI into the call loan market is a manifestation of the operation of a free market along with a controlled one and of the unrealistic nature of the level and structure of the controlled interest rates. It is also a symptom of the lack of development of the short-term money market.

Soviet-Japanese Collaboration

Political Railway

AFTER the initial blaze of publicity which they received, the Soviet Union's moves for securing large-scale assistance from Japan for the development of the natural resources of Siberia have got bogged down. This has been the result partly of the inability of the two countries to agree on the volume and terms of Japanese assistance and partly of wider political complications. Among the latter are the ups and downs in Soviet-American relations which have, temporarily at least, clouded the prospect of US credits for the projects, and the Chinese objections to Japan's involvement in the development of Siberia. The Soviet Union and Japan made yet another attempt to sort out differences between them at a meeting in Moscow in March of representatives of the committees set up in the two countries to advance economic co-operation between them.

The six specific projects which are under consideration by the two countries are: (1) development of the Tyumen oilfields; (2) development of natural gas in Southern Yakutia; (3) exploration of oil and gas resources on the continental shelf around Sakhalin; (4) development of coking coal deposits in Southern Yakutia; (5) development of forest resources in the Soviet Far East region; and (6) development of pulp resources in Siberia. Japan's main interest in collaboration lies in the badly-needed natural resources, such as crude oil and coking coal, which it can bargain to get in return for its assistance for the concerned projects. However, what the Soviet Union has been willing to offer has so far fallen short of Japanese demands. On the other hand, the Soviet Union's expectations of Japanese financial assistance have also exceeded what the Japanese have been willing to offer.

Some softening of the Soviet position in both these respects was evident at the Moscow meeting. For instance, the Soviet Union has offered to supply 25 mn tonnes of crude oil annually to Japan over a 20-year period. Similarly, with regard to the Yakutia coking coal project, a memorandum has been signed between the two countries under which the Soviet Union will export 5.5 mn tonnes of coking coal to Japan annually over a 16-year period beginning in 1983. This will be in return for Japanese assistance of $390 mn for the project, which represents considerable scaling down of the initial Soviet request for Japanese aid of the order of $586 mn. Besides, the Soviet Union had earlier insisted that Japan import both ordinary coal as well as coking coal. This insistence has also been dropped now.

These changes reflect the Soviet Union's anxiety to push ahead with the projects. However, a new problem, which is likely to cause much anxiety to the Japanese, appears to have cropped up at the Moscow talks. Originally, it had been proposed to construct an oil pipeline to transport oil from the Tyumen oilfields for shipment to Japan. Now, however, the Soviet Union has proposed the construction of a second Siberian railway line, to the north of the existing one, instead of the oil pipeline. The Soviet Union is pressing for Japanese assistance for the railway line which it wants to complete during its Tenth Five-Year Plan beginning in 1976.

The railway line proposed is not as innocent as it looks. The construction of the railway line will substantially strengthen the Soviet military position in Siberia. And, considering the tension on the Sino-Soviet frontier in Siberia, the Chinese will view such a development with the utmost anxiety. Chinese Deputy Premier Li Hsien-nien, is reported to have already made it very clear to a Japanese delegation visiting Peking recently that the Chinese would take a grave view of any Japanese involvement in a railway project in Siberia.

It seems that while the Soviet Union has made the terms of Japanese collaboration in the Siberian projects economically more attractive to Japan, it has introduced a political element into the deal which can queer the pitch for Japan's relations with China.

Official Secrets Act

The Game of Nations

Lawrence S Lifschultz writes :

TWO young Americans are shortly expected to be brought to the Calcutta City Sessions Court for the first ever trial in India of Westerners charged with spying. Anthony Fletcher and Richard Harcos, both from San Francisco, were arrested over a year ago in Calcutta. They have been charged under sections III and IX of the Official Secrets Act. Both are alleged to have participated in acts with "a purpose prejudicial to the safety or interests" of the state of India. If convicted, they could receive life imprisonment.

Harcos was arrested at four a m on April 26, 1973 in the King George Dock area of Calcutta with scuba diving gear. The same afternoon, his companion, Anthony Fletcher, was arrested from the Waverly Hotel in downtown Calcutta. The King George Dock is classified as a "prohibited area", considered to have military and security importance. Anyone found within such an area without permission is presumed to have been involved in acts prejudicial to the security of the country.

Sources close to the investigation report that the police officers who booked the two Americans following their arrest informed their superiors that they had caught two smugglers. The original suspicion of smuggling turned into a suspicion of spying. Special Branch police in Calcutta soon arrested David Chang, the owner of a Chinese restaurant which was around the corner from where Harcos and Fletcher were staying. They often ate their meals there. The restaurant owner Chang has a brother who is a doctor in San Francisco.

All proceedings about the case are secret under the regulation of the Official Secrets Act. When the trial opens, the prosecution will apparently allege that Harcos and Fletcher, in collaboration with Chang of San Francisco, hatched a conspiracy during October 1972 to carry out subversive acts in India on behalf of some foreign power. The country in question will not be specified nor will it be clearly alleged that the accused are CIA agents.

The attitude of the US Embassy to the case has been one of near indifference, if not calculated silence. Other than a sympathetic Vice-Consul in Calcutta who has visited the prisoners regularly, the US Embassy has not involved itself in the case. The US government has kept its distance because it would like this trial to go on in secret without any publicity or possibility of scandal.

The lawyers defending Fletcher and Harcos have been hampered because of the unique legal restrictions of the Official Secrets Act. A year after the arrest of their clients, they have not been provided with a specific list of charges against the accused nor have they been informed of the findings of the police investigation. Unlike under most laws, where an accused is considered innocent until proven guilty, the presumption of innocence is inverted in cases tried under the Official Secrets Act. Section III, sub-section II of this Act states that "on a prosecution for an offence punishable under this section, it shall not be necessary to show that the accused person was guilty of any particular act ... if no such act is proved against him, he may be convicted if, from the circumstances of the case, it appears that his purpose was prejudicial to the interests and safety of the state". All trials under the Official Secrets Act are held 'in camera'. No outsiders are allowed to witness such trials. Press coverage is, therefore, almost non-existent.

Harcos and Fletcher are being brought to trial, though after more than a year. But in West Bengal alone there are reported to be at least another 60 persons held allegedly for spying for one foreign power or the other (usually Pakistan). Many of them have spent upto seven years in prison without being brought to trial.

LETTER TO EDITOR

"Emergence of Regional Forces"

IN his article "Emergence of Regional Forces" (March 16, p 433) MR has described the Bharatiya Kranti Dal as "essentially a party of Jat Kulaks". Evidently, MR has fallen a victim to the malicious propaganda of Congressmen.

Jats in Uttar Pradesh are a community of small peasants and number only 1.5 per cent of the total population. They are found only in 8 districts in the western parts where they are outnumbered by Muslims, Chamars, Brahmins and Rajputs.

In the coalition Ministry of BKD formed with Congress in 1970, out of 14 BKD State and Cabinet Ministers only two were Jats and out of 11 Ministers in the succeeding Ministry of T N Singh there was only one Jat. In the last General Elections to the UP Assembly, BKD fielded only 15 Jat candidates out of more than 400. Out of about 60 district city committees only 4 are headed by Jats.

As for 'kulaks' I may tell MR that their number in Uttar Pradesh is the lowest in any state in the country. As the report of the Ford Foundation submitted to the Planning Commission in 1963 would show, Zamindari has not been abolished anywhere in India except in Uttar Pradesh. All the land reform measures were initiated and

implemented by the Chairman of our party, Charan Singh, who was Revenue Minister of the state at the time. Unlike in other states no zamindar here was given a right to resume land from his tenants. Further, subtenants and even trespassers were granted permanent rights in the land under their plough. So, the kulaks could not emerge or survive in this state as they have done all over the rest of the country.

BKD has a definite ideology largely based on Gandhian economics. Unable to draw up any accusation against Charan Singh in regard to his ability, character, popularity or record of service, Congressmen have simply resorted to vulgar attacks — *inter alia* characterising Bharatiya Kranti Dal as a casteist party or a party of Jats because Charan Singh was born in that community. In fact, the Congress leadership in this state as also at the Centre is more caste-minded than, perhaps, any other political party in the country.

President
BKD, UP
Lucknow

CAPITAL VIEW

The Turning Point?

Romesh Thapar

THE handling of the railway agitation and strike, despite the obvious messing around by Minister L N Mishra (christened "soft-head" by a leading daily newspaper!), suggests that the Prime Minister has taken her decision to cry halt to the spreading anarchy. It was certainly a critical decision, requiring a quiet interlude in Srinagar "far from the madding crowd". The future of the government now hangs on how effectively the Left and its unions will be isolated in their attempt to paralyse the government — for that, it is implied, was their objective.

Something of the story is now available. For months, in the coal belt, the CPM has been busy building a "command centre" capable of shutting down sectors of industry by cutting off coal deliveries with the skill of a computer. Indeed, this Marxist centre had become a parallel authority to the Railway Board. Stocks at vital points were down to one-day and two-day supplies, despite the cancellation of passenger trains and the stress on moving goods traffic.

Naturally, these "revolutionary" activities, backed with efforts to build "armouries", received a convenient cover from the agitations of various categories of railway workers, like loco drivers and guards, who had lost confidence in the corrupt central unions, interested only in perks and privileges for union officials and political parties. These agitations created the impression in the country that the railway workers were so incensed with their plight that they were prepared to break the back of the economy.

That there are areas of such intense discontent cannot be denied even by the insensitive among the railway bureaucrats. But the attempt by various radical politicians to exaggerate the strike fever definitely had serious political motivations. A surrender to the blackmail of the leadership of the railway unions would have made nonsense of Indira Gandhi's government and sparked a series of devastating strikes in a number of essential services run by government. With the lack of any political alternative, chaos would certainly have taken over.

It seems clear that careful assessments of the mood of the railway workers suggested that recent concessions, the implementation of the Pay Commissions' recommendations and certain agreements on the anvil had met their most urgent demands. It was apparent that the agitation was being fanned by minority activist groups. However, the talks went on. Only when it was realised that the activists were working for more time to crack the economy was the decision taken to order the arrests of the activists. It was a major decision for Indira Gandhi; the political repercussions will be many.

The crudeness of the operation has been widely criticised — indeed, even by the newspapers. But we have come to expect little else from the system. What matters in the long run is whether the steps taken are effective and based on correct information. First reports suggest that government has broken through. The railway workers have not gone on a rampage. The coal is moving as never before. There have been stoppages here and there, but of no damaging dimensions. It looks as if the incompetence of the GOI compares favourably with the stupidities of the Left.

Of course, it would be tragic if the Railway Minister and his Railway Board are permitted to go to sleep again, the sleep of the cynical, the corrupt, the self-seeking. The railway empire needs a drastic and thorough shaking up — wages, profits, efficiencies, facilities and extensions. It cannot be left in the hands of men only interested in holding jobs, making money and pushing themselves all over the public sector. Competing systems need to be restored in the sprawling mess. Political interference and business pressures must be curbed if profitability is to be restored. The railways must produce a return on the investment. To carry on as at present is to postpone the terrible day of reckoning.

From railways, the speculation has already turned to other areas of government. If Indira Gandhi is going to be the toughy people expect her to be, then naturally action is expected at various neglected points. I wouldn't expect too much too soon. The bunch that rules in Delhi is as confused as the ordinary citizen about what needs doing — and there's no visible desire to take risks with those who might perform. In fact, it is this cold and clammy thought which frightens thinking people about the prospect of the democratic system being abandoned. Will we be ruled by the flatterers and time-servers who now prance around in the corridors of power? Will we be at the receiving end of orders from all manner of flunkeys? Will there be ruthless vendettas against those who do not toe the line?

You would be surprised how many well-meaning people in the Capital wanted the government to get a thrashing for a while from the railway workers. "Only when they are thrashed, do they become human again." A sad commentary on the state of the ruling echelons. But don't feel too sad. Think of the CPI, thrown off the bandwagon, nursing its bruises. All manner of interesting permutations and combinations present themselves — price rise or no price rise.

And the central question remains: what is to be done policy-wise with the new toughness. Indira Gandhi had better begin applying her mind to this.

May 7

Calcutta Diary

A M

MAY DAY is a paid holiday in Calcutta — and in West Bengal. In the afternoon, unending processions of the labouring classes converge on the *maidan*: they are entertained to passionate speeches by the leaders, the brotherhood of the international proletariat is fullthroatedly proclaimed. But something sticks out, something at least mildly uncomfortable. The declaiming leaders all belong to a particular slot. Scan their names: irrespective of whichever Left party they might swear by, each one of the names is high caste, high-breed Hindu. There are may be thirty incarnations of Leftism in West Bengal. None can thrive without being shepherded by upper class Hindu ministrels.

This, it may be argued, is unfair banter, since the malady touches all political parties, and is not specific to the Left. But this precisely is the point. If the Swatantra party is studded with glamour boys and glamour girls from high society, that ought not to constitute any news. A party supposed to defend the interests of feudal elements, filthy capitalists and the rest of the bourgeoisie must in any case be led by the upper class. What baffles is the persistence of the motif even in groups and parties preaching the international brotherhood of the working class and the tenets of violent revolution. One of course can analyse the reasons. Once upon a time, those who form the top echelon of the Left leadership were in the mainstream of the so-called national movement. They are the offsprings of the bourgeoisie, the offsprings of landowning barons. After Independence, the national movement splintered, and they drifted to the left. Their ideology got oriented, but, you cannot rewrite heredity, the class and caste bases were incapable of being altered. Therefore, whether you make fun or do not make fun, there they are, guiding the destiny of Bengal's Left. Now and then, an occasional aberration, the scion of working class family has come to the fore, but by and large, the roster of names straddling the spectrum of Left leadership follows a set pattern. Begin with the Dasguptas and the Lahiris and end with the Mazumdars and the Chatterjees: all impeccable high caste names, either Brahmin, or Vaidya, or Kayastha.

This may not be so unique. Perhaps, if one travels all the way to Maharashtra and Gujarat, the phenomenon will be repeated. In the Bengali milieu, however, a further dimension gets added. High caste Bengali Hindu names are invariably also pristinely feudal names. You hardly have to go very far back. It could be that, barely fifty years ago, either the father or the grandfather of this or that eminent Bengali Left leader was a flourishing landowner in North or East Bengal. The offsprings walked away from their feudal moorings. They walked away from the memory of the attitudes and the mode of life which permeated their early upbringing. But is the transformation altogether total, does not something still linger on? Feudalism, after all, used to sustain itself on feuds. The ego of the lord was the heart of the matter. It was this ego which drove the master to collect more and more fiefs and revenue by squeezing the poor and helpless peasantry or, alternatively, by capturing, through war and litigation, the land of other feudal lords. To dispute, to contest, to join battle, made up the ethos of existence. Intolerance was the credo: *I matter, nobody else does;* only I deserve to survive and prosper, *the rest must either pay obeisance to* me, or be liquidated. The other side of intolerance was jealousy, all-consuming jealousy. He who has come up must be brought down, by hook or by crook. By now, one associates this attitude of petty back biting with drab, petty bourgeois values; this is, without question, feudal legacy, though.

One walks away from one's feudal past; one tries, consciously or otherwise, to declass oneself, but, in the stream of consciousness, something persists. However hard they try, the leaders find it nearly impossible to shed, totally, their heritage, the heritage of egotism. Thereby is unfolded a two-stage tragedy: the parties of the proletariat have not only to be led by quasi-feudal quasi-bourgeois specimens, a much greater calamity, these specimens import into the Left parties some of the fixations and mannerisms that are products of their heritage. Feudalism insists on feuds, it idolises intolerance, it transmogrifies petty jealousy. Take a look at the cross-section of the allegedly revolutionary parties infesting West Bengal. Cannot one say that their major staple is intolerance of each other, envy at the prospect of one of them stealing a march over the other? This bland fact will of course never be admitted. The intolerance will be cloaked in tough ideological jargon. The subjective differences would be given the garb of historically incontrovertible objective differentiation. Ordinary petty bourgeois jealousies would be dressed up in the claptrap of the philosophical line and tactical rationality. The Hegelian process of thesis-antithesis-synthesis would unfold *ad infinitum* in an archetypal Bengali Hindu middle class setting. From the snakepit of intolerance and jealousy, the antithesis would rear its head. But since for long-term survival, the revolutionary groups have *per force* to cling together every time the authorities launch an onslaught, a kind of synthesis would occur; this would soon again give way to a further bout of tension, and a further bout of mutual name-calling, till the announcement of the fire next time. And so on till dawn does not usher in the revolution.

The pattern has stuck, and continues to repeat itself. With all the animosity of the Centre, with all the other indiscretions committed by the different Left parties individually and collectively, the second United Front Government in West Bengal could have survived till this year, and the course of history around these parts could have been substantively different. Even when Ajoy Mukherjee walked out of the Front in February 1970, the Left parties still had a clear, comfortable majority in the state Assembly, and could have carried on. But it was jealousy and hatred and suspicion of one another which turned out to be the determining variable. To keep the United Front going would have been to allow one amongst the Left parties to come to the fore. Who knows, that party, given its superior clout, could soon have swallowed the others. Such a thing could not be permitted to happen; it was better that the Left, the great revolutionary Left, rather ceased to be in government. Talk to each of these parties today. Some of them would assign broader national — and international — considerations for their not agreeing to the continuance of the United Front in 1970. Some others would mention the big party chauvinism developed by one of the partners. Yet others would complain that the rules of the game were not being properly observed by any of the parties. A few would read a tract on how it was necessary, at that juncture, to liquidate the

United Front in order to cleanse the Left of the stench of sterile parliamentarism. Smokescreens are smokescreens. What motivated them was fear — fear that one of the parties might get way ahead of others; fear bred prospective envy: while there was still time, the rest of them must therefore do in that party. They tried to do it in, and therefore the overall Leftist cause, in 1970, and continued to do so till 1972. It is only following March 1972 that the intolerable pressure of external circumstances has forced the revolutionaries to rediscover the good points in one another.

You think the malady is confined only to the conventional Left parties enamoured of the parliamentary path and still encrusted in quasi-feudal quasi-bourgeois ethos? You have a shock coming your way: One has only to refer to the umpteen divisions into which the Naxalite movement is now splintered. Learned theses are still smuggled in and out, from this or that hide-out, from this or that prison; these, which find their way in newspapers and journals, go to great length in explaining how these splinters are consequential to fundamental differences in philosophical attitudes and tactical lines. Are they really? Scratch the surface, behind the facade of earth-shaking tactical lines would emerge the ugly face of commonplace, no-longer-even-feudal-but-essential-crass-petty-bourgeois bickerings. The bickerings could be as much over philosophical visions as over the disposal of funds or who must wangle a trip to China at whose expense. And this despite the fact that, on the individual plane, simultaneously, there is, and has been, magnificant display of courage, devotion to the cause and willingness to suffer.

History is supposed to make pace in this manner alone, through the *deus ex machina* of parties with greater historical relevance determinedly pushing out those whose lines and tactics become obsolete. One would like to believe in the proposition and play along — if only one were sure that the spectre which is haunting the entire Bengal scene is not, to a considerable extent, the spectre of ordinary, garden-variety village feuding.

COMPANIES

Having It Good

Hansavivek

PFIZER complains that it is operating in a situation where prices of end products are controlled by government but not the costs of inputs. The accounts show a slight contraction of margins, but the ratio of gross profit to sales stood at 26.75 per cent against 28.09 per cent in the previous year. And this when profits on sale of pharmaceutical formulations covered by the Drugs (Prices Control) Order were "well below the government ceiling of 15 per cent on their turnover"! The company's operations cover pharmaceuticals, chemicals, nutritional and health-care products and agricultural and animal health items. Net profit were shade lower, but total dividend, already disbursed by way of four interim payments, has been stepped up by a point to 22 per cent. In addition, the board has recommended issue of bonus shares on a one-for-two basis by capitalising Rs 279 lakhs out of the general reserve. It is stated that prices of some of the essential items and packaging materials have shot up and that the uncertain supply position of several important petroleum-based products will upset production schedules. The management hopes that the government will provide the necessary incentives and encouragement to the pharmaceutical industry to enable it to fulfil the Fifth Plan targets.

Pfizer increased exports by 12.5 per cent to about Rs 82 lakhs "with the assistance of the company's associates abroad". It takes pride in that the foreign exchange earnings through exports exceeded dividend remittances during the year. Out of the subscribed capital of Rs 558 lakhs, as much as Rs 420 lakhs is owned by the holding company, Pfizer Corporation of Panama. Equity shares of the value of Rs 292 lakhs comprise gift shares issued by the 23-year-old company from time to time by capitalisation of reserves. One of the contingent liabilities mentioned in the note appended to the accounts is in respect of a guarantee given to FNCB against a term loan of about Rs 14 lakhs given by the bank to the landlords of the company's office premises. There is also an uncalled liability of Rs 28 lakhs in respect of partly paid shares of 'Duchem Laboratories', a wholly-owned subsidiary whose total subscribed capital as at the end of June 1973 was a mere Rs 10,000. This unit has raised additional finance for implementing certain expansion plans. Another note on Pfizer's accounts reveals that the company distributed samples worth over Rs 29 lakhs during the last year. Auditors were paid Rs 34,000 for taxation services, Rs 21,000 for miscellaneous reports and other consultations and Rs 8,945 by way of reimbursement of out of pocket expenses, besides audit fees of Rs 60,000.

INDIAN ALUMINIUM completed construction of one of the two potrooms of the 20,000-tonne additional metal capacity being installed at Belgaum. The second potroom is expected to be finished by mid-1974. Work is also progressing on the related 50,000 tonnes per annum alumina plant, opening of the bauxite deposits at Kasarsada in Maharashtra, extension of the housing colony at Belgaum and additions to ancillary facilities. The total project is scheduled for completion by the end of this year. The estimated capital cost remains at Rs 16.1 crores. The company's applications for industrial licences to increase capacity of the sheet mill at Taloja, to install an extrusion press at the same location and to increase capacity of the Kalwa foil plant are still pending before government, but the management hopes that approvals will be received at an early date. During 1973, Indal's primary metal production was 76,426 tonnes as compared with 78,581 tonnes in the previous year. According to the directors' estimate, power cuts and supply interruptions reduced metal production in 1973 by over 16,000 tonnes. Besides, erratic power supplies led to an "abnormally high" incidence of pot-line failures and had an adverse effect on raw materials consumption, which caused substanital increases in costs. It is pointed out that the company's selling prices were lower than those that existed eight years ago. On the other hand, the effective international prices of aluminium is approximately one-and-a-half times the Indian domestic price. The company's sales were only slightly lower than in the previous year, but margins deteriorated and gross profit declined considerably. Dividend was maintained at 14 per cent, but at the cost of the earnings cover.

CEAT TYRES' licensed capacity has been regularised at 8.5 lakh numbers of automotive tyres and tubes per annum as against the previous capacity of 6.5 lakhs each. The company has also received a 'letter of intent' for effecting expansion of 1.6 lakh automotive tyres and tubes, each, at the Bhandup plant. Estimated to cost Rs 390 lakhs, the expansion will be financed largely out of internal resources and will be completed within 18 months of the receipt of import licence for machinery. Besides, 'letter of intent' has been received for establishing a new undertaking in the Telegana region of Andhra Pradesh for manufacture of 4 lakh automotive tyres and tubes, each, per annum. A project report is being prepared. Meanwhile, there has been some delay in the production schedule of 'off-the-road' tyres. Trial production of these tyres is expected in the last quarter of this year. The bicycle tyre plant at Nasik, which went into trial production in February 1973, could operate only on a single shift basis till the middle of that year on account of the power-cut. It is now operating on three shifts. The product was introduced in the market from October last and has been well received both in India and abroad. As the foreign collaborators' holding in the Indian company's capital exceeds 40 per cent, necessary applications under the Foreign Exchange Regulation Act are being filed with RBI. The company experienced a setback in its operations during 1973. This has been ascribed, among other things, to the go-slow by truck tyre builders from the beginning of the year and an "unjustified" strike from November 12, which continued till March 15 last. Production of automotive tyres and tubes declined to 6.73 lakhs and 6.06 lakhs from 8.29 lakhs and 7.18 lakhs, respectively; but the Nasik plant contributed 62,907 bicycle tyres to the total output. While sales fell by 15 per cent, margins deteriorated sharply and gross profit was more than halved. Even so, dividend was reduced by only a point to 16 per cent which, being payable on a capital enlarged by a bonus issue, demanded Rs 5 lakhs more than in the previous year. Even depleted earnings were adequate to cover the distribution. Export sales were lower at Rs 225 lakhs (Rs 268 lakhs). The expenditure in foreign exchange on import of raw materials, components, spare parts, capital goods, payment of commission, technical expenses and dividends, amounted to Rs 155 lakhs.

ELPRO INTERNATIONAL's profit has stayed at almost the previous year's level despite a 20 per cent rise in sales because of increased costs of raw materials and wages and because provision for royalties had to be made for two years as the government approved the company's application for extension of the technical agreement on high-rated lightning arresters, retrospective from the beginning of 1972. Dividend, lowered by two points to 10 per cent, was just covered. A small portion of the distribution is expected to be exempt from tax. The management expects increasing demand for lightning arresters of higher ratings. A development pro-

gramme for a number of new X-ray and related products is under way.

FIRTH (INDIA) STEEL is setting up a new alloy and high-speed steel plant at Nagpur with an annual capacity of 6,000 tonnes of billets in technical and financial collaboration with Firth Brown which has, the oldest and the largest alloy steel plant in the UK. The company is the first in India to employ the new electro slag remelting process which produces billets of high purity and gives 10 to 20 per cent better yield than the conventional processes as well as better forgeability. The steel melting shop is expected to be commissioned by June or July next; the forge shop, rolling mills and ESR plant and other imported equipment will be progressively taken up during the latter half of the year. The company is issuing to the public 30,000 cumulative redeemable preference shares of Rs 100 each, carrying fixed dividend of 9.8 per cent per annum, and 5 lakh equity shares of Rs 10 each to the existing shareholders as 'rights' on a one-for-one basis to raise part of the finance required for the project, estimated to cost Rs 310 lakhs. According to M P Pai, chairman, on completion of the expansion programme the company's turnover should increase to Rs 443 lakhs and pre-tax profit to Rs 95 lakhs from Rs 121 lakhs and Rs 16 lakhs, respectively, in 1972-73. When the Nagpur plant is fully commissioned, the existing Thana unit's production is expected to reach 90 per cent capacity — from the present 40 per cent in the case of high speed steels and 30 per cent in the case of alloy steels. Even on the present low capacity utilisation, the company has been regularly paying 10 per cent on equity. The public issue is managed by IIT.

HES is entering the market on May 14 with with a public issue of Rs 37 lakhs in equity shares of Rs 10 each at par, to raise part of the finance required for its Rs 65-lakh expansion aimed at achieving annual production capacity of 5 lakh alarm clocks, 40,000 8-day 5-jewelled lever movements/clocks, 45,000 B-50 clocks, and 40,000 transistorised battery-powered electric clocks. The last-named two items are new products. Having placed orders for the main items of equipment for manuacture of new products, the company expects to install all machinery by May 1975. Technical collaboration agreements have been entered into with Merkuria Foreign Trade Corporation and Chronotechna, both of Czechoslovakia. Founded in 1949, the company has a good record of earnings and dividends. On a turnover of Rs 135 lakhs, it earned a gross profit of Rs 15 lakhs in 1973, and is paying a dividend of 18 per cent. The management expects the current year's profits to be higher than those of 1973 and to be able to recommend a dividend of "not less than 10 per cent" on the increased capital. The new equity shares will rank for dividend on a proportionate basis from the date of allotment and on the amount paid up on them. The subscription list will close on May 24 or earlier, but not earlier than May 16. The public issue is managed by the Merchant Banking Division of National and Grindlays Bank.

ALLIED STEELS is setting up a 10/12-tonne electric arc furnace with an annual capacity of 18,500 tonnes of steel ingots (12,500 tonnes of mild steel and 3,000 tonnes each of tensile steel and spring steel) at Tatibund near Raipur, a 'backward' area of MP. The company's licensed capacity is actually 50,000 tonnes per annum, which is proposed to be implemented when the second phase of the project is taken up by installing a second 15/17-tonne arc furnace and a twin strand continuous casting machine. The first phase of the project, estimated to cost Rs 134 lakhs, is proposed to be met by share capital of Rs 55 lakhs and medium term loans of Rs 79 lakhs. Production is expected to commence by June next. The company is offering to the public Rs 27 lakhs worth of equity shares of Rs 10 each and Rs 9 lakhs of 9.5 per cent redeemable cumulative preference shares of Rs 100 each, both at par. The rate of dividend on preference shares is proposed to be increased to 9.8 per cent, subject to the consent of the Controller of Capital Issues. The subscription list opens on May 14 and will close on May 24 or earlier, but not earlier than May 18. The company has locational advantages of adequate power supply in MP and proximity to scrap generating centres like Raipur, Bhilai and Jabalpur. According to Viren J Shah, chairman, profit-margins on the company's proposed product-mix are attractive. The public issue is managed by SBI's Merchant Banking Division.

VIKRANT TYRES, a new company, is setting up a project near Mysore for annual production of 4 lakh automotive tyres and tubes each in technical collaboration with Technoexport of Czechoslovakia. The project is estimated to cost Rs 21 crores and is proposed to be financed by share capital (Rs 700 lakhs), institutional loans (Rs 909 lakhs), deferred payments on imported equipment from Czechoslovakia (Rs 408 lakhs), foreign currency loan from West Germany for import of equipment (Rs 74 lakhs), and deferred payment on land (Rs 9 lakhs). The company expects to commence trial production around mid-1975 and commercial output by September 1975. Contracts for import of machinery were entered into with Technoexport well before December last. The company thus qualifies for development rebate on the machinery. Moreover, it is also eligible for various benefits because of location of its factory in an industrially 'backward' area. Tata Consulting Engineers will provide engineering design and other services. The board is headed by M D Shivnanjappa. R B Jesudasen is the managing director.

BLUNDELL EOMITE PAINTS proposes to reduce its non-resident shareholding by one-half with a view to paving the way for obtaining industrial licences for further expansion and for issue of bonus shares, frequently demanded by shareholders. Blundell-Permoglaze Holdings of the UK, which holds 59.44 per cent of the Indian company's equity, has agreed, subject to the approval of the Government of India and RBI, to sell one-half of its holding to the Garware Group. On completion of the share transaction, the board will be expanded to include two more members of Garware family — S B Garware as Vice-Chairman and C B Garware as joint managing director with W H Hulme, the present managing director — in addition to A B Garware who has been on the board for the past few years. N G Bassett Smith will continue as chairman and R L White will also be a vice-chairman. According to Charles C Longstaff, Group Chairman of BPH, these decisions have been taken in the light of the Foreign Exchange Regulation Act and the policy of the Government of India. Up to now it was felt by the board of the holding company that if part of the shareholding was sold to the extent that BEP would cease to be a subsidiary, the former could not give technical and management support and that if such disposal took place through the market, there would be no new significant shareholder coming into the company to take these responsibilities. With Garwares as equal partners, the joint aim, it is claimed, will be to maintain the Indian company's eminent position in the country's paint industry. Exchange of information between Bombay and London will continue and, as before, no royalty or know-how charges will be payable by the Indian company.

Fictitious Cut in Deficit Financing

THE Finance Minister has performed quite a financial feat. He claims to have slashed deficit financing in 1973-74 from the revised estimate of Rs 650 crores to about Rs 320 crores. Such an achievement has been unknown in recent fiscal history. In 1972-73, for instance, the revised estimates put deficit financing at Rs 550 crores but the actual figures, when they became available, showed it at Rs 882 crores. Likewise, in 1971-72 deficit financing went up from the estimate of Rs 385 crores to Rs 519 crores and in 1970-71 from Rs 230 crores to Rs 285 crores.

The unique achievement of a significant reduction in deficit financing in 1973-74 over the revised estimates has been made possible, the Finance Minister has claimed, by economy measures and control of expenditure. In the Finance Minister's Budget Speech only two months ago there was not even a hint that was going to be contained in this fashion. The Finance Minister had then said: "Despite all these efforts, the year-end deficit will be of the order of Rs 650 crores. We are deeply concerned about the deleterious effects of deficit financing. But no government can overlook its obligation to alleviate the hardships and sufferings of the large sections of the people. It is this obligation that has rendered a large deficit inescapable." Is the implication then that the government has now decided to give the go-by to this obligation? Not, of course, that there is that kind of close correspondence between the alleviation of "the hardships and sufferings of the large sections of the people" and the level of government expenditure. For instance, it is questionable, to say the least, that a larger food subsidy consequent on a thumping increase in the price paid to rich farmers for government purchases of foodgrains is a contribution to alleviating the hardships and sufferings of the mass of the people.

The Finance Minister has been, on the whole, less than frank about the actual reasons for the decline in the budgetary deficit. The decline is partly fictitious and partly fortuitous. There appears to have been a windfall gain of around Rs 135 crores from foreign assistance from two sources: Rs 61 crores of compensatory finance for export fluctuations from the IMF and Rs 75 crores by way of a special credit from the UK. The fictitious character of the decline in the deficit arises from the likelihood that sizeable disbursements due in the year 1973-74 were deliberately postponed beyond March 31 so as to show a reduced volume of deficit financing. It is also possible that the government has funded *ad hoc* Treasury Bills into dated securities in excess of the amount of Rs 100 crores, though indirect evidence shows that this is unlikely to have taken place.

Conjectures and Surmises

Discussion of the subject of the government's deficit has necessarily to be based on conjectures and surmises because neither the government nor the Reserve Bank publishes periodic data on the government deficit. The monetary data of the Reserve Bank give information on its net credit to the government which covers the budgetary deficit (Treasury Bills and drawing down of government balances) plus changes in the Reserve Bank's holdings of dated securities and loans and overdrafts to state governments. The amount of net Reserve Bank credit to government had risen continuously in the financial year 1973-74 upto February 15, 1974 when it had stood at Rs 843 crores (against Rs 636 crores in the corresponding period of 1972-73 — a year in which the budgetary deficit eventually crossed Rs 880 crores). Subsequently, the figure declined to Rs 762 crores by March 29, or by about Rs 80 crores. Between February 15 and March 29, loans and advances to state governments went up by about Rs 80 crores from Rs 157 crores to Rs 238 crores. (Incidentally, at that level, overdrafts to state governments must have been about Rs 100 crores despite the formal ban on them.) The decline in net Reserve Bank credit to the Central Government must, therefore, have been about Rs 160 crores. During the same period, the net foreign exchange asset of the RBI rose by Rs 128 crores from Rs 531 crores to Rs 659 crores, largely as a result of the two loans mentioned above. We find government deposits with the Reserve Bank rising from Rs 59 crores on February 15 to Rs 160 crores on March 29, which is most unusual for the fag end of the financial year. But for the foreign assistance, the government's deficit would have been higher by at least Rs 136 crores.

It is also unusual that in the last week of the financial year (when normally substantial disbursements take place) there should have been repayment of government debt to the Reserve Bank of the order of Rs 60 crores. In the same week, the Reserve Bank's loans and advances to state governments went up by Rs 60 crores so that the decline in credit to the Central government was around Rs 120 crores in a single week. In the corresponding week of 1972-73, Reserve Bank credit to the Central government had gone up by about Rs 80 crores. To complete the picture, in the very first week of the current financial year, Reserve Bank credit of the Central government went up by as much as Rs 190 crores. (The rise was just Rs 4 crores in the corresponding week of April 1973.) It is obvious that there was an unusual rush of government disbursements in the first week of the current fiscal year. Is it not reasonable to presume that a large part of these disbursements were payments deliberately put off to the current financial year so as to show a lower deficit for last year?

There is evidence to show that financial transfers from the Central government to the state governments were also postponed in this manner. The state governments' borrowings from the Reserve Bank rose by about Rs 60 crores in the last week of March and have continued to rise since then. On April 19 they stood at Rs 274 crores. Delayed disbursements of loans committed by the Central government appears to have been a major reason for this. The recent instances of Kerala and Karnataka, to whom the Reserve Bank refused payment because they had exceeded their overdraft limits, confirm this possibility. Both states, and Karnataka in particular, have complained that loans promised by the Centre have not been forthcoming.

What does the government hope to achieve by these accounting manipulations? Does it thereby hope to convince its domestic critics that it has at last woken up to the need to do something about the raging inflation? Or is the whole exercise intended for the benefit of the IMF to prepare the way for further borrowings from it? Certainly, from the point of view of the economy itself, the supposed cut of Rs 330 crores in the budgetary deficit is of significance at all.

Ours is a magnificent Land-2

I was born unwelcome
into an overcrowded land.
But I have shared
my home with
the exiled.

I exist in a village
imprisoned by my fields.
But in quest of my spices
man discovered a globe.

I adorn my emaciation
with the tatters of penury.
But I have gifted the world
the luxury of fine muslin.

My cookfires I light
with the dung of cattle.
But I have taught man the
abstraction of algebra.

I grew up untutored,
unmusic'd and unsung.
But my syncopated sitar
has driven nations to frenzy.

I am surrounded by children
with malnourished minds.
But I have given man
his first philosophy.

I craft shoes that shod
three whole continents.
But I have just begun
to stand on my own bare feet.

I am named by many names
in a babel of tongues.
But I have adopted a name
by strangers given: India

I am sad.
But I am glad.
I am.

'Izvestia' Can, but Can the CPI?

THERE are legions of dedicated men left in the Communist Party of India. One may differ with them, disagree with their analysis of the domestic and international situation, yet it would be foolish to question either their sincerity or their devotion to the cause. The dilemma tormenting them must also be genuine. Politics is for the capture of power. A party dedicated to further the prospects of the working class owes it to itself to be as much interested in capturing power as any other. For the Communist Party of India, developments in the country since 1969 have been a godsend, since these have forced Indira Gandhi to come closer to it. She has been compelled to offer sustenance to the CPI in Kerala and form a government in that state in alliance with the party. She has had to agree to combine with the CPI in West Bengal in order to contain and overwhelm the CPM. There was a brief period, in the afterglow of the Bangladesh war, when she could have dispensed with the services of Ajoy Bhavan. But the worsening economic situation had her once more scurrying for the CPI's support. In both Uttar Pradesh and Orissa, she leaned considerably on the communists for putting down the right-wing challenge in the recent elections.

