Light weight tissues that are big earners in 14 export markets!

Tribeni Tissues export one-sixth of their total output.

Not surprising. Because Tribeni Tissues' expertise goes a lot *farther than manufacturing* tissues that match up to world standards. Knowledge of international markets coupled with pioneering experience in introducing tissues in India enable Tribeni Tissues to successfully meet the needs of countries with similar marketing conditions. To earn big money returns.

Add to this the vast sums of foreign exchange saved by Tribeni Tissues' successful import substitution. Tribeni's existing range already replaces sizeable imports and in hand are projects to introduce more high grade tissues that will substitute for others, at present being imported (like electrical issues, for instance)

Together, all these total up to make an invaluable contribution to India's foreign exchange earnings.

Tribeni Tissues Limited
—fine papers that matter.

Concealed Fascism

NO session of Parliament is considered complete without members on both sides of the two Houses shedding tears over the atrocities committed on the scheduled castes by the upper castes. This is followed ritually by assurances that the government takes a very serious view of such goings-on and will do everything to put an end to them.

In the space of a few days last week, a section of Bombay city's scheduled caste population had their worst-ever taste of organised repression. But their oppressors, this time, were not the upper castes primarily; they were the police force of the Maharashtra government. The reign of terror let loose by the police began at a meeting on January 5 in a predominantly scheduled caste locality in the city, organised by the Dalit Panthers — a fledgling organisation leaning more to Ambedkar than Marx and still largely confined to scheduled caste converts to Buddhism. The meeting was attacked with brick-bats, following which the police made a lathi-charge on those present and arrested a score of persons, including Raja Dhale, a prominent Dalit Panther leader. The next day, there was day-long violence in the BDD chawls, a residential area adjacent to the venue of the previous day's meeting. This is how the *Indian Express* reported the role of the police in the proceedings:

> "Boys and adults from the side of the Police Lines [policemen's quarters in the BDD Chawls] freely hurled stones at the buildings where the non-scheduled castes live ... It is mysterious that the police burst tear-gas shells at the scheduled castes, lathi-charged them, entered their buildings, and arrested and beat up some persons, but did nothing to stop the stone-hurling mobs from the Police Lines side .... A long line of policemen armed with lathis, rifles and tear-gas guns and the State Reserve Police had their backs to the Police Lines. Four policemen were actually seen throwing stones at the scheduled caste tenements."

By Monday evening, the numbers of scheduled caste injured were nearly 200 and of those arrested well over 100. But the worst was yet to come. It came on Thursday, when the Dalit Panthers organised a procession to protest against alleged police atrocities. Newspaper reports have emphasised how, though the procession was repeatedly stoned, the Dalit Panther leaders prevented those in it from retaliating. However, the police soon arrested the four most important leaders and followed this up with a cane-charge on the procession. What followed has been reported by *Times of India* as follows:

> "Leaderless, the young men and women ran helter-skelter, some going towards the Parel junction and the others going into the Central Railway Workshop playing ground.
>
> "Eye-witnesses said the police beat up the youths mercilessly. This reporter saw the police dragging some of the Panthers to the van by their hair; some were held by two policemen while the other constables beat them with lathis.
>
> "Some of the youths were hit with rifle butts as the policemen rained abuses on them."

Before it was all over a Panther youth had been killed, allegedly in the stone-throwing; and roughly another 100 and 40 respectively had been added to the lists of those arrested and injured. The determination of the police to put down the Dalit Panthers was to be seen also in their treatment of Raja Dhale who had been ordered to be released on a relatively small bail of Rs 2,000, reflecting the court's view of the gravity of the charges against him. However, the moment he was released the police rearrested him on other charges. The government's sympathy and solicitousness for the scheduled castes apparently last only so long as they are content with their exploited status; once they begin — however tentatively and feebly — to organise themselves to overcome that status, the full force of the government's repressive powers are to be turned against them.

Despite the very effective if informal control exercised by the police over newspaper reporting of such matters, enough details have become known about the events of the last few days involving the Dalit Panthers to require the immediate institution of a judicial enquiry into them. Further, the violence directed at the Panthers has completely vitiated the atmosphere for this Sunday's by-election to the Lok Sabha from the Central Bombay constituency. For the direct victims of the violence and for the rest of the large number of scheduled caste voters in the constituency, the poll will be neither free nor fair.

But to say that the election will not be fair in the sort of situation which has been precipitated is to suggest that, were it not for the police atrocities and the atmosphere of violence, it would have provided a reasonable forum for the choice of a representative of the people. It is precisely this presumption

that the Dalit Panthers have questioned in calling for boycott of the elections. What they, and other groups like theirs, are groping towards is a political process entirely different from the one to which this country has been accustomed and in which neither the electoral process nor the established political parties represent anything like a democratic method of formulating issues and making choices. The opposition parties' failure to articulate the distress of the mass of the people, not to talk of providing a credible alternative for its redressal, has left them as discredited as the Congress. But that failure is endemic to their situation. If the Opposition cannot mobilise the people it is because, given the contradictions in which these parties are caught, they can only marginally represent the people's interests. Mobilisation requires a consistent and coherent formulation of issues within an ideological framework. Framed in poll politics, the organised parties have necessarily to compete for loyalties whether these be on caste or feudal bases, as well as for financial support from the more wealthy. Both these require serious compromises inconsistent with the social, democratic goals too easily professed by these parties. Is it at all surprising, then, if the Congress governments at the Centre and in the states have decided that they need not lose much sleep over the activities of any of these parties?

The ineffectiveness of the established opposition parties, even as the economic condition of the mass of the people has steadily deteriorated, has led to the emergence of new political groups and formulations which, whatever their organisational and ideological shortcomings, today constitute the real opposition to the Congress. Despite their very limited influence, it is these groups which the government knows it has to nip in the bud. After the experience of the rapid growth of the CPI(ML) within the span of just a year or two, the government evidently intends to take no chances. In dealing with these groups it no longer makes even the pretence of observing democratic proprieties.

This gives the country's political system marked features of concealed fascism. On the one hand, there is the Constitution, the Judiciary, the Parliament and the state Assemblies, complete with opposition parties. On the other hand, the groups which pose, actually or potentially, any real threat to the government are suppressed with fascist ruthlessness. For them there are the police and para-military forces, armed with the DIR and MISA; worse, there are for them the cold-blooded murders which are dressed up as deaths in so-called "encounters with the police" and "attempts to escape from police custody".

Agriculture

Cumulating Imbalances

TALL talk about how installed capacity and production are to be doubled or tripled, accompanied by wholesale non-accomplishment or only token accomplishment, has been the rule in practically all key areas of the economy — coal, power, steel, and so on. The failure on the fertiliser front has particularly crucial implications, however, for the simple reason that this affects production in what is still the most important sector of the economy, *viz*, agriculture. In the current year, availability of fertilisers is estimated to fall short of requirements by close to a million tonnes. The position could grow worse if projected imports fail to mature; and the producing countries may well fail to deliver because of the crisis in their petrochemical industries as a result of the St Vitus's dance the Arab world has forced them into. And, given the grim outlook for the country's balance of payments, the position is hardly likely to improve in subsequent years.

It is in this context that the issue of the optimum pattern of fertiliser-application has to be sorted out. Whatever fertiliser is available in the country is at present disproportionately allocated between the kharif and rabi crops. Farm output in the rabi season still does not add up to more than two-thirds of that in the kharif. Yet, in the allocation of fertilisers, the proportions are reversed: two-thirds of the total supplies of fertilisers are allocated for the rabi season. A second type of imbalance has now appeared in the current year. A much higher proportion of total fertiliser supplies has been allocated to the north-western states than last year. The Union Ministry of Agriculture has justified this on the ground that since it is from these states that the bulk of rabi procurement will be made, their needs must be catered to on — as the cliche goes — 'a priority basis'.

There is an element of regression in this policy which deserves examination. Scientists and technicians are agreed that the effectiveness of fertiliser dosage is increased if it is combined with a system of controlled water management. Water can be applied in a regulated manner only if its source is subject to human control, i e, if the cultivated area happens to be in an irrigated tract. For historical reasons, in all the years since Independence, it is as a rule in those areas where rabi crops have flourished that facilities for irrigation have been expanded. Most states in the south and eastern parts, on the other hand, have brought sown areas under irrigation only at a very slow rate: the capital cost of major works has been considered prohibitive, and outlays in the name of minor irrigation have led nowhere. At subsequent stages, moreover, the relatively high proportion of sown area under irrigation in the north-western states has become the principal factor buttressing their claim for proportionately larger supply of fertilisers. Besides, with assured irrigation and fertiliser supplies, not only has the rate of growth of rabi crops been higher than that of kharif crops, in Punjab and Haryana — the traditional *rabi* tracts — the greater availability of irrigation water and fertilisers has meant a faster rate of increase in the production of kharif crops too. To that extent, also, it has been easier for these states to show higher procurement levels. While institutional factors, such as tenurial conditions affecting production, need not be ignored, there has been this chain of causality which has consistently worked against the kharif areas.

At least two dangers are inherent in the persistence of such a policy. First, if carried to the extreme, it could institutionalise the regime of disparate rates of agricultural growth in different parts of the country. In case the north-western states continue to enjoy the bulk of the facilities an the southern and eastern ones with isolated exceptions remain starved of them, the resulting distortions in the rates of growth might lead to problems of pricing, procurement, and distribution, which could prove altogether intractable. It might also provoke regional jealousies, to resolve which would call for a grotesquely disproportionate expenditure of resources in other directions.

The second possibility is equally serious. As the evidence of the past year has underlined, once the expansionary phase in wheat production is over, the rate of growth of farm output in the north-eastern parts would slacken. In case the limits of bringing sown area under irrigation have been reached, no amount of additional application of fertilisers can reverse the diminishing returns in output. Given the built-in inertia in the official arrangements, it might then be very difficult to reappraise the policy on the allocation of fertilisers and credit.

The Press

Prime Minister's Day

M R writes:

THE Prime Minister's new year-eve press conference yielded a 49-page transcript of the 95-minute encounter — but precious little copy. So much so the capital's largest-circulated daily limited itself to a single-column treatment of the annual event. Others, in the capital and outside, were more magnanimous about it, the newsprint crisis notwithstanding. Yet the little that was significant in Indira Gandhi's statements was missed by most, both in reporting and comment.

The back-log of general issues that dominated the press conference at Vigyan Bhavan underlined the steady loss of communication between the Prime Minister and the capital's press corps over the years. In 1966 Indira Gandhi was the Minister for Information and Broadcasting when she won the contest for leadership against Morarji Desai. Almost the first thing she did after her election was to meet the press at her residence, where seating arrangements had been made for over 300 correspondents in anticipation of her victory. Asked if she would revive her father's practice of meeting the press every month she had said, "perhaps more often than that".

Indira Gandhi was the first Prime Minister to have a Press Adviser to establish rapport with the mass media. Her monthly meetings with the capital's press began well but became a ritual in course of time. One reason was perhaps that Parliament was becoming very zealous about its privilege and the Prime Minister could not make major announcements or policy statements when Parliament was on. Gradually, the Prime Minister's press conference became an annual formality, on the last day of the year after the winter session of Parliament had ended.

The capital's swelling press corps feels that the Prime Minister meets the press more readily when she is away from New Delhi. In the capital the peripheral encounters between the Prime Minister and the press are brief, impromptu affairs at the VIP enclosure of the airport or the corridors of her offices in Parliament House or the Central Secretariat. While visiting journalists are able to meet her easily, the Prime Minister rarely gives interviews to Indian newspapers or to the large contingent of foreign correspondents stationed in New Delhi round the year.

At the meeting on December 31, 1973, originally scheduled for 45 minutes, about 60 minutes were taken up by the economic situation. Even so the exchanges yielded only generalities. Yes, it had been a bad year. But that was a universal phenomenon. Prices had risen sharply. So what? Industrial policy? There was no change at all; only, the Indian entrepreneurial class was not daring enough. The public distribution system was there to take care of the people's needs. The government was not opposed to strikes but the working class should voluntarily forgo the right to strike in the larger national interest. There was no more talk of 'turning the corner' or confident expectation of fall in prices; to that extent the Prime Minister's answers were realistic.

The most significant answers related to Indo-Soviet relations. *Pravda* had claimed Indian support for the Asian security pact. The Prime Minister said it had not been discussed at all by Brezhnev when he was here. India was for any form of economic co-operation which could strengthen countries within themselves and strengthen developing countries as a whole. Another correspondent followed it up: the Soviet press, which is an official press, has been writing in a manner as to give the impression that India had already become a part of the Soviet system. "Do you propose to take it up so that your non-alignment position is not jeopardised by false propaganda?" The Prime Minister thought propaganda, neither by the Indian press nor the Soviet press, would jeopardise India's non-alignment and the propaganda was more in the Indian press than elsewhere. About Brezhnev's plan, suggested in his address to MPs: "Obviously he made the suggestion with a view to seeing how peace can be maintained in Asia. Now each country of course looks at these problems from its own point of view and India has her own point of view which we have clearly expressed." The impression one got was that India was still keeping its options open on the issue.

Soviet correspondents rarely ask questions at press conferences. But the most 'leading' question of the day came from one of them who sought to know how the Prime Minister rated the Brezhnev visit among the Indian and Asian events of 1973. The Prime Minister would not oblige. It was a successful visit no doubt, and useful and valuable. What she added in this context suggested that India did not view the recent Indo-Soviet agreements as one-way traffic; the Soviet side was also gaining in the form of vital commodities it needed from India.

A certain anxiety to see United States aid resumed was obvious in the tone of the Prime Minister's answers on Indo-Soviet and Indo-United States relations. This the Press seemed to have missed.

Jute

Blinded by Short-Term Opportunities

A JOINT study team of the representatives of India and Bangladesh had earlier evolved a nine-point strategy to ensure a better price for jute manufactures in the world market, without touching on the major short-term problem of India's purchases of raw jute from Bangladesh. A ministerial delegation from Bangladesh was therefore in New Delhi last week to get a more explicit commitment on this issue from the Indian authorities. In fact, unless this underlying issue is sorted out soon enough the imbroglio over jute purchases could precipitate more awkward problems in relations between the two countries.

Under the trade agreement signed some months ago, India is committed to purchasing in the current season at least 600,000 bales of raw jute from Bangladesh. However, while the agreement laid down the quantity to be purchased, the price at which the purchases would take place was left unspecified. Now, with the recent jump in prices of jute and jute goods in the international and particularly the American market following the energy crisis, many of the assumptions on which the trade agreement was founded have been nullified. The price of polymer chips — a principal raw material going into the competing synthetics — has risen sharply, by almost 60 per cent during the past half-year. And it is bound to rise even further in the coming months. The demand for jute goods, therefore, has revived spectacularly. Those who had written off the long-run prospects of the jute industry are now having to revise their prognostications.

This makes the problem of raw jute easier in the long run for Bangladesh. The Bangladesh authorities would have no major problem in disposing of this excess supply of fibre once the internal administrative problems have been sort-

ed out and they have expanded their capacity in carpet-backing. Indeed, given the undoubtedly superior quality of their raw jute, in the districts of Mymensingh and Tangail for example, carpet-backing exported from Bangladesh could well come to enjoy an edge over the exports from India. But meanwhile there is the short-run problem of disposing of the current stocks — particularly after this year's excellent crop. If one were to work back the price of raw jute from the price of carpet-backing in the American market, the unit export value of raw jute would certainly be higher than the price India is willing to offer Bangladesh — though there is, of course, the other point of view that the unit price of raw jute, as worked out from the export price of carpet-backing, is mostly academic. It could be thus argued that Dundee, or any of the other jute-processing centres in the Western hemisphere for that matter, are in no position to lift the raw jute in the quantities that Bangladesh is wanting to offer at this stage; even if they consider some additional stock-piling, this could not be on a scale that would solve the immediate problem for Bangladesh.

India, therefore, remains Bangladesh's major hope. Going strictly by the terms of the trade agreement, Bangladesh has substance in its half-complaint that Indian parties have been dragging their feet in the matter. The major problem here seems to be the absence of official discipline over the country's jute industry and trade. Consequently, since revived spectacularly. These who had ceptionally good, prices on this side of the border have stayed easy since June; the jute interests claim to have already purchased their requirements for the current season. What is even more relevant perhaps, given the depressed condition of the non-official rate of exchange for the Bangladesh currency along the border, is that substantial quantities of raw jute have been smuggled across into India. Reports have it that smuggled jute from Bangladesh is being sold at around Rs 25-30 per maund; this, converted into Bangladesh takas, would today fetch around Rs 75. There is accordingly little urge in the Indian industry and trade to purchase raw jute at the official rate of exchange or at the price indicated by the Bangladesh authorities.

The resulting impasse presents a challenge to the Government of India. Indian private parties, always blinded by the year's crop and the short-term opportunities offered to them this year by the oil crisis, will fail to see that sustenance of the world jute market in the long run depends very much upon the goodwill of neighbouring Bangladesh. It is, therefore, for the government to impose its writ over the jute interests in the country, and force them to purchase under official auspices a specified quantity of the raw fibre from across the border. If the government is unable to compel the private interests to buy from Bangladesh, it cannot escape the residual responsibility of making the purchases on its own. The myopic ones entrenched in the jute industry and trade could not perhaps care less, but the government cannot escape its obligations.

The tentative agreement announced at the end of the meetings in New Delhi — and subsequently in Calcutta — indicates that Bangladesh's claim of a price for the fibre derived from the international prices of jute manufactures, has been partly conceded by the authorities here. Such a price has been acquiesced in for an initial lot of 200,000 bales. But it still remains a long haul, and what the government of India proposes may yet be disposed by creatures of darkness up and down the Hooghly.

Soviet Union

Less Painful Each Time?

A Correspondent writes:

ARE the collective farms in the Soviet Union on their way out? According to a recent front page editorial in *Pravda*, which analysed Brezhnev's speech to the closed plenum meeting of the Central Committee of the CPSU, they are. The editorial indicated that, in keeping with the directives of the Twenty-Fourth Congress of the CPSU, the Soviet collective farms would be merged to form much larger farms run on modern industrial lines. *Pravda* predicted that such mergers would not only help raise production and efficiency of the farm, through use of modern science and technology, but would also "eliminate the distinction between collective and state form of property, which is one of the tasks of the Party programme".

Nearly half the total sown area in the Soviet Union is under collective farms. Yet, while there are more than 32,000 collective farms *(Kolkhozi)* there are only 15,500 state farms *(Sovkhozi)*. The average size of a collective farm is thus 6,000 hectares, half of which is arable at any given time. The collective farms own on an average 4,000 heads of livestock and more than 60 tractors. The average size of state farms, on the other hand, is 21,000 hectares, and more than 6,000 hectares of it is arable. The state farms have on an average, 7,000 heads of livestock (cows, pigs, sheep) and 120 tractors.

Experiments in merging collective farms into modern 'industrial enterprises' have already been carried out in the European part of the Soviet Union, *viz*, Byelorussia and Moldavia. That this would be the general policy has been evident over the past few years. Now, the party feels, it is the time to take up the consolidation programme in agriculture on a national scale.

As if in reassurance, however, *Pravda* has added that the agricultural consolidation programme will not be pushed forward hurriedly — but slowly and steadily — to avoid the mistakes of the earlier collectivisation effort under Stalin. "Of course", it says, "it is necessary to be careful in carrying out this task". The task would be implemented "rationally and economically, intelligently taking into account all the important considerations". The agricultural consolidation programme would be carried out "step by step (*shag za shagom*) from small farms and brigades to large specialised farms".

But *Pravda* is tactfully mum about the likely fate of the half-hectare private plots allowed to collective and state farmers. For, indications are that these too would be merged with the larger farms. In fact, private plots of collective farmers and state farmers "still account for a big percentage of the total production of vegetables, milk and eggs", though the total area covered by these plots is only 7.9 million hectares — about 3.5 per cent of the total.

Coal Industry

The Russians Are Coming

THE Russians now come to India almost daily, or so it seems. Within weeks of Brezhnev's departure, a large and high-powered Soviet team, led by the Minister of Mines, landed in Delhi. Accompanied by the corresponding Indian Minister and his troupe, the team visited the country's coalfields, enjoyed the Christmas hospitality of hotels of Calcutta, and signed a protocol promising to develop three mines and to provide assistance to the Indian Design Institute. Another team will soon be in India; this one will visit the oilfields.

The speed with which the mission was completed might lead one to believe that much groundwork had preceded the visit as to the role that Soviet aid is best suited to play in the coal industry. In fact, however, there is even now no clear-cut policy in this matter, nor has any serious thinking gone into the formulation of the protocol.

The coal industry is one of the oldest Indian industries; even the public sector, which is a comparatively late entrant into the industry, has by now more than two decades of experience behind it. Indian mining expertise is known to have developed a high level of competence, both for underground as well as for open-cast mining, and the major bottleneck in practice has been the availability of equipment. Even equipment might not have been such a problem had the public-sector Mining and Allied Machinery Corporation (MAMC), Durgapur, been developed along correct lines; instead, at the first sign of difficulties to be surmounted, MAMC was allowed to turn to manufacture of agricultural tractors and to off-load its own orders to private sector units.

Thus it is not for the first time that we have turned to the Soviets for assistance in coal mining. The Manikpur open-cast mine of the National Coal Development Corporation (NCDC) was developed with Soviet aid. Later, we turned to Poland for technical help. Deep mines, such as Sudamih and Moonidih, were taken up with Polish assistance. Only a few months ago, a Polish team was traversing the coal fields of this country. Soon after nationalisation of the coking coal mines, an agreement was entered into with Kopex of Poland, which was later extended also to the non-coking coal mines.

What, then, is the distinct scope of the Soviet aid that is now being sought? Clearly, it is justified only in areas where our expertise is so far undeveloped. If, however, it is sought to develop the three mines — one at Singrauli in UP, another at Ksumunda in MP, and a third at Jhajra in West Bengal —, on what earthly ground can it be justified? For, even in terms of augmenting overall capacity, these projects would at most yield another 7 or 8 million tonnes by 1978-79 — a mere 5 per cent of the Fifth Plan target of 135 million tonnes.

But with the decision-making in the field resting with the political leaders and civil servants-turned-managers who do not know their own minds, anything from abroad — particularly if it is from USSR — is welcome. Evidently, the aid is sought so that those directly responsible may sit idle while the Russians do their job for them and even be conveniently available as scapegoats should things turn out not to order and questions are raised in Parliament.

West Asia

Of Troglodytes and Arabs

A Correspondent writes:

EVERY dog, the Arabs may cynically chant, has his day. The public squirming of the functionaries of the EEC in the presence of the visiting Minister of Oil from Saudi Arabia was a bizarre spectacle. Quite obviously, despite the somewhat indecisive cease-fire following the October war, the Arabs are getting their oil's worth *vis-a-vis* the rest of the world. Matter has triumphed over the mind. The selective denial of oil to Western Europe and the United States has brought about a total transformation in attitudes and pretences. This may be a crude way to self-assertion, but the premium garnered by the Arabs through this psychological rehabilitation is beyond quantification.

A new balance of power is therefore on the point of emerging in the world. Irrespective of how many concessions are extracted out of Israel at the Geneva conference, the hitherto anti-Arab tilt in Western attitudes is now going to be disturbed. To the US as well as the EEC countries, the emotions and predilections of the Arab world are going to matter a lot henceforth. For a change, the supercilious references to the alleged incompetence of the Arab military machine will cease to be the stock-in-trade of stale jokes along the corridors of the United Nations.

Those who cannot directly participate in the glory which this implies in many parts of the underdeveloped world should at least refrain from the churlishness of belittling the Arab achievement. For countries such as India, which, because of particular circumstances, are marginally at the receiving end of the Arab treatment, the need for introspection was never greater. Ever since Independence, this country had all the time in the world in the course of which to by-pass the intermediary of the multi-national oil corporations and set up direct, long-term arrangements with the Arab governments for the supply of oil. This was not done, because the possible susceptibility of the multi-national corporations and the Western countries to any annulment of past contracts was of supreme consideration to New Delhi. Some perfunctory attempts were made to negotiate with Iran, the country with an impeccable pro-American record. As it turned out, it was more in the nature of passing time, and India's courage ended there.

The other default on the part of the Government of India has been of a more general nature. Here too, prejudices planted by others have been allowed to cloud views and attitudes. There has been no long-term policy of developing enduring alignments with the countries of the Arab world: Gamal Nasser was different, but otherwise we, the leading lights among the non-aligned nations, have not ever bothered to conceal our big-brotherly attitude toward the Arabs. Only the most incompetent diplomatic personnel, or relatively junior and inexperienced officers, have been picked as envoys to capitals such as Riyadh. The seniormost among the diplomats were invariably occupied elsewhere. The superpowers and the erstwhile colonial powers provided the entire frame of reference for our external policy. And whenever a somewhat greater initiative was taken by New Delhi to organise the developing nations, such as in the Committee of Seventy-Seven, the primary motivation was to set up a bargaining counter exclusively for ourselves. All these follies are now coming home to roost.

Something, somewhere has to give way. We have been unable to raise our own domestic production of crude: we have been unable to establish direct lines of communication with the Arab governments; we have neglected to develop our most substantial source of energy, coal. We are unable to enforce the minimum social discipline which the rationing of petrol and petroleum products would involve. Faced with the spectre of a runaway increase in the import bill consequential to the rise in oil prices, the authorities can think only in terms of across-the-board solutions which, by their irrationality, might cause even greater harm to the economy. New Delhi is yet reluctant to bestir itself. Such a bestirring, let there be no illusion, would involve a restructuring of economic as much as of foreign policy. And that may be the major difficulty.

Oil and All That

Romesh Thapar

NINETEEN seventy-four has started auspiciously. We now know that the Arab oil weapon has not affected the USSR and the US in the least. In fact, it has benefited the economies of the super powers. Yes, the economic confidence of Japan has been smashed. But, then, both Moscow and Washington wished this wish for different reasons. The US wanted to knock the wind out of a serious competitor. The USSR wanted Tokyo to be persuaded about the desirability of risk-taking in Siberia. As for Europe, it will survive, at somewhat lower standards — at least, until alternative sources of energy are developed or located.

What no one had really bargained for was the disastrous impact of Arab oil policy on the economics of the developing world, particularly the planning calculations of India. We are being assured, almost daily, that our energy problem is fully understood.

The Soviets and the Chinese, too, to constitute a fund for aiding miserable situations like ours. There's no talk of differential prices. Such a line of reasoning would be too rational too simple, too clean and straightforward.

The Soviets and the Chinese, too, are having their little spree of money-making. We have agreed to pay prices for Soviet newsprint, which are higher than the highest Canadian price. The Chinese have taken from the Japanese what the Arabs charge for oil. As for kerosene, we don't know the tally as yet, but it will probably settle at around five times the last registered price. Iraq, another Indian friend, has agreed to supply the oil, but at market prices — whatever that might mean, for, these range from $ 10 to $ 18 per barrel.

Of course, this is not to suggest that we are desperate. Quite the contrary. We are already mending fences with the US, a 'tilt' which could develop noticeable dimensions if the Arabs continue to play their oil game in the style that even *Al Ahram* is critical of, or so it seems from the latest outpourings of its editor.

The economic situation in India, sought to be dressed up in bright colours in Yojana Bhavan and elsewhere, develops complications somewhat rapidly — because of the degree of industrialisation already existing, and its dependence on oil and its various products. Much the same crisis should be creeping up on the other developing economies. These, too, will have to trim their sails — or make their peace with the marauding systems of the affluent West if they want to avoid a zero rate of growth.

At the best of times, the Arabs have shown themselves as a rather confused bunch of policy-makers. If the oil 'gambit' doesn't develop certain 'variations', the assumption will be made that these Islamic States, with their mix of feudal-medieval-democratic practices, are in fact in collusion with the US, that the Nixon-Kissinger team is organising a huge conspiracy to restore the power of the dollar, as also the Watergate-damaged Presidency. This theory, dismissed as poppy-cock a few weeks ago, is gaining adherents daily.

Of course, speculation is also intense among 'model-making' observers. These argue that Arab oil tactics are only possible to the point that the basic interests of the super powers are not affected. When these threats develop, the Arab ruling groups will probably be given a roughing, the like of which they have not known. After all, if the Soviet Union can be dominant in Iraq, what is to prevent the US from manipulating more closely the Saudi set-up. And there is Iran, a sitting pigeon as it were, despite the alliances of the Shah.

The model-makers argue that the inevitable counter-attack will develop. Where? Nobody knows. Will it affect the price of oil? That's the central question for us in the developing world. After all, availability has been restored, officially and through 'leaks' — and that directly serves the interests of the advanced world.

Another block of thinking refuses to entertain theories about a possible fall in price. Now that the Arabs have tasted blood, they are unlikely to retreat. This element projects the notion that a huge development of exports from one nation to another will mark the first phase of a new attempt to balance world economic prices. A scenario of this kind will naturally involve the pre-empting of local markets of those goods which can be sold internationally. A huge speculation in materials, finished and unfinished, is forecast.

If our Foreign Office continues to work in some kind of euphoric state, waiting with confidence for a better tomorrow, the economic ministries of the Government of India are thoroughly oblivious to what is in store for us. The management of coal could not be in a bigger mess, and this is our most massive asset. Oil is compelled to wait for leadership which a selection team headed by P N Haksar is to provide. Atomic energy has still to emerge from the neglect of several years. As for electric power, it will take some time to bring order to the chaos. You would think that the first job would be to establish the authority of an Energy Czar to cut through the muddles and animosities of ministries. We continue to wait. Indeed, it almost looks as if we believe that our near monopoly of Thorium will do the trick in the course of nineteen seventy-four!

Meanwhile, all manner of essentials are disappearing from various markets. These disturbing reports, and developing pockets of violence, suggest that a great deal of money is at play — black money and white money. Could it be that the private funds of the wholesale trader in foodgrains are now cornering supplies of any and every article which might wield a tidy profit? This is an activity, that could prosper despite the absurd credit squeeze of the Reserve Bank which has damaged productivity all over the country. Yes, strange are the ways of high finance in a very mixed-up economy.

January 7

Venus Paper

VENUS PAPER is putting up a project at Faridabad to produce annually 3,600 tonnes of industrial papers by using market pulp and waste paper. Substantial progress has been made in implementing the project and the plant is expected to go on stream next month. The cost of the project is estimated at Rs 54 lakhs, which is to be financed by share capital of Rs 25 lakhs and a term loan of Rs 29 lakhs from a bank. Of the share capital, the public is being offered at par 1,50,000 equity shares of Rs 10 each under a prospectus. The entire public issue is underwritten by stockbroking firms. According to K L Rajgarhia, a director, the management does not envisage any difficulty in procuring the necessary raw materials nor in marketing the products which are in great demand.

Multi-Pronged Expansion

Hansavivek

AUTOMOBILE PRODUCTS OF INDIA expects to produce, in the first phase of the expansion programme, 36,000 units of scooters during the current financial year. It has an industrial licence to double capacity to 48,000 units. A 'letter of intent' has also been secured for manufacture of 50,000 numbers of four-wheeler light-utility vehicles at Nagpur, for which MIDC and SICOM have promised liberal assistance. The management has yet to decide whether to take up this project under a separate division of the company or to form a new company for the purpose. API has further applied to government and MRTP Commission for a separate licence for manufacture of another 24,000 units of three-wheelers per annum. This project too is intended to be set up at Nagpur, so that the Bhandup plant can concentrate on production of two-wheelers and the company can, at the same time, take advantage of the liberal assistance offered by the state government and its agencies. Meanwhile, API has approached the Central government for substantial price increases for scooters and three-wheelers to compensate the "unprecedented increase in the cost of men and material". The clutch and brake division has been shifted to Aurangabad, where production is getting stabilised. Government approval to shift manufacturing operations for flywheel magnetos to Aurangabad has been received and that for friction materials plant is expected. Machinery is expected to be shifted by the middle of next year. A scheme is being finalised for sale of the Lucknow division to Auto Tractors, to whom have been transferred the industrial licence for annual manufacture of 12,000 numbers of Leyland tractors — the collaboration arrangement API had with the British Leyland Motor of the UK — as well as the distribution arrangements — entered into with Projects and Equipment Corporation of India — in respect of the imported lot of 500 tractors. For 1972-73, API has turned out disappointing results, on account of prolonged labour unrest at all the company's establishments, and the power-cuts and drought in many parts of the country which further hindered the flow of raw materials and components to it. Total number of vehicles sold fell from 27,076 to 23,317 and profit-margins shrank, owing to rise in cost of inputs and "unrealistic restriction on selling prices" of scooters and three-wheelers. Together with a provision for certain adjustments in respect of prior years (Rs 4 lakhs), there was total deficit of Rs 67 lakhs. In their report, the auditors have pointed out that stores-accounting procedures at Aurangabad and Lucknow were inadequate. The directors say that there was difficulty in setting up the stores control system initially, when operations were being shifted from Bhandup to Aurangabad and that manufacturing operations in the Lucknow division were very much disorganised due to continuous labour unrest and irregular power supply so that production had to be quickly achieved whenever possible in "bits and pieces"; this hampered sys-

tematic stores accounting. They add that suitable remedial measures have been taken at both the units. The auditors have also reported that the system followed by the company for the disposal of scrap needs to be improved. Contrary to the earlier proposal, Scooters India has concluded arrangements with Innocenti of Italy for taking over its manufacturing facilities for manufacture of both scooters and three-wheelers. API is neither to participate in the equity capital nor to be associated with the management of that company. M A Chidambaram and C B Saran, who represented API's interests in that company, relinquished their seats on the board of that company. API's board is considering the question of increasing the equity capital of the company to improve the liquidity position and to augment the working capital funds.

MYSORE CEMENTS had a setback in production and sales during the year ended June 1973 on account of a strike by the workmen. Production of clinker fell from 3,85,080 tonnes to 3,39,275 tonnes, and of cement from 4,30,530 tonnes to 3,63,868 tonnes; despatches of cement fell from 4,31,659 tonnes to 3,60,973 tonnes. The directors complain that costs have been rising in all directions and margins have been shrinking. At the instance of government, the company has approached the Monopolies Commission to clear its application for setting up a new unit at Damoh in MP. Commenting on the government's decision to grant letters of intent and industrial licences to monopoly and big houses, with a view to overcoming the scarcity of cement in the country, the management says that this alone will not raise capacity: a fair return must be assured to the industry if it is to attract fresh investment.

INTERNATIONAL COMPUTERS INDIAN MANUFACTURE (ICL) has produced better results, with higher sales and higher gross profit. Net profit, however, turned out to be lower compared to in the previous year, owing to incidence of tax liability and higher provision for depreciation. Rates of depreciation have been increased, from 13 per cent to 18 per cent in respect of computers, and from 20 per cent to 25 per cent for test equipment. Consequently, the charge for depreciation is about Rs 5 lakhs more than it would have been if no change had been made. Ratios, both of inventories and of wages to sales, have come down appreciably — although total borrowings at the year-end increased and the company had to pay slightly more by way of interest charges. No provision has been made for the future retirement gratuity liability for employees, nor has the amount been ascertained. The board's borrowing powers are proposed to be increased, from Rs 150 lakhs to Rs 250 lakhs. The company's exports of machines, spare parts, and punched cards increased by about Rs 2 lakhs to Rs 21 lakhs.

ARLABS' selling agreement, entered into with Chem Mach in November 1970, has been modified because certain terms in it were found objectionable under the MRTP Act. Certain clauses of the agreement with Texdyes for distribution of some of the company's products were also modified. Prakash H Khatiwala, a director, and relatives are partners in the firm. The company has once again shown poor results despite higher sales, and it has skipped equity dividend. The directors blame restriction on electricity consumption and scarcity of certain raw materials for this. Trial runs were started recently at some of the plants put up under the expansion project. The company experienced difficulty in getting disbursements of part of the loan of Rs 9 lakhs, sanctioned to it under the new package scheme of incentives for expansion offered by the government of Maharashtra. The subsidiary, Pigments, Lakes and Chemicals, showed a loss of Rs one lakh on account of lower production owing to the power-cut.

"criticomments"

RIGHT OF WIVES AND CHILDREN

The Married Women's Property Act provides that a life insurance policy taken by a man specifically under the Act for the benefit of his wife and/or children will form a trust, free from control by his creditors.

Under the Estate Duty Act, the policy amount will not be added to his other estates, but will form an estate by itself, and estate duty leviable will be on the amount taken by itself.

This can mean a lot of tax saving for the man's wife and children, a right they enjoy under the Married Women's Property Act and the Estate Duty Act.

Let's take the example of a man with an estate worth Rs. 6 lakhs. The estate duty payable on his death is Rs. 1,02,000.

If instead his estate consisted of Rs. 5 lakhs and Rs. 1 lakh in a life insurance policy under the Married Women's Property Act, the estate duty leviable will be as follows: duty on Rs. 5 lakhs: Rs. 72,000. Duty on Rs. 1 lakh life insurance: Rs. 2,000. Total: Rs. 74,000. A straight saving of Rs. 28,000 for his wife and children, which is very useful when the breadwinner is no longer with them.

Another example: he leaves Rs. 3 lakhs as property, and Rs. 1 lakh each in life insurance under the MWP Act for his wife and two children. Duty payable will be as follows: on Rs. 3 lakhs: Rs. 27,000. On three Rs. 1 lakh policies: 3 x Rs. 2,000 = Rs. 6,000. Total: Rs. 33,000, instead of Rs. 1,02,000 on a Rs. 6 lakh agregated estate. Saving: Rs. 69,000.

This is in addition to the tax rebate a man enjoys in his own life-time on life insurance premiums. Thus a life insurance policy can help a family in more ways than one.

Calcutta Diary

A M

FIVE-YEAR plans are beautiful, lofty things; five-year plans have been debased beyond measure. Whence does all this fury come, this *ersatz* fury over *an ersatz issue*? Who goes there, friend or foe, halt and be counted. If you are a purveyor of the four and a half per cent rate of growth, you are mine sworn enemy, a reactionary and a wretch, let perdition overwhelm you. If, on the contrary, you wave the flag of a five and a half per cent rate of growth, a kiss on either cheek and maybe a Padma Vibhusana for you. The falsity which defines New Delhi's character leads to issues being formulated in such absurd terms with ponderous tracts being written on their basis.

Dilettante Politicians

If the choice were given to it, why should this nation remain satisfied with a bare five and a half per cent rate of growth per annum, for that matter? Why not ten per cent or even beyond? After all, if you tot up the sufferings of the Indian people — at least the majority of them — over the past quarter of a century, you can see that, not their willingness to suffer, it is the arrangement which has been at fault through all these years — the arrangement whereby the perseverence of the people, their toil and trouble, their waiting and patience, have merely created more opportunities for the dilettante politicians.

The formulation of five-year plans ought to be an occasion for economists to put these politicians in the dock. A high rate of growth is the prerogative of all deprived Indians, you have no business to play ducks and drakes with resources which the common people have spared, year in and year out, so that the nation could grow and prosper. If the nation has not grown and prospered, it is either because these resources have been diverted elsewhere, or because the necessary component of sacrifice on the part of the rulers — and the classes they belong to — has never been forthcoming. To indulge in hortatory poetry, without even a mention of the compelling need to bring the ruling class within the pale of national discipline, is to play the game exactly as the politicians would want it to be played. The ideas of the ruling class — didn't that curious-looking German, poring over books in the British Museum, once remark — are, in every epoch, the ruling ideas. And it is the idea of the ruling class to set technicians against one another, to set motivated cats among innocent pigeons. Thus it is that economists spoil for a fight among themselves, when they should really be on the same side of the fence, offering battle to the politicians.

But flesh is weaker than spirit; the economists succumb, they fail to discover a separate destiny for themselves beyond that of ingratiating pen-pushers, thankful for their daily bread and butter. They become Plato's functionaries, or, more appropriately, non-functionaries, since their basic function consists only of scribbling poetry, and poetry which is least bothered about political correlates. Thereby, a golden chance is muffed. For, if only for one furious moment economists would refuse to reduce the Plan to poetry and care to assert themselves, the politicians would cower in the corner: like the Upanishads or the Testaments, the Plan would then become the living credo of life.

Hollow Promises

What will not be will not be. The poetry stops way short of transforming itself into a credo. The economists, instead of being challengers, become the victims and the challenged. The politicians escape and continue to indulge in hollow promises. They live like Grecians, and — thanks to economists and such others — no occasion ever arises for them to die like Romans: nobody even demands that they should die like Romans.

As one looks round the country, inertia appears to be all-pervading. The system is sustained solely because no surrogate is available. Administration has almost come to a total stop. Transport refuses to work in important segments of the economy. Since arrangements for transport are uncertain, coal is not being carried. Since coal is not being carried, the steel plants are on the verge of closure and the power plants have turned temperamental. If transport does not hinder something else does, such as an intra-mural squabble within ruling groups, or a crass bureaucratic failure in supplying some vital raw materials or spares, or a row over the distribution of this or that essential article of consumption, or a particular explosion of emotion over a linguistic or caste tangle.

Atrophy in decision-making is accompanied by lack of moral courage. The rulers, for instance, cannot match their fiscal arithmetic. The crisis in oil supplies presents them with the opportunity to raise some extra revenue, by raising the excise on kerosene. But basic cowardice is also at work: not the need for revenue, but the objective of preventing adulteration of high-speed diesel by kerosene, is proferred as the reason for the rise in excise. A protest is lodged by a few politically powerful ones. Immediately there is a climb-down; a part of the freshly-imposed excise on kerosene is lopped off. By now prisoners of their own prevarication, the rulers are forced to reduce the levy on high-speed diesel, too, by an equal amount, and they end up by achieving something quite different from what they earlier had in mind.

A Facade

Ring-a-ring-a-roses, a pocketful of poses. Economic development and five-year plans, above everything else. So goes the pontification. Economic discipline must be enforced; the rule of the Congress party must, therefore, be established across the length and breadth of the country, because that provides the surest basis of national cohesion. However, in order that the party come to power here, there, everywhere, the electorate must be bribed in the short term. Fiscal discipline is, accordingly, breached all around; and all canons of inter-regional allocation of resources are flouted. How else does one make the elections safe in Uttar Pradesh and elsewhere? Beyond a point, the high-falutin socio-economic goals become a facade, and the medium itself turns into the message.

Let economists write and fight over five-year plans. Meanwhile, the ruling classes have to worry over problems of the short run. Who does not know that, if we fail to survive in the short run, the long run will lose all relevance? The exigencies of today therefore provide a cover for each successive violation of the cost-benefit calculus. They provide the substance of the rationale for the so-called planned economy being run increasingly on impeccable principles of *laissez-faire*. The nation would prosper, it is assumed, only if it is built first in one's own image; to do so, the spoils system must be amply used. Everything in good time, including the cost to be borne by the ruling groups and their friends so that the rate of growth could be accelerated. Meanwhile official releases of sugar are reduced progressively even as output soars

to record heights, and Maruti despite all that the Planning Commission might say in its essay becomes a law unto itself.

Consequently, each five-year plan resembles the contours of a Greek tragedy, pre-ordained, pre-packaged. Each of them has been, and will continue to be, a protagonist of a high rate of growth. None of the ruling politicians, however, will lift his little finger to ensure that this is brought about. And the people continue to languish. Fortunately for the politicians, the future is always postponable. Alibis have a way of presenting themselves. Scan through the speeches of the rulers and their obedient hangers-on, the scribes who pass as economists and you may be persuaded that if this country's growth has been retarded it is invariably on account of a number of exogenous factors over which the rulers have never had any control. Haven't you heard of the two — or several — wars forced upon us? Haven't you heard of the two — or several — droughts that have visited us? Aren't you also aware of the fact that we have had the misfortune of witnessing, during the process of our planned endeavour to eradicate poverty and income inequalities, the deaths of two of our great Prime Ministers? With such traumatic experiences, how could there be any major progress, how dare anybody suggest that India's stagnation is on account of the shortsightedness, folly, selfishness, unscrupulousness, or cynicism of it ruling classes?

We Propose, Arabs Dispose

Even as we step into the New Year, the vendors of the five point five per cent rate of growth in New Delhi have been bailed out by the Arabs — glory be to King Emir Faisal and the memory of Gamal Abdel Nasser. We had, after all, every intention of giving unto ourselves a noble Plan, a great Plan, a Plan poised for a sharply accelerated rate of growth as the universe has never seen. But, what we propose, the cussed Arabs dispose. If only they were not upto their tricks, we could have proved to the world what a fantastic pace we are capable of setting for ourselves. It is on account of the Arabs that our import bill would be affected; it is on account of the Arabs that our exports would fail to rise; it is because of the Arabs that external resources on concessional terms, which we could have expected to flow in, would now dry up; it is because of the Arabs, again, that the Japanese would decide to meet their commitments of fertiliser to China though not to us. Give or take a few hyperboles, and it would soon be seriously suggested that it is on account of the Arabs that we are unable to push through land reforms in the countryside or to impose a meaningful impost on lush agricultural incomes.

Some people have all the luck, particularly if they belong to the ruling classes in this country. And in case you dare demur, stand up and be counted; either you are an enemy of the people, or, it must be that our technical notes, which reflect the quintessence of India's pristinely glorious future, are beyond your comprehension.

FROM OUR CORRESPONDENTS

NEW DELHI

Soviet Aid: Where to Draw the Line

B M

IN the midst of the pervasive gloom over the economic situation and the declining trend in industrial production, a bright spot is the performance of the heavy engineering industry. The heavy engineering industry is primarily concentrated in the public sector and the working of the public sector units determines the industry's performance. The improvement in the working of the public sector units has been marked and is due largely to the fact that, for the first time, the managements of the industrial units have had an opportunity to function without bureaucratic interference and obstruction. The latest available figures of production of the units show that as against an output of Rs 145 crores during April to November 1972, production during the same period of 1973 stood at Rs 214 crores. The achievement is all the more creditable considering the steel, power and transport bottlenecks.

The performance of Bharat Heavy Electricals has been the most outstanding among public sector units in heavy industry. Bharat Heavy Electricals, formed after the merger of the Bharat Heavy Electricals, Hardwar, and Heavy Electricals, Bhopal, now appears to be geared to meeting the needs of the Fifth Plan power programme's requirements of machinery and equipment. The total value of production of the Hardwar complex jumped to Rs 122.32 crores during April-November 1973, of the Tiruchirapalli boiler plant to Rs 38.72 crores, of the heavy power equipment plant at Hyderabad to Rs 18.10 crores and of Heavy Electricals, Bhopal, to Rs 38.94 crores. These figures represent an improvement of between 60 and 100 per cent over the performance last year.

The Heavy Engineering Corporation has not done quite as well, but all indications are that it is also beginning to turn the corner. The principal problem here is the heavy reliance on imported components from the USSR. These imports are now expected to come through more smoothly after the recent visit of Brezhnev. A list of items and the sequence in which they are required to be supplied has been presented to the USSR authorities. Once the supply of components from the Soviet Union becomes steady, a significant expansion production is confidently expected. More heartening is the performance of the Mining and Allied Machinery Corporation (MAMC) at Durgapur which was at one time the most afflicted of the public sector units in this sector. With the demand for coal mining machinery expected to rise sharply, the position of the MAMC is expected to stabilise further. The proposal of the Action Committee on Public Sector Undertakings that the MAMC's rated capacity be scaled down by 25 per cent compared to the original estimates has therefore been rejected. In fact, the MAMC is now expected to offload some of the production lines which it had taken on in view of the lack of demand for coal mining machinery for which the plant is specifically designed, and to concentrate on its original production lines.

Skilful Dovetailing of Output

Impressive also is the working of some of the sick units taken over by the government in the engineering sector. Their production has improved significantly. This has been brought about partly by skilful dovetailing of their output with the production programmes of larger public sector complexes. The objective is to see that a large proportion of components required by the giant heavy industrial units like HEC and MAMC are manufactured in units like Jessops, Braithwaite, Richardson and Cruddas and others. This type of dovetailing is already seen to be yielding results. A major problem faced by these units is that during the industrial depression and when their own managements were weak they had accepted contracts at low prices which could not be executed except at a loss. An upward revision of the prices of their products was, therefore, necessary to match their costs. This has now been done in the case of railway wagons, which has given a strong stimulus to the operations of these units.

With the heavy engineering sector thus looking up, it is necessary to review the need for large-scale Soviet aid for supply of machinery and equipment for core sector projects in the Fifth Plan. According to the detailed projections of the Heavy Industry Ministry, total imports of machinery and equipment from the Soviet Union, which will consist entirely of parts and components, need not exceed Rs 300 crores during the Fifth Plan period. The rough break-up of this figure is as follows: Rs 120 crores of imports to support the production programme of heavy electricals, another Rs 120 crores for HEC and MAMC and about Rs 32 crores for the opening of open-cast coal mines. The Heavy Industry Ministry does not share the thinking of those, of whom there are many in the Planning Commission and elsewhere in the government, who are advocating turnkey projects and large-scale import of equipment in the name of speedy execution of projects.

Design of New Projects

The essential problem, once the heavy engineering and machine-building industries are geared to meeting the demand for equipment and machinery for the core sector projects as well as for such industries as cement, paper, textiles, etc, will be that of design and consultancy arrangements for execution of new projects and expansion of existing ones. If Indian engineering and design services are not organised and given the responsibility for this task — as has often happened in the past — reliance on foreign agencies for consultancy services will create conditions in which import of machinery and equipment will increase substantially at the cost of fuller utilisation of established capacities in the heavy engineering and machine-building industries. This is a real danger, as can be seen from the discussions with the Soviet coal team which was here recently.

No exception can be taken to seeking Soviet help to improve the working of the MAMC by importing essential parts and components for its production programme. Also, some equipment may have to be directly imported from the Soviet Union for the speedy opening up of some mines to get coal production going. But in the negotiations with the Soviet coal teams the emphasis was not on these types of assistance. The negotiations centred on Soviet experts taking up the responsibility for opening up of some of the open-cast mines and even for preparing feasibility studies for these projects. This is altogether unnecessary. Indian mining engineers are fully qualified in the field of open-cast mining and they do not have to depend on Soviet assistance. Similarly, new forms of turnkey arrangements are being made for Bokaro and Bhilai expansion. Of course, the anxiety to go in for turnkey arrangements is not confined to Soviet-aided projects only. They extend to other countries also — the deal with Toyo of Japan for setting up fertiliser plants is a notable example.

ECONOMIC CONFERENCE

Empty Ritual

THE Indian Economic Association's annual conference at Tiruchirapalli last month had an ambitious programme. Three interesting subjects had been chosen for discussion a year in advance: 'Theory of Profits', 'ECM and India' and 'Economic Analysis of the 1971 Census'. There were 15 papers, five each on the three subjects, and three rapporteurs' reports. These were thrown open for discussion in a series of group and general gatherings. A couple of general sessions were devoted to discussion of the current economic situation. There was also a special debate on 'Social and Economic Change'. V M Dandekar, who presided over the Conference, delivered his Presidential address on the theme of "Democratic-Socialist Path to Economic Development". V K R V Rao's lengthy inaugural discourse on "Some Fundamental Aspects of Socialist Transformation in India" set the ball rolling for the rambling discussions, mostly couched in very general terms.

Poor Quality of Papers

The quality of the papers read and the discussions was, to put it mildly, poor. Our more prominent economists have made it a practice of avoiding the annual conference of the Indian Economic Association unless they are compelled to attend because they occupy some position in the Association. Thus there was not a single past president of the Association at this year's conference, except V K R V Rao, who came as a guest to inaugurate the Conference, and D T Lakdawala who happens to be the editor of the Association's journal. It is true, of course, that these annual jamborees have progressively become the hunting grounds of charlatans and quacks; but it is also true that many of our senior economists are not particularly keen to test out their thinking on younger economists. With the image of these conferences thus spoiled, none of the Central government bodies — the Planning Commission, the CSO or the Bureau of Industrial Costs and Prices — cared to send any representative to the Tiruchirapalli conference, despite the large number of economists employed by them; there was a sole representative of the Reserve Bank of India.

Superficial Discussion

The discussion on the "Economic Situation in India Today" was superficial. Shanmugasundaram, who appeared quite unprepared for the task, initiated the discussion, but instead of the subject of the discussion he concentrated on Dandekar's Presidential address. This cleared the way for general outpourings on poverty, unemployment, income distribution, planning, power and transport bottlenecks, exports and what have you — all problems which will be with us for decades to come. There were few references to the specific problems marking the current economic situation, such as those of availabilities of different goods and services and demand management, production lags, procurement and distribution, the hold of speculators and hoarders and rich farmers on commodity markets, the dispensation of government funds for developmental and non-developmental purposes, deficit

financing and the economy's failure to regain the momentum of growth which has accentuated scarcities not only in the key commodity sectors but also in power, transport and fuel.