Touch-and-Go

From all accounts, a sharp decline in her personal popularity has taken place over the past few months. About the image of her party and those mainly constituting the top echelon of its leadership, the less said the better. Somehow it is back to the days of the middle 1960s when the Congress was synonymous with corruption, greed and lack of scruples. It has been reduced to a shambles in Gujarat, its position in Bihar is hardly better. Given the spiralling prices, rampant nepotism and a slide-back from many of the populist measures announced to the world with such fanfare four or five years ago, the position of the party is indeed touch-and-go. It might still continue to win elections for want of a credible, coherent opposition and also because the electoral process itself has been considerably vitiated. Even so, come each election season, the party cannot have the confidence that it would win in any case. But a party based on the system of spoils cannot afford to lose elections either, since that would demolish its *raison d'etre.*

The dilemma confronting the Communist Party of India is obvious. It may not like many of those who today occupy pivotal slots in the Congress. It may have begun to dislike immensely Indira Gandhi's recent shifts in policy. Yet it has little options open to it, given the fact that it has already won, because of its understanding with the Prime Minister, a certain position of vantage for itself in the polity. Despite the considerable erosion of her popular image, Indira Gandhi remains the biggest vote-getter. It might thus be considered most unwise on the part of the CPI to ditch the Prime Minister, and thus surrender its present advantage which could assist it to be even formally entrenched in power by, say, 1976. A fair enough calculation for the CPI could be that in view of the substantial shrinkage in the Congress party's mass base and the Prime Minister's stature, it would be impossible for her to manage a victory in the next Lok Sabha elections without sizeable outside support. In Tamil Nadu, Indira Gandhi might decide to seek such support from K Kamaraj, but, elsewhere in the country the CPI might assure itself, it is the only worthwhile political grouping alliance which could offer the Prime Minister's party more than a fair chance of victory.

If this is the analysis that prevails, the CPI would then regard it altogether foolhardy to alienate Indira Gandhi. It can fulminate at the fact that the big monopoly houses have once more begun to flex their muscles in the industrial sector; it can be annoyed no end that massive aid from Western sources is once more on the agenda for survival; it can weep over the fact that the idea of nationalisation of trade has received a major set-back. But these expressions of anger and unhappiness have to be tempered by the other, overriding judgment, namely, that if only the CPI could put up with some of these irritants for the next twenty months or thereabouts, it might succeed in its objective of being formally a part of the government process in the country. The theory of the national democratic revolution would then be vindicated wholesale; once in power, the problems arising out of the reversal of populist policies which has taken place in recent months could be duly taken care of.

But suppose things do not move in terms of the CPI's well laid-out plan; suppose Indira Gandhi reasons that evolving political alliances should be in conformity to the evolution of policies? Since the drift in policy is increasingly toward calling back the blithe spirit of free enterprise, the Congress could come round to considering it more advantageous to forge, simultaneously, political understanding with parties which believe in the sanctity of private property and initiative, as that would reduce many of the tensions attendant on a hiatus between the pursuit of policy and the pursuit of political alliances. After all, a major chunk of the Congress(O) has by now as good as agreed to merge its identity with the Prime Minister's party. Most of the industrialists, traders and big farmers, who five years ago had gathered under the unmbrella of the Swatantra party, are now back in the Congress fold: Piloo Mody, for one, has gone on record in Parliament fulsomely approving the government's new food policy.

Logical Culmination

The logical culmination of a rightward realignment of policy should be a similar realignment in the choice of friends as well as enemies. At the practical level, this will merely imply that some of the less wild men in such parties as Jan Sangh and the BKD would have to be won over by the Prime Minister. This is not perhaps a totally impossible feat. Personalities apart, there is little in the Congress plank which the BKD supporters can object to following the reversal of the policy on the take-over of trade. Atal Behari Vajpayee has many friends already in the Congress; with certain carefully worked out modulations in attitude, it might be entirely possible for the Prime Minister to neutralise him and those of his ilk. Both Atal Behari Vajpayee and Sheikh Abdullah could then come to co-exist with a party which believes in respecting the sentiments of religious and linguistic minorities, offering farmers proper incentives, protecting the small traders, subsidising, within the limits set by available means, those consumers who are weak and poor, building a nuclear bomb, and maintaining a free-wheeling foreign policy, which however underwrites a state of permanent hostility toward China. In fact, as long as the anti-China stance is adequately spelled out, and the option to seek occasional counsel and arms from Moscow is firmly reiterated, even the Soviet Union might find it difficult to run down such a regime, whatever the content of its

domestic policy. The five principles of co-existence lay great stress on non-interference in other people's affairs, and instances are altogether too many of both the Soviet Union and China winking at out-and-out retrograde domestic policies of a government which has nonetheless offered the one or the other of them a certain measure of support in the sphere of international relations.

The Prime Minister might well conclude that, in electoral terms, what she might lose on the CPI swings would be more than regained on the Swatantra-Vajpayee-Patnaik-BKD roundabouts. Can any activist of the CPI deny that such a possibility of a total drift toward the right does exist, or that, once the Prime Minister has made up her mind in the matter, the capacity of Ajoy Bhavan to prevent her from going the whole hog is limited?

Irrespective of a total turn-around in Indira Gandhi's domestic policies, the Government of the Soviet Union, for its own reasons, might still continue to offer her support. Even were the CPI to decide to sever its links with the Congress, the Soviet Union would thus still continue along its present course and shore up Indira Gandhi's regime. In other words, till as long as the compulsions of its foreign policy are satisfied, the Soviet Union might like to keep its options open. It is a matter of some irony that, at about the same time, the CPI nonetheless would be under the compulsion to close its own options, seemingly all because of the odd chance of sharing power from 1976 onward.

Distant Thunder

Is the moral problem resolved thereby? Suppose 1976 arrives, but power eludes the CPI. Would the sacrifices in the present period be worth it in retrospect? *Izvestia* is a distant thunder: it can continue to tell its readers that the current wave of unrest in India is entirely on account of the machinations of certain right-wing groups, who in their turn are also utilising 'ultra-leftist Maoist groups' for inciting religious and tribal feuds. This could be tongue-in-cheek, but *Izvestia* can afford to keep repeating its own make-believe that the main target of the onslaughts mounted by the Indian opposition parties is "the domestic policy of the Indian National Congress, which is working to restrict big private business and boost the government sector". What is involved here is both an aspect of logical positivism and what Marxists call the objective reality. *Izvestia*, which is printed several thousand miles away, can afford to define either in its own manner, but can the CPI? *Izvestia* can go on to comment that the right-wing parties have been responsibile for "serious provocations" in Uttar Pradesh, Gujarat and Bihar; it can, with exemplary delicacy, hint that these provocations have "entailed human casualties"; it does not have to spell out what hands have triggered the bullets which have led to these "human casualties", but can the CPI? Where there is tremendous welled-up discontent among the people, and the so-called Left parties, such as the CPI, default in mobilising it, channelling it and vocalising it, the right-wing parties are bound to fill in the vacuum. The happenstance that it is the right-wing elements which are organising the mass discontent in many places does not make an un-fact of the fact of discontent.

MAHARASHTRA

Broken Statue, Smashed Heads, Burnt Shops

Anil Awachat

PHALTAN, a taluka headquarter town in Satara district, is sixty miles from Poona. April 14, Ambedkar's birth anniversary, saw a violent attack by caste Hindus on the Scheduled Castes here. Satara district is the backbone of Western Maharashtra. It is also the centre of Maratha power. Because of this, the Phaltan incident has attracted a lot of attention.

Prosperous Area

Once a princely state, Phaltan has a population of about 25,000. Sugarcane cultivation, made possible by irrigation water from the Vir Dam, has made it an agriculturally prosperous area. There are two sugar factories here: the Shreeram Co-operative Sugar Factory and the privately-owned Phaltan Sugar Factory. Grape-farming too has caught on and fetches handsome returns.

Phaltan has a population of about 7,000 Scheduled Castes, mainly Buddhists. Among the other Scheduled Castes are Vadars, Faseparadhis, Matangs, Chamars, Beldars and Makadwales. The Scheduled Castes live in the Mangalwar Peth area of Phaltan. There is not a single primary school for the population of 7,000 Scheduled Castes. All the houses in Mangalwar Peth are in a dilapidated condition and the narrow alleys make movement difficult. Except for 2 or 3 tubelights at the approach to the locality, there is not a single municipal street light in the area.

According to information collected by Shankarrao Kakade, a local Republican Party leader, the majority of the industries and offices in the area do not employ a single Scheduled Caste. At best, some backward caste Hindus, such as Telis, Dhangars and Malis, find employment in them.

With virtually no employment opportunites, the Scheduled Caste young men of the locality are forced to turn to petty crime. A big gang of pickpockets operates in the area. Schools for pickpockets are run openly in Mangalwar Peth. Recently, a CID constable himself was relieved of Rs 1,800, though the amount was restored to him within a few hours — thanks to the 'hafta' relations which the police have with the pickpockets.

A concrete road divides Mangalwar Peth from the main city. This road has become the hang-out of the unemployed youth and the local toughs. Across the street is Raviwar Peth, where the caste Hindus live.

Marathas Dominant

Marathas are dominant among the caste Hindus. Among the Marathas the Nimbalkars constitute the aristocracy. Malojirao Naik Nimbalkar, now an octogenarian, is a former ruler of the princely state of Phaltan. He was also an ex-minister in the erstwhile Bombay state. For all that, the Nimbalkars do not accept Malojirao as their leader, because he was born into a Ranvane family and had been adopted into the Nimbalkar royal family. The Nimbalkars recognise one Hindurao Nimbalkar as their leader. Hindurao is a young man in his thirties. He does not belong to any party, but has a youth organisation of his own called the Yuvak Dal.

Next in importance to the Marathas among the caste Hindus come the Dhangars. Their deity, Khandolsa, is at Vejuri, very near Phaltan. The Dhangars are mostly rich and middle peasants. But since they enjoyed no political position during the period of Maratha rule, rivalry between the Marathas and Dhangars is traditional. Both castes are, however, equally oppressive towards the Scheduled Castes.

The Dhangar-Khatiks are a sub-caste of the Dhangars. They are butchers, though they like to describe themselves as Kshatriya-Marathas. Fights between the Dhangar-Khatiks and the Buddhists are a regular feature.

There are two relatively prosperous restaurants on the road dividing Mangalwar Peth from the rest of the town. One of these is called 'Visawa' and is owned by a person from Malabar and the other is 'Sarta', owned by Jaya Shetty from Udipi in Karnataka. Each of them shelters a gang. Habib is the leader of the gang under the protection of 'Visawa'. The other gang is led by Shyam Sargar, a Dhangar-Khatik. Both the gangs belong to the Raviwar Peth gymnasium, the patron of which is Hindurao Nimbalkar.

These gangs have been involved in many skirmishes with the Buddhist youth. On last October 25 a Buddhist young man asked a Khatik youth for a match to light a bidi. The Khatik took this as an insult. The result was a fight in which iron chains, bars and kuradis were freely used. There have been one or two more fights since. But what happened on Ambedkar Jayanti was much more than just a skirmish.

*

Actually, a fight might have taken place on that day between two groups of Buddhists — followers of the Republican Party and young men who are opposed to them. The latter are led by Scheduled Caste leaders in the Congress, chiefly G B Mane, an advocate and a supporter of the Maharashtra Social Welfare Minister, Rupawate. There were attempts to bring all the Buddhists together to take out one procession on Ambedkar Jayanti, but the attempt failed as the followers of the Republican Party insisted on the procession carrying their party flag.

The first procession was that of the Buddhist youth. It garlanded the statues of Shivaji, Gandhi, Ambedkar and Phule. It was followed by the Republican party procession. Gandhi's statue is on a ten-feet high pedestal. Lacking a ladder, people from the Republican Party procession climbed one on another to garland the statue. But just as a young man was garlanding the statue, there was a strong gust of wind, as a result of which the youth lost his balance and the human pyramid under him collapsed. To save himself from falling the youth clutched at the stick in Gandhi's hand, wrenching the hand along with the stick from the statue. Eye-witnesses to the incident, including a journalist, confirm that it was all an accident.

Leaders of the procession informed the Pranth Officer and the police of the accident and expressed their regret. The band at the head of the procession stopped playing after the accident. But soon this procession met the other procession of Buddhist youth. There was an exchange of angry words over the accident and there were some fist fights. The Buddhist youth brought down the Republican flag and tore it. Then both processions dispersed. All this took place around 6.30 in the evening.

Later, around 8 p m, Shyam Sargar and Habib with members of their respective gangs managed to get the broken arm from Gandhi's statue from the mayor's residence and took it out in a procession. They were shouting slogans such as 'Heads for Hand' and 'Burn Maharwada'. They approached former freedom fighters and people wearing khadi saying. "Don't you feel ashamed? These Mahars have broken your Father's arm". Pranth Officer Anand Bhadkamkar halted the procession and talked to the people persuasively. Both as soon as he went away, the procession reassembled and proceeded threateningly towards the Buddhist locality.

Systematic Attack

The Buddhists were unaware of these developments. The processionists entered the Buddhist locality, bolted some huts from outside and set fire to them, trapping the inmates inside them. A blind person tried to ecape by running through the flames. His brother-in-law rushed to rescue him but was pushed into the fire. He suffered burns. Six or seven huts in a row were set on fire. There were sick persons and children and infants in these huts.

By now the Buddhist youth had started stone-throwing in retaliation. Women and children of the basti were sent across the canal behind the basti. The fierce stone-throwing by the Buddhist youth forced the caste Hindu attackers to withdraw. The crowd, however, proceeded to the town area where they launched a systematic attack on the few shops belonging to Buddhists. In all, 13 shops were burnt. Shops owned by Buddhists were singled out and set on fire. In one case, between two shops owned by Buddhists there were five others owned by Chamars but they were not touched. In the main market, two of the 25 shops belonged to Buddhists; the caste Hindu shopowners identified these shops for the benefit of the crowd. The Buddhist owners of the shops, who were sleeping inside the shops, were pushed out and beaten up. The merchandise from the shops was thrown out and the shops set on fire.

The mob then moved to the residence of Krishnachandra Bhoite, a Congress legislator. This action appears to have been influenced by the leader of a faction within the Congress which is opposed to Bhoite.

As all this went on, there were only 12 policemen in Phaltan. The sub-inspector was not available. At 8.15 p m a message was sent to Satara, the district headquarter, some 40 miles away. The police force from Satara, however, took three and half hours to arrive. It reached Phaltan at quarter to twelve. When it arrived, the crowd threw stones at it and a police driver was hurt. However, the policemen managed to disperse the mob after a lathi charge.

Meanwhile, between 7.30 p m and 12 in the night, the Pranth Officer had been trying to calm the mob. In the attempt, he was beaten up by the crowd of caste Hindus. He was also caught in the stone-throwing while trying to reach the Scheduled Caste basti. Later in the night, when the police arrived, he received some lathi blows before his identity was established.

Next day a Peace Committee was formed and 50 kgs of foodgrains and Rs 350 were distributed to every family which had suffered in the riots. The Chief Minister donated Rs 10,000 from the Chief Minister's Fund.

*

Why did an accidental happening like the breaking of the Gandhi statue lead to the organised attack by the caste Hindus on the Buddhists?

Members of the Mahar community in Maharashtra have moved to towns and cities in large numbers on becoming Buddhists. In the towns and cities, their bastis are segregated. Given the lack of jobs and the limited opportunities for going into business, trade, etc, lumpen tendencies have been on the

increase among the Buddhist population in the towns and cities. The established gangs of caste Hindus find this a challenge to their position and activities.

This is the major reason for the tension between caste Hindus and Buddhists in Phaltan. Given their ruling class past and their economic prosperity, stemming from irrigated sugarcane farming, the Marathas are an arrogant, aggressive lot. They cannot brook the challenge posed to them by the Buddhist gangs. However, being powerful and rich, the Marathas use the Dhangar-Khatiks, who deem it a privilege to be called Kshatriya-Marathas, against the Buddhists.

Similar situations obtain elsewhere in Maharashtra as well. Two years ago, there had been an organised boycott of Buddhists in Bawda in Poona district. There are some similarities between that incident and the recent one at Phaltan. Both are agriculturally prosperous areas of irrigated sugarcane farming. In both, there is a relatively large population of Buddhists. In both places the Buddhists pose a challenge to the dominant community. Bawda being a village, the Buddhists are mainly agricultural labourers. So the element of organised gang violence is less there. In a place like Phaltan, however, the acute unemployment has resulted in the organisation of the Buddhists into gangs and the confrontation between them and gangs of caste Hindus.

Enterprising Community

The pattern of burning of shops in Phaltan shows that the caste Hindus' anger was directed only at the Buddhists. Shops owned by Chamars were not touched. One such shop accidentally caught fire, but the crowd itself put out the fire by throwing water. The Mangalwar Peth basti comprises Vadars, Faseparadhis, Makadwales, Chamars, Matangs and Beldars, besides Buddhists. But not one hut belonging to these other castes was attacked by the mob. The Vadars live near the beginning of the basti, but the mob passed them by to get to the Buddhist area.

Among the Mahars those who had made some progress in business had their businesses wiped out in the riot. Mahars are a relatively enterprising community. A few years ago a Buddhist had returned to Phaltan after learning tailoring. His tailoring business progressed well in Phaltan. He also taught tailoring to other Buddhist youth who in turn opened their own shops. All these shops were wiped out in the recent riot. A shop owned by a Shimpi (tailor caste) was also ransacked because he employed Buddhists. An 18-year old Buddhist girl, Kanta Kakade, had opened a tailoring shop with Rs 1,000 borrowed from a bank. She did well and paid off the loan. Later she took another loan of Rs 2,000 to buy two more machines. Now her shop has been reduced to ashes.

Politics does not appear to have been an important element in the riot in Phaltan. In Bawda, which is a reserved constituency, the Maratha leaders of the Congress had insisted that the choice of the Buddhist candidate to contest the election should be left to them. But, without paying any heed to them, a Buddhist had filed his nomination. This is what had led to the boycott referred to above. In Phaltan, however, the Buddhists do not yet seem to be challenging the Marathas on the political plane.

ADMINISTRATIVE STAFF COLLEGE OF INDIA

invites

Applications for Faculty Positions and Research Associates in Economics

Administrative Staff College of India are developing programmes of Research, Consultancy and Training in Economics with special reference to Planning and Development. The Faculty member will be expected to teach, conduct and supervise research and consultancy in these areas; and the Research Associates will generally assist their colleagues.

QUALIFICATIONS:

Faculty: The applicants for the Faculty positions should have a Doctoral degree or equivalent research experience in Economics preferably with a good background in quantitative methods and interest in allied social sciences.

Research Associate: The applicants for the Research Associates should have a first or a good second class degree in (i) Economics with Statistics and Mathematics as optionals or (ii) Mathematics or Statistics with a good knowledge of Economics. Research experience is desirable.

REMUNERATION:

The positions offer good prospects in research, training, and consultancy. Starting salary will be commensurate with qualifications and experience of the individual. Gross emoluments can be upto Rs. 20,000 per annum for a faculty member and Rs. 12,000 per annum for a Research Associate.

GENERAL:

Applications with detailed bio-data, details about present job and names of three referees (five referees in case of candidates applying from abroad), should be sent to the Registrar, Administrative Staff College of India, Bella Vista, Hyderabad-500004, so as to reach him within 20 days from the date of this advertisement. After preliminary screening, selection interviews will be arranged in the month of May/June 1974. All applications will be treated as strictly confidential.

LAND REFORM

When, How and By Whom?

M R

A REAPPRAISAL of the CPI(M)'s stand on land reform is reflected in General Secretary Hare Krishna Konar's report to the 22nd session of the All-India Kisan Sabha at Sikar in Rajasthan in the second week of April. Basic land reform — that is, total abolition of landlordism and not palliatives like marginal improvements in existing land reform legislation — is to be the central slogan of the All-India Kisan Sabha. This is an issue on which there have been differences in the CPI(M) since 1966.

Konar's report is a sequel to the resolution on 'Certain Agrarian Issues' passed by the CPI(M) Central Committee in March 1973 to concretise the party's 1966 document, 'Tasks on the Kisan Front'. Until the 1973 resolution there were differences within the party on issues such as land ceilings, rights of tenants-at-will *vis-a-vis* non-cultivating tenants, agricultural labourers' struggles for land and wages, use of tractors and mechanisation in general and, finally, land reform legislation — and, in this context, the relation between immediate demands and programmatic demands. That the 1973 resolution did not resolve all these differences can be seen from General Secretary P Sundarayya's explanatory note on the resolution. For instance, before the 1973 resolution, the party had been maintaining that only surplus land, over and above the ceilings, would be taken over. But the 1973 resolution sought to underline that landlords who did not physically cultivate their lands would have no right to retain even land within the ceiling. If such a landlord had no other means of livelihood he might be given some rehabilitation grant, but his entitlement to land would be taken away. This is crucial to the party's intention to draw a line between the landlord and the rich peasant. Rich peasants are different from landlords, in that they or members of their families physically participate in the main agricultural operations.

The differences within the CPI(M) here were on the attitude to be adopted to the rich peasant class. Once the ceiling limit is accepted as the demarcating line, a section of the rich peasantry, however small, is likely to be affected and a certain amount of land belonging to the rich peasants might be taken away for distribution. Some argued that this would adversely affect the attitude among the whole rich peasantry — spreading to the middle peasantry — towards the strategic people's democratic front which the party wants to construct. According to the party's programme, the rich peasant is an ally and, therefore, nothing should be done to touch even a small section of the rich peasantry. Therefore, the target of attack would have to be unmanageably widened. The party would thus limit itself to saying, in general terms, that it stood for abolishing landlordism. The CPI(M) is thus committed to the position that land ceilings legislation should be such as would not affect the rich peasant "as a class". And Konar's report is based on this commitment.

Konar notes that, in the past, the All-India Kisan Sabha — the rural arm of the CPI(M) — worked within the framework of ceiling laws enacted by the Congress government and did not demand complete abolition of all forms of landlordism. The party's position is that the Indian agrarian situation today is feudal — and semi-feudal, where capitalist exploitation is superimposed on the old feudal system. For this reason, the target of attack has to be landlordism, feudal or capitalist.

The main points of the All-India Kisan Sabha's stand, as spelt out in Konar's report, are:

Basic land reforms signifying total abolition of landlordism, both feudal and capitalist;

Distinction between non-cultivating small owners with a few acres and landlords: small owners owning upto half of the rich peasants' holdings may retain their holdings subject to the tenants' security and reasonable rent.

Konar's report again raises the central practical question: when, how and by whom is this basic land reform to be implemented? Certainly not by the bourgeois landlord government. And any attempt by the peasant movement to implement a basic agrarian programme of this kind will be opposed by the ruling classes. Konar says: "The basic solutions can be carried out in practice only when the revolutionary agrarian movement develops in necessary strength to enforce them, and the final successful completion can be achieved only when the present state is replaced by a people's democratic state.

While the CPI(M)'s disenchantment with partial land reforms of the Congress variety is obvious, it is far from certain that the party will opt out of the parliamentary system sufficiently to be able to organise the required extra-parliamentary agitation. Its emphasis on participation in the system while claiming to believe in extra-parliamentary methods of struggle leaves unresolved within the party the larger issue of the feasibility of peaceful transition.

TAMIL NADU

Grim Power Prospects

DRASTIC power cuts in the summer months have by now become a hardy annual in Tamil Nadu. The stoppages, frequent interruptions, trippings and voltage fluctuations are indicative of the basic disequilibrium between supply and demand. The state faced a severe drought in 1972-73 which affected hydel storage. As a result, a power cut of 75 per cent was in operation for most part of the year. The situation improved markedly from June 1973 with a merciful south-west monsoon. The government was able to lift all curbs on power consumption on July 17, 1973. But restrictions had to be reintroduced soon, although in a milder form. Effective from October 1, 1973 a 15 per cent power cut was enforced and from April 1 this year the cut has been enhanced to 30 per cent on both high-tension and low-tension services. The cut in respect of essential services such as railways, hospitals, water supply, etc, which was 10 per cent has been raised to 15 per cent. There is no guarantee that the cut will not be further enhanced since non-availability of coal, difficulties in movement of available supplies, uncertainties in regard to recommissioning of one of the sick generators at Ennore, etc, have been, one after the other, upsetting the calculations of the State Electricity Board.

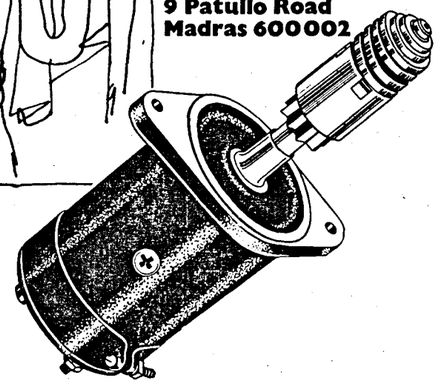
The demand for power in Tamil

PARTNER FOR LIFE: YOUR LUCAS-TVS STARTER ONLY STOPS WHEN YOU DO

Each day, over 7,00,000 quality Lucas-TVS starters spring to life. Starting cars, commercial vehicles, tractors, earth-movers, stationary and marine engines.

Available in a range of 6, most of these 7,00,000 starters are fitted as Original Equipment.

With Lucas-TVS reliability built into each, your starter is a partner for life.



And should one of the many components of a Lucas-TVS starter ever need replacement, ensure that you fit only a genuine Lucas-TVS part.

Because when you buy from Lucas-TVS, you buy a total integrated electrical system. Perfectly matched to the needs of every make of vehicle.

Yes, a Lucas-TVS starter proves that not all marriages are made in Heaven.

FREE FOR YOU!
Informative leaflet on profitable vehicle maintenance.

SAA/LTVS/1181

Nadu has far outstripped the increase in generating capacity. At the beginning of the first Plan the demand was only 110 MW, but currently it is estimated to be in the region of 1,500 MW and by 1980-81 it is expected to touch 3,820 MW. To meet demand of this order an effective capacity of 4,590 MW would be required by 1980-81. But available capacity, both from existing power houses and those under construction, is expected to be only 2,040 MW. There is thus a huge deficit of 2,550 MW which will have to be bridged by the installation of additional capacity and large-scale purchases from neighbouring states. The scope for the latter is not bright since none of these states is likely to have a surplus, given the rise in their own demand for power.

Out of an estimated hydro-electric potential of about 3,500 MW in Tamil Nadu, over 1,200 MW has already been harnessed. The balance can be tapped only with the co-operation of neighbouring states. Tamil Nadu, therefore, has to rely on thermal sources in the short run. But progress on this front has been far from satisfactory. The 600 MW capacity at the Neyveli power station is languishing because of insufficient lignite output and currently the plant is feeding only 180 MW into the grid. Ageing of machinery and failure to take timely action for replacement are responsible for the poor raisings of lignite at Neyveli. The next important thermal station at Ennore has an aggregate capacity of 340 MW. Supplies from this source are now placed at 150 MW and have been highly erratic. The four plants at Ennore have never worked simultaneously for many months and at one stage only one 60 MW plant was in operation. Even if all the plants are ready for operation by May, as the government claims they will be, the uncertainties on the coal front and the threat of the Railway strike mar the prospects of early utilisation of full capacity at Ennore.

It is widely accepted that more coal-fired power stations are not feasible in Tamil Nadu for the simple reason that coal has to be transported at exorbitant cost from distant places. A 110 MW station requires for its operation about 1,800 tons of coal per day or a minimum of two train-loads which, in the context of the wagon shortage and the railway capacity, cannot be counted upon.

A second mine-cut at Neyveli with a generating station of 800/1,000 MW capacity has been suggested as a solution to the state's power problem. The Central government is yet to clear this proposal. Apparently the experience of lignite raisings at Neyveli so far has caused reservations about the scheme.

This leaves only one alternative, *viz*, atomic energy. The Kalpakkam atomic project is under construction and when completed will have two units of 235 MW capacity each. The State Planning Commission has suggested the setting up of another nuclear station of 1,000 MW capacity at Madurai.

The power shortage has also been aggravated by pilferages and line losses. It is generally accepted that around 6,000-7,000 Kwh would be a fair annual generation out of every kW of capacity installed. As against this the average generation in Tamil Nadu, as also the rest of the country, is well under 4,000 Kwh. This suggests that while providing for additional generating capacity, allowance has to be made for 18-20 per cent pilferage and transmission losses.

Demand for electricity has been rising steadily in Tamil Nadu at an estimated 12 per cent per annum. Currently above 50 per cent of the total demand is from industry, 30 per cent from agriculture and 20 per cent from the rest. All the villages in Tamil Nadu have been electrified and 6.5 lakh wells out of 12 lakh wells are energised. Per capita consumption of electricity is the highest in this state. From 12 units at the end of March 1951, per capita consumption rose to 21 units by March 1956, 60 units by March 1961, 92 units by March 1966, 123 units by March 1971 and further to 133 units by March 1972. The national average is only around 90 units. Consumption of electricity by agriculture is also the highest in Tamil Nadu. This is understandable. The surface water potential in the state being very limited, ground water has to be exploited in a big way. Agriculturists have been encouraged to use power by the state government's policy of supplying power to them at a subsidy. As against a cost of supply of energy on low tension of 23 paise per unit, the agricultural tariff is 11.2 paise. The cost of high tension power, on the other hand, is 8 paise but the average tariff for industrial consumption was 17 paise in 1972-73.

A second mine-cut at Neyveli, a sizeable reduction in pilferage and line losses and expansion of atomic power alone will help overcome the power shortage in Tamil Nadu.

SAIGON

A Year after the Paris Agreement

Harish Chandola

IN the middle of April, the Saigon administration of President Thieu has unilaterally taken certain measures which seriously threaten the implementation of the January 1973 Paris Agreement on Vietnam.

The Saigon administration suspended for an indefinite period the consultative conference between the two South Vietnamese parties — *viz*, the Provisional Revolutionary Government (PRG) of the Republic of South Vietnam and the Saigon administration — which was under way in Paris, because of the alleged PRG attack on the Tong Le Chan base of the Saigon army. The Saigon administration is, of course, aware that such a suspension of the conference would scotch serious negotiations to seek a solution to South Vietnam's internal affairs. The administration then, unilaterally and indefinitely, suspended the sessions of the Central Two-Party Joint Military Commission in Saigon. It has gone further and suspended the weekly liaison flights between Saigon and Loc Ninh (the town which functions as the temporary headquarters of the PRG). To top it all, it has prevented the PRG delegation in Saigon from holding press conferences, cut off its telephone lines, and barred its contact with anyone outside including the International Control Commission. This, indeed, is a serious infringement of the privileges and the immunity accorded to the military delegation of the PRG under the Paris Agreement.

At the same time, the Saigon administration has intensified its operations for grabbing the territory under the control of the PRG and has sent planes in hundreds of sorties to bomb Loc Ninh town and many other heavily populated centres in the areas controlled by the PRG. And for such operations the Saigon army has used Tong Le Chan as a base against the various PRG-held areas in the two provinces of Tay Minh and Binh Long. Tong Le Chan is suitable for this purpose as it is in the midst of the liberated areas on the right bank of the Saigon river —

10 kilometres from the Vietnam-Cambodia border and 15 kilometres from An Loc which is the capital of Binh Long province.

Hundreds of thousands of political prisoners, moreover, continue to be detained by the Saigon administration, and political liberties for the people living in the Saigon-controlled zone are of course nowhere in sight. The Council of National Reconciliation and Concord has not been set up and the situation in South Vietnam has been deteriorating.

Under Articles 2, 3 and 5 of the Agreement, the US has ceased all its acts of war in South Vietnam, stopped the bombing, and ended the mining of the territorial waters, ports, harbours, and waterways of the Democratic Republic of Vietnam, deactivating or destroying the mines laid by it along 10 channels in the latter's territorial waters and withdrawing from South Vietnam its troops and those of its allies. Captured and detained military personnel and foreign civilians of the parties under Articles 8(a) of the Agreement were returned simultaneously with US troop withdrawals. The Government of the Democratic Republic of Vietnam and the PRG returned to the US all its military personnel and all foreign civilians captured in North and South Vietnam, totalling 588 persons; also, the PRG returned 5,016 captured and detained military personnel of the Saigon administration. The US and Saigon administration returned to the PRG 26,508 captured and detained military personnel; a number of prisoners are still detained by them, however.

Article 2 of the Paris Agreement stipulates: A ceasefire shall be observed throughout South Vietnam as of 24.00 hours GMT on January 27, 1973, and the complete cessation of hostilities shall be durable and without limit of time. But the Saigon administration had meanwhile prepared an overall plan called 'Territory Invading Plan', which included four stages: preparation, pre-ceasefire actions, actions concomitant with the ceasefire, and post-ceasefire actions. Under this plan, the Saigon administration's armed forces had been ordered:

(1) to expand military operations aimed at "securing control over 100 per cent of the population and territory" in the preparatory stage;
(2) to expand to a maximum the sphere of control and "launch simultaneous attacks against enemy units, inflict maximum losses on them or pin them down in remote places" before the ceasefire;
(3) to achieve increased "co-ordination among units while invading territory" as the ceasefire is ordered;
(4) "to secretly invade the territory or cut off the enemy-controlled area" after the ceasefire.

The Saigon administration has thus launched operation upon operation to grab lands in the area controlled by the PRG, and carried out savage air strikes against many areas deep in the liberated zone razing many villages and killing thousands of people. From January 28, 1973, to December 15, 1973, the Saigon administration committed 301,097 violations, comprising 34,266 land-grabbing operations launched by whole divisions and regiments; 35,532 artillery shellings; 14,749 aerial bombardments and recommendations; 216,550 police and 'pacification' operations, in all of which over 6,000 civilians were killed or injured.

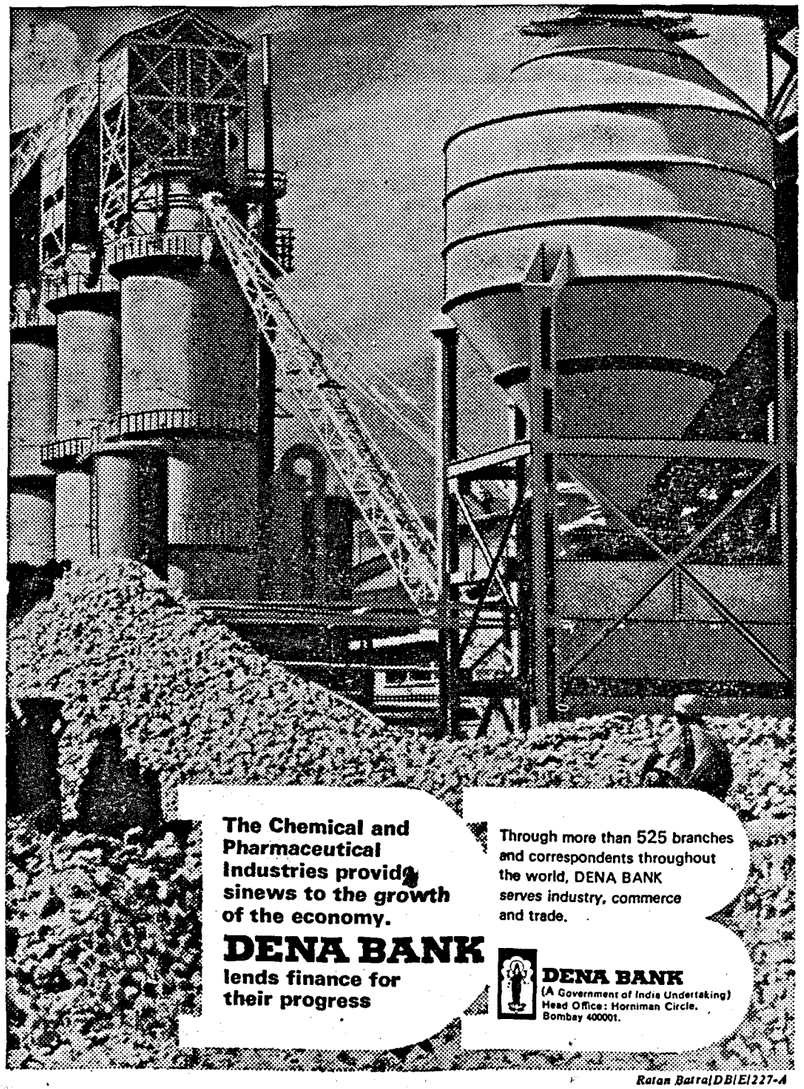
Article 8(c) of the Agreement says: The two South Vietnamese parties will do their utmost to resolve the question of the return of the Vietnamese civilian personnel captured and detained in South Vietnam within 90 days of the ceasefire. But the Saigon administration has refused to return all political prisoners captured and detained by it. Although it has under detention 200,000 Vietnamese civilian personnel belonging to the National Front for Liberation, the PRG and various religious and political affiliations which are non-partisan in South Vietnam, Thieu has bluntly stated: "There are no political prisoners in South Vietnam. There are only two kinds of prisoners: 21,000 common-law convicts and 5,081 communist prisoners."

Shortly before the ceasefire, the Saigon administration, in its attempt to avoid return of the prisoners, had sent the detainees from one prison to another, dispersed the prisoners among various jails, registered political detainees as 'common-law' convicts, compelled detainees to sign 'release certificates', and taken many prisoners to unknown destinations or secretly killed them.

After a trip to South Vietnam, an American Bishop Thomas J Gumbleton asserted: "I can state unequivocally that there are political prisoners in Saigon's jails and in jails throughout the provinces. They are in jail not for any crime, but simply because they are in political opposition to the present government. The proof is overwhelming, and it is clear that these prisoners are subjected to inhuman treatment, including deliberate prolonged torture."

The civilian personnel kept by the Saigon administration in 'tiger cages' or other jails are living in appalling conditions. As the US magazine *Time* of March 19, 1973, put it: "It is not really proper to call them men any more. 'Shapes' is a better word — grotesque sculptures of scarred flesh and gnarled limbs." On April 30, 1971, US Senator W Anderson, speaking before the US Congress, denounced that the US had spent at least $ 266,000 to build more 'tiger cages' in Poulo Condor. On September 9, 1973, Senator Edward Kennedy denounced the US government for violation of the Paris Agreement by continued financial support to the police apparatus and prison system in South Vietnam.

Article 11 of the Agreement stipulates: Immediately after the ceasefire, the two South Vietnamese parties will:



—Achieve national reconciliation and concord, end hatred and enmity, prohibit all acts of reprisal and discrimination against individuals or organisations that have collaborated with one side or the other;
—Ensure the democratic liberties of the people: personal freedom, freedom of speech, freedom of the press; freedom of meeting, freedom of organisation, freedom of political activities, freedom of belief, freedom of movement, freedom of residence, freedom of work, right to property ownership, and right to free enterprise.

One day after the signing of the agreement, Thieu bluntly stated that "as for all our affairs, laws, administration, we'll do exactly as in the past, nothing is changed ... If communists enter the village, they will be shot dead on the spot." Shortly before and after signing the Agreement, the Saigon administration in fact enacted dozens of new 'decrees', such as the "decree on local security" banning all market strikes and demonstrations and allowing the police to open fire on the spot; the "new Press decree" stifling freedom of the Press, and resulting in dozens of newspapers being closed down; the "decree" abolishing village elections and chiefs of province being appointed by Thieu, the administrative apparatus at the grassroots being put in the hands of officers loyal to Thieu; the "decree on the status of parties" aimed at eliminating 26 political parties in South Vietnam, leaving in existence only the so-called "Democratic Party" and other organisations belonging to Thieu; the "decree number 989" repressing anyone regarded as "dangerous" by the Saigon administration — and anyone suspected of com-

munist or neutralist convictions is considered "dangerous" and may be jailed.

In nearly a year of the signing of the Agreement, the Saigon administration has conducted innumerable police and 'pacification' operations in the course of which it has 'purged' over three million people, arrested and tortured over 36,000, herded over 920,000 people into concentration camps, plundered thousands of tons of rice, tens of thousands of head of cattle, and forcibly taken away 145 billion South Vietnamese piastres.

Article 9 of the Agreement asserts that the South Vietnamese people shall themselves decide the political future of South Vietnam through genuinely free and democratic general elections under international supervision. Article 12 says that the two South Vietnamese parties shall hold consultations to set up a National Council of National Reconciliation and Concord of three equal segments. The National Council, the Agreement stipulates, will ensure democratic liberties and organise general elections. But the Saigon administration wants the National Council to be a mere electoral Commission in the framework of the so-called 'Constitution' of the Thieu regime. Yet, so long as shooting does not stop, and the people are not allowed basic freedoms, there can be no elections in South Vietnam.

Paid Pipers

Nireekshak

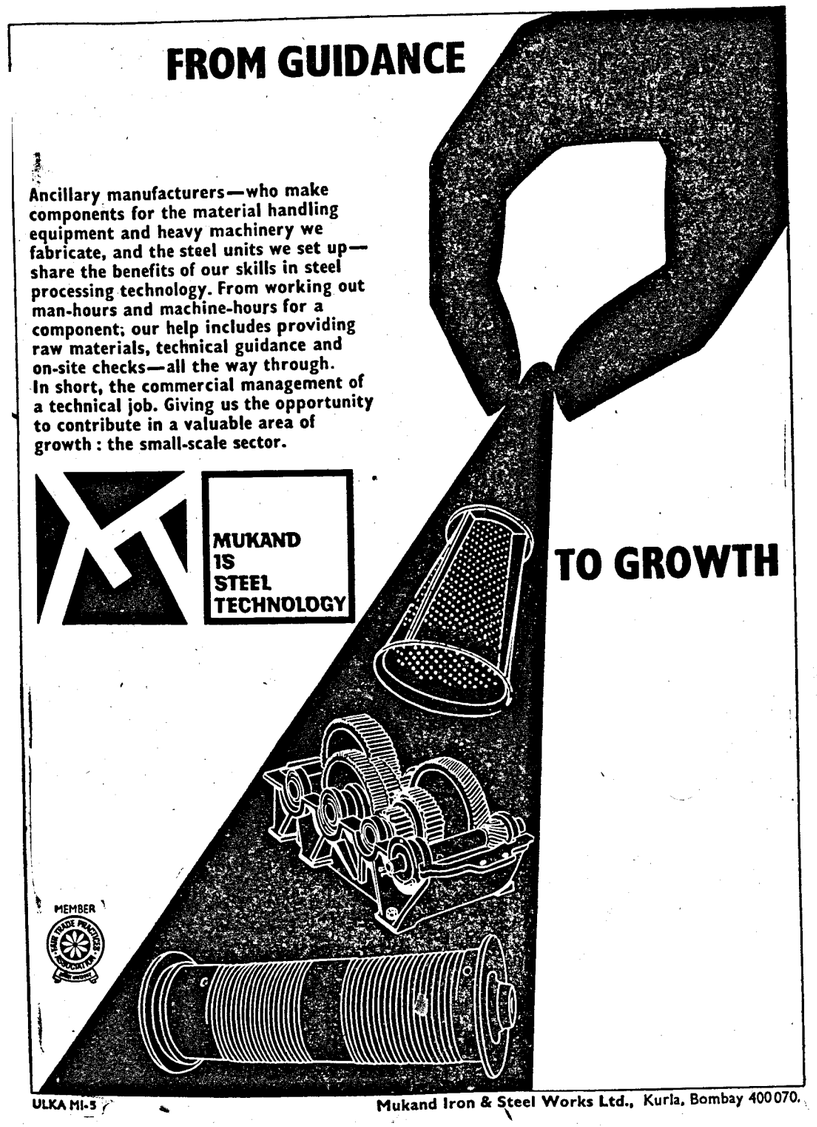
OPPOSITION spokesmen in the Lok Sabha were justified in charging the government with arranging a "calculated leak" to prejudice, even scuttle, the talks with trade union leaders to avert the railway strike. The charge relates to the letter the Prime Minister wrote to Chief Ministers on April 27, when negotiations between the railwaymen and the government had just been resumed. Spelling out the government's tough line on the strike, the Prime Minister called upon the Chief Ministers to act firmly, adding that it was impossible for the government to accept all the demands of the railwaymen. In particular, the demand for bonus was characterised as untenable by the Prime Minister. Simultaneously, and rather contradictorily, she also suggested that the railwaymen should await the report of the Bonus Review Committee — though everyone knows that the Committee's terms of reference do not cover railwaymen.

The Prime Minister's letter was not officially released to the Press, but quietly planted on one of the two national news agencies on April 29, when the Prime Minister was away in Iran. There was no confirmation or denial of the news agency story, but the report caused enough damage by raising doubts among the railwaymen's leaders about the *bona fides* of the government's representatives conducting the negotiations. If the demands were to be rejected outright — as the Prime Minister had done in her letter — what was the point of negotiations? Reconstructing the sequence of events, the railway workers' leaders are now inclined to believe that the government was never serious about a negotiated settlement on the charter of demands and was only trying to force a strike on the railwaymen at a time of its choosing to be able to crush it. The letter had been leaked out to break up the negotiations so as to prepare the way for the arrest of railway leaders throughout the country on May 2.

If the Prime Minister had desired publication of the letter, the honest course would have been to release it officially in New Delhi as part of the Railway Ministry's public relations drive to break the strike. But as things are, the only confirmation of the existence of the April 27 letter has come from the Tamil Nadu Chief Minister, M Karunanidhi, who referred to it in a public speech in Tiruchirapalli. One cannot help wondering if the Press did not become, albeit unwittingly, a party to the government's manoeuvre to disrupt the negotiations over the railway strike.

Questionable Procedure

The coverage of the Prime Minister's mission to Iran by a high-powered team of correspondents accompanying her was far from outstanding. All the ten or so of journalists wrote the same stuff because the sources in Teheran seemed to be limited — to wit, Foreign Secretary Kewal Singh and the Prime Minister's Information Adviser Sharada Prasad. The utility of Press parties accompanying the Prime Minister on such visits is highly questionable from the point of view of coverage. Going by the reports filed from Teheran, it is obvious that the coverage would not have been worse had the Information Adviser filed a daily round-up to be released in New Delhi in the form of a handout by the Press Information Bureau.



However, this kind of junket reporting assignments have attractions other than the purely journalistic ones. Often some of the language newspaper correspondents chosen for the joy rides do not carry with them so much as a cable-bearing authority because if they were to take the reporting seriously the budgets of their newspapers would be shot to pieces by the cable bills! Occasional trips abroad, euphemistically called coverage of VIP visits, are just another of the lollipops dangled before the New Delhi-based corps of special correspondents. The lobbying in the corridors of South Block on the eve of every such visit is certainly not an edifying sight.

The choice of the team this time was marked by some controversy. Those in charge of the selections went about their job in the usual way: choosing the beneficiary first and asking him or her to confront the editor with a *fait accompli* — the 'Prime Minister wants me to go' gambit. This time the editor of *Hindustan Times* rebuffed the government with a stiffly-worded letter. One of his correspondents, who covers neither the Foreign Office nor petroleum and chemicals (oil being one of the main issues expected to come up in the talks in Teheran), had been chosen without the knowledge of the editor. The editor, however, maintained that if his paper was to be represented at all on the Prime Minister's trip it would be for him to nominate the correspondent. Finally, he had his way and nominated the specialist on petroleum and chemicals on his staff. Other editors obviously meekly acquiesced in the lollipop game.

The government, which frets and fumes over big business control of the Press, has no inhibitions about subsidising these newspapers by meeting the expenses of their correspondents on such trips. If a trip by the Prime Minister or the President is considered worth covering, the newspapers and the news agencies should pay for their correspondents. However, almost as a rule, the government has been footing the bill and, in return, securing the kind of coverage it wants. Until a year ago, one used to hear Iran being referred to as a "sub-imperialist" power in government circles, but now the Press is being used to build up a new image of Iran, ruled by a progressive, socialist Shah who will go all out to bale India out of its economic difficulties.

To go by what Inder Gujral has been saying, the newsprint crisis will be with us for a long time. Two recent casualties of the crisis have been the *Times Weekly* (of the *Times of India* group) and the *Sunday World* (of the *Hindustan Times* group). Though both these papers were technically made out to be independent publications, they were for all purposes the magazine sections of their parent dailies. The suspension of these two weeklies might be due to the newsprint shortage, but they had also attracted the attention of the Monopolies and Restrictive Trade Practices Commission.

'Pull line forcing' is the term they use in the United States for the practice of making a consumer buy one product along with another. A reader from Bombay raised the issue of the *Times Weekly* and the *Sunday World* with the MRTP Commission. The Commission has served notice on the two papers that they cannot insist on their readers buying both the Sunday edition and the accompanying magazine as this constituted a restrictive trade practice.

Hidden History of the Sino-Indian Frontier

II—1954-1959

Karunakar Gupta

The negative role of the Historical Division of the External Affairs Ministry in keeping the Government of India and the public completely misinformed about the true history of the India-China border has been a major cause of the continued statemate over the Sino-Indian frontier. Ramsay Muir's dictum, 'bureaucracy is like fire; invaluable as a servant, ruinous when it becomes the master', is applicable to the officials of the Historical Division of the External Affairs Ministry who were able to hamstrung Nehru's original diplomacy which sought to work for a modus vivendi *with China, solving the boundary problems on a compromise basis.*

The official decision to keep the records of the External Affairs Ministry dealing with the Sino-Indian frontier from 1914 to June 1954 out of bounds for independent scholars has helped the Ministry to maintain till today a curtain of ignorance over the true border legacy of the British Raj. The history of the Sino-Indian frontier still remains hidden to most of us.

[The first part of this article, published last week, covered the period 1947 to 1954.]

BEFORE July 1954 there were only a few trouble spots on India's northern frontier. We have already referred to the exchange of several notes between the Nationalist Government of China and the Government of India during the period from 1944 to 1949. These Notes arose out of the Government of India's efforts to push its checkposts in the North-east frontier region from the foothills of Assam towards the vicinity of the McMahon Line. But since the establishment of the People's Republic of China in October 1949 no issues were raised by the Government of China over the persistent efforts of the Government of India to bring the tribal people under the control of the North-eastern Frontier Agency set up in 1950 under the Constitution of the Indian Republic. In the central sector, there was a recurrence of an old dispute in 1951 and 1953 in the Tehri-Garhwal region near Gum-gum Nallah. In 1926, a Boundary Commission consisting of the representatives of Tibet, Tehri-Garhwal and the Government of India had met at Nilang, but no agreement could be reached. There were no disputes in the Kashmir sector, though one of the Chinese armies which marched into Tibet in the fall of 1950 travelled by the Aksai Chin route from Sinkiang to Western Tibet. This is corroborated by Hugh Richardson in his book, "Tibet and Its History", (p 229). "A report on the presence of the Chinese troops in West Tibet and their advance from Sinkiang province was contained in an official despatch from the Government of India's Agent at Gartok, Mr Garpon Marlampa." (*The Statesman*, November 15, 1950). According to S S Khera, "Information about the activities of the Chinese on the Indo-Tibetan border, particularly on the Aksai Chin region, had begun to come in by about 1952 or even earlier. Subsequent events have shown that much of this activity was connected with the opening up of the road through the Aksai Chin region of Ladakh, and along the South Tibetan border towards Central Tibet and Lahasa ... However, no great significance appears to have been attached to the earliest reports of these movements from China into Western Tibet. But by about 1952, and in any case well before the 1954 Agreement, the developments had become too obvious to be ignored." ("India's Defence Problem", p 157.) Upto June 1954, the current Survey of India maps showed the northern as well as eastern boundary as undefined. Also, the future of Kashmir was still uncertain, India being committed to the verdict of an internationally supervised plebiscite, subject to the prior withdrawal of Pakistani armed personnel from its territory. These seem to be the real reasons why the Government of India kept silent for several years, even though they knew about the Chinese presence in the Aksai Chin region. Also they knew that the Head Lama of Ladakh, Kushak Bakola, had warned in June 1952 that Ladakh might seek political union with Tibet "as a last course left to us" [*vide* "The Danger in Kashmir" by Josef Korbel (Revised edition) pp 230, 231 and 233].

From the study of the White Papers published by the Government of India, we find that from July 1954 to July 1958 the protest Notes of the Governments of China and India were concerned with small areas of dispute such as Barahoti, Damzan (both south of the Niti Pass), Nilang area in in Tehri-Garhwal and Shipki Pass in the central sector. These disputes arose just after the signing of the Panch Sheel Agreement over Tibet because of several reasons. In the central sector, the Indo-Tibetan Border Force under the Home Ministry set up new check-posts in the previously disputed areas in accordance with the secret memorandum issued by Nehru in July 1954. The Chinese on the other hand were taking up a survey of the border region in this sector for the first time and, as the new overlords of Tibet, they were prone to support Tibetan irredentist claims in respect of the boundary. But these disputes did not form a part of the conversations between Nehru and Chou En-lai during the visits of the Chinese Premier to India in the winter of 1956-1957. They talked only about the North-eastern section of the Indian frontier. Nehru had discussed the Burma border in a recent letter to Chou En-lai in 1956, presumably because he thought that a satisfactory solution of Burma's northern border on the basis of the McMahon Line would strengthen India's position about the remaining section of the Line. Nehru got the impression that while Chou did not approve of this

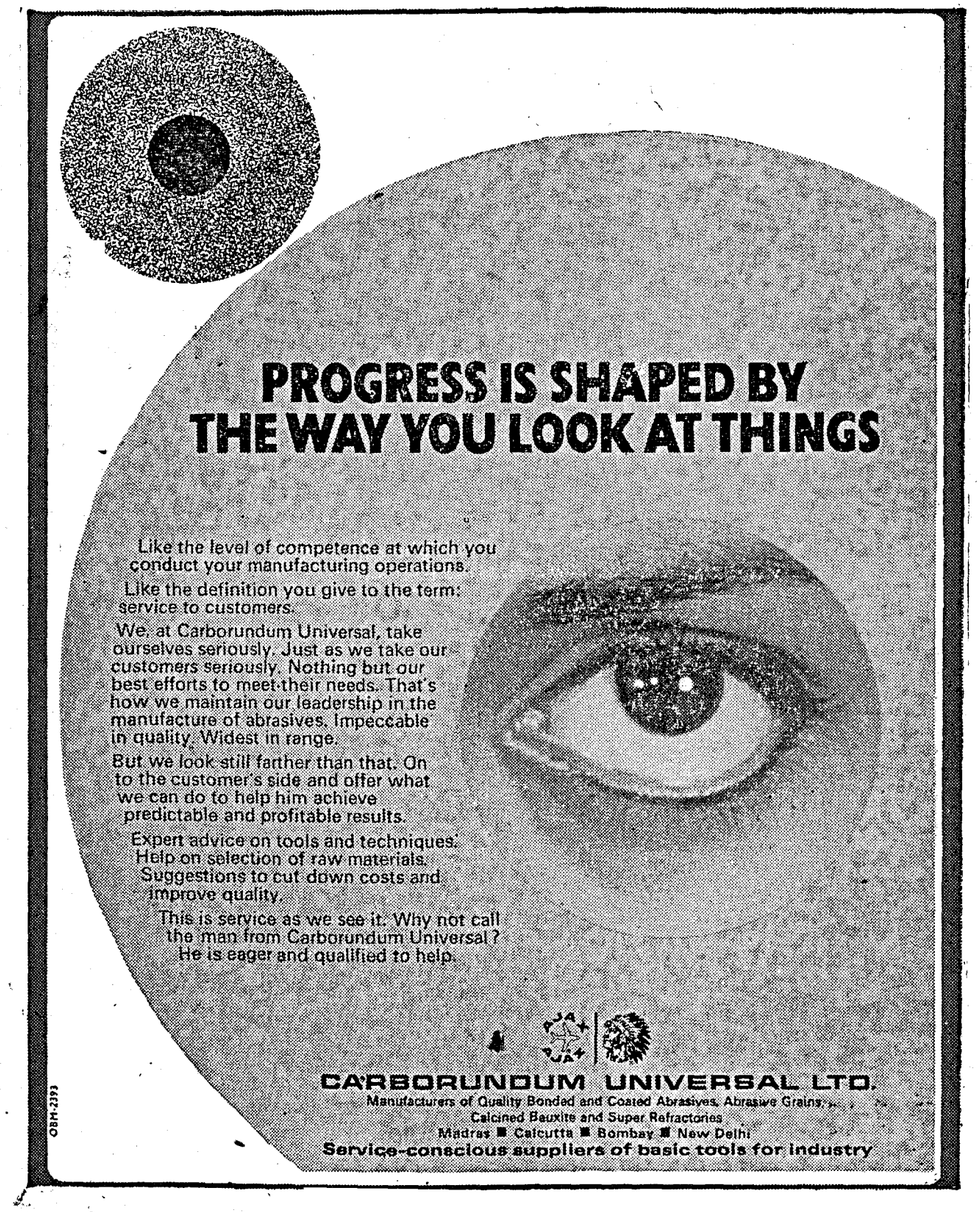
border being called the McMahon Line, he had accepted the McMahon Line border with Burma and that, whatever might have happened long ago, he proposed to accept this border with India also after due consultation with the authorities of the Tibet region "in consideration of the friendly relations between India and China". Nehru did not raise the issue of the Kashmir border. (At a Press conference in Calcutta on December 9, 1956, Prime Minister Chou En-lai characterised the Kashmir question as "an outstanding issue between India and Pakistan".)

On August 21, 1958, the Government of India sent a protest Note to the Counsellor of China in India on the publication of a map of China in the *China Pictorial* of July 1958 on the ground of inaccuracies in the delineation of the Sino-Indian borders. In this Note for the first time objection was taken by the Government of India over large areas of Ladakh, a part of the Kashmir territory disputed between India and Pakistan, being shown as Chinese territory. Before this, there was another minor dispute in regard to the Ladakh region of Kashmir. On July 2, 1958, a Note Verbale was handed by the Ministry of External Affairs to the Chinese Counsellor in India about the occupation of Khurnak fort in Eastern Ladakh by the Chinese troops. On October 18, 1958, the Foreign Secretary of the Government of India handed over to the Chinese Ambassador an informal Note protesting that the Chinese should have constructed a part of the Yehcheng-Gartok road "through indisputably Indian territory without first obtaining the permission of the Government of India and without even informing the Government of India". This letter also made an enquiry about an Army patrol of 15 people and 34 ponies which were out "on normal Patrol" in this area and did not return. The Foreign Secretary referred to these incidents as "petty frontier disputes". On November 8, 1958, the Note submitted by the Indian Ambassador to the Chinese Vice-Minister for Foreign Affairs said, *inter alia*, "It is now clear that the Chinese also claim this area as their territory. The question whether a particular area is Indian or Chinese territory is a matter in dispute which has to be dealt with separately". But Prime Minister Nehru's letter of December 14, 1958 to Premier Chou En-lai which mainly dealt with the border between India and China did *not make any reference to the* Ladakh, *i e*, Kashmir section of the frontier. This *seems to imply* that the letter of the Foreign Secretary dated October 18, 1958 was issued mainly to secure the information and the release of the Army personnel who had been sent to explore the exact location of the Sinkiang-Tibet highway and had been arrested by the Chinese at Haji Langar in the summer of 1958.

According to the IB Chief, B N Mullik, "... enough information was *available about the construction* of the road right from 1951 to 1957, when the road was formally declared open ... All through these years no questions were raised by the Army Headquarters or the Ministry of External Affairs about this road. It was only after the road had been completed and heavy traffic had started plying that some attention was *turned on it* though even then ... it was only considered to be of nuisance value and not one that *affected* our security" ("My Years with Nehru", p 199).

The first Director of the Historical Division, Ministry of External Affairs, K Zachariah, informed the North and North-East Border Committee that during the days of the British Raj the Government of India maps showed *consistently a definite alignment* only in the North-West corner of Kashmir, *viz*, the Gilgit region facing the border of the Russian Empire just beyond the narrow strip of Afghan territory known as *Wakhan corridor*. There were in the main three conceptions of the North and North-Eastern boundary of Kashmir put forward by British officials and cartographers, and explorers at different times:

(1) There was the *John Ardagh Line* showing a boundary alignment which took the crest of the Kuenlun range and enclosed within the British territory the upper reaches of the Yarkand river and its tributaries and the Karakash river as well as the whole of the Aksai Chin plateau. (This was a strategic adaptation of the Johnson boundary of 1865.)



(2) There was the Macartney-MacDonald line (1899), which put forth a less ambitious claim of territory north of the Karakoram range. East of the Karakoram Pass, it left to China the whole of the Karakash Valley and almost all of Aksai Chin proper. It followed the Lak Tsang range which left on the Indian side the Lingzi Tang salt plains and the whole of the Chang Chenmo Valley, as well as the Chip Chap river further north.

(3) Then there was the Karakoram Line, which was based on the watershed principle. (The Map of India attached to the Report of the Indian Statutory Commission Volume I shows the Karakoram alignment depicting the North and North-east boundary of Kashmir.)

Scanning the Survey of India maps during the last decade before Independence, we find that the Map of India (showing Provinces, States and Districts; scale 1 inch to 70 miles) published in 1938 failed to show any boundary line or colour difference along the wide region between Kashmir and Sinkiang/Tibet. Since 1945, however, though the North and Eastern boundary of Kashmir were shown as 'Undefined', an attempt was made by means of a colour-wash to convey a vague idea, of the North and Eastern boundaries of Kashmir more or less in conformity with the Ardagh line in the region east of the Karakoram Pass. (This change was made apparently at the initiative of Olaf Caroe, who was then the Foreign Secretary to the Government of India. This practice was followed in regard to Maps showing the North and Eastern boundaries of Kashmir, which were current till June 1954.)

Claim by Erasure

In the new map of India issued in July 1954, the words 'Boundary Undefined' were erased, and by this simple process the Survey of India maps laid claim to a boundary alignment of Kashmir east of the Karakoram Pass akin to the John Ardagh Line, including the whole of Aksai Chin and reaching the Kuenlun Mountain in the north-east. Though in his circular of July 1954 to the Ministries of External Affairs, Home and Defence, Nehru ruled that "the northern border should be considered a firm and definite one which was not open to discussion with anybody", no action was taken to push the checkposts to the forward areas in the Kashmir sector, as was done in the middle and eastern section of the Northern boundary. Regarding the setting up of checkposts in the Aksai region, "The Army's attitude was that they could send an occasional patrol but they were in no position to open and hold any posts in this area ... it would be difficult to oust the Chinese from this region. In any case, the army was in position to make that effort be-

cause of the limited resources available at Leh and of the non-existence of any road communication from Leh to these parts" (B N Mullik, "My Years with Nehru", p 201).

It appears that the Government of India's unilateral decision in July to issue new maps of India with a well-defined Northern boundary incorporating a version of the John Ardagh Line in the Kashmir sector east of the Karakoram Pass was primarily meant to provide a bargaining counter in boundary negotiations with China which were inevitable at some future date. It is significant that even in August-September 1959 when Nehru had to face an angry Parliament in the context of the concurrent leakage about the border clash at Longju and the construction of the Chinese highway through Aksai Chin, Nehru maintained a pliant attitude about the exact location of the frontier in the Ladakh region while asserting a firm claim about the McMahon Line all along. On August 28, 1959, Nehru said, "This was the boundary of the old Kashmir state with Tibet and Chinese Turkestan. Nobody had marked it ... But after some kind of broad surveys, the then Government had laid down that border which we have been accepting ... the Aksai Chin area is an area about some parts of which ... it is not quite clear what the position is". On August 31, 1959, Nehru said, "The position in Ladakh is different from the position in the North-Eastern Frontier Agency ... the Ladakh border was for these long years under the Jammu and Kashmir State and nobody knew exactly what was happening there although some British officers went a hundred years ago and drew a line and the Chinese did not accept that line. The matter is clearly one for consideration and debate ...". Nehru spoke in the same vein about the border of Ladakh in Parliament on September 10 and September 12.

Nehru's Directive Disregarded

Neville Maxwell quoted an official directive issued by Nehru on September 13, 1959 which also reveals his desire for a compromise settlement in the Ladakh sector of the boundary. "... (d) The Aksai Chin area has to be left more or less as it is as we have no checkposts there and practically little of access. Any questions in relation to it can only be considered when the time arises, in the context of the larger question of the entire border. For the present, we have to put up with the Chinese occupation of this north-eastern sector [of Ladakh] and their road across it ..." ("India's China War", p 130).

In the original draft resolution of the Working Committee of the Congress Party drafted on September 25 for the AICC session held in Chandigarh (September 25-28), there was reference to "the recent developments on the North-East frontier of India" only, there being no specific reference to the Ladakh region. This was objected to by many members of the AICC and the resolution was suitably amended. From this report published in the *Hindu*, September 28, 1959, we can presume that the Congress High Command also was not sure about the Indian claim on Aksai Chin.

In spite of Nehru's directive of September 13, prohibiting further movement in the Ladakh region, the Indo-Tibetan border force under the Home Ministry was involved in a clash with the Chinese border force near the Kongka Pass on October 21, 1959, in which nine Indian policemen lost their lives. This incident marked a critical point in the Sino-Indian frontier dispute, which hamstrung Indian diplomacy by rousing public anger to a boiling point. On October 23, 1959, the Ministry of External Affairs submitted a Note to the Chinese Ambassador in New Delhi protesting against the "sudden and aggressive firing by Chinese forces in the region of the Kongka Pass" and "intrusion by Chinese troops into an area which is part of Indian territory". This Note claimed that this area was about 40 to 50 miles west of the traditional Sino-Indian frontier which had been shown in official Indian maps. However, from the testimony of Karam Singh, the Commander of the Indo-Tibetan border forces which clashed with the Chinese patrols near the Kongka Pass, it appears that one Sharma, Deputy Director in the Ministry of Home Affairs, gave him instructions to establish new checkposts in forward areas in Ladakh on September 22, 1959. (*Vide* White Paper III, p 14.) This shows that some officials of the Home Ministry and its underlings, such as the Indo-Tibetan border force as well as the Intelligence Bureau, were nonchalantly flouting the directive of Nehru dated September 13, 1959, prohibiting forward movement of patrols in the Ladakh sector and that this led to the critical Kongka Pass incident of October 21, 1959. B N Mullik writes, "On October 23, when the facts of the outrage came to be known, the Prime Minister held a meeting which was attended by the Defence Minister, the Chief of the Army Staff and officers from the Ministries of External Affairs, Home and Defence ... The Intelligence Bureau was made the common target by the Army Headquarters and the External Affairs Ministry and accused of expansionism and causing provocation on the frontier ... The Army demanded that no further movements of armed police should take place on the frontier without their clearance ... the Prime Minister had to give in to the Army's demand. The result was that the protection of the border was thereafter handed over to the Army and all operations of armed police were made subject to prior approval of the Army command ..." ("My Years with Nehru", pp 243-44). Thus we have B N Mullik's own testimony to show that while the Government of India publicly accused China of unprovoked aggression at the Kongka Pass, within the inner conclave of the Government the blame for provocation and aggression was squarely laid on the Intelligence Bureau.

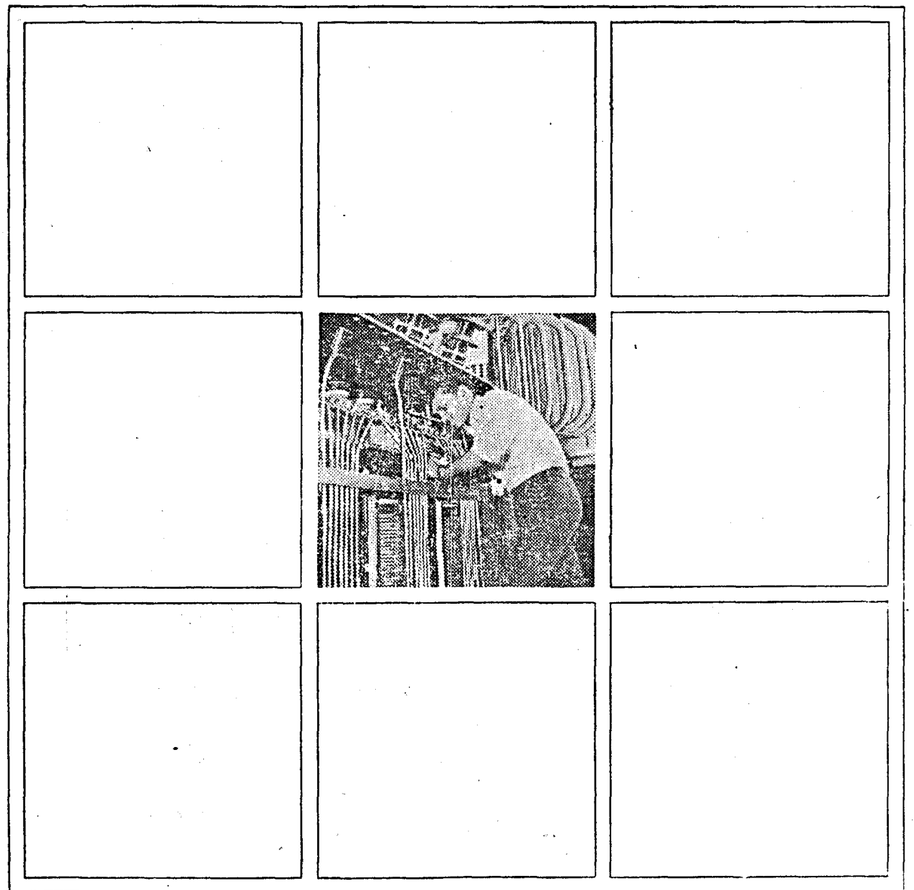
Rigid Attitude

It was after November 1959 that Nehru took a rigid attitude about India's border claims in the Kashmir sector. The Note of the Ministry of External Affairs to the Embassy of China dated November 4, 1959 described in detail for the first time the boundary claimed by the Government specially in the section eastward from the Karakoram Pass. "From the Karakoram Pass this boundary proceeds north-east *via* Qara Tagh Pass and then follows the Kuenlun range from a point 15 miles north of Haji Langar to Peak 21250 (Survey of India Map) which lies east of Longitude 80 east." This Note also made a strange assertion that "This line constitutes the watershed between the Indus system in India and the Khotan system in China", while according to authoritative opinion, the Karakoram Mountains, which extend south-east of the Karakoram Pass, form the watershed between the Indus system and the Khotan system. The famous Swedish explorer Sven Hedin, Owen Lattimore, The Imperial Gazetteer, Volume XV (1908), Chambers Gazetteer (1962) and and Columbia Encyclopedia (1963) agree on the Karakoram Mountains as the main water divide in this region. In early November 1959, the Historical Division of the External Affairs

in this sector also, as a part of the overall settlement of the boundary problem which would involve Indian recognition of the Chinese claims in the Aksai Chin area ensuring the security of the Sinkiang-Tibet highway.

MISINFORMED BY HISTORICAL DIVISION

K P S Menon has been the most knowledgeable person among the Indian diplomats since the days of the British Raj and he was speaking with unchallengeable authority when he made the following remarks in his address at the Convocation of the Indian School of International Studies, New Delhi, on December 13, 1969 referring to Chou En-lai's offer to recognise the McMahon Line in lieu of Indian recognition of Chinese claims in the 'disputed' Aksai Chin area. "I deliberately say 'disputed', because maps, treaties, agreements, and other documents on which both sides rely cannot be said to place the boundary, as conceived by either party, beyond the region of doubt or the need for negotiation. The watershed principle, on which we have heavily relied in other sectors of the frontier, is in the Aksai Chin area not in our favour. Moreover, it cannot be forgotten that Aksai Chin is of no importance to India, whereas to China, it is of the utmost importance because it is the link between two historically troublesome regions, Tibet and Sinkiang" ("The Sixties in Retrospect", page 12). The disputed nature of the Aksai region, as we know, was admitted by Nehru himself in several speeches in Parliament in August-September 1959. The official Note submitted by the Indian Ambassador G Parthasarathi to the Chinese Vice-Minister for Foreign Affairs in Peking on November 8, 1958 includes the following reference to the Aksai Chin area: "It is now clear that the Chinese Government also claim this area as their territory. The question whether a particular area is Indian or Chinese territory is a matter in dispute" ("White Paper 1954-1959", p 29). This was also a recognition of the disputed nature of the Aksai Chin area.



But as we have seen, the Historical Division of the Indian External Affairs Ministry misinformed our Government about the true legacy of the British Raj in regard to our border claims in the Western sector. In the case of the Eastern sector also it failed to do its homework and find out the spurious nature of the "Aitchison's Treaties" (Volume XIV) 1929 relating to Tibet, which Olaf Caroe fabricated in 1938 to falsely assert that the Simla Convention covered both the Sino-Tibetan and the Sino-Indian boundaries and to confirm that the McMahon Line was a legal boundary. [If it had simply cared to look into the Aitchison's Treaties (Volume XII), 1931, relating to Assam (p 100) it would have seen that the Tawang tract in at least its northern reaches was under Tibetan administration during the days of the British Raj.] In the case of the Western sector, it completely ignored the Aitchison's Treaties relating to Kashmir (Volume XII, Part I, p 5) 1931, which says, "The northern as well as the eastern boundary of the Kashmir State is still undefined". The way in which the Historical Division of the External Affairs Ministry twisted the content of the letter of March 14, 1899 written by the British Minister in Peking C M MacDonald to the Ministers of the Tsungli Yamen (Chinese Foreign Office) giving the boundary proposal for Kashmir — later known as the Macartney-MacDonald line — was disingenuous. (This important document relating to the Indian border claims in the Kashmir sector was misquoted in the following important official communication made by the Government of India during 1959-1961: (1) Nehru's letter to Chou En-lai dated September 26, 1959; (2) Letter to the Editor, *The Times* (London), entitled "China-India Border Dispute" written by M A Husain, Acting High Commissioner for India published on November 27, 1959; (3) "Report of The Officials of the Governments of India and The People's Republic of China on the Boundary Question" (Ministry of External Affairs, Government of India February 1961), p 55 of the Report of the Indian Officials.

The Historical Division of the External Affairs Ministry also appears to be responsible for the misrepresentation that the adaptation of the John Ardagh Line east of the Karakoram Pass — as shown in the Survey of India maps since July 1954, represents the watershed between the Indus system in India and the Khotan system in China. If the officials concerned had done their homework, they would have noticed that in "The Imperial Gazetteer of India" (1908), Volume XV, p 84, there is the following quotation about the watershed in that region: "The Karakoram range is of a far more complicated character. Broadly speaking, it is a continuation of the Hindukush, and forms the watershed between the Central Asian drainage and the streams flowing into the Indian Ocean."

The negative role of the Historical Division of the External Affairs Ministry in keeping the Government of India and the public completely misinformed as to the true border legacy has been a major cause of the continued stalemate over the issue of the Sino-Indian frontiers. Ramsay Muir's dictum, "Bureaucracy is like fire — invaluable as a servant, ruinous when it becomes master", is applicable to the officials of the Historical Division of our External Affairs Ministry, as they were able to hamstring Nehru's original diplomacy of working for a *modus vivendi* with China and solving the boundary problem on a compromise basis. An official decision to keep the records of the External Affairs Ministry dealing with the Sino-Indian Frontier from 1914 to June 1954 out of bounds for independent scholars has helped them to maintain till today a curtain of ignorance on the true border legacy of the British Raj, and the history of Sino-Indian frontier still remains hidden to most of us.

Enamelled Wires

ENAMELLED WIRES, founded in 1959 and licensed at present for manufacturing super enamelled copper wires and aluminium round wires upto 420 tonnes per annum and wire enamels upto 120 tonnes per annum for captive consumption, is now increasing capacity for production of super enamelled copper wires to 720 tonnes, paper covered wires and strips to 360 tonnes, wire enamels upto 720 tonnes, varnishes upto 160 tonnes, and synthetic resins upto 180 tonnes per annum. The new factory is being located at Tarapur near Bombay. Trial production is expected to commence in August or September and full production is to be in about three months thereafter. The project, estimated to cost Rs 145 lakhs, is intended to be financed by additional share capital (Rs 52 lakhs), internal generation (Rs 18 lakhs), and borrowings from SICOM and MSFC (Rs 75 lakhs). The public was offered 3,60,000 equity shares, of Rs 10 each, at par under a prospectus. During 1973, the company's sales amounted to a crore of rupees. In the first year of production on expanded capacity, sales are expected to go up to Rs 312 and to rise steadily to Rs 862 lakhs in the fourth year. On this basis, the company expects to pay a dividend at 12 per cent out of the earnings of the first year and to raise it to 15 per cent for the second and 25 per cent for the third year.