Dandekar's Presidential address was intended to be a blueprint for the Fifth Plan supposedly prepared by a one-member Planning Commission. To summarise, the address suggested that wage employment at the minimum poverty-line wage should be guaranteed to every able-bodied rural adult; in urban areas, the poverty-line minimum wage should be enforced by legislation, though there would be no guarantee of employment at that wage. The shift of incomes in favour of the poor would generate additional demand for commodities of common consumption and this would shift the terms of trade in favour of agricultural commodities and against industry. Dandekar considered such a shift "desirable". There would be no deficit financing at all — though there appeared to be some confusion, to which V K R V Rao referred in his comments, between deficit financing and government "borrowing from the banks". The objective of price policy for the Fifth Plan would be "a stable but gradually declining price level". All the rest would be left to market forces. Even the 'nationalised' trade in the essential commodities "must function on the principle of the market". One of the objectives of nationalised wholesale trade in foodgrains would be "to build and operate a buffer stock without administrative interference with the price and market mechanism".

Presidential Contentions Challenged

Not all the contradictions in the Presidential speech went unchallenged. Rao, Lakdawala, Bhate and Shetty raised many pertinent questions, but Dandekar ignored most of them in his reply at the end of the discussion. He was asked, for instance, how he proposed to bring about a basic change in the pattern of income distribution in favour of the poor without a commensurate change in the production pattern. How could the objectives of nationalisation of foodgrains trade be achieved by adhering entirely to the principles of a market economy? How could an interventionist policy for bringing about changes in income distribution be reconciled with reliance on the price and market mechanism for the production and distribution of commodities of common consumption? It was also pointed out that Dandekar's model envisaged constancy in money supply, and a stable (even gradually declining) general price level, accompanied by a shift of the terms of trade in favour of agricultural commodities. This implied an absolute reduction in the prices of manufactured goods. How could such a reduction in the prices of manufactured goods be achieved when Dandekar's model presupposed a deliberate push to the prices of wage-goods and even agricultural raw materials? The question was pointedly asked if it was empirically sustainable that official policies had tended to pay arbitrarily low prices for agricultural commodities.

In the discussion on the technical subjects, that on the theory of profit was perhaps the most noteworthy. One wishes though that P R Brahmananda, the Rapporteur on the papers on the subject, had resisted the temptation to play to the gallery. At the end of his report, he builds a model for surplus value distribution and introduces G (Government Consumption) which is an accumulation-depressant by definition. He then goes on to conclude that "G which eats up P (Profits) or keeps the latter under leash, does not help social justice, nor does it help growth". This is obviously incorrect. That apart, it does not follow from his 'model'. J H Adhvaryu in his paper on "A General Theory of Profit, Investment and Growth" similarly develops a model presenting the investment function in our economy as depending upon "the difference between the two saving functions and the share of profit in the national income, i e, P/Y". Adhvaryu confuses this share of profit in national income (P)/(Y) with the retained surpluses of corporate enterprises. He writes that these "acquire all the greater significance for investment and growth". It came as a shock to him that corporate retained surpluses formed just 5 per cent of total domestic saving in the Indian economy.

Slipshod Use of Data

An example of slipshod use of data was A C Minocha's paper on the "Rate of Profit in Indian Economy". According to Minocha, "profits after tax as percentage of net worth did not register any appreciable increase". However, the Reserve Bank data presented by him in respect of 280 large companies show that the percentage increased from 8.3 per cent in 1968-69 to 11.5 per cent in 1970-71. The same is true in respect of 1,501 large and medium companies studied by the Reserve Bank. Again, Minocha claims that "since 1965-66, the index of variable dividend securities has declined with occasional rise of a small order". In fact, the relevant index quoted by Minocha gradually rose from 76.7 in 1965-66 to 100.4 in June 1973. Quoting data on the rising incremental capital-output ratio from one of Brahmananda's earlier papers, Minocha writes that "the rising incremental capital to output ratio is an evidence of the phenomenon of diminishing returns". What Brahmananda and Minocha both fail to see is that if only the growth in investment, which has been poor during the past few years, had been faster, the incremental capital-output ratio would have risen still faster. In a developing economy, the growth in assets has to be faster than the growth in income.

TAMIL NADU

Passing of the Periyar

E V RAMASWAMI, or *Periyar* ('the Great One') as he was popularly called, breathed his last on Christmas eve, following his close personal friend and bitter political opponent, C Rajagopalachari, by exactly a year. While Rajaji had gradually become obsolete to the political process in Tamil Nadu, Periyar had opted out of it when events overtook him. By then, his initially firebrand social movement, which had mounted a frontal attack on traditionalism and particularly on Hindu religion and the caste system, was already frozen into a traditionalism of sorts. Despite their divergent attitudes on social issues, Rajaji and Periyar had one thing in common: both were against any upsetting of the existing economic order. In the result, Periyar's anti-Brahminism and his attack on religion have made no more than a minor dent in Tamil society and the DMK which was the inheritor of his rebellious mantle has been totally absorbed by the system. Nevertheless there can be no justification for ignoring Periyar.

At the turn of the century, Brahmins in the Madras Presidency, forming only 3 per cent of the population, had established a virtual monopoly in all fields of learning and administration. The Justice Party, formed by upper-class non-Brahmins in 1916, primarily sought representation for non-Brahmins in the legislative council, the civil service and the courts. Having achieved these aims, through its obsequious loyalty to the British, the Justice Party faded away in the early forties. It was this organisation that Periyar joined and turned into the Dravida Kazhagam (DK), giving it a radically different orientation.

Periyar founded the 'self-respect' movement. The non-Brahmin could learn to respect himself only by learning to hate the Brahmin who had deprived him of his self-respect. Only this could redeem him from long-enforced patterns of servility. A man had to learn to assert his worth before he could look his oppressor in the face and say 'No'. The Brahmin could be fought only by befriending the British. Hence British Raj was better than Brahmin Raj. This was Periyar's message. The day of Independence, therefore, became a day of mourning for him. Earlier, he had led a massive agitation against the compulsory introduction of Hindi in schools because he saw this as an attempt to confront and subjugate the Dravidian with an Aryan language.

When Independence came, the younger elements in DK led by Annadurai, sensing that they had been overtaken by nationalism, broke with the party and formed the Dravida Munnettra Kazhagam (DMK). For its part, the DK, shunning political involvement, became a purely social reform movement.

Rationalism, of however limited a kind, was the cornerstone of Periyar's movement from the earliest days. His crusade against the caste system was aimed primarily against the Brahmin. Although he had been once in the frontline of the Harijan temple-entry campaign and his speeches had thrilled the hearts of many a Harijan, he was concerned with the problem of untouchability only marginally. His anti-Brahminism was rooted in his opposition to religion. He believed that to attack the Brahmin without attacking the source of his power was useless. Periyar conducted thousands of self-respect marriages without priests and vedic rituals. The mass media and cultural shows were effectively used to spread the message. His public speeches were very effective in debunking religion in the eyes of the masses. He identified Hinduism with puranic lore, and exposed to his listeners thousands of scandals and inconsistencies found in Hindu religious texts.

Periyar's attack on religion turned out to be a kind of armchair atheism as it did not concern itself with the social relations which give rise to and nurtured religious differentiation. As such it was bound to fail. In fact, with the deepening economic crisis, recourse to the religious sedative in Indian society has been on the increase, leaving only the closest followers of DK to hold aloft the torch of atheism in Tamil Nadu.

There was a politically radical phase too in Periyar's career. For a brief period after his return from the Soviet Union in 1931, he organised a series of conferences demanding abolition of Zamindari. He was promptly jailed for sedition. Although his socialist rhetoric faded after that, he would often say in later years that only a communist government could eliminate religion and casteism. Yet, in holding that it was the demolition of religion in the Soviet Union that had brought socialism to it, he had totally misunderstood the process by which religion had been destroyed there. It was this fallacious perception as well as his intense reaction to caste prejudices that drove Periyar to stubbornly substitute caste for class in his social analysis and in the remedies he prescribed.

Another element in his rationalist message was his campaign against the oppression of women. He championed the causes of widow-remarriage, of marriages based on consent, and of women's right to divorce, to property and abortion. Pointing out that there was no Tamil word for the male counterpart of an adulteress he fumed: "... the word adulteress implies man's concept of woman as a slave, a commodity to be sold and to be hired". Periyar's demand at a conference two years ago, that no odium should be attached to a woman who desired a man other than her husband (which the press so avidly vulgarised) as well as Periyar's advocacy of the abolition of marriage as the only way of freeing women from enslavement, were about as radical as the views of any women's liberationist.

Periyar's style of functioning was dubbed as crude and vulgar by the Tamil elite. But it was precisely his uninhibited and direct expression, his lack of sophistication, and his uncompromising and strident style of criticism that made him a man of the masses. His constant touring and addressing of public meetings made him an extremely effective campaigner. In recent years his party had been holding periodic 'social stigma abolition conferences'. In the last few months the Centre had sought to create a stir over Periyar's old advocacy of a separate Tamil Nadu, suddenly taken note of now for political reasons — as was his Salem Conference on the eve of the 1971 elections. Periyar had in addition threatened confrontation with the Centre in late January, if by that time it did not bring in a constitutional amendment to make the practice of casteism an offence like untouchability. The threat will now probably never materialise. The DMK and the Congress in Tamil Nadu have in fact used Periyar as a political chequer block against each other. His closest followers, the DMK leaders in office, having prostituted their erstwhile atheism for political survival, had become his worst enemies. Even as they embraced him

FRESH ALTERNATIVES FOR INDUSTRIAL ENTERPRISE:

Start an industry with an OSFC long term loan...

AND PAY IT BACK IN ALMOST 15 YEARS

New small and medium scale industries and those requiring expansion or renovation in Orissa are eligible for financial assistance offered by the Orissa State Financial Corporation. Like long term loans which you repay in 10—20 years if your industry is located in a developing area. Or an interest rate of 9½% which can be further reduced to 6½% for industries in developing areas, through refinance from IDBI.

Read here how OSFC lends a helping hand to new industries:

CREDIT FACILITIES:
Public and private limited companies and co-operatives can receive credit up to a maximum of Rs. 30 lakhs. While the limit for other concerns is Rs. 15 lakhs. Assistance for industries takes various forms—rupee loan, deferred payment guarantee and underwriting of capital issue.

FOREIGN EXCHANGE CREDIT:
OSFC arranges foreign currency loans with the International Development Association (IDA)—a World Bank affiliate—for the purchase of capital equipment and spares for small and medium scale industries. This credit, which may be as much as Rs. 30 lakhs for public and private limited companies, can be obtained from any of the World Bank member countries and Switzerland.

Remember, if you are going to be engaged in any activity involving processing, manufacturing, storage, mining, transport, power generation, packaging, servicing and repair work or hoteliering, you are eligible for financial assistance under an OSFC scheme.

Send in detailed enquiries today, and start your industry on a sound financial footing.

ORISSA STATE FINANCIAL CORPORATION
Barabati Stadium, Cuttack-5

Other corporate partners in industrialisation:

INDUSTRIAL DEVELOPMENT CORPORATION OF ORISSA LTD.
P. O. Box No. 78, Bhubaneswar-1. (participation in joint sector projects)

ORISSA SMALL INDUSTRIES CORPORATION

INDUSTRIAL PROMOTION & INVESTMENT CORPORATION OF ORISSA LTD.
35 Satyanagar, Bhubaneswar. (finance and services to all industries)

U-IPICOL-7

most effusively on every public occasion, they as easily blocked his movement at every turn. The communist movement too failed to adopt a scientific attitude towards him based on a study of his movement and the need for it. It has not seriously considered why Periyar enjoyed the tremendous popularity that he did, and whether Tamil nationalism with anti-Brahminism as its main component is always inimical to class struggle.

SARKAR COMMISSION

Public Money for Private Empires

FOLLOWING the revelations of the Dutt Committee Report, the government appointed a Commission under the chairmanship of former Chief Justice A K Sarkar to inquire into certain irregularities with respect to the grant of industrial licences and institutional finance to the large industrial houses, especially the Birlas. Though the Commission was appointed on February 18, 1970, little is known about what the Commission has been up to so far. Now, suddenly the Commission has come to life with its public hearing in connection with the allegations of undue favours shown by the public-sector Industrial Development Bank of India (IDBI) to four companies belonging to the Birlas and two companies belonging to the Bangurs. The Birla companies in question are Central India Machinery Manufacturing Company (CIMMCO), Industrial Plants, Bihar Alloy Steel and High Quality Steels and the Bangur companies are Shree Digvijay Cement and Jayshree Chemicals.

Its terms of reference require the Commission to inquire into (a) the circumstances in which certain financial institutions granted assistance by way of loans, underwriting of shares and debentures, purchase of shares or otherwise, to the larger industrial houses referred to in the Dutt Committee's Report; (b) whether any undue favour was shown or undue influence exercised in the grant of such assistance or in prescribing the terms thereof; and, (c) if so, the concerns, institutions or persons responsible. The Commission selected the IDIBI as the first institution for inquiry since it is the youngest among the term-financing institutions, having been established in July 1964, and so would have relatively few cases requiring investigation. The period of the Commission's enquiry is upto the end of 1967. During this period, the IDBI granted assistance to 13 concerns belonging to the larger industrial houses. Among them, the Commission identified the above-mentioned six concerns as the ones where there was a *prima facie* case for inquiry.

The Commission, proceeding at a snail's pace, could cover only CIMMCO and Industrial Plants in the first phase of its public hearings. Even this has taken more than three weeks so far. The next round of the Commission's hearings is expected to start in the middle of January.

The facts of the case relating to CIMMCO are as follows. CIMMCO completed its 6,000-tonnes steel castings project some time between January and March 1965. This was on a new article licence and, as declared by CIMMCO itself, the steel castings plant was intended to meet the requirements on its wagon factory. Around the time this project got completed, CIMMCO applied for and obtained a substantial expansion letter of intent for expansion of steel forgings capacity by 7,200 tonnes. Almost simultaneously, the Birlas obtained other letters of intent/licences for steel forgings in the names of other Birla concerns like Texmaco, Indian Smelting and Refining, Manjushree Industries, etc. None of the letters of intent (including the one issued to CIMMCO for expansion of steel forgings capacity) was converted into an industrial licence.

However, a different picture emerges about the expansion activities of CIMMCO from their application to the IDBI made in September 1965. The company had two expansion projects — one at Bharatpur for expansion of structurals from 2,500 tonnes to 15,000 tonnes costing Rs 75 lakhs and another at Gwalior for a steel castings and forgings expansion from 3,000 to 6,000 tonnes costing Rs 90 lakhs. CIMMCO claimed to have licences in both cases. Out of the total cost of the two projects of Rs 165 lakhs, CIMMCO wished to raise Rs 125 lakhs through a debenture issue which it wanted the financial institutions to underwrite. No project report was prepared because, it has been claimed, it was an expansion scheme. IDBI was asked to underwrite Rs 40 lakhs. Applications were made simultaneously to LIC and ICICI and IFCI was informed a month later. Out of the total debenture issue, debentures worth Rs 91 lakhs were given to sister concerns like Jiyajeerao Cotton Mills and Hind Cycles as outstanding dues. This was the original application. Some time later the scheme was changed. It was claimed, in the wake of the September 1965 Indo-Pakistan War, that the project was a defence-oriented one. Under the changed scheme the cost of the Bharatpur expansion was estimated at Rs 70 lakhs and that of the Gwalior expansion at Rs 106 lakhs, including Rs 34 lakhs specifically on account of the supposed defence-orientation of the scheme. IDBI and IFCI were informed of the contemplated change, but LIC and ICICI were not. Till February 9, 1966, the day the memorandum to the executive committee of the IDBI was prepared, there were no orders or approvals from the defence department. On February 16, on the day of the meeting of the committee, some officer in IDBI was told orally about the materialisation of some defence order. On the basis of such scanty information, IDBI sanctioned Rs 40 lakhs of underwriting. When the public issue, made on May 10, 1966 was not subscribed to at all, the IDBI disbursed the entire sanctioned amount.

The Commission, which was represented by a retired judge of the Calcutta High Court, used three main arguments to show that IDBI had in fact shown undue favour to the Birlas. First, in the absence of any project details and particulars, and especially in the absence of any definite defence orders or approvals, the project was not assistable. Second, it was beyond the scope of the IDBI, as a development bank and as one charged with co-ordinating the functioning of the other term-financing institutions, to give assistance for purposes of repayment of loans, especially to sister concerns within the same group. In this context, the purposes for which IDBI was set up under the IDBI Act of 1964 need to be recollected. These were (a) to co-ordinate the activities of other financial institutions (including banks); (b) to supplement their resources; (c) to plan and promote industries of key significance to the industrial structure; and (d) to adopt and enforce a system of priorities in promoting future industrial growth. The third argument of the Commission's counsel was that since Rs 34 lakhs were meant for defence purposes, IDBI could have withheld its

assistance until such time as definite defence orders materialised. In any case, Rs 70 lakhs out of the total debenture underwriting assistance of Rs 125 lakhs ended up as deposits with Jiyajeerao Mills.

This was the case for the prosecution. The defence for IDBI argued that, on the first count, IDBI gave assistance only after satisfying itself about the feasibility of the project. If the project did not finally materialise, that was the fault of neither IDBI nor the Birlas. The project was held over because of the recession. Gory accounts of the recession were read out from the Reserve Bank *Bulletin* in support of the argument. Secondly, it was argued that no exceptions to the accepted principles and norms of IDBI's assistance were made in this case. Loan repayment was the immediate purpose, but subsequently the project would be financed through internal generation of resources. The assistance would thus ultimately serve the purpose of industrial development for which IDBI had been set up. In any case, there was a precedent, in the case of Associated Bearings, of IDBI assisting loan repayment. It was, however, pointed out in reply by the Commission's counsel that in the case of Associated Bearings IDBI had "reconciled" itself to the decision of the other financial institutions. With regard to the Commission's third argument, the defence was that IDBI's assistance played the role of 'rolling money' — it generated resources over time which could be used in case the defence orders materialised.

IDBI's defence was a weak one. As was pointed out by the counsel for the Commission, the circumstances in which the assistance was given were not beyond suspicion. There were too many twists and turns in IDBI's decision-making for it to be considered otherwise. For example, CIMMCO's claim that production of defence equipment, like ammunition trailers, would save much-needed foreign exchange and promote import substitution, did not appear to have been checked by IDBI either before or after the sanctioning of assistance. The proposal about production of defence equipment figured only in the supplementary note of CIMMCO to IDBI. Similarly, though the money had been paid to CIMMCO on June 28, 1966, it was not utilised for the purpose of expansion for which it had been obtained. On the other hand, in clear contravention of the condition laid down in a letter written before sanction by the manager (appraisal) of IDBI, Rs 70 lakhs of the Rs 125 lakhs received by CIMMCO was kept in deposit with its then holding company, Jiyajeerao Cotton Mills. This condition was not, however, included in the final assistance agreement, for no assignable reason. The circumstantial evidence against IDBI is thus formidable. As for the defence counsel's argument about the pressing circumstances in which CIMMCO required IDBI assistance to pay back its debts in time to its sister concerns, it was aptly pointed out by chairman Sarkar that "it is difficult to imagine Birla squeezing Birla!"

In fact, the Commission's case could have been even stronger. Two points overlooked by the Commission's counsel need to be pointed out. First, IDBI granted assistance for the steel forgings expansion project even before the conversion of CIMMCO's letter of intent into an industrial licence, which is in direct contravention of the rules of operation of public financial institutions. Even if underwriting or other assistance is sanctioned before such conversion, in no case is disbursement permitted unless the investment project is completely finalised. We are by now familiar with the pre-emption of licences by large industrial houses. This was a case of pre-emption of finance, which the assisting financial institution itself seems to have made possible. The second point is that the underwriting of the debenture issue — that too for a dubious project — in 1966, when the capital market was positively at a low, is evidence of negligence, if not worse, on the part of IDBI. If IDBI thought it fit to assist the project, it could have given a normal loan.

The Industrial Plants case is much simpler. IDBI underwrote Rs 13 lakhs of an equity issue by Industrial Plants. The project cost was Rs 183 lakhs. The case against IDBI is that it assisted a project which had inadequate promoter's stake — the Birlas were contributing only 8 per cent of the total project cost as against the norm of a minimum 15 per cent contribution. IDBI's defence was that the total direct and indirect contribution of the Birlas worked out to much more than 8 per cent. This argument, however, depends on the inclusion of the underwriting (which did not ultimately devolve on the underwriters) done by Shantilal Thar, a Birla associate.

What, one wonders, will be the outcome of all this ponderous investigation. The Sarkar Commission's term has been extended upto the middle of February 1974. How examination of all the remaining cases can be completed in just one month is anybody's guess.

SARDAR PATEL INSTITUTE OF ECONOMIC AND SOCIAL RESEARCH

invites

applications from (i) persons holding at least II Class Master's degree in Economics/Statistics and preferably below 30 years of age for the award of JR. RESEARCH FELLOWSHIP of Rs. 300/- p.m., initially for a period of one year, renewable for a subsequent year. The selected candidates will register for doctorate degree in Economics with the Gujarat University. (ii) Persons holding a degree in Library Science, and at least five years' experience in a University/Academic Institute Library for the post of ASSISTANT LIBRARIAN in the pay scale of Rs. 400-40-800 and all allowances admissible as per rules of the Institute. (Required experience can be relaxed for candidates with higher qualifications. Those who applied in response to our earlier advertisement may indicate if they would like to be considered again). Apply giving full particulars to the Director, Sardar Patel Institute of Economic and Social Research, Post Box No. 4062, Navrangpura, Ahmedabad-380009 on or before January 31, 1974.

BRITAIN

Nationalising Disruption

Farrukh Dhondy

IDI Amin announced last week that he was setting up a 'save Britain' fund and sending this country a food parcel to help it out of its troubles. In one of his characteristic Commonwealth court jester jibes, he appealed to the former colonies to help their old masters out of a mess. With Amin one can never tell where a joke ends and politics begins, but I suppose he was cashing in on the third world's demonstrated ability to slow Europe noisily down.

If his point was to call attention to the friction caused by the shortage of oil, Heath for one was trying very hard to miss it. Cabinet ministers have gone out of their way to deny that oil is at the root of the problem. They insist there's enough to go around even if the price has to rise to 50 pence (Rs 9) a gallon, and that rationing it to motorists is the severest thing that they need to do. Britain's crisis, they say, has been caused by the miners controlled by the reds. The question is one of power, not in the literal sense of coal and oil but in the more fundamental sense — who rules the country, the power of organised labour or the power of public opinion in support of capitalist parties?

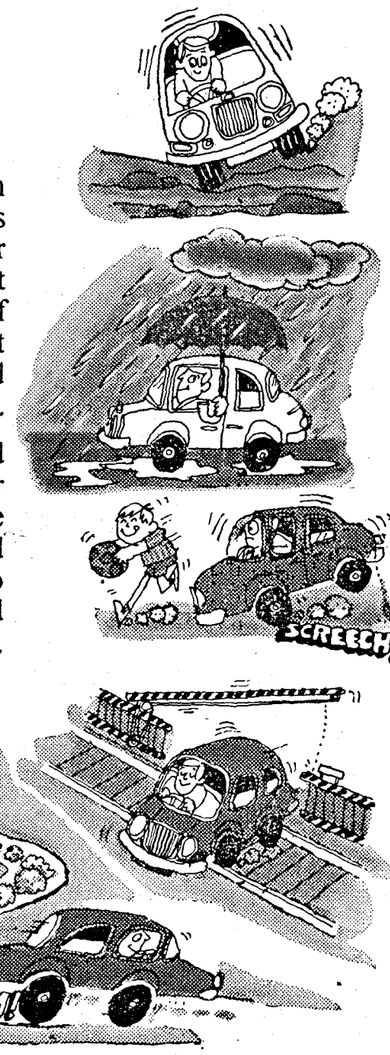
Britain is promised a cold winter. The National Union of Miners, the most powerful section of the real British opposition, have imposed a ban on overtime work and cut the country's coal production by 35 per cent. The railway union, fighting the government's wage policies in concert with the miners, refuses to transport all the coal that's brought to the surface in the collieries, again by simply banning overtime.

The miners have been offered every possible permutation of a settlement within what the government calls its anti-inflation policy, and have resolutely held out for the £ 8 a week more that they have demanded on their basic rate. Their second attempt in two years to break through the cordon of law with industrial power is seen as more than a wage dispute because its repercussions have brought about the most serious political situation since the last war. The Vice-President of the Union, Michael McGahey, a Communist Party man, says its the miners collective wish to overthrow the profiteer's government and put a CP and Labour majority in its place. The Labour party, to whom most of the leaders of the unions are affiliated, has no such wish of course. Wilson has displayed trembling knees at the miners' demonstration that their normal working hours leave the country without the coal it critically needs.

Giving way to the miners' wage claim will mean that the government will suffer defeat. The balance of payments, the expansion drive and the attempt to fight off the effects of inflation on investment and profit, and hence on employment, all depend on the success of the government's anti-wage rise policies. Every union in the country will follow the miners through a breach in policy.

The Tories are in no mood to give way. Rather than pay the miners, they have announced a series of emergency measures calculated to bring the country to a standstill and bring as many sections of the population as they can carry into conflict and confrontation with the miners. The present crisis, with a deficit of £ 1,500 million in the balance of trade and price rises of over 20 per cent in a year, could ultimately make the thirties look like a garden party.

Though the Tories have no long-term perspective for getting out of the mess, they have staked their all on a fight with the miners. The emergency measures have put most industries and services on a three-day week from the first of January. In practice this will mean a partial closure for even the essential industries such as steel which will immediately make 100,000 workers redundant. The government will have to contend with their displeasure if it can be turned against the Steel Corporation and the government rather than against the miners.



There are several ways of preserving power, but the government has chosen the one that will either challenge the unity of the unions or their combined strength. Many industrial workers and some service and office workers will be paid for only three days in the week and be laid off for the rest. But engineering and car workers in the Midlands have accepted the challenge of the national lock-out and are demanding five days pay. They threaten to close industry down totally rather than accept an indefinite cut in their wages. If other branches of industry follow, as seems likely, the government will use its option to call a general election.

The toughs within the Tory party, said to include Chancellor Anthony Barber, anticipate and welcome the deadlock. They are confident of dealing a decisive blow in the class war, using a snap election as their chief weapon. Their argument goes something like this: "We close the country down and point at the greed of the miners. The militants pull the disunited unions into a half-hearted, demoralised general strike. The Labour Party has more or less the same attitude to the unions, only it can't show the country that it is willing to smash the power of organised labour. We've got legislation to sequester all union funds, well-trained mob control squads and enough police to smash pickets and so on. The Trades Union Congress leaders have repeatedly shown that they are willing to negotiate with a new Tory government. An election will give us a decisive majority as the voters always tend towards the *status quo*, especially when no alternative parliamentary leadership is forthcoming. With an enhanced majority we can bring in what measures we like."

This argument, composed more from speech-reading than mind-reading, is not that simple. Heath and other dovish tendencies in the party realise that they cannot call an election to break the unions and expect the unions to give them a vote of confidence. With eleven million unionised workers in the country and a public surprisingly sympathetic to the miners' cause and alarmingly sensitive to the burden of rising prices, the country may very well turn to anybody they can lay their vote on. Even if the Tories do win an election, the parliamentary medicine will not cure the endemic disease. However large a majority the Tories have in the House, the government will have to use more than promises, persuasion and television to push the workers back to happiness within the terms of the wage freeze. Most dangerous of all will be the attempt to run the country under laws which large and powerful sections of the country are willing, ready and forced to defy. The parliamentary majority will count for nothing if the fight is taken to the streets.

The rank-and-file action of the unions has already forced the Tory Industrial Relations Act into a deep freeze. At the start of the crisis, William Whitelaw, chief trouble-shooter of the party and ex-boss of the Irish campaign, was called in to handle the unions. He declared that the law

Firestone tyres- made in India to suit Indian road conditions.

Firestone has been making strong tyres in Bombay for over 33 years. Tyres that meet the demands of the most difficult Indian road conditions.

Specially developed Firestone rubber compounds have the toughness and resilience needed to withstand wear and tear on rough roads.

The exclusive Triple-Strength Construction of Firestone tyres can take the friction of high speeds on highways.

Firestone tread patterns give the tyres a safety grip on wet roads and at intersections, for smooth braking and take-off. The wrap-around shoulder improves control on curves with road-hugging grip.

would not be used against the present go-slow workers. He has proposed that the letter of the wage law be followed and that the pay board dodge its spirit by allowing the miners an increase on their basic wage by disguising it as payment for the time that miners spend before and after they work at the seams. In other words, they will be paid for bath time and for the time spent in fetching and leaving gear. Even if this measure is accepted, it is too late to call off the three-day week. That the government can only afford to do when coal supplies are normalised and wages are once again connected to full production. Even then the procedures for accepting the offer will take till the end of January.

Meanwhile Britain prepares for nationalised disruption.

THAILAND

Reluctant Rulers

Harish Chandola

THE King and the new government of Prime Minister Sanya Thammasak have now become the most popular elements in the politics of Thailand. Both have taken steps to dismantle the superstructure created by the ousted military regime of Marshal Thanom Kittikachorn to keep itself in power. The most recent of such steps was the dissolution on December 17 of the National Assembly which was full of military officers and other henchmen of the ousted regime. Some members of this Assembly had already resigned because in the new situation the Assembly had become meaningless.

The students who toppled the dictatorial regime appear quite happy with the role now being played by the King and the new government. The King had quietly opposed the old military regime which had tried to suppress him. There were rumours that the strongman of the former regime, Deputy Prime Minister Marshal Prapas Charusathiara, and his son-in-law, Colonel Narong Kittikachorn (son of the former Prime Minister), were planning to do away with the institution of monarchy and get themselves declared as President and Vice-President, respectively. Last year, it is reported, there was an attempt to shoot the King's son in Australia where he is studying. This incident is now being linked with the conspiracy to do away with the institution of monarchy.

Throughout the past troubled years, the King remained constantly in touch with the students. He used to visit both Chulalangkorn and Thammasat Universities and in his talks to students used to be openly critical of the corruption of the military regime and its other actions. The Marshals did not like that and they had therefore told the King not to provide encouragement to students who they thought were turning radical. The King was in no position to overrule the 'advice' given to him by the military government, as the institution of absolute monarchy had been brought to an end as far back as 1932. But he did not stop visiting the universities and continued to remain in touch with the students. The King also travelled all over the country to keep in touch with the people.

Thammasak's government is extremely popular partly because it has made it very clear that it is only a caretaker government and its mandate is to give the country a constitution and arrange for popular elections so that Thailand can have a democratic government. It hopes that the drafting of a constitution will be completed by next April and elections will be held in another three months. Then, this government's work will have ended.

It will be the new, elected government's task to lay down the domestic and foreign policies of the country. The present government will let the old administration function almost as it did before, of course without the excesses, because bringing about a change in the system of administration would also be the task of the popularly-elected government.

There has been some criticism of Thammasak's government for seeking the advice of student leaders at every step for almost everything it does. A prominent Thai newspaper, *Siam Rath*, has asked: "Are the students running the government?" I recently met the Deputy Prime Minister, Sukich Nimmanhemin, and asked him about this criticism of the government. He replied that the members of the new government could not forget that they are there because of the sacrifices of the students. He said: "We older people feel very ashamed that we did nothing to oppose the tyranny imposed upon the Thai people by the military dictatorship. It was the young people who rose up, made great sacrifices, and brought to an end the black night of despair that had descended upon Thailand. The young people paid with their blood the price of this change that we now have. How can we forget that? We are in the government because the students have put us there. We are not the elected representatives of the people. We are there by courtesy of the students. Why should we not consult them? Who are these people who are questioning the authority of the students? These are people who have done well under the military regime and they now wish to tell the country what it should do."

Since there are no political parties in Thailand (except the underground Thai Communist Party), I asked the Deputy Prime Minister if the Prime Minister or he himself would be forming a political party to contest the elections that are to be held in a few months' time? He said that he and the Prime Minister had decided that neither of them would form political parties or contest the elections. As soon as a constitution was drafted and elections held, the Prime Minister and he would consider their task over. The Prime Minister wished to go back to his university campus (he had been the Rector of Thammasat University) and Sukich Nimmanhemin would go back into retirement. They had no wish to seek positions in the government to come.

I asked about the priorities the elected government should have after taking office. The Deputy Prime Minister initially said he was not competent to answer that question. But then he added that whoever took office must first look to the economic problems of the country instead of attending to problems of foreign policy. There were people in the country who were still hungry and there was unemployment and there were many other domestic problems crying for solution.

What did he think of SEATO? He thought SEATO was somewhat unnatural. It was like putting into a soup, chicken, geese, ducks, foxes and wild cats. In it there were countries which were geographically far apart and whose interests were different. There was no understanding among them. He was aware of the opinion that SEATO should be dissolved and of the demand by many in his country that Thailand must withdraw from SEATO if it was not dissolved. But he felt that his mandate was only to see that popular elections were held to form a democratic government. The new government, which would be elected by the people, would have to decide what to do with SEATO and with the US military bases in the country, he concluded.

A challenging future calls for greater austerity & hard work

Kamaljit Singh, Managing Director (Marketing Division), Indian Oil Corporation Limited

Shri Kamaljit Singh

Following is the speech delivered by Shri Kamaljit Singh, Chairman of the 14th Annual General Meeting of the Indian Oil Corporation Limited held on the 17th December, 1973 at New Delhi:

At the outset, and before going over the working results of the year, it is necessary to dwell on some recent developments in West Asia, which are of considerable importance to the oil industry in India. Various factors have helped to push up the world prices of crude oil to phenomenally high levels. Compared to the prices of crude oil prevailing about two years back, the present prices in West Asia are almost ten fold. Such a steep increase in so a short period has been unprecedented in the world crude oil market. These developments have, at one stroke, increased steeply the foreign exchange drain on the country for the import of crude oil and other petroleum products. It is also not easy to secure adequate supplies of oil, either on a short-term, or on a long-term basis. The outlook for the future is neither bright, nor even clear; and India alongwith several other Nations, has had no alternative but to tighten its belts and seek all possible steps for the conservation, and a very cautious utilisation, of the available energy resources. Obviously, such a major development is bound to affect the future outlook of your Corporation as regards growth, planning and profitability. While the Government of India and your Corporation are fully alive to this problem, it is much too soon to estimate what precise effects will be felt on the progress and profitability of your Corporation in future years.

YEAR OF CHALLENGE

Turning to the year under report, 1972-73 turned out to be a year of sustained progress for your Corporation, the details of which will be mentioned later. However, despite such progress, during the year 1972-73 itself, signs were evident of grave stresses in the national economy and steep increases in the cost of living; and these necessarily had their influence on the style and working of your Corporation. Even though your Corporation made increased profits during the year, it had to take several steps for economy and austerity in its operations, in the context of the overall national economy. For example, your Corporation has dispensed with the customary printing and distribution of Calendars and Diaries for the year 1974. At the same time, your Corporation was also called upon to shoulder increasingly higher responsibilities towards society and to foster the common weal. The year was one of severe drought and acute scarcity in several parts of the country and your Corporation made substantial donations to various Relief Funds. In brief, though your Corporation continued to be the leader in the corporate sector, with the largest profits of any company whether in the public sector or in the private sector, it has had to assume a dual role, on the one hand as a pace setter for economy and austerity, and, at the same time, as a torch bearer in fulfilling larger social responsibilities.

WORKING RESULTS

For your Corporation, it was a year of continued progress on all fronts. During the year, the three refineries at Gauhati, Barauni and Koyali processed a total quantity of 6·91 million metric tonnes of crude oil, as against 6·72 million metric tonnes in the previous year. The sales turnover of your Corporation amounted to Rs. 996 crores as against Rs. 862 crores in the previous year, resulting in an increase of 15·55%. The total volume of products sold also increased by 10·60% going up from 13·68 million kilolitres to 16·00 million kilolitres. The overall market participation of your Corporation increased from 54·2% to 59·2%.

FINANCIAL RESULTS

The total profits during the year, before providing for depreciation and interest, were Rs. 66·32 crores, as against Rs. 53·42 crores in the previous year. In 1972-73, the net profits, after providing for depreciation and interest and for adjustment of prior years, were Rs.49·17 crores as against Rs.36·94 crores during the previous year. Your Corporation is determined to make every effort to maintain its profitability, inspite of adverse conditions and the grave challenges looming ahead.

The paid up capital of your Corporation continued to be Rs. 71·18 crores. During the last nine years, your Corporation earned net profits totalling about Rs. 127 crores, and channelised general revenues to the Government through Customs and Excise Duties to the tune of about Rs. 1900 crores.

Your Corporation has been repaying to the Government of India, according to schedule, the loans taken from them. Out of total loans of Rs. 94·53 crores drawn from the Government of India since 1964, your Corporation has repaid about Rs. 69·36 crores and the loan due to Government on 31-3-1973 stood at Rs. 25·17 crores. Various steps were also taken for the prompt collection of outstandings due to your Corporation from the customers. At the end of the year, the total outstandings from customers represented about nine days' sales.

CONSTRUCTION OF NEW REFINERIES

It was a day of great significance for your Corporation when the Prime Minister recently laid the foundation-stone of the proposed refinery near Mathura with an initial annual capacity of six million metric tonnes, and with provision for possible expansion at a later date. Various preliminary steps have already been taken in order to commence the actual construction of this refinery as early as possible.

As an adjunct to the refinery, a 1200 Kms long pipeline has been planned from Salaya, a village on the Gujarat coast to Mathura. Reconnaisance surveys and other investigations have been conducted over the proposed route of the pipeline. Your Corporation is also planning to commission the most up-to-date unloading facilities for crude oil at the offshore terminal near Salaya. Necessary hydrographic and Seismic surveys have been undertaken recently. This will be the largest refinery complex in India and, together with the pipeline and other related facilities, will cost about Rs. 217 crores. We are glad that technical collaboration has been promised by the U.S.S.R. in a large measure for the construction of this refinery.

The construction of the Haldia Refinery has reached an advanced stage, inspite of various difficulties and delays during the construction phase. Fuel part of the Refinery is expected to be commissioned in middle 1974.

OPERATION OF EXISTING REFINERIES

As regards the three operating refineries, the Gauhati Refinery had a crude throughput marginally less than in the previous year, due to emergency shutdowns and shortage of power. However, the refinery commenced production for the first time, of low-sulphur fuel oil for the use of the Chandrapur Power Station, and also of liquid petroleum gas (Indane). The Barauni Refinery processed 2·39 million metric tonnes of crude oil as against 2·28 million metric tonnes in the previous year. The refinery also processed imported crude for the first time during the year, after minor modifications were successfully made to the refinery facilities. Your Corporation has worked out a major scheme for revamping the Barauni Refinery, to enable it to process imported crude and achieve a capacity of 3·4 million tonnes per annum. The Gujarat Refinery processed 3·73 million metric tonnes of crude oil as against 3·64 million metric tonnes in the previous year. Schemes for expanding the capacity of this refinery to 7·3 million tonnes per annum have already been approved by the Government and preparatory steps are in progress. Your Corporation also proposes to maximise the production of Benzene, to meet the demands inside the country and for possible export. In order to improve the general working of all refineries, a service-group has been established as part of a Central Services Organisation. This group renders technical advice to the refineries in various fields like corrosion control, improved maintenance, import substitution, etc. It is gratifying to note that the Ceylon Petroleum Corporation of Sri Lanka has also been subscribing to this Central Services Organisation, thereby pooling the available expertise.

PERFORMANCE OF PIPELINES

The Gauhati-Siliguri, the Barauni-Kanpur, the Barauni-Haldia, the Haldia-Maurigram and the Koyali-Ahmedabad Product Pipelines transported a total quantity of 3·23 million metric tonnes of products during the year. Your Corporation commissioned the Haldia-Maurigram Section of the Product Pipeline during the year; this pipeline transported more than 6 lakh metric tonnes of products during the year.

Construction work on the Maurigram-Rajbandh section of the pipeline is in progress. From November 1972, the existing Haldia-Barauni product pipeline was used for the transportation during the rest of the year, of about 1·7 lakh metric tonnes of crude oil from the Haldia port to the Barauni Refinery. Your Corporation's pipeline engineers also successfully handled difficult assignments like realigning and lowering the submerged river crossing section of the Haldia-Maurigram pipeline to allow for desilting of the Damodar river bed and the emergency diversion of a section of the Koyali-Ahmedabad product pipeline due to change in the course of the river Watrak; and these tasks were completed without interrupting pumping operations. For the continuous and efficient maintenance and monitoring of pipeline operations, your Corporation is taking steps to introduce the most modern ultra high-frequency telecommunication system for the Haldia-Barauni-Kanpur product pipeline.

MARKETING ACTIVITIES

Storage Facilities:

Besides the existing network of 16 port installations, 8 pipelines installations, one inland installation and 115 bulk depots, the Corporation, has commissioned storage facilities for use by the Railways, Cement Companies, Fertilizer Companies, the State Trading Corporation etc. Additional bulk storage facilities are being commissioned at Mangalore, Tuticorin and Bombay.

Retail Trade:

Your Corporation's retail trade made impressive progress during the year. 159 new retail outlets were commissioned, bringing up the total to 3311 at the end of the year. Out of the existing retail outlets, 288 were further modernised by provision of additional facilities, remodelling, etc., thus enabling better service to the motoring public. With these steps, the average monthly sale per retail outlet went up substantially (Motor Spirit from 12 KL to 15 KL and H.S.D. from 31 KL to 39 KL per retail outlet). As a result, for the first time in the history of your Corporation, motor spirit is not being raised to sale to the private oil companies.

Your Corporation's retail trade has also helped to give gainful employment to several war veterans or their families. As on 31-3-1973, as many as 450 dealerships and distributorships were awarded to defence personnel, their widows or dependents, besides 340 to unemployed graduates, in terms of the older scheme. To improve the retail supply of kerosene, your Corporation has recently undertaken the sale of kerosene at selected points directly to customers, over and above the normal trade channels of supply through agents.

Indane:

The erratic supply of electrical energy and other fuels has created a sudden spurt in the demand for Indane (LPG) used as a domestic fuel and the number of enrolled Indane customers went up by more than 30%, as compared to the previous year. As cylinders were not available in adequate numbers, and as there were rail transport bottlenecks due to floods, etc., there have been sporadic difficulties in reaching Indane gas promptly to customers in some areas. Your Corporation is giving extra attention to these problems and has taken definite steps to ensure the prompt supply of Indane to customers in outlying cities also.

Imports:

During the year, your Corporation imported approximately 3·5 million metric tonnes of bulk refined products and base stocks, valued at about Rs. 60 crores. Your Corporation also arranged for the imports of more than 9 lakh tonnes of crude oil on behalf of Bangla Desh, besides despatching about 1·2 lakh tonnes of petroleum products from India to Bangla Desh.

Import Substitution:

Your Corporation continued to attach the greatest importance to developing indigenous equipment and processes, in order to reduce dependence on imported parts and to save foreign exchange. Three officers of the Aviation Department of your Corporation were awarded "Import substitution awards" and your Corporation received a silver shield for the development of the 45 kilolitre giant refueller for Jumbo Jets. In the field of lubricants, your Corporation accelerated the process of change-over from Mobil premium branded products to IOC's own brands. Several additional brands received the necessary authorisation from the standardisation authorities controlling the specifications. Thus, the proportion of IOC's own brands (in the total production by the Indian Oil Blending Limited, a 50-50 partnership concern between your Corporation and Mobil Corporation Inc.) increased from 40% during the last year to about 61% during the current year. Your Corporation's officers in the Refineries & Pipelines Division were associated with the "Technical Development Committee for indigenous materials" formed by the Refinery and Fertilizer Industry and several complicated items like high temperature service valves, tubes for heat exchangers, cathodic protection rectifier units, flow recorder charts, fuel injector pipes, etc. were got indigenously fabricated.

ECONOMIES AND IMPROVEMENTS

In the face of continuous challenges, your Corporation took several steps for achieving economies. By closer control on all operations during marketing, the percentage of stock losses during storage and handling was brought down from 0·06% in the previous year to 0·03% in the current year. Inland distribution arrangements were generally improved in consultation with the Railways. Your Corporation's fleet of tank trucks was also used more intensively (resulting in a 14·2% increase in utilisation). Likewise, the tanker fleet handled a larger number of shipments, as compared to the previous year. Efficiency Research Studies of Systems and Procedures were conducted to ensure better utilisation of manpower and other facilities. In order to instil productivity consciousness, various programmes and training schemes were carried out at all levels. These steps resulted in increased productivity, reduced cost per unit sale and improved profitability during the year.

WELFARE

Your Corporation took an active part in fighting drought conditions in various States by making several tankers available for distributing water. Apart from this, your Corporation also made liberal donations to the Drought Relief Funds of the State Governments. Apart from cash donations made directly by your Corporation, donations were also made voluntarily by your Corporation's employees and dealers.

Your Corporation continued to devote adequate attention to various welfare measures to the employees. The Industrial Relations were, by and large, satisfactory, consequent upon the management establishing a line of communication with the employees. The relationship with the union leaders is cordial and regular meetings are held with the staff at all levels to establish whether there are any problems and to evolve quick solutions. The Long Term Wage Agreement with the employees of the Marketing Division ended on 31-12-1972. The Agreement with the Refineries and Pipelines Division is due to expire on 31st December, 1973. Your Corporation entered into a Short Term Wage Settlement with the unions of the Marketing Division for the calendar year 1973, which hopefully would pave the way for wage negotiations for the future. It is my firm belief that a band of well trained and dedicated employees is the most precious asset for any Organisation. This is particularly true at this juncture when the country and the oil industry have to face major challenges in future. In order to prepare the staff and officers for the onerous tasks that lie ahead, your Corporation has an intensive training programme for the employees. The objective is to impart new skills and knowledge to the staff and officers, so that they are in a position to shoulder the responsibility and authority delegated to them. This has enabled your Corporation to fill up most management positions by promotion from within, instead of resorting to external recruitment.

I am confident, that whatever changes may take place in future in the overall energy picture of the country, oil will continue to have a crucial role. And therefore, while I take this opportunity to place on record the appreciation of the work of all employees and dealers of the Corporation during the year, both on behalf of the Board of Directors and on my own behalf, I once again invite all concerned to face the challenges of the future with an increased sense of dedication and by sustained hard work. I am sure your Corporation can meet the challenges of the future with confidence and competence.

With these remarks, I now propose that the accounts be adopted.

This does not purport to be a record of the proceedings of the Meeting.

IRAN

Regime of the Well-Oiled Gun

Darryl D'Monte

NOTHING illustrates the contradictions within Iran better than the state of its capital. The northern part of Teheran, just short of the snow-capped mountain ranges, is new, modern and aggressively 'western'; to the south of the city, however, people still live in 'oriental' chaos and squalor. Six years ago, I had stayed free in a gurdwara in south Teheran; when I recently revisited the city, this time as an Iran government guest attending an international film festival, we were housed in a luxury hotel in the northern sector, safely insulated from realities.

A British journalist covering the Teheran film festival said, somewhat ruefully, that it was nice to smell oil again in the heated lobbies of posh hotels and other buildings. Indeed, the upper half of the capital reeks with prosperity, earned almost entirely from the country's burgeoning oil revenues. The streets are chockful of sleek, imported cars; the clothing stores look trendier than those in London; bankers and bureaucrats strut about with a new air of confidence.

The reason, as we know only too well, is Iran's ample reserves of oil which contributed an incredible $ 3,000 million to the country's revenues last year, paying for nearly 80 per cent of its development projects. Now, with the free auction of some of its oil at $ 17 a barrel and the raising of posted prices to around $ 11 a barrel, its earnings threaten to exceed all expectations.

This triumphant phase in the Shah's chequered career is an appropriate time to consider Iran's pattern of development as a 'model' for other third world countries. PR men in the West and in India have spared no attempt to paint Iran as a glowing example of rapid, efficient modernisation, accompanied by social progress. There are those in India who look on Iran's progress with envy, believing that it has achieved all that we have only dreamed about.

But examine the reality. If you leave out the oil industry, the state of the economy is by no means very impressive. There is the Aryamehr steel complex, built with Soviet capital, equipment and knowhow in exchange for Iranian gas. A few ore mines have been opened; ports like Bandar Abbas have been modernised and roads built; TV — universally used as a dubious yardstick of progress — is soon expected to cover two-thirds of the country. Yet there is no sign of Iran developing a solid industrial infrastructure of the kind India has been working towards, however sluggishly.

The potential, of course, is very great since Iran is reaping surpluses which any country would be envious of. But instead of using these vast sums for nation-building projects, the Shah is embarking on a reckless arms-buying spree. According to recent figures published by the International Institute for Strategic Studies, the Shah spent around £ 800 million on defence last year — more than twice as much as the previous year — and these are now judged conservative estimates.

From the US alone, Iran expects to buy around $ 2,500 million of arms within the next five years. Among these purchases are aircraft which are not even used in the US, as also laser guided bombs. Its fleet of hovercraft, purchased from an ever-grateful Britain, is the world's largest.

Arms against Whom?

Arms against whom? The Shah claims that it is for his country's security against its neighbours. This is hardly convincing: even in terms of manpower, Iran's army of 200,000 is twice that of its enemy number one, Iraq. According to Iranian spokesmen, the Pakistani defeats of 1965 and 1971 have also prompted the massive armament. Prime Minister Hoveida is reported as saying: "We are absorbing the lessons of history. Pakistan lost two wars and half its territory despite belonging to two regional pacts — CENTO and SEATO. We have decided to take an all-risks insurance policy: to depend exclusively on our own forces." The Shah is apparently perturbed by India's treaty with the Soviet Union, and more recently, by the establishment of a pro-Soviet regime in Afghanistan. And with the British pull-out from the Persian Gulf, the Shah also has visions of Iran policing the entire area which, after all, contains 60 per cent of the world's proven oil reserves. Not surprisingly, the US and Britain are most enthusiastic in their support for the Shah.

The picture that emerges, then, is that of a one-product economy which, instead of reducing its dependence on foreign investment, is in fact becoming increasingly indebted to it. A mere glance at Teheran's shop windows indicates that there are few consumer goods that are either not imported or made in collaboration with foreign firms.

Thanks to over-generous incentives, foreign capital, particularly American, has come to stay. Iran's foreign debt is put at nearly $ 3,000 million in 1973 — exactly equivalent to its oil revenues. If there is any model that Iran presents to other underdeveloped countries — and one ought to remember that its per capita income is only $ 513 — it is of a country which mortgages its entire interests to foreign monopoly capital, aided and abetted by a super power, the US.

All this cannot happen without the most serious internal repercussions. The Shah rules despotically and is in constant fear of assassination — nowadays, even on short trips he apparently travels by helicopter. The security precautions for him and his family have to be experienced to be believed.

The Shah, for all the facade of supreme power and the extravagant displays of pomp, exists precariously. After all, he himself came to the throne by default when his father, Reza Shah (a cavalry officer who was catapulted to power in 1921), abdicated in 1941 in the wake of the Allied invasion of Iran. Now he has a monster of his own making — an over-privileged military elite. As an Iranian social scientist has put it: "The Shah's concern for the officer corps has not been purely budgetary. He has continued to take a keen interest in their training, salaries, fringe benefits, travels abroad, promotions and decorations — some of them have been given so many medals that they resemble over-decorated Christmas trees". The same commentator points out that at the incredibly lavish (cost: $ 17 million) 2,500th anniversary celebrations of Cyrus the Great, what was actually on parade was not Iranian culture but the Iranian armed forces. Given a pampered military elite with some of the most sophisticated weapons in the world and no prospect of any actual engagement with other countries, it is conceivable that the Shah may be ousted in a miliatry coup if the generals or some colonels decide to taste real power.

The social imbalances in Iranian society have grown painfully obvious. If we leave out the oil industry, two-thirds of the goods and services in the country are produced and consumed in Teheran alone, which comprises only three million out of the total population of 30 million. Once you leave the elegant confines of the capital, the the stark backwardness of the countryside is appalling. Even in Teheran itself, as stated earlier, the disparities are enormous: one out of every four dwellers has neither running water nor electricity and 70 per cent of the buildings could be classed as slums. Familiar indices of underdevelopment — like a three per cent annual population growth and an exodus to the cities — make a mockery of the 'progress' that Iran claims it has achieved. Even in organised industry, wage rates are by no means high because of the huge reserves of unemployed labour. Strikes are very rare: one Iranian told me, quite disingenuously, that they weren't necessary in his country! Trade unions, needless to say, don't exist. There has at the same time been a remarkable increase in the ranks of the middle class — small entrepreneurs, traders and others — because of whom land speculators in Teheran have been thriving.

"The much vaunted reforms for which the Shah has been praised all over the world are hardly commendable. Under his "White Revolution", agrarian reforms were carried out and big landowners eliminated, but the new owners were not given sufficient finance or other facilities to enable them to run their holdings efficiently. (The previous owners were compensated with cash and government bonds which they were encouraged to invest in industry and trade.) More often than not, therefore, small owners have been bought out by bigger ones.

To bolster any regime of this insidious nature, political repression at home is inevitable. Any attempt at building up an opposition is ruthlessly crushed. Political parties are a sham: Tudeh, the official communist party, has been outlawed. The press is entirely subservient, and all newspapers serve as couriers of court news, generously illustrated. While I was in Teheran, *Kayhan International*, one of the city's two English language dailies, published the double-column headline: "Queen Braves Rough Weather to Visit Hospital".

The repressive machinery is master-minded by Savak, the Shah's dreaded security organisation. The very name causes consternation in any discussion on Iranian domestic politics; few people venture to talk about its activities. Strike up a casual conversation with someone in a Teheran street and you are told: "Please don't discuss this — we don't even talk about these things at home, because our fathers may be Savak informers." The organisation keeps a watchful eye on any possible subversive activity and is known to have interrogated, tortured and killed hundreds of people.

Security Police Development

According to Amnesty International, the London-based organisation which champions the cause of political prisoners all over the world and has been taking an active interest in Iranian trials Savak's development plans for 1968-72 included the spending of $ 6.7 billion on 84 new buildings for the organisation and a detention centre for political prisoners. Unofficial estimates put the number of political prisoners at anything between 2,000 to 20,000. Savak is known to work in close co-operation with the CIA (which in the early 1950s spearheaded the move to oust Mossadeq, the nationalist premier who had become a threat to the Shah) and more recently, with Israeli intelligence services. Israel, in fact, has also armed the Iranian police force with Uzi sub-machineguns and trained some crack military units including the Shah's personal bodyguard.

Under such circumstances, it is hardly surprising that opposition movements have gone completely underground. Within the last two years, at least 200 people, usually described as "Marxists", have been executed, while hundreds have been given long prison sentences and their families intimidated. Apart from Tudeh, there is also a Maoist movement called Saka. All such organisations, however, are under constant surveillance and Savak inevitably infiltrates them. One of the biggest sources of embarrassment to the Shah, consequently, is the Confederation of Iranian Students, which has bases in West Germany and the US. The savage repression has its impact: there are virtually no strikes or peasant revolts and the underground movements, led by intellectuals and students, have splintered, making it impossible to forge any common front.

The picture that Iran presents to third world countries, then, is indeed bleak. Given the present direction in which the country is heading, the economy will continue to depend heavily on oil revenues and foreign investment, and the benefits will accrue only to a privileged class, including the military elite.

Problems of Trade Policy

GERALD M. MEIER

This book offers a new approach to the study of policy issues in international political economy. It presents the complexity and controversy of international economic policy problems through the study of three specific policy-making situations: the Kennedy Round of tariff negotiations the United States' imposition of textile import quotas, and the enlargement of the European Economic Community.

Paper covers £1.85

International Economic Reform

Collected Papers of Emile Despres

Edited by GERALD M. MEIER

This is the first volume to gather together the papers of Emile Despres one of the leading economists between the 1930s and the 1960s in terms of policy advice. The papers deal with topics in international trade, economic development, and international monetary reform.

Who May Judge a Judge?

S P Sathe

Appointment of a Chief Justice by A R Antulay; Popular Prakashan, Bombay; pp 243; Rs 12.
Judicial Appointments by S Kumaramangalam; Oxford and IBM Publishing; pp 96; Rs 7.80.
The Appointment of the Chief Justice, the Government and the Supreme Court by S P Mitra, published by S P Mitra, New Delhi; pp 34; Rs 1.50.
Crisis in Indian Judiciary by K S Hegde; Sindhu Publications; pp 93; Rs 18.

NORMALLY, the appointment of a Judge, even of the Chief Justice, is a tame affair, and one finds only a small report in the newspapers about it. The appointment of the fourteenth Chief Justice, however, became a matter of controversy. Instead of appointing, as was the practice, the seniormost Judge as Chief Justice of India, Justice A N Ray was appointed Chief Justice over the heads of three other senior Justices, Shelat, Hegde and Grover. The appointment took place just a day after the Supreme Court, by a majority of seven judges out of thirteen, had pronounced judgment in the famous Fundamental Rights case, declaring Parliament's right to constitutional amendment to be subject to limitations. The three superseded Judges had been parties to the majority decision, whereas Justice Ray had been among those who had voted for the unlimited power of Parliament to amend the Constitution. The timing of the supersession, therefore, was bound to create the impression that the superseded Judges had been thus punished.

The four books under review will help the reader to gain insights into both sides of the controversy. The two sides are not equally matched in this selection, however, as three of the four books support the government's action.

The Law Commission, in its fourteenth report (1958), deplored this practice. According to the Commission, the qualifications required for a Chief Justice were different from those for a Judge. In spite of this recommendation, the practice was continued. But there is evidence that neither the makers of the Constitution nor those who were at the helm of affairs in the initial years had contemplated that the Chief Justiceship should go by seniority alone.

In his book, Antulay underscores that, when Articles 124 and 126 are read together, it is quite clear that even for making a temporary appointment the Constitution gives power to the President to appoint any one of the Judges of the Court as Acting Chief Justice. Setalvad and Chagla were offered the post of Chief Justice; the former did not accept it and the latter was not finally appointed because the other Judges of the Supreme Court threatened to resign. Neither Setalvad nor Chagla was a member of the Court, so the fact that they were nevertheless considered for the post shows that the Chief Justiceship was never intended to go only according to seniority. The author also argues that no convention regarding seniority had been established; he maintains that "for a convention to be established its life cannot be as short as say twenty-three years" (p 15). In his book, Kumaramangalam similarly argues that "a convention that stood for a decade and was considered at that time erroneous and wrong by the Law Commission does not become any more the right because it was observed for another decade" (p 14).

Hegde, on the other hand, thinks that "though the seniority rule is not the best method for appointing the Chief Justice, it is undoubtedly a safe one. It excludes political considerations, personal likes and dislikes and other collateral considerations in appointing the Chief Justice" (p 42). Hegde's argument has been countered by both Kumaramangalam and Antulay. They point out that the elevation of Judges from the High Courts to the Supreme Court has never been on the basis of seniority. Even the three superseded Judges had been brought up to the Supreme Court in preference to other senior Judges. If this did not undermine the independence of the judiciary, there is no reason why disregarding of the seniority rule in the appointment of the Chief Justice should be seen as undermining that independence. Besides, the Supreme Court is a national tribunal; and care is therefore taken to represent on it the various regions. The present Bench has Judges belonging to the High Courts of Allahabad, Andhra Pradesh, Assam, Bombay, Calcutta, Gujarat, Kerala, Madhya Pradesh, Madras and Punjab. Important minorities have also been given representation on the Bench. There has always been one Muslim Judge on the Bench; and the present Bench also has one Christian Judge. Political considerations have in this way determined the appointments to the Supreme Court, and rigid adherence to the seniority rule is out of question.

Neither Antulay nor Kumaramangalam, however, have suggested alternative criteria for selecting the Chief Justice. Antulay points out that the Chief Jusice is only one of the judges so far as the judicial function is concerned: he cannot influence the other judges in any way; the decisions of the Court are by a majority; the Chief Justice can neither favour a Judge nor discriminate against him. Yet, if one looks at the statistics of decided cases, one might find that there have been a greater number of unanimous and majority judgments from the Chief Justice than from any other Judge. It would be interesting to find out to what extent a Chief Justice actually influences the Court. He may not bring pressure on individual Judges; yet he may influence the Court as an institution. If he does influence the Court as an institution, then longer tenures of younger Chief Justices may well make for greater continuity and consistency of judicial policy. The Chief Justice is, moreover, consulted on the appointment of Judges to the Supreme Court. Since the Government has neither the time nor the first-hand knowledge of the eligible persons (except as in the present Government, the Law Minister of which was formerly a Judge), such appointments might depend entirely on the Chief Justice's advice. Longer tenure for a Chief Justice could thus also assure continuity in recruitment policy.

But, even here, evidence is not conclusive. We have no idea as to how far former Chief Justices took into account the prospective Judges' views on social and economic matters in recommending them for appointment. Seven Judges came to the Supreme Court during the tenure of Chief Justice Sikri (January 1971 to April 1973). With the exception of Justice Alagiriswami, the six others sat on the Bench of the Court to hear the Fundamental Rights case. Out of the six, four — Justices Mathew, Beg, Palekar and Chandrachud — voted against Sikri, and only two — Khanna and Mukherjea — voted with him. Yet, Chief Justice Sikri had known that a major showdown was coming on the question of amendability of Fundamental Rights. Either he did not want to pack the

court with men of his viewpoint or the Government did not go by his advice.

Kumaramangalam is forthright in saying that "the relationship between the Court on the on the one hand and Parliament on the other has been none too happy these last six years" (p 15). He thinks that "it is vital that this relationship should be a stable and friendly relationship" *(ibid)*. But how can this relationship develop when Court and Parliament are wedded to entirely different sets of values? During the past 23 years, the Court has laid greater emphasis on the right to property; Parliament has amended the Constitution to overcome the judicial objections; but in the Golaknath case the Supreme Court held that Parliament could not amend the Constitution so as to take away or abridge the Fundamental Rights — thus foreclosing the only way that was open to Parliament.

To this, Hegde may say that "the decision of the Supreme Court, right or wrong, is final and binding", and that "only if the executive and the legislature accept the finality and the binding character of the decision rendered by the Supreme Court can there be stable relationship between the judiciary, the executive, and the legislature" (p 43). But it is difficult to accept this unless one accepts the infallibility of the Court. It may be noted that twice the Supreme Court had held that Parliament had the power to amend the Constitution. Yet, this view was overruled in the Golaknath case by a narrow majority of six against five. In the Fundamental Rights case, 10 out of 13 Judges (including Justice Hegde) observed that the Golaknath decision was wrong. What is the remedy against wrong decisions? According to Hegde, the community should wait until the Court itself corrects the error — which means we will have to wait till the Judges change, and further, that to ensure such a change the Court would have to be packed. Hegde should thus be able to see that the supersession he complains about is the logical outcome of the very position which he, along with his other colleagues, had taken in recent cases. His stand would also imply that, whereas two-thirds of the members of Parliament cannot decide what the Constitution should be, 7 out of 13 Judges can.

Hegde claims that "if sovereignty resides in the Parliament, the Constitution becomes a scrap of paper" (p 46). However, all written Constitutions do contain provisions for their amendment, and they require a larger majority to carry the amendment precisely as a safeguard against hasty and intemperate amendment. Hegde, going further, claims that this Parliament is not representative of the people because, although the Congress party secured two-thirds of the seats in the Lok Sabha, the total votes secured by it were less than 50 per cent (p 92). As if in reply, Kumaramangalam says, "Justice Hegde in making his analysis challenges the very basis of our electoral system" (p 65). Judicial review has to be exercised with caution; in examining the validity of legislation, the Judges ought not to act "in a crusader's spirit to tilt at legislative authority". A Court must accept that other organs of government are as much parts of the democratic process as the Court. It should not start on the presumption that the Legislature is bound to act tyrannically and that the Court is sitting to prevent it from encroaching upon the freedom of the individual.

Kumaramangalam's main argument is that "in choosing persons who are fit and suitable for appointment to the Court, it is important to assess their outlook on broad matters of State, on the crucial socio-economic matters that face us in India today" (p 36). He says that, "to look upon a Judge as guided only by the pure light of reason, having no views of his own, most of all on matters of economic policy, is to ignore the realities of life" (p 36). He examines the views of Justices Hegde and Ray on certain fundamental questions, "as expressed in their recent judgments". The essential difference between the majority Justices in the Fundamental Rights case (though Kumaramangalam names only Justice Hegde) and Justice Ray, lay in how they looked at the Court-Parliament relationship. Justice Ray advocated judicial restraint. He admitted that the last word on the Constitution must rest with Parliament, not with the Court. The seven Judges of the Sikri group were not prepared to leave the final word regarding the Constitution to Parliament. They felt that, if Parliament had unlimited power of constitutional amendment, it might use that power to change the Constitution beyond recognition. It was probably this stand on judicial restraint that earned Justice Ray the Chief Justiceship.

Antulay seems too preoccupied with the thought of replying to Palkhivala and others, which is why his book takes the form of a wordy duel between him and the Palkhivala group. Hegde, on the other hand, appears too subjective in his treatment, and this mars the quality of his book. In particular, his reference to Justice Krishna Iyer's appointment to the Supreme Court is in bad taste. He points out that Chief Justice Sikri had objected to Justice Iyer's appointment. According to Hegde, Justice Iyer's sin consists in his past association with the Communist Party. But if the Communist parties are recognised parties under the Indian Constitution, why should there be a special disqualification attached to past association with these parties? Hegde forgets that Justice Iyer was a Judge of the Kerala High Court and later a member of the Law Commission, before coming to the Supreme Court.

Mitra in his book, gives us a good background of the constitutional developments in the last 23 years. He observes that "A Chief Justice does not lose his independence *vis-a-vis* the Government, just because his broad views on this question happen to be more or less the same as theirs" (p 27). He points out that there was identity of views on fundamental policy between the Court and Parliament upto 1966. Mitra thinks that "the only power the people have over the Supreme Court ... is through their elected representatives in Government and Parliament — that of appointment of the Chief Justice and the Judges, through the power vested in the President acting on the advice of the Union Council of Ministers" (p 31). By his view, ultimately, even the Supreme Court must be subject to control of Parliament.

Planning for Growth, Redistribution and Self-Reliance in the Fifth Five-Year Plan — I

Suresh D Tendulkar

An average annual growth rate of gross domestic product of 5.5 per cent, self-reliance and redistribution of consumption for the removal of poverty over the Plan period were the three accepted objectives of the Fifth Five-Year Plan as enunciated in the Approach to the Plan. The details of the planning model underlying the Approach document were supplied in a Technical Note that was circulated to the panel of economists in April 1973. The same planning model (with a change in the price base from 1971-72 to 1972-73) is said to form the basis of the Draft Fifth Five-Year Plan released recently. The objective of this paper, published in two parts, is to evaluate the planning model underlying the Approach document.

The model is found to be inadequate in its institutional specification and operationally unsatisfactory. The empirical basis for the three major policy-oriented conclusions emerging from it is found to be a poor approximation to the realised experience in the recent past, thereby making suspect their economic feasibility in practice. Because of the inadequate institutional specification of the model and the absence of a simultaneously worked-out policy-frame, the problems of evolving policy measures ex post *are shown to be intractable.*

It is not at all surprising, therefore, that the commitments on self-reliance and removal of poverty have been considerably diluted in the Draft Plan—although certain exogenous factors have been held responsible for this, especially for throwing overboard the objective of self-reliance. Even in the absence of these exogenous factors, the pronounced biases in the numerical parametric specification of the model, the inappropriate institutional specification and the socio-political infeasibilities involved in working out the policy-frame ex post facto *for the redistributive objective would have led to the same result.*

I

Introduction

AN average annual growth rate of 5.5 per cent of gross domestic product, self-reliance and redistribution for the removal of poverty over the plan period were the three accepted social objectives of the Fifth Five-Year Plan as enunciated in the Approach to the Fifth Plan[1] (hereinafter referred to as the Approach document). The details of the planning model underlying the Approach document were supplied in a Technical Note[2] that was circulated to the panel of economists in April 1973. The same planning model (with a change in the price base from 1971-72 to 1972-73) is said to have formed the basis of the Draft Fifth Five-Year Plan released recently. The Draft Plan has made the commitments on self-reliance and removal of poverty much less categorical than it was in the Approach document. This can be traced to certain basic inadequacies in the institutional specification of the model as well as certain inherent rigidities in it, certain pronounced biases in the parametric specification and the absence of a policy frame to back up the quantification of social objectives in the Approach document. The objective of this paper is to focus attention on these problems and to evaluate the planning model underlying the Approach document.

II

The Model

The basic multi-sectoral model employed by the Planning Commission belongs to the modified open-ended static Input-Output variety. Given (a) a set of input-output co-efficients and (b) sectoral levels of final demand (consisting of private and public consumption expenditure, gross fixed investment, exports, competing imports and changes in stocks) for the target year, this type of model provides a consistent set of sectoral targets of gross output. The pattern of utilisation of total supplies from domestic production and imports for the i th sector may be written as:

$$X_i^t + M_i^t = \sum_{j=1}^{n} a_{ij}^t X_j^t + C^t + \bar{G}_i^t + \bar{E}_i^t + \bar{I}_i^t + ST_i \qquad (1)$$

where $X_i^t =$ level of gross output of the i th sector measured at factor cost;

$M_i^t =$ level of competing imports of the i th sector type (in commodity classification) measured at c i f inclusive price;

C_i^t and $\bar{G}_i^t =$ levels of private and public consumption expenditure on the commodities produced by the i th sector (measured at producers' prices);

$\bar{E}_i^t =$ level of exports of the i th sectors' products measured at f o b prices;

$\bar{I}_i^t =$ gross fixed investment by the i th sector of origin measured at producers' prices;

$ST_i =$ additions to stocks of commodities produced by the i th sector measured at producers' prices;

$a_{ij}^t =$ input-output co-efficient at producers' prices incorporating the demand for the i th sectors' product as intermediate input into the unit level of production in the j th sector.

All imports are treated as competing with the sector's output and are esti-

mated partially endogenously by making the following specification:

$$M_i^t = \sum_{j=1}^{n} m_{ij}^t X_j^t + c_i C_i^t + g_i^t \bar{G}_i^t + f_i^t \bar{I}_i^t \qquad (2)$$

where m_{ij} = imported intermediate input co-efficients incorporating the demand for the competing imports of the i th sector type as intermediate input into the unit level of output at factor cost in the j th sector.

c_i^t, g_i^t and f_i^t = co-efficients indicating the requirements of the competing imports of the i th sector type per unit level of private consumption, public consumption and gross fixed investment respectively.

Substituting (2) into (1), we get

$$X_i^t = \sum_{j=} (a_{ij}^t - m_{ij}^t) X_j^t + (1-c_i^t) C_i^t + (1-g_i^t) \bar{G}_i^t + (1-f_i^t) \bar{I}_i^t + \bar{E}_i^t + S_i (X_i^t - X_i^o) \qquad (3)$$

where changes in stocks are assumed to be proportional to the incremental gross output of the sector between the target and the base year. It is clear that provided $(a_{ij}^t - m_{ij}^t)$ satisfy viability conditions, this is a system of n equation in equal number of unknowns given C_i^t, $\bar{G}_i^t$, $\bar{I}_i^t$ and $\bar{E}_i^t$ which can be solved to get

$$X_i^t = \sum_{j=1}^{n} A_{ij} \left[(1-c_i^t) C_i^t + (1-g_i^t) \left\{ \bar{G}_i^t + (1-f_i^t) \bar{I}_i^t \right\} + \bar{E}_i^t - S_i X_i^o \right] \qquad (4)$$

where A_{ij} denote the elements of the inverse of the matrix

$(I - a^t + m^t - \hat{S})$ with

$a^t = \left\{ a_{ij}^t \right\}$, $m^t = \left\{ m_{ij}^t \right\}$ and $\hat{S}$

is a diagonal matrix formed from the column vector of incremental stock co-efficients appearing in (3).

The Planning Commission provides two sets of levels of sectoral gross outputs: one for the base year 1973-74 which is the final year of the Fourth Plan and another for 1978-79 which is the final year of the Fifth Plan. The *only* link between the two for consistency purposes is the exogenously stipulated target growth rate of aggregate GDP at factor cost. The base year levels are the anticipated estimates for the final year of the Fourth Plan. For deriving the levels of gross outputs for 1978-79, the sectoral composition of the final demand in 1978-79 needs to be specified. This is done as follows.

Exports and public consumption expenditure are assumed to grow exogenously each at some prespecified rates. The sectoral composition of both these variables is also specified in an exogenous fashion. The macro-model is then used to get the remaining two variables, *viz*, gross fixed investment and the aggregate private consumption expenditure, the procedure being as follows. Assuming a constant aggregate incremental capital output ratio and given the exogenously stipulated target growth rate of the aggregate GDP at factor cost, the gross investment over the five-year period is estimated. Dividing this into fixed and inventory components and using some linear annual phasing assumption (the details of both being unspecified) one gets a figure for gross fixed investment in 1978-79 whose composition by sector of origin is exogenously specified. Foreign assistance [derived as a difference between aggregate imports as estimated from (2) and exogenously specified exports] is then subtracted from the gross fixed investment at market prices[3] to get the estimate of gross domestic savings (S_t). The aggregate private consumption at market prices is then derived after subtracting from the aggregate GDP at market prices, the aggregate gross domestic savings and aggregate public consumption expenditure at market prices. This is then substituted into the consumption model to get the sectoral distribution of private consumption expenditure. The consumption model consists of the following components.

(a) A proportionately fixed basket of consumer expenditure for various sectoral outputs is specified for the 27 subgroups of the population classified according to the level of per capita monthly total consumption expenditure. This is available for the rural and the urban subgroups separately. This has been derived after converting the quick tabulation data for the 23rd round of the NSS (July 1968 to June 1969) to factor cost and to 1971-72 prices, the details of both being left unspecified.

(b) The rural-urban distribution of the population and the rural-urban differential in expenditure per capita are exogenously specified for 1973-74 and 1978-79.

(c) The size distribution of the aggregate private consumption expenditure among the population is assumed to be two-parameter lognormal that can be specified by the mean level of total consumption expenditure per capita and the variance parameter. This is done separately for the rural and the urban population.

(d) Given (i) the aggregate private consumption expenditure at market prices from the macro-model; (ii) the indirect taxes on consumption; (iii) the rural-urban distribution of the population; and (iv) the rural-urban differential in total expenditure per capita, it is possible to find per capita monthly total expenditure for the rural and the urban population separately. (See Appendix 2 for details.)

(e) Given (i) the per capita monthly total expenditure derived in (d); (ii) the variance parameter of the lognormal distribution; and (iii) the upper limits of the per capita expenditure classes [for which the proportionately fixed consumption basket is specified in (a)], it is possible to derive the percentage distribution of the population as well as the aggregate private consumption expenditure among different per capita expenditure classes under the lognormal assumptions. From this, we can deduce the per capita monthly total expenditure for each of the 27 per capita expenditure classes. This is done for the rural and the urban populations separately.

(f) Using the proportionately fixed basket [explained in (a) above] along with the per capita total expenditure [derived in (e)] for each sub-group of the population classified according to the level of per capita total monthly expenditure it is possible to get the per capita monthly expenditure on each sector's output for each sub-group of the rural and urban population separately. Converting these into annual totals for each sector's output (by multiplying by 12 times the population in each sub-group) and aggregating across sub-groups in the rural as well as the urban population, the sectoral composition of aggregate private consumption expenditure is determined.

The sectoral levels of private consumer expenditure along with other elements of final demand can then be substituted into (4) to obtain consistent level of sectoral gross outputs.

Since competing intermediate imports as well as competing imports directly for private consumption along with the indirect taxes on private consumption and intermediate inputs are determined in an endogenous fashion, presumably an iterative solution to the system in (4) along with certain elements of the macro-model may have to be obtained or else the system appears to be indeterminate. The Technical Note is completely silent in this connection.

The Technical Note presents the alternative exercises by varying the following assumptions:

(i) the average annual target growth rate of GDP at factor cost over the five year period, the alternative values being 5.0 per cent, 5.5 per cent and 6.0 per cent;

(ii) the average annual growth rate of total commodity exports over the five year period, the alternative values being 6.5 per cent, 7.0 per cent, 7.5 per cent and 8.0 per cent;

(iii) the specification of inequality in the size distribution of private consumer expenditure; the alternatives being with and without postulated reduction in inequality in bringing the bottom 30 per cent of the population to the desired minimum level;

(iv) the specification of the import-substitution the alternatives being the import co-efficients m_{ij}^t, c_i^t, g_i^t, f_i^t [defined in (2)] remaining the same as in the base year or getting reduced in specified manner; denoted as without and with import substitution variants respectively.

In all 24 variants have been worked out by combining these assumptions in alternative ways. No discussion appears regarding the rationale or the results in the Technical Note. The Approach document, however, mentions (Ch IV, para 3, p 16) that on the basis of these exercises, "the balance of payments consideration does not justify lowering the rate of growth to 5 per cent". The objective appears to be mainly to work out the balance of payments implications of alternative growth rates of GDP and exports. Although the alternatives have been worked out with and without redistribution as well as with and without import-substitution, the discussion of the balance of payments appears to take for granted both import-substitution and redistribution. Out of the 24 variants, the best or the preferred variant in the judgment of the Planning Commission consists of the combination of the following assumptions: 5.5 per cent growth rate of GDP at factor cost, 7.0 per cent growth rate commodity exports, with import-substitution as well as with a postulated reduction in inequality in consumer expenditure. We will have occasion later to comment on each of these assumptions.

As regards the rationale behind the adoption of the particular analytical framework outlined above, it is stated that it was "basically determined by three factors: (a) the nature of the objectives to be realised; (b) the type and coverage of data currently available and (c) the nature of computing facility that could be utilised by the Commission. Among these factors (b) often proved to be decisive in ruling out conceptually more ambitious schemes whose information requirements were far too large judged by the level of disaggregation and consistency that was considered to be essential for drawing up a coherent plan. "(Technical Note, Introduction, para 2), We are indeed assured that considerable work is under way in terms of extending and deepening the data base." (Technical Note, same para as in the previous quotation). It is, however, not clear what role the new data base is going to play in view of a very unequivocal statement in the Approach document: "It is, however, *unlikely* that the conclusion regarding the rate and pattern of growth and the related policies outlined above will change in *any significant way as and when more data become available.* (Approach, Ch VI, para 27, p 22)

We may note before we end this section that the macro-model adopted by the Planning Commission is a variation of the well known Harrod-Domar model and the input-output model is a variation of the static-open-Leontief model. As we will see later the consumption model is identical in assumptions to the one adopted by Manne and Rudra (1964) and by Srinivasan, Saluja and Sabherwal (1965). Methodologically, therefore, the model does not contain any novel feature that has not been used before in other similar planning models.

III

Institutional Specification of the Model

Methodologically, a typical planning problem involves the following elements with a view to achieving given social objectives and subject to certain prespecified constraints:

(i) the determination of the feasible quantum of investment and its distribution by sector of origin;

(ii) the appropriate sectoral allocation of investment by sector of destination;

(iii) the pattern of financing investment from the internal and external resources;

(iv) the policy frame spelling out concrete ways of mobilising the required quantum of resources, their channelling into appropriate sectors and their transformation into desired composition of productive investment[4] which in turn is expected to bring about the desired composition of economic activity in conformity with the planned objectives;

(v) if redistribution is an explicit social objective of planning, the policy frame has to specify in addition to (iii) above, the concrete mechanism of bringing about the socially desired income (or expenditure) transfers.

Ideally, all the elements require to be simultaneously determined as there exists obvious interdependence among them. In actual practice, however, this has never been possible in one grand analytical framework.

Confining ourselves to a single period framework[5] adopted by the Planning Commission, most of the presently available models address themselves to at most the first three elements. The last two elements which are most important from the point of view of implementation are usually either neglected or are worked out outside the framework of the model. They acquire added and crucial significance in view of the constraints imposed by the socio-political environment of a federal, constitutional democracy and the institutional framework of a mixed economy.

The modified open-ended static input-output model adopted by the Planning Commission contains *only* the first element. The aggregate quantum of investment is determined from the aggregative Harrod-Domar framework by postulating a constant incremental capital-output ratio and a target growth rate of GDP. Its distribution by sector of origin is specified exogenously and given this along with the other elements of final demand (the details of which have been discussed in the last section), the targets of sectoral levels of gross output have been worked out through the static input-output model *without* explicitly considering the second problem of sectoral allocation of investment. The third element of financing investment is covered *exogenously* in an independent resource exercise (Ch VII of the Approach) bringing out at the aggregate level the con-

sistency between gross investment and its financing through the various sources, *viz*, the public and the private sectors and the external assistance. The policy-frame covering the fourth and the fifth element does not appear in the Approach document. There is, however, an assurance that "It is proposed to devote concentrated attention during the next few months towards working out a consistent policy-frame encompassing agricultural policy, industrial policy, price-wage-incomes policy, policy for resource mobilisation, policy for regional balance in development, and management policies" (Approach, Ch XII, para 2, p 59). To recapitulate, the formal model presented in the Technical Note which forms the basis of the Approach document, addresses itself to only the first element of a typical planning problem in a purely static input-output framework. The second and the third elements are worked out exogenously outside the formal framework of the model whereas the fourth and the fifth elements do not appear in the Approach document except in a very cursory fashion.

Conceptually, even within the static framework adopted by the Planning Commission, it is possible to introduce in a limited manner the financing of investment on the lines of Rudra (1967) which would have been more meaningful than treating the financing aspect in a purely exogenous fashion. Moreover, the single-period models of the Manne-Rudra (1965) variety solve the first two aspect of a typical planning problem in a mutually consistent and semi-endogenous manner given the incremental capital co-efficient matrix (by sector of destination) and certain assumptions connected with the stock-flow co-efficient parameters. The Approach document gives (Ch VIII, p 48) the "implied" incremental capital output ratios for 10 broad sectors. It is not clear how they have been derived. However, given these along with appropriately adjusted incremental capital co-efficient matrix available in Manne and Rudra (1965) it is possible to check the consistency between the implied allocation of investment by sector of destination (as given on p 48 of the Approach) and the exogenous specification of distribution of gross investment by sector of origin as also the sectoral levels of gross output derived from the static input-output framework.

Both the static input-output model and a single period consistency model of the Manne-Rudra variety belong to what may be termed as open-loop models. They address themselves to the problem of consistency in *physical* terms between a prespecified vector of final demands and the required levels of sectoral gross output to sustain it. The underlying policy premise implicit in these models is that the government (and hence the planning authority) has a fairly complete and sufficiently effective fiscal, monetary as well as direct control over the economy so that the mobilisation (as well as canalisation) of the required quantum of domestic savings (for an exogenously given level of foreign assistance) can *always* be undertaken in real terms so as to finance the given quantum of investment.[6] This approach is valid as long as any conflict that appears between the time preferences of individual economic agents and the social time preference of the planning authority can be resolved with the help of whatever policy instruments and measures are at the disposal of the planning agency. This premise is certainly justified in a completely centrally planned economy with public ownership of the means of production. However, the constraints imposed by the federal democratic socio-political environment and the institutional framework of a mixed economy do not justify the uncritical acceptance of this premise especially in the early stages of development in view of the remote and inadequate control of the planning authority over a very large part of private sector economic activity. The difficulties may arise from the political, sociological, behavioural and institutional considerations imposing a definite upper limit on the feasible rate of savings in the underdeveloped countries. [See Sen (1961), United Nations (1967).] More specifically in the Indian context where the government has so far contributed less than 30 per cent of the domestic savings, where under the most optimistic assumptions the government owns no more than 25 to 30 per cent of the reproducible tangible capital stock [see Reserve Bank of India (1972)], where 50 per cent of household savings take place directly in terms of physical assets (out of nearly 65 to 70 per cent contributed by them) over which the government has no control and where the market forces governed by the existing distribution of income and privately owned wealth and means of production predominate, the policy premise underlying the open-loop model does not appear to be justified on empirical grounds as well. In other words, the ensuring of consistency in physical terms is not sufficient in this type of institutional framework to guarantee the realisation in real terms of the planned quantum of investment. This may be prevented by the infeasibilities involved in raising the domestic resources that may fall short because of the government's inability to check private consumption and mobilise private savings. In these circumstances, the present author has elsewhere (1971) suggested what may be termed a "closed-loop model" to deal with this type of a situation. The closed-loop model attempts, in a single-period optimising framework, to ensure mutual consistency between the investment plan and its sectoral allocation on the one hand and its internal and external resource requirements on the other. This, in turn, is achieved by establishing mutual consistency between the process of production, the resulting generation of incomes and its uses among the principal components of final demand.[7] The information requirements of this model are only slightly more than those of the open-loop models of the Manne-Rudra variety. An important feature of the model is that it incorporates in a mutually consistent fashion the first three elements of a typical planning problem outlined at the beginning of this section and hence is more general than the static input-output model or the single period model of the Manne-Rudra type. Moreover, since it seeks to work out the pattern of financing investment from the internal and external resources through the specification of foreign assistance, public savings and private marginal savings propensities, the analytical framework takes into account endogenously the crucial feature of the institutional framework of a mixed economy and hence it is specially appropriate to that framework. By abstracting from this crucial feature of the institutional framework, open-loop models appear to be particularly inappropriate specifications of a typical planning problem in a mixed economy. In the present Indian context, the restrictive nature of the abstraction implicit in the static input-output framework used by the Planning Commission is all the more glaring for at least three reasons. First, unlike in the past, foreign assistance including food aid is no more a flexible and adjustable component to make up for the lack of controllability over the mobilisation and canalisation of domestic savings. In fact, this component has been reduced to a minimum level. Secondly, if self-reliance as a social objective is to be taken seriously, it requires stringent measures for the mobilisation of domestic resources and these efforts have to be on a much higher level (with all its socio-political

consequences) than in the past in view of the drying up of foreign assistance. Thirdly, redistribution as an explicit social objective implies adverse effects on marginal savings propensities as also requires complete controllability over the composition of economic activity. These crucial features of the present Indian situation highlight the necessity and importance not only of incorporating the first three elements of the typical planning problem in an endogenous fashion but also of backing them up *simultaneously* with a co-ordinated and feasible policy-frame (containing the fourth and the fifth elements).

The present author has elsewhere (1971) examined the resource-allocational consequences of the open-loop and the closed-loop models on the basis of certain illustrative exercises for the Indian economy. The main conclusion that emerged is that the sectoral resource allocation (and the plan strategy based on it) suggested by the open-loop model is drastically different from that suggested by a closed-loop specification. In other words, if the closed-loop specification is institutionally more appropriate to a particular situation, but the open-loop specification is in fact used to determine the resource allocation (as well as the plan strategy), it would lead to gross misallocation of resources in the process of implementation with all its disastrous consequences. As we have seen, the formal static input-output model adopted by the Planning Commission abstracts from the crucial problem of working out the allocation of investment by sector of destination (which is possible in the open-loop models of the Manne-Rudra variety) let alone the problem of financing of investment. Any model involves by its very nature an abstraction of reality provided "the loss of details [through abstraction] is more than compensated by the greater clarity and a more effective tackling of the problem it permits". However, "there is a certain point in simplification beyond which a problem ceases altogether to be the same so that a course of action based on it will yield a result that is not merely less satisfactory but one that is altogether unsatisfactory" [Rudra (1962), p 193].

The static input-output model developed by the Planning Commission strictly belongs to a very restricted form of the open-loop variety where the problem of income-generation from the production process and its use-pattern is regarded as exogenous to the system. However, the Planning Commission goes one step beyond this framework and works out the sectoral average annual growth rates of value added along with those of the value of gross output (Approach, appendix to Ch VI, pp 23-24). As a purely arithmetical exercise, this is all right. But it is economically meaningful and valid only under a closed-loop framework. But no attempt appears to have been made to check the closed-loop consistency between the income-generation from the production process and its adequacy to sustain the exogenously specified vector of final demands which, in a static input-output framework, is used to derive the sectoral levels of gross output.

Neither the Technical Note nor the Approach document furnishes complete information for checking the closed-loop consistency. This may be done in an approximate manner by making certain plausible assumptions regarding the missing information.

Let us start with the definitions of consistency. A *static input-output consistency* (a special case of an open-loop consistency) pertains to that between the exogenously specified sectoral levels of final demand and the sectoral levels of gross outputs for a given numerical specification of technology as incorporated in an input-output co-efficient matrix. This definition applies to the formal model adopted by the Planning Commission. A more general *open-loop consistency* ensures, in addition to the static input-output consistency, a mutually consistent matching between the distribution of gross investment by sector of origin and its sectoral allocation by sector of destination. A *closed-loop consistency* requires, in addition to the open-loop consistency two more conditions: (a) for exogenously specified level of foreign assistance, the quantum of investment is of the size that can be financed from the internal savings generated in the process of production; and (b) the incomes originating in the various sectors of the production process equal incomes accruing to various factors of production (after allowing for transfers and other national accounting adjustments) and their disposal of these incomes on various goods and services as also contributions to domestic savings all of which have connections to the relevant components of final demand which are exogenously specified in an open-loop framework. It may be noted that the first condition of a closed-loop consistency relates to the feasibility of the underlying savings efforts whereas the second takes the feasibility of savings efforts for granted and examines the consistency at the aggregate level. It is important to emphasise that the second condition is not conceived in purely arithmetical terms but in terms of the observed past trends regarding the relationship between different elements of final demand.

As we have seen, the resource exercise (Approach, Ch VII) which is exogenous with reference to the formal model, indicates the pattern of financing gross investment from the internal and the external resources that is required for the condition (a) of the closed-loop consistency. To start with, we treat this as a given datum, assume its consistency with the formal model and then concentrate on the condition (b) which is required to check the closed-loop consistency between the sectoral levels of value added and those of gross-output.

Calculations detailed in the Appendix show that given the pattern of financing assumed in the resource exercise and a conservative depreciation estimate consistent with the past trend worked out from the official national income estimates, the GDP at factor cost required to sustain the prespecified levels of final demand for 1978-79 works out to at least 2.6 per cent higher than what is specified by the Planning Commission. In other words, income generated in the process of production in the target year 1978-79 is less than adequate to sustain the exogenously specified vector of final demands. As a result, the macro-model generating the levels of final demand and the static input-output model translating these final demands into sectoral levels of gross output are mutually inconsistent in a closed-loop framework and hence the rates of growth of value added and those of gross output given on p 23-24 of the Approach document are also mutually inconsistent. Actually, assuming the closed-loop consistency to hold in 1973-74, the growth rate of GDP required for sustaining the prespecified levels of final demand for 1978-79 turns out to be at least 6.0 per cent per annum and not 5.5 per cent as postulated in the Approach document.

As regards the rationale behind the particular choice of the growth rate the Approach document states: "After taking full cognisance of the current factors inhibiting growth, of the long-term needs of the economy, and of the possibilities inherent in the diversified agro-industrial base already created, a five and a half per cent growth rate has been postulated as the appropriate

punjab national bank

Provisional Results - 31st December 1973.

* A year celebrating the 1000th branch ** A year ushering in CHANGE *** A year of good results and profits

First branch opened at Anarkali, Lahore on April 12, 1895

PNB performed well in 1973 - aggregate deposits up 20%; credit up 30%; and profitability significantly improved - a no mean achievement in a year of rising costs.

NATIONALISATION : A momentous step in our history of banking, indeed our economy and society, gave Indian banks, known for soundness though less so for innovation, some new tasks :

— To develop "Priority Sectors", the backward and the neglected small industry, agriculture, self-employed. (PNB has just undertaken to help with 20,000 cycle rickshaw peddlars becoming owners under a Punjab Government scheme)

— To take banking facilities to the rural and mountain areas. (PNB is opening a branch at Kinnaur in the high Himalayas)

PNB has given a good account of itself in this regard, as figures below will show :

PNB since Nationalisation

		1969 June	1973 Dec.	1969 – 1973 Rise %
Aggregate Deposits	Rs. Crores	355	720	103
Total Credit	"	243	425	75
— Priority Sector	"	23	116	404
— As % of total credit		9	27	
Branches	Number	560	1020	82
— Rural	"	84	366	336

Among the interesting problems we face in PNB is 'ageing management' - their average being : Senior Managers 55 years, Managers 52, Junior Managers 47 and Special Assistants 48. In the past it has taken an average clerk ten to fifteen years to become an officer, and as long to become a manager; reaching an age when not everyone is bold or innovative.

We have now signed two agreements with the workmen and officers, that are a marked advance in throwing open a merit-based fast track to the young.

	Clerks to Officers		Officers to Managers	
	Old %	New %	Old %	New %

** A scheme to help very low income families in selected districts at a differential interest rate of 4% per annum.

PNB with a long history of a sturdy resilience and growth over 78 years, a chequered history of many weathered crises, has now embarked upon a process of Change through a structural reorganisation, new systems and a new culture.

NEW ORGANISATION : Our first task was reorganising the head office, where divisions like Regional Coordination, an inter-face between regions and head office; Management Services, an inter-disciplinary group for specialist advice handling information; Manpower Planning, Selection & Training Division to rationalise selection and training, were formed.

A number of permanent committees, such as the Executive, Finance, Credit, Personnel, Priority Sector, have been formed to change the past one-upon-one system of decision-making for something wider and participatory, and especially to involve the younger middle managers. Functionally and not hierarchically structured, the committees are meant to speed up and not slow down decisions or to shelter the indecisive. There is also a weekly communication meeting of all managers, besides a daily meeting of the seniors. In the field, the eight regions have been increased to twelve - soon to fourteen - to make for compact concentrated attention and quick local decisions. Regional Managers and head office management meet quarterly to discuss and frame policy, budgets and appraise performance; and in their own headquarters they have similar monthly discussions. Ultimately, the regions will become replicas of head office.

NEW SYSTEMS : Communications, the problem of any growing organisation, is being tackled through an Information and Accountability system whose heart is the new performance budget and its monthly, quarterly, and mid-year review, prepared in a series of projections between July and December of the previous year, and reviewed specially through the Monthly Flash Report received from over 1,000 branches.

Delegation is the key: new and wide powers have therefore been given along the line.

NEW CULTURE : The Change we are introducing will only endure if we can also change the old culture, the most challenging of tasks! New organisation structure and systems will indeed induce a measure of change, but PNB's dynamism must develop a self-sustaining capacity to change; in fact anticipate its need.

MEN : What matters in all this is the men - change agents, decisive and dedicated. While there are many aches and pains in the process, let us hasten to add that change has found fertile soil in PNB.

To befit these men for higher responsibility at each step, we are developing a network of six training centres besides making extensive use of outside institutions. The number trained is thus being stepped up from 349 in 1972 to 1100 in 1973 to 3150 in 1974.

COSTS : An acute problem is rising costs, a common feature with all banks, reaching proportions that are seriously affecting the systems' profitability. We are deeply conscious of our responsibility to the objectives of nationalisation, whose cause we shall have ill served if the profits we ought to turn over to the State diminish or extinguish; and worse if the service we give the customer leaves him dissatisfied. The scale of cost escalation since nationalisation contains some food for thought. Total expenditure has risen by 82%, establishment 83% and overtime by 119% in the last four years.

Rising costs somehow go with diminishing service, and here we must improve. Inflationary pressures will push up costs; but a good management is never choiceless in exercise of some initiative at least in cost reduction, and this we are trying to do, especially in areas of wasteful costs. An expenditure audit and the Monthly Flash Report together monitor costs; and are receiving encouraging signals.

To render courteous and prompt service to the lakhs of our customers is a sacred task, which causes us concern and where we must do better.

FUTURE : To sum up, PNB is earnestly endeavouring to achieve

— The objectives of nationalisation; through

— Giving it a new structure, systems and culture; by

— An operational philosophy, we call our 'Panchsheel'

— maximisation of deposits — maximisation of credits

— maximisation of profitability — minimisation of expenditure

— maximisation of priority sector assistance

— And, above all to give service.

Towards this end, the newly constituted Board, that included representatives of the workmen and officers, worked purposefully and harmoniously through its first year, backed by the men and women who serve in PNB; and all of them hope together to make it a model and the premier institution in the nationalised banking system. If we can achieve in 1974 the progress we have already achieved in 1973, curbing wasteful expenditure, giving better customer service, greater cohesion in effort : we shall indeed have made nationalisation meaningful. We are confident we shall do it ! And for all this, we must record the exceptionally supportive backing we always receive from our Ministry and the Reserve Bank.

growth rate for the economy for the period of the Fifth Plan" (Ch 1, para 6, p 2). Further, "a higher rate of growth, though very desirable from the angle of removal of poverty and building up the growth potential *has not been considered feasible*, taking into account the implications for balance-of-payments, the overall investment requirements and the physical constraints on creation and utilisation of capacity in different sectors" (Ch VI, para 2, p 16; emphasis added).

We have already seen that with unchanged technology, the aggregate income generated in the production process is not sufficient to sustain the prespecified levels of final demand. If, in addition, the target growth rate of 5.5 per cent per annum is to be accepted as the maximum feasible one, the brunt of adjustment has to be borne by the final demand vector. The possible alternatives are as follows : (a) a reduction in the private consumption expenditure with adverse welfare consequences; (b) a reduction in the government consumption expenditure with its adverse effects on the direct welfare services supplied by the government; (c) a reduction in the quantum of gross investment with its adverse effects on long-term growth; (d) a reduction in exports and/or an expansion of imports with their adverse consequences on the balance of payments and the social objective of self-reliance; or (e) any combination of (a) to (d). It is at this point that the trade-offs between redistribution, growth and self-reliance make their unpleasant appearance.

The past experience of the government in checking the private consumption expenditure has at best been dubious. Even if we assume for the sake of argument that this is possible and if the postulated redistribution programme is to be kept unchanged, the socio-political consequences of redistribution may be expected to be even more pronounced at a lower level of expenditure per capita, especially from the point of view of the upper income groups who besides being socio-politically influential are supposed to lose in the process of redistribution. The past record of the government in checking its own consumption expenditure has been even more dubious. As it is, the Technical Note assumes a very conservative rate of growth of 7.00 per cent per annum of public consumption expenditure as compared to the realised rate (over the last decade) that was more than twice as high even after excluding the abnormal drought years 1965-66 and 1966-67.

The remaining two alternatives (c) and (d) basically imply adjustment in the financing elements of gross investment. It is clear that if, in the absence of effective control over private and public consumption (that has all along been the experience), it is difficult to curb consumption, its effects are reflected in the reduction of private and public savings which, in turn, bring about a reduction in gross investment in real terms assuming foreign assistance to be given and non-adjustible. If the last proviso does not hold and foreign aid is a flexible component, then the gross investment can be maintained in real terms only by increasing the foreign capital-inflow which enables an increase in imports combined with a reduction in exports. The overall marginal rate of savings for the Fifth Plan period has been postulated at 27.9 per cent (Approach, Ch VII, p 27) in comparison with the 15 to 20 per cent maximum that has been realised in the past. The pattern of financing postulated for the Fifth Plan period is presented in Table 1 along with broad indicators of the past record.

It is clear from Table 1 that the Fifth Plan postulates an increase in the relative importance of public sector savings not only to compensate for the reduction in the importance of foreign assistance but also to partially substitute for the relative importance of the private sector. As a result, the marginal rate of savings implied for Central and state budgets is expected to be 35.5 per cent with a steep rise in the corresponding average rate of savings from 14.0 per cent in 1973-74 to 21.6 per cent in 1978-79 (Approach, Ch VII, p 27). This implies a sharp break with the past record as well as requires a discipline so far never exhibited by the Central and state governments. If the savings performance of the government sector falls short (as has been the past experience) of the target, the draft on private savings has to increase in order that the level of public sector gross investment be maintained. This can either be at the cost of private sector investment or the required level of private savings has to be raised above the level postulated in the plan. If the marginal rate of savings for the private sector is already postulated at the ceiling level (after taking into account all policy measures to increase it), the net increase in private sector's savings is clearly infeasible.

Coming to private savings, 85 per cent of these are expected to originate in the household sector and the remaining 15 per cent in the corporate sector in contrast to the 90 to 95 per cent and 5 to 10 per cent breakdown realised in the past. In fact, in recent years, the private corporate sector has come to depend increasingly on the public financial institutions for capital formation instead of financing it out of retained earnings. If this trend continues, the importance of corporate savings as a source of financing capital formation may go down. As regards household savings 41 per cent are postulated in the form of direct investment in comparison with 50 per cent in the recent past. It is important to note that this component is not available for transfer to other sectors and if this is underestimated, as it appears to be, the difficulties of mobilisation and canalisation of household savings may themselves be underemphasised. Moreover, if the redistribution postulated under the preferred variant of the Planning Commission (Approach, Ch VI) transfers incomes from those whose marginal savings rate is relatively high to those whose marginal savings rate is relatively low, the adverse consequences on household savings are obvious. This is only one of the reflections of the trade-off between growth and redistribution.

If redistribution affects household savings adversely and if the government is unable to curb either its own consumption or the conspicuous consumption of the rich, the only way in which the growth objective can be retained in the face of closed-loop

TABLE 1: PATTERN OF FINANCING GROSS INVESTMENT FOR THE FIFTH PLAN AND THE PAST EXPERIENCE
(Percentage of total investible resources)

	Fifth Plan	Past Experience
(1) Public Sector Savings*	34.65	17.00
(2) Private Sector Savings	62.69	70.00
(3) Foreign Capital Inflow	2.66	13.00

*Including those of public financial institutions.
Source: Approach, Ch VII, Table 15, p 33.

inconsistency is through having more foreign assistance than what is postulated in the plan by cutting down exports and increasing imports. If this is not politically or otherwise feasible, the only component in the final demand vector which can be feasibly sacrificed in order to ensure a closed-loop consistency is the aggregate level of gross investment. If maximum efficiency of utilisation of capital is already assumed, this alternative would have adverse effects on growth. In other words, the foregoing discussion clearly indicates that the closed-loop inconsistency detected in the Planning Commission exercise may be expected to be feasibly resolved only by sacrificing the target growth rate in favour of redistribution and self-reliance. Indeed, it is possible to give up the objective of redistribution or self-reliance or some combination of the sacrifice in the two for maintaining the long-run growth objective. But these trade-offs have to be faced explicitly.

To recapitulate, we have made three main points in this section. First, we have argued that the static input-output framework adopted by the Planning Commission is a very unsatisfactory institutional specification of the Indian situation and is most likely to give misleading directions regarding the allocation of resources. Secondly, the growth rate of GDP at factor cost required to sustain the prespecified levels of final demand incorporating the social objectives turns out to be at least 6.0 per cent per annum under certain plausible yet conservative assumptions against the 5.5 per cent rate assumed by the Planning Commission. Thirdly, in the context of this inconsistency, we have highlighted the tradeoffs between the accepted social objectives, though more substantively, the same tradeoffs would arise if the domestic savings postulated in the Approach document prove overambitious and difficulties in their transformation into an appropriate composition of investment prove insurmountable.

IV

Model in Relation to Social Objectives

Growth, redistribution for the removal of poverty and self-reliance can be taken to be the basic social objectives of the Fifth Five-Year Plan. The utility of the planning model may then be judged with reference to the light it throws on the consequences of alternative quantifications of these objectives as well as on the interrelations among them.

The objective of economic self-reliance requires the specification of (a) the rate of growth at which and the date by which self-reliance is to be accomplished; (b) the definition of self-reliance (in terms of net or gross aid); (c) the detailed areas where import dependence is currently crucial and the causes thereof (for example, indigenous non-availability, or availability at costs higher than at international prices or inability to meet total demand from domestic production due to supply bottlenecks and so on); (d) the present level and composition of exports, the detailed analysis of the factors influencing their growth and the likely international demand for them over the five-year period; (e) the realistic limits of possibilities of expanding domestic capacities both for import-substitution and export expansion and their adverse effects on the rate of growth in terms of the economic costs involved in the delays in getting the crucial inputs from domestic sources on time and in the inefficient high cost structure developed under the protective umbrella provided by the permanent foreign exchange shortages; (f) the resolution of the possibilities of trade-offs between export-expansion and import-substitution; and (g) the mutual compatibility between (a) and (b) as desirable targets on the one hand and (e) and (f) as feasible objectives on the other, the underlying trade-offs between growth and self-reliance revealed in the process and the explicit ways in which they can be resolved.

The exercises required for the examination of attaining self-reliance have to be carried out at a level of disaggregation much more detailed than what is possible in a broad sectoral classification adopted in the input-output table. The static input-output framework incorporates in an exogenous manner the end results of the exercises indicated above and hence cannot confirm nor refute in a substantive manner the economic feasibility or otherwise of the assumptions in this regard. The model by itself does not shed any substantive light on the objective of self-reliance. All it indicates is the implications of these assumptions for the sectoral growth rates of output. But even in this limited sphere, the utility of the model has been severely limited for the following reasons.

First, the specification of the import-structure in the model is based on a set of import co-efficients which are basically unstable even on a priori grounds besides the pronounced biases they may contain.[8] It is clearly dangerous to project the import-requirements on the basis of unstable parameters. Secondly, the import-substitution targets are specified in terms of an apparently *ad hoc* downward revision in a large number of unstable co-efficients. No discussion of the rationale behind these reductions in import co-efficients is found either in the Approach document[9] or in the Technical Note. One has to search painstakingly through two matrices of 66 x 66 and 66 x 3 dimensions each for the two years 1973-74 and 1978-79 in order to figure out the specification of the import-substitution targets. No wonder that the Technical Note specifies *only one* set of import-substitution targets in view of its unwieldy nature. It is here that the limitation of the specification (besides its unstable basis) becomes obvious. The Planning Commission has indeed tried alternative specifications of the growth rate of exports although even here its choice of the range between 6.5 per cent per annum and 8.0 per cent per annum reflects unwillingness even to face the consequences of the trend growth rate of 4.0 per cent per annum over the last decade or so. But even neglecting this, one would have thought it useful (i) to specify the set of import-substitution targets in alternative ways, and (ii) to do a sensitivity analysis with reference to certain crucial import-substitution targets. This is extremely important from the point of view of working out a trade-off beween import-substitution and export expansion. Moreover, our previous plans have tended to underestimate both the import requirements and the difficulties connected with the expansion of domestic capacities required for import-substitution. This has resulted in a misallocation of investible resources leading to excess capacities in certain sectors combined with inadequate capacities in certain others with their adverse consequences on the balance of payments. If one were to learn from this experience, it is clearly desirable to chalk out alternative strategies based on alternative specifications of the import-substitution targets. However, this is nowhere apparent either in the Approach document or in the Technical Note. Thus it is clear that the utility of the model even within the limited sphere in which it could have been useful is severely restricted because of the weaknesses both in the specification of import co-efficients and in the speci-

fication of the import-substitution targets. As we indicate in the next section, a simpler specification based on relatively more stable and more readily available numerical parameters would have corrected these weaknesses and increased the flexibility of the model.