The specialist stands alone.

The specialist is not content with mediocrity. He remains immersed in his lonely search for perfection. Like we are, with transformers. □ This is the surest way of creating confidence in a basic product that industry and agriculture must depend upon. Transformers. And we make the most reliable range, to the designs of Siemens – a rare combination of proven skill and technical prowess. BHARAT BIJLEE LTD.

WITH THE ACQUISITION OF THE FOURTH BULK CARRIER SST ENTER PHASE II

SST, conscious of their role in the National Economic Development through adequate provision of transportation facilities, keeping in view India's dynamic and ambitious 5th Five Year Plan, completed Phase I in June 1973 with the acquisition of 3 ships:
m.v. SATYA KAMAL 27,174 DWT;
m.v. SATYA PADAM 19,710 DWT;
m.v. SATYA SOHAN 19,861 DWT;
thereby, adding 66,745 DWT to Indian Merchant Shipping.
In October 1973, SST pledged a Four Fold Expansion Scheme to help achieve the target set for the 5th Five Year Plan.
SST, now enter PHASE II with the acquisition of m.v. SATYA KAILASH of 75,350 DWT (Ex. "Gallic Bridge",) thus more than doubling the fleet in terms of carrying capacity, in less than 12 months.
SST reaffirm their pledge to serve the nation unceasingly with maximum contribution to the national endeavour.

TRYST WITH DESTINY
"Long years ago we made a tryst with destiny, and now the time comes when we shall redeem our pledge....."
—Jawaharlal Nehru.

SATYA KAILASH, the largest Bulk Carrier presently on the Indian Register.

Our Golden Goddess buys Indian

She is our Golden Goddess because she buys our Indian handmade carpets —worth millions in dollars, pounds and marks each year.

This is a Kashmiri Prayer Rug and is known world-wide for its weaving expertise and ancient craft. Last year Dodsal, India's leading exporter of handicrafts, sold Indian carpets worth Rs. 94 lakhs. Dodsal's world-wide export network is proud to be serving the craftsmen of India to successfully enter the most sophisticated markets of the world.

The lovely weaves of the Kashmiri carpet was introduced to India by Prince Shahi Khan of Sikandar in the 15th Century. By the 19th Century Kashmiri carpets won many distinctions and prizes. By the 20th Century their Oriental and Persian designs were winning many hearts abroad and earning foreign exchange for the nation!

Shri B. S. Gupta,
leading manufacturer,
whose carpets we export.

Over to the Police

THE nation-wide strike of railway workers will rank as a landmark in the government's backward march from the pseudo-socialist slogans of 1969. The Defence of India Rules and the Maintenance of Internal Security Act, indefinite detention without trial, police violence and even arranged murders have become stock weapons against political elements inconvenient to the government. The railway strike has seen the use of some of these weapons against organised labour on a scale hitherto unknown. What leaves one aghast is the calculated cold-bloodedness with which the operation has been conducted. There can be no pretence that the intensity of the repression has increased in response to provocations from the other side. In this case, the provocation and the repression have both come from the same side — the government's. Beginning with the use of the DIR to pronounce the strike illegal and the sudden arrest on May 2 of over 300 leaders of railway workers, including some members of the National Co-ordinating Committee for Railwaymen's Struggle, even as negotiations were going on between the government and the Committee, the government's actions have followed what is, quite obviously, a carefully predetermined course.

In a little over two weeks, more than 20,000 persons have been arrested, most of them under DIR and MISA. Railway workers have been thrown in jail simply for not reporting for work. Others have been arrested for no more than attending meetings in support of the strike. More active support for the strike has, of course, become a grave crime. The police and the paramilitary forces like the Border Security Force and the Central Reserve Police have been systematically terrorising the railway workers. Houses of workers have been raided in the dead of night by armed policemen and workers offered, at gun-point, the choice between returning to work immediately or being arrested on the spot. Large numbers of workers have been thus forced to go into hiding, which has turned the wrath of the government against their families, especially those living in railway colonies.

Three Members of Parliament who visited the Tughlakabad railway colony in Delhi found "the spectacle of a deserted town in war-time". In a statement they have said, "the entire male population of the colony is in self-imposed exile, following attempts by the police to hunt out railway employees and take them to places of work at the point of the bayonet". A report from Mughalsarai gives some idea of what the railway workers and their families have had to go through: "Scores of women residing in a railway colony on the outskirts of this town gheraoed the divisional mechanical engineer today [May 14] to register their protest against alleged police excesses. They dispersed only when women Home Guards were called in ... The residents alleged that a large contingent of BSF personnel and policemen surrounded the colony in the early hours and conducted a door-to-door check for striking employees ... The wife of an employee showed newsmen the smashed doors of her flat and alleged that a group of policemen forced their way into it and took away her husband who is on strike. Tears rolling down her cheeks, another woman complained that some policemen had not only misbehaved with her but also hit her two-year old child on the head. Meanwhile large contingents of the BSF, the CRP and the RPF continue to be posted in various railway colonies" (*Times of India*, May 15).

Many railway colonies all over the country have had their water and electricity supplies cut off since the beginning of the strike. Families of workers on strike have been forcibly evicted from their quarters. A report from New Delhi says: "Large-scale eviction of families of striking railway employees from the staff quarters has become the talk of the town ... The railway authorities have pasted eviction notices on 353 staff quarters in various colonies. The families have been given 12 hours to vacate the quarters or face eviction by the police ... Neighbours of the evicted families said police did not even allow them time to take out their belongings ... The evicted families have shifted to unknown places, as the neighbours and others in the colony were terrified to provide them temporary shelter in their quarters" (*Hindustan Times*, May 17). The terror-stricken atmosphere in railway colonies is described in this report from Bombay: "A knock on the door of a tenement these days strikes fear in the hearts of residents of railway colonies in Bombay. Wives and grown-up children of the striking railway employees are in a disturbed state of mind. The wife of a guard in the Parel colony told this reporter she had been keeping awake every night since the strike began. Starting from the early hours of the morning police vans fitted with loudspeakers enter the colonies at least three times a day, the residents stated. The high-pitch announcements that the strike is illegal and the strikers will lose their jobs are follow-

ed by arrests of the employees in their homes. When this reporter visited two of the colonies on Monday [May 13] he found that most of the employees were not at home. Their wives and children were hesitant to open the doors" (*Times of India*, May 14).

Given this overwhelming reliance on use of terror to cow down the workers, it is not surprising that the initiative in dealing with the strike has passed from the railways to the police. This is in keeping with the trend of growing dependence of the government on the police to sustain it in power. If despite the unrestrained use of the police, the railway workers have been able to keep the strike going for so many days, the reason is not that they were particularly well organised for the strike or that they have received any extraordinary support from the opposition parties. It is the desperate economic condition of the workers — the cumulative result of continuously and sharply rising prices, acute shortages of the basic necessities of life and growing unemployment — which has made them unsuspectedly resilient and militant. Recent trends in government policy point to a further worsening of the economic crisis — continued erosion of resources available for investment, further distortion of the distribution of income in favour of the better-off sections and of the pattern of investment in favour of non-essential items, breakdown of even the existing highly inadequate public distribution system for foodgrains, an even freer hand to trade and industry to boost prices by speculative hoarding and output restriction and, therefore, a continuation of the inflationary spiral. The prospect, therefore, is of a mutually reinforcing process of growing mass discontent and growing mass repression. As she retires to the cool of Srinagar this weekend, the Prime Minister would do well to ponder the implications of this for the political system over which she presides.

Tarapur Atomic Power Plant

Falling Apart

THE Annual Report of the Department of Atomic Energy for 1973-74 indicates, for the first time, that a great deal is wrong with the Tarapur atomic power plant. To quote from the Report:

"The output levels of both units [of Tarapur] had to be deliberately restricted, principally on fuel considerations. In Unit I, significant fuel defects are suspected to have occurred, probably as a result of extensive thermal and pressure cycling during the June-July series of reactor scrams resulting from transmission lines problems. These defects result in activity releases which have to be stringently controlled by restricting power levels. The output of Unit II on the other hand had to be kept low to postpone its refuelling until early February in response to urgent requests from the grids, particularly from the Gujarat Electricity Board. The refuelling should have normally been undertaken in November/December 1973. Another reason contributing to occasional restrictions on output was leaks in condensors."

The tentativeness of some of the statements in the above passage reflects rather more than the customary bureaucratic proneness to caution and understatement. For, it appears that the Tarapur authorities themselves have been unable to diagnose in detail the problems of the power station and to pin-point their causes. The reason for this has to be traced back to the planning of the Tarapur project and the place assigned to it in the power systems of Gujarat and Maharashtra.

The Tarapur reactor was planned as an integral, and vital, part of the Maharashtra and Gujarat power grids. These grids have been planned on the basis of 80 per cent load factor on Tarapur. As a result, if Tarapur is out of action there is a sharp cut in availability of power in the two grids which cannot be made up from any alternative source. Inevitably, therefore, there has been enormous political pressures — which is reflected in the statement from the Atomic Energy Department's Annual Report, about postponement of refuelling of Unit II, quoted above — to keep the Tarapur plant operating at any cost.

The cost of this flogging has been very heavy. When there has been a failure, instead of investigating it in detail, the project authorities have been forced to patch up the defect in an *ad hoc* manner and restart the power station at the earliest. Very often the result has been another related failure, followed by another hurried patch-up. The chain has gone on lengthening. The area of ignorance about the problems of the reactor has expanded while the entire system has deteriorated rapidly.

Both the units of the reactor have scrammed dozens of times. Though the statement quoted above blames, "transmission lines problems" for the scrams in June-July last year, the fact is that in most cases it has not been possible to identify the precise cause of scramming. Even where the immediate situation in which the scramming has occurred is known, it has not been possible to trace the sequential chain of happenings to the basic cause. As a result, the reactor system has aged rapidly, with leaking valves and joints, clogged pipes, corroded equipment and bewildered operators. Transformers get burnt, feeder lines trip, steam mains burst, instruments behave erratically. Yet the slogan has been: 'run the plant at any cost'.

Tarapur being a nuclear power plant, there is another aspect to this neglect of plant maintenance: the rise in the level of radioactivity and the grave danger posed by it. Radioactivity levels inside the station and the nearby areas are already excessive and the regular leaks ensure a continuous rise in these levels. Waste management has been haphazard. Personnel at the site and in Bombay having been exposed to very high levels of radiation, workers have had to be brought from the Rajasthan and Madras atomic power projects and even from the Neyveli Lignite Corporation to work in high radiation areas. The periodic reports on the health aspects of Tarapur, prepared by the concerned division of the power station, have persistently drawn attention to the high and rising levels of personnel radiation and to instances involving deviations from and violations of technical specifications of the plant. It has also been pointed out that often personnel have been authorised to receive very high doses of radioactivity. There have been known cases of fatalities in the last year and a half from radiation-induced cancer. Because of the pressures generated by the directive to keep the plant in operation, often even major accidents have had to be hushed up.

Both for the future of the power plant and for human safety, it is imperative that Tarapur is allowed a long enough shutdown for thorough investigation and rectification of defects and modification of systems. This will involve requiring Maharashtra and Gujarat to do without power from Tarapur for a long period, extending perhaps even upto a whole year. Clearly, this is possible only if a decision is taken at the highest level in the Central government.

Because of the disorganisation of postal services, Calcutta Diary and Capital View do not appear this week.

Monopolies

Growth with Government Blessings

THE Monopolies and Restrictive Trade Practices (MRTP) Act was brought into force in June 1970 with much fanfare. The objectives sought to be achieved through the Act were nothing if not pompous; they were traced to by now almost forgotten Directive Principles of State Policy which, *inter alia*, enjoin the government to ensure that the ownership and control of the material resources of the community are so distributed as to subserve the common good and that the operation of the economic system does not result in the concentration of wealth and the means of production to the common detriment. The objectives set out in the preamble to the Act ran along parallel lines: to ensure that the operation of the economic system does not result in the concentration of economic power to the common detriment, to control monopolies, to prohibit monopolistic and restrictive trade practices.

The need for the enactment arose out of not hypothetical possibilities but incontrovertible evidence of the existence and rapid growth of concentration of economic power and of monopolistic tendencies, as shown by R K Hazari's study, by the Monopolies Enquiry Commission Report and, more comprehensively, by the Dutt Committee Report. A series of distortions in the working of the entire industrial licensing system had come to light, such as the lack of any clear industrial priorities, concentration of industries in a few large industrial houses, pre-emption of industrial licences and cornering of large funds from the term-lending institutions. These were some of the tendencies which the Monopolies and Restrictive Trade Practices Commission, established under the MRTP Act, was intended to check.

In the four years from 1970 to 1973 a total of 12,096 applications for industrial licences were received by the government. Of these, those falling within the purview of sections 21 (substantial expansion) and 22 (establishment of new undertakings) of the MRTP Act numbered no more than about 400, from the enforcement of the Act in June 1970 to November 1973 (50th Report of Estimates Committee on Industrial Licensing and Annual Report for 1973-74 of the Ministry of Law, Justice and Company Affairs). These 400 applications pertained to the 917 undertakings registered with the government — 803 as inter-connected undertakings having assets worth Rs 20 crores or more and 114 as dominant undertakings having singly or jointly assets of the value of not less than Rs 1 crore. Against the Dutt Committee's finding of a disproportionately large share of all industrial licences having been cornered by the large industrial houses, the figure of 400 applications from large houses and dominant undertakings out of a total of 12,000 applications is unbelievably small.

The reason for this is obvious. The provisions of the MRTP Act with regard to registration have been applied so legalistically and restrictively that a large number of inter-connected undertakings have evaded registration. A couple of examples will make this clear. According to the Dutt Committee Report, Birlas as a large industrial house had in 1966 203 concerns directly under them and another 73 second-tier concerns, making a total of 276. Against this, as revealed in the government's reply to a question in Parliament, only 45 undertakings belonging to the Birlas have been registered with the government as inter-connected undertakings. Likewise the Dutt Committee identified 70 inter-connected undertakings directly belonging to the house of Tatas and 14 second-tier ones. However, only 25 of them have been registered with government as inter-connected undertakings under the MRTP Act. With so few undertakings belonging to the large houses registered with the government, it is not surprising that the number of applications for industrial licences falling within the purview of the MRTP should bear little relationship to the actual number of applications made by the large houses.

The story of the government's contempt for the objective of curbing the concentration of economic power does not end there. Even out of the 400-odd industrial licence applications deemed to fall within the purview of the MRTP Act according to the government's highly restrictive judgment, only 32 have been referred to the Monopolies Commission for detailed inquiry. The rest have been disposed of by the government without reference to the Commission. After the establishment of the Commission, the Birlas have got about 20 licences in respect of just the 45 registered inter-connected undertakings and Tatas about 12 in respect of the 25 registered inter-connected undertakings.

There is no apparent logic behind the government's decision to refer or not to refer to the Monopolies Commission particular cases pertaining to the large houses. As the Commission itself complains in its Annual Report for the year 1972, "As against 22 references received in 1971 only 10 references were received in 1972. The Commission has, however, observed that a number of cases of large magnitude and importance to the economy were decided by the Central government without reference to the Commission ... the Commission is not able to understand the policy which is being pursued in this respect. The Commission cannot help feeling that there is some incongruity in that sometimes cases not involving any major issues are referred to the Commission while others, which would *prima facie* involve important considerations, are not referred." The present chairman of the Commission, Justice J L Jain, confirmed the general impression about the irrelevance of the Commission when he said in his speech to the Madras Company Law Study Circle in November last year that "the Commission plays even a less important role than what the Act envisages". He was rebutting the criticism that the MRTP Act had impeded industrial growth. Also referring to this criticism, H K Paranjape, a member of the Commission, said at the same meeting: "people give us too much credit ... We are not that effective because the number of cases covered by the MRTP constitutes a very small part of total industrial growth".

This is entirely true. Only 4 per cent of the industrial licence applications come under the provisions of the MRTP Act as restrictively interpreted by the government. Of these 4 per cent less than 10 per cent are referred to the Monopolies Commission. And, as the Chairman of the Commission stated at the Madras meeting, of the number of proposals referred to the Commission, those rejected form less than 10 per cent.

In the circumstances, even a cursory cost-benefit study of the Monopolies Commission and the attendant paraphernalia can lead to only one conclusion: disband the Commission and scrap the Act. As things are, the ex-

istence of the Act and the Commission only serve to foster the totally false impression that the government is concerned about checking the growth of the large business houses and the concentration of economic power.

Government and FICCI

United We Stand

THE government's version of the railway workers' strike has certainly not suffered for want of publicity. The government has fully exploited its control over All-India Radio to retail all manner of lies and half-truths to discredit the strike while almost completely shutting out news and views favourable to the railway workers. The propagandist nature of the AIR's coverage of the strike has been so blatant that even its own employees have been driven to protest against it. In addition, the railways have spent tidy sums of public funds to pay for the clumsily-written advertisements condemning the strike and holding out veiled threats to workers which have been appearing in newspapers all over the country. In the regular news coverage of the Press too the government's side of the story has received many times the prominence that has been given to the other side. With so much propaganda on behalf of the government, the modest-sized advertisements in the newspapers calling upon "citizens" to "help the nation meet the challenges" would not have deserved any notice but for the fact of their being sponsored by the Federation of Indian Chambers of Commerce and Industry.

The FICCI must know that its advertisements can have no startling impact on the state of public opinion about the railway strike. In fact, some parts of the advertisements sorely strain the reader's credibility. For instance, most people will ask whether the appeal against hoarding should not be more appropriately directed at some of the pillars of the FICCI itself than at ordinary "citizens". However, the FICCI's purpose in publishing the advertisements is perhaps very different — *viz*, to publicly affirm that in the difficult situation created by the strike of railway workers, the FICCI stands solidly by the government.

Not, of course, that anyone expects the FICCI to take the railway workers' side. But what is significant is the *public* affirmation of camaraderie with the government. There was a time — not as long ago as it now seems — when this sort of demonstrative show of affection would have acutely embarrassed the government and would have been, for that reason, carefully avoided by the FICCI. Those were the days of 'garibi hatao', of nationalisation of banks, of promises to curb the predatoriness of the large business houses. These are different times. The wholesale trade in wheat has been returned to private traders; the supposedly enormous potential of the large houses for contributing to production and growth stands fully revealed to the government; the Monopolies and Restrictive Trade Practices Commission and other irritants are, therefore, being put out of the way; price controls on a variety of commodities are being liberalised or removed altogether; industrial licensing and other controls on investment are being relaxed beyond the hopes of even industrialists and businessmen.

Spokesmen of private industry and trade have always been pressing for these changes in policies. It is, therefore, understandable that the FICCI should exude a feeling of warmth towards the government. The close rapport between the two was evident at the FICCI's last annual conference in April at which the Federation's outgoing president hailed the government's decision to abandon state trading in foodgrains as demonstrating "the highest level of political and economic confidence" of which only a "fearless and national-minded leadership" could be capable.

Surely, faced with something like a nation-wide strike of railway workers, this "fearless and national-minded leadership" deserves the public support of the FICCI. The Prime Minister will be duly grateful.

Rags Scandal

Guarding the Guards

THERE are reports once again of a rags scandal — interestingly enough, a couple of months before the monsoon, exactly as happened last year. The seasonality of recurrence of the rags scandal can perhaps be attributed to the anxiety of the importers that the so-called rags piled up with the port trust authorities, unless cleared before the rains, will get completely spoiled. The controversy arising out of the importers' hurry to get the rags cleared and the allegedly 'non-co-operative' attitude of the customs authorities in clearing the goods without appropriate scrutiny has drawn attention to the fact that in the name of rags good quality woollen and synthetic garments continue to be clandestinely imported.

That such imports were taking place had been known for long, but the trade grew in volume after the State Trading Corporation entered the field as the canalising agency. Before the STC's entry, the so-called rags trade was going on smoothly as the private importers had established the necessary rapport with the customs authorities. Besides, the volume of trade was small enough to be manageable. As a public sector agency, the STC entered the rags business in a bold way, confident of receiving favoured treatment from the customs. The report of the Kaul Committee on foreign exchange leakages has pointed out how customs authorities are more lenient in dealing with the STC which, being a public sector agency, is deemed to be above suspicion. However, when some of the customs officials got an inkling of the shady transactions by some STC personnel, they understandably wanted a share of the takings. The understanding worked out between the STC and the customs did not apparently function smoothly. As a result, news of the import of garments as rags was leaked out. Another factor which contributed to the exposure was that the so-called rags flooding the markets in different parts of the country hit the sales of Indian manufacturers of woollen goods in a big way.

Despite the exposure of the scandal, the import of rags continued for some more time because the business was a highly profitable one yielding a return of as much as 200-300 per cent on the import costs. Finally, at the instance of the government, a procedure for stopping misuse of the rags import facility was introduced by the customs. Under this arrangement, the customs were to ensure that only genuine rags were imported and that garments in usable condition would be mutilated under the supervision of the customs before they were handed over to the importers. The customs, hand in glove with STC officials, interpreted this directive according to their convenience in many cases. What is considered a rag in such countries as the USA or Australia is very much a usable garment. Once it was certified as a rag at the point of shipping, the customs could make that the ground for clearing the goods.

Since the malpractice continued to grow, the government was forced to altogether suspend the import of rags. It is reported that the CBI probe into

the scandal yielded interesting details about the involvement of both STC and customs officials. The CBI found several instances where the customs had cleared rags in violation of specific departmental instructions that wearable garments should be passed only after mutilation or under bond for mutilation. Of the 18 cases of preliminary enquiry gone through by the CBI, nine were made regular cases. The CBI recommended prosecution of one gazetted officer and one non-gazetted officer of the customs. It also recommended major penalties through departmental action against eight gazetted officers and one non-gazetted officer. It is not known whether these recommendations of the CBI have been carried out, but several customs officials were transferred away from Bombay, the major importing port for rags.

Despite all this, the government decided to resume import rags about nine months ago, and on a much larger scale. Once again the STC was entrusted with the job. It does not come as a surprise, therefore, that the old game of importing usable as rags has been resumed on a big scale. We are now told that the STC would be asked to discontinue the practice of transferring consignments on the high seas to private parties and that the STC would be required to hand over imported rags only after they have been completely mutilated. In fact the STC not only transfers goods on the high seas, but it also leaves the concluding of transactions with foreign exporters to private parties. It merely lends its name as the so-called canalising agency and collects its commission from importers. In addition, its officials collect their own cuts for granting various favours. Finding itself once again implicated in a rags scandal, the STC has struck a self-righteous pose and sought to shift the blame to private parties. It claims to have black-listed 24 firms for breach of rules and regulations regarding import of woollen rags. Does this not amount to admission by the STC that, though import of rags is supposed to be canalised through it, it is really the private importers who arrange the deals with the foreign exporters? In the circumstances, what earthly purpose does the so-called canalisation serve except to make it possible for STC officials to make money on the side?

According to press reports, the STC has now proposed that consignments of 'rags' should be released only after cent per cent mutilation under the supervision of officers of the Textile Commissioner, the Chief Controller of Imports and Exports, the STC and the customs. It is interesting that of the four bodies sought to be entrusted with the task of surveillance, the STC, the Textile Commissioner and the Chief Controller of Imports and Exports are under the control of the Commerce Ministry. The Commerce Ministry's reputation has been already besmirched by its failure to check — and, indeed, by its complicity in — the rags scandal. Nor is this a solitary instance. There was, for example, *art silk export scandal in the* early sixties. The Ministry, and its agencies like the STC and the Controller of Imports and Exports, do not exactly inspire confidence as safeguards against malpractices by importers and exporters.

Vanaspati

Farce of Price Control

THAT the government's attempts to control the prices of commodities have been reduced to a farce is well illustrated by the case of vanaspati. It is not surprising, therefore, that the government should be considering abandoning the price control on vanaspati. However, the reasons advanced for the move — to defeat the manufacturers' efforts to restrict output and to raise the level of utilisation of capacity in the industry — are as farcical as the actual operation of the price control has been.

The fact is that in vanaspati, as in practically every commodity the price of which has been controlled, whether it is steel or fertilisers or cement, the government has neither the will nor the ability to enforce price control. As soon as there is a shortage — and shortages can be, and are, created — manufacturers and traders alike cock a snook at the controlled price and charge what the market will bear. The government has fixed the price of vanaspati consistently below that of raw oil. This ridiculous arrangement could be sustained in the past only by supplying to vanaspati manufacturers low-priced imported oils. A more indefensible attempt to subsidise the relatively well-off, and at substantial foreign exchange cost at that, would be difficult to imagine. Not, however, that the consumer always, or even generally, got his vanaspati at the controlled price. Irrespective of the controlled price, supposedly finely tuned to the cost of production, the market price of vanaspati has been generally above the price of cooking oil — and quite rationally so. In times of shortage, and high prices, of vegetable oils, the benefit of the supply of cheap imported oils has been shared by the vanaspati manufacturer and trader. Large fortunes have been made in the vanaspati industry simply by selling quotas of imported oils in the market.

All these are well known facts. Yet the government has gone about administering its price control with loving attention to detail. For many years now, it has been reviewing the price of vanaspati every fortnight and pretending to offset small fracturations in raw oil prices by finely regulating the release of imported oils, varying the controlled price only in response to major fluctuations in the price of oil. Even so, the controlled price of vanaspati was changed six times in 1973-74, four times upward and twice downward. All this diligent activity was, however, of little consequence to the consumers of vanaspati who have by and large paid a price reflecting the shortage of vegetable oils in general and vanaspati in particular. And production of vanaspati declined from 6 lakh tonnes in 1972 to 4.7 lakh tonnes in 1973 and is expected to be no more than 4 lakh tonnes in the current year.

Now, however, it has become difficult for the government to maintain even the appearance of price control. The government has little stock left with it of imported oils. And even if it decides to persist in the completely indefensible policy of spending foreign exchange to import oils — imported oils currently account for 35-40 per cent of all oils used by vanaspati manufacturers — to subsidise the vanaspati industry, this is no longer possible because of the rise in the international prices of vegetable oils. This leaves the government with a choice between raising the controlled price of vanaspati very steeply, by almost Rs 2 per kg, with the prospect of further increases later and giving up the farce of price control altogether. Faced with alternatives both of which are politically unpalatable, it is just likely that the government may plump for the latter course. However, it will be typical of the double-talk that one has come to expect from the government in such matters if some high-falutin objective — such as improving capacity utilisation in the industry — is put forward to justify the move instead of simply conceding that price control on vanaspati, which was always something of a ridiculous proposition, has now become impossible for the government to operate.

Arrested Expansion

Hansavivek

PHILIPS INDIA is still discussing with the government its long-term industrialisation plan, originally submitted in May 1971 and revised in March 1973. The company's several applications for manufacturing new items and expansion of the present range of products have been rejected. In some cases, applications have been made at the instance of government for clearance under the MRTP Act. The directors are studying the implications of the new Foreign Exchange Regulation Act. The company will have to obtain permission from RBI to continue each of its many industrial, trading and commercial activities. They comment that the new law adds to the already numerous and diverse controls and permissions required for carrying on business. They record their appreciation of the "valuable help and co-operation" received by the company from N V Philips' Gloeilampenfabrieken of Holland and stress the need for continued co-operation and technical assistance in all fields. Of the 44-year-old Indian company's subscribed capital of Rs 679 lakhs, as much as Rs 407 lakhs is held by a subsidiary of the ultimate holding company. Moreover, Rs 326 lakhs out of the total share capital comprises bonus shares. Another one-for-one bonus issue has been recently recommended by the board.

PIL increased exports by about 15 per cent to Rs 119 lakhs in 1973 and has been recognised as an 'export house'. A number of proposals have been submitted for manufacture of electronic components, entirely or mainly for exports, on which government decisions are awaited. During 1973, the company's consumption of imported raw materials, components and spare parts was 17.7 per cent at Rs 225 lakhs. Its imports of raw materials and components amounted to Rs 120 lakhs, spare parts to Rs 15 lakhs and capital goods to Rs 31 lakhs. Expenditure in foreign exchange by way of technical service fees, interest and commission aggregated Rs 38 lakhs. Moreover, remittance of the final dividend for 1972 and interim payment for 1973 to the dominant non-resident shareholder cost Rs 73 lakhs.

The company's 1973 results show contraction of margins despite higher sales. Total dividend is maintained at 24 per cent on the enlarged capital at the cost of earnings cover. Last year PIL installed equipment for manufacture of leading-in wires for lamps and commenced production. It has received industrial licence and capital goods licence for manufacture of high wattage incandescent lamps, infra-red lamps, mercury vapour lamps and halogen lamps. Equipment is being installed and production is expected to commence by mid-1974. The range of gramophone equipment was extended to include a portable system and a high-powered stereo system.

HINDUSTAN FERODO's chairman, *N Dandekar, expects that the reduction* of non-resident shareholding in the company from 79.9 per cent to 73.9 per cent by sale of a block of shares to Indian parties will smoothen the way for the company's expansion. For some time HF has been endeavouring to find fields in which to expand "to the advantage not only of its proprietors but also of the economy". While permission has been obtained for expansion of the facilities for production of clutch facings, another scheme for manufacture of a sophisticated type of millboard has been turned down. Under the recent Foreign Exchange Regulation Act, the company will have to seek permission, among other things, to carry on its existing business and also to continue to hold its properties. While Dandekar is confident that the required permissions will be readily given, he wonders why so much time and effort must be expended on the administrative work involved. With a change in the accounting year, the company has compiled accounts for 9 months ended December last during which period there has been a perceptible contraction of margins. While the ratio of wages/sales was lower, that of inventories/sales was higher compared to the previous year. Dividend, maintained for the proportionate period, was as before just covered. The board has appointed TBA Industrial Products of the UK as exclusive export agent for five years for the sale of products at 10 per cent commission.

PHILLIPS CARBON has obtained clearance under MRTP Act for promoting a new company. Government has permitted it to participate upto 32 per cent in the equity capital of the new company which has been registered under the name 'Oriental Carbon' to establish a plant with a capacity of 9,000 tonnes per annum. An agreement has also been signed by PC with Gujarat Industrial Investment Corporation, which has got a 'letter of intent' for setting up a plant with an annual capacity of 10,000 tonnes, to form another new company to implement the project. This plant is intended to be located near Baroda. Meanwhile, PC's own application for fuller utilisation of the capacity of its plant at Durgapur is pending clearance by government. During 1972-73, the company produced 27,566 tonnes against 21,292 tonnes in the previous year and the installed capacity of 22,680 tonnes. This was made possible by regular supply of feedstocks throughout the year. For the first time, the company was able to make exports to South-East Asian markets and Japan. The financial results have been satisfactory with higher sales and profits. Dividend was stepped up 2 points to 16 per cent, which, however, was just covered. Prices of carbon black, maintained for several years, were increased recently. The directors point out that production can be further improved only if sufficient feedstock, which is predominantly petroleum based, is available.

CENTRON INDUSTRIAL ALLIANCE, maker of 'Swish', 'Hi-life', 'Platinex', and other brands of stainless steel razor blades, having a major share of the high-priced segment of the blade market, is expanding capacity from 100 million to 250 million pieces per annum at a cost of about Rs 200 lakhs. The 25-year-old company is offering six lakh equity shares, of Rs 10 each, at par to the public in July next to raise part of the finance required for the project. Plans have been chalked out to widen the dealer network and to introduce lower-priced stainless steel blades in the home market and to expand exports. Centron has a technical collaboration agreement with Scots Blade, an associate of Warner Lambert International of the US, and was the first in the world to introduce platinum-edged blades manufactured by the 'sputtering process'. It has been competing with smuggled blades and also has production contracts for 'Ucar' and 'Morning Star' blades, marketed by other well known companies. Manufacture of razor blades apart, the company also turns out a full line of machinery for making blades, besides specialised stainless steel castings, by using scrap from the razor blade division. According to Dilip S Dahanukar, managing director, the proposed expansion of the factory located at Aurangabad, a backward area of Maharashtra, will be completed by the end of 1975. He expects sales to steadily increase from Rs 214 lakhs in 1973 to Rs 542 lakhs in 1979, and profit before tax to rise from Rs 21 lakhs to Rs 74 lakhs in the same period. On this basis, the company should be in a position to repeat the 10 per cent distribution on the increased capital for 1974 and 1975, to step it up to 12 per cent for the subsequent two years and further to 15 per cent for 1978 and 1979. Centron already has a fair growth record. Of the present share capital of Rs 30 lakhs, nearly Rs 28 lakhs comprise bonus shares. Even after the forthcoming public issue, the book value of the Rs 10 share will be over Rs 14.

MILKFOOD, a new company promoted by Jagatjit Industries, is installing a plant at Bahadurgarh in Punjab for manufacture of 4,000 tonnes of milk powder and other products, 600 tonnes of cheese and 3,200 tonnes of ghee and butter per annum. The project cost, estimated at Rs 110 lakhs, will be met by equity capital of Rs 45 lakhs and loans and deferred payments of Rs 65 lakhs. The main plant for manufacture of milk powder, cheese and ghee is expected to go into production by June this year and manufacture of baby food and butter will commence about three months later on receipt of certain imported equipment. The company has been allotted by the Government of Punjab a specified milk-shed area with a radius of 20 miles around the factory for procurement of milk. The company therefore does not envisage any difficulty in getting the basic raw material for its requirements. The management estimates that the company's sales will gradually rise from Rs 200 lakhs in the first year ending March 1975 to Rs 573 lakhs in the fifth year and that in the same period profit before tax should expand from Rs 17 lakhs to Rs 88 lakhs. On this basis, the company should be able to pay a maiden dividend of 12 per cent for the first year and progressively increase it to 20 per cent in the fourth.

MODI RUBBER envisages overrun of about Rs 563 lakhs in its project cost and is offering 'rights' shares at par on a one-for-three basis to raise additional finance of Rs 200 lakhs. IDBI, ICICI, LIC and IFCI have agreed to provide loan assistance aggregating Rs 315 lakhs and PNB and FNCB to give an additional term loan of Rs 24 lakhs each. Out of the additional finance of Rs 315 lakhs to be provided by institutions, IDBI has sanctioned two separate loans, one of Rs 100 lakhs and the other of Rs 40 lakhs. While the former loan of Rs 100 lakhs will not carry any conversion right, the latter loan of Rs 40 lakhs will carry a conversion right of 70 per cent into equity shares of the company. Thus the total amount convertible into equity shares will work out at 20 per cent as originally intended. The overrun has occurred, according to the management chiefly because of adverse fluctuations in the exchange rate and increase in customs duty.

GIAN AGRO INDUSTRIES is setting up a plant near Ganaur in Haryana, for the manufacture of 900 tonnes of guar gum powder, 937 tonnes of guar, split, 4,200 tonnes of un-dehusked chuni and 1,125 tonnes of dehusked chuni. The raw material, guar seed, is available in abundance in Haryana and the neighbouring states of Punjab and Rajasthan, which together account for about 80 per cent of the country's production. The project is estimated to cost about Rs 35 lakhs and is intended to be financed by share capital of Rs 19 lakhs and a term loan of Rs 16 lakhs from Haryana Financial Corporation. The company expects to commence trial production by the end of 1974 and pay a maiden dividend of 10 per cent for 1975.

PERSPECTIVES

Recognition to Teachers, At Last!

Ashok Rudra

T N Srinivasan

OF all the mad steps the Government of India is taking, one after another, and all its disastrous inactions which are causing the economy to burst asunder under the pressure of a runaway inflation, making the process of development grind to a halt, and giving rise to further accentuation of the inequality of distribution of income and wealth, the recently announced pay revision for college and university teachers takes the cake for its stunning quality. Stunning, because it is so puzzling. Various categories of organised workers are agitating for wage increase all over the place. The government has been talking of taking a tough stand *vis-a-vis* all of them. Whether it is the thoroughly justified demands of the jute workers or some of the long-standing genuine grievances of railway workers or the totally unjustifiable demands of Indian Airlines personnel, the government has been at least pretending to resist all of them equally strongly. In the context of this, how to understand the fantastic increases granted to a community that has hardly made any agitation worth the *name*? Readers and Professors have not put forward any organised demands whatsoever for grade revisions. College teachers and university lecturers have indeed been demanding that grade distinctions between lecturers, readers and professors should be removed, allowing whoever joins at the bottom of the lecturer's scale to end up at the top of the professor's scale. But the lecturers' agitation did not in any university go beyond sending up petitions and memoranda. There was hardly any pressure that they could exert before which the government could be thought of as having yielded.

Is this gift of a 25 per cent or so increase at the beginning of each grade and 50 per cent or so increase at the terminal points to be taken in a civilised manner as a belated recognition by the rulers of the country that the teaching profession is after all not less important for society than, say, government service? One wishes that this were so. But it is difficult to give any such interpretation. If it was recognising the worth of the teaching profession, one would have thought of giving a subsistence wage to primary school teachers to begin with. Primary school teachers in different parts of the country have over the years agitated for salaries somewhere near to what a peon in a government office earns — to no avail. Again, what could be the justification of giving such a high salary rise to college lecturers, without touching the pay scales of high school teachers, when one requires about the same qualifications to be a high school teacher as to be a college lecturer? (In addition, to be a high school teacher one has most often to have a degree or a diploma such as BT.) What good can come to the country from such an enlargement of the gap between the level of living of school teachers and college teachers? If primary education constitutes the foundation of the country's educational system, secondary education constitutes its backbone. In contrast, so called higher education — college and university level education — is largely recognised to have developed since Independence along totally wrong lines. Nearly a hundred universities have been opened and colleges have proliferated in their thousands. This fantastic expansion has taken place without any guidelines coming from any manpower planning. The result is the phenomenal increase in the number of the educated unemployed. What is called for in higher education is its total overhauling. It is derisory to talk of recognising the worth of education when one leaves the lot of primary school teachers and secondary school teachers untouched and, instead of overhauling higher education, only announces a big pay rise for college and university teachers.