Coming next to the objective of redistribution for the removal of poverty, the consumption model works out the sectoral composition of the private consumption expenditure with and without reduction in inequality in the size distribution of consumer expenditure. The static input-output model then works out the consistent levels of sectoral gross outputs under the alternative redistribution assumptions and their implications for the output-mix (see section II for further details). This specification has two basic weaknesses. First, it does not indicate the income-generation consequences of the postulated redistribution because of its open-loop nature (see section III). Secondly, since it seeks to bring about redistribution of *expenditure* and *not of income*, it fails to focus attention on the consequences of redistribution on savings and hence on the economy's ability to successfully undertake a given quantum of investment with foreign assistance treated as exogenously given.

However, even within a static input-output framework, to the extent that the model sheds light on the sectoral growth implications, the Approach document observes that "with respect to agriculture, core industries and mass consumption goods", the sectoral growth rates are broadly similar and "almost invariant with respect to any *alterations* in the inequality parameter" (Approach, Ch VI, para 16, p 21; emphasis added). The corresponding calculations in the Technical Note admit "some differences in a few sectors consequent on further scrutiny of the results". However, "all these changes do not affect any of the qualitative aspects of the growth strategy adopted in the Approach document" (Technical Note, p 35).

Four comments are warranted. First, exercises in the Technical Note indicate that the inequality parameter has been altered in only *one* way. Hence, the invariance, if it holds, holds with respect to *only one* alteration in the inequality parameter and *not* any alterations as claimed in the Approach. Secondly, we would discuss the extent of invariance as well as the reasons behind it in the next section where we argue that whatever invariance that exists is due to the block-angular structure of the input-output matrix combined with the open-loop framework adopted and it need not hold in an institutionally more appropriate closed-loop framework. Thirdly, the invariance, if true, has an interesting implication, namely, that growth and redistribution are functionally independent objectives. This is contrary to what is generally believed. We will come back to this point in the next section. Finally, the invariance implies that the basic growth strategy suggested by the model is numerically insensitive to the basic objective of the plan, namely, the removal of poverty.

Once the insensitivity of the sectoral growth implications to the specification of redistribution for the removal of poverty is granted, the *only* function their redistributive exercise performs with reference to the social objective of the removal of poverty is in indicating the sacrifices and gains to various sections of the population. But even in this limited context, the Approach document tends to underplay the amount of sacrifice involved for the upper sections of the population and overplay the gains to the lower sections without explicitly admitting the massive nature of the redistribution involved in the process.[10] Redistribution has far-reaching socio-political consequences especially in a democratic environment and its socio-political feasibility requires a very careful scrutiny. Moreover, even when socio-political feasibility is guaranteed, the economic and policy-frame feasibilities do not necessarily follow in view of the constraints imposed by the institutional framework of a mixed economy. On these grounds, one may justifiably have expected the Planning Commission to confine itself not just to only one specification of redistribution but work out a discrete range of possible alternatives. If, in addition, these alternatives had been backed up by their policy consequences, the political choice could have been more informed after being fully aware of the consequences of alternative courses of action.[11] Unfortunately, the exercises contained in the Technical Note are woefully lacking even in this limited sphere on which the numerical results of the model could have thrown some light.

Finally, we turn to the growth objective. As the discussion of the model in section II indicates, this is specified at the aggregate level and independently of the remaining elements of the model. Because of its exogenous nature, the model is incapable, by its very construction, of working out the trade-offs between self-reliance and growth or between redistribution and growth. This feature is further accentuated by the fact that no alternative exercises have been performed as we have seen in this section with reference to the specification of import-substitution or redistribution. All that the results of the model indicate is, assuming the aggregate growth rate to be functionally independent of other objectives, what the consequences are of growth with redistribution and/or self-reliance on the sectoral rates of gross output. Whatever trade-offs or interrelations that may exist between growth and redistribution or growth and self-reliance are implicitly assumed to be resolved prior to specification.

At this point we may note the rigidities in the analytical structure of the model which lead to certain counter-intuitive results with reference to the operation of the redistribution objective.

We may recall from section II that the exogenous specification of the aggregate growth rate which, besides fixing the value of gross domestic product in the terminal year, determines the quantum of gross investment through the Harrod-Domar mechanism that is invariant, by construction, to the specification of self-reliance or to the redistribution of private consumption even though on economic grounds we may have reasons to expect inter-dependence. The gross domestic savings (S^t) follow as a residual after we subtract from gross investment ($\bar{I}^t$), the foreign assistance (F^t) derived as a difference between partially endogenous imports (M^t) and totally exogenous export ($\bar{E}_t$). Private consumption (C^t) is then derived as a residual after we subtract from gross domestic product ($\overline{GDP}^t$), exogenously specified government consumption expenditure ($\bar{G}^t$) and gross domestic savings (derived above). In other words

$$S^t = \bar{I}^t - (M^t - \bar{E}^t) \qquad (1)$$

$$C^t = \overline{GDP}^t - \bar{G}^t - S \qquad (2)$$

Now, a redistribution of consumption brings about a reduction in partially endogenous imports and since exports and gross investment are invariant to redistribution, gross domestic savings go *up* as compared to a situation without redistribution. Consequently, the rate of domestic savings in the terminal year and the marginal rate of domestic savings go *up* as a

result of redistribution. This counter-intuitive result is a direct consequence of the invariance of growth to the specification of redistribution combined with the focus of redistribution on consumption rather than income. The problem does not end here. Because gross domestic savings go up as a result of redistribution, it is clear from the relationship (2) above that the aggregate private consumption goes *down* as a result of redistribution — a very strange result indeed on any grounds. Fortunately for the Planning Commission the reduction in imports resulting from redistribution does not turn out to be quantitatively significant; otherwise, we would have had a *situation* where redistribution results in a steep reduction in aggregate private consumption and a correspondingly steep rise in domestic savings as well as a reduction in import requirements — a real dramatic situation of bliss in a paradise where no unpleasant trade-offs exists between self-reliance, redistribution and growth which bother mortals outside the Planning Commission. But it is important to emphasise that the paradise is a direct consequence of the rigidities in the analytical framework and in the specification of the model adopted by the Planning Commission.

Now a reduction in imports resulting from redistribution has been justifiably mentioned in the Approach document as evidence of "positive correlation between reduced inequality and self-reliance" (Approach, Ch V, para 7, p 13) whereas the Technical Note (p 42) provides "the level and type of aggregation adopted in the input-output analysis", as the reason for its insignificant quantitative magnitude.[12] One only wonders whether, if in fact this magnitude had been significant, it would have been a "confirmation" of the rigidities in the analytical framework and the specification of the model or of the positive correlation between self-reliance and redistribution.

We have, however, good economic grounds to expect conflicts between growth, self-reliance and redistribution for the removal of poverty. But the Planning Commission's model is of little help for this purpose for the following reasons:

First, the direct and indirect import-dependence through the current private consumption of luxury items is likely to be quantitatively much less significant than that through investment goods directly as also through the raw materials required for their domestic production and spares for replacement. Since the quantum of gross investment and its composition by sector of origin is exogenously and rigidly fixed and is invariant to the redistribution in private consumption, the model cannot bring out these wider interconnections between self-reliance and redistribution.

Second, to the extent that redistribution transfers incomes from those with a higher marginal savings rate to those with a lower savings rate, it would give rise to a reduction in the aggregate investible resources and hence to a conflict with growth and self-reliance. The model does not incorporate income and savings generation endogenously and hence is unable to bring out this conflict.

Third, foodgrains provide yet another link between self-reliance and redistribution, through the import outlays on fertilisers and raw materials for their domestic production as also through the direct foodgrains imports. Fertiliser imports have always been underestimated due to delays in commissioning their domestic production. Moreover, the fertiliser requirements for stepping up the rate of agricultural output well above the trend rate are likely to go up steeply. In addition, the cushion provided by the PL 480 imports is no more available for direct imports of foodgrains. On top of these factors, since the demand for foodgrains resulting, from the postulated redistribution is underestimated by 5 to 6 per cent in 1978-79 (as we would see shortly), its effects on domestic price stability and balance of payments repercussions are likely to put the objective of self-reliance in jeopardy.

Finally, the import-substitution fostered under the protective umbrella provided by the continuous foreign exchange shortages and export-expansion of non-traditional items through various subsidies involve inefficient domestic production which conflicts with the growth objective. Additional costs are also involved in terms of delays in getting crucial inputs from indigenous sources. These trade-offs between growth and self-reliance are outside the scope of the Planning Commission's model.

We have thus seen that the analytical rigidities as well as the weaknesses in the specification of the model adopted by the Planning Commission combined with the absence of well-worked-out alternatives with reference to import-substitution and redistribution have prevented the results worked out from the model being useful even within the limits imposed by the general specification given by a combination of the Harrod-Domar and the static input-output framework.

Appendix

A closed-loop consistency condition (b) in the text requires the following relationship to be satisfied among the relevant macroeconomic variables.

Definition:

GDP at factor cost equals net disposable income of the households
plus direct taxes
plus net retained earnings of the corporate and co-operative sector and those of the financial institutions.
plus net retained surplus of the Central and state enterprises.
plus depreciation.

We now take up the estimation of each component on the right hand side of the definition.

Net disposable income of the households: Using the gross savings ratio of 11.2 per cent and the aggregate consumption of Rs 45,171.68 crores for 1978-79 (Approach, p 27), the gross disposable income of the households works out to Rs 50,867.83 crores in 1978-79 implying gross savings of Rs 5,696.15 crores. From Table 14 (p 33), 41 per cent of the gross savings may be assumed to be in physical assets on which depreciation has to be provided. For the period 1960-61 to 1965-66, depreciation as per cent of gross savings in physical assets for households amounts to 53 per cent on the average [Central Statistical Organisation: "Estimates of Savings in India 1960-61 to 1965-66", Department of Statistics, Government of India, 1969, See Table 8, p 13.] On this basis, the depreciation on physical assets is calculated at Rs (5696.15)x(0.41)x (0.53) or Rs 1237.77 crores. Substracting this amount from the gross disposable income yields Rs 49,630.06 crores as an estimate of net disposable income of the households (see Table A).

Assuming that direct taxes would grow at 15 per cent per annum (a historical growth rate over 1960-61 to 1965-66 has been 16.2 per cent per annum) and using the stock-flow conversion factor developed by Manne, we find that 28 per cent of the direct taxes over the five year period, or Rs 3,005.52 crores may be expected to realise in 1978-79.

The net retained earnings of the corporate and co-operative sector are indicated as Rs 1,229 crores and Rs 141 crores respectively (Approach, para 31, p 32). The net retained earnings of the *financial institutions* works out to Rs 465 crores for Reserve Bank of India (Approach, para 27, p 31) and Rs 220 crores for other financial institutions (Approach, Table 11, pp 31-32) thus making a grand total of Rs 2,055 crores. Assuming these savings to grow at 10 per cent per annum, 25 per cent of this grand total or Rs 513.73 crores may be taken to realise in 1978-79.

Retained surplus of the Central and state governments has been estimated at

TABLE A: DETAILS REGARDING DIRECT TAXES

	Amount to Be *Raised over* the Five Years (Rs crores)	Source in the Approach Document
(1) Direct taxes by the Centre		
(*i*) Income tax	3,914	Table 5, p 28
(ii) Corporate income tax	3,385	Table 5, p 28
(iii) Estate duty	42	Table 5, p 28
(*iv*) *Wealth tax*	230	Table 5, p 28
(v) Gift tax	17	Table 5, p 28
(vi) Additional mobilisation from direct taxes	2,450	Para 23, p 31
(2) Direct taxes by the states		
(*i*) Land revenue	608	Table 8, p 29
(ii) Agricultural income tax	60	Table 8, p 29
(*iii*) Tax on urban property	28	Table 8, p 29
(3) Total: all direct taxes	10,734	

TABLE B

Year	GDP at Factor Cost at 1960-61 Prices (Rs crores)	Depreciation at 1960-61 Prices (Rs crores)	Depreciation as Per Cent of GDP at Factor Cost
(1)	(2)	(3)	(4)
1960-61	14,101	735	5.21
1961-62	14,643	784	5.35
1962-63	15,040	885	5.88
1963-64	15,871	913	5.75
1964-65	17,044	983	5.77
1965-66	16,175	1002	6.19
1966-67	16,456	1064	6.47
1967-68	17,959	1117	6.22
1968-69	18,401	1168	6.34
1969-70	19,350	1218	6.29
1970-71	20,254	1369	6.76
1971-72	20,634	1433	6.94

Source: Central Statistical Organisation: "Estimates of National Product 1960-61 to 1969-70", New Delhi, May 1971, Tables 5 and 6, pp 8 and 10. Upto 1969-70: Central Statistical Organisation: Press Note dated December 3, 1973, p 7 for 1970-71 and 1971-72.

Rs 1,703 crores at 1972-73 rates (Table 10, p 31) and additional mobilisation is postulated at Rs 400 crores (para 26, p 31), thus making a total of Rs 2,103 crores over the 5 year period. Assuming these surpluses to grow at 15 per cent per annum (or twice the rate of growth of aggregate investment), 28 per cent of this or Rs 588.84 crores may be expected in 1978-79.

As regards *depreciation*, Table B indicates the historical position over the last decade. From this Table, it appears that even excluding the two abnormal years 1965-66 and 1966-67, depreciation as per cent of GDP at factor cost has been steadily rising and that in 1971-72 it has been observed to be 6.94 per cent. For 1978-79, it may be conservatively expected to be at least 7.00 per cent. It may be higher in view of the fact that gross fixed investment is postulated to increase at the rate of 7.50 per cent per annum and that the aggregate incremental capital-output ratio is expected to go up from 2.33 in the Fourth Plan to 3.14 in the Fifth Plan (Approach, p 49).

Putting these figures together, the net domestic product (NDP) at factor cost covering the first four elements of the right hand side of the definition works out (in Rs crores) to (49,630.06 + Rs 3,005.52 + 513.73 + 588.84) or Rs 53,738.15 crores.

Now GDP at factor cost would be given by NDP at factor cost *plus* depreciation. Assuming depreciation to be 7 per cent of the GDP at factor cost, the estimate of GDP at factor cost amounts to Rs 57,782.95 crores.

Thus, the GDP at factor cost *required* to sustain the prespecified level of final demand appears to be Rs 57,783 crores in comparison with Rs 56,300 crores postulated in the Approach document or higher by 2.63 per cent. Assuming the closed-loop consistency to hold in 1973-74, the *required* average annual growth rate of GDP at factor cost is a little over 6.00 per cent and not 5.5 per cent as postulated in the Approach document. This required rate of growth would be higher if depreciation forms a higher percentage of the GDP by 1978-79 as may be reasonably expected on the basis of the extrapolation of the observed trends in the recent past.

[This is a shorter version of a more technical paper (see Tendulkar (1973)) that was presented to a seminar at the Indian Statistical Institute, New Delhi, on November 28, 1973. I am indebted to my colleagues Pranab Bardhan, V K Chetty, D Dasgupta, P Mallela, Kirit Parikh and especially T N Srinivasan for detailed comments and criticisms and to R N Kar for competent assistance. Ashok Rudra gave valuable suggestions for the present version. I am also grateful to S Chakravarty for making a copy of the Technical Note (April 1973) available to me, to K C Majumdar for supplying clarifications regarding the details in the Technical Note and to Nitin Desai for pointing out some double-counting in an earlier version of the Appendix in the present paper. I alone take the responsibility for the views expressed and the errors and shortcomnigs that persist.]

Notes

1 See Planning Commission (1973) in the references.

2 See Perspective Planning Commission (1973).

3 It may be noted that indirect taxes on GDP (T_t^{**}), public consumption (T_g^{**}), gross fixed investment (T_i^{**}), and exports (T_e^{**}), are exogenously specified and constitute the difference between the corresponding variables measured at market prices and at producers' prices. Indirect taxes on intermediate inputs (T_{int}^t) are said to be determined endogenously through the specification of the rates of excise and import duties on the domestic and imported intermediate inputs. Indirect taxes on private consumption (T_c^t) follow as a residual, i e,

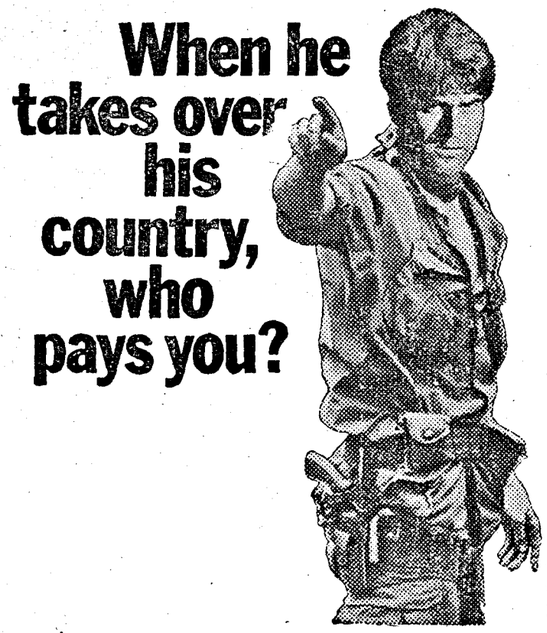
$$T_c^t = T_t^{**} - (T_g^{**} + T_i^{**} + T_e^{**} + T_{int}^t)$$

4 It is assumed here implicitly that capital is the most binding bottleneck to growth. It also holds for the exercise carried out by the Planning Commission and is accepted as a good enough approximation to reality. This is not the place to go into the debate regarding this premise.

5 This framework consists of making a comparative static jump from the base year to the terminal target year of the five-year plan without explicitly tracing out the time path of the various variables during the intervening period.

6 The clearest statement of this proposition is found in Mahalanobis (1955): "We have taken our stand on the *obviously true* proposition that if something can be shown to be feasible in *physical* terms, then the financial and fiscal machinery can *always* be adjusted to supply a satisfactory monetary counterpart (provided there is no difficulty in making the necessary institutional changes)" (emphasis added) p 50. See also Lewis (1962) p 35, Perspective Planning Division (1964) p 26, para 80 and Manne and Rudra (1965) p 67, para 1.6 for similar views.

7 It may be clarified that this model too is an abstraction from reality because it assumes free transferability of savings across sectors and their transformability into productive investment in accordance with a prespecified incremental capital co-efficient matrix. In actual fact, certain types of savings may be tied to certain uses and may not be freely transferable nor transformable. But this level of abstraction is much less than that assumed by the static input-output models or single period models of the Manne-Rudra variety.



8 We examine this aspect in detail in the next section.

9 Chapter V on self-reliance in this document is conspicuous for its non-quantitative nature in terms of the total absence of any discussion on the sectoral dependence on imports and its postulated reduction.

10 See section VI Tendulkar (1973) for elaboration of this statement.

11 We would get back to this question again in section VI.

12 We will examine this aspect further in section V.

When he takes over his country, who pays you?

Revolution isn't good for an export business.

A coup that gets a two-line mention in the Indian newspapers might get an exporter into serious trouble in that particular country.

The new government may pay. Or may not. Or delay the payment so much that it will throw an exporter into grave crisis.

ECGC can cover your exports against such risks. And others. Like your buyer's protracted default to pay. His insolvency. Moratorium on payments by your buyer's government.

Other services of ECGC include extended credit coverage, and performance guarantees.

If you read about a coup tomorrow, relax. With an ECGC cover, it won't kill your export business.

just 100 km from Bombay Airport

Over 30 entrepreneurs have already selected MIDC's Industrial Area at Tarapur for their new ventures. Many more are moving in. Why?
Apart from the proximity to Bombay, Tarapur offers these important advantages:
level land in MIDC Industrial Area (which means low development cost)
adequate water from MIDC's Surya River Water Supply Scheme
power supply from new 132/11 KV sub-station of MSEB
developed ancillary base nearby
location near the sea enables economical effluent disposal
round-the-year goods transport facilities by rail and road, including four train connections with Bombay every day
urban amenities, such as industrial housing, cinema, a bank, shopping facilities for daily needs
in addition: SICOM's varied financial support and project implementation services, and the Maharashtra Government's Scheme of Incentives.

Fumbling with the Oil Crisis

FACED with a major foreign exchange crisis as a result of the sharp rise in the cost of petroleum imports, the government continues to fumble. There is still no visible seriousness about shifting the energy base of the economy to coal. Instead, the government's primary preoccupation appears to be with negotiating with some of the oil exporting countries to ensure undiminished and, if possible, larger imports of oil. The problem of paying for these imports is apparently proposed to be tackled by seeking credits from the oil exporting countries. The red carpet rolled out for the Iranian delegation visiting New Delhi to discuss nebulous proposals of economic co-operation between the two countries has to be seen in this context. The simultaneous despatch of the Planning Minister to Iraq for negotiating credits was a rather crude attempt to put pressure on Iran. The Iranians have, however, refused to oblige. The joint press statement issued at the end of the talks with the Iranian delegation contains no reference to agreement on any specific proposals; there is no mention even of broad agreement in principle on any projects for co-operation in industry or trade. The Iranians perhaps want to assess India's performance in its dealings with Iraq before committing themselves to any specific proposal. Thus there is to be another round of talks in Teheran next month.

What is it precisely that the government of India hopes to achieve by courting the oil suppliers? Even if they were keen to help India, it is unlikely that any of them would be willing to sell oil to India at lower than the going market prices. Exhortations to the oil exporting countries to mind the interests of the developing countries are all very well. But in practical terms all that these countries would be willing to do is to extend short-term credits to some of the developing countries for purchasing their oil. This the oil exporters may do in their own interest; what is not equally evident is whether it will be in the interest of countries like India to buy large quantities of oil on credit.

At the current price of crude of about $ 10 per barrel, the landed cost of one million tonnes of crude would be around $ 80 million. The current level of our imports of crude oil and petroleum products is around 16 million tonnes. Even if it is assumed that we are able to peg our imports of crude at 16 million tonnes, the total import bill on account of petroleum goods is unlikely to be lower than $ 1,300 million in 1974-75, compared to about $ 300 million in 1972-73. It would be naive on our part to assume that the oil exporting countries would be willing to offer credits anywhere in the range of $ 700-1000 million annually. Even if it is assumed that these countries prove to be very generous and offer credits of $ 500-600 million a year, what would be the implications? Since such credits would be on commercial terms, at interest rates exceeding 8-9 per cent, the repayment implications would be truly staggering. Already the debt servicing burden on the country exceeds $ 700 million per annum. To accept large short-term credits on commercial terms, on top of this, to finance oil imports would be suicidal. It may be mentioned, incidentally, that the readiness of the oil exporting countries to offer us credits will be related to their assessment of our ability to service our debts. This should rule out the prospects of very large credits even if the government of India is foolish enough to seek them. There is thus simply no escape from reducing the country's dependence on oil as an energy-source and as feedstock for industry. Instead of high-falutin diplomacy aimed at the oil producers, this is the task to which the government should be getting down immediately.

How distasteful the government finds down-to-earth planning and policy-making of this sort is to be seen from the list of possible collaboration proposals submitted to Iran. The list includes a joint refinery in Iran with a capacity of 25 million tonnes; expansion of the Madras refinery to six million tonnes along with a fertiliser plant and a petro-chemical complex oriented mainly towards export; export of minerals, cement, sugar, textiles, jute and alumina to Iran; starting of a joint shipping company; and offer of consultancy and technical services for building infrastructure and economic overhead facilities in Iran. Projects such as a huge petroleum refinery in Iran or a shipping company would require large foreign exchange contributions by India as its share and it is not at all clear how we propose to find the foreign exchange resources. Again, setting up a petrochemical complex in India to cater exclusively to foreign markets makes little sense when this country is certain to be very short of these goods for the next several years. Similarly, proposals for export of commodities like cement and alumina, of which there is acute shortage in the country, can hardly be taken seriously by anyone.

The government of India has put forward similar proposals to a number of other countries, including Iraq. Few of these countries are likely to take

these proposals seriously, considering the state of the Indian economy which is itself short of a wide range of commodities as well as of investible resources, including foreign exchange. The countries whom we generously offer to help in all sorts of areas are surely aware that we are ourselves seeking help from other countries like the USSR, Japan, etc, for practically the same sort of projects. It is little wonder, therefore, that despite so much talk of joint projects and economic co-operation with so many countries, so little has been actually achieved.

The Political System

Back to 1967?

A Correspondent writes:

FOUR by-election reverses for the Congress in quick succession; the Prime Minister forced to abandon her public meeting in Nagpur without completing her speech, and later advised by the intelligence services to drop her one-day visit to Bombay for fear of unpleasant incidents; and all this in a 'safe' state like Maharashtra. It is difficult not to jump to the conclusion that the Congress is on the run. Yes, of course, it is. Politically speaking we are nearer 1967 than 1971 or 1972. But is that such an appetising prospect, after all?

In the 1967 general election a number of states went over to non-Congress governments and the Congress party's strength in Parliament was dramatically slashed. Yet what happened? One by one the non-Congress governments in the states crumbled. Then along came the Prime Minister to dangle the prospect of a new, radical Congress party, of socialism and of removal of poverty to put the Congress back in overwhelming power. True, it has taken the people rather less than three years to realise that they were duped, but where do they go from here? Another round of Samyukta Vidhayak Dal and United Front governments?

Indeed what is being exposed is not so much the failure of the Congress as the failure of the political system. The kind of protest that the system is capable of generating will not make the slightest difference to the way the country is governed or the economy is managed. Indeed, as the political threat to the ruling party grows, its concern is going to shift even more from economic management to political support-buying. It is no accident that some of the more disturbing trends in the present economic situation can be traced back to the post-1967 and especially the post-1969 period, when, after the split, the ruling party's position had become precarious. Thus it may be taken for granted that, as political trends elsewhere in the country raise doubts about Congress performance in the coming assembly elections in UP, wheat procurement in that state will be soft-pedalled, not stepped up. And there will be even more liberal commitment of government funds to a variety of projects for the Prime Minister to inaugurate.

Faced with the prospect of 1967 all over again, it is still open to the Prime Minister, or someone else in the Congress, to force another split in the party, to promise another crusade against poverty and to hope that the trick will work, largely because none of the other parties has anything more credible to offer. But how many times can this particular act be repeated? Even the last time, the Prime Minister had to back up the shiny charter of hope offered to the people with very firm support from the intelligence apparatus, the bureaucracy, the police and paramilitary forces and the army itself. If they are called upon to play this role too often, they may seriously wonder whether they can't do the job themselves instead of being just backroom boys.

Engineering Exports

Flattering to Deceive

AS has been happening for the past several years, this year also exports of engineering goods will fall short of the target fixed by the Engineering Export Promotion Council (EEPC). The EEPC, easily the most influential and vocal among the export promotion councils, recently admitted that the target of Rs 200 crores of engineering goods exports in 1973-74 will not be achieved. The EEPC chairman has cited a number of reasons responsible for this; not surprisingly, the reasons are almost identical to those the EEPC has been regularly citing for the last several years, including in years when engineering goods exports had gone up sharply. It may be recalled that when, in 1970, an export target of Rs 200 crores was suggested as being reasonable for 1973-74, the EEPC had quixotically talked in terms of a target of Rs 500 crores for 1975. Later the EEPC lowered its sights and accepted the figure of Rs 200 crores for the current financial year, but by then it had become obvious that even this lower target was beyond reach — mainly because wagon exports, which had made such a promising start about three years ago, have been doing very badly.

Engineering exports in the first six months of 1973-74 totalled Rs 72 crores, as against Rs 62 crores in the corresponding period of last year. The prospects for the rest of the year do not appear to be bright and the rate of growth achieved in the first half of the year is unlikely to be maintained. On optimistic reckoning, exports in the whole year would be below Rs 160 crores. If the depreciation in the value of the rupee against most of the major currencies is taken into account, the export performance of engineering goods in the last two or three years must be reckoned as quite disappointing, after the promise shown upto 1969-70.

With that, hopes for a major diversification of India's overall exports have been more or less shattered. Engineering goods generally account for a substantial proportion of the total exports of countries with a developed manufacturing sector. In view of the obvious limitations on the growth of India's agricultural, mining and plantation exports, the poor performance of engineering goods exports should have been taken seriously by the government as well as the industry. The government has so far adopted a peculiar attitude towards engineering exports by viewing the problem essentially as one of offering disproportionately high cash subsidies and import replenishments and leaving the crucial organisational decisions to the clique that controls the EEPC. It has not bothered to look into the complaints of smaller and, in terms of contacts at various levels of the bureaucracy, less resourceful engineering goods exporters who are at the mercy of the EEPC, as they have to route their claims for incentives and for allocation of vital raw materials through the Council. Of course, it is not only the EEPC which is dominated by a few powerful vested interests, the other export promotion councils share the same fate in varying degrees. The irrational structure of the government's export incentives, to which attention has been drawn so often in these columns, and the excessive discretionary powers which the civil servants have in administering these incentives, have encouraged the domination of the export promotion councils by small groups and reduced the government's export promotion policies into devices for conferring benefits on a few at the cost to the exchequer.

Among the factors responsible for the stagnation of engineering exports, the EEPC has pointed to the acute shortage of production capacity in several labour-intensive sectors the products of which have good export potential. One would like to know what the EEPC has done to secure expansion of production capacity in these sectors. The export promotion councils waste most of their time and effort in securing ever-increasing incentives and allocation of vital raw materials at controlled prices. The substantive aspects of export promotion — such as market research, identification of product lines with the most export potential, ensuring adequate production of these items, etc — are neglected by contrast.

The chairman of the EEPC has disclosed the disturbing fact that there is a 'virtual stoppage' of booking of contracts by a large number of exporters. According to him, this is due to the recent increase in steel and pig iron prices. In fact, until only a few months ago, Indian steel prices were competitive with those of even Japanese steel. Admitting that prices of steel and pig iron have gone up recently, why should they affect export activity so much as to result in a virtual 'strike' by exporters? The current levels of export subsidies available to exporters should adequately compensate exporters for any reduction in net cash flows from exports. The intent of the EEPC chairman's statement appears to be to try to further push up these subsidies and incentives.

Bangladesh

Plots and Ploys

RECENT events in Bangladesh are amenable to multiple interpretations. The sudden resignation of Abu Syed Chowdhury has been sought to be papered over, but presidents of republics do not quit as casually as he has done. Rumours have been afloat, not all of which need be ignored. Chowdhury is still relatively young in age and a certain restlessness in being pushed to the position of a decorative figurehead was understandable. But he is also known to have expressed in private serious misgivings about the recent amendment to the country's still-brand-new Constitution, vastly increasing the discretionary authority of the government and arming it with powers of preventive detention. Another story suggests that Sheikh Mujibur Rahman's decision to let out from prison a large number of hardened criminals and former collaborators with the Pakistani regime received only lukewarm support from Chowdhury. What was particularly galling was the Sheikh's gracelessness in announcing the reprieves from his own office, although, according to the Constitution, the orders should have been issued in the name of the President.

The operation against the so-called extremists has been meanwhile continued with great vigour. Extremism can be made to cover many sins, including the cardinal one of a consolidation of opposition against the Sheikh and his party. Apart from the various leftist groups, the major victims of the current operations are the cadres of the Jatiya Sramik Dal, the breakaway faction of the Awami League led by two of the erstwhile youth leaders, Rab and Siraj. True, with so much arms still lying unaccounted for over the vast countryside, the encounters taking place are not altogether one-sided: here and there, opposition elements have taken the opportunity to hit back at the forces of law and order and the Awami League toughs. Given the predictable nature of official reporting, it is only when an Awami League functionary is shot or killed that the police are stirred to let the world know; the killings the other way round are hardly ever mentioned.

None of these developments will apparently prevent the Sheikh from maintaining a certain flexibility in the country's external affairs. The game which Krishna Menon innovated two decades and more ago has now been found to be one which just anybody can play. There is no question of the government of Bangladesh remaining permanently beholden to India. And if the impasse over jute is unresolved, the rationale for a continuing pro-Indian stance would further thin out. Domestic exigencies have forced the Awami League to come to a short-term political agreement with the Moscow-leaning Communist Party of Bangladesh and the National Awami Party led by Muzaffar Ahmed; this does not portend a permanent tilt in policy towards the direction of the Soviet Union either. Reports of a developing rapprochement between the Sheikh and the ever-wayward Maulana Bhashani should not therefore be straightaway classified as belonging to the genre of fiction; nor is the story of a special emissary, equidistant from the two personalities, being despatched to Peking to sound out the Chinese altogether without foundation. Irrespective of the class character of the Sheikh's regime and the repressions let loose against the radical Left, China too might not find it all that incongruous to bestow late blessings on the Bangladesh leader in case such a gesture would help, howsoever marginally, to contain the influence of the Soviet Union on the government of this strategic land. Men like Tajuddin Ahmed, with their known leanings toward India and the Soviet Union, may thus have genuine cause to feel nervous. The current gossip about the Finance Minister's having recently offered to resign can certainly be linked to some of these more recent developments.

Press and Police

Facts, Fortunes, Bodies

IT seems to have become an article of faith with Bombay's press reporters on the crime or political-communal disturbance beat that the police version of any incident be accepted without question, however incredible it may be. And even if some individual reporter is professional enough to write a news story after some independent investigation, it is more than likely to be killed or mutilated by the editors or news editors in case the facts annoy the higher gentry in the government or police establishment. But basically, the tie-up between the police and the press is a marriage of convenience and of occasional profit.

Sometimes, the press-police tie-up exhibits itself in ridiculous — and tragic — stories which are so patently cooked up that even the casual reader cannot possibly believe them. One such story appeared as the lead item on the front page of the *Evening News of India* on December 14. 1973. It stated: "The death in Nair Hospital yesterday of Jaikishan Laxman Mahavir Dhobi (45), who became ill while eating food brought by his wife to him in a police lock-up, was reported to the coroner.

"The Gamdevi police told the coroner that Dhobi was taken into preventive custody on Wednesday. The same day his wife brought him food in a tin.

"Dhobi began eating food in the presence of his wife and the police, when he started getting convulsions, it was stated.

"He was taken to the Nair Hospital, where he died.

"The post-mortem report said the cause of death was 'fractured skull and subarachnoid haemorrhage, with cerebral softening and cardio-respiratory failure'.

"Dhobi's wife, Shantabai, staying in the servants' quarter in a bungalow on Mount Pleasant Road, has claimed the body."

The staff reporter, the police and the coroner together created medical history. They established a connection between a fractured skull and food poisoning! But some further investigation has elicited the information from

reluctant police sources that Jaikishan Dhobi was "a bad character" who had been caught more than once loitering in and around Raj Bhavan. On catching him this time the police gave him a thrashing — presumably to teach him a lesson. He died from head injuries sustained during the course of the lesson.

A more recent case of blatant misrepresentation of the facts by the press-police consortium has been the incidents involving the Dalit Panthers and the police during the past week. The first incident took place on the evening of January 5 at a meeting organised by the Panthers. Since the incidents at the meeting took place late in the evening, among Bombay's English newspapers of January 6, only the *Sunday Standard* managed to put in a small item stating: "The police resorted to a lathi-charge when a 5,000-strong meeting at Worli's Ambedkar Maidan suddenly turned violent after some miscreants started hurling stones at it on Saturday night." Thus, the very first paragraph of the first little news report on the Worli incidents used loaded terms like the "meeting... suddenly turned violent", without bothering to verify whether the meeting had turned violent or the police had turned violent against the meeting.

On January 7, the *Indian Express* made amends and published an eye-witness lead story by a staff reporter who was honest enough to report what he saw. The *Free Press Journal* of the same day dismissed these serious incidents as part of the usual pre-poll clashes. The *Times of India* did not appear that day ostensibly due to newsprint shortages. The next day, the *Times of India* gave prominence to the police version of events and in an attempt to appear fair stated: "It is alleged by the leaders of the scheduled castes that the police took a partisan attitude..."

But that was not to be the end of the incidents. On January 10, according to numerous observers at the scene, the police again brutally broke up a totally peaceful demonstration which had earlier been attacked by some 'mysterious' stone-throwers but had refused to be provoked. This time, the *Times of India* (January 11) did admit: "Cops beat Panthers 'mercilessly'". But the *Indian Express*, no doubt exercising self-censorship after its truthful lapses of January 7, headlined its report — "1 killed: Panthers turn violent again". The *Free Press Journal* continued to behave in a distant, patrician fashion. It began its January 11 report: "Pre-election clashes claimed their first casualty in Bombay on Thursday..." And so once again the fortunes of pressmen triumphed over the facts and a few men in the street were killed without any bother.

LETTER TO EDITOR

Atrocities on Dalit Panthers

SINCE Saturday, January 5, 1974, Bombay city has witnessed a series of clashes and violent incidents, the victims of which have been members of the Dalit Panthers, an organisation of Scheduled Castes. On January 5, a meeting called by the Dalit Panthers at Ambedkar Maidan in Worli was attacked with stones, following which the police made a lathi-charge on the participants in the meeting and arrested 19 persons. The next day, there was day-long violence in the predominantly Scheduled Caste BDD Chawls, close to the venue of the previous day's meeting. Newspaper reports suggest that the police behaved in a partisan manner, beating up and arresting a large number of Scheduled Caste persons, while taking virtually no action against those attacking the Scheduled Castes.

By Monday evening, the number of Scheduled Caste injured was nearly 200 and of those arrested well over 100. But the worst attack on the Dalit Panthers came on Thursday, January 10, when they organised a procession to protest against the partisan attitude of the police. Though the procession was attacked with stones at numerous points, the leaders of the Dalit Panthers successfully restrained the processionists from retaliating — till the police arrested the four most important leaders and followed up with a lathi-charge.

Eye-witness accounts suggest that the police beat up the Dalit youths mercilessly. According to the reporter of the *Times of India*, the police dragged some of the Panthers to the police van by their hair; others were held by policemen while constables beat them with lathis. Some of the youths were hit with rifle butts as the policemen rained abuses on them. Before the procession was finally broken up, Bhagwat Jadhav, a Dalit Panther youth, had been killed and some 40 injured and another 100 arrested.

The determination of the police to put down the Dalit Panthers, which went far beyond the requirements of law and order, was also reflected in their action in rearresting Raja Dhale, one of the Dalit Panther leaders, immediately after he had been released on bail on January 10. Similarly, Namdev Dhasal was rearrested on different charges.

Official spokesmen lose no opportunity to affirm the Government's concern over atrocities committed on Scheduled Castes by the upper castes and its determination to put an end to them. But the events of the last week in Bombay city show that the Government has sympathy and solicitousness for the Scheduled Castes only so long as they meekly accept their exploited status; once they begin to organise themselves to fight exploitation, the full force of the Government's repressive powers are turned against them.

The increase in the incidence of violence directed against them, indicated by the Government's own statistics, can hardly strengthen the Scheduled Castes' confidence in the Government's willingness and ability to protect them. In the circumstances, the only recourse left to them is to organise themselves politically. This is what the Dalit Panthers are trying to do.

The Association for Defence of Democratic Rights demands that:

(1) The Maharashtra Government take steps immediately to remove the atmosphere of terror against the Scheduled Castes in general, and the Dalit Panthers in particular, created by the events of the last week by taking action against those, policemen and others, responsible for the attacks on the Dalit Panthers.

(2) The Government withdraw all charges against the Dalit Panthers arrested on trivial and flimsy grounds — particularly, Raja Dhale, Namdeo Dhasal, Bhai Sangare, J V Pawar and Latif Khatik — and they be released forthwith.

(3) The Government respect the democratic right of the Dalit Panthers to function freely as a political organisation.

(4) The Central Government immediately order a judicial enquiry into last week's clashes and violent incidents, especially into the alleged partisan behaviour of the police.

The Wizardry That's Wanted

Romesh Thapar

SO ... Indira Gandhi was compelled to cancel her visit to Bombay city, for fear that the price rise protest movement backed by trade unions of all complexion and the profound anger sparked among Harijans over the brutal attempt to crush the 'Dalit' protest in the city would cause a total breakdown of law and order. Independent observers confirm the existence of a desperate mood in this city of bursting population and bursting prices. To pretend that the change in the PM's tour programme was due to other pressures of work merely causes merriment of an unkind sort.

The breakdown of law and order has of late become a feature of city life. Opposition parties have naturally found the price rise a convenient motivation for mass action. Frustration is brimful. The Congress Party in the towns has become a symbol of a thoroughly corrupt political machine attempting to play with votes as if governance meant little else. The image of the Prime Minister herself is now of someone who heads the operation in the shadows, not of a person struggling to cleanse the corroded political process. And there doesn't seem to be anyone around who can cry halt to the spreading anarchy in the towns.

Strike follows strike in critical areas of national activity. Publicity comes to the Indian Airlines because it services the elite and because its glaring misuse of power, patronage, perks and privileges has lost it all public sympathy. Close it down, and it doesn't do any damage except to the infant tourist trade. Then, the doctors. Public sympathy is with them. Ordinary people are worried over the closure of limited medical facilities. In any case, those doctors get half of what is the take-home pay of an illiterate loader at the airport under the new rules. There follows the Life Insurance Corporation. Another messy financial operation when you study its management. Bank operations will soon show the same trend. And then the Railways punctuate the scene with what are called "unofficial, lightning strikes", although the suspicion is strong that these "hold-up" strikers are manipulated by a certain section within the Council of Ministers, that Indira Gandhi knows but does nothing about. Managers and workers in the public sector obviously seem to imagine that the assets of the public sector corporations have been transferred to them to use as they will.

Maybe, the new political style is so sophisticated that we do not understand the profound role that strikes are playing to prepare the way for the five-year plan. If we had the computers properly programmed, we would probably be doing better than the British two-days a week. Not a single calculation appears of the loss from the bandhs in Bombay. Bangalore, Gujarat, leave alone the violence and the killings. Politically, the movement from individual strike actions in urban areas to state-wide bandhs is a conscious effort to involve the countryside. It doesn't seem all that difficult judging from the way violence has swept across Gujarat.

For several months now, the Prime Minister has been wondering what can be done to halt the steady deterioration — somewhat rapid during the past few weeks! — of the nation's economic performance. Is it all that difficult to come to a package of action which would begin to restore general confidence. After all, during the worst months of last year, the people waited patiently for some partial solutions to these problems.

Is this just a question of handling the working force as some fool politicians seem to imagine? Is it a question of toughness and speed in the settlement of labour problems as some arrogant and isolated money-makers believe? Is it a question of initiatives resting with cynical union leaders interested only in politicking for their respective political parties which have no solutions to offer to any of the major problems? Is it a questoin of wrong priorities between agriculture and industry, between profit and taxation, between trade and aid, between public and private enterprise, etc, etc? Is it a question of black money becoming the dominant currency in the economy? Or is it just plain, bad, incompetent, unintelligent, corrupt and incapacitated leadership that is at the root of it all? Each theory has its adherents. Yet, the truth lies in a cocktail of many such theories.

We must be clear that the return to balanced and organised effort for a population soon to touch 600 million will be very painful for all categories. We must, however, zero in on critical grass-roots issues. And they are not as complex as the experts in the Planning Commission try to make out. Let me pin-point the simple consensus among persons who have experience of the system both from within and without. Remember, it's a simple consensus:

1 No investments except in those areas which help correct the imbalance in the present capacity of the economy to perform in as self-reliant a manner as is possible.
2 Immediate concentration on doubling the utilisation of existing industrial and agricultural capacities — and capacities to mean those which are *actual* and not those deliberately shown below installed levels. Performance today hovers around 35 per cent, despite claims to the contrary, if we put good performers and bad performers together.
3 An attack on government by committee. This is the institutionalisation of the "slow down", of directionless government. Have your committees, but establish clearly the points of decision-making, the points which will be held responsible for results.
4 Call for decisions and results on fixed dates. No excuses. Failure means the sack, a close-down, retrenchment, take-over.
5 Decisions and deadlines demand delegation of responsibility, particularly financial. Make each ministry responsible for its budget. Make each ministry delegate to its autonomous corporations. Establish a system of annual financial reviewing. Promote the doers. Sack the non-starters. Begin from the top and move down into the work force.
6 Provide one managerial power which has been denied and which has wrecked performance, particularly in the over-protected public sector — the power to hire and fire, to reward and punish. A job is a privilege in hungry India. Let it not become a means of blackmail.
7 And, legislate austerity for this society, austerity which will make the people feel that there is some justice in governance and not just black money affluence at the top.

Without special wrapping these sweets won't stay delicious and fresh—

and without Tribeni Tissues there wouldn't be the finest special wrapping for them!

From sweets to telecommunications and transformers. Tribeni plays a little-known but vital role. Pioneering speciality paper manufacture here, most of which was previously imported.

And from speciality grades of papers for carbonising, laminating, cigarette manufacturing, printing overseas editions of newspapers, wax matches to even fireworks fuses...Tribeni's list of 'firsts' continues to grow. It's now also geared to meet India's emerging demands with the latest know how, research and development and quality control.

Today, Tribeni is exporting its products to over 14 foreign markets and earning valuable foreign exchange.

Tribeni Tissues Limited
—fine papers that matter.

ITC-11

> The people do not ask for much, but they are sick and tired of invocations about commitment to the nation's welfare from the friends of smugglers, blackmarketeers, profiteers, fixers, gangsters and the scum of the earth. If this is the way to survive, then the people too will take this path — as they are doing in some of our leading cities.

There are a multitude of possible steps, but these seven simple points pack a punch. I often ask myself why no political group ever mobilises on such a platform. Probably, the platform is too revolutionary for the political parties we have and their dishonest involvement with the all-pervasive power and patronage of the State. We ask for wizards when the power is in our own hands.

Could it be that one day very soon our people will began a massacre of Congress election candidates. Or, maybe, just stop voting as they did in the Bombay Central parliamentary election? Not a single Harijan, in this overwhelmingly Harijan constituency, voted. Impressive. A lesson in the new *Satyagraha*. We should read the writing on the wall, as it were, even as we shuffle and re-shuffle ministries. Steel has its thirteenth Minister in ten years — or is it the twelfth? And he should have been the "Czar" of energy directly under the PM, with powers to co-ordinate and direct the ministries. But what's the use of saying so ...

The other day, an European obsessed by the oil crisis passed through Bombay and Delhi. "Well, India seems to be doing pretty well", said he, "the scene looks absolutely normal". Ironic, isn't it? Living it up on nothing. Waiting for tomorrow, probably because the astrologers, political and economic, have told us that any day now the oil will begin to flow and at prices within our reach.

What, if it doesn't? Will we claim Iran as the lost homeland of the Parsis? Quite a thought, you must admit ...

January 16

Calcutta Diary

A M

WE have been here before: The ministers almost foamed in the mouth, proclaiming to the world about the record *kharif* harvest. The Chief Ministers met in New Delhi, congratulated one another, praised the Prime Minister's leadership, and raised procurement prices across-the-board by nearly 30 per cent. Instrumentalities of the State were apparently all set ready for a gaint procurement operation. The politicians had learnt from the disaster of the preceding *rabi* season. They had now revised their strategy: they would no longer be led up the garden of vacuous ideology-mongering, no more the theme of wholesale take-over of trade; instead, in this new season, the strategy would consist of dangling high procurement prices before traders and farmers. You could almost see the smug feeling of self-contentment oozing from the pores of the minister's faces; everything was keyed up for a record procurement from out of the *kharif* crop. Trumpets rented the air. For rice, the procurement would be five million tonnes, no less; for coarse grains, for the first time, a determined effort would be made to attain a target of 1.5 million tonnes. Till as late as December, Krishi Bhavan was found to give vent to the conviction that in the case of both rice and the coarse grains, actual procurement might even exceed the targets.

But we have been here before, over and over. The effective part of the *kharif* procurement season is more than half-way through. Barely 1.8 million tonnes of rice have been procured; the purchase of coarse grains — the food of the poor — is even more dismal. The bulk of the procurement of rice has been in Punjab and Haryana, where the cereal is barely consumed and is intended mostly for export: farmers and traders in the two states were exceedingly happy with the generous increase in the procurement price, which was much higher than what the local market would have offered. In contrast, in the traditional rice-producing states, the substantial increase in the government's purchase price has not made the least difference. In most of them, procurement is even lower than last year's. On an average, market prices have risen by roughly a quarter over the year, while the procurement price has risen by one-third; the relative distance between market and procurement prices has therefore narrowed. But so what; what fool of a farmer or trader is around who would voluntarily hand over his stock to a government agency when by holding it back, and selling it to a private party, he can get a much higher rate of return, particularly since the government itself has arranged for the credit which makes such holding back of grains a costless operation?

Thus it is that while on paper the production of rice in the country has perhaps increased by close to 40 per cent during the past decade, a magnificent constancy has attached to procurement: it has always hovered around 3 million tonnes each year, until last season, when, following the nation's solemn reaffirmation of faith in the noble leadership of the Prime Minister, it suddenly dipped to 2 million tonnes. The record harvest notwithstanding, given the rate at which things are progressing, this year too, the procurement of rice is unlikely to exceed 2.5 million tonnes. Even in those near-famine years, 1965-66 and 1966-67 — it is by now almost tiresome to point out the fact — procurement was substantially more. And in the matter of coarse cereals, the less said, the better: why bother at all to procure these, how does it matter if the needs of the poor are not met? The poor are dispensable.

Procurement, in other words, is impervious to both production and prices. It is all a unilateral arrangement. You sink money in expanding irrigation facilities, you spend money to reach the farmers high-yielding seeds, you dispense funds for ensuring the supply of pesticides and insecticides, you make outlays in previous foreign exchange to import scarce fertilisers, you go slow with land reforms, you turn the other way in case any committee of innocent experts suggests a slightly higher impost on agricultural holdings, or calls for the up-to-dating of land records. You fly in the face of facts relating to actual cost of production, and fix inordinately high purchase prices for the grains. All this enables the farmers to raise production. But what for? None of the additional grain raised can be claimed for purposes of the State — for meeting the needs of the public distribution system, or for feeding the rural poor. Quite the contrary. Since you raise the level of price, an inflationary bias is introduced, and market prices adjust themselves upwards; if the wages and earnings of the rural poor fail to keep pace with this rise in market prices, distress in the countryside is intensified. Besides, since food prices are the most crucial element in the cost of living in this poor

country, the price inflation spreads everywhere. There is no apter instance of the classical precept of *kalakai-valyam*: the increase in output is only for the sake of increase, the increase in procurement price too is only for its own sake, let not anybody suggest that either phenomenon should lead to a rise in procurement, or to the furtherance of some other vulgar national goal.

We have been here before, over and over again. Thus, come next July and August, there would be another crisis in the public distribution system. With each year, as the holding power of the affluent farmers and traders goes up because of the rise in prices and the generous supplies of credit from various official sources, the market availability of foodgrains shrinks and landless labourers and small farmers, who have to buy their requirements from the market in the lean season, reels on the verge of starvation. Come next July and August, they would begin to trek to the urban areas in search of food. Another crisis would be at hand, irrespective of the size of, or the procurement from out of, the *rabi* crop. (Now that fertilisers are in short supply, there would be no lack of alibi for a failure in *rabi* procurement either. Once more, an official delegation would therefore begin to negotiate with the Russians or the Canadians or the Australians for an emergency quota of foodgrains imports. Self-sufficiency in food would begin to be interpreted in a new manner. Per capita availability may go up, but who says this increase has to be related to a diminution in the per capita dependence on imports? Under the Indian arrangement, self-sufficiency will be distinguished from *self-reliance*. We will have progressively more food produced in the country, at the same time we will continue to rely on others for maintaining our public distribution system.

Once the food is produced in the country irrespective of the level of price offered by the government, it is not impossible to appropriate a modest proportion of it, such as 10 per cent or less, for purposes of the State. But, to bring this about, you need to enforce a quality of national discipline. You have to impose a levy on the producers, the traders, the millers, the hullers, and such others, and enforce this levy. You have to cordon off areas, prevent the movement of grains across the borders of police stations or districts, deny credit to parties known to indulge in speculation, refuse to shower favours upon your partymen where they belong to entrenched interests or to the underworld. What is the point of being polite, with each year in Indira Gandhi's regime, this discipline has petered out. Where a political system has been nurtured on the basis of, and is made to depend entirely upon, spoils, it is difficult to enforce the called-for discipline, for the government is reduced to an apparatus from which all sections —, farmers and traders included — only expect favours. The moment the administration tries to extract a *quid pro quo* from those classes for whom it has been the benefactor, they revolt. The character of the Congress party, who does not know, has been transformed beyond measure in recent years. Not a trace of ideology is left in it any more. Perhaps it was always a party of graft, but never so unashamedly so. The government — the men and women belonging to the party, or supporting it from outside, have been given to understand — exists exclusively for their satisfaction. To talk of compulsory levy and other similar measures in such an atmosphere would be fantastic nonsense. Which is why procurement is left to its own devices: an instance of indicative planning *a la* France, the smart ones would say.