Forgetting for the moment primary and secondary education, can one say that the pay revision is likely improve the standard of teaching in colleges and universities? There are two questions to answer here. Would better talents be drawn to the teaching profession, now that the profession is more paying? Secondly, would the existing teachers teach better as a result of enjoying easier and, in the case of professors, more affluent standards of life?

Before giving an answer to these questions, it may be worthwhile to remember that it would be wrong to measure the level of living of teacher in higher education solely in terms of salary. There are various benefits, perquisites and advantageous service conditions that are exclusive to the teaching profession. Thus, college and university teachers enjoy vacations which are denied to all non-teaching professions. Even during term time, the amount of work which even the most hard-pressed college lecturer does bears no comparison with the work that has to be done by senior engineers or doctors or by anyone in, say, the banking profession — whether a bank clerk or a bank manager. It may be said that the vacations, off-days or off-hours that teachers enjoy are meant to provide them with the time and opportunity to equip themselves for their teaching. It may sound harsh but that is however not the way the sparetime of teachers gets mostly utilised. Again teachers can and do make extra income be various means like correcting examination papers, writing text books, etc. University level teachers get increasing opportunities of going abroad for studies or for teaching, incidentally making no small extra income in foreign currency. Then there are more and more conferences, seminars and refresher courses which provide opportunities to teachers to travel around the

country at the expense of the tax-payer.

Let us now turn to the questions we set ourselves: can the pay rise be expected to lead to an improvement in teaching standards? It is indeed conceivable that some talents are going away to the government or to the private sector because of the higher emoluments available in those sectors. This can be neither proved nor disproved. (There is incidentally no evidence in this country, as there is, say, in the United States, of top level scientists working in the private sector rather than in educational institutions.) But it is doubtful that diverting some of these talents to the teaching profession would raise standards in higher education. That is because the problem of standard in our higher education is not one of too few talented teachers, but one of too many untalented and unmotivated ones. The bane of our higher education is that there are too many universities and too many colleges, too many lecturers, too many readers and too many professors. Most professors in our country would not qualify to become readers in our own best universities or lecturers in any good university in the educationally more advanced countries. Most lecturers in our colleges and universities would not qualify to be teachers in our best high schools. The problem of standards cannot therefore be solved by adding a few talented persons to this sea of mediocrity. Considering that the country really requires much fewer colleges and universities it is doubtful that we require more talents to come to the profession. What is required is to screen the untalented or the unmotivated from entering the profession. This role of screening is at present done to some extent by the very fact of the teaching profession being considered less lucrative than government service or private sector jobs. This has meant that the talents that have come to the teaching profession have come because of a certain academic motivation. The best teachers in our higher education could all earn more by going over to other professions; but they prefer the way of life of a teacher. The increased flow of talent that would hypothetically take place as a result of economic attractions would, by the very fact of this attraction, be bereft of these values and this motivation. In this connection, one can mention also the problem of brain-drain: would the pay rise reduce in any way the volume of the drain? There are no reasons to expect this given that the differential between the emoluments in the country and in the more advanced foreign countries is so large that the pay rise that has been announced is unlikely to have any impact on those who get drained out on account of that differential.

We can now take up the second question: would the standard of teaching of those already in the profession go up because they will be paid more? This would imply that the teachers now have such a hard life that it reduces their teaching quality. It is a highly doubtful proposition. It may be argued that college teachers often have so much lecture-load that they do not get enough time to study and to improve their knowledge, so that the quality of teaching suffers. To the extent this is true, what is called for is lessening of lecture-loads — it is not clear how a salary increase will give lecturers more time or opportunity to acquire knowledge. In this connection it may be emphasised that whether there is excessive lecture-load for college teachers or not, there is certainly no such problem for university teachers. UGC norms are 16 hours per week for lecturers, 12 hours per week for readers and 7 hours per week for professors — an hour being mostly of less than 60 minutes duration. In many universities actual loads are much less than these norms; also, even outside the vacations, there are lean seasons when teaching is partly or wholly off.

Can it be said that university teachers are so harassed by their material worries that they cannot settle down peacefully to their academic pursuits, so that improving their living standards would improve their teaching? Once again, if there is any truth in this proposition that would hold only for teachers at the lecturer's level. Readers and professors enjoy eminently comfortable lives by this country's middle class standards. To believe that their teaching or research would improve if their living standard is made to go up further would require acceptance of the proposiiton that there is a positive correlation between living standards and scholarly pursuits.

Is there such a positive correlation? There is not much evidence in the country that would tend to support the hypothesis. Thus, the two universities that had marked themselves out in the past for their outstanding contributions to the advancement of knowledge are those of Calcutta and Bombay. These two universities in their days of glory did not provide their staff with any quarters, nor did they even pay house rent and other other allowances amounting to anything comparable to what the Central universities do now. In contrast many small town universities provide their teaching staff with extensive and luxurious residential accommodation, sometimes in the true style of empire-day civilians; yet they have never managed to attract any talent to them.

The University Grants Commission, however, seems to very much subscribe to the theory of a positive correlation between easy living standards and high scholarly pursuits. It has always been extremely generous with respect to the living standards of teachers of the universities of Delhi, Aligarh, Banaras and Visva Bharati and is now exceeding itself in extravagance in the case of the Jawaharlal Nehru University. Of this, the last mentioned has yet to justify its existence; among the earlier ones, the record of Visva Bharati is one of steep decline of academic standards since the the days of Tagore, strictly in inverse proportion to the increase in the material well being of its staff; Aligarh and Banaras have become homes for all kinds of intrigues and troubles. Delhi University has done well in many fields, but its record is not comparable to those of, say, Calcutta at its height (which, of course, is long past). The UGC is not, however, consistent in its policy regarding material incentives for scholarly pursuits. For if material incentives have to work there has to be matching of rewards with performances. It would, in this frame of logic, make more sense to provide for higher payments to teachers in a university of well established standards than to those in one known for its poor standards. Also, the philosophy of material incentives would call for the provision of efficiency bars in all the grades. It is pointless and discriminatory that efficiency bars are provided for in the new pay scales only for College Lecturers.

There is, however, evidence to the contrary — of high academic standards going with a spartan attitude towards the question of living standards of teachers. There is only one subject in which India enjoys standards in scientific achievements comparable to that of any other country in the world and that is Statistics, and this is undoubtedly due to the enlightened leadership of the late P C Mahalanobis. It was a matter of deliberate and systematic policy with that great academic

leader that he selected young scientists to take under his wings and provide research opportunities on the basis of a dual criterion of talent and motivation. He checked the motivation by explicitly stating to the young scientist at the time of recruitment, "I shall give you just enough to survive; if you want money, go elsewhere". It is a matter of record that not many young scientists whom he thus gave opportunity to work under his benign guidance left him to go elsewhere for more money.

The pay revision cannot, therefore, get any foothold on any argument in terms of academic standards. It is a welfare measure pure and simple. The question is why should this particular community be made to benefit so much, when so many other organised groups of workers are struggling to prevent their living standards from falling and not succeeding and when the vast majority of the unorganised groups are not in a position even to do anything to halt the inexorable process of pauperisation in which they are caught? Even ignoring the broad masses, unorganised and organised, why this measure that would cause so much accentuation of inequality within the small world of education itself? What about the gap that would be created between the levels of living of teachers in Central Universities and Centrally financed institutions and universities, colleges and institutions financed by state governments, given that the latter may find it impossible to increase their budgetary allocations on revenue account since the Centre has promised to shoulder this burden only for five years? What about the accentuation tension that already exists in the campuses between the so-called academic and the non-academic staff? Will the universities be in a position to give any comparable pay rise to all the non-academic workers amongst whom the teaching community works and lives? And this other category includes not only clerks and officials of the administration and accounts departments but also library staff and research staff belonging to certain centres attached to Universities.

One possible explanation for the phenomenon is that a lobby of Professors exercising its influence over the UGC and the Education Ministry has seen to it that in these hard pressed days they do not get stuck at a mere basic of Rs 1,600 (or at the maximum at the Senior Professor's ceiling of Rs 1,900) but can go up to some more comfortable income ranges; and in order to do that they had to make concessions to Readers and Lecturers as well.

Another explanation suggested by such recent examples as the raising of salaries in UP just prior to the state elections would be that the government is out to buy off the teaching community at the level of higher education. Government in this country has no employment policy, only an incomes policy for those who are already employed in the organised sector. In this it has been helped by the working class movement that has restricted itself to the narrowest form of economism — almost exclusively to wage demands — and not cared too much about the unemployed nor, contrary to their professions, aimed at knocking at the capitalist foundations of the regime. Given this, the government has developed the policy of yielding to wage demands when they cannot be resisted any more, whereas its attitude towards the unorganised masses in the process of pauperisation has been one of "Let the devil take the hindmost". Within the section of organised working people, the government has understandably seen to it that government servants remain a privileged class. Government servants get houses at the taxpayers' expense, cars at the taxpayers' expense, medical reimbursements at the taxpayers' expense and also such things as free passes to Radio Sangeet Sammelans and and things of that kind organised at the taxpayers' expense. This is, of course, understandable, for bureaucracy, wherever it exists, is allowed to fatten itself on the misery of the people at large so as to provide secure support for the regime.

It may be argued that the government is finding it necessary for its stability, during these troubled and uncertain times, to buy off a few other communities. The economic crisis in the country has taken such a shape and such dimensions that the country is in for a series of explosions of popular anger, examples of which have already been seen in Gujarat and Bihar. These explosions would work themselves out and not touch the foundations of the regime as long as they remain without any political direction.

If the intellectuals of the country are allowed to get engulfed by the economic crises and if they are led by desperation to join the agitating masses, there could conceivably be the emergence of such guidance and leadership. So this class has to be isolated from the masses. With the pay revision announced, the government may rest assured that most teachers in higher education will find themselves fiddling while the rest of the country burns.

Post-script: If this line of our argument is correct, one would expect some steps by the government to placate the student community also. Lo and behold, as these lines get written, the news arrives that the government has announced certain economic benefits — the right to purchase whatever they want at a discount — for a section of students. It should not surprise anybody that a beginning in the giving of such largesse should be made with the student of the Jawaharlal Nehru University, probably the most pampered student in the country.

NEW DELHI

Soviet Doubts about Steel Programme

WHAT prompted the Economic Counsellor of the Soviet Embassy in New Delhi to call a press conference and publicly blame Indian organisations and the government's policies for the delays in the implementation of the steel programme, particularly the expansion of the Bokaro and Bhilai steel plants? This question is being widely discussed both in the government and outside. Though the Steel Minister, when questioned in Parliament, tried to play down the episode, more is likely to be heard about it in the days to come. Soviet officials are generally very discreet and very protocol-conscious. In private they are known to be very blunt and are often severely critical of working conditions in, and efficiency of implementation of, Soviet-assisted projects. They also insist on compliance with all their terms for providing assistance. However, in public they maintain very correct behaviour.

One possible explanation for the Economic Counsellor's departure from normal Soviet standards of propriety could be that the Russians are becoming seriously worried about the long delays in the implementation of Soviet-aided projects in the steel industry. This would be quite understandable in view of their close and long-standing association with our steel programme, in which the expansion of the Bhilai and Bokaro plants occupies a special place. The delays in the implementation of these projects, therefore, hurts their image and reputation. However, these delays are not a new development. The first phase of construction of Bokaro upto the 1.7 mn tonne capacity stage, for which agreements were signed with Soviet agencies as far back as in early 1965, is not likely to be completed before 1976. This will be nearly three years behind even the revised schedule, set in 1970, to complete the work in 1973. Similarly, there has been an equally long delay in the case of expansion of Bhilai to 4 mn tonnes. This was a Fourth Plan project and a provision of Rs 98.80 crores had been made for it in the Plan. However, actual expenditure on the project during the Fourth Plan was only Rs 16.74 crores and the deadline for its completion has been shifted to September 1978. The Soviet Economic Counsellor was particularly unhappy about the latest shift of the target of completion from December 1976 to September 1978. He maintained that this was entirely the fault of the Indian agencies involved.

The Steel Authority of India, the Steel Ministry and the project managers concerned have carried out their own detailed review of the progress of the projects. Not surprisingly, their review has laid a part of the blame for the delays on the Soviet side. In regard to Bhilai expansion, for instance, the review has held that there had been delay in the delivery of technical data by the concerned Soviet agencies who are the prime consultants for the project. Another reason for the delay, according to the review, was the Soviet suggestion of continuous expansion of the project to 7 mn tonnes which required updating and revision of the technical parameters for even expansion to 4 mn tonnes. It is possible that the Soviet Counsellor was countering these criticisms of the Soviet Union. He said that the Soviet organisations had stuck to the December 1966 schedule for the completion of the Bhilai expansion project and had been fulfilling their obligations accordingly. However, "now, according to the information we have, the question of postponing the completion of this stage till 1978 is under consideration".

If the Soviet diplomat had confined himself to these remarks, he might not have attracted much attention. But he went on to say, by way of clarification, that "we do not feel any reluctance on the part of the Indian Government" towards the expansion programmes but some "unwillingness on the part of certain quarters" in the government. His criticism was obviously directed at officials of the Steel Ministry. There have been reports that senior officials in the Ministry favour giving preference to the expansion of TISCO to that of the public sector plants, including Bokaro and Bhilai. The Russians are also known to be not very happy over the decision to commission Nippon of Japan for preparation of the feasibility report for the TISCO expansion with the possibility of subsequent collaboration with Nippon in the execution of the project. The feasibility report by Nippon, which is now under examination by a Steering Committee set up for the purpose, has been found to suffer from many shortcomings. Its estimates costs are believed to be inflated and its assessment of the import content inordinately high. The cost estimate is Rs 1,700 crores for expansion from 1 mn tonnes to 5 mn tonnes. Even if the cost of related facilities such as the development of coal and iron ore mines are excluded, the cost of the expansion will run to Rs 1,300 crores. However, TISCO expansion may still get the support of the Steel Ministry unless the Tatas themselves have second thoughts about associating Nippon with the expansion on the basis indicated by the latter.

The most notable part of the Soviet Counsellor's comments at the press conference was his criticism of the performance and capabilities of the Heavy Machine Building Plant at Ranchi and the Metallurgical and Engineering Consultants of SAIL, specially the latter. It may be argued that the Russians may have an interest in understating the HMBP's ability to manufacture machinery and equipment. This would justify larger imports of Soviet machinery and equipment. On the other hand, the HMBP is heavily dependent on Soviet collaboration and so the Russians cannot be very happy with having to publicly criticise its performance. Equally surprising was the criticism of MECON and the doubts expressed by the Soviet diplomat about its ability to complete in time the "massive design work" work for the Bokaro and Bhilai projects.

MECON, formely the Central En-

gineering and Design Bureau of Hindustan Steel, has a tight and exclusive collaboration tie-up with the Gipromez of the Soviet Union. After the collaboration arrangements between MECON and Gipromez had been concluded, the Russians have been trying for the past several years to get MECON placed in key places wherever Soviet financial and technical collaboration arrangements are involved. They even insisted on inducting MECON for their part of the Korba aluminium project, displacing the National Industrial Development Corporation which had been working on this project on the Indian side since its inception and was known to have done good work and acquired a degree of expertise in the field. Yet the Russians favoured MECON even though non-ferrous metallurgy is not its main field.

The Soviet Union's preference for MECON is easy to explain. The association of MECON in Soviet-aided projects provides some kind of a cover for what are essentially turnkey arrangements for their construction. The Russians can then hope to have things their way without interference of questioning by Indian technical agencies. The Korba project is only one case in point. It has again Soviet insistence which brought MECON into the Bokaro expansion project in preference to Dasturco, the other Indian design and engineering agency in the field. The present position thus is that MECON has been assigned almost the entire engineering work connected with the steel programme. As a result, MECON is overstretched, while Dasturco has been complaining of underutilisation of its capacity and expertise. The chairman of SAIL had some time back mooted a proposal for SAIL acquiring some shareholding in Dasturco. This was intended to make it easy to associate Dasturco with the public sector steel programme. The proposal, said to be acceptable to Dasturco, has not made any progress for nearly a year now, reportedly because of reservations on the part of MECON.

In these circumstances, it is most curious that the Soviet Union should suddenly turn round and question MECON's ability to undertake work assigned to it by the Soviet agencies and to attribute to this the delays in the execution of projects. A logical sequel to this criticism should be that the Soviet agencies and the Steel Ministry should be ready to review the present consultancy, design and engineering arrangements for the various Soviet-aided projects and permit greater participation of expertise available in the country to speed up their execution.

MAHARASHTRA

Sudden End of a Movement

THE Marathwada Janata Vikas Kriti Samiti has announced the postponement till August 15 of the agitation for the speedy economic development of Marathwada. The Samiti will, however, intensify its agitation should the state government fail to implement the measures announced by it and fulfil the promises made to representatives of the Samiti and the Students' Co-ordination Committee during their their week-long discussions in Bombay from May 5 to 11 with Chief Minister V P Naik, his Cabinet colleagues and other prominent Congress leaders.

The Samiti's decision is further proof that the agitation, in which four persons lost their lives in police firing in April, was very largely a manifestation of factional politics within the Congress party in Marathwada. However, first let us briefly review the meeting of representatives of the Kriti Samiti and the Students' Co-ordination Committee with the Chief Minister and other Congress leaders. The measures announced by the Chief Minister after the meeting are exactly the same as those announced by him on April 24 after he had met MPs, MLAs and Congressmen belonging to the faction of the Marathwada Congress led by Kalyanrao Patil, Minister of State for Industries and Tourism. This faction is pro-Naik and is opposed to Shankarrao B Chavan, Minister for Agriculture and an aspirant for the Chief Ministership, who is the leader of the other faction in Marathwada Congress. The Shankarrao faction, led by Baburao Kale, MP, and Balasaheb Pawar, MLA, has been the main force behind the recent agitation.

The Chief Minister has announced that the state government would take immediate steps to start five co-operative spinning mills, one in each of the region's five districts; set up one composite textile mill in the state sector; recommend to the Centre that two major public sector projects should be located in the region in the Fifth Plan period; modernise and expand the government-run textile mills at Nanded and Aurangabad; and persuade the private sector to establish a baby-food factory at Nanded. The state government would take steps to secure funds from the World Bank through the Centre for expediting the work on the second stage of the Jayakwadi irrigation project and, till the World Bank's assistance is available, make available funds from its own resources. The state government would try to secure the speedy clearance by the Centre of the region's pending major irrigation projects, namely, Nandur Madhyameshwar, Sina-Kolegaon, Manjra and Upper Vainganga. The government would take steps to start a medical college in Ambejogai, in addition to the opening of an institute of science at Aurangabad and examining a proposal to set up a university sub-centre in consultation with the University Grants Commission. The government would urge the Centre for speedy conversion of a number of metre gauge railway lines in Marathwada into broad gauge lines and for starting work on many new lines.

The state government has undertaken to collect facts and figures about the economic development after November 1956 of all the five districts of Marathwada along with comparative data for districts in the other regions of the state and place them before the representatives of students and the Kriti Samiti so as to remove the feeling that any injustice has been done to Marathwada. It has also been announced that the state government would soon appoint an officer of the rank of secretary to the government to investigate all cases of alleged injustices to government employees from the Marathwada region. This officer would submit his report to the government within three months and the government would announce its decision on the report within two months of its submission. Finally, the state government would request the Centre to double the maintenance scholarships given to scheduled caste and scheduled tribe students.

Chief Minister Naik, however, rejected the demand for setting up a regional committee for Marathwada on the pattern of the regional committee for the Telengana region of Andhra Pradesh. Naik also rejected the demand for withdrawing cases against students involved in the agitation. He maintained that it was the government's firm policy not

to withdraw cases involving arson, loot and assault on public servants.

At the end of his discussion with the Chief Minister and his Cabinet colleagues, Govindbhai Shroff, leader of the Kriti Samiti, declared that he was "satisfied" with measures announced by the government and for good measure added that he was "convinced" that the Chief Minister and the government had tried to do whatever was possible in the circumstances. These sentiments were shared by the leader of the Students' Co-ordination Committee, Dwarkadas Pathrikar, who said that the government had adopted a "generous attitude" towards Marathwada's demands for speedy economic development.

Except for the decisions relating to the starting of a medical college and science institute and making funds available for the Jayakwadi irrigation project and the setting up of a composite mill in the state sector, fulfilment of the rest of the promises is not in the hands of the state government but will depend upon the Central government and the private sector. For starting a co-operative spinning mill in each of the five districts of the region, the state government can be of help only in providing finance, but the matching capital and the necessary organisational and entrepreneurial effort will have to come from the local population.

The measures announced by the state government for Marathwada's development do not, therefore, seem to be the main reason for the decision of the Kriti Samiti and the Students' Co-ordination Committee to hold off the agitation till August 15. As mentioned earlier, the moving force behind the student agitation was the Shankarrao Chavan faction in the Congress led by Baburao Kale and Balasaheb Pawar. Kale and Pawar had succeeded in bringing Govindbhai Shroff and Anantrao Bhalerao, editor of the influential regional daily *Marathwada*, into the movement only to give it the appearance of wider support. However, the pro-Naik faction of the Marathwada Congress was able to persuade the Central leadership of the party to put pressure on Kale and Pawar and to make it clear to them that any attempt by them to launch an agitation against their own party's government in the state would attract severe disciplinary action. Y B Chavan is believed to have told Kale and Pawar and their supporters that by their open participation in the agitation they were undermining the Congress party organisation in the region. The threat evidently worked and Kale and Pawar have been persuaded to put their agitation in cold storage for the time being. At the same time, it was suggested to Shankarrao Chavan that he had very good chances of succeeding Naik as Chief Minister and that these chances might be jeopardised if the impression gained ground that an agitation against the government had his blessings. This too had the effect of quieting Kale and Pawar.

It is to be seen now whether the Kriti Samiti of Govindbhai Shroff and the Students' Co-ordination Committee will be able to resume the agitation from August 15 without the backing and resources of Kale and Pawar.

NORTH

In Financial Trouble

STRANGE as it may seem, Punjab — India's most prosperous state with an annual per capita income of Rs 995 — faced a financial crisis in the post-budget period this year. The Reserve Bank's refusal to grant more overdrafts to the state government was the first indication of trouble; then came the sudden announcement of a sizeable tax package designed to net Rs 13 crores (the doubling of the truck token tax was later withdrawn). The government also resorted to the unusual step of asking local corporate and other semi-autonomous bodies to deposit their funds in the state treasuries and not in commercial banks. The not very credible explanation offered was that this would prevent the Punjabis' money from being transferred to other regions for development purposes and would ensure reinvestment of the money within the state itself. The advice to public corporations and semi-government institutions to put their funds in treasuries would, however, mean depriving them of interest. Nor has the government acquired any legal power to compel these institutions to comply with this directive.

The Finance Minister claimed to have overcome the government's financial problems through additional mobilisation of resources and by gearing up the tax collection machinery. The overdraft with the Reserve Bank had been liquidated by May 7. What the Minister did not mention was that the Centre had baled out the state government by enhancing its borrowing limit.

But it is not being temporarily in the red that is important. It is the factors that brought about the situation that call for notice. These include reckless expenditure as well as ever-increasing liabilities on account of payment of higher dearness and other allowances to government employees. A former Punjab Finance Minister has alleged that although the state government has denied scrapping of any welfare scheme in recent months, several such programmes have in fact had to be cancelled owing to the paucity of funds. The present Finance Minister, Hans Raj Sharma, admitted earlier this month that the frequent DA hikes by the Centre for its employees had "almost pushed Punjab into bankruptcy". During the last two years, the state government had to pay Rs 40 crores additionally to its staff following the periodic revision of Central DA rates. He intended to take up the matter with Y B Chavan soon.

Cost of Image-Building

In 1972 the Haryana government too had been in serious financial difficulties and had to be similarly baled out by the Centre. The Reserve Bank had pulled up the state for its overdrafts amounting to Rs 30 crores, but was later prevailed upon to show greater accommodation. The basic cause, of course, was the lack of fiscal discipline which manifested itself in thoughtless expenditure, in part for political ends. The state government's massive outlays on rural electrification, irrigation and other projects, all in a bid to maintain the tempo of development, had depleted the treasury. So busy was Chief Minister Bansi Lal with his image-building drive that he took no notice of the Finance Ministry's advice to observe restraint.

Haryana is the country's second most prosperous state with a per capita income of Rs 829, but its finances were in such poor shape that payments due to contractors, rents of private buildings occupied by government offices and even refunds of securities and other types of deposits were held up for months under the Chief Minister's orders. All these measures had created a general impression of financial bankruptcy.

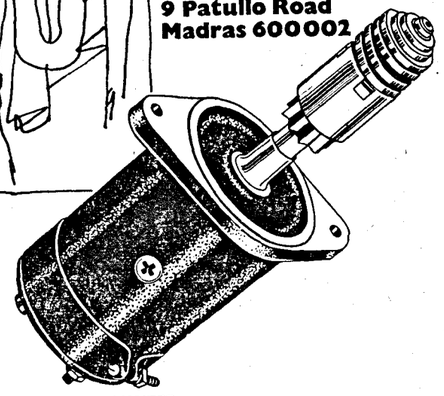
Like Punjab, Haryana also complains that the major portion of the deposits mobilised by commercial banks within the state are spent outside the state. Himachal Pradesh too has now joined

PARTNER FOR LIFE: YOUR LUCAS-TVS STARTER ONLY STOPS WHEN YOU DO

Each day, over 7,00,000 quality Lucas-TVS starters spring to life. Starting cars, commercial vehicles, tractors, earth-movers, stationary and marine engines.

Available in a range of 6, most of these 7,00,000 starters are fitted as Original Equipment.

With Lucas-TVS reliability built into each, your starter is a partner for life.



And should one of the many components of a Lucas-TVS starter ever need replacement, ensure that you fit only a genuine Lucas-TVS part.

Because when you buy from Lucas-TVS, you buy a total integrated electrical system. Perfectly matched to the needs of every make of vehicle.

Yes, a Lucas-TVS starter proves that not all marriages are made in Heaven.

FREE FOR YOU!
Informative leaflet on profitable vehicle maintenance.

this chorus. Deposits of commercial bank branches situated in the sprawling state amount to about Rs 34 crores, but the credit extended within the state comes to less than 15 per cent of this amount. Chief Minister Parmar recently suggested that the Reserve Bank should issue a directive requiring banks to invest a reasonable proportion of any state's deposits within the state. Thus alone, he thought, could the financial drain from the less developed to the developed regions be stemmed.

TA-DA Bonanza

Himachal is still a backward state and so there is all the reason in the world to avoid leakages of funds and squandering of public money. However, the way most of its Ministers try to build up neat piles for themselves at the public cost is striking. Their disproportionate and inflated TA and DA bills have been the subject of much opposition comment in the state assembly. The Forest Minister drew Rs 3,104 as TA-DA in one month alone, his total for seven months and 17 days in 1973-74 being Rs 21,345. The chief parliamentary secretary is stated to have received Rs 2,117 per month between April 1973 and February 1974. Many of the lengthy official tours which the Ministers undertake almost round the year are not justified by administrative or even political exigencies. According to a report, all except two Ministers have taken loans from the government to buy cars and their effort seems to be to clear the loans as soon as possible by "earning" more and more TA while the sun shines.

Total unconcern for economy in expenditure is also apparent in the inflation of administrative personnel — the bureaucratic bulge — throughout Himachal. The Commissioner for Finance has admitted in his explanatory note to the 1974-75 budget that the state's total wage bill is disproportionately high compared to its domestic receipts. The Sixth Finance Commission's award covered in full the state's revenue gap on the basis of the June 1973 pay structure, with extra provision for later hikes. The chairman, however, sounded a note of caution to the state government and said that the massive expenditure on administration (101 per cent of the domestic receipts) weakened Himachal's case for more Central subsidies. Restraint on staff employment, he said, was a 'must'.

All this notwithstanding, yet another instance of avoidable duplication of posts has been provided by the government's decision to appoint two Inspectors-General of Police along with three Deputy IGs. Political pressure is stated to be the reason for the decision. As a result, like many other branches of government, the police department has also become top-heavy.

SOUTH AFRICA

Election Rites

Karim Essack

IN the recent South African general elections, whites, who alone have the vote, were once again asked to choose how they wanted the 18 million Africans, coloureds and Asians to be ruled. Prime Minister Vorster's ruling Nationalist Party collected 123 seats while the opposition United Party under De Villiers-Graaff trailed behind with only 44. The defeat of the United Party was surprising only because it conceded five seats to the Progressive Party, which now has six in parliament.

Even for the whites, the general elections have become meaningless. For over two decades, the same party has been elected. Before a single vote was cast this time, the ruling party was already ahead of the United Party by 18 seats: out of a total of 171, it secured 31 seats unopposed. The United Party too was returned unopposed in 13 constituencies. In other words, there was no voting in 44 constituencies or for about 30 per cent of the white electorate.

The success of the Progressive Party can be attributed principally to the backing given to it by the industrialist, Harry Oppenheimer. Only last month, Oppenheimer's Anglo-American Corporation absorbed the key Schlesinger organisation. Thus Oppenheimer, besides cornering the mining industry, controls 40 per cent of South Africa's institutional credit. Without his financial support, the Progressive Party would not have won a single seat.

Choosing between the ruling Nationalist and the opposition United Party is like choosing between Tweedledum and Tweedledee. The former believes in *apartheid* and *baaskaap* (white rule) while the other stands for white domination with justice! The Nationalists advocate Bantustans while the United Party peddles the idea of a federation of territories. A prominent Nationalist Cabinet minister explained the policy differences thus: "I would prefer a bull which is fenced in than have a black mamba around my neck". The Progressive Party on the other hand believes that the only way to ensure white supremacy in South Africa is to give a tiny black elite the vote. These will be 'civilised' blacks who have passed stiff educational tests.

The other minor parties which put up candidates were the Hersigte National Party (HNP) and the Democratic Party. In the 1970 elections the HNP grew into a force to be reckoned with. It was labelled as consisting of the *verkramptes* — the diehard conservatives. The HNP believes that the Nationalist Party has betrayed the ideals of Afrikaanerdom because it has made too many concessions to the blacks. The HNP stands for *baaskaap*, now and for ever. It is anti-communist, anti-Catholic and anti-liberal. It wants a rigid Calvinistic state where there will be no equality between white and black in either state or church.

The Democratic Party is led by Theo Gerdener, an Afrikaaner. He was at one time the administrator of Natal province. He was invited by Vorster to join his Cabinet and for a few years served as Minister for the Interior. One could call him the Spinola of South African politics. He too does not believe in military solutions and advocates that the blacks have to be divided in order to perpetuate white domination. Gerdener has said publicly that he is against petty *apartheid*. He is realistic enough to realise that once you dig deep enough very few Afrikaaners can be said to be 100 per cent white. More importantly, he believes that it is wrong to drive the 2,000,000 coloureds and 500,000 Asians into the black camp. He wants to incorporate the 2.5 million "brown citizens" into the white bloc. If his proposals are ever accepted, it will not result in four million whites opposing 18 million people, but 6.5 million white and brown citizens facing 15.5 million Africans.

Another party which announced its intention of putting up candidates was the Alliance for Radical Change, but it did not get very far. The dreaded South African police stepped in, tore up

its posters and before its election meeting could start, arrested its supporters and bundled them into police vans. The crime in the eyes of the ruling party was that it stood for "Black Majority Rule Now".

If the results of the elections were predictable, it is because voting in South Africa has always been along racial lines. Afrikaaners form 65 per cent of the white population of four million; the English-speaking whites make up the rest. While the Afrikaaners back the Nationalist Party, the latter until this election have been voting for the United Party. Now the Progressive Party has captured a fraction of the English-speakers' vote. Nevertheless, if the racial pattern of voting continues, the Nationalist Party is assured of forming a government indefinitely.

However, the elections come at a time when there is a new awareness growing amongst the oppressed. The spectre of the 'black proletariat' which has been haunting the Nationalists ever since they came to power 26 years ago has now cast its shadow on South Africa with a series of well-organised labour strikes. Their impact has been such that even Vorster now talks about bridging the gap between white and black workers.

In the coming struggles ahead, it is these workers, together with the peasants and other sections of the oppressed who will come to the fore. It is this force, and not the whites-only general elections, which will remove the deeply entrenched rule of the Nationalist Party.

Continued US Perfidy in Indochina

Harish Chandola

THE Paris Agreement on Vietnam stipulates: "The US...will not continue its military involvement or intervene in the internal affairs of South Vietnam" (Article 4). The Agreement also stipulates that the dismantlement of all US military bases in South Vietnam shall be completed within 60 days of the signing of the Agreement (Article 6), and the two South Vietnamese parties shall not accept the introduction of troops, military advisers, and military personnel, armaments, munitions and war material into South Vietnam (Article 7). The two parties shall be permitted to make periodic replacements of armaments on the basis of piece-for-piece, of the same characteristics and properties, under the supervision of the Joint Military Commission of the two South Vietnamese parties and the International Commission.

Biggest Airlift

The US has violated all the above-mentioned provisions. Before signing the Agreement, the US had established the biggest airlift in the history of the wars in Indochina to urgently introduce into South Vietnam hundreds of aircraft, tanks, artillery pieces, and tens of thousands of tons of other armaments and munitions at the average rate of 700 tons a day. Nor did the withdrawing US troops take away their war material. The US also did not dismantle its military bases in South Vietnam.

Over the past year, the US has illegally and repeatedly brought in armaments, munitions, aircraft and artillery pieces into South Vietnam to lend a helping hand to the Saigon administration in its sabotage of the ceasefire and of the Agreement. The US has also left behind thousands of military personnel disguised as civilians and has brought in more of them during the past year. At present there are about 24,000 US military personnel disguised as civilians working in Saigon's Defence Ministry, the various branches and services of the Saigon army, police organisations, intelligence agencies and pacification services.

To direct and manage this system of "advisers", the US has disguised its former military organisations as "civilian" agencies. The Defence Attache Office (DAO) of the US Embassy in South Vietnam is a variant of the former Military Assistance Command in Vietnam (MACV); SAAFO (Special Assistant to the Ambassador for Field Operations) is in fact the former CORDS (Civil Operations and Rural Development Support) in disguised form and continues to direct the "pacification" and "Phoenix" programmes; USAID (US Agency for International Development) is nominally an economic agency, but has been for a long time now responsible for training, equipping, and giving advice to the police force of the Saigon administration. As for the four US "Consulates-General" in Da Nang, Nha Trang, Bien Hoa, and Can Tho, and the US provincial "Consulates" established since the signing of the Paris Agreement, they are in fact US commands in the various military regions and provinces of South Vietnam. With such an organisation, the US is actually directing the war and repressive machine of the Thieu administration in the conduct of land-grabbing and "pacification" operations in South Vietnam.

More US Military Aid

US military aid to the Saigon administration after the signing of the Paris Agreement has been even bigger than in war time. The US Defence Secretary, reported to the Defence Appropriations Committee of the US House of Representatives that in the 1973-74 fiscal year, US military aid to South-East Asia totalled $ 4.069 billion, surpassing by far the $ 2.735 billion of military aid to South-East Asia in the 1972-73 fiscal year. Out of this $ 4.069 billion, the appropriations for "the use, maintenance, and purchase of arms" in South Vietnam alone accounted for $ 3 billion. This does not include the military expenditures concealed under other headings and the aid to the police organisation and prisons in South Vietnam. In application of the so-called "strategy of deterrence", the US also maintains big air and naval forces in Thailand and South-East Asia in an attempt to intimidate the Vietnamese and other peoples of Indochina.

Article 21 of the Paris Agreement stipulates: The US will contribute to healing the wounds of war and to post-war reconstruction of the Democratic Republic of Vietnam (DRVN) and all of Indochina. The DRVN-US Joint Economic Commission was formed on March 1, 1973, and held its first meeting on March 15, 1973. After over a month of discussions, the US side unilaterally suspended *sine die* on April 19, the work of the Commission and of the group of experts. The US came back to the meetings of the Joint Economic Commission on June 18, 1973. This time the DRVN and the US agreed on the amount of credit and its use for the five-year plan and towards healing the wounds of war and for post-war reconstruction in the DRVN. However, the US posed political conditions for the signing of the document on the agreed points in an attempt to delay it. And to this day, the US has not resumed discussion on this subject.

Article 20 of the Agreement stipulates that the parties to the Paris Conference shall strictly respect the fundamental national rights of the Cambodian and Lao peoples and the independence, sovereignty, unity, territorial integrity and neutrality of their countries. In Cambodia, right after the conclusion of the Paris Agreement, the US mobilised B-52s and other kinds of aircraft to launch a 161-day bombing campaign with 35,000 sorties and 240,000 tons of bombs dropped in an attempt to destroy the liberated areas. Besides, the US has introduced many more US military advisers and military personnel into Cambodia to directly take in hand the command of the Lon Nol troops. On October 19, 1973, Nixon asked Congress to extend to the Lon Nol administration additional military aid of $ 200 million in the 1973-74 fiscal year. The US continues to use Thailand to train Phnom Penh troops and an airlift from Thailand to Cambodia has been established to supply fuel. According to the Thai newspaper, *Nation*, the US has shipped about 3,000 tons of munitions a month from Thailand to Cambodia.

The US still regularly conducts reconnaissance flights in the air space of Laos, numbering 1,500-2,500 sorties a month. It continues to supply by air the Vientiane army and the US-backed Vang Pao Special Forces with arms and munitions. For instance, on May 7, 1973, Pathet Lao troops shot down a US plane, and captured its US pilot, Emmet Kay, along with six Lao mercenaries. US military and economic aid to Laos has remained high — over $ 350 million a year.

While systematically violating many essential provisions of the Paris Agreement, the US and the Saigon administration, are levelling slanderous charges against the DRVN by saying that it is preparing a major offensive in South Vietnam. Key personalities in the Nixon administration have repeatedly referred to the possibility of "a new intervention of the US Air Force in Indochina". On November 30, 1973, US Secretary of Defence Schlesinger said: "President Nixon has the right to order a new bombing campaign in Indochina". The purpose of the US and Saigon slanders is to cover up their violations, to mislead public opinion and, at the same time, to prepare for new military adventures.

Meanwhile, the PRG issued a statement on March 22, 1974, calling for strict respect for and scrupulous implementation of the Paris Agreement. It also called for an immediate end to the shooting and strict observance of the ceasefire. Saigon, however, rejected this positive offer.

The PRG has also asked that all persons from both sides captured before and after January 28, 1973, be returned not later than June 30, 1974. These captured personnel include over 200,000 men of the Provisional Revolutionary Government and the third political force (parties and religious groups supporting neither the PRG nor the Saigon regime), and more than 15,000 PRG military personnel.

The PRG has also asked for consultations with organisations and personalities of the third political force for the establishment of the National Council for National Reconciliation and Concord, and has proposed that the date for the general election be decided by this National Council and that it should be held not later than one year after the establishment of the Council. But Saigon has ignored the points on the ceasefire and return of detainees and insisted that the general election be held on July 20, 1974 — during the shooting war Thieu is now intensifying all over South Vietnam.

OFFICIAL PAPER

Political Economy of Technology Transfer

Frederick F Clairmonte

UNCTAD, Guidelines for the Study of the Transfer of Technology to Developing Countries: A Study by the UNCTAD Secretariat; New York, 1973; pp 57.

THE mounting peripheralism of conventional economics as taught in our still underdeveloped economics departments is everywhere apparent, as can be seen in the quest for bolder and more coherent answers to the burning historical issues of our times. Samuelsonian economics with its neo-classical alibis and its spindly theoretical scaffolding is little more than a set of refurbished rationalisations of nineteenth century economic liberalism with nothing more to offer, or better still its offerings are so blatantly apologetic and irrelevant that it has earned the contempt of a rising body of academics in the nineteen sixties and after. Curricula need to be revised in the light of new phenomena, notably so with the advent of the multinationals and their dominant role in the framework of contemporary capitalism.

There are many critics who believe that the heavily bureaucratised and trivialised international agencies are incapable, out of sheer inertia and the power struggle in which they are entangled, of breaking new ground and becoming a source of spiritual and institutional renewal. Whatever the rationale of these critics may be, with this small and inexpensive publication we have the subject matter of a new discipline which can easily be woven into the economics curricula of our undergraduate and graduate courses. For this we should render homage to UNCTAD for its contribution in highlighting one of the vital issues of our time, viz, the problems of technology transfer and the anomalies of contemporary patent law. In so doing, it has contributed to raising the teaching and practice of development economics to a new level.

This is a small, factual, highly analytical and exquisitely written publication. It is divided into two sections: the first covering patterns and problems of technology transfer, the second negotiations of transfer agreement and national institutional machinery. With a broad but effective impressionistic brush the authors have given their readers a picture of the mechanics of the transfer of technology, proposed methods of studies at the product group level, contractual transfers of technology and costs of the transfer. With this text younger economists can come to grips with the exciting problems of the role of the multinationals in their interactions with the underdeveloped countries. Indeed, it can be said that the point of intersection where relationships between the multinationals and the developing countries are best revealed is seen in the marketing, distribution and sales of such technology from the rich industrialised countries to the endemically impoverished ones.

The form that such technological dependence assumes can best be glimps-

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

ANNOUNCEMENT REGARDING ISSUE OF 1,00,000 (9.8%) (FREE OF COMPANY'S TAX BUT SUBJECT TO DEDUCTION OF TAX AT SOURCE AT THE PRESCRIBED RATES) REDEEMABLE CUMULATIVE PREFERENCE SHARES OF RS. 100/- EACH FOR CASH AT PAR.

Applications will be made by the Company to the Stock Exchanges at Bombay and Calcutta for permission to deal in and for official quotations of the shares.

Persons interested in full details may obtain copies of the prospectus and application forms from the Company, the Brokers, the Underwriters and the Bankers to the Issue named below.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON TUESDAY, 4TH JUNE 1974, AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON FRIDAY, 14TH JUNE 1974, OR EARLIER AT THE DISCRETION OF THE DIRECTORS BUT NOT EARLIER THAN THE CLOSE OF BANKING HOURS ON THURSDAY, 6TH JUNE 1974.

MAHINDRA AND MAHINDRA LIMITED

(Incorporated on 2nd October, 1945, as a Private Limited Company under the Indian Companies Act, VII of 1913 and converted into a Public Limited Company on 15th June, 1955)

Registered Office: Gateway Building, Apollo Bunder, Bombay 400 039

HISTORY AND MAJOR ACTIVITIES OF THE COMPANY

The Company was incorporated on 2nd October, 1945 as a Private Limited Company under the Indian Companies Act VII of 1913, and was converted into a Public Limited Company on the 15th June, 1955.

The main objects of the Company are as set forth in its Memorandum of Association. In particular, they are to carry on the business of buying, selling, importing, exporting, manufacturing, treating, preparing and dealing in merchandise, commodities, machinery, tools, goods and articles of all kinds and generally to carry on the business of merchants, contractors, importers and exporters.

The most important branch of the Company's activities has been in respect of automotive manufacture. The Company manufactures the Jeep range of vehicles at its plants at Bombay under a licence agreement with M/s. Kaiser Jeep Corporation (presently known as Jeep Corporation, a Division of American Motors Corporation). As sole representatives in India of Jeep Corporation, U.S.A., since 1945, the Company has established a sound reputation for service and sales in respect of Jeep vehicles. It supplies Jeep vehicles to Government on the basis of a negotiated rate contract and has been exporting vehicles to both developed and developing countries.

The Steel Division of the Company is engaged in the import and sale of steel. The Electronics Division of the Company at Bombay and Nasik manufactures sophisticated electronic equipment like temperature controllers, gear-box controllers, capacitors, D.C. calibrators and foetus-monitors. The Company has a plant in Calcutta which manufactures process control instruments for the recording and control of variables such as pressure and temperature.

The Company has the following subsidiary companies :— Mahindra Owen Ltd., Mahindra Sintered Products Ltd., Indian National Diesel Engine Co. Ltd., Mahindra Electro-Chemical Products Ltd., and Indian and Eastern Engineer Co. Ltd.

OBJECTS OF THE PRESENT ISSUE

The Company holds an industrial licence for the expansion of its plant capacity to 25,000 Jeep Vehicles per annum, including the Jeep Forward Control truck and the Station Wagon. This expansion scheme is being carried out in stages. During the year ended 31st October, 1973, the Company produced 14,216 vehicles and it has now embarked on the next phase of the expansion programme to raise the production capacity to 18,000 vehicles per annum within the next two years together with sufficient quantity of spare parts.

The proposed issue of (9.8%) preference shares will provide a part of the additional finance required for the current phase of the expansion programme.

SHARE CAPITAL

Authorised :

1,00,00,000 Ordinary Shares of Rs. 10/- each	Rs. 10,00,00,000
Preference Shares :	
25,000 6% [increased to 7.80% in terms of the Preference Shares (Regulation of Dividends) Act, 1960] Tax-free Redeemable Cumulative Preference Shares of Rs. 100/- each	Rs. 25,00,000
1,00,000 9.8% (Free of Company's tax but subject to deduction of tax at source at the prescribed rates) Redeemable Cumulative Preference Shares of Rs. 100/- each	Rs. 1,00,00,000
1,25,000 Preference Shares of Rs. 100/- each having such preferential rights, privileges and conditions as may be determined by the Board of Directors at the time of issue	Rs. 1,25,00,000
	Rs. 12,50,00,000
Issued and Subscribed	
44,10,825 Ordinary Shares of Rs. 10/- each fully paid up	4,41,08,250
25,000 6% [increased to 7.80% in terms of the Preference Shares (Regution of Dividends) Act, 1960] Tax-free Redeemable Cumulative Preference Shares of Rs. 100/- each fully paid-up	25,00,000
	Rs. 4,66,08,250

NOW OFFERED FOR PUBLIC SUBSCRIPTION 1,00,000 (9.8%) (FREE OF COMPANY'S TAX BUT SUBJECT TO DEDUCTION OF TAX AT SOURCE AT THE PRESCRIBED RATES) REDEEMABLE CUMULATIVE PREFERENCE SHARES OF RS. 100/- EACH FOR CASH AT PAR.

TERMS OF PAYMENT AND APPLICATION

Rs. 100/- per Share payable in full on application. Application must be for a minimum of 5 Shares or multiples thereof. Applications may be made only by Indian Nationals resident in India, Applications from foreign nations and non-residents, or their nominees, will not be considered.

Applicants are advised, in their own interest, to submit only one application for the total number of Shares required by them, and not to make multiple applications. All applications must be in single names and not in joint names. Multiple applications and applications in joint names are liable to be rejected.

The Shares now being issued are subject to the Terms of the Prospectus, the Application Form and the Memorandum and Articles of Association of the Company, and will rank for Dividend from the date of allotment.

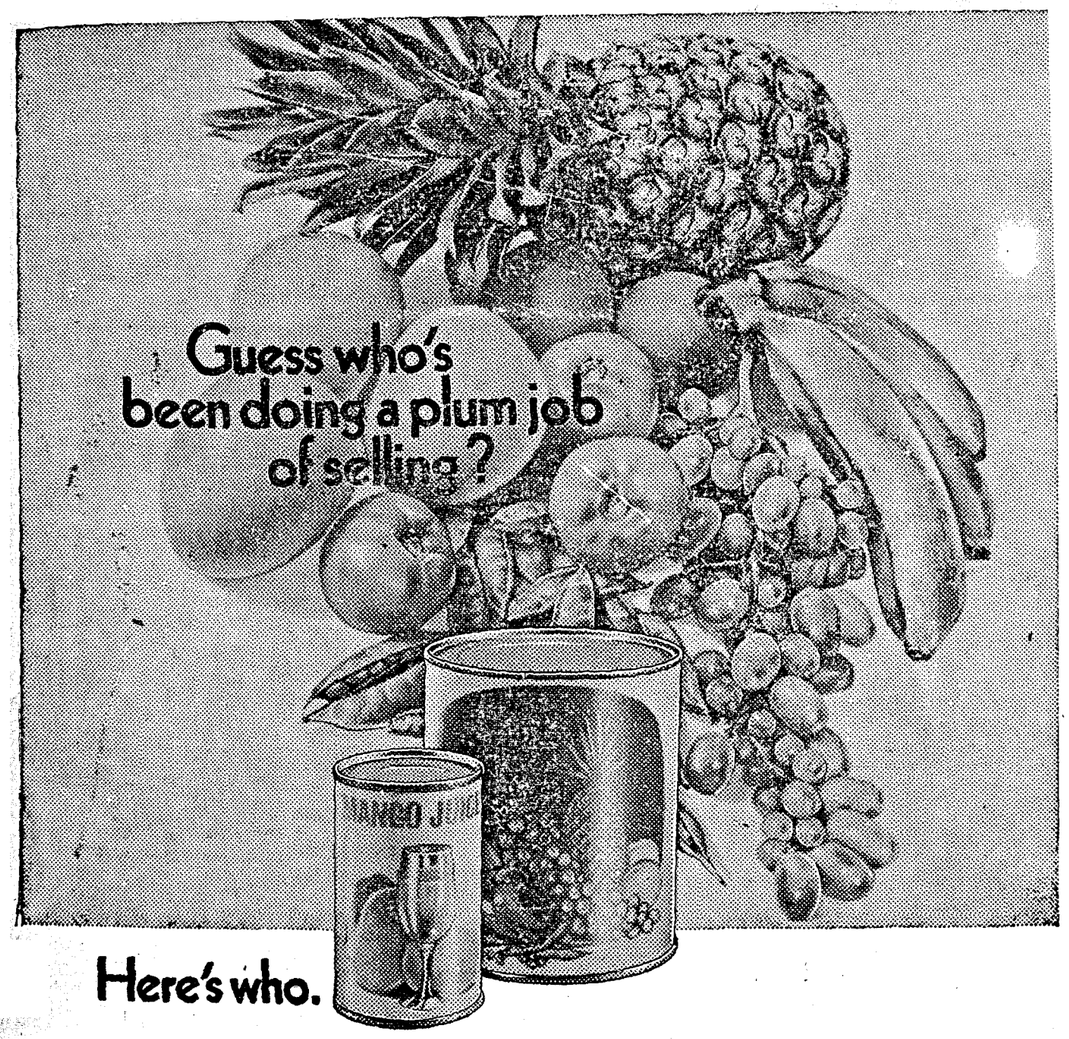
ed from certain data. The share of the underdeveloped countries in world patent grants was around 6 per cent of the total. But such a statistic is partial since only a small share, i e, only one-sixth is held by the nationals of these countries, the other five-sixths being granted to foreigners. This implies that the nationals of the underdeveloped countries hold no more than about one per cent of the world stock of patents or around 30,000 of the estimated current stock of 3 million valid patents. Here, perhaps, is one of the most gripping indicators of the process of underdevelopment, and one which has never been marshalled in the multitude of development texts in current usage.

Technology transfer is now taking place (if indeed it ever did take place) not according to the laws of the 'simple system of natural liberty' and the vaunted pristine price mechanism, but through the activities of at best a few dozen large multinationals, strikingly so in the chemical and engineering industries which are the lifelines of modern industrialisation. In such a world we are far removed from the *laissez faire* land of Samuelsonian economics where sellers are numerous; capital requirements are modest; a rudimentary technology is generally available and market entry in consequence is not difficult; the products of different sellers are largely substitutable and, in further consequence, no seller has the power to manipulate appreciably the price at which he sells; in other words, where market power is diffused for all sell at an externally and impersonally determined price. This is the Samuelsonian universe in which the Harry Johnsons, the Bauers, and the Friedmans frolic. Reality is different and it is the unequal power between the multinationals and the developing world which is revealed in the burden of technology transfer.

The UNCTAD secretariat has highlighted important data which have a direct bearing on the need to restructure international trade and modify present trading arrangements. Technology dependence is merely one facet of economic dependence and its other corollaries but its financial burden is already significant. The direct costs to the developing countries according to the secretariat's estimates consist of payments for patents use, licences, process knowhow and trade marks and amounted to $ 1,500 million in foreign exchange in 1968. This figure is expected to soar annually by 20 per cent to $ 9,000 million by the end of the seventies — or a six-fold increase. The exploitative dynamics of economic dependence seen through the prism of technological dependence can be better visualised if compared with other magnitudes in the developing countries: 5 per cent of their net investments; 8 per cent of imports of machinery and equipment (excluding passenger vehicles) and chemicals; 37 per cent of service payments on external public debts; 56 per cent of the annual flow of direct private foreign investment, including reinvested earnings; two and a half times the domestic expenditure on research and development. To be sure there are also the *hors d'oeuvre* of external royalty payments which climb as high as 10-30 per cent of sales and salaries for their consultants which, in some cases, are as steep as 50 times those paid to local personnel undertaking similar work.

Indirect Costs



In opposition to the direct costs there are the indirect burdens that assault the underdeveloped countries such as the now increasingly recognised overpricing of imports of intermediate products and equipment; accepting payment for knowhow by shares in the firms of the developing country rather than in cash (foreign exchange); a sustainedly high volume of repatriated profits of the wholly-owned subsidiaries or joint ventures; and price mark-ups for technology included in the cost of imported capital goods and equipment. In short, direct or indirect costs are tantamount to new forms of colonisation.

But if the direct and indirect costs are exploitative there is another aspect which the report stresses namely that "the technologies transferred to developing countries are themselves often inappropriate both as to factor-use and product type. Large-scale transfer of technology from abroad may inhibit development of local technological capability and thus make technological dependence on the developed countries virtually perpetual". The "may inhibit" which is the conventional fetish of the language of diplomacy could well be replaced by the more categorical "often does". With almost maddening understatement the report notes that "there may be a mistrust on the part of developing countries of possible foreign domination, particularly through the operations of multinational corporations. The possibility that national welfare might be affected by economic decisions taken in foreign countries is unpalatable for political reasons to most if not all of the technology-receiving countries". If anything the massive takeovers and strides of the petroleum and other major primary producers has set in train a movement that is irreversible and one which goes under the generic title of 'participation'. The impact of this powerful social current will ineluctably impart fundamentally new impulses to technology transfer and patent law by the end of the seventies or the middle eighties.

This work is recommended at both the undergraduate and graduate level for a variety of courses including micro and macroeconomics, development theory and international trade with special emphasis on the multinationals. It will open new vistas to teachers and taught alike as well as to those planners whose skulls have not become impervious to new ideas through years of repressive orthodoxy, inertia and institutional lethargy. How many developing countries, both large and small, have genuinely studied the political economy of technology transfer — apart from their ritualistic genuflections at international conferences — for the future of their peoples? Such studies would entail not merely defining national policies *vis-a-vis* the multinationals, but also by definition would contribute to outlining new forms of social engineering required for the restructuring of society as a whole.

What a genuine approach to transfer of technology involves is not merely greater international co-operation but a determination on the part of emerging nations to come grips with some of the salient inhibitors of economic growth and development. For those who believe that the multinationals are special creations — fixed and immutable historical categories — unamenable to control by nations and its peoples this book could be jettisoned. But for others it offers the 'theoretical practice' of new designs of social engineering.

It is to be hoped that in a subsequent edition readers of this book will be given more specific national and product case histories. Such pedagogic supplements would enable us to see the generalised unfolding of a historic process. This is all the more mandatory since technology transfer is destined to assume more strident proportions in the seventies — and this slender volume is, indeed, one of the most remarkable thoughtways blazed by an international organisation since the end of the War.

Right now somewhere, a can of delicious fruits is fast disappearing.

You don't even realise it but our cans have been helping to bring you the things you use every day: fruits and vegetables, baby foods, cosmetics, fish, ghee and vanaspati, pharmaceuticals, paints, motor-oils. All with their quality intact.

Our way of doing it is with the most modern technology.

We are an associate of the world's largest can manufacturer, the American Can Company. Through us, the fruits of their over $ 20,000,000 annual research and development programme are available to canners and consumers in India.

Which means, better and more cans for you, naturally.

Pattern of City Literacy

Gopal Krishan

Madhav Shyam

Cities differ strikingly in literacy rates which are related to their location, function, population composition and size. Their literacy rates also have a strong association with the literacy patterns of the areas in which they are located. Cities with a sophisticated industrial base or with a pre-eminence of administrative and educational services display higher literacy rates. Low literacy rates are characteristic of cities in which Muslims or Scheduled Castes form a substantial segment of the population. Broadly speaking, south Indian cities are distinguished by higher literacy rates than the north Indian ones.

THE Indian census classifies all those concentrations which have a population of at least 100,000 as cities and all those persons capable of both reading and writing a simple letter with understanding as literates. The 1971 census shows that 56.4 per cent of the city population is literate. Even if children younger than five years (all of whom are recorded as illiterate)[1] are excluded, the literacy rate would remain less than 65 per cent. This raises a number of questions: Why is a sizeable segment of the population in the cities illiterate? How do the male literacy rates in cities differ from those of female literacy? What have been the past trends in city literacy, specially since the beginning of the century?[2] How do cities differ in their literacy rates with regard to their location, function, population composition and size? This paper purports to investigate these questions.

The reasons for considerable illiteracy in Indian cities are to be understood in the context of the low literacy rate (29.5 per cent) of India's population as a whole. No wonder the migratory current to cities from rural areas as also from smaller urban places consists of a large number of illiterates.[3] The industrial structure of many cities is dominated by labour intensive, large-scale industries which can absorb illiterate migrants. Besides, a substantial proportion of the population in several cities, mostly of smaller size, is engaged in household industries, general labour, etc, for which literacy is not an occupational must. The higher incidence of illiteracy among persons belonging to the older age group, say 35 plus, also has a depressing effect on the literacy rate.

Above all, the excessive illiteracy among females brings down the percentage of literate persons. Of the illiterates in cities in 1971, about 55 per cent were females although they constituted only 44 per cent of the city population. The wide gap between the male and female literacy rates (64.3 per cent and 46.9 per cent, respectively) in the cities conforms to the pattern in rural areas and smaller urban places. Among the migrants to cities, the proportion of literate males is much higher than that of literate females,[4] accentuating the differential in literacy between the sexes. In 1971, about 70 per cent of Indian cities recorded more than half of their female population as illiterate. By comparison, only in five per cent of the cities did the proportion of illiterate males exceed 50 per cent. In fact, there is an inverse relationship between the male-female differential in literacy and the general literacy rate of various cities. If a city has a markedly low literacy rate, this is usually due to excessive illiteracy among females rather than among males. Nevertheless, there is a strong positive correlation between the literacy rates of the two sexes.

Any explanation for existing illiteracy in the cities must take into account

the backlog of illiteracy. In 1901, only 16.9 per cent of the city population was literate, the figure being as low as 5.4 per cent in the case of females compared to 25.9 per cent for males. Not even in one of the 25 cities was one-fourth of the population literate. Calcutta, the then capital of British India, had the highest literacy rate — 24.8 per cent. Madras ranked next with 22.7 per cent. Bombay recorded 19.1 per cent of its population as literate. In contrast, Srinagar, Jaipur, Delhi, Agra and Lucknow did not record even 10 per cent of their populations as literate.

The percentage of literate persons in cities increased to 25.6 in 1931. The female literacy rate rose faster (5.4 per cent in 1901 to 13.7 per cent in 1931) than the male literacy rate (25.9 to 33.8 per cent) though the former continued being much lower than the latter. Calcutta, with 39.6 per cent literacy, remained at the top. Baroda and Mysore, which were capitals of progressive princely states, Poona and Bangalore, which were emerging as prominent cultural and educational centres, and Howrah, Madras and Tiruchirapalli, which were respectively big industrial, port and religious cities, were the other places in which literacy exceeded 30 per cent. A majority of these cities were in south India. By comparison, most of the cities in north and central India recorded only 10 to 25 per cent literacy. Srinagar had only one literate person in ten, Delhi one in six and Allahabad one in four. Literacy rates were particularly low in cities with large Muslim populations. Looking at the total picture in 1931, more than three-fourths of the population in 17 out of the total of 28 cities were illiterate.

By 1961, the number of cities had shot up to 113 and their literacy rate to 51.8 per cent. Thus, while the city literacy rate had increased by 1.5 times during the first three decades of this century (16.9 per cent in 1901 to 25.6 per cent in 1931), it had doubled during the next three decades (25.6 to 51.8 per cent). This development was in line with the speedier progress of literacy after 1931 in India as a whole.[5] Not only were more people getting educated within the cities but the proportion of literate migrants to them was also rising. The female literacy rate in the cities advanced faster (13.7 per cent in 1931 to 40.7 per cent in 1961) than the male literacy rate (33.8 to 60.7 per cent) during this period. As a result, the gap between the two narrowed, though it still remained quite wide. The previous pattern of higher literacy rates in south Indian cities than in north Indian ones persisted. However, the cities in north-western India, which were marked earlier for their low literacy rates, improved considerably in this regard due, among other factors, to the influx of the relatively more literate non-Muslims from Pakistan and the outflow of many illiterate Muslims in 1947. The literacy rate of Delhi more than tripled from 16.6 per cent in 1931 to 56.2 per cent in 1961. The honour of being the most literate city went to Gauhati which recorded 63.7 per cent of its population as literate. Srinagar was at the bottom of the list with a literacy rate of only 24.8 per cent. It is worth noting that more than half of the population in 50 per cent of the cities in 1961 was still illiterate.

By 1971, the number of cities had gone up to 149 and their literacy rate to 56.4 per cent. The male-female differential in literacy persisted, the two rates being 64.3 and 46.9 per cent respectively. More varied were the differences between the literacy rates of various cities. Alleppey in Kerala recorded 70.1 per cent literacy, the figure being the highest for any city in India. At the other extreme, Rampur in Uttar Pradesh showed the lowest literacy rate of 31.3 per cent. Taking all the 149 cities into account, 42 recorded more than half of their population as illiterate; in 72, the literacy rate ranged between 50 and 60 per cent; and in the remaining 35 cities, the percentage of literate persons exceeded 60. Generally, the cities experienced an improvement in their literacy rates over the

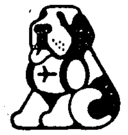
AIRCRAFT FANS' CORNER

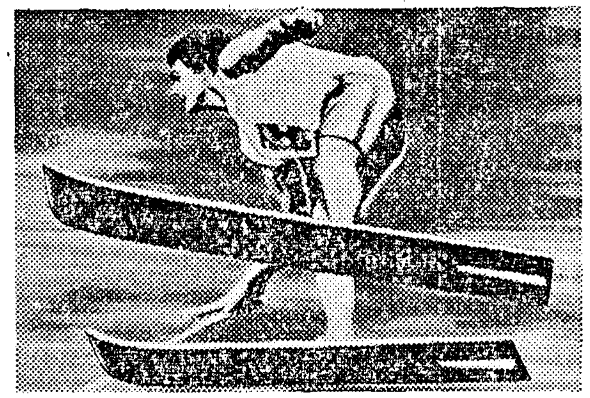
ONE OF THE quietest and lowest-emission wide-body aircraft, the McDonnell-Douglas DC-10, has been evolved into a special long-range version for the "KSSU group" of airlines (KLM, SAS, Swissair, UTA).

Tagged DC-10-30, it can carry 249 passengers, plus 108

Although not much smaller than the 747 B, the DC-10-30 has one row less seats: elbow room for the passengers.



cu. m. of cargo, passenger luggage, and mail. Max. range at full load: 7150 km. Cruising speed: 895 kph. Max. payload: 35 tonnes.



Swissair is using the DC-10 on six of its 12 weekly flights from Bombay to the East and the West.

SWISS NATIONAL DOG GIVEN NAME BY BRITISH

BIRMINGHAM—St. Bernard dogs, which have saved 2000 travellers from avalanches on the Great St. Bernard since 1670, were known simply as Alpine rescue dogs until a show here in 1862, when the breed was tagged with the name it now bears in all languages.

Aptly, it was St. Bernard himself who first said: "Love me, love my dog."

LANDING SEEN AS REAL PURPOSE OF FLYING

GENEVA—Air travel is merely a preliminary to going by riverboat, sleigh, mountain railway, on muleback, foot, skis, by canoe or sailboat to some valley, peak, lake, or historic town.

This is the message of a dozen colour brochures issued by a privately owned European airline* under the collective title of "Alpine Highlife."

The publications also advocate coming to a complete stop by renting a chalet, taking courses, or spending a couple of days getting to know one of 19 cities ranging alphabetically from Basel to Zurich and geographically from Paris to Vienna and Nice to Munich.

The Editors are sure that travellers to Europe will find these brochures a most valuable aid to wining, dining, sports, excitement, fun and culture.

Facts not worth knowing

DAVOS (Snowbeach)—The golf course here was laid out under the eye of Sir Arthur Conan Doyle, creator of Sherlock Holmes.

Davos is also the scene of Thomas Mann's novel *The Magic Mountain*.

★★★

LEAVING HOME WITH FOND BACKWARD GLANCES

BOMBAY—It has been almost positively established that a traveller on business or pleasure never leaves his country without a fond backward glance.

To help such a sentiment linger pleasantly on board a Swissair jet, the airline specially serves piping hot Indian vegetarian meals to those passengers from Bombay who request the same while booking.

This in no way decries the enjoyment of the other delicious meals served on board. The Editors also commend the airline's delectable Continental cuisine for those whose tastes run à la European.

The decision is indeed a difficult one to make as both types of meals are equally a gourmet's delight.

ANNOUNCING THE "BOMBAY-TOKYO EXPRESS"

Flash! Great news for Tokyo-bound travellers! Swissair now has a DC-10 flight non-stop from Bombay to Tokyo.

The flight, aptly named the "Bombay-Tokyo Express", leaves Bombay every Saturday night. Swissair is the only airline offering this express service, fastest from Bombay to Tokyo.

There is also a "Swiss Express" for those whose goal is Zurich. Every Friday night, a Swissair DC-10 whisks passengers from Bombay to Zurich non-stop.

STATISTICIAN CLAIMS THAT MANY VISITORS TO SWITZERLAND AREN'T

ZURICH—Of all the people who fly to Zurich, Geneva, and Basel airports in the course of a year, close to one million actually don't see Switzerland outside the airport, according to Emil Niggli, a transportation research specialist.

"It seems sort of a pity," Mr. Niggli said, "but on the other hand, the ones who do stop over on their way between the Far and Near East and Europe, Africa, and the Americas find things less crowded."

decade from 1961.

Before an attempt is made to analyse differences in literacy rates of cities belonging to different regions or to the same region, it would be useful to review the principal correlates of city literacy. Firstly, it is evident from Table 1 that the literacy rates of cities find a strong association with the literacy patterns of areas in which these are situated. The persistence of higher literacy rates in south Indian cities than those in north Indian cities is in conformity with the continuing relative differences in the literacy rates of the two areas.[6]

Secondly, the occupational pattern of a city is an equally strong factor in determining the literacy rate. Cities with a sophisticated industrial base requiring skilled labour (e g, Poona, Nasik, Bangalore, Ranchi, Jabalpur, Baroda) and those with a pre-eminence of administrative and educational services (e g, Chandigarh, Gauhati, Bhubaneswar) display higher literacy rates than those cities where a considerable proportion of the population is engaged in household industries, general labour or agriculture (e g, Varanasi, Bhagalpur, Malegaon). It is also notable that the literacy rates of state capital cities are generally higher than those of all the other cities in a state (Table 1).

Thirdly, the population composition of cities is another determinant. It is obvious from Table 2 that cities with a relatively high proportion of Muslims[7] are marked by low literacy rates. On the other hand, cities with a relatively high percentage of Christians (e g, Alleppey, Cochin, Quilon, Mangalore) are distinguished by high literacy rates. Also, a relatively high percentage of Scheduled Castes in a city has a depressing effect on its literacy rate.

Finally, despite great disparities in literacy rates of cities in a particular size category, the bigger cities as a group display higher literacy rates than the smaller ones. This is so because the bigger cities, by virtue of being greater centres of modern industry, administration and education, tend to attract a higher proportion of literate migrants. Thus, literacy rates of cities are related mainly to their location, function, population composition and size.

Although cities form only small points in an area, they fit into a framework of regional literacy rates. Table 4 shows that cities situated in the two most literate states of Kerala[8] and Tamil Nadu are distinguished by high literacy rates of more than 60 per cent. The same is the case with many cities in western Maharashtra and the Calcutta conurbation. Relatively high literacy rates (56 to 60 per cent) are characteristic of cities located in areas with an agro-industrial economy, such as the Ganges delta (West Bengal), the Punjab-Haryana plain, Gujarat state and the Bombay-Nagpur axis in Maharashtra. In contrast, low literacy rates (less than 48 per cent) are typical of cities in Uttar Pradesh, Rajasthan, north Bihar and interior Andhra along with its adjacent areas in Maharashtra and Karnataka. All these areas are noted for their subsistence agriculture economy. Cities in the remaining parts of India also exhibit relatively low literacy rates of 48 to 56 per cent. Almost invariably, city literacy rates are closely related to the various levels of socio-economic development in different parts of the country.

Notes

1 The 1971 census noted that 12.9 per cent of the urban population were younger than five years. In the absence of separate data, the same figure has been adopted for cities (which contain 52 per cent of the total urban population) for calculating the percentage of literate persons in the five-plus age group.

2 The definition of a literate person in the Indian census has remained the same since 1901 facilitating comparison of data recorded in various counts since then.

3 Among the migrants to cities, 41.8 per cent were illiterate according to the 1961 census. Due to non-availability of the requisite 1971 census data, the 1961 census data are being used to illustrate certain points.

4 The 1961 census revealed that 67.5 per cent of male migrants were literate as compared to 44.7 per cent of female migrants.

5 G S Gosal, "Literacy in India, An Interpretative Study", *Rural Sociology*, p 263.

6 The higher literacy rates in south India are attributed to a more sustained history of traditional learning, an early start in Western education, and the more vigorous efforts of Christian missionaries in this area.

7 Most such cities are in Uttar Pradesh, Bihar, Andhra Pradesh and Maharashtra showing a consistent pattern of low literacy rates. The excessive illiteracy among the Muslims, even in cities, is a subject for detailed investigation in the context of economic, social and political factors, all to be viewed in historical perspective.

8 It may be of some interest to note that the literacy rate of Kerala's rural population (59.3 per cent) is higher than that of the country's city population as a whole.

Camphor and Allied Products

CAMPHOR and allied products is participating in a joint-sector venture in association with the Meghalaya Industrial Development Corporation for manufacture of essential oils. Apart from providing technical knowhow for the project, it will hold 40 per cent of the equity capital of the new company registered under the name 'Meghalaya Essential Oils and Chemicals'. MIDC will take 41 per cent of the equity. CAP has also signed an agreement with 'Terpene Industries', which is establishing a project in Himachal Pradesh, for supply of technical knowhow for production of various terpene chemicals. Under the terms of the agreement, CAP has already received Rs 2 lakhs as fees for the technical knowhow and is also entitled to royalty at 5 per cent of net sales of alphapinene, betapinene, terpineol and longifolene for 10 years from commencement of commercial production. CAP's research centre at Baroda is carrying on research on better utilisation of by-products and intermediate products of the plant, and initial results have been encouraging. The company is also going ahead with its expansion project. Production of CP resin and betapinene is expected to begin in June this year and work on PMHP will start in the second half of the year and will be completed by June 1975. A capital expenditure of Rs 60 lakhs has already been incurred, and the company intends to issue debentures worth Rs 40 lakhs to finance the balance of the cost of expansion. Jayant Dalal, chairman, feels that the company will have to raise the prices of its products owing to all-round sharp rise in costs. With a 40 per cent power-cut in UP, where the company's plant is situated, and with the prevailing scarcity of diesel and furnace oil, the chairman feels that production will be affected although turnover in the first quarter of the current year at Rs 137 lakhs could meet the planned target. The company's exports were Rs 6 lakhs in the first quarter of this year, compared to only Rs 54,500 in the corresponding quarter of the previous year.

Inequality of Farm Incomes

A Comment

M L Dantwala

V M Rao

PRANAB BARDHAN's findings on *inequality in the distribution of farm business income in agriculture* ("Inequality of Farm Incomes: A Study of Four Districts", Annual Number, February 1974) raise a number of questions regarding the informativeness of the concentration ratio and its analytical utility in monitoring changes in land and income distributions. The purpose of this comment is to place these questions before Bardhan and other researchers in the field of income distribution in the hope that a consideration of these questions might be of some help in improving the usefulness of the concentration ratio as a tool in the analysis of inequality.

Negative Information

The difficulty at the outset in comparing two or more values of concentration ratio pertaining to different time-periods or communities arises in interpreting the observed differences as unambiguous indicators of improvment/deterioration in distributional equity. Ordinarily, the values being compared would be intermediate values rather than values close to the extremities (0 or 1). While the extreme values are relatively easy to interpret by associating them with states of near-equity or sharp inequity, as the case may be, the intermediate values seem to provide merely the negative information that neither of these simple prototypes fits the situations being observed. The difficulties of interpretation usually get further compounded by the embarrassing habit of the Lorenz curves of getting in each other's way and by the absence of any objective standard to classify the observed differences in the values of concentration ratio as small or large. It also needs to be borne in mind that the concentration ratio, by itself, provides no clues whatsoever regarding the features of distribution depending on absolute values of the relevant variable such as the proportion of population below the poverty-line or the proportion of farms below the viable size, etc.

The concentration ratio gets even less communicative, if not totally mute, when the problem is to assess the changing distribution of land/income in a given community over time. Let us first consider the case of distribution of land which would be changing over time through diverse modes such as dropping out of certain members from the community of landowners, acquisition of land by new members and the changing ownership of land held by the rest owing to purchase and sale of land and other types of transfers of land. Some of these would be in the nature of changes brought about through deliberate policies, others would be arising in the course of the attempts by landowners to get around these policies and still others would be the result of relatively autonomous factors like migration, inheritance, breakup of joint families, etc. It is obvious that a researcher's or a policy-maker's assessment of the changing distribution will turn much more on these modes of change and the factors behind them than on mere increase or decrease in a summary measure of inequality such as concentration ratio. To drive this point home, it is enough to note that events which are polar opposites of each other like imposition of ceiling on the one hand and growing landlessness of small owners on the other affect the concentration ratio in the same direction, viz, a reduction in its value.[1] In the case of distribution of income, the process of change is even more complicated since, unlike land, total income itself would be changing substantially over time and, in response, the distribution of income would be both changing its shape and shifting its centre.

It appears to us that Bardhan's findings are more helpful in seeing these limitations of concentration ratio than in comprehending the changes in the distribution of farm business income between mid-fifties and end-sixties in the four districts covered in his paper. His findings reveal one case each of clear increase and clear decrease in the concentration ratio with two ambiguous cases of changes in the Lorenz curve. Even the former cases do not provide any meaningful propositions based on the magnitude of change observed in the concentration ratio and, of course, no insights at all into the interaction of factors underlying the change. As noted by Bardhan, what the findings permit is a largely negative and tentative inference that, despite many policies and hopes aroused by the "green revolution", there would not still appear to be any general and discernible trend towards improvement in the distribution of farm incomes. While this is an important and relevant inference, we doubt that the extensive data of good quality used in the paper (cost-accounting data for over 350 farms in the initial year and for nearly 550 farms in the later year) can tell no more than this.

Common Knowledge

Much of what we have said above about the concentration ratio is a matter of common knowledge. To judge from the past experience, it is unlikely to have any inhibiting effect on the researcher's willingness to use concentration ratios in his work. It is, possibly, in the nature of researchers to turn instinctively to tools which are simple to understand and compute; the Cobb-Douglas function in production economics and Ordinary Least Squares estimation in econometrics are other notable examples of such tools in economics which remain in use despite many and continuing criticisms against them. It would, therefore, be more to the point to encourage researchers to accept certain ground-rules while making use of the concentration ratio to ensure a fuller and more illuminating analyses of their data. The two rules which should be of help from this viewpoint are the following. The first rule relates to situations in which the data are available only in the form of size-distribution of land/income with no further details in respect of the members comprising the distribution. In this situation, it would seem best to supplement the analysis using the Lorenz curve with indicators and measures based on appropriate absolute sizes of income/land such as poverty-line income, contemplated ceiling on holding, etc. The second rule relates to analyses of inequality covering field-material collected in village surveys and farm investigations. It appears to us that the most effective use of this material lies in portraying the process of change in the distribution over time as fully as possible within an appropriate conceptual framework such as movement of farmers up or down the "agricultural ladder". Hopefully, the results

With Best Compliments

of

BRAKES INDIA LIMITED

Padi, Madras 50

and insights obtained in such detailed portrayals would eventually cumulate into more general hypotheses about the changes in inequality and factors behind them in different broad settings and regions. The rule appropriate for this situation is to carry out the analysis based on the concentration ratio not in isolation but as a part of a detailed study of the changing distribution. It should not be beyond the ingenuity of mathematically-oriented researchers to work out suitable decompositions of the concentration ratio which help in integrating the analysis based on concentration ratio with the broader study of change. Unless some such helpful ground-rules are accepted, we are afraid that researches based on concentration ratio would remain scrappy and impressionistic and, besides, would imply ineffective use of data in an important and sensitive area of research.