This need not be the case, others may argue, does not the strong stance the government adopted against the employees of the Indian Airlines belie the above proposition? The authorities have stood resolutely firm; the lock-out of the airlines employees was not lifted, and the unions were not offered the slightest concession: one can now witness the extraordinary scene of the *vast majority of the employees tamely* going back to work. But, here again, it is the class character of the employees and those ranged against them which has been crucial in government decision-making. The victims of the alleged sloth and inefficiency of the airlines workers are made up of the upper classes — businessmen and industrialists, senior civil servants, affluent professional groups. They have fumed and fretted even as the go-slow practices of the Indian Airlines employees have delayed them for hours at the airports: their schedule of engagements has been upset, they have missed their lunch or dinner dates, their wives have waited long and hard for them to return home from business trips to other cities, their children's barely month-long vacation from Doon or Woodstock or Mayo has been fouled up. Despite the obfuscation deliberately sought to be created, there are only a handful of highly paid ones in the Airlines, the bulk of the employees belong to the category of low-paid clerks, technicians and porters. By taking a firm stand against them, the government have gladdened beyond measure the hearts of its own class supporters. Now they will not have to wait for more than five minutes to get their bags, there will be no interminable waiting for flights to take off. Discipline above all, but, for eminent reasons, not a whiff of a similar enforcement of discipline is suggested when procurement lags way behind and the common people have to go without food. Kicks for the vassals and serfs, kisses and considerations for our class brethren. Waiting for the weekly bread ration is only normal and nothing to raise one's hackles: waiting for one's baggage to be unloaded from the plane is however an intolerable imposition and must be redressed *immediately. First things first.* Isn't the first principle of our Five-Year Plans, the sorting out of priorities?

Not by Higher Prices Alone

Hansavivek

NATIONAL NEWSPRINT AND PAPER (NEPA MILLS) has once again shown disappointing results for the year ended March last, with a lower gross profit despite higher sales. Production of newsprint was a little higher at 40,770 tonnes against 40,040 tonnes in the previous year, although it was far below the installed capacity of 67,500 tonnes. The surplus of Rs 2 lakhs was utilised to reduce the accumulated loss to Rs 80 lakhs. Equity dividend, last paid at a meagre rate of 4 per cent for 1967-68, is being once again skipped. Lower despatches notwithstanding, revenue from sale of newsprint increased because of the full year's effect of the increase in the selling price, revised from September 1971. The selling price has been further revised from October 1973 to Rs 1,500 per tonne for despatches up to the previous year's level and Rs 1,800 per tonne on increased despatches. The company is entitled to development rebate aggregating about Rs 147 lakhs, but no allocation has been made apart from Rs 23 lakhs set aside in 1968-69. There is a contingent liability of Rs 74 lakhs for higher payment of replacement cost to the forest department of MP on account of salai extracted from government forests from 1961 onwards. Also, the terms and conditions in respect of 46 additional bamboo felling areas allotted to the company for extraction of pulpwood have not been settled as yet and the additional liability, if any, has not been provided for. No provision has been made, moreover, in respect of future liability for gratuity estimated at Rs 34 lakhs.

Further loans amounting to Rs 132 lakhs were received last year to finance the expansion scheme. It is estimated that additional loan of Rs 568 lakhs would be required for completion of the expansion. The company's proposal for reorganisation of the capital structure by conversion of a part of government loan into equity is under consideration of the government of India. If sanctioned, this will reduce the interest and improve the company's profitability. The structural erection work of pulp and recovery plants is expected to be completed soon. The management hopes that these plants will be commissioned by the end of 1974. A 'letter of intent' has been issued to a Swiss firm for the supply of machinery for expansion of the caustic soda chlorine plant, and a firm order will be placed on receipt of the import licence.

USHA TELEHOIST has not yet received industrial and import licences

for manufacture of load luggers, despite various representations made to government. The company is finalising a collaboration agreement with Telehoist of UK for manufacture of automatic chassis lubricating systems. A collaboration agreement with that firm has been executed for expanding the manufacturing range and capacity of hydraulic tipping gears, for which too industrial and import licences are awaited. The management is also considering a project for manufacture of backhoe attachment and front end loaders, steel and aluminium bodies for dumpers, placers and tippers. A collaboration agreement has been entered into with Plessey of the UK for expanding the capacity of hydraulic pumps and valves from 20,000 to 80,000 units and of valves from 10,000 to 60,000 units. Orders for imported plant and equipment required for the magneto and electrical contact projects have been placed. The directors expect trial runs early next year. The company has secured substantial orders from the Defence department and is striving to boost domestic sales by diversifying production and catering to the special requirements of major customers directly. The management expects better results in the current year. Last year, the company's sales were higher mainly on account of exports aggregating Rs 33 lakhs to Yugoslavia at a "very competitive price". Profit margins fell sharply also owing to increase in costs. Dividend was reduced by two points to 8 per cent, which too was paid out of the past reserves. The company is seeking increase in import subsidy.

JAY ENGINEERING experienced contraction of margins owing to increase in costs and increasing industrial unrest. The fan units operated satisfactorily, but the sewing machine unit at Calcutta continues to pose a problem. It underwent another year of loss. Because of its high cost structure, industrial unrest and increasing competition from the low-cost unorganised sector, the prospects for this unit continue to be "unpromising". Operations of Usha Sri Lanka have proceeded satisfactorily, subject to constraints of the foreign exchange shortage in that country. The workers of the sewing machine unit at Calcutta went on a lightning strike, resulting in a long shut-down of both units in Calcutta during the current year. The factories resumed work in September last after a six-month long shut-down. While trying to make up for the time lost on account of the strike, the management feels that its effects will be reflected in this year's results. The auditors have commented that they could not audit books of accounts pertaining to the West Bengal sales unit on account of strike and picketing there.

Meanwhile, the 1972-73 accounts of the company reveal a sharp fall in net profit, with the result that the major portion of the equity dividend, reduced by 2 per cent to 8 per cent, is short-earned. Unprovided gratuity liability upto the end of 1969-70 came to Rs 53 lakhs. Contingent liabilities not provided for on account of income-tax, sales-tax, corporation tax, etc, amounted to Rs 71 lakhs.

JAYANT PAPER is going ahead with expansion of capacity from 6,720 tonnes to 15,720 tonnes per annum. Orders for indigenous plant and machinery have been placed and licences for import of components and equipment are being obtained. The project is expected to be completed by the end of 1974. GIIC has sanctioned a loan of Rs 18 lakhs and GSFC Rs 20 lakhs for the expansion. The company may need further finance for the expansion. Therefore, the directors' borrowing powers have been stepped up from Rs 30 lakhs to a crore of rupees. During the year to June last, Jayant's production was slightly lower at 6,879 tonnes against 6,916 tonnes in the previous year, but net sales were unchanged at Rs 127 lakhs. Margins shrank and gross profit was lower than in the year before. Borrowings increased and the ratio of inventories/sales showed considerable rise over the year. Dividend was maintained at 15 per cent. The company has been permitted to issue bonus shares on a one-for-three basis by capitalising about Rs 10 lakhs out of the general reserve. These shares will participate in the dividend from the current financial year.

SAYAJI MILLS sold its undertaking 'Sayaji Mills Number one' alongwith its current assets to Shree Keshariya Investment, a nominee of Alok Prakash Jain. The company says that the purchaser, after the registration of the conveyance on May 26 last, wrongfully withheld account books and other records pertaining to the undertaking in question which were within its premises and were kept in trunks duly locked and were to be delivered to Amratlal Hargovandas, a sole arbitrator appointed by parties under the agreement to sell dated October 8, 1972. The company's secretary has filed a criminal complaint against three officers of the purchaser Shree Keshariya Investment in the court of the Judicial Magistrate, Baroda, and the company has filed a suit in the City Civil Court at Ahmedabad. In the absence of the account books and other records of one of its units, the company is not in a position to prepare the accounts for the year ended March 1973 and lay them before the annual general meeting. The meeting, however, has been called on December 29 to consider, among other things, the directors' report and to adjourn it, in the first instance, to June 29 next. The directors will give the usual 21 days' notice to convene the adjourned meeting if they are able to lay the accounts and the auditors' report thereon before the aforesaid date. The company has three other units, namely, 'Maize Products', Kathwada, Tapioca Products (Chalakudi) and Sayaji Mills Number Two (Bombay).

GOVERNMENT OF INDIA, DEPARTMENT OF SUPPLY
DIRECTORATE GENERAL OF SUPPLIES AND DISPOSALS

(REGISTRATION BRANCH)
NEW DELHI

Procedure for Registration with the D. G. S. & D., New Delhi

OBJECT OF REGISTRATION :

The main object of registration of firms as approved suppliers is to facilitate the location of reliable sources of supplies as and when demands are received from the various Indenting Departments of the Government of India including Defence, Railways and Posts & Telegraphs. It also undertakes purchases on behalf of the State Governments and the expanding Public Sector Undertakings. Purchases embrace practically all types of stores excluding food-stuffs and live-stock. The annual purchases made through D.G.S.&D. extend over quite a few hundred crores of rupees.

BENEFITS OF REGISTRATION :

Firms registered with DGS&D enjoy the following benefits:-

i) Demands which are not advertised are met from registered firms.
ii) In case of advertised demands, copies of the notice are sent to registered firms, giving them advance information of the demands.
iii) Rate Contracts and Running Contracts are normally reserved for registered firms.
iv) Operational demands are normally reserved for supply by registered firms.
v) Normally 80 per cent of the quantity against Express and Urgent demands is reserved for supply by registered firms. Even ordinary demands are mostly covered from registered suppliers.
vi) The State Governments and Public Undertakings may at their discretion waive the requirements of Security Deposit from firms registered with D.G.S.&D.
vii) Registration with D.G.S&D. raises the firms' status in business, not only with Government Departments but also with foreign firms and establishments.

APPLICATION FORM :

All firms in India and in foreign countries are eligible for registration. The application must be made to DGS&D, New Delhi in the prescribed application form. Firms in USA and Canada may purchase the form at $5/- from India Supply Mission, Washington. Foreign firms in other countries are supplied forms free of cost by DGS&D, New Delhi. Indian firms may purchase application form from DGS&D, New Delhi or Director of Supplies & Disposals, Bombay/Calcutta/Madras/Kanpur on payment of Re 1/- either at the counter or by Money Order. Application for registration in the prescribed form should be submitted along with a Treasury Challan for Rs 10/- indicating the Revenue Head of Account "XX-Supplies & Disposals". Form of application for renewal of registration will be issued free of any initial charge on request. Application for renewal of registration should, however, be accompanied by a Treasury Challan for Rs 10/- as mentioned above. Application forms are issued free of cost for initial registration as well as for renewal to Small Scale/Cottage Industry Units on production of certificates by the firms from the State Director of Industries or the NSIC authorities to the effect that the Units are registered with them as bonafide Small Scale/Cottage Industry Units. Such Units are also not required to forward necessary Challans for Rs 10/-.

CATEGORIES OF REGISTRATION :

(1) Manufacturers.
(2) Sole Selling Agents/Sole Distributors of Manufacturers registered.
(3) Stockists (a) of imported stores
(b) of indigenous stores such as Timber, Hides & Skins and Cotton Waste.
(4) (i) Foreign firms who are manufacturers; and
(ii) Accredited Agents in India of foreign firms registered.

It pays to get registered as approved supplier with the Directorate-General of Supplies and Disposals.

davp 73/129

FROM OUR CORRESPONDENTS

BOMBAY

Attack on Dalit Panthers

IT is still not very clear why the Maharashtra government chose this particular moment for cracking down on the Dalit Panthers; but about the fact of the crack-down itself there is no room for doubt. Beginning with the public meeting organised by the Dalit Panthers on January 5, at the Ambedkar Maidan near the predominantly scheduled caste BDD Chawls in the Worli area of Bombay, the *modus operandi* of the police has been fairly clear: to wait, as if on cue, for the Panthers' meetings and processions to be attacked with stones, soda-water bottles, etc, by outsiders and then to pounce on those in the meetings and processions with lathis and tear-gas shells. This technique was most clearly evident in the police handling of the meeting on January 5 and the procession on January 10. It is, therefore, useful to describe these two events in some detail. The description that follows is based on eye-witness accounts.

The Worli meeting — together with another at Naigaum, which the police did not permit to be held — had been announced by the Dalit Panthers, among other things, for publicising their decision to boycott the by-election to the Lok Sabha from the Central Bombay constituency. For the Dalit Panthers, the decision to boycott the election was a major political step, reflecting as it did the progressive crystallisation of their attitude to the different political parties and to the system of elections itself. The day before the meeting, the BPCC had issued a press statement claiming that, among other parties and organisations, the Dalit Panthers had extended support to the Congress candidate. This misleading statement by the BPCC lent added significance to the Dalit Panthers' Worli meeting.

All the speakers at the meeting, which was attended by about 12,000 people, focused attention on the decision to boycott the elections. Referring individually to each of the established parties, they explained how none of them could be expected to tackle the problems of the scheduled castes or the 'dalits'. Even the communist parties were not spared; these too had failed to identify themselves with the masses. The communist parties had been trying to achieve revolutionary objectives through petty struggles and agitations centred around economic demands. Referring to the electoral system, it was pointed out how, so long as political parties remained concerned with winning elections, they would have to continue pandering to caste distinctions in order to secure bloc votes in their favour.

It has been alleged that the speeches made at the meeting had strong communal overtones and were likely to offend the non-scheduled castes. In fact, about the only reference to religion was when one of the speakers referred to the claims of parties like the Jan Sangh and Shiv Sena about hoisting the 'bhagwa' flag on Parliament House in New Delhi and asked caustically if these parties really thought that Parliament was a 'bhajan mandali'.

The first stone attack on the meeting came almost as soon as Raja Dhale, president of the Dalit Panthers, began to speak. However, Dhale with the help of other leaders, was able to quieten the crowd and it looked as if the meeting would be able to continue. Resuming his speech, Dhale asked the policemen present to find out who had been responsible for the stone-throwing and to protect the meeting from such attacks, instead of milling around the stage. The stone-throwing was, however, resumed in a few minutes, with much greater force this time. Once again, instead of apprehending those responsible for the attack on the meeting, the police with their lathis and and batons tried to push the crowd in the opposite direction, towards the chawls largely occupied by scheduled

castes. At the same time, a number of police vans and jeeps moved from the place of the meeting to encircle the chawls towards which the people from the meeting were being driven. The people were thus sandwiched between the policemen behind them and other policemen encircling the chawls. In the ensuing confusion, policemen used their lathis freely both on those from the meeting as well as on the inmates of the chawls, allegedly entering the chawls and beating up those inside and smashing utensils, etc.

Raja Dhale and other Dalit Panther leaders went round the chawls, trying to quieten the people and persuading them to disperse. The women from the chawls decided to take a morcha to the nearby police station to protest against the police behaviour. The morcha was soon attacked with stones and one of the women was injured. It was then decided to take out a procession of all the people present to the police station. The police stopped the morcha and allowed only a few leaders to go to the police station. There the leaders were asked to tell the procession to disperse. The crowd dispersed after a few short speeches by the leaders.

As the leaders themselves were preparing to leave the area, stone-throwing started again forcing them to hurriedly take shelter in some of the chawls. They were followed into the chawls by the police and a senior police official ordered Raja Dhale to go away immediately. Dhale tried to point out that it was impossible for him, or anyone else, to leave because of the heavy stone-throwing. Upon this, the police officer is alleged to have pushed Dhale, who was seized and beaten by other policemen as a result of which he sustained a bleeding head-wound. Other leaders present were similarly beaten. All the injured were then put into a police van and taken to hospital. After their wounds had been treated, they were told that they were all under arrest.

In the meanwhile, stone-throwing at the scheduled caste chawls continued. One of the chawls, No 54, which is occupied by scheduled castes and is surrounded by non-scheduled caste tenements, was particularly singled out for attack. However, because of the police bandobust, scheduled castes from the other chawls were prevented from going to the rescue of the residents of Chawl 54.

The objective of restraining the scheduled castes while those attacking them were more or less left free was achieved again the next day when Section 144 was clamped down on one part of the BDD Chawls, inhabited mostly by scheduled castes. While the scheduled castes were, as a result, immobilised and prevented from coming out of their chawls, the police made no comparable effort to curb those who were attacking them.

A similar sequence of events was repeated at the morcha organised by the Dalit Panthers on January 10 to demand the release of Raja Dhale and the withdrawal of cases against other leaders and to publicise the boycott of the election. The morcha started from the venue, in Naigaum, of the proposed public meeting which the police had not allowed to be held. Though those going to join the morcha were subjected to stone-throwing at Dadar station and at Naigaum, the procession proceeded peacefully to Ambedkar Road. Four prominent leaders — Namdeo Dhasal, Bhai Sangare, Avinash Mahtekar and J V Pavar — joined the morcha at different points on the way.

After crossing Parel Tram Terminus, the morcha neared Krishna Nagar, a Shiv Sena stronghold. At this point it was attacked with stones and soda water bottles. The leaders, however, managed to keep the procession quiet and under control. However, as the procession reached Lakshmi Cottage, it was attacked from the other side as well. The central part of the morcha was worst hit. At this point the police brought their vans to the centre of the morcha, splitting it into two. The police lathi-charged the rear part of the morcha and dispersed it.

The front half continued to move forward till it came under heavy attack near Aimai Lane where a large mob had assembled. At the head of the procession were about 500 to 600 women. Caught between the police at the back and the attacking mob these women began to run towards Aimai Lane. Some men from the procession threw a cordon around the women to protect them. Bhagwat Jadhav was one of these men. He was killed by a tile thrown from the terrace of one of the buildings. The morcha was soon stopped by a double line of armed policemen. The policemen fired tear gas shells and started a lathi-charge at the back. Simultaneously the leaders of the procession were arrested and quietly whisked away in a police van. After this, it did not take long for the procession to scatter.

What stands out as an astonishing fact is that though it was the Dalit Panthers who were repeatedly attacked — at the January 5 public meeting, in the BDD chawls thereafter, at the January-10 morcha — resulting in Bhagwat Jadhav's death and injuries to scores of others, the police directed their actions almost entirely at them. Similarly, almost all those arrested are Dalit Panthers. The police have further tried their best to keep the Dalit Panther leaders under arrest — rearresting them on another charge as soon as they are released on bail on one charge.

The question of the Maharashtra government's reasons for acting against the Dalit Panthers at this particular moment remains to be answered. It is clear that the violence directed against the Panthers adversely affected the fortunes of the Congress candidate in the Lok Sabha by-election. It is likely, however, that the government is taking a longer-term view of things. In this context, two facts need to be taken into account.

First, the Dalit Panthers has been gaining strength as an organisation of the scheduled castes in different parts of Maharashtra. In Bombay, they have begun to build a regular organisation with ward-wise units. Their leaders have also been combing the scheduled caste areas of the city, holding sometimes as many as six or seven street-corner meetings in a day.

Second, there has been a change in the political orientation of the organisation and its leaders. It may be true that in the procession taken out to mourn his death, Bhagwat Jadhav's photograph was placed between pictures of Buddha and Ambedkar; but the Panthers have been gradually laying emphasis on the economic and class origins of the persecution and exploitation of the scheduled castes. While they continue to defend the rationale of Ambedkar's call for conversion to Buddhism, they are realising that mere change of religion will not change the facts of the scheduled castes' economic and social status; for that, a change of economic and political institutions is necessary. The speeches of their leaders, as well as their first published manifesto, released last year, reflect this change. It is also seen in their analysis of the other parties and their boycott of the Bombay by-election. An even more pointed indication of the change has been their decision to support the current strike of Bombay's textile workers organised by the Leftist trade unions. All these are still stray straws in the wind; but the Maharashtra government has perhaps decided not to take any chances.

NAXALITES

Strained Mercy

AFTER keeping the issue pending for three years, the Union Cabinet decided last month to commute the death sentence on Nagabushan Patnaik into imprisonment for life. A young Naxalite leader of Orissa, Patnaik had been charged with murder, arising out of a guerilla squad action of the Communist Party of India (Marxist-Leninist) in Visakhapatnam district of Andhra Pradesh. Though a lawyer by training, he had refused to participate in the trial or defend himself or go in appeal against the death sentence. He also refused to plead for mercy, though scores of MPs, several MLAs, his aged father, his wife and several well-wishers, including Jaya Prakash Narayan, had pleaded for the commutation of the death sentence on him. In view of this mobilisation of public opinion, the government did not want to go ahead and execute him. Yet it hesitated to commute the death sentence. So Patnaik was kept in the 'death row' of the Visakhapatnam central jail for over three years. In the meanwhile, he fell seriously ill and was denied medical facilities. A plea for his transfer to a city with better medical facilities was rejected. Patnaik is also standing trial in the Parvatipuram conspiracy case. The hearing in the case had to be adjourned for two months because he was ill and had to undergo a major operation.

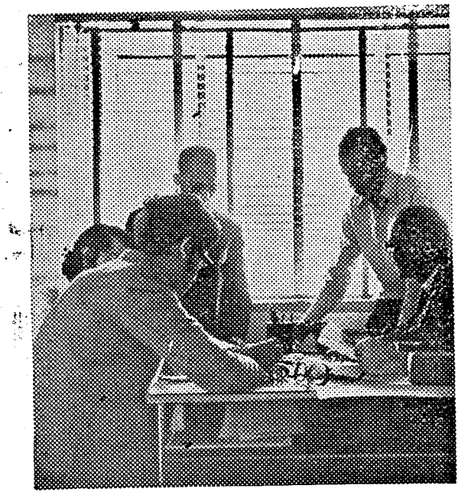
Psychological Pressure

Had Patnaik been executed, an unprecedented situation would have been created. The government could not have honestly claimed that the due process of law had been gone through because the decision to execute him would have been an *ex parte* one. If only Patnaik had addressed a one-sentence letter pleading for mercy, so that the sentence on him could be commuted, the government would have been able to save its face. The consistently hard line of the Andhra Pradesh government and the Centre in the matter, even as anxious Sarvodaya leaders of Orissa including Nabakrushna Chowdhury and Ratan Das were tirelessly campaigning to save Patnaik's life, indicated that the authorities were hoping that Patnaik would give in under psychological pressure. The authorities had repeatedly drawn attention to Patnaik's refusal to plead for mercy as the justification for not commuting the death sentence on him. However, a few weeks before the decision in Patnaik's case was taken, the Tamil Nadu Governor commuted the sentence on another Naxalite leader, Kaliaperumal, on a petition from his wife. Kaliaperumal himself had not pleaded for mercy.

The government's concern for the letter of Anglo-Saxon jurisprudence in insisting on a mercy petition by Patnaik before commuting the death sentence on him fits in ill with the complete travesty of justice in dealing with most Naxalite prisoners. Thus it has not hesitated to stoop to low tricks to deny them the services of lawyers. Asoke Das, charged with murder, and an 'undertrial prisoner' in one of West Bengal's prisons, wrote to a lawyer seeking his services. The letter reached the lawyer 45 days later! In the meantime, Das was sentenced to death by the Sessions Court. Similarly, a letter from Panchu Pramanik, another 'undertrial', was deliberately delayed by officials until after the hearing in his case had concluded.

Deceitful Benediction

The law, it is true, requires the government to arrange for legal defence for those who cannot do so on their own. But this is a deceitful benediction because the lawyers chosen by the government are rarely competent to handle serious cases such as those against the Naxalites, especially when the most competent lawyers are engaged for the prosecution.



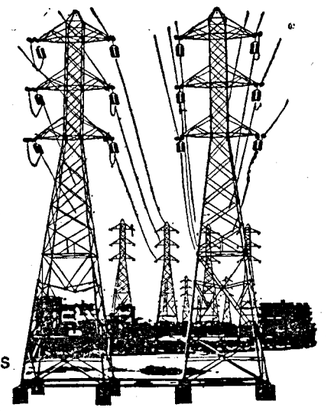
About 25,000 Naxalites pack India's prisons today. Since there is no distinction between political undertrials and other prisoners, no precise estimate is possible and the authorities can keep denying the existence of political prisoners on such a large scale. Next to Indonesia and Chile, India probably has the largest number of communist prisoners in the world. A large number of these prisoners have been in custody since 1968. Undertrials often spend six to eight years in prison without being brought to trial. If they are lucky to be brought up for trial, the hearings are put off on the flimsiest pretexts and the trial drags on endlessly. Prisoners ordered to be released, when the charges against them fail, are rearrested within the premises of the courts, on new, fabricated charges. Some of the Naxalite prisoners have been charged with five or six separate offences at a time and the expenses involved in engaging lawyers for so many cases at a time are prohibitive.

When the government finds that charges against a prisoner cannot be proved, he is brought under one of the several preventive detention laws — the Maintenance of Internal Security Act (MISA) and preventive detention laws of the state governments and the Defence of India Rules. The recent Supreme Court ruling involving the MISA underlines the draconian nature of the law. Those detained under the MISA can be held for 12 months or as long as the Defence of India Rules are in existence; in other words, the government can prolong the State of Emergency for years and keep MISA prisoners in continued detention.

Held on Short Leash

Different states have handled the man-hunt against the Naxalites differently. While the West Bengal government, for instance, has shown a predilection for rough and ready tactics, including recourse to the notorious Prevention of Violent Activities Act and the MISA, the Andhra Pradesh government has managed things more subtly. It has been freely resorting to the conspiracy provisions of the Indian Penal Code. Once brought under a conspiracy charge, the government's political opponents can be held on a short leash. The Nagi Reddy conspiracy case, as it came to be known, took over three years after which those sentenced were given conditional bail pending appeal. They cannot travel outside their areas (usually the city or town known to be their normal residence) without special permission. In the Parvatipuram conspiracy case, which relates to the Srikakulam peasant movement of 1968-70, several accused have been in prison since 1969 and the trial has hardly begun. The trial, which involves 1,020 witnesses, 19 volumes of printed evidence, 2,500 pages of cyclostyled documents, and 68 accused, will drag on for years and even if some of the accused are given bail, they can be kept under strict watch and control.

Orissa can offer just what so many industrialists eagerly want.



A lot more power.

Orissa has the ideal infrastructure to nurture a new or expanding industry. Not the least is an abundance of electric power which is supplied at concessional rates for as long as five years after the commissioning of a plant.

Today the potential investor in an industrial project in Orissa is offered ready-to-occupy industrial estates and developed land on easy lease terms; water at no-profit rates; financial incentives and services coupled with a price preference on Government purchases.

Moreover, Orissa offers the advantages of Paradip, the port with the deepest draft in the country. An outlet that is crucial to the economical export of ores and finished industrial products. In this port lies the future of much of India's foreign trade.

So if it's an industry that you wish to set up, Orissa offers a lot more than you'd get elsewhere. A sound foundation that provides the ideal climate for healthy enterprise.

Orissa—where the scene is set for industrial enterprise

Plugging the Leaks

THE Punjab government started the New Year with an all-out bid to augment its revenues. This it tried to do by seeking the co-operation of the neighbouring states to plug a leak in its sales-tax revenues and by pressing its claim for an equitable share of development finance from commercial banks.

Addressing the Regional Consultative Committee of nationalised banks on January 2, the State Finance Minister, Hans Raj Sharma, urged the banks to expand credit facilities, particularly in the rural areas, and to grant financial help to official and semi-official organisations. While the newly-established bank branches in the state have succeeded to some extent in mopping up savings, they have not made much headway in providing credit to small and medium farmers, artisans, petty shopkeepers and new entrepreneurs. Many potential borrowers belonging to these categories are not in a position to offer tangible assets as security, nor can they afford to pay the banks' normal, commercial rates of interest. Besides, farmers with holdings of less than 10 acres are not eligible for tractor or tubewell loans which keeps bank assistance out of the reach of about 60 per cent of Punjab's farmers who have holdings of less than 10 acres.

The Punjab Finance Minister has reiterated the plea, made by the state government in July 1972, for a much larger share of the deposits collected by bank branches in the state. The percentage of advances to deposits mobilised by commercial banks in the state is hardly 30 per cent. This gives rise to the persistent complaint of Punjab (and also Haryana) that scheduled banks are diverting crores of rupees from this region for investment in industrially advanced states like Maharashtra, Gujarat and Tamil Nadu. Commercial banks have admitted to such diversion of funds, though they have denied that it is part of a deliberate policy. This takes place, according to them, because of the better opportunities for use of funds outside the region. In August 1972, the Punjab Finance Mnister had stated, after discussion with the banks, that the banks had agreed to invest within the state 50 per cent of the deposits mobilised in Punjab. However, in the last 18 months very little improvement has been noticed in this regard.

On December 31, 1970, the number of banking offices per thousand kilometres of area was 13 in Punjab, next to Kerala which led with 23. Punjab also stood high in respect of the number of banking offices per lakh of population, with an average of 5, on par with Maharashtra and Mysore and only just behind Gujarat with 6, the highest in the country. As for per capita bank credit, Punjab was way behind with an average of Rs 72.2 against Maharashtra's Rs 262.4, West Bengal's Rs 176.6 and Gujarat's and Tamil Nadu's Rs 113. Some progress has been made since then, but there is much leeway to be made up. Incidentally, the Chandigarh union territory was far ahead of all other states and union territories with an average of Rs 2,022.6, but its economy stands in a class apart.

Another Punjab Minister has focused attention on the drain of sales-tax revenue. Revenue from this source constitutes 22 per cent of the state's total revenues. But in the absence of uniform rates in contiguous states, Punjab has been losing revenue from this source through the transfer of some business centres to Delhi, where the tax rate is much lower, and through smuggling which continues to be an increasingly prosperous business. The difference in tax rates explains, for instance, the recent shifting of the dry fruits business from Amritsar to Delhi. While Punjab levies 3 per cent sales tax on dry fruit, Delhi levies no tax at all. Truck and bus body building has been for years a flourishing industry in Punjab towns, but while the tax on it as well as on electric motors, foodgrains and kerosene is 10 per cent, Delhi collects only 5 per cent. On foodgrain sales, Punjab imposes a 3 per cent levy, while Delhi has no such impost. There are other discrepancies too which affect Punjab adversely. Punjab is, therefore, among the strong advocates of a uniform sales tax.

Haryana has supported Punjab's stand on almost every issue of common interest. At a meeting of the co-ordination committee of the state's commercial banks held at Chandigarh, it was decided that more loans would henceforth be given to artisans and other small entrepreneurs in the countryside, including carpenters, shoemakers and rickshaw-pullers. The banks also promised liberal loans to boost dairy development which has a bright future in the state. Chief Minister Bansi Lal envisages a 50 per cent increase in the present population of 9 lakh buffaloes as part of a "white revolution" in the near future. The state government is also considering measures to check the drain of the much-coveted milch cattle from Haryana to Bombay, Calcutta, Delhi and other places where they fetch fancy prices.

As in Punjab, only a part of the funds mobilised in Haryana by the banks is being invested in the state. In sales-tax also, Haryana has been losing Rs 7 to 10 crores annually since goods are being diverted for disposal in Delhi in view of the lower tax rates there.

But even more than Punjab and Haryana, Himachal Pradesh needs substantial funds for development. The state government has been urging banks to grant liberal loans on easy terms to poor farmers, especially for plantations and expansion of orchards — the most fruitful avenues of investment in this hilly region. Like the Punjab Finance Minister, who has asked banks to conduct techno-economic surveys to identify so-called credit gaps, the Himachal Chief Minister has urged the establishment of a consultancy corporation in the state to undertake feasibility studies, assess the industrial potential and provide assistance to entrepreneurs. Himachal Pradesh has scored a major success in its quest for institutional finance by persuading the World Bank to launch a four-year horticulture project in the apple-growing belt. The Bank's assistance will be available for streamlining the production, transport and marketing of apples.

Preparing for Democracy

Harish Chandola

NEITHER the popularity of the King and the caretaker government nor the prospect of an elected government is the solution to Thailand's problems. They do, however, provide favourable conditions for creating political consciousness among the people and organising them politically.

Thailand was under absolute monarchy until 1932 and after that has been ruled by military dictatorships. There was practically no freedom of political association and all genuine political activity was suppressed. The people had no choice but to quietly suffer at the hands of whosoever ascended to power, through faction fights, foreign support and intrigues.

The formation of an elected government later this year is not going to end this situation. The level of political consciousness among the peasants, who form the overwhelming majority of the population, is low. The primary task is, therefore, to raise the level of consciousness of the peasants so that in the coming elections they are able to choose persons who will care for the interests of the people they represent in the new parliament and the new government.

It is this issue of politically educating the people which has caused a split in the ranks of the student movement, which overthrew the military government last October and created the conditions for the holding of elections and the formation of a democratic government. Some prominent office-bearers of the National Student Centre of Thailand (NSCT) think that the formation of a popular government is an end in itself. They believe that if the elected government provides rice at a reasonable price by eradicating blackmarketing and profiteering, if it acts in a just manner and if it is not corrupt, then most of Thailand's problems would be solved. This group of student leaders thinks that the task before the NSCT, therefore, is to get involved in organising the elections and contesting them. Another group of student leaders feels that if the students think only of forming a government they will be taking a very short-term view of their role. Their first task should be to politicise the people, particularly those in the rural areas. A people who are not politically conscious can be duped by those who might talk and act in the name of democracy but who in reality might only be concerned with safeguarding their own positions obtained through elections. This is not an imaginary fear. In a number of countries parliamentary democracies have turned into dictatorships.

This politically-enlightened group of students, therefore, does not want to get involved in either organising the coming elections or contesting them. Its members want to go out to the rural areas to educate and organise the peasants politically so that they can in course of time become the most decisive political force in the country. Such students are now forming many small groups. Each group is to be led by a student who has direct connections with villages (whose family or near relations might be living in a village). During the three-month vacation beginning in February, these groups will visit the areas with which they have connections to explain to the people the role that they should play during the elections and afterwards if the elected government ignores their needs.

Since most villagers in Thailand are illiterate, the student groups are now working out methods of communicating with them on political matters. They are preparing posters, photographs, pictures and other visual aids to explain matters simply and directly to the people, and some are thinking of making short films to emphasise the need for political organisations in the new situation.

There are other students who have chosen to work in the cities and towns, with the same aim of mobilising the people for the new situation. Two organisations have been formed for that purpose. One, called People for Democracy, was formed by the group of 100, of whom 13 had been arrested, who had signed the petition presented to the ousted military government demanding a constitution. It was for the release of these 13 persons that the students had held massive demonstrations in the middle of October last resulting in the collapse of the military dictatorship. The other organisation is called the Civil Liberties Union, and has among its members university teachers, representatives of the army, the police and the civil service, housewives, lawyers, doctors and people from other professions. This organisation is campaigning for the restoration of civil liberties.

Both organisations were formed towards the end of November. They propose to co-operate with each other in organising the people in the urban areas and educating them about their responsibilities in electing representatives to Parliament and in ensuring that political power remains in the hands of the people and is not again usurped by a handful of persons.

The army is still the most organised and powerful force in Thailand. It can, if it decides to, stage a coup and resume power. But this will mean bloodshed and a civil war. Nobody has the courage to plunge the country into that just now. Besides, right now the army is in a very weak position, morally. The three top army leaders who fled the country last October were so selfish and corrupt and so intensely disliked by the people that none in the Thai army hierarchy now dares to say that he was an associate of theirs. In fact, the Thai army is at the moment engaged in changing its image. Its leaders are saying that the army as a whole is not corrupt; that by and large it is nationalistic and has no desire to rule by suppressing the people. The new head of the Thai armed forces, General Kris Sivara, has affirmed that the army will now stay in the barracks and act according to the instructions of the political leadership.

It will be difficult for the armed forces to suddenly change their position and organise a coup and resume power. This would not, however, prevent the army from attempting a political takeover in the future, if the politicians who came to power turned out to be unpopular. The crucial question at the moment is: could another political force be created in Thailand in the meantime, before the army thinks of asserting itself again politically?

Such a force does not exist today. There are, however, minor political forces, like the students, the emerging organisations of workers, the prestige and popularity of the King, the intellectuals who desire civil liberties, etc. Could these forces, which are all opposed to a return to military rule, form a united front while the people organise themselves politically?

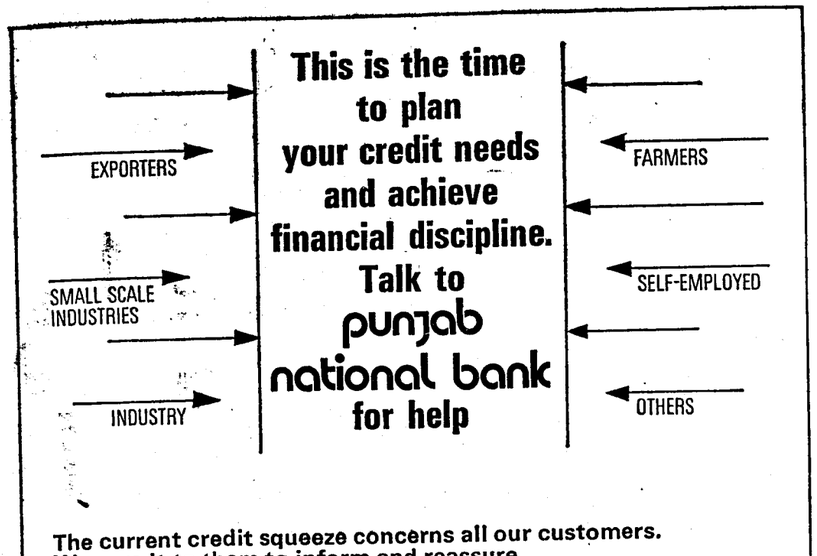
Cost-Benefit of Rupee Trade

Nandita Pant

India's Trade with East Europe by Sumitra Chishti; Indian Institute of Foreign Trade, New Delhi, 1973; pp xiii + 118; Rs 11.

THIS is the second booklet in the IIFT series evaluating the cost-benefit of India's trade with the East European countries. Despite the claim made in the foreword that the first booklet, published five years ago, was "highly appreciated", it was a rather poor attempt compared to the present study. The present study has extended the earlier analysis and examined some of the issues in greater detail, though still not always in depth.

The study attempts to examine in detail four 'fundamental' issues pertaining to India's trade with Eastern Europe, *viz*, growth of trade, composition of trade, trade diversion and terms of trade. Even a cursory reading of the booklet would indicate that the first two issues are most perfunctorily dealt with. Similarly, pp 23-31 dealing with the 'theoretical' exposition of the 'gains' from trade with centrally planned economies is more or less a restatement of the analysis given in the earlier booklet. Chapter III dealing with India's overall trade with the world is not sufficiently integrated with the theme of the book. Chapter IV provides a very unsatisfactory analysis of the pattern of India's trade with Eastern Europe.



Among the East European countries, the USSR stands on a different footing from its other COMECON partners in respect of its trade and economic relationship with India — as it does in regard to its political relationship as the major supplier of defence material. Some of the problems in our trade with the other East European countries, such as switch-trade, do not affect our trade with the USSR. Further, the USSR has shown considerable willingness to adjust its imports from India in such a way that, as far as possible, it purchases goods of which the country has exportable surpluses and the purchase of which by the USSR would not deprive India of the possibility of earning free foreign exchange. Finally, expansion of India's trade with the USSR in the last ten years has been to a large extent due to the large-scale imports of defence equipment from that country. In view of these major considerations, an analysis of the pattern of India's trade with Eastern Europe makes sense only when India's trade with the USSR is discussed separately, instead of all the East European countries being clubbed together, as the author has done.

The discussion of trade diversion and switch-trade forms the relatively more useful portion of the book, though it suffers from some obvious shortcomings. The analysis used by the author for examining the possibility of trade diversion and switch-trade in respect of a given commodity takes into account its domestic production, aggregate exports, exports to Eastern Europe and exports to the rest of the world. If Eastern Europe as a whole buys an unusually large quantity of a commodity in a given year, it is inferred that the larger purchases were possibly for switch-trade. Though this is not a wholly satisfactory method, there is no foolproof way for a research worker to prove that switch-trade has actually taken place. The author should have, however, supplemented this analysis by probing a little more into the imports by the Western countries of these commodities from East Europe. Fairly detailed import-export data are available for a number of Western countries. If scrutiny of this data reveals imports of such items as coffee, oilcakes and coir products from East Europe, it is an indication of the possibility of switch-trade. It may be noted that even when goods are diverted on the high seas, the importing Western countries record it as an import from the relevant East European country which has transferred these goods to them or the country from whose port the goods are diverted.

The author has, surprisingly, failed to draw upon the extensive, and at times heated, discussions that have taken place at frequent intervals on this subject in Parliament. Nor does she show any awareness of the controversial official report on leakages of foreign exchange which has devoted a whole chapter to switch-trade and has affirmed that such trade is taking place on an appreciable scale. It is difficult to understand why the author chooses to be so guarded on this subject when this official report, published about two years ago, is categorical about the existence of switch-trade.

The discussion of unit values of exports and imports attempts to examine whether unit values realised in respect of trade with Eastern Europe are relatively unfavourable to this country as compared with those realised on trade with the rest of the world. It should be kept in mind that unit value comparisons often lead to misleading conclusions because of the deficiencies of the recorded foreign trade data. Since goods actually traded in do not fully conform to the standardised code of trade classification — however detailed this classification —, even a seven-digit commodity code would encompass a group of heterogeneous or differentiated commodities. This holds for even primary commodities like tea, coffee and cashew kernels and is bound to be much more so in respect of manufactured goods, especially those belonging to Sections 6, 7 and 8 of the Indian Trade Classification (which is based on the Standard International Trade Classification). For instance, alloy steels that are included in a single seven digit code of 6732100 comprise different types of alloy steels with a wide range of price difference. The author shows awareness of this problem (p 58) and, though she bases unit value comparisons on unhelpful trade data, she does not hesitate to explain unit value differences in terms of commodity heterogeneity or quality differences which the trade data do not reflect.

The author has constructed export-import unit value indices for India's trade with the East European countries and with rest of the world and has used them to assess "gains" from trade through relative movements of terms of trade. However, as expected, the terms of trade indices do not help much in arriving at meaningful conclusions about gains from trade. The terms of trade index is a crude tool of economic analysis, as it may suggest changes in terms of trade without there being any actual changes in the prices of traded goods whenever there is a change in the commodity composition or a change in the relative importance of items figuring in the basket of traded commodities. It is, therefore, unwise to attach disproportionate importance to the results emerging from a study of variations in the terms of trade over time.

The current credit squeeze concerns all our customers. We owe it to them to inform and reassure.

To behave with a new financial discipline is unquestionably the need. We, on our part, will stretch our resources to assist you. We are fortunately in a relatively comfortable funds position. Our customers, therefore, have less reason to worry.

Our priority sector customers—the farmers, the small scale industrialists, the self-employed and the exporters—their reasonable demands will be adequately met.

The medium and larger customers will receive what they genuinely need to maintain the growth of production. But we would ask them to exercise restraint and discipline in their inventory build-up and cash management. It will be necessary for them to keep us informed of their state of affairs and cash flow, at least quarterly, better still, monthly.

We ask all our customers to refrain from excessive buying of credit. We ask them to be careful in the use of money which is dear. Our national interest demands it. Your own interest demands it.

Come and talk to us.

ULKA PNB-7

There is another obvious flaw in the study of unit value comparisons, though it is not of a serious nature. Prices of a large number of traded goods are subject to fluctuations of a seasonal nature either due to skewed distribution of production within a year in the exporting country or due to fluctuations in demand abroad. In view of the possibility of such fluctuations, the author should have used unit values based on monthly rather than annual data on values and quantums of goods traded. Since this would eliminate the effects of seasonal price variations, it would give a better idea of the unit values realised in respect of India's trade with the East European countries as against those with the other countries.

Really speaking, unit value comparisons are subject to grave limitations unless a serious attempt is made to employ field investigation techniques to study market conditions in different countries and to interview persons engaged in foreign trade with the East European countries and with other countries. The first part of such a project can be undertaken by the IIFT if it is willing to allocate the necessary financial resources to employ market-oriented research staff. As regards the second part calling for extensive and frank dialogues with the business community engaged in foreign trade, the IIFT is not likely to succeed in its attempt as it has not built up the necessary contacts with and gained the confidence of the business community, even though it has been organising numerous training courses for persons employed in foreign trade. It is for this reason that one of the Institute's earlier publications on Indian joint ventures abroad failed to collect the necessary information from the Indian partners for evaluating the working of these ventures. All the same, the merit of that publication was that it pooled tother a good deal of useful information about the climate for foreign investment in some of the important countries in which Indian joint ventures are located. The utility of the booklet under review could have been similarly enhanced had it been less ambitious and had it concentrated more on country-wise analysis of the growth, diversification and changing pattern of India's trade with the East European countries over the last two decades.

In Chapter VI the author has devoted barely five pages to the problems and prospects of India's trade with East Europe. The burden of the argument here is that while there is need for diversification of India's exports in favour of non-traditional goods, there is equally a need for obtaining larger volumes of goods like non-ferrous metals, sulphur and petroleum crude from the East European countries so as to reduce the growing expenditure of free foreign exchange on their imports. The author does not show awareness of the fact that many non-traditional manufactured export items have an appreciable import content which is financed by free foreign exchange. Excessive stress on exports of these items to East European countries will result in the conversion of foreign exchange into inconvertible export earnings that can be used to finance imports only from the East European countries. Even conceding that a sizeable proportion of the goods imported from the East European countries would otherwise have to be imported with free foreign exchange from third countries, a sizeable step-up of non-traditional exports to the East European countries would be worthwhile only if we can obtain in exchange for them the same quantity of goods which would otherwise have to be obtained from third countries. Past experience on this score is not a very happy one. The USSR, for instance, quoted ridiculously low prices for the wagons it had thought of purchasing from India a few years ago. Similarly, East European countries have not been generally interested in selling more of goods which earn them free foreign exchange or have quoted unrealistically high prices for them. Indian importers give very low preference to import licences specifying East European countries as the source of import because of the unfavourable terms often quoted for such imports.

The recent 15-year trade and economic co-operation treaty with the USSR, however, has altered the picture to a large extent and in all probability the USSR and its allies may show greater willingness to accommodate India in its attempt to diversify its exports to them in favour of non-traditional exports by offering in exchange commodities required by India. But as regards the terms of exchange, the picture is still hazy. It needs to be stressed again that diversification of export-import trade cannot be justified on any *a priori* economic reasoning, as the author has attempted to do.

Though the booklet under review was released in the latter half of 1973, the data cited do not go beyond 1970-71 and a large number of tables give data only upto 1969. When almost all the required data are available on financial year basis from a single source, *viz*, DGCIS, it is strange that the author freely cites data both on calendar and financial year bases, for no better reason perhaps than that she has thereby saved some effort. The author appears to have reproduced a great deal of data compiled by the export promotion councils or the Reserve Bank on calendar year basis without bothering to compile the data for subsequent years herself.

INDAL

INDIAN ALUMINIUM COMPANY, LIMITED
1 Middleton Street, Calcutta 700016

Shareholders are informed that Letters of Offer, in respect of the 12,42,132 Ordinary Shares being offered for subscription by Indian Shareholders holding Ordinary Shares of the Company, have been mailed to the registered address of the shareholders by registered post on *22 December 1973*.

The last date for submission of applications is *25 January 1974*.

IA 7876

ANNOUNCEMENT REGARDING THE ISSUE OF NEW ORDINARY SHARES

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

Persons interested in full details may obtain copies of the Prospectus and Application Forms from the Company, the Principal Brokers, the Brokers, the Underwriters and the Bankers named below.

INDIAN ALUMINIUM COMPANY, LIMITED

(Incorporated on 17 December 1938 under the Indian Companies Act 1913)

Registered and Head Office: 1 Middleton Street, Calcutta 700 016

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON TUESDAY, 29 JANUARY 1974 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON FRIDAY, 8 FEBRUARY 1974 OR EARLIER AT THE DISCRETION OF THE DIRECTORS BUT NOT BEFORE THE CLOSE OF BANKING HOURS ON THURSDAY, 31 JANUARY 1974.

Applications have been made to the Stock Exchanges at Calcutta and Bombay for permission to deal in, and for official quotations for, the Shares now being issued.

HISTORY AND BUSINESS OF THE COMPANY

Indian Aluminium Company, Limited (Indal) is engaged on a nationwide scale in all phases of the aluminium industry from bauxite-mining to manufacture of finished aluminium products. From incorporation as a private limited company on 17 December 1938 and conversion into a public limited company on 28 March 1945, Indal has grown to become one of the largest public limited companies in India. In 1947, Indal sales were Rs. 69 lakhs and gross block was Rs. 1.9 crores. In 1972, sales were Rs. 44 crores and gross block was Rs. 78 crores. Indal now has nine production facilities located in six states. These comprise aluminium smelters located at Alupuram in Kerala, Hirakud in Orissa and Belgaum in Karnataka; alumina plants at Muri in Bihar and Belgaum; sheet-rolling mills at Belur in West Bengal and Taloja in Maharashtra; an extrusion plant and a properzi unit at Alupuram; and a foil plant and an aluminium powder and paste plant at Kalwa in Maharashtra. Indal also operates bauxite mines at Lohardaga in Bihar and Chandgad in Maharashtra. A network of sales offices markets Indal products throughout the country.

DEVELOPMENT PLANS

Indal is now engaged in a further major development on the West Coast. Construction is well advanced on a further 50%, or 20,000 tonnes, addition to the licensed annual capacity of the Belgaum smelter for which a licence under the Industries (Development & Regulation) Act 1951 has been received. This smelter project includes related additions to the alumina plant, bauxite-mining operations and ancillary facilities. The Company has also applied to the Government of India for industrial licences to increase the capacity of the sheet mill at Taloja, to install an extrusion press at the same location and to increase the capacity of the foil plant at Kalwa. The estimated capital cost of the aforesaid projects is Rs. 20.10 crores, of which the present issue amount of Rs. 6.70 crores (that is, 31,90,477 Ordinary Shares at Rs. 21 per share) is one-third.

Planning for Growth, Redistribution and Self-Reliance in the Fifth Five-Year Plan—II

Suresh D Tendulkar

An average annual growth rate of gross domestic product of 5.5 per cent, self-reliance and redistribution of consumption for the removal of poverty over the Plan period were the three accepted objectives of the Fifth Five-Year Plan as enunciated in the Approach to the Plan. The details of the planning model underlying the Approach document were supplied in a Technical Note that was circulated to the panel of economists in April 1973. The same planning model (with a change in the price base from 1971-72 to 1972-73) is said to form the basis of the Draft Fifth Five-Year Plan released recently. The objective of this paper, the first part of which was published last week, is to evaluate the planning model underlying the Approach document.

The model is found to be inadequate in its institutional specification and operationally unsatisfactory. The empirical basis for the three major policy-oriented conclusions emerging from it is found to be a poor approximation to the realised experience in the recent past, thereby making suspect their economic feasibility in practice. Because of the inadequate institutional specification of the model and the absence of a simultaneously worked-out policy-frame, the problems of evolving policy measures ex post *are shown to be intractable.*

It is not at all surprising, therefore, that the commitments on self-reliance and removal of poverty have been considerably diluted in the Draft Plan—although certain exogenous factors have been held responsible for this, especially for throwing overboard the objective of self-reliance. Even in the absence of these exogenous factors, the pronounced biases in the numerical parametric specification of the model, the inappropriate institutional specification and the socio-political infeasibilities involved in working out the policy-frame ex post facto *for the redistributive objective would have led to the same result.*

V Parametric Specification

THE economic feasibility of the alternative levels and combinations of social objectives indicated by a planning model is a direct *consequence* of the numerical assumptions made regarding the technological, behavioural and policy parameters as well as the specification of the crucially binding constraints operating on the system. Hence, before economic feasibility can be taken as realistically established by the numerical results of the model, it is necessary to investigate carefully whether there exist any pronounced biases in the numerical representation of certain crucial parameters (with reference to the observed behaviour in the past) that would reflect themselves and hence substantially affect the numerical results of the model. Viewed from this angle, we examine in this section three crucial conclusions that emerge from the numerical results of the model which are both striking and directly dependent on the numerical characterisation of the model. They relate to (a) the demand for foodgrains required for the removal of poverty; (b) the *import requirements*; and (c) the relationship between the growth strategy and redistribution.

Two fairly obvious principles that should be strictly adhered to in the parametric specification of the model may be mentioned at this point. First, the parametric specification should be operationally as simple as is permitted within the constraints of conceptual soundness and empirical stability. Second, the observed data should be adjusted as little as possible and that only when reliable empirical basis exists for the same. If adjustment is inevitable and its empirical basis is shaky it is preferable to adjust a smaller number of final variables to a larger number of individual co-efficients. The greater the extent to which these principles are violated, the farther removed is the numerical parametric specification from the observed reality and hence the more illusory is the economic feasibility based on it.

Demand for Foodgrains

Table 2 summarises the results from previous studies relating to the implications of alternative assumptions regarding redistribution for the rate of growth of foodgrains demand and output. These studies are closely comparable because they assume roughly the same level of *initial inequality* with reference to which changes are made for alternative redistribution objectives. From the perusal of column (6) of this Table, it is clear that the projected rate of growth of foodgrains demand estimated by the Planning Commission under the postulated redistribution [variant (D) in line 1(b)] are lower than those estimated by the other studies. This is partly to be expected because both the rate of growth of population and of per capita total expenditure assumed by the Planning Commission are lower than those in the other studies. However, this factor is likely to be more than compensated by the *steepest* postulated reduction in inequality and the *shortest* time horizon over which this is sought to be achieved. In other words, at least with reference to similar other studies carried out in the past (which adopt both longer horizons and less steep reduction in inequality) the rate of growth of demand for foodgrains appears to be under-estimated, and warrants a close investigation into the numerical specification of the consumption model from which it follows.

For working out an alternative exercise based on the past experience we adopted two variants. Variant (L) is based on the lowest realised aggregate proportion of total expenditure spent on foodgrains. This turned out to be the case for the 9th round. Variant (R) is based on the average proportion spent

TABLE 2 : IMPLICATIONS OF REDISTRIBUTION FOR FOODGRAINS DEMAND AND OUTPUT—SUMMARY OF PREVIOUS STUDIES

Specification of the Study	Period Covered (in terms of April-March year)	Length of the Plan Horizon (years)	Rate of Growth of Population Per Cent Per Annum	Rate of Growth of Per Capita Expenditure Per Cent Per Annum	Postulated Reduction in Concentration Ratio for Redistribution	Required Rate of Foodgrains Demand Per Cent Per Annum	Required Rate of Growth of Foodgrains Output Per Cent Per Annum

Notes : See References for details regarding the studies cited here.

on foodgrains by each fractile group over all the available rounds of the NSS. The method of projection is the same as the one followed by Manne and Rudra (1965) and Srinivasan, Saluja and Sabherwal (1965). It may be noted that this method is identical in assumptions to the one followed by the Planning Commission in the Technical Note. If we assume that the trade and transport margins are an unknown but a fixed proportion of the market price, the rates of growth of demand at the producers' prices worked out from the Technical Note and at the market prices worked out from the NSS data are comparable. Table 2 summarises the rates of growth of foodgrains demand over the 5-year period under the alternative exercises. [For more complete technical details, a reference may be made to Tendulkar (1973): Section VI.(A), pp 61-74, Appendix 2, pp 168-174 and Appendix 3, pp 175-182.]

A careful examination of Table 2 brings out the following salient features. First, for the rural population as a whole, which accounts for nearly three-fourths of the total demand, the consumption model tends to underestimate the demand for foodgrains by 5 to 7 per cent with or without redistribution. The extent of underestimation is lower for the urban population. Second, for the rural population at a more disaggregated level with a postulated redistribution, the consumption model tends to underestimate the demand of the bottom 30 per cent of the population by 14 to 15 per cent, of the middle 40 per cent by 8 to 9 per cent and of the top 30 per cent by 2 to 5 per cent. For the urban population (with a postulated redistribution), the demand for foodgrains of the bottom 30 per cent of the population is underestimated by the consumption model by 18 to 20 per cent, that of the top 30 per cent by 5 to 8 per cent whereas the demand of the middle 40 per cent of the urban population is *overestimated* to the extent of 7 to 10 per cent.

The foregoing observations clearly suggest that as compared to the realised behaviour in the past based on the various rounds of the NSS, the consumption proportions adopted by the Planning Commission contain pronounced biases in understating the extent of demand for foodgrains for the bottom 30 per cent of the population and somewhat more so for the urban population than for the rural population. So far as the middle 40 per cent group is concerned, the consumption model tends to underestimate its demand for the rural population and overestimate it for the urban population. For the top 30 per cent of the population, there is a uniform tendency towards underestimation though it is much less than that for the other groups in the population and relatively lower for the urban population than for the rural population.

What are the implications of these biases for the aggregate demand for foodgrains? They are summarised in Table 4. It is clear that the aggregate demand for foodgrains is underestimated by 1 per cent per annum by the consumption model adopted by the Planning Commission or by 5 to 6 per cent in 1978-79. It may be emphasised that this requires additional 5 to 6 million tonnes of foodgrains in 1978-79. The repercussions of the extra demand of this magnitude for increasing the domestic production (when the assumed target growth of foodgrains output is considerably above the trend growth rate), balance of payments (with increased import requirements of foodgrains and/or fertilisers) and for domestic price stability are too obvious to note here.

Hence, the conclusion that the steepest reduction in inequality involving massive redistribution for the removal of poverty can be managed with 3.99 per cent average annual growth rate of foodgrains output is itself conditional upon the pronounced downward biases in the numerical specification of the consumption model and cannot be accepted as a realistic approximation to the realised consumer behaviour in the past.

ESTIMATION OF IMPORT REQUIREMENTS

An average annual growth rate of only 3.5 per cent for import of goods and services is claimed to be sufficient to sustain 7.5 per cent growth rate of fixed investment and 5.5 per cent growth rate of GDP. Combined with an assumption of 7.0 per cent growth rate of exports, estimated net imports of goods and non-factor services of Rs 403 crores in 1978-79 without import-substitution and redistribution are expected to be transformed into net exports of Rs 198 crores. This conclusion is a direct consequence of the specification of the import structure as also the import-substitution on assumptions which have to be closely examined.

We may recall from section II that the specification of imports in the static input output model adopted by the

TABLE 3 : INDICES OF FOODGRAINS DEMAND FOR 1978-79 WITH 1973-74—100 UNDER ALTERNATIVE EXERCISES FOR THE BROAD GROUPS OF THE POPULATION

Source : Tables VI.4, VI.5 and VI.6 in Tendulkar (1973).

Planning Commission consists of two matrices:

(a) matrix $\left\{ m_{ij}^t \right\}$ of 66 x 66 dimension (M_1 matrix for short)

and (b) matrix $\left\{ c_j^t, g_j^t, f_j^t \right\}$ of 66 x 3 dimension (M_2 matrix for short)

where m_{ij}^t denote intermediate input co-efficients incorporating the demand for the competing imports of the i th sector type as intermediate input into the unit level of output at factor cost in the jth sector,

and c_j^t, g_j^t and f_j^t denote co-efficients indicating the requirements of the competing imports of the i th sector type per unit level of final demand originating in the private consumption, public consumption and gross fixed investment respectively.

The M_1 matrix is specified in Annexure III.4 for 1973-74 and in Annexure IV.4 for 1978-79 whereas the M_2 matrix is specified in Annexure III.5 for 1973-74 and in Annexure IV.5 for 1978-79 in the Technical Note. It may be emphasised that, conceptually, noncompeting imports do not appear in the model at all. For obtaining these two matrices for 1973-74, use has been made of "the actual levels of commoditywise imports for the year 1969-70 with necessary correction for 1971-72 prices, allocating them into intermediate and final uses on the basis of 66 x 66 input-output table" and "the two import co-efficient matrices have been suitably modified to take into account the estimates of commodity-wise imports for 1973-74" (Technical Note, p 10). The import-substitution assumptions involve exogenous changes in the elements of these matrices for the year 1978-79.

What are the considerations that should go into the specification of the import-structure? As we have noted in the last section in connection with the objective of self-reliance, the analysis of import-dependence has to be carried out in a very detailed manner, the level of required disaggregation being much more detailed that what is available in a 66 sector breakdown. Nothing of this type is spelt out either in the Approach document (where the chapter on self-reliance is conspicuous for the lack of quantification) or in the Technical Note. In the absence of detailed analysis of this type, the criterion on the basis of which the numerical specification of the import structure can be judged is its closeness of approximation to the realised import-dependence of the economy in the recent past.

The numerical specification of the import-structure adopted by the Planning Commission is based on the commodity composition of imports for 1969-70. Now this year is conspicuous for the lowest level of imports (measured here in dollar terms) registered during the period 1960-61 to 1971-72 both of capital goods and of intermediate products, barring the year 1966-67 which was affected by a very severe drought and devaluation. In particular, the imports of raw materials and intermediate products declined by 11 per cent from $ 1150.9 million in 1968-69 to $ 995.3 million in 1969-70 and rose to $ 1429.4 million by 1971-72 (or by 44 per cent over 1969-70). A similar remark applies albeit less sharply to the imports of capital-goods which declined from $ 703.3 million to $ 537.6 million, or by 24 per cent in 1969-70 over the previous year and rose to $ 626.8 million, or by 16.5 per cent in 1971-72 over 1969-70. It is clear, therefore, that any numerical specification based on the realised import-structure in 1969-70 is most likely to introduce a downward bias in at least the import requirements of intermediate inputs.

What effect this downward bias at the aggregate level would have at a detailed sectoral level needs to be investigated. Some sketchy information for some of the machinery industries has been put together in Table 5 for the years 1970 and 1971, the source being the Directorate General of Technical Development (DGTD). All the industries except agricultural tractors (which form part of the sector Agricultural Implements) are fairly comparable to the sectoral classification adopted by the Planning Commission. The imported intermediate input co-efficients used by the Planning Commission are listed in columns (9) and (10) for comparison with columns (5) and (8) calculated from the data given by the DGTD. This Table illustrates two points. First, the actual import content even at the aggregate level in any industry using the procedure of the Planning Commission fluctuates considerably even in two consecutive years, thus clearly confirming our earlier serious doubts on the stability of these co-efficients from year to year. Secondly, in all the cases, the total imported intermediate input co-efficient adopted by the Planning Commission for 1973-74 is invariably an underestimate and in almost all cases by a large margin.[13] It may be noted that the definition of "indigenous content" adopted by the DGTD implies buying from an "indigenous seller" who may have imported the commodity. Consequently, the import-content calculated from the data given by the DGTD may itself most probably be an underestimate. Notice that we have investigated the downward bias in the total imported intermediate input co-efficient for the sector as a whole. This, in turn, implies the percolation of the downward bias (along with its associated instability) to its allocation across sectors in a given column of the M_1 matrix.

Since, in the absence of any other recent data, it is not possible to extend the foregoing analysis to others sectors,

we adopt the next best alternative method of investigation. Here we attempt to assess the closeness of the import-structure resulting from the M_1 and M_2 matrices for 1973-74 with the realised import-structure in the recent past. If there are significant differences between the two import-structures, this would constitute an indirect evidence about the biases in the individual components of the M_1 and M_2 matrices.

The use-pattern of imports for 1973-74 that results from the Planning Commission's exercise has the following composition:

- Imports for intermediate use 49 per cent
- Imports for gross fixed investment 22 per cent
- Imports for private consumption 15 per cent
- Imports for government consumption 14 per cent

This composition appears to be at variance with the statement that appears in the Approach document itself that maintenance imports "constitute about 80 per cent of the total estimated imports". (Approach, Ch V, para 6, p 13). However, we do not possess the comparable use-composition for any recent year. All we have is a commodity composition of imports for various years. We have, therefore, attempted to rework the estimated commodity composition of imports for 1973-74 according to the input-output classification into three groups for which the data for 1969-70 to 1971-72 are available. The resulting percentage composition is as follows:

(Per Cent)

	1969-70	1970-71	1971-72	1973-74
(1) Imports of raw materials and intermediate products	47	54	59	50
(2) Imports of capital goods	25	25	26	23
(3) Imports of other goods (consumer goods)	28	27	15	27

Before we discuss this table, three comments are called for as a background. First, food imports were fairly low in 1970-71 and 1971-72. Secondly, although the aggregate imports showed an increase of 11 per cent after remaining fairly stationary in 1969-70 and 1970-71, the aggregate non-consumer goods imports increased by 11 per cent in 1970-71 over 1969-70 and further by 20 per cent in 1971-72 over the previous year. Thirdly, industrial production registered a fairly high growth rate of 7 per cent in 1972-73. The composition of imports for 1971-72 can, therefore, be regarded as in some sense "normal".

Notice, to start with, that the commodity composition of imports that we have worked out for 1973-74 is very close to the use-pattern that results from the numerical specification of M_1 and M_2 matrices noted above. In other words, we have not introduced any significant biases in our reworking of the import-structure. Second, the estimated commodity composition for 1973-74 conforms closely to the one realised in 1969-70 if we make an allowance for food imports. This is only to be expected because the commodity composition for 1969-70 was used for the computation of M_1 and M_2 matrices. Thirdly, and most importantly, the numerical specification of the import-structure adopted by the Planning Commission results in a clear and unmistakable underestimation of the proportionate importance of the imports of raw materials and intermediate products and a corresponding overestimation of imports for final consumption. The extent of underestimation is around 9 per cent for raw materials and intermediate products if we accept 1971-72 as a normal year and 5 per cent if we take an average over 1969-70 to 1971-72 after allowing for heavy food imports in 1969-70.

For capital goods, as a whole, even though the proportionate importance turns out to be about right in the aggregate, the broad composition of this sub-group reveals further discrepancies with respect to 1971-72 as is presented in Table A.

Thus, the imports of Electrical and Transport Equipment are expected to decline in absolute terms to negligible levels whereas the imports of Non-Electrical Equipment are estimated to be about twice their level in 1971-72. This implausible and drastic change in the composition of capital goods is a direct consequence of two factors: (i) the biases and errors in the numerical specification of the f_t^i elements in the M_2 matrix, and (ii) the exogenously specified composition of gross investment by sector of origin.

At a more disaggregated level, Table 6 attempts to examine the discrepancies at the aggregate level for all the uses put together between the actual imports in 1971-72 and those expected to materialise in 1973-74 on the basis of the numerical specification of the M_1 and M_2 matrices [columns (3) and (4)]. The sectors have been selected in a way that the imports are quantitatively important. They include all the raw materials and intermediate products (except plantations where imports are likely to be negligible) and those capital goods identifiable in the Indian Foreign Trade Classification. Since the capital goods considered here exclude Electrical and Transport Equipment (where we have already noted an implausible discrepancy between the actual imports in 1971-72 and those estimated for 1973-74), the imports covered in Table 6 account for 54 per cent of total imports in 1971-72 and 71 per cent in 1973-74. After qualitatively allowing for some growth over the two year period, the following discrepancies emerge.

Imports of Iron and Steel are estimated to decline in absolute terms of Rs 100 crores over the two years from Rs 238 crores in 1971-72 to Rs 138 crores in 1973-74. The corresponding aggregate import-availability ratio in 1973-74 works out to be a mere 10.5 per cent whereas in 1970-71 and 1972-73 this ratio stood at 13.4 per cent and 22.9 per cent respectively (Economic Survey, 1972-73, p 164). Since Iron and Steel is a basic intermediate input that goes into many machine-building and other industries, this steep reduction in imports as well as in the import-availability ratio is clearly a consequence of underestimating the import requirements of Iron and Steel in the imported input co-efficient matrix M_1.

Machine Tools is another sector where the import-availability ratios in the last few years had been 62 per cent (1968-69), 43 per cent (1969-70), 30 per cent (1970-71) and 38 per cent (1971-72) whereas the ratio that results from the Planning Commission's specification is 6.85 per cent. This is all the more odd for two reasons. The import-availability ratio does not conform even to the year 1969-70 on the basis of which the numerical specification of the M_1 and M_2 matrices is made. Secondly, the imports of machine tools are underestimated despite the overestimation of imports of Non-Electrical Equipment that we have already noted.

With the exception of crude oil, Inorganic Heavy Chemicals and an omnibus sector of Other Machinery (where there appears a strong tendency to overestimate the import-requirements), for all the other sectors, imports are either expected to decline in absolute terms or increase very slowly. Since all these sectors (except Agricultural Implements) relate to raw materials and intermediate products, this tendency is clearly the result of the pronounced downward biases in the imported input co-efficient matrix M_1. The over-estimation in the sector Other Machinery is mainly due to the high value of f_i^t (=0.55) in the M_2 matrix combined with the exogenously specified high weight attached to this sector in the composition of gross fixed investment in plant and equipment by sector of origin.

With a reasonable expectation of the absence of any drastic change in the import-structure between the one realised in the recent past and the one estimated for 1973-74 (without import-substitution), the foregoing analysis clearly discerns a tendency on the part of the numerical specification of the import-structure adopted by the Planning Commission to under-estimate the *import-requirements* of raw materials and intermediate products and possibly over-estimate the demand for imports for final uses. Import-substitution assumptions incorporate possible reductions in the elements of the M_1 and M_2 matrices for the year 1978-79. We have already commented in the last section on the unsatisfactory nature of this specification of import-substitution. The net overall result of all these changes at the sectoral level can be simply studied by examining the changes in the aggregate import-availability ratios for some key sectors that form a little over 70 per cent of the total imports estimated by the Planning Commission. The aggregate import-availability ratio at the sectoral level is defined as

$$\frac{M_i}{X_i + M_i}$$

where M_i is the level of competing imports in sector i (measured at c i f prices) for all the uses put together and X_i is the corresponding level of the gross output of the ith sector measured at producers' prices. These are presented in column (5) for 1973-74 and column (7) for 1978-79, in Table 6. It is clear that except for Crude oil where the import-availability ratio

Now there's a new giant with not just one lounge but two...

SIA 747B

You can see for yourself that our Raffles Lounge is a very special sort of place. And you'll find that our Silver Kris Lounge is very much in the same category. On SIA's new 747Bs there are two lounges instead of the usual one—the 'Raffles' and the 'Silver Kris'. Two extra galleys for smoother meal service. And eighteen hostesses and stewards to look after you (quite a few more than most other 747Bs). As well as standard features like movies and music. It's all part of our aim to maintain a standard of inflight service that's stood out in crowded skies for 27 years. The SIA 747B joined our all-Boeing fleet on October 1, serving UK, Europe, the Orient and Australia. The SIA 747B: a new giant that's more than just another jumbo.

A great way to fly SINGAPORE AIRLINES

realistically goes up from 69 per cent in 1973-74 to 82 per cent in 1978-79. and Other Minerals, there is a uniform decline in all the other sectors. Especially for paper and paper products, Fertilisers, Organic Heavy Chemicals, Petroleum Products, Non-ferrous Metals and Other Machinery (all these accounting for Rs 1,079 crores or 60 per cent of the imports in sectors covered in the Table 6) there is a fairly drastic reduction in the import-availability ratios by 1978-79 which are supposed to decline roughly to three-quarters or half their magnitude in 1973-74 and the absolute level of imports in these sectors in 1978-79 is estimated to be Rs 1,030 crores or a shade *less* than their corresponding level in 1973-74. Out of these steep reductions in the import-availability ratio, only one appears justified. In view of the upward bias in the estimation of import-requirements of Other Machinery in 1973-74 that we have already noted, a steep reduction in the import-availability ratio by 1978-79 may probably correct the bias. But correspondingly, the import-requirements of the Electrical and Non-Electrical Machinery (not covered in Table 6) may have to be significantly stepped up to correct for the downward bias we have already detected. The import-availability ratio for the Electrical Equipment sector is estimated at a low level of 0.0433 for 1973-74 and it gets further reduced to 0.0288 in 1978-79 as a result of import-substitution assumptions, whereas the ratio for the Transport Equipment sectors declined from a negligible level of 0.0227 in 1973-74 to 0.0134 in 1978-79. For Iron and Steel, we have already mentioned the possible underestimation in the competing import-requirements and this results in a low import-availability ratio of 0.1056 in 1973-74 and it does not change in 1978-79. For the remaining sectors, the import-availability ratios are estimated between 5 and 10 per cent in 1973-74 and are postulated to decline only slightly in 1978-79.

To recapitulate, in the foregoing analysis we have presented direct as well as indirect evidence which suggests that the estimated import-structure for 1973-74 that results from the numerical specifications of the M_1 and M_2 matrices shows significant deviations with respect to the realised import-structure in the recent past. In particular it exhibits a pronounced downward bias in the estimation of import-requirements of raw materials and intermediate products as well as Electrical and Transport Equipment. The only sector where there appears to be a significant overestimation is the heterogeneous sector Other Machinery. The anticipated import-availability ratios estimated for 1973-74 directly reflect these downward biases. To the extent that the import-substitution assumptions bring about a further significant reduction in these ratios, this would clearly imply a further accentuation of the already existing biases. The drastic nature of the import-substitution assumptions is brought out by the fact that the aggregate imports (including current transfers and non-factor services) which are estimated to increase by 41 per cent over the 5-year period in the absence of import-substitution, are postulated to increase only by 19 per cent with import-substitution and by 17 per cent with both import-substitution and redistribution.[14] The original outcome without import-substitution being far removed from the realised experience in the recent past, the connections the final outcome with import-substitution would have with the realised experience and actual feasibility would be anybody's guess. The empirical basis of the economic feasibility of self-reliance brought out by the model is shaky indeed as it is founded in assumptions accentuating the already existing pronounced downward biases in estimating the import-requirements, besides a high 7.00 per cent growth rate of exports.

RELATIONSHIP BETWEEN GROWTH STRATEGY AND REDISTRIBUTION

The final striking conclusion of the model is claimed to result from the insensitivity of sectoral growth rates of core sector output to the specification of the inequality parameter. This implies that the basic growth strategy that depends on the core sectors turns out *empirically* to be *functionally independent* of the social objective of the removal of poverty. If true, this is indeed very convenient and has far-reaching policy implications. First, this indicates that empirically, there is no conflict between growth and redistribution in the Indian context. Second, the policies required for these social objectives can be pursued independently of each other and a shortfall in the attainment of one objective need not affect the other. It is clear that both these features make the life of an

economic planner immensely comfortable. It is, however, necessary to investigate whether the assumptions from which this result directly follows are indeed appropriate in the Indian context.

After comparing the solutions from the two variants — one without and the other with the postulated redistribution — the Approach document notes that an "important point emerging from the exercise was that the inter-sectoral patterns of growth in the two variants were *broadly similar* at the level of aggregation reflected in 66 x 66 table" (Ch VI, para 16, p 21). Further, the "exercises have shown that, given the pattern of inter-industry relationships and limited patterns of trade and external assistance, *the pattern of growth rates of output in the core sectors* of the economy which provide essential raw materials, capital goods and infrastructural facilities is *almost invariant* with respect to *any alteration* in the inequality parameter, so long as the commodity consumption pattern of every size class remains the same as in 1968-69. With regard to agriculture, core industries and mass consumption goods conclusions are *broadly similar* in both the cases". (Ch VI, para 16, p 21). The Technical Note adds: "While the observations made in the Approach Paper on the sectoral growth rates ... broadly stand, the results presented here would show *some differences* in a few sectors consequent on further scrutiny of the results. However, all these changes do *not* affect any of the *qualitative aspects* of the growth strategy adopted in the Approach document" (p 35; emphases added in all the quotations).

These extensive quotations indicate that the growth rates of "core sectors" are "almost invariant" to the specification of the inequality parameter given the pattern of inter-industry relationships, limited possibilities of trade and external assistance and the commodity consumption pattern. Presumably, these given factors are responsible for the invariance phenomenon. It may be noted that these conclusions are derived from the comparisons of average annual growth rates over the five-year period between the two variants. Now when a growth rate over five years is reduced to an average annual term, it tends to blunt the differences in the original growth rates. Moreover, the invariance is based on the implicit assumption of a uniform and equal weight attached to differentials in growth rates in all the sectors. In other words, an x per cent differential in the average annual growth rate in foodgrains (sector 1) carries the same weight or relative importance as an x per cent differential in any other sector, say, ball-bearings (sector 39), nuts, bolts, etc (sector 36) or aircraft (sector 55).

Table 7 presents the average annual growth rates in the two cases: variant without redistribution (3C) and with the postulated redistribution (3D) also the differential between the two.

The Approach document (Ch VI, para 15, p 21) mentions that for 10 sectors, the preferred variant shows a higher growth rate by 0.1 percentage point, for 29 other sectors, it is lower by 0.1 percentage point or more whereas, by implication, for the remaining 27 sectors, the growth rates differed by less than 0.1 percentage point in either direction. Table 7 indicates that only for 10 sectors the growth rates differ by 0.1 percentage points and even if we widen the bound to 0.25 percentage points in either direction, the number of sectors does not exceed 20. 16 sectors (as compared to 10 mentioned in the Approach) register an increase in growth rates exceeding 0.25 percentage points. For 18 sectors (as compared to 5 mentioned in the Approach) the growth rates in the two variants exceeded by more than 1 percentage points in either direction. Out of 47 sectors that register a decline in growth rate in the preferred variant, only for 8 sectors was the decline less than 0.1 percentage point. It appears, therefore, that the "further scrutiny" in the Technical Note results not just in "some difference" as claimed there but fairly substantial differences. For agriculture, the growth rates in the preferred variant are 0.85 percentage points higher which would make a difference of 4 per cent over the five-year period. Since one percentage point difference in the production of foodgrains amounts to over one million tonnes, the growth rates emerging from the two variants for foodgrains can certainly not be called "broadly similar". The sectoral composition of the "mass consumption goods" whose growth rates are claimed to be "broadly similar" does not appear in the Approach document. If we take them to cover sugar and gur (sector 11, whose growth rate, i e, up by 1.49 percentage points in the preferred variant), vegetable oils (sector 12, up by 0.80 percentage points), cotton textiles (sector 15, up by 0.51 percentage points), the conclusion does not

Notes: (C) refers to the variant without any change in the level of inequality.
(D) refers to the "preferred" variant with the postulated change in the level of inequality.
Figures in columns (2) to (4) and (7) to (9) are in rupees at 1971-72 market prices.

Source: Calculated from data supplied in the Technical Note.

seem to hold.

For some 14 sectors covering various "luxury" commodities, the growth rates are justifiably lower by one percentage point or more in the preferred variant. This confirms the statement in the Approach document (Ch VI, para 16, p 21) that "In respect of luxury consumption sectors ... the preferred variant implies rigorous curbs on their growth". However, it is interesting to note that redistribution pushes up the growth rate by about 2 percentage points per annum in the sector "Other Industries" (no 60) covering "jewellery, mints, musical instruments, pens and pencils, fountain pens, button making, ice, celluloid articles, brooms and brushes, games and sports goods, toy-making, bone and ivory products, slates and other miscellaneous industry products" (Technical Note, Annexure II, p 54). This is just another reflection of the biases in the consumption proportions introduced in the process of making adjustments for trade and transport margins and for 1971-72 prices which violate the principle of minimal adjustment to data that we have mentioned at the beginning of this section.

Coming finally to the core sector industries, the sectoral classification of these industries does not appear in the Approach document or in the Technical Note. From the sectoral classification, the following sectors can be taken to include the core sectors (with sector numbers in the brackets):

Group I: Those producing essential raw materials: coal (6), crude oil (9), fertilisers (23), inorganic heavy chemicals (24), organic heavy chemicals (25), other chemicals (29), cement (31), iron and steel (34), non-ferrous metals (35), bolts, nuts, etc (36) and metal containers (37).

Group II: Those producing capital goods: sectors 39 to 57 (with the exception of 49, namely, radio) covering sectors producing electrical, non-electrical and transport equipment.

Group III: Those providing infrastructural facilities: electricity (62), construction (63), railways (64), other transport (65) and other services (66).

For all the sectors in group I, the differential in the average annual growth rates exceeds 0.2 percentage points (in either direction) and for at least three it is significant in a positive direction, *viz*, for coal (2.56 percentage points), fertilisers (0.94 percentage points) and organic heavy chemicals (0.60 percentage points). For coal, the differential is extremely implausible and may reflect the biases in the inter-industry coefficients.

For most of the 18 sectors appearing in group II, the differential appears to be negligible in the range of 0.3 percentage points in either direction.

For the sectors in group III, the differential is in the negative direction (except for electricity) ranging between 0.39 and 0.87 percentage points.

Thus, if we accept 0.3 percentage point difference as a plausible cut-off point, for four sectors in group I (including iron and steel and non-ferrous metals) and most of the industries in group II, the invariance phenomenon appears to hold. These sectors constitute what may be called investment goods sectors since their output basically determines the quantum of real fixed investment excluding construction. Prospects for long-term growth depend on the rate of output of these sectors and hence the "growth strategy" itself. It is the rates of growth of output of these industries that appear to be invariant to the specification of the inequality parameter and this explains the sense in which basic growth strategy and redistribution can be termed to be functionally independent. We have already indicated the convenience of this feature in the planning process.

The crucial question is under what conditions the phenomenon of invariance of the growth strategy to the specification of redistribution can be expected to hold. The existing input-output tables for the Indian economy suggest that the investment goods sectors have quantitatively insignificant direct and indirect current account inter-industry linkages with other consumer goods sectors and especially those sectors like foodgrains that are important from the point of view of redistribution. This is the near block-angular structure that has been noted in particular by Manne and Rudra [(1965), section 1.4, pp 63-65]. The input-output matrix constructed by the Planning Commission possesses this characteristic. Next, notice the structure of the final demand vector. The aggregate quantum and the composition of investment by sector of origin is completely exogenously specified by the growth objective and remains

INDUSTRIAL UNREST IN THE LIC:

FACTS YOU SHOULD KNOW

An appeal to the LIC employees

Millions of newspaper readers and listeners of All India Radio must have wondered during the last two months about the reports of the continuous agitation for higher wages by Class III & IV employees of LIC.

Let us first consider the justification, if any, for this unrest in the face of the management's sincere attempts to settle matters amicably. And secondly, the final offer made on 28th December 1973, involving an additional outlay of Rs 6 crores per annum. Both these points should be examined in the light of (i) LIC's capacity to pay (ii) Wages in outside employment (iii) LIC's obligation to the policy holders and the community.

What does the employee gain?

Under the new offer, there's a gain of Rs 68 to Rs 87 for peons and Rs 95 to Rs 154 for clerical assistants. Here are the improvements proposed for the peons, clerical assistants and Superintendents.

Category	Remuneration as per the existing scales (inclusive of bonus component) per month		Remuneration as per the offer (inclusive of bonus component) per month	
	Min	Max	Min	Max
Peons	336	575	404	726
Clerical Assistants	419	1174	514	1447
Superintendents	785	1723	933	2033

The other components of the offer:
The offer also contains a generous provision for Bonus.

	Minimum	Maximum
Peons	increase from 340 to 571	increase from 600 to 975
Clerical Assistants	increase from 424 to 730	increase from 1248 to 2003

On an average every employee will benefit by Rs 115 per month.

What's more under the new scales a new recruit in the peon's category will get Rs 390 per month while the clerical assistant will start with Rs . 467 per month.

Capacity to pay :

While the major union in the LIC has flatly rejected these generous terms, there has been no constructive response from the other 4 unions.

The reason? They argue that LIC's capacity to pay has grown enormously due to the increase in new business and renewal premium income. All this is very true. But these growth factors cannot be considered in isolation. They must be examined in relation to both the wage bill and the returns to the policy holders.

During the period between 1957 and 1973, the wage bill has moved up from Rs 9.16 crores to Rs 58.04 crores, showing an increase of 534 per cent. As against this new business increased by 514 per cent and renewal premium by 452 per cent only. It is clear from this that the wages have increased faster than both, the renewal premium and new business. However, LIC has not succeeded either in reducing the premium rates for policy holders or significantly increasing the rate of bonus.

Why not a second look?

Instead of considering the offer on its merits, inter-union rivalry has led to the escalation of the agitation in the form of work-to-rule, go-slows, strikes, holding of meetings and demonstrations within the office premises during office hours. All these have brought the working of the LIC to a grinding halt in some of the Divisions. This has rendered it difficult to give any service to the existing policy holders and provide life insurance protection to the public.

Let wiser counsel prevail.

The employees' current methods cannot improve LIC's capacity to meet their demands. In fact, LIC could only agree to the additional outlay of Rs 6 crores per annum in the hope that it would secure industrial peace and this in turn would increase productivity and profitability. Only if the latter condition was fulfilled, could LIC absorb the additional burden. If, however, the agitation continues, it may even compel LIC to review its position in order to protect the interests of the policy holders.

Lastly

LIC appeals to all its employees to give up the agitational approach. Instead, LIC would like its employees to realise their responsibilities and turn to constitutional methods. It is worthwhile remembering that while life insurance provides its employees sustenance in a relatively generous measure, it also provides to people at large an essential measure of financial security for the future. And at the same time, it secures much needed funds for the economic development of the country.

Notes: See Notes to Table 8.

rigidly fixed between the two variants without and with the postulated redistribution. The only component that changes between the two variants is the composition of the private consumption expenditure which does not make any significant direct demands on the investment goods sectors. When these features of the final demand vector are combined with the near block-angular structure of the input-output co-efficient matrix in a static input-output framework, it is very clear that the invariance phenomenon between the basic growth strategy and the specification of inequality is a direct consequence. In fact, Manne and Rudra (1965) have shown this type of a phenomenon in a different context to hold in a more general single-period framework incorporating inter-connections through capital account deliveries between the final demand and the gross output vectors *via* the specification of the capital-co-efficient matrix (see in particular, sections 1.7.2-4, p 70). Keeping the level of inequality and the exogenously specified level of gross fixed capital formation unchanged, they increase the household consumption from Rs 17,900 crores (in case 1AB) to Rs 21,400 crores (case A). Predictably, the output of investment goods sectors (covering all types of machinery and iron and steel) turns out to be roughly invariant between the two cases 1A and 1AB, whereas the output of foodgrains and cotton and other textiles turns out to be higher in case 1A than in 1AB (see Table 10, p 76). Even here the invariance is much less sharp when the aggregate quantum of investment and its composition as well as sectoral allocation is made semi-endogenous in a full-fledged single period open-loop framework.

The foregoing analysis indicates that the invariance of the average annual growth rates of investment goods sectors to the specification of changes in inequality is a direct consequence of the near block-angular structure of the input-output matrix combined with the static input-output framework. The result tends to weaken in a more general single period though open-loop framework when the interconnections through the capital account deliveries are introduced. The present author (1968), using the input-output matrix developed by Manne and Rudra with slight modifications, found in a series of illustrative exercises based on a closed-loop framework that the growth rates of even the investment goods sectors tend to be sensitive to different specifications of saving rates of wage and non-wage income-earners even though the consumption patterns of the two types of income-earners are assumed (implausibly) to be homogeneous. In fact, the invariance phenomenon may not be expected to hold in a closed-loop framework (a) when the marginal savings rates of different sections of the population are not the same even though the sectoral capital co-efficients may be identical and (b) when the sectoral capital co-efficients differ even with the same marginal savings rates for the entire population. The result would be reinforced when both (a) and (b) are in operation so long as the capital intensities, and the associated marginal savings rates may be expected to be correlated with each other. Hence the conclusions drawn from the invariance of the basic growth strategy to the specification of the inequality parameter are a direct consequence of the restrictive framework of the model adopted by the Planning Commission. As we have argued in detail in section III, this framework does not take into account the constraints imposed by the socio-political environment of democracy and the institutional framework of a mixed economy, and hence is inappropriate especially in the Indian context. Moreover, as discussed in section IV, the rigidities in the specification of the model even within the given framework make it incapable of investigating the interrelationships between growth and redistribution. We may thus conclude from the foregoing discussion that the inferences drawn from the invariance phenomenon are certainly not warranted nor are they likely to hold in an institutionally more appropriate closed-loop framework.

VI

Redistributive Planning and the Problems of Policy-Frame

While considering the problems of a consistent and co-ordinated policy-frame, the constraints imposed by the socio-political environment and the institutional framework of a mixed economy have to be kept in the forefront. Here, the crucial consideration is whether the government (dominated naturally by the political party in power) is willing to accept the consequences of acting as an agent of desirable social and economic change independently of

the existing dominant interest groups. Wherever it is capable of acting independently, the socio-political feasibility of certain socially desirable but politically unpalatable measures can be assured. When it tends to choose politically 'soft' options, it fails to act independently and the socio-political infeasibility of a given policy measure makes it a non-starter. This consideration is very crucial when redistribution is an explicit social objective which, by its very nature, involves sacrifices on the part of the existing dominant interests in favour of the weaker sections of the society. In this context, we may especially note the dangers of not working out a policy-frame simultaneously with the quantification of social objectives that takes place through the exercises based on a planning model. First, if the institutional specification of the model (discussed in section II) is inappropriate to the planning problems of a mixed economy and is suited strictly to a centrally planned economy with public ownership of the means of production, it is quite clear that a feasible policy-frame may just not exist to back up the quantification of social objectives. This is mainly because the requirements of the control over the direction and composition of economic activity implicit in an inappropriate institutional specification may not in fact exist in a mixed economy. Secondly, an informed political choice of the socio-politically feasible course of action among the alternatives can only be made at a concrete programme level where the consequences of each alternative become explicit. If the quantification of social objectives is carried out without spelling out in concrete terms the consequences in the form of a policy-mix required to attain the prespecified levels of social goals, it is very likely that the crucial parts of the policy-frame may turn out to be socio-politically infeasible if an attempt is made to work them out *ex post facto*, as is postulated in the Approach document. Finally, the most dangerous aspect of this feature is that the quantification of social objectives in the absence of its policy consequences may turn out to be politically appealing at the slogan level and, being trapped in the slogans, its half-hearted implementation after being aware of its concrete consequences, may turn out to be worse for the attainment of the social objective than the original situation. Given the socio-political feasibility, the operation of the policy-frame itself will be subject to the constraints imposed by the administrative, organisational and financial resources at the disposal of the government.

The social objective of redistribution for the removal of poverty requires strict control over the composition as well as the organisation of economic activity. In a mixed economy, this, in turn, requires effective controls especially over the private economic activity covering production, distribution and consumption of goods and services. It may be instructive to review briefly the Indian experience over the last two decades in this context as a background. Here we draw on the two perceptive analyses of the Indian situation made by two of our prominent economists. Gadgil (1967), in his assessment, concludes:

> "In short, where the Government of India directly undertakes large programmes of public expenditure, it succeeds best. It fails to the extent that the planned use of resources lies in other hands, especially where it is a matter of detailed multi-directional operations, or where the long term policy is needed to obtain results". Therefore, "in the aggregate the eeconomy operates as almost a *laissez-faire* economy, in part modified by the operation of particular controls. It also means that where the particular measure is in line with trends set in motion by *laissez-faire* operation the trend is accentuated; on the other hand, where it seeks to counter such a trend it is usually powerless." [Gadgil (1972), p 365-66].

K N Raj (1969), in his analysis of the Indian planning experience, provides an explanation of the recent drying up of financial resources for the public sector investment (which, as Gadgil noted, is the area where the government's controllability has been at its best). In his view, the inability of the government to control the distribution of private income and wealth and the pattern of private consumption and investment that results from it, led to non-plan investments in the private sector. This created a scarcity of funds for public investments. In this situation, the government opted for a soft option of dependence on foreign aid. Since foreign assistance was available during the Second and Third Plan periods, the resource-drying-up was not felt acutely. However, in recent years, with a sharp reduction in foreign assistance combined with the inability of the public sector enterprises to generate surpluses and a steep rise in the current expenditure of the government, public sector investment had been fairly stagnant in real terms. The part of the private sector investment that is sustained by virtue of its complementarity with the public sector investment has also consequently experienced stagnation.

The conclusion that emerges from these two analyses is that the controllability of the government over the private economic activity has been ineffective. The rate as well as the pattern of growth of this sector that looms large in a mixed economy have never closely conformed to those postulated in the plans. It is important to emphasise this phenomenon in order to highlight the nature of constraints imposed on a feasible policy-frame by the existing system of working of the economy. It is in the light of the foregoing considerations that we wish to discuss the single most important area of the Fifth Plan, *viz*, the redistributive programme for the removal of poverty which is the primary objective of the plan.

Removal of poverty has been accepted as one of the major objectives of the Fifth Plan. In pursuance of this, a redistribution exercise has been carried out in a static input-output framework and reported in the Technical Note and the Approach document. In one variant [denoted by (C)] the level of inequality in 1973-74 and in 1978-79 is assumed to remain the same as in 1968-69 in specifiying the sectoral levels of aggregate private consumer expenditure. This exercise yielded a solution in which the bottom 30 per cent of the population increased their average per capita monthly total expenditure at 1971-72 prices from Rs 22.90 in 1973-74 to Rs 26.33 in the rural areas and from Rs 25.17 in 1973-74 to Rs 28.44 in the urban areas. These levels fall far short of the desirable minimum consumption level that has been worked out to Rs 36.64 in the rural and Rs 39.64 in the urban sector. Since the aggregate growth rate has been estimated at the ceiling level and hence cannot be increased, redistribution becomes inevitable. In the alternative (the so-called "preferred") variant [denoted by (D)], the level of aggregate private consumer expenditure as derived in variant (C) is assumed to be redistributed in such a way that average per capita monthly total expenditure of the bottom 30 per cent of the population is brought to the desired minimum level in both the urban and rural sectors. This implies an increase over the Fifth Plan period of "60 per cent for the rural poor and 50 per cent for the urban poor. The *sharp* levelling up of the poor involved *some* levelling down of the rich. The monthly per capita consumption of the richest 30 per cent of the population was estimated to decline, over the Fifth Plan period, from Rs 84.42 to Rs 80.38 *in the case of the rural rich and from* Rs 113.21 to Rs 108.07 in the case of the urban rich" (the Approach, Ch VI, para 9, p 18, emphasis added). It is further observed that the "envisaged decline in the average per capita consumption level of the richest 30 per cent of the population *cannot be described as an overly drastic one*" (para 10, p 18, emphasis added). The consistent levels of sectoral gross output are worked out under each variant in a static input-output framework. It may be noted that this type of exercise had been carried out by the Perspective Planning Division (1962) and by Srinivasan Saluja and Sabherwal (1965) in a more general single period open-loop framework. The full implications of the exercise carried out by the Planning Commission has not been brought out either in the Approach document or in the Technical Note. Tables 8 and 9 attempt this task for the 12 fractile groups of the rural and the urban population.

TABLE 10: IMPLICATIONS OF REDISTRIBUTION FOR THE UPPER 30 PER CENT OF THE POPULATION: SUMMARY

(per cent)

Fractile Group	Rural		Urban		All India Total Contribution
	Reduction in Per Capita Total Expenditure	Total Contribution for Redistribution	Reduction in Per Capita Total Expenditure	Total Contribution for Redistribution	
(1)	(2)	(3)	(4)	(5)	(6)
Between 70 and 80	5	7	3	4	7
Between 80 and 90	13	22	10	20	21
Between 90 and 95	20	22	18	22	22
Between 95 and 100	31	49	29	54	50

Source: Columns (6) and (13) of Tables 8 and 9.

First, notice that, in terms of the familiar concentration ratio, the postulated redistribution implies a steep reduction of 38 per cent from 0.31 in 1973-74 to 0.19 in 1978-79 for the rural population, of 32 per cent from 0.35 in 1973-74 to 0.24 in 1978-79 for the urban population, and of 36 per cent from 0.32 in 1973-74 to 0.20 in 1978-79 for the rural and the urban populations together. Historically, the concentration ratio *at current prices* declined from an average of 0.34 over the First Plan period to 0.33 over the Second Plan period and to 0.30 over the Third Plan for the rural population. The corresponding reductions for the urban population are 0.38 (First Plan), 0.37 (Second Plan) and 0.36 (Third Plan).[15] At constant prices the extent of reduction may probably be less than at current prices. With this background, the postulated reduction in the preferred variant over just five years is certainly massive by any standards.

Second, even after the bottom 30 per cent of the population is enabled to enjoy an *average* consumption level satisfying a desirable minimum, 15 per cent of the population or 86.4 million persons would still remain below the poverty line. Technically, this is just a trivial consequence of the assumption of lognormality. But it is important to emphasise that even the quantification of the "preferred" variant does not completely "do away with poverty in terms of the Plan objective" as claimed in the Approach document (Ch VI, *para 9, p 18*). *This has obvious* socio-political implications when the quantification is adopted as an operationalisation of the political slogan of the eradication of poverty.

Thirdly, when the overall per capita expenditure is postulated to grow over the 5-year period by 15 per cent for the rural population and 13 per cent for the urban population, the per capita total expenditure of the 8th decile (between 70 and 80 per cent fractile group) is expected to grow by 9 per cent, that of 9th decile, is supposed to be frozen at the 1973-74 level, that of the next 5 per cent of the population, is required to *decline* by 7 to 8 per cent whereas for the top 5 per cent of the population the required reduction works out to 20 per cent as compared to their estimated *realised* level in 1973-74 [See column (5) in Tables 8 and 9].

In the previous paragraph we have presented the combined effect of growth and redistribution by taking the net effect over a 5-year period. This net effect can, *in turn*, be *decomposed* into two components, *viz*, (i) that due to redistribution after growth has been achieved as in the non-preferred variant and (ii) that due purely to growth in the absence of redistribution. This decomposition is crucially important for at least two reasons. First, the policy measures to pursue the growth objective are relatively easy to devise in a mixed economy as they do not involve going sharply against the operation of the market forces. This cannot be said about the policy measures to pursue redistribution. Secondly, the socio-political consequences of redistribution can be put in a sharp focus when the question is posed in terms of countering the operation of the natural and the dominant forces in the process of growth in favour of redistribution. This serves to highlight the importance of politically "hard" policy options and their socio-political feasibility. This decomposition is presented in terms of per capita annual total expenditure in absolute terms in columns (7) to (9) and in percentage terms in columns (10) to (12) in Table 8 for the rural population and Table 9 for the urban population. For lack of space, we confine our attention to only a few salient and broad features. An interested reader may get additional insights by analysing these Tables in more detail.

Notice that pure redistribution seeks to bring about a reduction in the *per capita* annual expenditure of the rural population *ranging from* Rs 586 for the top 5 per cent to Rs 43 for the 8th decile or between 36 per cent (top 5 per cent) and 23 per cent (next 5 per cent) to 14 per cent (9th decile) and 6 per cent (8th decile) [Table 8, columns (7) and (10)]. For the urban population the postulated reduction ranges between Rs 771 (top 5 per cent) and Rs 33 (8th decile) in absolute terms and between 33 per cent (top 5 per cent), 20 per cent (next 5 per cent) and 12 per cent (9th decile) and 4 per cent (8th decile). Thus, *in proportionate* terms, the declines are steeper for the rural population than for the urban population. We may note that these declines have been worked out under the assumption that the urban-rural differential in per capita consumer expenditure is reduced from 1.36 in 1968-69 to 1.238 in 1978-79 which implies that the growth of per capita total expenditures of the urban population would have to be curbed through

the taxation and other measures much more stringently than that of the rural population. The redistribution exercise, on the other hand, implies stiffer curbs on the growth of the rural per capita total expenditure than for the rural population. These are mutually neutralising forces.

Finally, the aggregate financial implications of redistribution are indicated in column (13) of Table 8 (rural) and Table 9 (urban). The total sacrifice on the part of the upper 30 per cent of the population amounts to Rs 3,936 crores or roughly 9 per cent of the aggregate private consumer expenditure. Out of this total, Rs 2,936 crores or roughly three-fourths are postulated from the rural population and the remaining Rs 962 crores from the urban population. The fractile group-wise proportionate contribution to this sacrifice is summarised in Table 10 along with the postulated reduction in per capita total expenditure as compared to a situation without redistribution. From this Table, it is clear that the incidence of redistribution is expected to be borne mainly by the upper 20 per cent of the population and more so by the rural elite than their urban counterpart. The political importance of these sections of the population in the Indian context needs no special emphasis. They represent socially and politically dominant interests and it is futile to expect that they can be *induced voluntarily* to give up the fruits of the growth process. The crucial problems in the socio-political feasibility of the postulated level of redistribution become clear at this stage. When we turn to the choice of policy measures, on the basis of past experience, the picture becomes even more transparent. In view of the various concessions the farm lobby has been able to extract in the last few years and the dismal fate which the proposals of agricultural income and wealth tax have met, it appears well-nigh impossible to think of effective policy measures to curb the consumer expenditure (or income) of the rural elite. When it comes to the urban population that is covered extensively under the taxation net, the problems are no less though their contribution to total sacrifice comes to no more than 25 per cent. Evasion of direct and indirect taxes is known to be rampant. This along with the existing operation of a large multiplicity of direct controls and the current system of financing elections has led to the creation of unaccounted money in the large way that makes a mockery of the existing fiscal system and casts serious doubts on the government's ability to check the consumption of the well-to-do sections.

The Approach document after admitting that "purely fiscal devices are unlikely to make a substantial impact on the existing income differentials at the accrual stage" boldly maintains that "In the case of well-to-do sections, it is not the accrual of incomes that has to be controlled, provided that income is earned from legitimate sources (*sic*) as the disposition of accrued incomes" for which fiscal devices seem to be the only available policy instruments. In the same breath, it also proclaims that the "production pattern *must* be controlled in such a manner that inessential but expensive articles of consumption are not made available in the present stage of development" (Ch VI, para 11, pp 18-19). In view of the constraints imposed by the socio-political environment and the institutional framework of a mixed economy, one indeed awaits with eagerness for the policy frame that is promised in the final plan document for new socio-politically feasible policy measures to check effectively the consumption pattern of the upper 20 per cent of the population as also the composition of the output-mix in the private sector.

It appears that so long as the government's ability to make a significant dent on the size distribution of private wealth and means of production is limited in a mixed economy, its ability to check the accrual of private incomes as well as its disposition is at best indirect and mainly through fiscal devices. The effectiveness of the fiscal devices is corroded by the existence of direct controls and the corruption they have introduced as also by the irrational motley of exemptions brought into being by the socio-political pressures to soften the incidence of fiscal measures on the dominant interest groups. With this background, prospects of generating the resources for redistribution from the upper 20 per cent of the population appear bleak indeed. If this is in fact the case, the redistribution exercise is a non-starter. But granting for the moment that this is not the case, what policy measures are visualised to effect the transfer of resources to the bottom 30 per cent of the population? The following are listed in the Approach document:

(a) substantial additional opportunities for wage-employment in the non-agricultural sectors (pp 3-4),
(b) expanded, fuller and more productive self-employment opportunities in the agriculture, cottage industry, and road transport, trade and service sectors (p 4),
(c) land-reform measures (p 5),
(d) preventing indiscriminate mechanisation in agriculture (p 5),
(e) rural works programmes (p 6),
(f) special programmes such as SFDA and MFAL projects, crash schemes for rural unemployment and drought prone-areas programmes (p 6),
(g) national programme for minimum needs (Ch IV).

Of these programmes (a) and large parts of (b) are very much a function of general economic growth and not specifically designed for the poor. However, admittedly the possibilities of creating substantial additional wage employment "in the organised sector of the economy appear to be rather limited" (para 4, p 4). Recourse is then taken to construction and service sectors which have all along been the absorbers of surplus wage labour.

In the context of rural self-employment especially in Khadi and Village industries, a recent publication of Khadi and Village Industries Commission (1972a, pp 51-52) indicates that full-time as well as part-time employment provided by Khadi, after reaching a peak of 19 lakhs in 1965-66 dwindled to 9 lakhs (8 lakhs part-time and 1 lakh full-time workers) in 1970-71 whereas in village industries, the employment has increased very slowly from 8.75 lakh workers in 1965-66 to 10 lakh (1 lakh full-time and 9 lakh part-time) workers in 1970-71. In fact, their annual report (1972b) for 1970-71 presents the trends in physical production from 1956-57 to 1970-71 for some 18 commodities. Excepting for some 8 industries accounting for 2 lakh workers in 1970-71 for the production of the remaining industries (including Khadi), there appears a distinct decelerating tendency. The reasons for this are not clear but this phenomenon appears to be disconcerting from the point of view of creating additional employment opportunities of self-employment [see also Dantwala (1973) pp 46-51 in this context].

So far as rural unemployment mainly connected with agriculture is concerned, Raj Krishna in his perceptive analysis has clearly indicated that "the elimination of poverty is a much more gigantic undertaking than the elimination of the idleness of those who are available for work" and then he provides an operational classification of the poor requiring different policy treatments: the unemployables need income transfers incorporated in social insurance schemes, the self-employed (small farmers and artisans) need additional inputs, credit and knowledge: the employed need more effective unionism and the unemployed need work and/or means of production. [See Krishna (1973), p 6].[17] Prospects for these depend crucially on the institutional arrangements.

Coming to land reform measures, Minhas (1970) separating "realistic radicalism" from "political demagogy" reached the conclusion "By itself, a radical redistribution policy ... would not be able to solve the problem of poverty". Even within the limits in which land reforms could make a limited impact on poverty, their acceptance at the slogan level with a half-hearted implementation due to socio-political infeasibilities involved resulted largely in the eviction of small tenants, insecurity of tenure where it still persists, and the splitting of large ownership holdings among individual family members. Whatever little surplus land that has been available for redistribution, political contacts rather than poverty seems to be the criterion in allocation.[18] Actually, land reform measures provide an excellent example of a measure that was invoked in the name of the poor but its tardy implementation has left the poor possibly in worse situation than they were in its absence. With this record, it is either utter naivete or wilful ignorance of fact on the part of the Planning Commission to mention that "emphasis has been laid on land reform measures as a matter of high priority" (para 9, p 5). In either case, it is indefensible.