Brief Recapitulation

We conclude this comment with a brief recapitulation of the findings obtained in a field study recently completed in the Department of Economics, University of Bombay.[2] The purpose of the field study was to analyse the impact of "Tiller's Day" legislation implemented in the old Bombay state in 1957 on the agrarian structure. The field material collected for the study consisted of family-wise data on ownership, cultivation and leasing of land from 36 villages located in three districts. The terminal year of the study was 1964. The indications of change revealed at different stages in the analysis of agrarian structure were broadly as described below.

(A) The analysis using Lorenz curve revealed that over the period 1957-64 the concentration ratio had decreased in 29 out of 36 villages. However, in most of these villages the decrease was nominal in magnitude and the cases of unambiguous improvement in the distribution of land were seen to be very few (only 7 out of 36 villages).

(B) The comparison of size-distribution of ownership holdings as between the initial year and the terminal year showed that the distribution had not undergone any material change over the period of study.

(C) While the indicators noted above suggested that the impact of the legislation on the agrarian structure had been meagre, the analysis of movement over the agricultural ladder of the families common to both the years of study showed a substantially different picture. To quote from the Report, "A comparison in terms of the size-class between the pre-reform (1956-57) and post-reform (1964-65) years reveals that out of the total of 3,854 families common to both periods, the size-class of as many as 2,969 remain unchanged; 767 families moved up the agrarian ladder, meaning that their size-class in the post-reform period was higher than that in the pre-reform period. As against this, 118 farm families came down the ladder ... the most predominant group which moved up the agrarian ladder is that of the landless. Out of 567 tenant families who were landless in 1956-57, 394 families acquired ownership of 1,749 acres of land. The next important group to climb up the ladder is that of the small holders. Out of 2,020 families, 269 moved up the agricultural ladder and only 23 moved down. The group, as a whole, acquired ownership of 1,743 acres of additional land. Out of a total of 68 large holders in 1956-57, 58 retained their status and 10 came down the agrarian ladder. The group lost 312 acres during the intervening period ... All this movement up and down the agricultural ladder cannot be attributed to the tenancy legislation only. Several factors were responsible for this change, such as break-up of families due to the death of the owner, inheritance and purchases and sales of land" (pp 69 and 70). An analysis of the transfers of land brought about by the legislation itself indicated the following net positions in respect of the different groups.

Size-Class (in 1956-57)	Net Land Gained (+)/ Lost(—) (in acres)
Large	— 1663
Big	— 537
Medium	— 125
Small	+ 827
Landless	+ 1311

It seems to us that the contrast between the picture of change as revealed by analyses A and B on the one hand and that obtained in analysis C on the other is striking enough to be brought to the notice of researchers. In our view, this contrast provides a good illustration of limitations of summary analyses of distributional changes and should also serve to emphasise the need to extend the analysis of change to the level of families, particularly those which exist in the sample throughout the period of study, and to distinguish between the different factors and components of change impinging on the distribution. It is also our feeling that "families" — rather than "farms" — are the more appropriate units of analysis to understand better the dynamics of changing land/income distributions in agriculture. In situations where the two terms may not necessarily refer to identical entities, the analysis in terms of "families" is likely to provide findings which are both more relevant and more readily interpretable.

Notes

1 This particular difficulty can be got over by treating people becoming landless as owners with zero land. The point, however, is the more general one that, as a rule, changes in the concentration ratio do not speak for themselves.

2 The detailed results of this study are contained in "Evaluation of Land Reforms", M L Dantwala and C H Shah, Department of Economics, University of Bombay, 1971.

National and Grindlays

NATIONAL AND GRINDLAYS BANK has extended its consultancy services by establishing a small-scale consultancy division in Bombay. The division will offer a variety of specialist services to assist entrepreneurs in the small-scale sector, including: management audit and review of small-scale industrial units: preparation of project feasibility reports and loan dossiers for small, medium and large scale units; assistance in systems design like budgetary control systems, costing systems, planning and control systems, production planning and information systems; formulation of marketing strategies, sales plan, distribution analysis and marketing research studies; management of small and medium sized issues; organisational development programmes; and locating matching financial partner for a technical entrepreneur, preparation of feasibility report and arranging finance. The Bank's small-scale consultancy division was first introduced in Calcutta in June 1973 and has made good progress in the first 11 months of its existence.

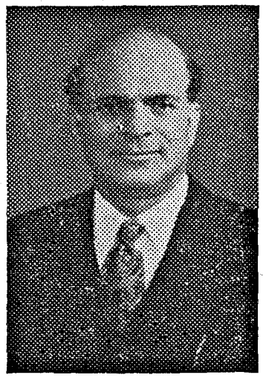
Statement by the Chairman
Shri Mulki Sunder Ram Shetty

THE following is the Statement by Shri Mulki Sunder Ram Shetty, Chairman, Vijaya Bank Limited at the Forty-second Annual General Meeting of the Shareholders of the Bank held at Mangalore on May 8, 1974:

LADIES AND GENTLEMEN,



I have great pleasure in extending to you a hearty welcome to the 42nd Annual General Meeting of our Bank. The Directors' Report and Audited Accounts for the year ended 31st December, 1973 have been in your hands for some time now and with your permission I shall take them as read.

ECONOMIC SCENE 1973

It is only natural for a developing country like India to have quite a number of riddles and problems to be resolved, particularly on the economic front. To strike a proper balance between the requirements of accelerated growth with stability and greater social justice is indeed a formidable task even under favourable conditions. As all of you are aware, many unfavourable conditions have been operating in our country during the last two or three years. The year 1973 was a year of acute shortages and unprecedented price rises. Inflation continued to be one of the most serious and one of the most difficult problems facing the country. A steep rise of 26 per cent in the wholesale price level was the most disconcerting development in the economy during 1973. Food articles and industrial raw materials together accounted for as much as 78 per cent of the increase in the wholesale price index.

The unsatisfactory performance both in the field of agricultural production in two successive years 1971-1972 and 1972-1973, and in the industrial sector in 1973 was mainly responsible for this unhappy situation. The economy had to face acute shortages of strategic raw materials, serious transport bottlenecks, power crisis, high prices and widespread industrial unrest. Among the important industries which suffered a setback in 1973 were cotton textiles, jute, steel, electricity generation, cement, aluminium, paper and vanaspati.

The Government had to import significant quantities of foodgrains, vanaspati oil and also important raw materials to supplement the inadequate supplies in the country which increased our import bill. The oil crisis which shook the entire world further aggravated the situation.

Shri Mulki Sunder Ram Shetty

But fortunately our good performance on the export front helped us to a great extent in filling up the gap between our import bill and export earnings. The deterioration in our balance of payments position has been contained within manageable limits.

On the international front, the oil crisis which was an offshoot of war in the Middle East created almost a chaotic condition both in developed and developing countries. Uncertainty continued to prevail in the international money markets following the floating of the major currencies of the world.

THE BANKING SYSTEM

In the banking field, 1973 was a year of momentous events. The developments of 1973 were marked by contrast to those of 1972. As I stated last year, an unusual situation developed in the country in 1972 when the banks had to bear the burden of a surfeit of funds without finding sufficient outlet for advances. The year 1973 presented altogether a new picture. The 'interest rate war' fought by the major banks in the field of advances in 1972 was shifted to the field of call and short notice money market in 1973.

Considering the difficult conditions that prevailed in the country, particularly the unrelenting pressure on prices, the performance of commercial banks in 1973 should be considered as satisfactory. The total deposits of all the banks reached the level of Rs 9,952 crores — an increase of 22.17 per cent over the previous year. The increase during 1972 was only 17.4 per cent. Total advances increased by Rs 1,466 crores from Rs 5,398 crores to Rs 6,864 crores showing a rise of 27.15 per cent over the previous year. The year 1972 recorded a rise of only 6.9 per cent. As regards the branches, the total number of branches increased by 1,646 from 14,739 to 16,385 bringing down the average population per branch to 33,500 from 37,000 last year.

CREDIT POLICY

The Reserve Bank of India had to keep diverse considerations in view while devising the credit policy measures during 1973. At times it had to act with greater vigour than at any other time. Probably, never before has the credit policy of the Reserve Bank of India been the subject of so much criticism and discussion. It was indeed as much a critical year for the central bank of the country as it was for the commercial banks and their clients. Many of the banks had to do a lot of tightrope walking. I am very happy to mention that though the Reserve Bank had to act with greater force, yet while doing so, it showed all sympathy and consideration to the commercial banks.

As you are all aware, one of the most important reasons for the steep rise in prices in our country has been the abnormal increase in money supply. The monetary scene in recent years has been marked by a very high rate of growth of money supply. The annual rate of growth of aggregate monetary resources went up from 12.4 per cent in 1969-70 to 17.7 per cent in 1972-73. There was a further expansion of about 14 per cent during the 9 months of 1973 commencing from April. In an attempt to fight inflationary forces by bridging the widening gap between the aggregate demand and aggregate supply the Reserve Bank followed a policy of credit curbs.

As I mentioned earlier there was very keen competition among the banks for advances as a result of excess liquidity in the banking system in the beginning of the busy season of 1972-73. But the demand for funds picked up particularly during the latter half of the busy season which continued to increase unabated even during the traditional slack season of 1973. Actually, the slack season ended with a record contra-seasonal credit expansion of Rs 294 crores.

The year 1973 has seen a few disturbing trends in the monetary field. As a result, a number of credit restraint measures were taken by the Reserve Bank in quick succession, particularly during November 1973. Bank credit expanded by Rs 712 crores between October 1972 and mid-March 1973. Deficit financing continued at a high level. Reserve Bank's net credit to the Government increased by over Rs 800 crores during the year 1972-73, on top of Rs 882 crores in 1971-72. The increase in money supply during 1972-73 was 15.7 per cent. All these developments made the central bank of the country take a series of measures to restrain credit expansion mainly by curtailing the lendable resources of the banks and by increasing the cost of lending to the borrowers from the banks. The Bank Rate was raised from 6 per cent to 7 per cent with effect from May 31, 1973. The net Liquidity Ratio was raised from 36 per cent to 37 per cent in March, from 37 per cent to 39 per cent in June and to 40 per cent with effect from September 8, 1973. The minimum cash reserve ratio to be maintained by the scheduled commercial banks was also raised in three stages — from 3 per cent of the aggregate time and demand liabilities to 5 per cent from June 29, and to 6 per cent from September 8, and further to 7 per cent from September 22, 1973.

The credit policy for the busy season extended and intensified the credit control measures already taken by the Reserve Bank, particularly since the end of the last busy season of 1972-73. Lendable resources of the banks were further squeezed. The Reserve Bank has directed the banks to observe a ceiling on credit expansion at about 10 per cent of the outstanding level of advances as at the end of September 1973 for sectors other than food procurement. The refinance from Reserve Bank was made dearer and its availability was restricted. It also introduced a ceiling on a bank's borrowings from the Reserve Bank. Borrowings in excess of the stipulated ceilings, were allowed under exceptional cases after detailed scrutiny. However, facilities for re-discounting of bills under the New Bill Market Scheme continued and the banks availed of this facility to a large extent. The Reserve Bank has also raised the maximum borrowing rates from 12 per cent to 15 per cent with effect from November 16, and also the minimum lending rates on loans granted by the commercial banks for different purposes.

All these developments in the monetary field really created uncertainty regarding the availability of credit and so a scramble for funds started among the borrowers. The banks also found themselves in difficulty while following the Reserve Bank directions. Though different banks were affected differently, competition among the banks for funds in the call money market pushed up the interest rate to unprecedented levels — even beyond 30 per cent.

However, it must be admitted that the Reserve Bank has taken sufficient care to see that the genuine needs of the priority sectors, particularly small-scale sector and the export sector are met to a considerable extent. Later, it even relaxed the 10 per cent ceiling on the additional credit given for export purposes.

On the whole, one must admit that the Reserve Bank acted with a sense of pragmatism and also with dynamism. We have also to admit that the experiences of 1973 have once again brought to focus the need for proper credit planning by the banks and for exercising financial discipline among the borrowers. It is our utmost duty to co-operate with the Reserve Bank in discharging their onerous responsibilities.

OUR BANK

I am indeed very happy to mention that 1973 proved to be yet another successful year for us. In spite of the difficult economic situation in the country and in spite of the new challenges we had to face in adjusting ourselves to the new developments that had taken place in the banking field as a result of the enormous increase in price rise and the credit curb, we maintained the tempo of our all-round progress. Our deposits reached the level of Rs 81.13 crores recording an increase of about 38 per cent over the previous year. This is far above the average rate of increase of 22.17 per cent in the banking system as a whole. Our rate of increase for the year 1972 was 35 per cent. Our advances during 1973 increased by 45 per cent whereas average rate of increase in the banking system was only 27.16 per cent. As regards the opening of branches we really created a history in our own way by opening as many as 63 new branches in one year — an average of one branch every six days. It may not be out of place to recall that the total number of branches of our bank in 1966 was 63.

You may recall that I became the whole-time Chairman of the Bank in 1969 and I hope that you are interested in reviewing the progress of our bank during these five years. During this period of five years — starting from 1969, the total deposits shot up from Rs 13.21 crores as at the end of 1968 to Rs 81.13 crores in 1973 — recording an increase of 514 per cent. Likewise, our advances recorded an increase of 494 per cent — it went up from Rs 8.82 crores to Rs 52.44 crores, while the number of branches increased to 247 from 89 showing an increase of 178 per cent during the same period. The paid up capital recorded an increase of 373 per cent — from Rs 13.83 lakhs to Rs 65.40 lakhs while the reserves showed an increase of 543 per cent — from Rs 7 lakhs to Rs 45 lakhs. The shareholders' return on their investment, in the form of dividend was doubled — from 6 per cent to 12 per cent. The total number of employees stood at 3,244 as at the end of 1973 while it was only 982 in 1968. I am very proud also to add that the above figures should not be taken as indicative of mere quantitative growth. Our people not only possess the required qualifications and experience but have also acquired the needed skill and training to function effectively indicating growth qualitatively also. Above all, they have gained the confidence to face the challenges they may have to face while discharging their duties.

We have expanded both functionally and geographically. The year 1973 marked a new phase in the expansion programme of our Bank. We opened a number of branches in North India, Rajasthan, Uttar Pradesh, Gujarat and West Bengal are the new States where we opened our branches last year. We also opened a branch in Goa — a Union Territory.

WORKING RESULTS

Considering the constraints and restrictions under which we had to operate, our performance was really good during 1973. While earnestly making an attempt to strictly follow the directions issued by the Reserve Bank in re-

gard to the credit policy in the national interest, we tried our best to make the best use of our resources. Though we opened a large number of branches in far off places and though there was considerable increase in the salary bill partly due to the revisions in salaries and allowances following the upgradation of the Bank into 'A' Grade in October 1972 and frequent revisions in Dearness Allowance paid to the award staff as a consequence of continued rise in the cost of living index in 1973 and partly due to the increase of about 1,350 employees during 1972 and 1973 we could have a net profit of Rs 14.62 lakhs. Our gross earnings recorded a rise of 44 per cent over the previous year. There was a slight increase in the working ratio of salaries and allowances to the gross earnings. It has gone up from 0.30 to 0.34 because of the reasons mentioned above.

Our advances during the year increased by 45 per cent. The average credit-deposit ratio stood at 66.85 per cent as against 63.5 per cent last year.

Priority Sector

The experience of 1973 has once again reminded us of the crucial role agriculture has to play in the economic development of our country. Apart from the usual schemes in 1973 we launched on new programmes in the agricultural field. Under the Village Adoption Programme, we have already adopted seven villages for intensive development. We have also taken up Minor Irrigation Programme with the assistance of Agricultural Refinance Corporation and the World Bank. Our total priority sector advances excluding exports formed about 30 per cent of our total advances out of which more than 30 per cent was given to agricultural sector.

Foreign Exchange

I am very happy to mention that though we started foreign exchange business just two and half years ago our performance in this field has been really encouraging. There has been a continuous increase in the volume of business.

In the year 1973, there was more than fivefold increase in export finance. Three more branches — Calcutta, Quilon and Calicut have been added to the list of branches which have been authorised to deal directly in foreign exchange thus taking the total to 11.

With an addition of 25 banks during 1973, now we have agency arrangements with over 85 leading international banks at almost all the important centres of the world.

Human Resources

I need not over-emphasise the importance of human resources for any institution. The progress of any industry, particularly banking being a very important service industry, ultimately depends upon the quality of its human resources. Therefore, it has been always our endeavour to develop them in whatever way it is possible. In the year 1973 more than 235 of the members of our staff including executives and senior officers received training in different fields at different places in and outside India.

Our Thanks

I am immensely happy to mention that I have always had the privilege of having the continued support and co-operation of my esteemed colleagues on the Board. I am extremely grateful to each one of them. My thanks are also due to the members of the Local Advisory Committees for their co-operation.

I also sincerely thank the Special Officer, other executives, officers and all the other members of the staff of the Bank for their unstinted loyalty and dedicated service. I am extremely happy that we continued to have excellent industrial relations.

I acknowledge with gratitude the co-operation and support we have received from our shareholders and customers and thank all of them for the confidence they have reposed in us.

Thank you.

Hindustan Lever Limited

Crisis in Oils and Fats — An Answer

THE following is the summary of the Speech delivered by Mr T Thomas, Chairman, Hindustan Lever Limited, at the Annual General Meeting of the Company held in Bombay on May 10, 1974:

1. Introduction

One of the major problems confronting our country and our business is the acute shortage of oils and fats which constitute the basic raw material for a major part of our business. Fifteen years ago, the Chairman of this Company, Mr S H Turner, spoke at the Annual General Meeting about India's future needs of oils. Today, I would like to review what has happened in the past fifteen years and to look ahead to the next fifteen years so that we can get an idea of the shape of things to come and evolve some ideas on how to meet the yawning gap between supply and demand for oils.

2. Importance of Oils and Fats

Next to foodgrains (105 million tonnes valued at Rs 9,700 crores), oilseeds (12 million tonnes valued at Rs 2,200 crores) constitute the second major agricultural crop in value. Furthermore, it employs over fourteen million persons, constitutes 13 per cent of the general wholesale price index, provides a vital nutrient (oils being required by the body as a vehicle for conveying vitamins) and contributes over Rs 100 crores towards foreign exchange earnings.

3. The Widening Gap between Supply and Demand

During the last fifteen years, there has been an agonisingly slow pace of a meagre 2 per cent compound growth per annum in the production of oilseeds in India, the actual supply of local oils rising only by 0.7 million tonnes (from 1.9 to 2.6 million tonnes) in those fifteen years. On the other hand, the demand for oils has grown by 1.4 million tonnes, thereby leaving a deficit of 0.7 million tonnes. This gap was only partially covered through imports of about 0.12 million tonnes during the last few years, with an uncovered gap of 0.6 million tonnes. This is a widening gap because with the increase in population and incomes, the demand is constantly growing while domestic supplies are nearly stagnant.

4. The Consequences of Widening Gap

Such a widening gap has had three major adverse effects, *viz*:

(a) It has resulted in a serious drain of foreign exchange. From being net exporters of oils till 1963-64, we have ever since been importers and spend nearly Rs 70 crores per annum in foreign exchange.

(b) There has been a steep rise in domestic prices from an average of Rs 1,980/- tonne of groundnut oil in 1958-59, to Rs 3,970/- tonne in 1965-66 and Rs 6,600/- tonne in 1972-73, with the maximum price reaching over Rs 9,000/- tonne in 1973.

(c) On account of shortage and high prices, the per capita consumption of oils and fats per annum has actually *declined* from 3.4 kg in 1958-59 to 2.6 kg in 1972-73 and the decline continues unabated. We have to contrast this low and declining level of consumption against a recommended minimum nutritional requirement of 20 kg per capita per annum.

5. The Grim Prospects for Next 15 Years

In 1973 many of us, as consumers, experienced a near famine in oils which became either totally unavailable or prohibitively expensive, especially in the urban areas and for the more vulnerable sections. The grim experience of 1973 is likely to be repeated unless we, as a nation, take remedial steps because the gap between supply and demand will widen further.

We estimate that with a modest growth rate of 4 per cent per annum in national income, the demand for oils and fats will increase to 5.9 million tonnes by 1989. If supplies continue to grow at 2 per cent per annum as in the past, the net deficit will be about 2.4 million tonnes. In other words, the deficit in 1989 will be equal to the current total supplies. This is indeed a frightening prospect because it will then lead to a steep escalation in the price of oils to anything between Rs 20,000 and Rs 25,000 per tonne — that is, 300 per cent over current prices! Corrective steps are therefore imperative.

6. Possible Remedial Steps to Bridge the Gap

It is relevant to note that during the last fifteen years, certain steps were taken by the Government and industry with encouraging but not adequate results, *viz*, (a) the increase in recovery and usage of cottonseed oil by the vanaspati industry and the increased usage of non-edible oils in soap-making, both achieved through fiscal incentives; (b) extension work in oilseed cultivation; and (c) substitution of soap by synthetic detergents.

As we look ahead to the next fifteen years, the possible remedies for dealing with the problem fall into two broad categories, *viz*, increasing supplies and exploiting more fully the world market opportunities.

7. Increase in Supplies

The major opportunities for increased supplies are as follows:

(i) Agricultural extension work in groundnut cultivation in the States of Gujarat, Andhra Pradesh and Tamil Nadu, to achieve a feasible 40 per cent increase in yield per acre to give an additional 0.4 million tonnes of oil per annum.

(ii) Recovery of rice bran oil by encouraging the use of sheller type rice mills to replace hullers. This can result in additional production of 0.14 million tonnes of oil and 1.1 million tonnes of rice bran extraction which can be exported for a price of over Rs 22 crores per annum. It will also avoid wastage of 0.5 million tonnes of rice which goes as broken rice in hullers today.

(iii) Extraction of oil from a major portion of the cottonseed produced in this country which is now fed directly to cattle without extraction of oil which is not required at that level for balanced animal nutrition. An additional 0.12 million tonnes of oil can be extracted by diverting all cottonseed from ginneries to extraction plants.

(iv) Cultivation of oil palm which has been successfully undertaken in Malaysia and can be done in the

Andamans or Kerala. This may be allowed to be taken up as a plantation crop by joint stock companies. By bringing about one lakh acres under palm cultivation we can produce about 0.2 million tonnes per annum of palm oil which is edible.

(v) Propagation of sunflower which offers the single largest opportunity for increased oilseed production in India. It is a short duration crop, drought resistant, with high oil content and reasonable yield per acre. We estimate that about 1.5 million hectares can be brought under sunflower cultivation in the next fifteen years to yield an additional 1 to 1.5 million tonnes of oil.

8. Export/Import Opportunities

A different set of opportunities exists for our country to utilise world market opportunities for export and import of oilseed products as follows:

(i) Barter trade in groundnut oil — As groundnut oil fetches more than 50 per cent premium over other edible oils such as soyabean and sunflower oils in the world market, it will make sense for us to export about 0.2 million tonnes of groundnut oil and import against it over 0.3 million tonnes of soyabean oil, thereby increasing our net supplies by 0.1 million tonnes.

(ii) There is a potential for export of about 20,000 tonnes per annum of castor oil as castor based chemicals and it is estimated that we could import about 40,000 tonnes per annum of edible oils against the value of these exports.

(iii) If 20 per cent of cottonseed extractions are exported, it should be possible to import about 70,000 tonnes per annum of sunflower oil with the earnings.

(iv) A further 40,000 tonnes of oil can be imported from the potential saving of Rs 14 crores of foreign exchange by 1989, if the lint from cottonseed is recovered and used by the rayon industry instead of importing pulp.

(v) Similarly by ensuring aflatoxin free quality of groundnut, India could export an additional 20,000 tonnes per annum of handpicked groundnut seed and improve the price realised on groundnut extraction exports by Rs 100/- tonne. These will yield an additional Rs 15 crores which could enable imports of another 42,000 tonnes per annum of edible oils.

9. Conclusion

To sum up, all the steps outlined above could augment indigenous supplies of oil by about 1.94 million tonnes per annum by 1989 and enable imports of an additional 0.3 million tonnes per annum approximately. These together will nearly cover the estimated deficit by 1989 of 2.4 million tonnes per annum.

Thus, through a series of planned remedies, it would be possible to avoid what would otherwise be an oil famine that will develop in our country. We have felt it our duty and responsibility as users of oils to present these recommendations and shall be willing to offer assistance where it is required and relevant.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting. Due to shortage of space it has become necessary to publish this brief summary of the speech, the full text of which is available from the Company Secretary.

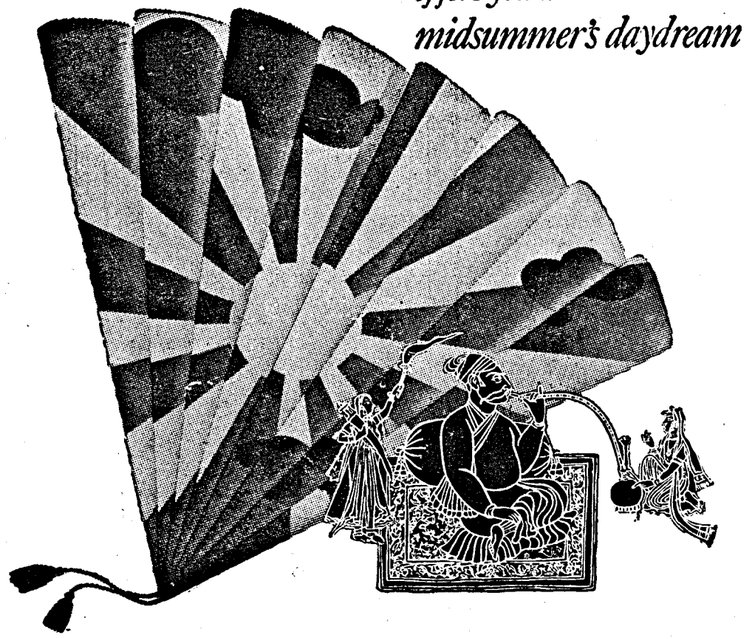
The Twelfth Seminar on

MANAGEMENT BY OBJECTIVES

(August 5 - 10, 1974)

PROGRAMME OUTLINE: Management by Objectives is a top management planning and control approach to improve performance of both the individual executive and the enterprise. To provide deep understanding of this new approach, the seminar will cover all the elements of MBO, including the concept and methods, setting of corporate and unit objectives, action planning, improvement of managerial performance, management job description, performance review, management development, process of implementation and role of management adviser. Indian case histories of MBO practice will also be presented.

ELIGIBILITY: This is a top management seminar designed for the executives of the private and public sector enterprises as well as the Government. Only chief executives and top executives directly reporting to the chief executives participate in this seminar.



PROGRAMME DIRECTOR:
Dr. B. L. Maheshwari.

FEE: Rs 2,000/- to cover course material, tuition, boarding, lodging, etc.

LAST DATE FOR NOMINATIONS:
June 24, 1974.

For brochure and nomination form, please write to:
The Programmes Officer, Administrative Staff College of India, Bella Vista, Hyderabad-500004.
Grams: BELLAVISTA — Phone: 36952/56
Telex: Hyd 015-390

The great Akbar offers you a midsummer's daydream

Forget the commonplace thought of heading for the hills.

This year take a different break from the sun.

The Akbar. A cool green oasis. Offering you impeccable service and five-star facilities.

Here at the Akbar there's so much more to discover.

The Madhuban—a rustic coffee shop with earthenware decor. Cool, quiet and secluded.

The Sheesh Mahal. Shimmering restaurant of bangles, beads and mirrors. Swinging nights of music and dancing.

A swimming pool amidst trellised vines. Tall drinks and a poolside barbecue.

Treasure hunting in the shopping arcade. A shopping complex, movie theatre next door.

Your room—a rosewood hide-away of peace.

The Akbar adventure. A midsummer's daydream.

Superiority that is sought after

Superiority that leads to outstanding performance when power is controlled effectively and dependably. You can expect this control from L&T switchboards and motor control centres—the widest range built for every application. These switchboards and motor control centres offer you other qualities as well, like minimum maintenance and lower operating costs.

Leaders in the field of low tension switchgear, L&T has the technical know-how to manufacture equipment to meet your specific requirement.

CONTROL POWER WITH L&T Switchgear

Cultivating Our Egos with Delight and Terror!

THE poet Alexander Pope once thought of organising a "Little Men's Club". The idea was that the little men should not be shy of being little. They need not wear high-heeled shoes to look tall. Pope had contempt for little men who wore high heels. India's successful 'peaceful' and 'contained' underground nuclear explosion is a classic case of a little man wearing "high heels"! It is, indeed, no more than that. It's an attempt to look "tall". But then high heels do not make you look a little ridiculous.

A lot has been said about the science and technology involved in this nuclear explosion. Nobody can deny that it has proved, if proof were needed, that Indian technological knowhow is not any the less advanced than, shall we say, China's. In fact an underground explosion requires a higher degree of sophistication than an atmospheric one. But who had disputed Indian technological competence? Who had disputed the strides India's science-elite had made in learning the not-so-secret lessons of nuclear theory? On the contrary, everybody has held the Atomic Energy Commission and the learned men in it in very high esteem, and so on. It is time somebody pointed out that this argument about science and technology has always been a bit of a hoax. All nations wanting to arm themselves have used "science" in a very unscrupulous manner and it is too late in the day for anybody to pretend that "science" will be used any differently in this country.

India is perhaps the only country to have gone nuclear with three-fourths of its population below the poverty line. Inflation, unemployment, hunger have become so commonplace that we have probably lost all ability to see the simple truth that you do not become a power, and certainly not a nuclear power, when you are on the threshold of economic chaos. Nuclear explosions, whether peaceful or otherwise, do not give a country the status of a power. They certainly confirm such a status if the country concerned is already a power. India's elite has given itself a nuclear toy. It is out wearing high-heeled shoes!

There is no doubt that the Indian elite takes itself very seriously. It must now be hoping that the United States will condemn its 'peaceful' explosion in harder terms. A paper like the *Daily Telegraph* welcoming the test may be a little inconvenient to our blue-eyed socialists. But then the more reliable Tass will relieve the anxiety. Tass has already reproduced the Atomic Energy Commission's remarks on the explosion without comment. It might do even better sooner than later. Meanwhile, the Americans can be trusted to make a silly statement so that the Indian explosion appears a genuine thing. The ideological problems are then taken care of. The progressive section of the national bourgeoisie, in its battle with reactionaries within the Congress and outside, has delivered the bomb — or rather a 'clean' explosion as the Prime Minister put it on TV the other day.

In a sense this explosion was inevitable. It is rather difficult for ever-expanding military machines now to settle for anything less than the nuclear weapon. It is a logical, and therefore unavoidable, extension of modern defence doctrine. Nuclear weapons are an inalienable part of it. It was always a little naive to hope that India would not go nuclear. No country which has a military machine of the size that India has can escape going nuclear. In other words, the explosion had to occur. Whatever categories of the national bourgeoisie that one may think of, none of them could have avoided it very long. And, of course, there is the toiling mass of humanity to pay the price. What is a little hunger and starvation when it comes to national honour, science, defence and what have you? When the kulaks and the officers and, of course, the neo-Brahmins get together as they have in our country, a bomb — or a peaceful explosion if you prefer it — was inevitable.

This does not however mean that it will not make an international impact. It will. Strange as it might seem this is the first nuclear explosion by a non-nuclear power which the super powers have chosen to ignore and which they may over a period of time even applaud. This confirms the alignment on our subcontinent. Attlee's nuclear blast had confirmed Britain's secondary status in the Western alliance system. We shall soon see that something similar has occurred here. In international terms the blast has isolated us within our regional framework. Bhutto's worries are not altogether unjustified. What is worse probably, it is only a partial isolation. Alignment with a super power prevents us from acquiring the privileges of total isolation. It only increases our dependence. India's dependence on the Soviet Union has come to stay. And what is regrettable in today's world as contrasted with the world of the fifties is that dependence on one super power necessarily involves dependence

on the other. The blast has confirmed our status as comparable to that of Attlee's England.

But even this may be an illusion, sheer make-believe. Attlee's England was not starving. Indira Gandhi's India is. You cannot play power politics on empty stomachs. So you take a little delight in an 'achievement' here and an 'achievement' there. As for the rest, use terror if necessary. It was Baudelaire who once said of some people that they "cultivate their egos with delight and terror". With the nuclear explosion the Indian elite has done just that.

India-Bangladesh Relations

Sharing Farakka Waters

THE joint declaration of the two Prime Ministers as well as the trade and long-term economic agreements initialled afresh at New Delhi between the governments of India and Bangladesh, are so much fluff. The four so-called 'joint' ventures emerging out of the agreements have been talked about for more than a year now. India was already committed to set aside close to Rs 50 crores worth of resources for the fertiliser, cement, and sponge iron plants; clinkers for the cement plant are merely a minor annotation. Similarly, right from January 1972, talks have proceeded back and forth on measures to prevent the smuggling of jute and other essential commodities across the border: sentiments expressed last week are, therefore, a reiteration of past ones. At various official and ministerial levels during the past two years, resolutions have been passed recommending concerted action for raising the unit value of jute in the world market; no concrete follow-up steps have been evident. The notes on trade arrangements initialled by the two Commerce Ministers contain a review of the progress of the trade plan entered into last year. Apart from a formal expression of hope that henceforth the performance would be better and movements either way would pick up, the ministers have no further tidings to convey.

Each of these was therefore in the nature of so much background music while the main debate was on between the two Prime Ministers over the disposal of the Farakka waters. Notwithstanding the window-dressing of the joint declaration, obviously no meeting ground has been found and the issue has been kept open. The Bangladesh Prime Minister delayed his departure by several hours, indicating some hard bargaining over the choice of words to go in the declaration pertaining to Farakka. That this issue would come to the fore, and would bear the principal responsibility for the gradual clouding of relations between the two countries, was predictable. So far as India is concerned, the problem of the disposal of the Farakka waters has both domestic and international implications. Even if the proposal of the former Union Minister for Irrigation and Power to unite in a common grid the waters from the Ganges and the Cauvery is taken to be a non-starter, there is the quite acute problem of arbitrating between the demand of the upper riparian states of Uttar Pradesh and Bihar for a greater share of the flow of the Ganges water for purposes of irrigation and the demand of West Bengal for a stepped-up release of water downstream so as to prevent the silting of the Calcutta and Haldia ports. Centrifugal forces are once more threatening to rear their head in the country; in case inflation continues unabated and economic and political confusion aggravates, the tussle between Bihar and Uttar Pradesh on the one hand and West Bengal on the other would, if anything, further intensify. On top of this would be the problem of deciding the distribution, between Bangladesh and West Bengal, of whatever quantum reaches the barrage at Farakka. The battle of 40,000 cusecs is hence still very much on. While New Delhi does not have to deal with the Government of Pakistan any more on this issue, as far as substantive questions go, there is no perceptible difference at all between the stance adopted by Pakistan on the issue in the early 1960s and that now adopted by Bangladesh. It is therefore going to be a long haul.

Enthusiasts abound who are convinced that the enduring solution lies in an arrangement, similar to the one implemented for the Indus Valley, for a multi-country, multi-river authority for drainage, irrigation and water management in the lower Ganges-Brahmaputra basin; such a scheme, if carried out, could, once and for all, solve several outstanding major problems for Bangladesh, Assam and West Bengal. Even assuming the concurrence of the governments of the two countries, the implementation of such a project would call for massive investments and meticulous planning spanning over several years. At a certain point of time in the recent past, the World Bank and Robert McNamara had expressed a certain keenness to father a scheme of this nature. The Government of India, for a number of reasons, has been perceptibly less enthusiastic. Bangladesh, which hopes to be the greatest beneficiary in case the project could be pushed through, has an understandable gleam in its eye: if only India could be persuaded to fall in, it is being argued in Dacca, big money could be obtained from abroad. This is, however, hardly a matter of mere technology or economics; geopolitical issues too are involved. In the case of the Indus Valley project, in addition to funds from international sources that were pumped in, the Government of India was also called upon to make a substantial contribution. Whether India would be equally eager to make a similar contribution for a Ganges-Brahmaputra project would depend as much upon its geopolitical implications as upon an assessment of the concrete benefits accruing to the eastern states. On the other hand, if procrastination is considered to be the most efficacious instrument of policy, Farakka would emerge as a great spoiler of relations between the two countries.

Metals and Minerals

Irrational Pricing

Magnus writes:

THE phenomenal price increases in the world's metal markets have been matched by rise in prices in the Indian market. The price increases highlight the opportunities we have missed in the mineral field in the last ten years. What is truly startling, however, is the manner in which the government and public-sector bodies are reacting to the situation, particularly in the matter of price-fixation. Two cases in point are those of zinc and of rock-phosphates.

There are two zinc producers in India. Cominco-Binani in Kerala smelts imported concentrates, with a smelter capacity of 20,000 tonnes metal per year. Hindustan Zinc has its own mines, concentrator and smelter in Udaipur, with a capacity of 19,000 tonnes (now being expanded), and another concentrator on the way at Vizag, based on imported concentrates for the time being. The prices of concentrates have no doubt increased internationally, but by no means in the same proportion as those of the metal. Certainly, HZL's costs cannot have gone up in line with the London prices which went up from around £ 220 to £ 840 per tonne between April 1973 and April 1974. And yet HZL's selling price of zinc metal has now been increased from Rs 9,000 to Rs 15,000 at one stroke. What is the justification for this price hike? HZL's predecessor company was nationalised because it had asked for a selling rate of Rs 3,200 about 10 years ago, and which the nationalised company was then promptly allowed. Further, by-product cadmium from both smelters is now selling at a healthy premium world-wide, as also by-product lead. All of which makes the rise in zinc prices allowed to HZL and Cominco-Binani unfair to the consumer. The latter would now be paying its Canadian partners more for the concentrates, and remitting higher dividends, both in hard currency.