Preventing indiscriminate mechanisation in agriculture appears to be possible through credit and pricing policies, especially in the case of capital-intensive items like tractors. However, tractors act mainly as a substitute for drought animals and not labour. Relatively less capital intensive but more labour displacing items like mechanical harvestors would present problems as their production appears to be predominantly in the small-scale sector exempted from the indirect tax net.

After a long experience with the rural works programme every evaluation report has been narrating the same story for the last 15 years: lack of competent, non-power seeking rural leadership, red tape, audit obduracy, lack of interdepartmental co-ordination, if not active non-co-operation, bureaucratic ineptitude, lack of knowledge of local conditions, absence of prior survey and preparatory work. "Perhaps a report can be written even prior to the evaluation and the subsequent field investigations can be guaranteed to confirm it" [Dantwala (1973), p 44]. Even if some of these features can be corrected, we still "do not know how to integrate the rural works programme with the requirements of time, place, skill, aptitude, motivation and the social constraints of the excluded" (1972), p 2463. See also Krishna (1973, p 21).

The evaluation of the special schemes such as SFDA, MFAL and others has indicated that besides being very limited in their coverage their performance has not at all been satisfactory, the main reason for their failure being their routing through the existing rural institutions which act as "instruments in the hands of the power groups" [Jodha (1973), p 635. See also Planning Commission (1973b) and Dantwala (1973), pp 51-58, Rao and Acharlu (1972) in this context.]

So far as the minimum needs programme is concerned, it is as yet on paper and its evaluation is not possible at this stage.

The foregoing discussion suggests that the failure of the various measures for the removal of poverty has been basically due to two factors. First, the socio-political infeasibility of certain measures made them effectively non-starters. Second, even within the socio-political feasibility constraints, the measures which were sought to be routed through the existing institutional arrangements, the fact that the overwhelming part of the existing social, political, economic and administrative institutions favour the dominant interests and are biased against the weaker sections of the society led to their failure. There is considerable need for hard thinking on both these factors although the first factor as we have observed at the beginning of this section, is fundamentally a function of whether the political party in power can act independently of the existing dominant interests in the society.

As regards institutional arrangements, Raj Krishna (1973, p 20) cites two requirements of the success of a massive works programme: "a radical restructuring of the district development administration" with "strong and well-staffed Project Formulation Bureaus ... to prepare shelves of technically and economically sound projects"[19] and "the organisation of the unemployed, the landless, the crop-sharers and insecure tenants into militant unions to prevent the benefits to be pocketed by contractors, rich farmers, and petty bureaucrats through whom they are channelled". We may only comment briefly on the suggestion for unionisation. Successful unionisation requires two prerequisites: first, a holding capacity of the members and second, the homogeneity of interests. On both the counts Raj Krishna's suggestion appears to meet with many difficulties, though we agree with its desirability. The difficulties are compounded by the fact that at present in the prosperous agricultural tracts in the North and East, there are tensions between the local agricultural labourers and the labourers migrating from the backward regions in search of work.

Dantwala (1973) after carefully considering the various alternatives, concludes: "What is suggested is not abandonment of political action, but a deliberate tolerance of a countervailing force, not merely at a political level (parliamentary opposition) or a semi-political level (trade unions, co-operatives, etc) but also at the level of the people in the form of voluntary organisations" (p 62). He makes a strong argument for "an agreed policy of revival and reorientation of constructive work, entrusting it to voluntary agencies and giving them the financial, administrative and the technical support they may need, without impairing their autonomy" (p 64).

These suggestions, important as they are, are still in the nature of groping into unknown regions. The immediate fact is that such institutional arrangements do not exist on a large scale nor can the changes in the existing institutional framework be expected to be drastic over the next five years. To top it all, the important question of the socio-political feasibility still remains. In this situation one tends to agree helplessly with a humorist who wryly said while commenting on the "Economics of poverty and *vice-versa*" that "it is in the nature of the poor to always remain with us". As if realising the futility of the exercises, the Approach document itself provides a classic escape-route for the politicians in the form of a grand conclusion:

> "It follows that even if the reduction of inequality that may actually be achieved during the Fifth Plan period is much less than postulated in the preferred variant, while it will substantially slow down the progress towards the removal of po-

verty, the broad pattern of growth emerging from the preferred variant will not require major modification" (Ch VI, para 15, p 21).

This conclusion is derived from the invariance of the growth rates of output of the investment goods sectors to the specification of the inequality parameter. We have already investigated this phenomenon in detail in the last section and found that this statement is a direct consequence of the near block-angular structure of the input-output co-efficient matrix combined with a static input-output framework. The analytical framework being inappropriate in the Indian context, the above conclusion itself is unwarranted. However, independently of the model, this statement may be taken to be as an indication of the realisation on the part of the Planning Commission about the socio-political infeasibility of the major objective of the Fifth Plan.

VII

Conclusions

After presenting the model adopted by the Planning Commission in section II, we examined in section III, the institutional specification of the model and found it inappropriate in the Indian context. We then analysed in the context of an aggregate inconsistency in the Planning Commission's exercise, the tradeoffs between the accepted social objectives of growth, redistribution and self-reliance. Looked at from another angle, the same tradeoffs would arise if the resource mobilisation assumptions made in the Approach document prove overambitious and their transformation into appropriate composition of investment found difficult due to inadequate controllability over the composition and organisation of the private sector economic activity.

Even within the limitations imposed by the institutional specification adopted by the Planning Commission, we examined in section IV, the usefulness of the model in relation to the light it sheds on each social objective as well as the conflicts and complementarities among them. We reached the conclusion that the analytical rigidities as well as the weaknesses in the specification of different components of the model combined with the absence of well-worked alternatives with reference to redistribution and import substitution have prevented the model from being useful even within the limits imposed by the general static-input-output framework. They were also shown to lead to a situation of illusory paradise though devoid of any realism (by definition) where all the social objectives — growth, redistribution and self-reliance would turn out to be mutually reinforcing!

The numerical results of the model are a direct consequence of the numerical parametric specification whose closeness of approximation to reality provides a basis for judging the economic feasibility of social objectives. We investigated in section V, the empirical basis of the three most striking conclusions emerging from the numerical results. First, a sharp downward bias in the numerical specification of the consumption model was found to be responsible for the conclusion that a massive redistribution could be managed with an average annual 4 per cent growth rate of foodgrains output. The required average annual growth rate turned out to be at least 5 per cent on the basis of the alternative exercises presented there. Second, the parametric specification of the import-structure was found to be clumsy, empirically unstable and containing pronounced downward biases that were accentuated by the drastic import-substitution assumptions. The empirical basis of the feasibility of self-reliance is, therefore, shaky and biased. Thirdly, the claim regarding the invariance of the basic growth strategy to the specification of inequality was then scrutinised. It was found to hold in a restricted sense and was shown to be a direct consequence of the approximately block-angular structure of the input-output co-efficient matrix combined with a static input-output framework. It was then argued that the conclusion was certainly not warranted in an institutionally more appropriate framework.

The problems connected with the development of a co-ordinated policy-frame were discussed specifically with reference to the redistributive objective in section VI. The dangers of the procedure followed in the Approach document, *viz*, adopting a quantification of social objectives without simultaneously working out a policy-frame, were noted. Then the constraints on the policy-frame imposed by the past experience were indicated in the context of the adopted social objectives. In the face of the yawning credibility gap in the recent past between the avowed socialist intentions that remain at a superficial slogan level and the actual practice that is guided by short-term political convenience, any tall talk about 'Garibi Hatao' has become devoid of any substantive content. Besides this aspect of socio-political feasibility, the limited instruments for effecting the mechanism of income transfers and the lack of proper institutional arrangements were found to be the problematic factors that make the adopted level of redistribution infeasible in the light of past experience.

To recapitulate, the planning model underlying the Approach document has been found to be inadequate in its institutional specification (section III) and operationally unsatisfactory (section IV). The empirical basis for the three striking policy-oriented conclusions from it has been found to be a poor approximation to the realised experience in the recent past thereby making suspect their economic feasibility in practice (section V). Because of its inadequate institutional specification and the absence of simultaneously worked-out policy frame, the problems of evolving the policy measures *ex post* were shown to be practically very difficult (section VI).

In the light of these conclusions, it is not at all surprising that considerable dilution in the commitments on self-reliance and removal of poverty has appeared in the Draft Plan, although certain exogenous factors have been held responsible especially for throwing overboard the objective of self-reliance. Our analysis indicates that even in the absence of these exogenous factors, the pronounced biases in the numerical parametric specification, the inappropriate institutional specification of the model and the socio-political infeasibilities involved in working out the policy-frame *ex post facto* for the redistributive objective would have led to the same result. We would elaborate on this in a later paper.

Annexure

SECTORAL CLASSIFICATION FOR THE INPUT-OUTPUT TABLE

Sector No	Name of Sector
1	foodgrains
2	other agriculure
3	animal husbandry
4	plantation
5	forestry
6	coal
7	misc coal and misc petroleum products
8	iron orc
9	crude oil
10	other minerals
11	sugar and gur
12	vegetable oils
13	tea and coffee
14	other food products
15	cotton textiles
16	jute textiles
17	other textiles
18	miscellaneous textile products
19	wood products
20	paper and paper products
21	leather and leather products
22	rubber products
23	fertilisers
24	inorganic heavy chemicals
25	organic heavy chemicals
26	plastics
27	cosmetics and drugs
28	man-made fibre
29	other chemicals
30	petroleum
31	cement
32	refractories
33	other non-metallic mineral products
34	iron and steel
35	non-ferrous metals
36	bolts, nuts, etc.
37	metal containers
38	other metal products
39	ball-bearings
40	office and domestic equipment
41	agricultural equipment
42	machine tools
43	other machinery
44	electric motors
45	electric wires
46	electronics
47	batteries
48	electric household goods
49	radio
50	telephone and telegraph equipment
51	other electricals
52	motor cycles and bicycles
53	motor vehicles
54	ships and boats
55	aircraft
56	railway equipment
57	other transport equipment
58	watches and clocks
59	miscellaneous scientific and industrial instruments
60	other industries
61	printing
62	electricity
63	construction
64	railways
65	other transport
66	other services

Notes

[This is a shorter version of a more technical paper (see Tendulkar (1973)) that was presented to a seminar at the Indian Statistical Institute, New Delhi, on November 28, 1973. I am indebted to my colleagues Pranab Bardhan, V K Chetty, D Dasgupta, P Mallela, Kirit Parikh and especially T N Srinivasan for detailed comments and criticisms and to R N Kar for competent assistance. Ashok Rudra gave valuable suggestions for the present version. I am also grateful to S Chakravarty for making a copy of the Technical Note (April 1973) available to me, to K C Majumdar for supplying clarifications regarding the details in the Technical Note and to Nitin Desai for pointing out some double-counting in an earlier version of the Appendix in the present paper. I alone take the responsibility for the views expressed and the errors and shortcomings that persist.]

13 So far as agricultural tractors are concerned, this sector forms about 50 per cent of the total gross output of the sector agricultural implements according to the Annual Survey of Industries 1965. Hence 50 per cent of the import content of agricultural tractors may be taken as a realistic lower bound of the import content for agricultural implements assuming zero import content for other commodities in the sector. Even if we make a liberal assumption that agricultural implements include the traditional implements mostly produced in the unorganised sector, and that agricultural tractors form 10 per cent of the gross output, a liberal lower bound on the import content would be around 0.03 which is way above the one adopted by the Planning Commission.

14 See a comment by T N Krishnan (1973) on this point.

15 See Mukherjee (1972).

16 See Direct Taxes Enquiry committee (1971), Ch 2, esp, paragraphs 2.20-24, pp 9-11.

17 The discussion of unemployment in the Approach document (Ch III) does not provide any insights from the policy angle besides a repetition many times over of a three-fold categorisation: "the unemployed, the underemployed and the very thinly employed". One notes with amusement an almost virtual obsession with a a conceptually arid and operationally obtuse categorisation "very thinly employed" in this chapter.

18 These comments are in the nature of a summary of the evaluation studies of land reform measures surveyed by P C Joshi (not dated). Also see P K Bardhan (1970), D Narain (1973) and Ladejinsky (1972).

19 See Planning Commission (1973b) for a similar suggestion.

Because it's a long distance runner.

CAR POWER

LINTAS-STB.52-140

Note the latest change in Maharashtra's industrial geography.

This Package of Graded Incentives makes all areas more attractive.

"Grading"— a new advantage

Maharashtra's Package Scheme of Graded Incentives has divided the State into 4 zones—the developed areas and the developing areas. All developing areas have been graded according to existing circumstances and higher scales of benefits apply in areas which are relatively less favourably placed. For instance the Sales Tax Refund is offered for 6 years in certain areas but for 10 years in other areas.

Similar gradations apply to incentives like relief from incidence of certain rates (electricity tariff, octroi, water royalties, and non-agricultural assessment) and preferential treatment under the government purchase programme.

There's something else

This scheme is implemented by SICOM—the people who work hard with expertise and guts. What's more, you can take advantage of SICOM's flexible financial assistance and plant location, project investigation and project implementation services. All given to you in SICOM style.

Avail of the Maharashtra Government's Package Scheme of Graded Incentives. Now!

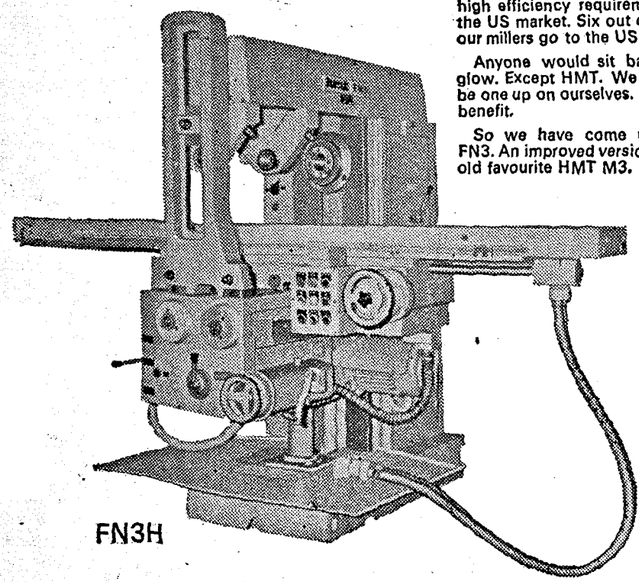
At HMT we have a family planning problem.

FN2V

The FN2 gets a brawny brother FN3 and a little one is on the way



The FN2 has fully satisfied the high efficiency requirements of the US market. Six out of ten of our millers go to the USA.

Anyone would sit back and glow. Except HMT. We want to be one up on ourselves. For your benefit.

So we have come up with FN3. An improved version of the old favourite HMT M3.

That is not all. To complete the range, HMT will shortly add to it FN 1.5 — a compact machine specially designed for small components.

The FN range will cope with all your requirements for accuracy at high production rates.

INDIA AND THE ASIAN MARKET

PRICES AND THE PLAN

The world had nothing before it got zero

India introduced the concept. The Sanskrit name for the figure was Sūnya meaning void. India was the first to use it in the modern form. The earliest inscription dates back to 800 A.D. But there is evidence in Indian scriptures that the zero was used centuries before.

In this and other spheres Indian talents have enriched the world. We at L&T try to continue the tradition by enriching life through industrial development. We design, manufacture and instal plant and equipment for every vital industry—steel, cement, fertilizer, paper and pulp, nuclear. Leading companies like Toyo Engineering, Snam Progetti, Humphreys and Glasgow, Usine De Melle, Power Gas have called on us for complete engineering, manufacturing and construction services in and outside India. You can call on us for more. We have a vast pool of computer programming man power especially on tap for you.

Who are we? A major industrial complex strategically located to serve the developing world. The success of our service lies in the individual talents of over 10,000 people in our network of offices all over India.

Farce of Procurement

THE Central government's decision to advise the states to allow inter-state movement of coarse grains, albeit only on government account, marks the final abandonment of any serious attempt to procure coarse grains in the current kharif season. As it is, procurement of coarse cereals had been even more unsatisfactory than that of rice — only about 2 lakh tonnes having been procured so far against the target of 1.5 million tonnes. From now on the procurement agencies will have to bid not only against private traders but also against state governments which have been allowed to buy coarse cereals in other states at the prevailing market prices. The farce of procurement of coarse cereals might as well be given up altogether.

To get the picture in perspective, it is necessary to consider the reasons for the decision to relex curbs on movement of coarse grains. The step was taken in response to pressure from states like Maharashtra and Gujarat to which supplies of foodgrains out of Central stocks have not been sufficient recently to keep the public distribution system going. For instance, the ration quota in Bombay for the second fortnight of this month has had to be cut by almost a third from 3.5 kgs to 2.5 kgs. The Centre's inability to maintain supplies to the states stems from the insufficient stocks of foodgrains with it which, in turn, are the direct consequence of the dismal failure of wheat procurement in the last rabi season. State governments are now hoping to at least partially make up for the cut in Central supplies by making available coarse grains bought at market prices from the major producing states. The cumulative character of the failure to manage the food economy thus becomes clear. The inability to build up adequate stocks out of the rabi crop has now forced the government into moves which foretell a worse failure for the kharif procurement — of coarse grains, at any rate.

Not that the achievement in rice is going to be very much better. Against the target of 5 million tonnes, procurement so far is said to be only 2.8 million tonnes. Of this, again, almost one-half has been contributed by Punjab and Haryana, with the other states lagging far behind the targets set for them. In assessing this performance two facts have to be kept in mind: first, that this is supposed to have been a record rice crop, whereas in the past larger quantities have been procured out of very much smaller crops; and, second, that procurement prices had been raised by almost a third on the eve of the current season. Neither the larger crop nor the higher price thus appears to have had any effect on procurement. Market prices of rice are easily 25 to 30 per cent higher than those of last season, so that despite the sharp rise in procurement prices, the gap between them and the prices prevailing in the market has remained more or less unchanged.

How are the higher market prices despite the larger crop to be explained? There is nothing to suggest that there has taken place an unusual rise in the consumption of foodgrains. On the contrary, various indicators such as the stagnation of industrial investment and production and the slow growth of employment would suggest a shift in the distribution of real incomes adverse to the poorer sections of the population, a rise in whose incomes could be expected to lead to a marked rise in the consumption of foodgrains. In the absence of a sharp rise in consumption, the present levels of prices of foodgrains can be explained only in terms of large-scale withholding of stocks from the market by producers and traders. The ability of these two groups to finance larger stocks in the expectation of bidding up prices further has been appreciably augmented in recent years by higher prices, by the larger flow of institutional finance to agriculture and by the overall increase in liquidity in the economy. Expansion in money supply with the public at 7.3 per cent in the current financial year till December 28, 1973 was actually higher than in the same period last year. And despite the cut of Rs 400 crores in developmental expenditure and the windfall gains as a result of the enhanced excise duties on petroleum products, deficit financing bears no relationship to anything postulated in the budget for 1973-74. Net bank credit to the government expanded by another Rs 800 crores or 10.4 per cent in the current financial year till the end of December 1973 and bank credit to the commercial sector increased by Rs 745 crores (10.1 per cent), which was considerably higher than the figure of Rs 517 crores (8.2 per cent) for last year.

The full impact of the failure of procurement in the current kharif season will be felt in the coming months. If, as is feared, the size of the next rabi crops is significantly affected by the fertiliser shortage, then the first year of the Fifth Plan might see the virtual elimination of the government from foodgrains distribution. This would be an ironical beginning for a Plan which, on paper, sets such store by public distribution of mass consumption goods.

A Fernandes

ALPHONSO FERNANDES, the *Economic and Political Weekly*'s Business Manager, passed away at Calcutta after a heart attack in the early hours of the morning of Tuesday, the 22nd. He was 61.

After a colourful stint with the INA in Singapore and Malaya some years earlier, Fernandes joined *The Economic Weekly* in 1951 when that journal was barely two years old. Great as Sachin Chaudhuri was as an editor, he was strangely ill at ease handling the multifarious problems of production, distribution and financing of the journal. It was these tasks that Fernandes took over; and, despite heavy odds, he had the satisfaction of making the physical foundations of the journal strong enough for it to survive and grow for 17 years and thereafter to be reborn, after a break of a few months, as the *Economic and Political Weekly* in August 1966.

As Business Manager, Fernandes was, of course, the link between the journal and the world of advertising and advertisers. In *The Economic Weekly* he was equally the link between Sachin Chaudhuri and the loose organisation which sustained the journal, including not only the, always small, staff of regular employees but also the much larger group of active helpers. This brought him into contact with people of widely different temperaments, but he dealt with them all — whether this meant the despatch of a messenger to some far-off suburb of the city at some unearthly hour to pick up a piece of 'copy' or arranging an air or rail ticket at very short notice or a little help in getting round the prohibition laws — with quiet efficiency. He was, in the best sense of the term, *The Economic Weekly's* estate manager. Solid, a little hard of hearing and not excessively touchy — these qualities presumably stood him in good stead while dealing with contributors and subscribers as much as with the press, paper merchants, company managers and advertising agencies.

The onerousness of his formal responsibilities as Business Manager of a journal with a relatively small circulation was compounded by frequent editorial indifference to the general and particular sensitivities of advertisers. Yet even the most carping criticism of the most valued advertiser did not drive him to complain or despair. It was not just that he took it all in his stride; he was completely committed to whatever appeared in the journal of which he was a part. This stubborn loyalty contributed in large measure to the success of his efforts on the journal's behalf. An equally important contribution was made by his basic decency in interpersonal dealings which made it possible for him to successfully draw on even those who, quite frankly, did not care much for the journal's policies.

In a different way from Sachin Chaudhuri, Fernandes too had no world outside the journal. Yet, after his first wife's death in 1958, he reared four children to adulthood — even as he did *The Economic Weekly*. In 1972, after the children had been settled and *Economic and Political Weekly*, he felt had been put on a sound footing financially, he married a second time. It is sad beyond words that the unconcealed happiness which came to him as a result should have been cut short so abruptly.

For us the passing of Fernandes brings back the pain and the emptiness we had felt back in December 1966 with the death of Sachin Chaudhuri. We will miss the familiar figure, the calm manager, who made the office seem almost like a home with his orderly but affectionate house-keeping.

Prices

Eating the Plan Out

THE Planning Commission has clung to one particular point to justify its failure to take into account in the Draft Plan the price rise since 1972-73. Over the relevant period, the rise in the price level of capital goods has been much less than the rise in the general price index; the spiralling inflation, the Commission has therefore argued, might not vitiate significantly the assumptions in the Plan: it is the investment content of the Plan which is basic, and if the price level of investment goods has not been too greatly disturbed by developments of the past eighteen months, why get excessively worked up over the issue of the erosion of the resource base?

There can, however, be another aspect to the matter. If industrial prices, and particularly prices of machinery and eqpipment, have not risen as much as the general price index since 1972-73, to that extent prices of industrial raw materials as well as of foodgrains must have risen even more sharply than the latter; the data bear this out clearly. This being the case, in recent months the terms of trade have swung violently in favour of agriculture and against the industrial sector. A given sum of monetary resources now commands a considerably smaller volume of industrial raw materials and wage-goods than in 1972-73. As a result, the unit cost of production is bound to have risen in the industrial sector; as investment activity is in essence an embodiment of wage-goods, deployed either directly or indirectly, an outlay in money terms cannot but have a lower real content now compared to, say, a year ago.

Besides, if the price level of key industrial goods persistently lags behind the general rate of inflation, the possibility of a declining trend in the rate of industrial profits cannot be ruled out. This need not be a ubiquitous trend: consumer goods industries — such as sugar or textiles — might continue to bulge with profits. But, other things remaining the same, a sharp movement in the terms of trade against the capital-goods sector should lead to a downward shift in the rate of return at least in this sector.

Even were the Planning Commission to pour contempt on the orthodox doctrine that inflation' discourages autonomous investment, it cannot quite brush aside the terms-of-trade effect on the real content of the Plan's public investment programme — and on private capital formation induced by the latter, such as in the engineering industries. The Commission has promised a review of the resources position toward the end of the current fiscal year. The physical content of the draft Plan's crucial investment proposals could be saved only if this reappraisal leads to concrete actions paving the way for an enlargement of public savings. The prospects are however meagre.

There is little assurance that the authorities would be able to regulate public expenditure on the non-developmental account: the exigencies of the parliamentary system — witness the pies-in-the-sky being promised to the electorate in Uttar Pradesh — and the consequences of past indiscretions cannot simply be wished away. Other sources of revenue-raising are gradually running dry; the assumptions, about the role which could be played by public undertakings in aumenting their internal savings almost belong to the category of wishful thinking. A larger impost on agricultural holdings perhaps offers the only viable scope for raising additional public savings. But given the existing political alignments, which would not perhaps allow even a marginally stiffened levy on land holdings, savings over and beyond what have been assumed in the draft Plan are unlikely to come forth. The academic essay to which the draft has already been reduced would therefore prove to be unsalvageable.

Congress

Absentee Rulers

SIDDHARTHA SANKAR RAY took over as Chief Minister of West Bengal on March 20, 1972. Between that date and the fifteenth of this month, six hundred and sixty-six days have intervened. It may take some believing, but, during this period, the West Bengal chief minister was away in New Delhi on eighty-six different occasions, accounting for altogether three hundred and six days. The average length of stay in New Delhi per trip works out to 3.4 days. The number of trips per month being plus minus four, nearly a fortnight during each month has been spent by Ray in the nation's capital since the beginning of his tenure. The state's health resort, Darjeeling, has also emerged as a spot of great attraction for the chief minister: all told, he has been away there for thirty-nine days, spread over eight separate visits, in the course of the period under reference.

This is a new style in administration. The Madhya Pradesh chief minister, Prakash Chandra Sethi, has almost a comparable record: he too has interpreted his functioning as the head of the state cabinet as being synonymous with commuting to and from the nation's capital. Personality cult has replaced all other doctrines of administrative behaviour. The fountain of their power and glory, the chief ministers have come to the conclusion, is the Prime Minister: lobby with her, seek her directive on each single issue, big and small, and nobody could challenge your authority any more. It is therefore no longer considered necessary to toil and trouble on one's own at one's own seat of administration, to cope with the problems at the grassroots, to stay back and supervise the daily chores of administration or to oversee the progress of the various development projects in the state. Rather, at the slightest sign of difficulty or stress, the Congress chief ministers run to New Delhi and solicit a session with the Prime Minister. Inevitably, a new tribe of absentee chief ministers have come into being. If tensions surface within a state, if a minor problem in administration rears its head, or some local political issue threatens to create a slight tremor, the new doctrine demands that none of these need be sorted out at the state capital, or at the particular point or points within the state where they might have arisen. Each piffle of a problem has to be carried to New Delhi, and discussed 'at the highest level'.

The Prime Minister, as a political being, has to ascribe the country's present economic woes to the droughts and wars and refugees from Bangladesh; in her more recent speeches, the energy crisis has also come in handy as an alibi. The other equally important fact, namely, that many of the economic failures are on account of a deterioration in the quality of administration, in delays in decision-making, in the sheer incompetence, exhibited at different levels, to execute decisions finds no place in the Prime Minister's reckoning. There is a correlation between the style of functioning of the chief ministers and the declining quality of state administration. The reluctance of the chief ministers to stay at their posts without running to New Delhi even for a single week, and their inability to reach and implement decisions on their own, thoroughly demoralise the state bureaucracy. The apparent lack of self-confidence on the part of the chief ministers to tackle even minor issues corrodes their moral authority. At the other end, since each little problem, whether administrative or political, is wont to be referred to the Prime Minister, she must be literally inundated by minutiae, presumably leaving her with only limited time for those crucial matters of Statecraft which should receive her undivided attention.

Over the past few years, the Congress party has, understandably, nurtured the personality cult; it is the Prime Minister's personality which is the party's major — if not only — electoral asset. But the practice cuts both ways. Many of the organisational issues which in the past would have been taken care of by the functionaries of the party are now sent up to Indira Gandhi, and the status of the party President has been more or less reduced to that of a dummy. And as West Bengal's rather grotesque, but nonetheless concrete, example shows, an excessive dependence on the Prime Minister's power and glory may bring administration at the lower echelons to a screeching halt. A chief minister who is all the while hovering around South Block or Safdarjung Road will, for instance, have little time to think out the essential modalities for a successful procurement programme. It is going to be an unhappy harvest, even for the Congress, if the habit is persisted with.

Plan

False Upholstery

THE Plan outlay under the Fifth Five-Year Plan is to include, unlike in the previous Plans, the expenditure for replacements and for building up of inventories. In doing this, the Planning Commission has initiated a new principle. What are the grounds for this?

The generally accepted practice is to term as Plan investments only those investments which go to increase the total output of goods and services beyond the levels obtaining at the beginning of the Plan period. In other words, not all developmental expenditure can be termed Plan expenditure. Only that part of developmental expenditure which results in incremental benefits to the community — by way of the output of either goods or services — is called 'Plan outlay'. This definition follows from the argument that Plan efforts are those that take the country forward in its developmental efforts and not those that just maintain it at its present levels. Expenditure on mere maintenance of the existing levels of output and of social services, however essential it way be, would fall in the non-Plan category — even if it be classified as 'developmental'.

Consequently, outlay on replacements undertaken for plant and machinery installed in an earlier Plan period is not called Plan outlay, since it only helps to maintain the existing levels of production. To do otherwise is to sanction the possibility of a situation in which the outlay on the so-called Plan does not result in any increase in the capacity to produce goods and services.

In any case, inventory accumulation by itself can hardly be regarded as leading to greater production. Though it is not clear which types of inventories the Planning Commission has in mind for inclusion in the figure of outlay Plan,

it must be remembered that these are determined by working capital requirements. Since variations in inventory levels occur continuously such requirements are often financed with medium or short-term loans. Clearly, to term such requirements as investments under the Plan is far-fetched.

The present departure from the accepted concepts of planning thus defies fundamental considerations. Principles apart, such practices would introduce quite autonomous determinants of the magnitudes in Plan outlay. For instance, the outlay on replacements and on inventory increases are quite sizeable in the industries sector. In an industry such as coal mining, moreover, it would work out to about 20 per cent of the Plan outlay.

An outlay of Rs 600 crores for replacement and inventory increases has been assigned in the draft Fifth Five Year Plan (chapter 5, volume II) for the Central public sector units alone. Out of the total outlay of Rs 13,528 crores for industries in the draft outline, a sizeable chunk is to go only for replacements and inventories. Is this perhaps an attempt then to make-believe at a much bigger Plan than is really being undertaken?

Gujarat

Bullets for Bread

FOR more than a month now there have been serious riots all over Gujarat from Surat in the south to Palanpur in the north and Rajkot in the west. The rioting was set off, as seems to be becoming the rule, by police excesses in curbing separate agitations. In Morvi, a demonstration by the local engineering college students against increased mess charges was fired on by the police, leading to student morchas against police atrocities in Ahmedabad and other towns. Similarly, a Jan Sangh organised bandh led to violent police interference in Rajkot and other Saurashtra towns which in turn led to further rioting and clashes.

Over the last three weeks the rioting has taken a distinct turn. It has been directed against government and private grain godowns and shops and against state property such as buses. Price rises and food shortages have been the major causes of popular discontent. It is notable that there is no single party or group which has fanned this discontent. In fact, the opposition parties have played a relatively meek role in the agitation, the greater role being left to *ad hoc* or previously inconspicuous groups like student fronts or seva sanghs of various complexions.

In Bardoli, near Surat, the arrest under MISA of two prominent leaders of the Khedut Samaj, which is a powerful association of landlords and kulaks with its own private 'army' known as the Sardar Sena, led to violent disturbances against the government and against a group which works for the welfare of the area's landless labourers, most of whom are adivasis. This group, the Halpati Seva Sangh, retaliated against the brutal beating and stripping of its secretary, Arvind Desai, by raiding the godowns and property of some of the patidars (landlords).

The Khedut Samaj had been agitating for some months against the new land ceilings act which was finally passed last November and, more recently, was actively defying government attempts at compulsory procurement of a proportion of the paddy crop. It is most unlikely that the Chief Minister, Chimanbhai Patel, decided to deal firmly with such powerful lawbreakers as the two leaders of the Khedut Samaj, Dayaram Patel and Vallabhbhai Patel, for the sake of the downtrodden or for any 'socialist' principle. It is more likely that the Khedut Samaj had become associated with the factions within the state cabinet which have been working for the displacement of Chimanbhai Patel from the chief ministership; hence the arrest of the Khedut Samaj leaders and the police raids on the godowns of some rich farmers.

But considering that the Congress — and even more transparently, the Gujarat Congress — is closely involved with the rich and the powerful, especially in the rural areas, the forays against the kulaks and the traders were bound to come to an end. In fact, last week, the Gujarat government came out in its true colours when it announced the virtual ending of the government's takeover of the wholesale trade in wheat. Of course, this was done in the name of making foodgrains more easily and cheaply available to the people. No doubt, again in the name of the people, the compulsory levy of paddy will be quietly forgotten and the land ceilings act implemented as tardily as is the wish of the big farmers.

Poland

The Egalitarian Poor

Vinod Mehta writes:

SURVEYS on income differences in the socialist countries and on attitudes towards these differences and other such topics are usually not made public. Recently, however, the Polish Sociological Association made available a paper on "Attitudes of Employees from Warsaw Enterprises towards the Differentiation of Wages and the Social System in May 1958" by the late Polish socialist, Andrzej Malewski. This survey, though 16 years old, reveals some interesting points.

The questionnaire was sent to 5,000 workers, technicians, engineers, teachers and economists. Only 1,530 replied. Two important questions were asked in the survey. The first question asked respondents whether they were for relatively equal incomes or against them. The other question asked them whether they were for or against limiting income differences.

The survey revealed that 66.3 per cent of those who replied were for relatively equal incomes and 20.3 per cent against. The rest did not have any opinion on this question. Breakdown of the data according to type of employment showed that a great majority of workers, technicians, teachers and clerks were in favour of relatively equal incomes while a great majority of engineers were opposed to such egalitarianism. Similarly, on the question of limiting wage differences in Poland, workers, technicians, teachers and clerks — who generally earn low wages — favoured such a step while engineers — who usually earn higher wages — opposed it.

Those who were for such egalitarian ideas advanced six types of reasons which are arranged below in the perceived order of importance: income differences are unjust and opposed to the principles of socialism and democracy; everybody has the same 'stomach' (needs); income differences 'make people angry', cause discord between social groups; income differences must be eliminated to prevent the emergence of an elite group; too high wages cause 'spend-thriftness contrasting with the average situation of the people'; to improve the material situation of the poorest part of the population differences in income should be reduced.

Those who were against such egalitarianism, notably engineers, maintained that different kinds of work are not equal and better work ought to be better rewarded, and that wage differentials stimulate people to improve the quality of work.

The main conclusion of the paper is that people with the lowest wages express the strongest tendencies towards changing the *status quo* in the egalitarian direction while those with relatively high wages and with greater opportunities for further increases in wages are for the *status quo*.

In the Midst of a Revolution?

Romesh Thapar

IN Bombay city, wide sections of the population, the well-to-do and the not-so-well-to-do, are "thrilling" to the fact that the Prime Minister was denied entry. In Uttar Pradesh's towns, they are joking about the foundation stones which have been laid during the past few weeks. "There are so many that it would be possible to build another Taj with them". In Gujarat, one over-grown village after another is engulfed by the violence and looting which have swept in from the bigger towns. Daily, the newspapers bring us news of strikes, clashes, tear-gassing and shooting. We are certainly on the edge of major events.

Food is the immediate challenge. Despite record harvests, the foodgrains are not coming into the market. The charge is that despite price increases large-scale hoarding persists. Speculators seem to have the funds to manipulate the availability of many essentials. The official distribution machinery is rapidly being reduced to a farce, a farce best seen in the city of Bombay where the rice ration is a kilo a month per person — when in every street it is possible to buy everything in any quantity at unofficial prices.

Tangle of Contrary Pulls

Naive planners and bureaucrats, now engaged upon writing nonsense articles in popular magazines, imagine that weaker sections are being "protected" by the official foodgrains distribution machinery. This myth is fed into the receptive ears of the political leadership, even as the experts sit baffled by the phenomena of sudden shortages and high prices in a year of increasing supply. A web of dishonesty, a system of fabricating facts and situation surveys for the endless committee meetings which characterise government today, keeps decision-making in a tangle of contrary pulls. Everyone ploughs his own furrow, knows he is telling lies, but this is the style. The make-belief theorising of the ruling party has never been so removed from the reality that is India today.

When will we admit that the natural disciplines of the national market have been shattered by both massive speculation and political manipulation? If goods are not cornered by traders, there are the politicians to divert supplies to create artificial surpluses as in the North for the Uttar Pradesh elections. The disruption of the national market in food is now total with the catastrophic failure of the official food distribution machinery. Refusal to face this central fact of our crisis is pushing the country into a continuing trauma.

Yes, politically, the decision must be taken to free the movement of foodgrains over the entire country. To keep foodgrains "captive" in surplus areas to assist procurement has become self-defeating. When the foodgrains move across state borders, prices in the free market will find their own level — and very much below the present blackmarket rate. There is more food in the country than ever before. Of course, the speculators may still speculate. Well, then, crack down simultaneously on black money. This is not difficult. Only the smugglers, speculators and politicians will be poorer. Let us take two steps in one, and without wasting any more time.

As for the rest of the economy, there's little point in theorising until we know what the energy bill is going to be. The emphasis should be on getting more than a hundred per cent out of the existing industrial capacities, with particular emphasis on those industries which are vital to agriculture. The way international currents are shaping, and with the disengagement of Arab and Israeli forces, it should be possible to get to grips with the oil price within the next few months.

There is a fairly solid body of opinion which is beginning to express itself against the holding of frequent elections in the states. These elections, now caricatured by the use of extraordinary funds raised from the smugglers and speculators, are destroying our capacity to cope with problems. If the Congress Party does not want to dig its grave, it had better do an about-turn on its favourite system of highly-financed electioneering. In any case, the necessary assault on black money should solve the problem for a while.

Major Confrontation

Of course, even as we feel the gathering of an explosive crisis, the thought does occur that whatever we may do the situation will remain tension-packed. We are obviously in the midst of a revolution — Indian style! A major confrontation is developing at two broad levels, within the Haves and between Haves and Have-nots. The strikes, described as "anti-people" by sections of the Left, are a reflection of the first level of confrontation. The second level is seen in the Dalit struggle in Bombay and the upsurge in Gujarat. To permit both confrontations simultaneously is to invite political disaster. And, therefore, the attempt to discipline opportunist trade union activity.

However, the scale of deterioration in the situation is such that over the past six months — that is, within two years of the so-called "Indira wave" — the ruling party is facing a noticeable isolation in urban India. Reports from Uttar Pradesh, not published in the press because of fears of newsprint

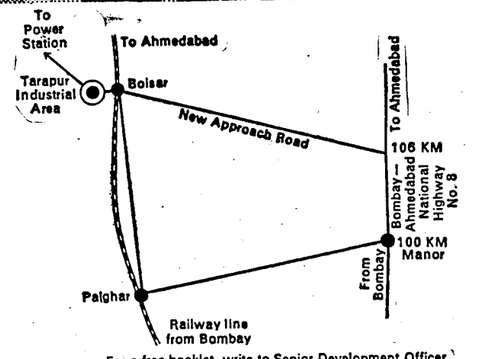
A Rs. 234-lakh infrastructure is ready at

Tarapur Maharashtra's brand new industrial growth centre



just 100 km from Bombay Airport

Over 30 entrepreneurs have already selected MIDC's Industrial Area at Tarapur for their new ventures. They have found the infrastructure excellent. All Rs. 234 lakhs of it.

Asphalted approach road and motorable internal roads costing Rs. 69 lakhs. A Rs. 32-lakh water supply scheme on the Surya River, from which 30,000 cubic metres of water is daily pumped to the Industrial Area. Another Rs. 22-lakh on distribution pipeline within the Industrial Area. A Rs. 99-lakh, 132/11 KV sub-station, MSEB's powerful contribution. And a broad road 18 km in length links the Bombay-Ahmedabad National Highway to the Industrial Area via a Rs. 12-lakh bridge.

Level land (which means low development cost), seaside location (enables economical effluent disposal), round-the-year goods transport both by rail and road and urban amenities. Plus SICOM's varied financial support and project implementation services, along with Maharashtra Government's Scheme of Incentives.

cuts, clearly indicate a developing swing against the Congress Party. Forecasts at the moment are suggesting only a marginal majority which could be easily eroded through factionalism and political horse-trading. The Congress Party continues to talk of 275 seats because it refuses to accept its growing urban isolation and the sizeable defection of the Muslim vote. And we have yet to see what happens to those who have been denied Congress tickets.

But whatever the result, the elections in Uttar Pradesh will be described as a costly farce.

In the capital, which is so untypical of the rest of the country, we keep hoping that the political leadership will be able to rally enough courage to adopt a packet of down-to-earth emergency decisions, revolution or no revolution.

January 21

Calcutta Diary

A M

NO apologies need be proffered for continuing with the theme of the season, but let there be a shift from the general to the particular, from the problem of procurement at the national level to the woes of procurement in this state. Production of rice in West Bengal in the current year is supposed to have exceeded all past records: a crop of seven million tonnes, the people have been informed with a triumphant wink. One can see how the output of rice in the state has moved up and down during the decade: it was 5.8 million tonnes in 1964-65, but came down to 4.9 million and 4.8 million respectively in the drought years of 1965-66 and 1966-67, rose to 5.2 million in 1967-68, galloped to 6.2 million in 1968-69; from then on, it has been 6.4 million in 1969-70, 6.1 million in 1970-71, 6.5 million in 1971-72 and 5.7 million in 1972-73. And now, in 1973-74, the output is supposed to have scaled the glorious height of seven million tonnes. Procurement of the grain has however maintained no relationship at all to the trend in production. In 1964-65, procurement was 335,000 tonnes; despite the drought, P C Sen in his innocence was able to push it up to 584,000 tonnes in 1965-66. Next year, procurement fell to 123,000 tonnes, but was again up, to 265,000 tonnes, in 1967-68. Largely because of the efforts of the United Front administration, it was once more as high as 434,000 tonnes in 1968-69 and 411,000 tonnes in 1969-70. Under President's rule, the purchase of rice slided back to 266,000 tonnes in 1970-71 and stayed at around 250,000 tonnes in the following year. In 1972-73, with political stability allegedly fully restored in the state and a Congress government re-installed in power, procurement dropped further, by as much as 100,000 tonnes compared to the previous year, and was only 150,000 tonnes. In the current year, never mind the record output, hardly 60,000 tonnes have been procured till the middle of January. The only issue that seems left to be determined is whether, as the season closes, total procurement would be even lower than what it was in 1966-67. The year with the decade's highest output could thus indeed also be the year with the decade's lowest procurement.

Species of Make-Believe

Before the season began, the state government had fixed a procurement target of 500,000 tonnes, about seven per cent of the estimated output. Some amongst the amateurish ones within the ruling party had then claimed that the target was too low, at least ten per cent of the production ought to be commandeered by the State. These days of naivete were soon dissipated. The bulk of the rice has already been harvested. The peak of the marketing season is over. Each day, newspapers are full of some fresh measures of cordoning and dehoarding proposed by the authorities. But these belong to the species of make-believe. The bird has already flown; it is now too late in the day to do anything to reach anywhere near to the procurement target.

Of the total target of 500,000 tonnes, the rice mills were supposed to deliver 360,000 tonnes; the rest was to be collected through a levy on the big producers. Till last week, the rice mills have handed over hardly 20,000 tonnes. If you go round the countryside and visit the *mandis*, you will find the mills apparently all lying idle. They have, you will be told, no custom this year; despite the sharp increase in the procurement prices of rice and paddy, the latter are still 25 to 30 per cent lower than market prices; nobody therefore chooses to deliver the paddy to the rice mills; the paddy goes to the hullers, who are innumerable, and to the thousands of husking contraptions in private households. This however is only one part of the story, for one also hears of rice mills which work, clandestinely, at nights, under the benign patronage of the local political boss. There is also the general environment in the countryside to be considered. The agent of the Food Corporation, poor creature, will have to run for dear life if he tries any funny tricks. Since he cannot collect from the rice mills, he dares not even collect the levy from the big farmers. And those who have been called upon to pay the levy have merely put the squeeze on the share-croppers for some more grain. All told, it is a bizzare situation. You wanted stability; it is now there: from village after village, the trouble-makers, the leftists, have been driven out; neither the share-croppers nor the landless labourers can any longer afford to make even a squeak; the Congress party's sway is complete. Yet, none of these is of any help; procurement is perfunctory. Naturally, certain consequences have followed. It is only January, but the public distribution system is already under strain in many areas in the state: its total collapse is being feared in the lean months.

Auto-Regressive Quality

For there is a certain auto-regressive quality in what is happening. Procurement is poor, supplies from the Centre are fitful, therefore everybody is predicting a collapse of the public distribution system in the coming months. But precisely on account of that, each and all — big farmers, small farmers, big traders, small traders, urban housewives, peasant women — are trying to stock up. In the countryside, the most impoverished ones too have started to sell trinkets and utensils in order to have cash with which to buy some cereals for the drier days that are acoming. Petty clerks in towns are borrowing from their provident funds for the same purpose: stock up, stock up, food would be still scarcer in the lean season, the government would not be able to help, so do stock up now whatever little you can. Since nearly everybody is gripped by this psychosis, the price shoots up even more in

the market, and so much less is available for procurement: what starts as a scare soon turns into a panic, and the panic soon assumes the corpus of an inevitable doom.

In all this, one can hardly ignore the class composition of the Congress party in the countryside. The rich farmers and traders continue to form the solid, enduring core of the party; they have lived through the nightmare of the leftist jackals; but now that a dazzling day has followed that grim interregnum, let them, for a while, breathe the free, non-claustrophobic air. It is sheer ingratitude to ask them to disgorge their stocks. True, procurement prices have been raised, but market prices have also jumped. True, traders and farmers cannot claim the entire credit for the rise in market prices; the government, through its various policies, has also helped a great deal. But, after all, it is *their* government, it is its bounden duty to keep prices high so that *they* could widen their rate of return. Is it natural justice, they would ask, for their own government to press them to sell the grain to the Food Corporation at a laughably low price when it can fetch at least forty to fifty per cent more in the open market? To bully them to do so would be an un-Congress-like act, a CPM-ish exploitation. The Congress is there to support and protect the affluent; the whimsies of those talking in leftist jargon must not be allowed to harm the interests of the party's original, essential class base.

Internecine Warfare

But this is by now a commonplace: about everybody knows that it is difficult for the ruling party to alienate the rich farmers and traders. There is however something else too happening in the countryside and which makes it altogether impossible to enforce a rigorous programme of procurement. The young, unemployed ones on whose strength the Congress has returned to power in this state are not to be scoffed at. It is they who, with the active connivance of the forces of law and order, combined most effectively with the elements of the underworld and squeezed out the leftists from their traditional bases. Two seasons ago, they were promised a lot: once the Congress rule was restored and stability returned to the state, milk and honey would start flowing, industries would revive, agriculture would flourish, opportunities would multiply, banks would offer saturation credit to the self-employed, there would be a thousand new schemes for the expansion of jobs and incomes, it would be a golden Bengal. The performance of the Congress ministry, installed in March 1972 following the decimation of the leftists, has been anti-climatic beyond measure. The young ones who were promised work and prosperity find that things are now much worse. A handful, who are either close to ministers or have come to handle the party's funds, have managed to flourish. But the vast majority are left out. Envy has sprouted, and the youth wing of the Congress is now riven by wide, sharp divisions. The guns and bombs are out; almost every day, there is internecine warfare, accompanied by one or two murders. Attempts to patch up the differences have failed. The party's leaders are finding it extremely difficult to cope with the wrath of the disillusioned cadres.

Secret Network

A large number from amongst them have decided to fend for themselves. Procurement can never succeed in the state because the young ones — mostly from middle class and lower middle class homes — who now constitute the Congress party's stormtroopers are also those who run the state-wide operations in smuggled rice. From the lush villages to the not-so-lush ones, from the surplus districts to the deficit ones, from the countryside into the areas covered by statutory rationing, from across the state border into the isolated high-price belts in Bihar such as Jamshedpur, Sindri and Barauni, lies the rice route, completely taken over by the Congress rank and file, either on their own or on commission from the more exalted ones. Some months ago, there was much high falutin' talk of fifty thousand young Congress workers who would help the official agents in the procurement operations. On a rough reckoning, fifty thousand Congress workers are in fact at the moment blanketing the West Bengal countryside: they are however on the other side of the operations. Each such person is perhaps either directly engaged in smuggling, or has entered into an arrangement with a trader to ensure the safe movement of smuggled rice within a particular police station. The terms apparently are arranged in advance. For permitting untrammelled movement over a distance of ten miles, the levy to be paid per quintal of rice is maybe seven rupees for a Congress worker and three rupees for the minions of the police. This is all part of a secret network, but it has its own logistics, decentralised operational commands and signalling arrangements. The overheads and the operational costs are neatly spread across the total turnover. If, to reach the cordoned area of Calcutta, a quintal of rice has to be transported over a distance of forty miles, obviously forty rupees will now be added to the price over and above to what is quoted in the village market from where the rice originates.

No Lack of Demand

This relay system of smuggling is maintained through headloads, and through movements in cycles, boats, trains, occasionally even trucks. It is a regular full-fledged operation and, in some senses, more efficient than the officially maintained public distribution. In areas notionally covered by statutory rationing, such as Calcutta and Durgapur, the actual delivery of rice through this network in some weeks even exceeds what the consumers are able to get from the ration shops. They of course have to pay two and a half to three times the price charged in the ration shop, but given both the current shortage and the spectre of famine five or six months hence, there is no lack of demand. In the so-called 'fringe' areas not served by statutory rationing, where the supply through the fair price shops has almost totally collapsed, it is in fact the bounty of the smugglers which is providing the daily bread to a large majority of the people.

This is a precarious equilibrium which you cannot afford to disturb. Something, somewhere has got to give: political stability of a kind has been thrust back on West Bengal, the leftists have been hounded out; a price however has to be paid. Since, in the absence of jobs, the young ones who, with their guns and bombs, enabled the Congress to come back to power have somehow to be kept happy, they must be given an extra cut by traders, farmers — and the authorities. The urban and semi-urban consumers should not complain either: at least a surrogate has filled in for a government which has stopped functioning. And those unable to buy the cereals at the price quoted by smugglers have the freedom to starve: it is, after all, not such a new phenomenon in this country.

Not Out of the Woods

Hansavivek

JESSOP, which had experienced a decline in sales in the last few years, reversed this trend in the 17 months ended March 1973 when its average monthly sale increased to Rs 126 lakhs against Rs 67 lakhs in the previous 12 months. Considering the total capital employed in business, however, even this increased turnover is quite low. Worse still, the company has incurred a higher loss, lifting the accumulated deficit to Rs 9.87 crores to stand against the total paid-up capital of Rs 2.24 crores. Dividends have been skipped once again. Arrears of preference dividends amounted to about Rs 6 lakhs. Liability for gratuity to employees was estimated at Rs 198 lakhs, but that for pension has not been determined. As per the usual practice, retirement gratuity and pension to employees have been debited to profit and loss account on cash basis. Also, no provision has been made in the accounts for anticipated losses on orders in hand for which work is still to be done. Anticipated losses on such major orders have been estimated at Rs 3.47 crores. Interest on government loans has been provided at 6.25 per cent per annum on Rs 2.50 crores and at 6.75 per cent per annum on Rs 8.98 crores. Interest amounting to Rs 25 lakhs due to non-payment on scheduled dates has not been provided for, as the company has approached the government for its waiver.

Consequent to the purchase of 2,000 preference shares from LIC by the President of India, the company has become a government company from April 1 last. The company's borrowings have been mounting. After the year-end, the company received further financial assistance from the government of India to the tune of Rs 4.20 crores, taking the total cash assistance from that source to Rs 15.68 crores. These are unsecured loans and the government has the right to convert them into equity. While the company's application for increase in the cash-credit limit by Rs 2 crores to finance inventory build-up is being considered by the State Bank of India, Rs 50 lakhs have been granted as an interim measure. The bank has also accommodated the company with bridging finance to meet various commitments. Government has also approved the steelworks duty crane project involving a capital expenditure of Rs 3.20 crores to be given as a loan. The company has taken on hand this project as also other programmes of diversification, expansion and modernisation besides routine replacement of plant and machinery. Net expenditure on capital account amounted to Rs 125 lakhs against Rs 28 lakhs in the previous year.