The case of rockphosphate pricing is even more bizarre. The Rajasthan government used to make a clean profit of approximately Rs 80 per tonne on rockphosphates; this it did by the expedient of appointing a semi-government raising contractor (Bikaner Gypsums), paying it Rs 46 per tonne and selling at Rs 140 or Rs 150 per tonne to fertiliser plants. BGL tried unsuccessfully for four years to get a price increase to meet rising costs and it was ultimately fully taken over by Rajasthan government last July. It immediately received additional funds to the extent of nearly Rs 75 lakhs for purchase of heavy equipment, and more funds are in the pipeline. But this was not enough for the new government company: it has received a price increase, retrospectively from January 1973, of Rs 24 per tonne and the amount is now being paid to it. As from April 1974, the price is no less than Rs 96 per tonne, that is more than double the price which was considered satisfactory for the firm when it was partly privately-owned.

The secret is in the sale of this rockphosphate to the consumer: Rajasthan government has been watching international prices, and is now generously offering this mineral at prices ranging upto Rs 550 per tonne, as against Rs 150 last year. The profit on sales is booked as government revenue and is exempt from income-tax of any kind. What could be the justification for raising more than four-fold the price of a fertiliser input?

Aluminium prices have been increased by 25 per cent, from Rs 4,000 to Rs 5,000 per tonne from May 17 as a result of the Cost and Prices Bureau's study of costs. Aluminium is a good test case of the government's intentions of controlling prices because, unlike zinc or rockphosphates, there is almost no import of aluminium into the country and hence the so-called principle of import parity applies even less. But world prices have started moving up after a long period of stability. Jamaica, the largest exporter of bauxite, has steeply increased royalty and taxes on the mineral, and this is bound to raise US prices from this month, probably to the region of Rs 11,000 per tonne. What then will be the Indian fixed price? Because all aluminium is at present produced by private sector companies, there may be little sympathy for them — at least until the next general election comes near. Or possibly the authorities will wait until Bharat Aluminium's plants finally go into production to conclude that, after all, aluminium cannot be produced any cheaper in India than elsewhere in the world.

Finally, one cannot overlook copper, the major metal imported into India, and which represents the greatest missed opportunity in the mineral industry. The Khetri project of Hindustan Copper has a projected capacity of around 31,000 tonnes of metal per year and every assessment has shown that it is an economically viable venture at a product price of around Rs 9,000 per tonne. (The project's estimated cost has moved up from Rs 65 crores in 1966, through Rs 90 crores and Rs 115 crores at three-yearly revisions, to the present figure of Rs 127 crores.) But the international price of copper which was in the £ 400 range for many years went up to £ 640 last May, and to over £ 1,300 in May 1974. HCL's acquired complex of Ghatsila was, and presumably is, comfortably profitable at a price of Rs 10,000 per tonne, i e, say £ 500. Where then will HCL fix its selling price? Between it and the MMTC, the price can be fixed at any level, and where they fix it will show whether the government is at all serious about keeping prices of industrial raw materials as low as reasonably possible.

These examples cover cases where India is largely an importer of the commodity, where there is substantial local production and also a fair proportion of imports and, as in the case of aluminium, where a fair degree of self-sufficiency has been achieved. The products affect all kinds of industrial goods, particularly electrical goods which India hopes to export in increasing quantities. Our steel, and our metals, can now be produced at competitive prices but unless internal prices are de-linked from international prices wherever possible, the country as a whole will derive no benefit at all.

Secondly, rising world prices make it more urgent than ever that the public sector undertakings begin to show larger production immediately. At current prices, the total loss due to delay in the Khetri project alone has reached a figure of about Rs 500 crores, all of it in hard currency. Reduced availability of copper and zinc (and their alloy, brass) retards many other downstream industries, which adds further to the burden. And the loss through low production and over-pricing of rockphosphates can be measured in millions of tons of foodgrains. It is time to stop this irrational use of the pricing freedom given to state enterprises and to make them concentrate on producing more.

Paper

Many Drags

PAPER prices are around Rs 3,500 per tonne at present. Between May 1973 and January this year they rose by between Rs 1,100 per tonne (MG poster white) and Rs 1,950 per tonne (MG coloured). The industry has sought to justify price hike in terms of the rise in raw material costs. Royalty payments for bamboo have gone up considerably (for example, royalty rates have been raised from Rs 7 to Rs 18 per tonne in one case and from Rs 20 to Rs 40 per tonne in another); the cost of chemicals has also gone up, particularly that of caustic soda (by about Rs 350 in the last six months). The industry has taken full advantage of decontrol to make up for what it might have missed by way of profits during the control era. Simultaneously, it continues to complain of the high cost of new investment, difficulties of securing raw material and the like.

No new investment has been made in the paper industry in recent years, except for two medium sized units being set by the public sector Hindustan Paper Corporation. And the only expansion that has taken place has been through so-called crash programmes, which aim at increasing production of paper through suitable modifications in paper machines already installed. There are some new projects proposed to be set up in Uttar Pradesh and Madhya Pradesh. But the output from them will not be available for another five to six years.

One of the major problems with regard to expansion of capacity in the paper industry is the absence of production facilities on the paper machine side. Lack of design facilities is largely to blame for this, but surprisingly no effective steps have been taken to strengthen our design capabilities.

Profitability in the paper industry is better than the average for all industries, all the complaints of the industry notwithstanding. The paper units have achieved this by switching over to special varieties of paper. Over the last five years the share of industrial paper in total paper output has been on the increase. The share of writing and printing paper in total output has thus been declining while its prices have continued to rise.

This has brought forth the demand that at least for educational purposes writing and printing paper should be made available at around Rs 2,700 per tonne. However this is unlikely to find favour with the industry. What the government could do is to insist on a minimum production of writing and printing paper — say, 60 per cent of the total output. This would not be enough by itself, however; the government would have to fix the price of writing and printing paper — at, say, Rs 3,500 per tonne.

One aspect of the paper industry which has not been examined in detail is its selling and distribution practices and arrangements. At least some companies have sole selling agents and almost all have distributors. In the context of a sellers' market, it is worth considering whether these arrangements have helped the industry at all.

Calcutta Diary

A M

NO, the blast was by no means a sophisticated one. It was coarse, as coarse as crudity could go. For at least the past five years, it was known that our scientists are capable of setting off a nuclear device with a thrust of upto around 20 kilotons. Since the capability was there, the actual assembling and detonation of the device is not much more than an empty formality. Unless, of course, the government is determined to have a bomb: if its protestations are to be taken at face value, it is not. As for the supposedly peaceful uses to follow the blast, one's first impulse is to break out in a Nixonian expletive: an administration which, over a number of years, has been unable to set right the troubles bedevilling the nuclear power plant at Tarapur should have the decency to stay away from the theme of how, henceforth, the atom was going to be deployed for peaceful purposes.

But a wayward government would try anything in its desperate hours. In private conversations during the past several months, several times, one has heard the wry comment: to break out of the impossible corner where they have played themselves in, the authorities might look around for some spectacular extravaganzas — such as an atomic blast. That even such grotesque jokes are made to come true indicates the state of neurosis gripping New Delhi. In the process, a reluctant admission is now also wrested from that other group of agnostics: it cannot be said any longer that everything the radicalist scriptures say is bosh. The dogmatists of the Left have always maintained that, when cornered, a reactionary regime will scrounge around for diversionary tactics: if the masses are seething with discontent, while measures necessary for assuaging this discontent hurt the class interests of the ruling groups and cannot therefore be recommended, the thing to do is to divert the people's attention away from the realities of everyday life to some ersatz concoction, such as a border war, or some other equally cynical device which could detonate an emotional fervour, Category Patriotic. This, you might think, is again much too crude an analysis. But you have only to scan through the statements gushing forth from the state chief ministers and the ruling party's stalwarts in the wake of the Jaisalmer blast: in a collective Pavlovian response, each of them has rubbed it in that the explosion once more vindicates the greatness, nobility and brilliance inherent in the leadership the nation has been fortunate to receive from the Prime Minister. The line-toeing newspapers have followed suit: the lead picture, nearly everywhere, is the Prime Minister's, and not of the backroom scientists and technicians, and the editorials have talked, as the Americans say, 'hopefully', almost in the manner of Seventh Day Adventists, of a consequential, coming resurrection of the Indira wave. They have taken the blast — rightly — to be an act of preponderantly political import. The explosion, the Prime Minister has gone to considerable lengths to assure the Press, is nothing to get 'excited about'. Such sophistication is however lost on a Shankar Dayal Sharma or a Siddhartha Sankar Ray. They, simple souls, would take the detonation for what it surely has been intended to be: a lifebuoy, an attempt to refurbish the government's sagging image, a *deus ex machina* to drown the tale of inflation and the crippling railway strike in the cacophony of manufactured raptures a successful blast could be expected to give rise to.

The costs and benefits must have been carefully gone into. The costs are enormous. After the April signing of the tripartite agreement between this country, Pakistan and Bangladesh, a genuine possibility was opened up, perhaps for the first time in several years, for a season of subcontinental *detente*. Pakistan was visibly happy over what it got out of the New Delhi meet: Bangladesh in its turn could extract a formal recognition, granted grudgingly or otherwise, from Pakistan, a recognition which was akin to a passport to the United Nations. India too made the best of a bad job, and at least succeeded in cutting its losses. A suggestion of stable peace had seemed to hang, however thinly, in the air. Now, with the blast, everything will once more be set topsy-turvey. Zulfiqar Ali Bhutto has been handed a beautiful alibi for pressing down hard upon the administrations of both the United States and China — who now will have to help *his* government assemble a nuclear toy or, alternatively, pump in more arms and defence assistance. The king-emperor of that livid Zoroastrian State, Iran, lush with oil funds, would be equally caught up with the idea of acquiring a contraption which could illuminate the horizon brighter than a thousand suns. Once the atmosphere has thus been churned up, you would need little further provocation for steeply adding to India's defence budget. If, as a result, some further funds have to be taken away from the investment kitty and thus the nation's rate of economic growth is further stunted, ah, well, that cannot be helped. Cabinet ministers and members of Parliament, carried away by patriotic blues — true as much as false — would thunder, to the accompaniment of applause: the nation's defence and security and honour must take precedence. The budget grants for the Ministry of Defence would be quickly passed, to be followed by tea at Rashtrapati Bhavan, never mind who its occupant might be.

All this has evidently been considered worth it. The blast fits, snugly, into the frame of the policy for total confrontation. Total confrontation calls for total mobilisation. The recalcitrance of the railway employees has to be answered. The unreasonable people who demand the control of inflation have to be silenced. Those who insinuate about corruption in the highest quarters have to be blasted off. More modest weaponry must have been considered, and rejected. Desperate situations call for desperate remedies. The authorities, you or I might argue, would have enhanced their credibility if they had held off the explosion till the railway strike was over. Apparently, such civilised modes of behaviour have been ruled out of order. A government at bay decided to reply to the striking railwaymen with a bang-bang. It is a pity, you or I might say, that the scientists had to be dragged into this messy business, and made to play, in whatever remote manner, the role of strike-breakers. But this, after all, is what alienation is about: under the given system, never mind whether a nuclear scientist or a functionary of the Planning Commission, you are merely a species of wage-labour, you do not control either the instrumentalities or the modalities of your output, you receive your subsistence packet, and go home to drown your sorrow: some drown it in Scotch whisky, some others write transcendental poetry.

Unfortunately for the government, perhaps it is later than it thinks. Time is an important determining variable, adding to, or otherwise detracting from, the potency of even kilotons. A week has gone by, and May 18, 1974 promises to acquire none of the halo of either July 19, 1969 or December 16, 1971. Death is apparently failing to double up as Resurrection.

One, alas, writes as one feels, as one experiences. Are the above paragraphs jaundiced, unfair, biased beyond redemption, the outpourings of a sick mind? You circulate, and talk with people, any cross-section of them: housewives, labourers, students, clerks, teachers, shopkeepers, street vendors. True, they worry little about Pakistan's reaction to the blast, nor are most of them, at this juncture, overly concerned with its long-range implications; for example, its impact on the country's defence expenditure, and, therefore, by inference, its capacity to resume the process of economic growth. But — you will be surprised — the harassed housewife has nonetheless come a long way; maybe this is how environment works upon one's state of consciousness. She will not let you go, she will demand a straight response from you: what is the link between the blast and the nation's current economic plight, will it lead to a lowering of prices, to a greater supply of essential articles in the market, to a reduction in the level of nepotism and corruption, to an improvement in the supply of power, coal, kerosene? The blast is excellent, she will, caustically, inform you: where, however, do we go from here...?

For how does one get around the obscenity of it? Each of the other governments which preceded New Delhi in presenting the world with a series of nuclear explosions had the decorum to ensure food for its people. Here, the story is somewhat different: we are in a position to crack the atom, but are in no position to crack the resistance of the greedy farmers and traders who are sitting pretty on the heap of the wheat crop. Some kilotons present a greater challenge than some others. Some challenges are taken up, some are *not*. Discretion is the better part of valour.

LETTER TO EDITOR

Determinism vs Individual Choice

APROPOS of AM's concluding remarks in the Calcutta Dairy dealing with the death of Buddhadeva Bose (March 30) in which he laments, like most Marxists, Buddhadeva's failure to make the right kind of choice, one feels prompted to observe that the talk about choice, and individual choice at that, coming as it does from the pen of one saturated with Marxism, is the most weird thing conceivable. What I should like to know is: Does AM maintain like, say, Sartre that one is free to choose to be a revolutionary? Such a view of the revolutionary potentiality of an individual would be quite tenable, as it is in the case of Sartre, if and only if AM were ready to strip Marxism of its deterministic core and locate this revolutionary potentiality within the sphere proper to it, namely, the sphere of free authentic individual choice. Perhaps, I am afraid, AM is not fully aware of the implications of the moral issue here involved: his stand is that of neither a good Marxist nor a consistent propounder of free will or any of its Kantian variants.

AM's theoretical contradiction comes to a clearer and sharper focus when we consider that he has accused Buddhadeva of having failed to make the correct and unambiguous social choice. Disregarding for the moment the specific content of his accusation against 'poor BB', we may point out that inasmuch as it was a moral failure, which in AM's opinion it surely was, it was to that extent a personal failure; but here, perhaps without realising it himself, he shifts the burden of the choice from the domain of the collectivistic historical forces to the sphere of individual conscience.

However, this contradiction is nothing new among orthodox Marxists. While they have all along denied rather vociferously the effectiveness, and in some cases the very existence, of authentic individual choice, curiously enough, their lives have often belied the soundness of this philosophical position: despite their class orgins Marx, Engels and Lenin could commit themselves wholly to the task of revolutionary transformation of society. To explain away the evidence of the revolutionary individuals' capacity for transcending the class limitations, they have, it is true, invented the theory of declassed individuals; but the theory goes only to corroborate the ethical view of man which considers him as more or less a free moral agent. Only Marxists have had to make room for such an admission against the overwhelming odds of an economic determinism. Their admission of this inalienable freedom of individual conscience, as a result, has never been woven into an integrated ethical theory.

That the problem is central to a responsible theory of individual commitment has been admitted by even Marxist thinkers. Years ago, N Bukharin wrote in his "Economic Theory of the Leisure Class": "Marx examines the causal nature of the resultants of individual wills, without examining the latter in themselves; he investigates the laws underlying social phenomena, paying no attention to their relation with the phenomena of the individual consciousness."

B M

FINANCE MINISTER Y B Chavan's letter to state Chief Ministers on the need to exercise discipline in expenditures and raise additional resources has only elicited frivolous comment. Wide publicity was arranged for the letter which has warned the state governments that the Centre will not give them any more special accommodation and that they will, therefore, be well advised to cut down low priority expenditure and embark on additional resource-raising. But only a couple of weeks earlier when the Reserve Bank had refused to honour the cheques of the Karnataka government and Kerala also had reached a similar position, all that the two state governments had to do was to come rushing to New Delhi and secure authorisation for special accommodation. This will always happen as the state governments cannot be left in the lurch in such a situation and they know it. If the Finance Minister were to prove difficult, the state chief ministers can always go over his head.

This is not, however, the most important aspect of the Finance Ministry's directive to state governments about the management of their finances. What is important is that the state governments have been asked to take measures at once to raise additional resources. The measures proposed are not new — securing a better return from past investments in irrigation and power through higher irrigation and electricity rates, some form of tax on agricultural incomes and several other suggestions of a similar nature which have been discussed between the Centre and the states in various forums and on different occasions for the last ten years. There is always agreement in principle on these measures, but nothing gets done in practice. There is much scope for taxing the agricultural sector and the case for taking steps to raise resources from this sector is so well established that it is not necessary to go over it again. What then stands in the way of action in this crucial area of resource-raising?

Vast sums have been pumped into the development of agriculture in the last two decades. Most of these resources and the benefits arising from their use have been monopolised by a narrow upper crust of rich farmers. At the same time, adequate returns from these investments have not been forthcoming. Thus even the operating costs of irrigation works and power schemes are not recovered. The Venkataraman Committee had gone into this question way back in the mid-sixties and recommended increases in irrigation and electricity rates. Though these recommendations were accepted by everybody, they have not been implemented. Similarly, the question of taxing agricultural incomes, both from the point of view of social justice and raising resources for development, was raised by D R Gadgil, the then Deputy Chairman of the Planning Commission, in 1968. This question too has been discussed again and again and there has been agreement in principle on the need to tax agriculture. And yet two years have gone by without any action being taken on the Raj Committee's proposals.

The case for taxing agricultural incomes has become stronger with every increase in the procurement prices offered to rich farmers and with the windfall incomes that they have made by exploiting shortages in the last two years. Actually, the reluctance to tax rich farmers has grown stronger. This is hardly surprising. If the Central government finds it so difficult to resist the pressure of the rich farmer lobby on the question of fixing procurement prices, the state governments, which feel their pressure from closer quarters, cannot but be expected to fight shy of taxing their incomes. The issue is not economic but political.

This came out sharply at the meeing of the full Planning Commission held earlier this month. When the members of the Commission pleaded for raising additional resources, they had not bargained for the sharp rebuff that they received. As usual, they were ready to settle for a general affirmation of the government's anxiety to save the Plan and to mobilise resources. But this time the Prime Minister told the planners unequivocally that there was no question of taxing agriculture, adding that none of the experts in the Planning Commission and in the government or for that matter even outside the government seemed to her to have a realistic appreciation of the political factors and constraints applicable to these matters. Agriculture could not be taxed for political reasons and so alternative ways of financing the Plan would have to be found. After being rebuffed in this manner, the planners turned to the Finance Minister with their pleas for raising resources. His response too was cold; he made it clear that it would be impossible for him to attempt to raise additional resources given the state of the economy and the political situation. The planners were simply left high and dry.

The Planning Commission's own ideas on resource-raising had been modest. Reports which mentioned gold control and ceiling on incomes and expenditure as the proposals of the Planning Commission for raising additional resources were the result of a mistake. Mohan Dharia, Minister of State of Planning, had submitted his own ideas on the subject which had not been endorsed by the full-time Members of the Commission or its Deputy Chairman. But Dharia's note had been nevertheless placed on the files for the full meeting of the Commission. This gave rise to the wrong impression that this was part of the Commission's proposals which were rejected by the Finance Ministry. Anyhow this mix-up was all of a piece with the release to the press of the Dharia Committee's report recommending extension of the public distribution system to ten more items of mass consumption besides foodgrains, just when even the existing public distribution system in foodgrains is in the process of being dismantled. All the effect that such incidents now have is to make the Planning Commission an object of ridicule in ministerial circles and in the Finance Ministry in particular.

The other highlight of the meeting of the Planning Commission was the expression of the Prime Minister's continued unhappiness over the absence of an economic wizard who would deliver the goods without asking for unrealistic measures which were not politically feasible. The idea of holding the meeting was to place the issues facing the Commission squarely before the Prime Minister and to ask for clear directives on various policy parameters. The Commission wanted to know what exactly should be its policy assumptions in regard to foreign aid, the public distribution system and resource-raising in making its plan exercises. The response to this was that the Commission had to find solutions within the existing political constraints. To this was added the remark that none of the experts had so far offered such solutions. The Prime Minister's widely reported call for 'unconventional' measures and solutions indeed hinted at giving up much of the basic assumptions of planning, not merely those contained in the Fifth Plan document but also those underlying the entire planning process since its inception. After the exit of B S Minhas, in individual terms the Prime Minister's remarks could be seen as directed against S Chakravarty who is the only expert Member left in the Commission.

The Planning Commission's plight is really pathetic in these circumstances. It has wisely decided to put off all work on updating and revising the Fifth Plan. But it passes one's comprehension why it decided to put together the kind of Annual Plan for 1974-75 that it has when it knew that by the time the Plan was presented to Parliament the bottom had been knocked out of it. Consider, for instance, the reiteration of the figure of the Budget deficit of Rs 125 crores as the safe limit for deficit financing during the year, in modification of its earlier recommendation against any deficit financing at all during the Fifth Plan period. However, even this figure of Rs 125 crores has already become irrelevant. The same applies to the cost estimates of projects and programmes included in the Annual Plan.

The full meeting of the Commission was supposed to have been called to look for ways to salvage the Annual Plan. That this became necessary within two weeks of the presentation of the Annual Plan to Parliament is itself proof of the aimless working of the Commission. Even the Plan for the much-advertised core sector has ceased to be viable. It is estimated that the core sector of power, steel, fertiliser and coal alone will require Rs 400 crores more if the physical targets set in the Annual Plan are to be achieved. Since raising additional resources is ruled out and there is little cushion in the Annual Plan for diverting resources from other sectors — the social and welfare services having been cut to the bone already — there appears to be no way of avoiding large shortfalls in the core sector.

The Planning Commission did muster courage to express the opinion, in as mild terms as it could, that any weakening of the public distribution system would be very harmful and would add to inflationary pressures. There was an implied criticism here of the decision to abandon the takeover of trade in foodgrains without consulting the Planning Commission. But this subdued manner of confronting the government on policy issues did not create much of an impression. On the contrary, the Prime Minister's new-found preference for 'unconventional' solutions is leading the government headlong on the path of lifting price and distribution controls.

Nuclear Explosion: Limited Prospects of Peaceful Use

R S Ganapathy

THE long-awaited Indian nuclear explosion took place on May 18 in Rajasthan. The basic technology for making a nuclear bomb and the explosion device is the same, but there are differences in design, configuration and incorporation of safety features. The material suitable for use in nuclear explosives is either U-235 or PU-239. India does not at present have any stock of U-235 free for use in explosives. However, it has a stockpile of 100 to 150 kg of PU-239 from its research reactors at Trombay. The present explosion, it can be estimated, required about 8 kg of 95 per cent PU-239 for yielding a 15-20 kiloton (in equivalent terms of TNT) explosion. This Plutonium is free from 'safeguard' conditions and India is free to use it as it chooses to. The Plutonium produced in Tarapur and Rajasthan are subject to safeguard clauses and cannot be used for explosives. With the commissioning of the Madras atomic power project towards the end of the seventies and the Narora atomic power project in the early eighties, enough Plutonium will be produced free of safeguard conditions. However, this Plutonium would be necessary for our breeder programme. An additional 100 MW thermal research reactor is being constructed at Trombay which will also produce Plutonium for possible use in explosives. After it is commissioned, the total production of Plutonium from research reactors would be nearly 20-25 kg per year, enough for 2-3 devices similar to the one exploded recently.

The possible applications of peaceful nuclear explosions (PNE) fall into three categories:

(a) Contained applications: These are basically underground applications where the nuclear explosion is contained. These can be used for gas and oil stimulation in depleted fields where permeability of rocks is low. Storage reservoirs for petroleum and gas at high pressure can also be created. Other applications of such explosion are oil shale retorting, *in situ* copper leaching, recovery of low grade ores, block cave mining, disposal of radiation wastes, geothermal heat recovery and sealing off underground fires in oil fields or coal mines.

(b) Excavation applications: These are essentially surface applications where the explosion is not contained. These are technically much easier to conduct and more economical than contained applications. Some examples of such applications are construction of harbours and waterways, development of water reservoirs and dams and removal of large quantities of earth for mineral exploitation.

(c) Scientific applications: These fall in the category of scientific studies or research and development. While they contribute to the advancement of knowledge in this area, they are usually incidental to the applications mentioned earlier. Some examples are neutron experiments, heavy element studies, seismic experiments and radiochemical analyses.

Apart from scientific and technical capabilities in design, metallurgy of explosives, manufacture of fusion and detonation equipment and nuclear engineering, several other factors are critical for the success of these explosions. These are:

(a) minimisation and containment of the radioactive wastes and fallout so as not to disturb the ecology significantly;
(b) minimisation of ground motion to avoid earthquakes, etc;
(c) avoidance of contamination of groundwater aquifers.
(d) adequacy of treatment facilities to purify products like oil, gas or water available from the site of explosion; and
(e) considerable knowledge of geological and hydrological conditions at site.

These factors are not always easy to control or comprehend fully and hence in many experimental explosions conducted all over the world, the effects

have not been according to predictions. Obviously modelling all the variables involved or affected by the experiment is not an easy task as the system conditions are very complex. The results of the Indian experiment will probably be known after six months of data collection and analysis.

What did it cost the nation? The explosive alone would have cost (according to a UN study) Rs 15-20 lakhs. The costs of on-site survey and engineering, drilling, emplacing the equipment, sealing, moving local inhabitants and inspection, clean-up operation after detonation and experimental analysis for determining yield, etc, would be another Rs 50-80 lakhs depending upon the accuracy of results needed. However, if tests are planned in a series, costs would come down dramatically or would even be halved. Should the nation spend Rs 65-100 lakhs on an explosion like this? What does India gain from it?

The economic impact of this new capability is, however, not very clear at the moment. The USA and USSR have conducted a large number of experiments but have not been able to use this knowhow to significant economic advantage. While the potential appears to be considerable, it has not found any commercial scale application. There are still several technical problems to be overcome. India probably will have to invest considerable resources in conducting such experiments in a variety of site conditions over at least the next ten years before it can think of any major application. Some potential applications appear to be (a) stimulation of Koyali and Assam oil and gas fields which are getting depleted; (b) release of groundwater resources in Rajasthan; (c) recovery of low grade copper, uranium, lead and zinc ores; (d) recovery of geothermal heat in selected geyser locations; (e) building of waterways and canals linking Ganga and Cauvery; (f) silt removal in river beds and harbours; (g) construction of highways and all-weather roads in hilly terrains of North-East India; (h) blasting the Western Ghats in selected places to improve the rainfall and climatic conditions in the Deccan plateau.

These applications, however, are all for the present on paper only. Considerable progress has to be made in earth sciences, ecology and safety standards before they can become realities. While studies and experiments might continue, it is the experience of several countries that efficiency and reliability of the end results (e g, long-term stability of the excavation/crater against seepage, weathering, seismic motion or undercutting of slopes by wave or swell action) can be ascertained only by full-scale projects. The caution with which the peaceful nuclear explosions programme is being pursued elsewhere is best reflected in the statement that "Plowshare [the American peaceful explosions programme] is a race in which everybody wants to be second".

For India, the next decade holds limited possibilities in this field. Surface applications (in spite of the prohibitions imposed by the limited test ban treaty) under controlled conditions appear to be more feasible. A programme with a high degree of coordination among AEC, the Geological Survey of India, ONGC, user agencies, etc, needs to be worked out. A series of experiments under differing site conditions would be necessary. The country has invested nearly Rs 930 crores (at 1972-73 prices) in the last 20 years on the atomic energy programme. A carefully worked-out policy is necessary to make this considerable investment to yield commensurate returns.

RAILWAY STRIKE

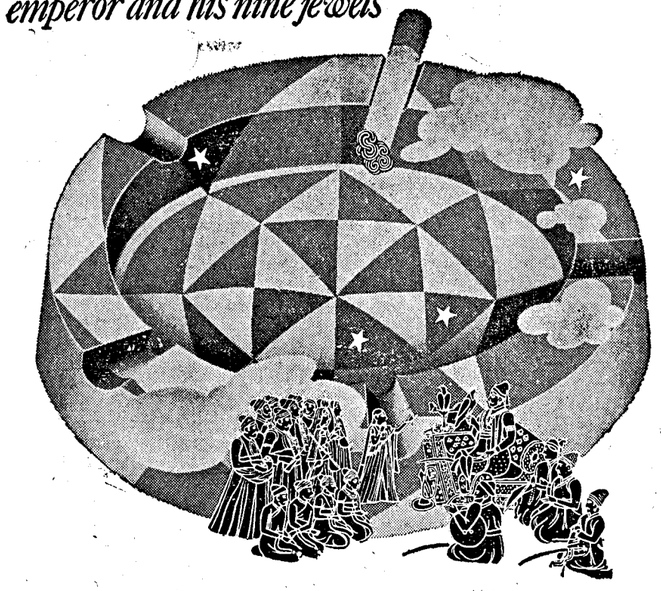
The Mid-Night Knock

(From a Special Correspondent)

GROWING acquaintance with instances of the application of strong-arm methods may make people indifferent to atrocities perpetrated under official auspices. True, in the present circumstances, even sharp questions raised through the public media might not have much of an impact on a government which has apparently prepared itself to meet practically all eventualities. Nonetheless, till as long as the nation keeps swearing by democratic principles, protests need to be recorded, even if these are no more than empty formalisms. The manner in which the Union Government has gone about to crush the railway strike bears the hallmark of the darkest authoritarian regimes.

When the railway unions, over a hundred of them, served the necessary notices of the strike under the Industrial Disputes Act, silence reigned in official quarters. The government had more than a fortnight during which to challenge the strike notices. It chose not to do so, and, in fact, went through the motion of continuing negotiations with the representatives of railway employees. It was only on the morrow of George Fernandes's arrest that suddenly the world was informed that, under the Defence of India Rules, the proposed strike was illegal. Under the DIR, any and every inequity can of course be perpetrated, or sought to be made valid retrospectively.

One has read a lot about the dreaded mid-night knock which is the staple of all authoritarian regimes: a direct taste of that was forthcoming as union leaders, totally taken unawares, were picked up in their hundreds from May Day onwards. Besides, on the eve of the strike, through a simple administrative circular, the provisions of the Payment of Wages Act were suspended, thus freeing the Indian Railways from the legal obligation to pay railway workers the wages they had earned during April. The ploy could not be more crude: deny the employees their wages, the wages which were their due and thereby you would be able to weaken their will power; maybe, as a result, they would be somewhat more amenable to exhortations not to join the strike. Even if the exhortations fail and they do join the strike, given the paucity of funds, their will to be on strike would snap within a short time.



This was a despicable manoeuvre, and does not behove a government which still has pretensions to observing democratic norms. What followed as the strike went into swing has been much, much worse. Reports received from practically all over the country indicate the thoroughgoing manner in which the Railway Protection Force, the Border Security Force, and the Territorial Army, apart from regular units of the police, have raided workers' colonies, terrorised the inmates, tortured relatives of railway employees in order to bully them back to work: physical belabouring, summary evictions and indiscriminate arrests have been the order of the day. These reports could be exaggerated here and there, but they are much too numerous to be ignored; there is also a certain uniformity in the alleged manner of terrorisation which suggests the presence of a set of carefully worked out, centralised directives: otherwise it could hardly have happened that in the Eastern, South-Eastern, North-Eastern, Northern, North-Western, Western, Central and Southern Railways, the same pattern of terror and intimidation would be repeated, for days on end, over and over. It is not the case that there has been no instance of counter-intimidation on the part of the striking workers. Individual employees, who wanted to stick to work, for whatever reasons, must have been occasionally threatened or ostracised by the strikers, or their relatives: blacklegs imported from outside must have also, naturally, received a hostile reception. But one must still not abdicate one's sense of proportion. Qualitatively there can be no comparison between the kind of onslaught unleashed by the government, backed by the combined might of the army, the police and the para-military forces, on the striking groups and what the latter might have done to their non-striking colleagues.

The Prime Minister has stated that she does not want any confrontation with the railway employees; the acts and attitude of her government indicate that altogether contrary is the intention. Either you believe in the notions of democratic behaviour or you do not. By the manner in which they have conducted themselves, the authorities have already made it clear that moral proprieties are for the birds. Since the opposition is weak and disorganised, and the Government has a steam-roller of a majority in Parliament, practically anything can be made to go. The Defence of India Rules and the Maintenance of Internal Security Act are there to ensure that howsoever outrageous the government's conduct, it can still be claimed to have the implicit sanction of constitutional practices. In a way, therefore, the railway strike has served as a reminder that the Emergency and the rule of democratic institutions are irreconcilable existences. Till as long as the Constitution flaunts the Articles supportive of the Emergency, the fundamental rights can continue to be breached merrily, and those who breach them can pretend that everything is being done in accordance with the rule of law.

Does anybody worry about such matters in New Delhi any more? If the democratic tradition is being debauched in this country, the debauching is being done under the government's own auspices. Viewed objectively, the continuance of the Emergency at the present moment has absolutely nothing to do with either the country's external security or its internal law and order. If it is not being revoked, it must be exclusively because it provides a convenient cloak to the rulers for suspending the rule of law and taking recourse to authoritarian instrumentalities. And since the government itself is an active participant in the orgy of despoiling the legal and constitutional process, is there any scope for righteous indignation if, from amongst elements in the opposition, quite a few decide to return the compliment?

Within the government, there are several individuals who, till yesterday, used to describe themselves as champions of trade union rights and democratic practices. While the workers are being mercilessly set upon and their civil and trade union rights trampled, not a squeak has been audible from their quarters. As always, matter has prevailed over the mind: the retention of a job is to be preferred to the retention of one's conscience.

The great Akbar invites you to confer amidst an emperor and his nine jewels

The Akbar experience.
An experience of efficiency and enjoyment. The finest guarantee of a successful conference.
With every facility you require, plus that unique blend of royal tradition and youthful exuberance which is our very own thing.
A choice of conference rooms. The Nauratan, named after Akbar's nine "jewels" or councillors, seats 150, and accommodates 200 guests for cocktails.
The intimate Birbal Room hosts smaller meetings and get-togethers.
You get attentive, personalised service. PA systems, secretarial services, telex, dictaphones, tape recorders. Plus ITDC Car Rentals & Tours.
And cuisine. We offer you two of Delhi's finest restaurants. The shimmering Sheesh Mahal, and our 24-hour coffee shop, Madhuban. Our catering and menu services can be tailor-made to your conference budget. So write to us. We promise you a conference service second to none.

Wilson's Double-Talk

Farrukh Dhondy

THE Conservative party, having been beaten in the February snap election, is counting the blessings of defeat. Its second rank politicians are continually saying that it is quite willing to let Wilson's Labour minority government rule for a year or so without deliberate and concerted filibusters. A narrow parliamentary defeat for the Conservative party seems to have avoided a major political defeat. The Labour government of Harold Wilson hangs by a majority of six over the Conservatives, who could with the 14 Liberals and the rough assortment of Ulster Unionists and Welsh and Scots Nationalists force a re-election at any time. From their parliamentary tactics of taking part in debates but staying away from the lobbies, it seems that the Tories have to work hard to stay defeated and to avoid the embarrassment of another thrashing by allowing the Labour government to try and sort out the mess of industrial antagonisms that they bred.

They can't of course be seen to be turning the other cheek. Consequently they growl in public and make noises about their opposition to 'radical socialism'. This suits Harold Wilson and his balanced Cabinet of righties and lefties. The argument of senior members of the Cabinet is that the balance of power can easily be upset if their promises to the electorate are carried out. Their problem, they say, is finding a veil of moderation for the naked socialism they believe in.

In the first instance, 'moderation' has meant finding parliamentary ways around extra-parliamentary demands. Their manifesto, framed by the political artisans of the trade unions, promised the repeal of two of the Tories' major legislative bases. It also promised the nationalisation of an unspecified number of companies and banks. The nationalisation bogey has been pushed back into the cupboard, and the two acts which they promised to repeal continue to be the bones of contention between a precariously balanced government and its popular base, the trade unions.

The Housing Finance Act, which forces local councils to charge higher rents to their tenants and halts the expansion of state housing, is still with us. For the 15 million people directly and indirectly affected by the Act, it is a bitter pill. The new government is trying its best to sweeten it. On the third day of office, the Labour government passed restraining legislation to freeze rents in the private and state sectors. It promises the eventual disappearance of the Housing Finance Act and is looking at immediate ways to pass pennies back to the electorate through food subsidies so that it can claim to have kept its 'social compact' with the eleven million unionists of the country, to whom it promised a better standard of living without immediate wage increases.

It is too early to say whether the unions have bought the line. There are signs that the 'compact' (Harold Wilson's term) is loosening. Lower paid groups like the teachers and nurses, not to mention the higher paid engineering unions, are demonstrating their impatience. In the main the unions are co-ordinating the restraint which the compact calls for, but the rank and file of the unions are calling for a speedy end to the compact itself — a precarious enough situation for any government, made even more so by the climate of scandal that surrounds the government.

The British press, almost envious of the American focus of Watergate, has in the past month staged its own drama. The present government's record of small scandals is perhaps more interesting than its legislative achievements. In its first week, the government's sincerity was called into question by the disclosure that Harold Wilson, the declared enemy of Tory style property speculation, was associated with a very shady deal. His office manager, who is also the brother of his private secretary Marcia Williams (she has now been elevated to a life peerage), besides being his golfing companion, happened to be involved in a finance deal of a speculative nature. Even though Wilson wasn't directly involved, he admits that he knew of the land deal which Anthony Field pulled off in partnership with Millhench who is now in jail pending trial for the forgery of Wilson's signature on House of Commons notepaper. The forgery, it is implied, was perpetrated in the course of a transaction which involved the purchase of land by Wilson's manager at a low price and its sale at a phenomenal profit.

Harold appeared on TV to deny any involvement in the deal, but attempted to draw some flimsy and cringing distinction between speculation and reclamation. In order not to seem as though he was praising the entrepreneurial spirit, he added that the only solution to the problem of land profits was the nationalisation of all development land for housing and industry — another vague promise large enough to be postponed till the day when Labour have a firm majority.