ALKALI AND CHEMICAL is hopeful that it will soon get industrial licences for manufacture of pharmaceu-

ticals, 'Gramoxone' and expansion of rubber chemicals and has, in anticipation, applied to the Tamil Nadu government to purchase sites for the first two of these projects. During the year to September last, the company produced good results with higher sales and profits. The improvement in working results was due mainly to better utilisation of plant capacities and higher productivity, though benefits resulting from these achievements were partly offset by increases in raw material costs. Further improvements in plant availability have been made to achieve a record production of polythene. A 'token' increase in prices had to be made "to partly offset the substantially higher cost of imported alcohol". Demand for polythene continued to be far in excess of supplies. Production of paints at Rishra and Hyderabad was maintained at levels necessary to support the growth in trade and industrial demands, but export production suffered on account of shortage of rutile titanium dioxide. Power shortage and labour problems experienced by the rubber industry throughout the country reduced demand for rubber chemicals, but the company was able to maintain its position in the market. Production of caustic soda and chlorine was maintained at levels higher than last year. Demand for the company's drugs has grown rapidly. Lack of essential imported raw materials forced postponement of deliveries against several export orders for paints. Likewise, shipments of rubber chemicals to important South-East Asian markets continued to be affected because of the reluctance of shipping companies to accept such cargoes for one reason or other. The sudden exclusion of these chemicals from the trade plan with Russia also resulted in loss of an important market which had been developed at considerable cost and technical effort.

STEEL AND ALLIED PRODUCTS experienced a marked contraction of margins during the year ended June last, despite increase in turnover. This outcome is ascribed to inflationary rise in costs without corresponding increase in realisation. While factory number one continued to work satisfactorily, production at the unit number two showed little improvement "in spite of considerable rise in wages and other benefits given to the employees". A lock-out was declared in this factory from mid-August 1973 due to "persistent go-slow, illegal tool-down and other unlawful activities". The entire net profit of about Rs 12 lakhs has been transferred to the development rebate reserve to make good the arrears. Dividends have been once again skipped. Arrears of preference dividends exceeded Rs 16 lakhs. No provision has been made in the accounts for gratuity liability, nor has the accumulated liability on this account for the 22-year-old company been determined. Owing to appreciation in the rate of exchange of DMs, the company's liability to IFCI in respect of the DM loan increased by over Rs 17 lakhs. The subsidiary, Anglo American Marine, has shifted the site of its gear hobs project from Poona to Aurangabad to avail of various incentives offered by government.

BAGALKOT UDYOG's board had indicated in a note on the balance sheet as at June 30, 1972 that there appeared to be some shortage in stock of clinker and that the adjustment would be made in the accounts after an investigation. The investigation revealed that there was a difference of 18,168 tonnes valued at about Rs 17 lakhs between the book figure and actual stock. This amount has been adjusted in the 1972-73 accounts and it is stated that "this difference arose mainly due to the fact that the formula applied for conversion of slurry into clinker in the earlier years resulted into an assumption that more clinker was being produced than the actual production". The company has also shown a loss of about Rs 5 lakhs on sale of certain investments. As a result of these two items, the accounts showed an adverse balance of Rs 9 lakhs which has been erased by transferring a like amount from the general reserve. Depreciation amounting to Rs 16 lakhs on the straight-line method has not been provided for in the accounts. Also, no account has been taken of the future gratuity liability, nor has the liability been ascertained. There is a contingent liability of a government claim for royalty in respect of limestone and clay amounting to about Rs 10 lakhs, which is disputed by the company. During the 12 months ended June last, the company produced 1,98,145 tonnes of clinker and 2,68,760 tonnes of cement against 2,54,905 tonnes and 2,76,845 tonnes, respectively, in the preceding 15 months. Despatches of cement were 2,68,241 tonnes aagainst 2,79,315 tonnes. The management complains that production costs have continued to rise. The company has been issued a 'letter of intent' for expansion of capacity by 90,000 tonnes per annum by converting the existing kiln from wet process to dry process. An application has been made to government for permission to instal a separate dry process plant. The Bagalkot municipality has filed a suit against the company alleging that dust emission from one of its stacks is hazardous to the health of the citizens.

BARODA RAYON has become a big complex, as a result of the merger with it of Gujarat Polyamides. It produces annually 3,000 tonnes of filament rayon yarn, besides turning out daily 40 tonnes of sulphuric acid, 5 tonnes of carbon disulphide and 10 tonnes of sodium sulphate. It has its own 500-kw power plant based on coal. And now it will produce annually 1,800 tonnes of nylon yarn. In this plant, inaugurated recently, provision has been made to take on additional loads with expansion in the future or, with slight modifications, to switch over to polyester fibre. The plant has been supplied by Snia Viscosa of Italy, a leader in the field of man-made fibres, which is now the second largest shareholder of BRC. Mitsubishi and Asahi Chemicals, two other big names, rank third and fourth amongst 42,000 shareholders of the Indian company. Presidents of both Snia and Asahi are also on the board of BRC. With these influential connections in the international field, it is expected that the nylon plant will perform very well. Snia and Mitsubishi have already given to BRC 300 tonnes and 100 tonnes of caprolactum, respectively, which, in the prevailing acute world-wide shortage of this essential raw material, is of great help to the infant plant. BRC's management believes that the products of this plant will match the world's best in quality.

PRECISION BEARINGS INDIA, which makes ball and cylindrical roller bearings, has secured a 'letter of intent' for manufacture of 18,000 numbers of spherical roller bearings. These bearings, to be manufactured for the first time in the country, are specially used by railways, steel plants, cement factories, paper mills and other heavy industries. The project, estimated to cost Rs 170 lakhs, is expected to be completed by August 1975. On full utilisation, the new plant is estimated to add Rs 470 lakhs to the company's turnover which was around Rs 330 lakhs in the year ended August 1973. Meanwhile, installed capacity at the existing plant has been stepped up to 28.82 lakh numbers per annum, which alone should lift the turnover to around Rs 500 lakhs. It is also proposed to modernise part of the existing plant for which an application will soon be submitted to government. As an interim measure, reconditioning of the machinery is in progress. The first phase of modernisation is likely to be over by 1975-76. The entire scheme of expansion and modernisation will involve capital outlay of Rs 450 lakhs, including Rs 215 lakhs in foreign exchange.

WEST BENGAL

Despite the INTUC

DURING the good old colonial days, the Indian Jute Mills Association (IJMA), led by the British jute magnates, was reckoned as the real government of Bengal; a general strike by the jute textile workers was therefore deemed to be little short of a rebellion. However, much water has flowed down the Hooghly in the past quarter of a century, and many significant changes have occurred in the political and industrial contours of this state. Most jute mills have passed from European hands into Indian ones, particularly of Marwari business houses; the white managers have gone home, leaving their spacious and beautiful bungalows on both banks of the Hooghly to their brown brethren; and, more importantly, the weightage of jute textiles in the industrial matrix of the state has declined appreciably as a result of the growth of other industries, particularly of engineering industries.

Secret Conclaves

But what has survived is the misery of the jute textile workers and the jute-growing peasants. The workers still have to live in the same 8 ft by 6 ft hovels — which, way back in 1937, had excited Jawaharlal Nehru into the outburst that they deserved to be blown up with dynamite —, and they have still to subsist on lowly wages. The growers of raw jute for their part are still deprived of a fair price — thanks to the manipulation of the market by the millowners and their benami agencies — in a market that forces them to part with their crop at Rs 30 to Rs 45 a maund though the floor price fixed by the government is Rs 58 a maund. The open tie-up between Clive Street and Writer's Building may have dissolved, but it is now the Marwari big business which wields a large measure of power in the state, particularly through the secret conclaves of the ruling party bosses.

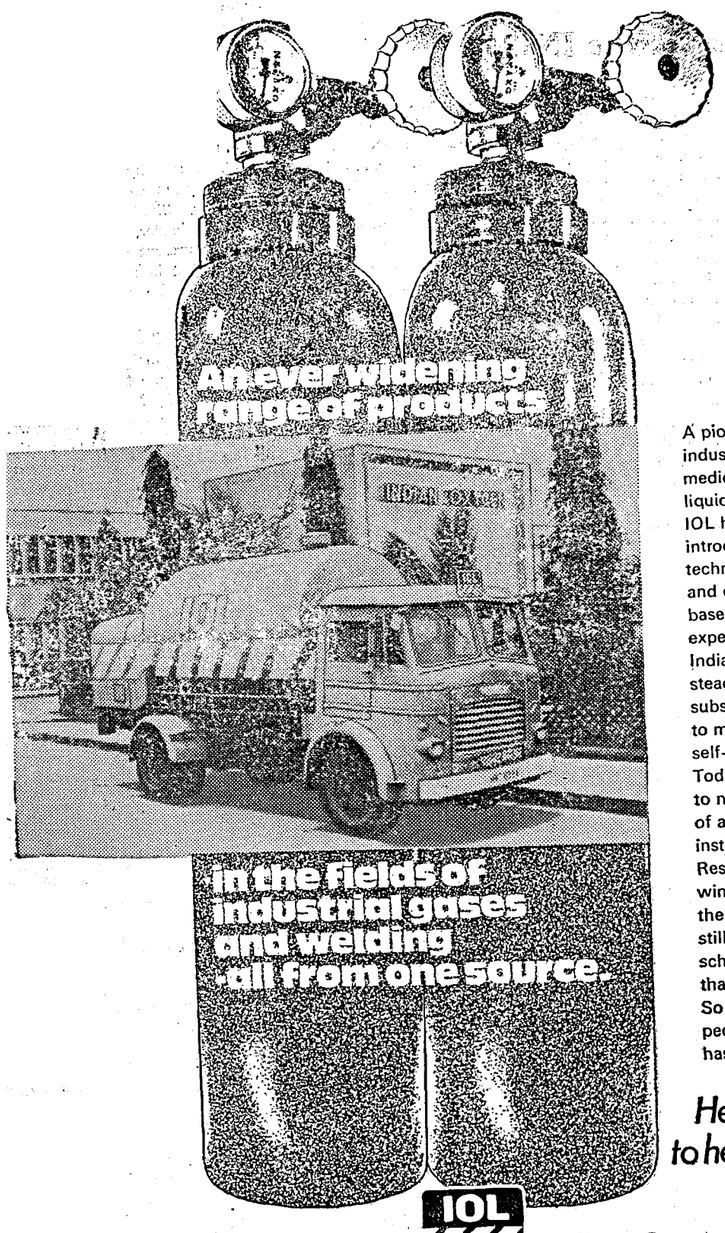
And yet, a silent revolution must have occurred in the sooty hovels of the more than 250,000 jute textile workers. For, they contemptuously decided to ignore the government-sponsored midnight agreement between the IJMA bosses and the INTUC leadership, and to join almost to a man the general strike sponsored by the six trade union centres headed by CPI(M)'s CITU and CPI's AITUC. This is the more striking because the INTUC had always been regarded as a major force among the traditionally pro-Congress jute-mill workers of West Bengal of whom by far the great majority are from outside the state.

In their initial bewilderment at this unexpected rejection of their leadership, the INTUC leaders tried to ascribe the turn of events to a 'communication gap' — *viz*, to their failure to acquaint the workers with the facts and terms of the settlement which was reached in the early hours of January 13-14. However, their subsequent efforts to bridge the so-called communication gap, though these were powerfully aided by All-India Radio and the establishment Press, failed to have any visible impact on the strike situation. Indeed, in complete disregard of the fiat of the INTUC leadership and the exhortations of the ruling Congress party and the government, vast masses of hitherto pro-Congress workers and large sections of local INTUC and Congress activists have worked unitedly with the striking trade unions — including those belonging to the CPI(M)-led CITU — for the success of their struggle. The close liaison between CITU and AITUC, has helped underpin the jute workers determination to bypass the subservient leadership of INTUC which has taken the workers for granted and bartered away their vital interests.

Demands Rejected

The present general strike, which started on January 14, 1974, is the culmination of a long process of a united campaign — in which the INTUC, too, played an important part. In fact, all the trade unions, including the INTUC, which had attended the tripartite meeting convened in New Delhi by the Union Labour Minister on December 18 and 19, 1973, decided unanimously to reject the petty concessions offered by the millowners and to go on a strike as from January 14. Indeed, identical strike notices were served on the managements, as well as on the government, by all the trade unions.

Earlier, on November 5, INTUC had even taken part along with other unions in a one-day, token, general strike. It is still a mystery what eventually persuaded the INTUC leaders to back out at zero hour. What is even more striking is that, under the terms of the agreement signed by INTUC, all the common demands on which the quarter of a million jute workers had been steadily mobilised over the last two years were rejected by the millowners. Significantly, the veteran INTUC leader, Kali Mukherji, MP, who was present at the parleys, slipped away just before the signing of the agreement and soon afterwards left for Delhi.



Of the 14 items on the charter of demands, the major ones agitating the jute workers are (i) fixation of grade and scales; (ii) higher bonus; (iii) full employment or relief to *badli* workers; and (iv) full protection of earnings of the jute workers who have been subjected to lay-offs or interruptions of work on account of load-shedding.

Paltry Concessions

What the millowners conceded in the eve-of-the-strike agreement is: (i) annual increment of one rupee per month, (ii) lump-sum payment of Rs 45 per worker in settlement of the demand for higher bonus, and (iii) setting up of a tripartite body with the state Labour Minister as the chairman who will have the power to arbitrate in the absence of agreement between the nominees of the millowners and the workers. The agreement includes neither any guaranteed minimum nor any principle on any of the disputed questions, for the guidance of the tripartite body. Instead, in return for these paltry concessions, the agreement signed by the INTUC leaders seeks to commit the jute mill workers not to raise any demands with financial implications for the next two years.

The other two major demands contained in the strike notice — one regarding the nationalisation of the jute mills and the other regarding trade in raw jute — found no place even in the last round of the tripartite negotiations.

The strike has continued for a whole week and, so far, there has been no overt move from any Congress quarter to break the strike. But pressures from New Delhi and Writer's Building, not to mention from the jute barons, are mounting for 'effective action' to break the strike.

A pioneer in the fields of industrial gases, welding, medical gases and apparatus, liquid oxygen explosives—IOL has over the years introduced the most advanced technology and equipment and contributed its expertise based on world-wide experience in the service of Indian industry. Through a steady process of import substitution, IOL has helped to make the country virtually self-sufficient in these fields. Today IOL is moving on to new fields—manufacture of air separation plant, for instance. IOL's Diversification, Research and Development wings are busy examining the technological gaps that still exist and preparing schemes for new projects that will fill these gaps. So that it can serve the Indian people in the future as it has in the past.

Helping India to help itself.

House-Sites on Paper

OF the many gaps between the Punjab government's claims and achievements, that relating to the allotment of house-sites is perhaps the most glaring. An official statement released last year had said: "Conscious of the fact that housing represents one of the basic needs, the present ministry decided to implement the [site-allotment] scheme on a time-bound basis." In pursuance of the ambitious scheme, impressive ceremonies were held at Amritsar and a few other places some months ago, raising high hopes among the homeless. But the multi-million-rupee scheme remains on paper; physical possession of not even a single site has been given so far, five months after the target date.

Cruel Joke

A brochure captioned "Socio-Economic Development in Punjab", issued by the government a few months ago to mark the silver jubilee of Independence, had claimed that "already the target of allotment of 1.70 lakh house-sites has been achieved... A majority of the beneficiaries of the scheme are members of the Scheduled Castes and backward classes... Punjab is the only state in the country which has undertaken to complete this task in the short period of eight months... to impart a feeling of complete security to the down-trodden". Actually, the scheme so far looks like a cruel joke on the down-trodden. The only achievement is the completion of a survey of eligible persons for allotment of plots. These have been found to number 3.21 lakhs. The government tried to secure donations of land for the scheme and addressed an appeal to landowners. However, no donations worth the name have come.

Out of government land in the various districts, 1,84,531 sites were marked out, each measuring 100 to 150 sq yards. The Centre had promised Rs 150 for developing each site. However, against the estimated requirement of Rs 482.85 lakhs for this purpose and the state government's immediate demand for Rs 277 lakhs, the Centre has actually released less than Rs 8 lakhs.

No allotment of housing sites has materialised in Haryana either, but at least this state has made no loud claims in this regard. Plans are now being formulated to allot sites to Harijans and the Deputy Commissioners have been directed to "hurry up". Last July the government was reported to have "initiated" steps to provide sites to all houseless people in the rural areas and the entire programme was supposed to be completed by August 15, 1973. But hardly any progress has been made so far. Unlike the Punjab government, the Haryana authorities have been keeping silent over the implementation of the scheme.

*

Haryana is the first among the states to have presented the 1974-75 budget; it has even secured the state assembly's approval for the budget. This expeditious disposal of business by the assembly was dictated not by any considerations of public interest — in fact, such early and premature estimates lead to wide discrepancies later in the year — but by party exigencies. Chief Minister Bansi Lal was anxious to be free by the third week of January to devote himself to the Congress election campaign in western UP where his personal prestige is at stake. So he decided to score another "first" to impress the Central leadership. The two-week budget session concluded on January 18. That 11 bills, besides the Appropriations Bill, were passed in one day shows the way in which business was rushed through.

The Rs 318-crore budget has a Rs 18-crore deficit, against last year's deficit of Rs 14 crores. The Finance Minister maintained that the state's fiscal position was sound despite the heavy debt liability which would amount to Rs 289.4 crores by April 1 next — an increase of Rs 21.57 crores in a single year. The expenditure on debt repayment now forms the largest single item of state expenditure on revenue account, exceeding even the much-publicised outlays on irrigation and multi-purpose projects.

No new taxes have been proposed in the budget, though the Chief Minister has repeatedly announced the government's intention to mobilise more resources for development purposes. The budget speech hinted at additional imposts later and within a week the government did bring forward two taxation measures. Both are, however, relatively minor in their scope. The first raises the market fee from Re 1 to Rs 1.50 for every Rs 100 worth of goods and commodities brought and sold in the notified markets. The fee will now be on the Punjab level and the proceeds are expected to be spent on improving facilities extended to the growers in the market areas. The second measure raises the tax on sugarcane purchases from three annas (19 p) per maund to Rs 1.50 a quintal. The Agriculture Minister has given the assurance that the tax on sugarcane transactions would be recovered from the purchasers. The state government has also decided to raise the court fee from Rs 13 to Rs 25 and change the basis of the levy to the market value of the land in possession suits. This enhancement would add to revenues by Rs 38 lakhs annually.

Half-Hearted Measure

The budget estimates have exposed the hollowness of another much-publicised "first". Last year the Haryana government imposed a comprehensive Land Tax which was expected to net an additional Rs 3 crores. The government claimed to be the first to have tapped the rural sector for additional resources in accordance with the Raj Committee's recommendations. But the measure has been implemented half-heartedly and the yield in 1973-74 comes to only Rs 70 lakhs. The Minister remained silent on the reasons for this failure of implementation, though he described it as "unfortunate".

The bubble of Haryana's rising per capita income has also virtually burst. While the growth rate in the Fourth Plan is estimated at 8.8 per cent, official statistics show that per capita income (at 1960-61 prices) has been declining during the last three years — from Rs 437 in 1970-71 to Rs 434 in 1971-72 and Rs 426 in 1972-73. The economic stagnation implied in these figures contrasts sharply with the government's claims of "spectacular progress" in various fields. What is more, it has been found that the state had recorded the highest growth rate (9 per cent) during the years 1965-69 when the heavy investments, now being proclaimed from the house-tops, had not been made.

FRESH ALTERNATIVES FOR INDUSTRIAL ENTERPRISE:

Join forces with IDCOL in a large industry.

A PROVEN RECORD GUARANTEES ITS SUCCESS.

Today IDCOL is a motivating force behind the rapid industrialisation of Orissa. The Corporation has succeeded in building the stable infrastructure of industry. And this is not surprising, because IDCOL has a wealth of experience setting up large manufacturing units covering diverse fields of activity—pig iron, ferro alloys, cables, re-rolled steel, cement, ferrous and non-ferrous castings, industrial salt and chemicals. Sure proof that IDCOL's grand plan for development is fast getting results.

And that's not all. There's much more on the anvil—like a nylon yarn plant, an automobile tyre and tube unit, a sponge iron complex, a jute mill, and calcium carbide and chrome chemical units among others. This then is the shape of things to come in Orissa.

IDCOL's peformance also bears full testimony to the industrial climate of the state—peaceful and productive. The environment where an industry can be planned for growth. So if you have some investing capital that can be utilised profitably in a large industry, why not go into fruitful partnership with IDCOL in a joint venture. The entire resources of the Corporation are at hand to ensure the success of any project.

Why not write today and get the details. IDCOL may have a proposition that's just right for you.

UTTAR PRADESH

Low Key, High Stakes

M R

THE Prime Minister's blistering attack on the Opposition at Mathura on October 2, was for all purposes the beginning of her crash campaign to win the Uttar Pradesh elections. The ragtag Opposition had organised a feeble black-flag demonstration, and that perhaps was the provocation for the strident tone of her speech. But her style of campaigning has changed vastly since. On Jaunary 2, she had to abandon her meeting at Nagpur where the audience was sullen and a section of it hostile. It is significant that she has chosen to ignore the Nagpur incident in her subsequent speeches, though 40 over-enthusiastic Congress MPs rushed to the Press with a statement suggesting that the Nagpur disturbances were the beginning of some sinister 'Rightist plot' against the Prime Minister.

Listening to her recent speeches in Uttar Pradesh, one got the impression that she has no new slogan for the campaign. She is content to defend the old *'Garibi Hatao'* slogan, while promising plenty in the remote future. She has also been keeping her speeches on a low key; the tone is persuasive, not aggressive as in the past. She has refrained too from her usual denunciatory attacks on the Opposition. Almost as a rule, some of the Central Ministers from Uttar Pradesh as well as some prominent personalities in the state Cabinet apart from Chief Minister H N Bahuguna adorn the rostrum, and they do much of the speaking. The function at Narora on January 13, to inaugurate the work on an atomic power project — the first stage of which is to materialise in 1981-82! — falls into the pattern. The Prime Minister's persuasiveness, moreover, is underpinned by promise of several major projects.

Sarvodaya leader Jayaprakash Narayan has charged the government leadership with political corruption in the make-believe inauguration of numerous high-cost projects in the state on the eve of the elections. The Mathura refinery, the electronics outfit at Ghaziabad, the Sahadra-Saharanpur rail link, the Narora atomic power plant, and the biggest fertiliser plant in South Asia at Phulpur — are all still on paper. The cynic tots up the value of the projects at Rs 600 to 700 crores; all of them were hurriedly announced or formally inaugurated between October and now.

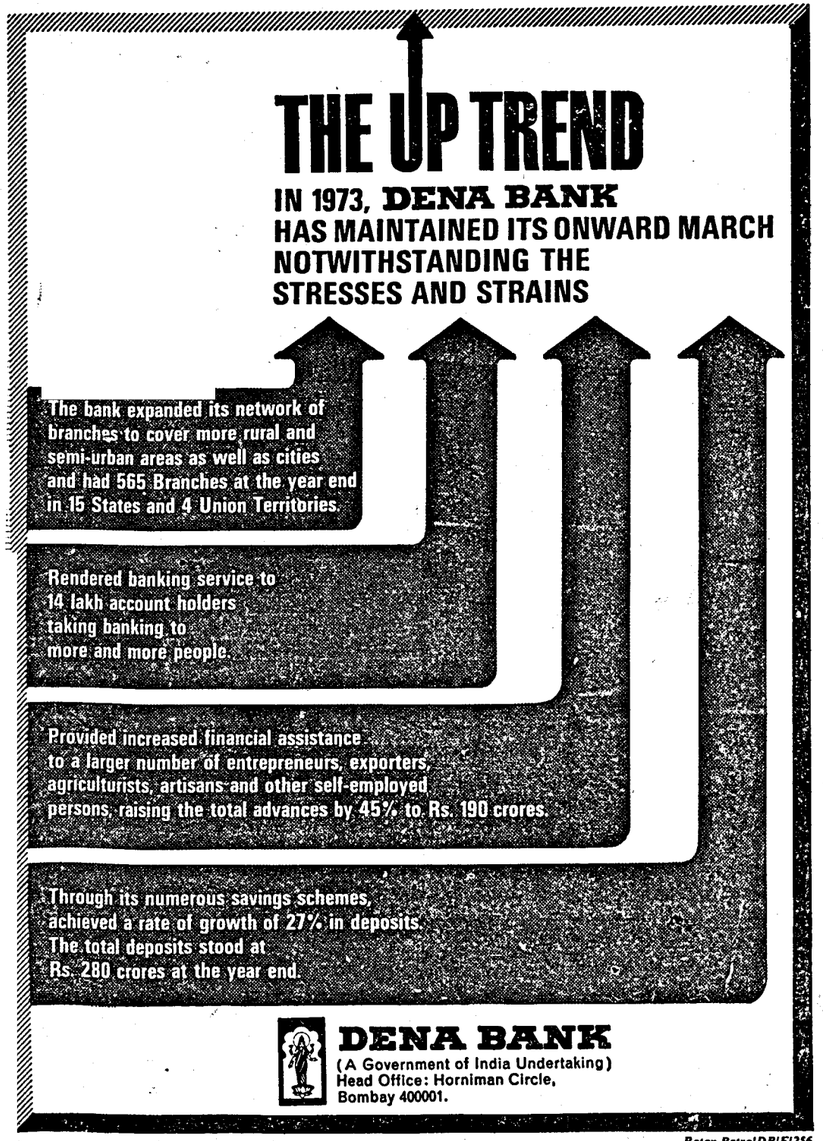
At Narora, therefore, Indira Gandhi seemed self-conscious about the political reaction to the bonanza of projects-on-paper. She said the atomic power plant to be set up there was no election gimmick; it had been thought of as early as 1967. Chief Minister Bahuguna was quick to correct her — '1971', he said. Uttar Pradesh personages (the state Cabinet has for all practical purposes been functioning from New Delhi these days) have confronted heads of public sector undertakings with the question: "What have you got for UP before the elections?". That is how one of the industrial-units-to-be was wrested for Uttar Pradesh — without so much as a feasibility report.

In a planned economy, projects are not to be doled out of a brief-case, as it were, just because the party in power at the Centre has to win the elections in a state. Yet, Uttar Pradesh has struck not only a veritable mine of projects. It has had rain on it other pre-election bounties as well. Name any scarce commodity and the state has got plenty of it — sugar, cement, vanaspati, fertiliser, kerosene. Cane prices were raised and a Cane Corporation set up in a year of bumper harvests, to placate the kulaks who have block votes to deliver. Also, there has been a corporation for metalware in Moradabad, another for footwear in Agra, new textile units, increased pay and allowances for government staff, confirmation of those on temporary service. Uttar Pradesh has never had it so good, though the Congress has ruled it since Independence, except for the short spell under Charan Singh's Samyukta Vidhayak Dal government and another under Congress-O.

Uttar Pradesh accounts for one-sixth of India, and has provided all the Prime Ministers in the country. It is larger than a lot of other countries, in terms of its population. It is Indira Gandhi's power base. It cannot be lost by the Congress. The absence of a formal Opposition alliance may not enhance the chances of the Congress if the by-election trends are any indication. Even in multiple contests (as in Banka, where Madhu Limaye won, or in the Bombay and Ramtek by-elections for the Lok Sabha from Maharashtra, or earlier on in Dindigul in Tamil Nadu) the pattern has been unmistakable. The Congress cannot bank on the multiplier; it cannot bank on winning seats out of proportion to the votes polled because Opposition votes will be divided. Anti-Congressism too has its logic. The electorate has demonstrated its uncanny instinct to spot the winner and vote in his favour to defeat the Congress. Multiplicity of candidates has not worked out to Congress advantage just as a direct contest has not always helped the non-Congress candidate.

Even the CPI, which is an electoral ally of the Congress, admits that the Indira wave of yesterday has given way to a stormy anti-Congress hurricane. There is no united, state-wide challenge to the Congress in Uttar Pradesh; but the most meticulous assessments, made available to the Centre by the proper quarters (and these reports determined the choice of candidates by the Central Election Committee of the party) hedged their bets. It could be anything between 185 and 200 seats for the Congress in the 425-member House. This is the most optimistic estimate. The Congress might even manage a post-election majority through defections because the bill to ban floor-crossing is safe with the select committee and will not become law before the budget session of Parliament is out.

Among the imponderables are the Muslim vote and the vote of the socially and economically handicapped sections (i e, the Harijans and other backward classes). On these the Congress had capitalised in the past. The Muslim Majlis and the Muslim League, in ensuring that the Muslim vote does not help other Opposition parties — specifically, the Jan Sangh —, may thereby freeze it for the Congress. Which is only a negative gain. Nevertheless, the Congress is losing what it gained in the 1971 Lok Sabha elections: It has lost the Harijan and backward class vote; the middle-class vote is also an uncertain factor.



Indira Gandhi had won her home state in the 1971 Lok Sabha poll without any party structure to back her. The situation has not changed since. The vertical mobilisation she could achieve is hardly possible now.

No wonder that, in the massive mood of anti-Congressism that obtains in the state today, Indira Gandhi has chosen not to attack the Opposition but to

keep the campaign on a low key despite the high stakes involved. Loss of Uttar Pradesh or even a marginal victory there would mean a political crisis in neighbouring states such as Bihar and Madhya Pradesh. It would mean a party crisis at the Presidential election, in August, when V V Giri's term ends. It would mean a greater leverage for the Pradesh bosses *vis-a-vis* the High Command.

The list of Congress candidates has been weighted in favour of H N Bahuguna in keeping with the pattern set by the High Command, signifying sabotage by the dissident group. The bogey of a 'Rightist' takeover of Uttar Pradesh, conjured up by the CPI, will not help the situation any because, even by CPI's own admission, the state is the social and political base of 'Right reaction'.

Money intervention is, therefore, the last weapon left in the Congress armoury, as the tide of anti-Congressism swells. A Congress victory, say, with about 35 per cent votes polled (like the 38 per cent polled in Bombay Central-North) will be a hollow one — a passive protest by a populous electorate. A marginal defeat might mean a Congress ministry with the help of defectors. As it is, every third Congress MLA in the state happens to be a defector. A decisive Congress defeat, leading to a non-ideological coalition in office, would mean chaos in the state with spin-off effects on neighbouring states. The crisis will then rise in a vortex towards New Delhi.

AMNESTY INTERNATIONAL

Growing Repression in Asia

A G Noorani

AMONG all the non-governmental international organisations functioning today, few command the respect for independence and integrity which Amnesty International does. Amnesty's concern is the release of "the prisoner of conscience", that is, "any person who is physically restrained (by imprisonment or otherwise) from expressing by words or symbols any honestly held opinion and who does not advocate violence".

Amnesty's founder was a British lawyer, Peter Benenson. Although he practised commercial law, his interest in fundamental liberties took him to places like Hungary, South Africa, Cyprus and Spain either as defence counsel or simply as an observer to watch a trial. In 1961 he read of two Portuguese students who had received seven-year prison terms for no more than raising their glasses in a toast for freedom. He contemplated, at first, lodging a personal protest with the Portuguese Embassy in London, but thought the better of it. A more effective idea, the core of Amnesty's present technique, suggested itself. Why not a chorus of protests from many sides?

Benenson discussed the idea with Eric Baker of the Society of Friends and together they worked out its implications. Benenson set them out in an article entitled "The Forgotten Prisoners" in *The Observer*, London. He announced the establishment of an office to collect information about political prisoners and to work for their release, and expressed his readiness to help groups willing to join in this task. Amnesty was thus launched on its way on the evening of Saturday, May 28, 1961 when the early editions of *The Observer* carried the article. The article was widely reprinted, and the response was overwhelming. Benenson and Baker convened a meeting of supporters from Britain, Ireland, France, Germany, Belgium and Luxemburg. Amnesty was formally brought into being.

"Persecution", a Penguin Special, written by Benenson, about the time, reflected the breadth of his concern. Among others, it set out the cases of Agostinsho Neto, an Angolan Doctor and poet imprisoned by the Portuguese; Olga Ivanskaya and her daughter in Russia; Antonio Amat, a Basque Socialist in one of Franco's prisons, and Hu Feng, an independent Marxist writer jailed in China.

It would be very hard, indeed, to have a central office large enough to deal with all such prisoners. What the institution does is to collect the facts and transmit them to its volunteer supporters who work in the group system, peculiar to Amnesty. Each group consists of from 6 to 20 members which makes itself responsible for the release of prisoners of conscience. It followed rigidly a rule of threes, adoption of three prisoners — one each from the West, the East and the non-aligned parts of the world. "By choosing one prisoner of conscience from each area of the world, we stress that the Amnesty movement has no political considerations, it is impartial between the rivalries which bedevil the world." The rigidity of the rule has been relaxed but not the impartiality underlying it.

The Group "adopts" prisoners and goes to work on their behalf. However, and this is another and salutary peculiarity of Amnesty's working rules, a group, or for that matter a National Section of the international organisation, may not adopt prisoners in its *own* country. This at once preserves the group's detachment and places responsibility on foreign opinion in a matter properly of international concern.

The group writes to the embassy of the government concerned and, if possible, discusses the case with someone in authority there. It writes, also, to the Minister or official directly involved in the imprisonment and secures the interest of any international organisation concerned with the particular prisoner of conscience. It would even write to the managing director and chairman of commercial concerns with trading interests with the prisoner's country. Finally, it keeps up a regular campaign of press publicity about its efforts to secure release.

As Martin Ennals, Secretary-General of Amnesty International writes in the latest Annual Report, "What started as a special campaign in 1961 is now a permanent campaign, with a permanent staff of researchers producing information about political prisoners and their treatment and servicing a membership in 62 countries, in 32 of which there is a central national organisation dedicated to work for the release of prisoners of conscience and the abolition of torture and the death penalty. . . . During its first year of life Amnesty compiled a list, with personal details of 1,200 prisoners of conscience; persons in prison because of their political or religious beliefs, their colour or their ethnic origin. Today not only are 1,200 Amnesty groups of members working for individually adopted prisoners, but there are also many thousands of other prisoners (the names of whom in some cases are not even known), who are the subject of Amnesty action, benefit from Amnesty relief programmes, or are within the purview of Amnesty concern."

Last December, Amnesty climaxed its campaign against torture by holding a conference in Paris for the Abolition of Torture.

An Indian Section of Amnesty International has been set up, largely on the initiative of Mridula Sarabhai. Its President is M C Setalvad, former Attorney-General of India. The Section's office is at A-23 Kailash Colony, New Delhi-48.

Amnesty International's Secretariat has an excellent Research Department which collects information and feeds it to the groups and National Sections. The Report tells us, "The number of cases taken up has continued to grow, and so has the number of released prisoners. During the calendar year 1972, the cases of 1500 new prisoners were sent out to the groups, and there were

842 releases; in the first five months of 1973, 818 new case sheets were constructed, and 520 prisoners were released. Amnesty International of course does not claim all the credit for the releases. The performance of the Research Department, it can be assumed, will further improve when the Latin American Department starts using the contacts it has recently established and when the Middle East unit goes into action.

"In addition to the work on individual cases, we have published several major reports dealing with political imprisonment, torture and the state of human rights in several countries; in September 1972 the report on torture in Brazil appeared; the Draft Protocol on Civilian Prisoners in Indochina was followed by the report on Political Prisoners in South Vietnam, which was published in July 1973; the Indonesian submission to the United Nations and the Indonesian Special — a joint publication with the Dutch Section — were prepared. Unfortunately, the *Chronicle of Current Events*, a reliable record of the state of human rights in the Soviet Union, which was published in English translation by Amnesty International, stopped appearing in Moscow; November 27 of the *Chronicle* was the last one to be published."

An idea of Amnesty's technique of work is afforded by the following case in the US. "The policy of looking behind alleged criminal cases to determine, with a view to adoption, the existence of miscarriages of justice instigated for political purposes, has been extended. Accordingly, it was decided to adopt Martin Sostre, the owner of a radical 'Afro-Asian' bookstore. He had been convicted of the illegal sale of narcotics. The principal police officer involved was subsequently suspended from the police force and the main witness against Sostre signed an affidavit confessing to participation in a frame-up. With the assistance of a thorough report prepared by the German USA-Co-ordination Group it was determined that Dr James Grant has been falsely convicted in North Carolina of burning riding stables and assisting fugitives from justice. He has been adopted. An observer was sent to the Los Angeles trial of Daniel Ellsberg and Anthony Russo who were responsible for publication of the secret Department of Defence study on the origins of the Vietnam War."

As regards the other super-power, the Report says "the past year has seen an intensified campaign against the dissident movement in the USSR ... On December 30, 1972, the Soviet Union celebrated the 50th anniversary of the founding of the USSR. The Chairman of Amnesty International sent a telegram to Mr Brezhnev on this occasion, calling for an amnesty for all political prisoners. The Soviet Union did declare an amnesty, but like that of 1967 this did not cover those sentenced for political crimes."

The most depressing passage in the Report concerns Asia. "The dominant feature of Amnesty's work in South, East and South-East Asia is the vast scale of political imprisonment when compared with other regions; in 3 countries alone, Vietnam, Bangladesh and Indonesia, the total number of prisoners easily exceeds 200,000, most of whom are not only unsentenced, but have undergone no form of legal proceedings."

Amnesty vigorously campaigned for the release of the prisoners of war and civilian detainees in India, Pakistan and Bangladesh after the 1971 war. "In July 1972, a prominent Singapore lawyer visited Bangladesh briefly to investigate for Amnesty the situation of large numbers of alleged 'collaborators'. Although assured that the accused would be given fair trials, he reported that the scope of the Collaborators Order under which they were being held was very wide, covering at the same time cases of grave criminal offences and atrocities, as well as simple co-operation with the then government during the months after March 1971. In October the Home Minister announced that the number of arrests had risen to 42,000 and more arrests were still to follow ... At the end of May, the Secretariat's researcher of the area went on a research mission which included Bangladesh to collect information."

Bangladesh has announced an amnesty for "collaborators" since the above was written. Another welcome development since the Report was published was the Indo-Pak Delhi Agreement on the POWs and civilian detainees.

But what the Report has to say about other categories of detainees in India and Pakistan deserves be set out *in extenso*. "Although Martial Law was lifted in Pakistan early last year, soon after the civil Government came to power in December 1971, the State of Emergency evoked one month earlier still exists. Under the Defence of Pakistan Rules, which provide for 6-month periods of preventive detention, a number of politicians, well known journalists and students have been arrested for shorter periods, and then re-arrested immediately after their release. Of the 16 cases Amnesty took up, 11 were subsequently released. One of the prisoners is now serving a 5-year sentence under Martial Law for making an 'objectionable' speech."

Of India it records, "About 17,000 people are held under preventive detention in West Bengal, detained on allegations of Naxalite activities. The arrests were first made under the Maintenance of Internal Security Ordinance which was passed early in 1971 to deal with the situation of Naxalite violence then existing in the state. But they have continued even though the situation has improved considerably. Early in 1973, Amnesty International approached the Indian Government to release those against whom no criminal charges could be brought."

The following passages from the Report concerning Nepal and Sri Lanka complete South Asia's unhappy record:

"At the beginning of 1972, King Birendra announced plans for moderate reform and moves towards a more liberal policy. But when students and the (outlawed) opposition raised their demands for political change in the summer, a number were detained. Seven parliamentarians and former prime ministers were arrested under the old Security Act, among them K P Bhattarai, who was adopted by Amnesty International in 1968 and had spent years in prison previously for his vigorous advocacy of the 1960 system of parliamentary democracy. All these were adopted by Amnesty, as well as some 50 cases of students. Group work, however, has experienced difficulties and has not so far met with any official response."

What of Sri Lanka? "No precise figure is known for those still detained under the 1971 Emergency Regulations in Sri Lanka. In December, the total was put officially at 5,000 of whom 2,500 would be released 'by the end of the year'. But unofficial estimates suggest that the real figure is nearer 8,000, and informed sources in Colombo have expressed their disappointment at the slow working of the Government's much-publicised rehabilitation schemes. Some further arrests took place early in 1973 and in May, the International Secretariat wrote to Mrs Bandaranaike, the Prime Minister, asking for information about the total numbers and location of those still detained, and about the Government's plans for their trial or release."

Government Expenditure and Income Distribution

Public Expenditure and Income Distribution by Mohammad Zahir; Associated Publishing House, 1972; pp 191+xiv; Rs 30.

THERE has been a dramatic distribution of benefits of public expenditure in favour of the poor in USA, says a recent study by Herriot and Miller (*Business Horizons*, February 1972). Could it be true of India? That is the central theme of this doctoral dissertation by Mohammad Zahir. The subject is of considerable interest both to academics as well as policy-makers for none of the income distribution studies made so far for this country takes any account of the impact of public expenditure though it is being increasingly realised that measures of income distribution remain deficient unless they take note of the pattern of public expenditure, since, with public consumption growing rapidly, private goods form "only a subset of commodities which contribute to household welfare" (Henry Aaron in *National Tax Journal*, December 1969).

Incorporating the provision of public goods in welfare comparison between different income groups, however, raises difficult conceptual problems of which the most formidable perhaps is that of valuation of public goods consumed by each household. For a satisfactory solution one has to go in for Samuelson's 'quasi-prices', that is, what the households would be prepared to pay for goods and services provided to them through programmes of public expenditure. Such subjective valuation being infeasible, alternative methods are required for the treatment of public goods in income distribution measurement and that calls for a reasonably clear analytical framework.

Zahir's study does try to give, as the preface says, 'an analytical framework' while presenting the "results of an empirical-cum-analytical objective study of the influence of the changing pattern of public expenditure on distribution of income in India from 1951-52 to 1965-66". But the analysis shows little awareness of the conceptual knots and consists mainly of a collection of the views of well known authorities (Lewis, *et al*) on subjects like equality, growth, etc. In fact the first chapter is devoted to an examination of the rationale of equitable distribution but the discussion ends up with some trite observations such as "A more equitable distribution of income and wealth is preferable to a less equitable one in that a more effective access to a wider range of alternatives is secured for a larger part of the population". One should have thought that the case for equality rests on firmer grounds than that. The next chapter provides a survey of the available estimates of income and wealth distribution in India but much of the material is presented uncritically without any serious attempt to go into their shortcomings. Presumably these two chapters are by way of preliminaries meant to provide a perspective for the study which is concerned with the redistributive effects of public expenditure. But the space (and time) spent on the preliminaries — they occupy more than a quarter of the book — do not seem to be commensurate with their contribution to the development of the main thesis.

In studying the effects of public expenditures on income disparities, the author first takes the reader through the figures of revenue and capital expenditure of the central government for the period, the various components of expenditure and its break-up under the heads 'Civil Administration' and 'Social and Developmental Services'. To see what the state governments have done with the tax-payer's money, the author uses the concepts of "development" and "non-development" expenditures. For assessing the redistributive effects, public expenditure is classified under three major heads:

(i) Expenditure on development services — which includes agriculture and allied services, irrigation and power, industry and mining, and transport and communications. These are believed to have substantial redistributive effect.

(ii) Expenditure on collective consumption — e g, on social services like education, health, and housing and social welfare.

(iii) Other expenditures — like defence and general administration of which the redistributive effects are difficult to identify.

Figures of expenditure are furnished under these heads for the first three Plan periods with their percentage shares in the total. It is seen that during the first three plans, of the total public expenditure roughly 50 per cent was devoted to development and of the remaining 50 per cent about 39 percentage points was spent on non-development purposes and only 11 on directly redistributive items, whereas in most of the West European countries, expenditure with a redistributive content accounts for 40-50 per cent of the total. And the pity of it is that not the whole of the expenditure that has an ostensibly redistributive purpose always helps the poor. Expenditure on education, for example, provides considerable assistance for the universities though few students of the working class or peasant families go to the universities. Similarly, in the matter of housing, the study shows that "almost all housing construction has been planned for the upper and middle class".

A good portion of development expenditure no doubt helps to redistribute incomes. But on the whole, the author feels, "it seems fair to conclude that for the bulk of the population the pattern of primary income distribution is not even slightly modified by Government action". That may be so, but the analysis on which this conclusion is based is much too sketchy to warrant any confident assertion. The development expenditure on agriculture, for example, needs to be gone into in greater detail to see which income-groups have reaped the benefits before any judgment about the effects can be pronounced. Similarly, one has to look into the break-up of expenditure on development of "Transport and communications" for an idea of the groups to which the benefits have largely accrued (e g, from import of Boeings for domestic services of IA, construction of posh lounges at air terminals, running of Rajdhani Expresses and provision of TV stations) and whether these have helped redistribution.

As regards purely redistributive expenditures too there could be scope for some scepticism as to whether they really serve the intended purpose and if so to what extent especially when large chunks of money earmarked for relief of the distressed go to fatten the bigwigs. Tracing the beneficiaries for every rupee spent by government is of course not feasible. But a more

thorough study than Zahir has attempted is required if the redistributive effects of public expenditure are to be properly assessed. As mentioned earlier, a few items are subjected to some scrutiny in the book, *viz*, education, health and social services. But the discussion proceeds somewhat tangentially to the main question. Thus at one place there occurs this comment: "A review of educational development programmes during the first three plans reveals that the educational system has not geared itself to meeting the needs of our growing economy which is based on various short and long term social and economic objectives" (p 88). Similarly, for social services, the conclusion is that the effect of such expenditure on income inequalities has been small because the amounts spent on these services are relatively small. Suggestions for pension and insurance schemes for the aged and the unemployed are not favoured by Zahir because in his view those who can be taxed to raise the resources needed for the purpose are numerically small. His remedy is a "more thorough and integrated regulation of public expenditure so as to achieve desired redistribution of income and wealth". Then follows the inevitable recommendation for "an expert and independent body" to oversee the task.

The next chapter is on "Inflation and Pattern of Income Distribution", where the percentages of changes in national expendiutre and prices are duly noted but little indication is provided of how serious the impact of inflation has been on income distribution beyond statements like these "The middle classes are being wiped out, lower classes are in ruin" (p 123). The chapter, replete with concern for the damage done by inflation to equality concludes with a suggestion for a proper "incomes policy".

The penultimate chapter (the final one being devoted to summarising the conclusions) is devoted to an examination of the effects of public expenditure on regional inequalities. This part of the book furnishes at one place some useful data on the per capita expenditure on heads like education and health in different states, the state-wise spread of central government undertakings and other aspects of inter-state economic disparities. The conclusion is that "economic planning in India has not led to any noticeable change in the relative positions of the relatively developed and the relatively non-developed states" (p 152). But again the reasoning on which it is based is too loose and weak to make the argument a persuasive one.

Perhaps the limitations of a doctoral project did not permit the researcher to go deeply into the issues that the subject raises. The promise of the title thus remains largely unfulfilled. One hopes, the author will follow up the study to find more convincing answers to the questions he has posed for himself in this book.

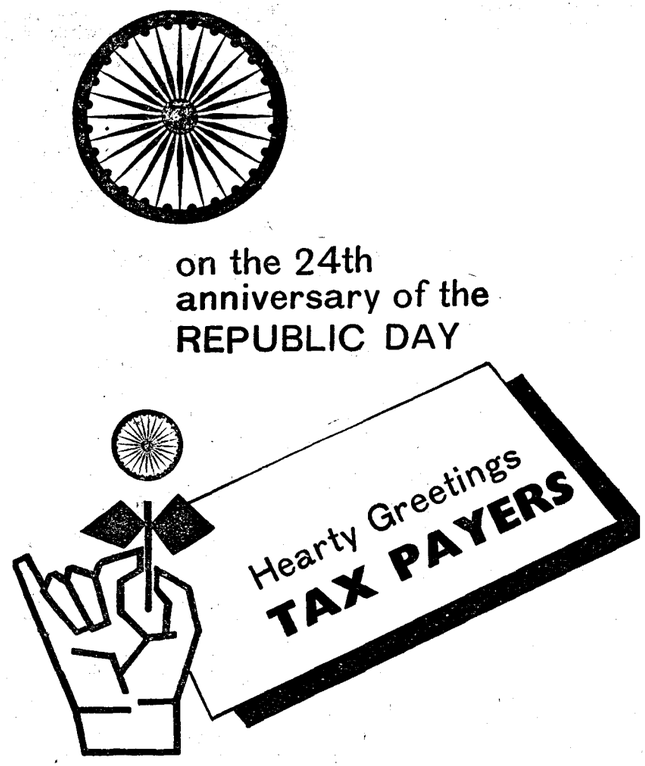
SPECIAL ARTICLES

Data Base for the Fifth Plan

Some Critical Gaps

J N Tewari

The information requirements of planning may be thought of for the different stages of the planning exercise: (i) plan formulation and target-setting; (ii) detailed project/programme formulation; (iii) project/programme appraisal; (iv) implementation evaluation or concurrent evaluation; and (v) ex-post evaluation of the impact of Plan programmes.



This note tries to bring out some of the crucial gaps in the data base of the economy which affect these different stage of planning.

THERE is growing awareness of data requirements for planning, but lack of data seems to be tackled on an *ad hoc* basis as and when the problems come up. Information requirements for the planning process should be thought of for the different stages in the planning exercise, *viz*, (1) plan formulation, and target setting; (2) detailed project/programme formulation; (3) project/programme appraisal or *ex ante*-evaluation; (4) implementation evaluation or concurrent evaluation; and (5) *ex post* evaluation or evaluation of the impact of Plan programmes. The purpose of this note is to bring out some of the crucial data gaps in the above stages that impede scientific execution of planning and to help bring about better awareness of the steps to be taken for achieving a more adequate data base for the economy.

I

Plan Formulation

The Approach Paper on the Fifth Plan put forward removal of poverty as one of the two major objectives, and to achieve that end, emphasised reduction of inequality on the one hand and adequate growth on the other. Poverty is defined in terms of consumer expenditure per capita per month of about Rs 40 (in 1971-72 prices). One would normally expect poverty to be thought of in terms of 'personal income' data but this could not be done because personal income data are at present not available. The Integrated Household Schedule No 16 in the NSS rounds (23rd, 24th and 25th) collected data on receipts and disbursements, from which income figures for the household can be built up. The real question is whether the data so derived would give a consistent estimate of savings if consumer expenditure figure obtained from the other NSS schedule is deducted from the income figure so estimated. The NSS(O) has not, to my knowledge, released any estimates on these lines for the 25th Round but such an exercise appears to be rewarding firstly for improving schedule No 16 with a view to give dependable estimates of income and secondly, for assessing which of the two estimates could serve the purpose of the plan-

ners better as an indicator of poverty — the consumer expenditure estimate or the income estimate so derived.

Inequality is thought of in terms of consumer expenditure per month per capita (based on the NSS data) for the top and the lowest 30 per cent of the population and in terms of the urban/rural ratio of these figures. Sectoral growths are worked out for the variant — with reduction in inequality and without reduction in inequality. The removal of poverty objective together with reduction of inequality sub-objective leads to the assumption in the planning exercise that the lowest 30 per cent of the population will have in the terminal year of the Plan income enough for meeting the basic minimum needs (which is put at Rs 39.6 for the urban and Rs 36.6 for the rural areas in 1971-72 prices).

Growth Rate and Plan Size

From the angle of adequate growth the figure of 5.5 per cent is indicated as against the achievement of about 3.7 per cent in the past decades, and a Plan size of Rs 51,000 crores is postulated. On the question of the total size of the Plan, the decision is mostly based on the financial resources picture. This requires estimation of savings from different sectors. The Approach Paper gives the following figures:

	(Rs crores)
(i) Public sector	14,965
(ii) Financial institutions	688
(iii) Private sector	28,310
(a) Corporate (4,011)	
(b) Cooperative (229)	
(c) Household (24,070)	

Savings accruing in the household sector are thus put at about 17 per cent of that in the public sector; but how dependable are the estimates of the household sector? While the figures on accretion of financial assets to the household sector (Rs 19,105 crores) and on net borrowings (Rs 4,855 crores) are relatively more dependable, it is not clear how the figure of direct investment by the household sector (Rs 9,850 crores) has been built up, even though it satisfies the hypothesis (thrown up by some other studies) that net borrowings are half of the direct investment in this sector. There is a strong need of a household survey to give firm estimates of this parameter. The survey could also bring out how much of the borrowings in the household sector are used for investment purposes and how much for consumption purposes.

Besides resources or the feasibility consideration (including the limiting factor of implementation capacity), one can look upon the size of the Plan as derived in another way; by taking the figure of gross domestic product for the base year of the Plan and applying the overall rate of growth considered adequate from the angle of removal of poverty. This brings into focus the importance of the base year figure of gross domestic product. The Approach Paper gives this figure for 1973-74 as Rs 43,070 crores. If one applied to gross domestic product for 1970-71 (Rs 36,319 crores as given in the Economic Survey) a 2 per cent rate of growth for 1971-72 as well as 1972-73 (which, again, is mentioned in the above document) and a 5 per cent rate of growth for 1973-74, one gets a much lower figure; there seems to be an overestimation of more than Rs 2,000 crores. Obviously, there is need for making the national income figure firstly more up-to-date and secondly more firm and based better on primary data.

While the National Income work in our country started in the CSO in 1950-51, the national series still suffers from severe data gaps — only abou 50 per cent of the estimate is based on primary data. The estimates for the unorganised sector — the household enterprises and the unregistered establishments — need priority attention. A household survey is required. Both from the angle of making the task manageable administratively and also to insure reliability of the data collected, it may be wise to consider in such a survey the household enterprise as a *unit* and forget about industry-wise classification within the activities of the household unit.

Sectoral Growth Rates

The decision on the pattern of growth (i e, sectoral growth targets) in the planning exercise for the Fifth Plan approach is not based purely on the material balances technique. The major innovation in the present exercise is the enmeshing of the 66x66 sector consistency type input-output model with the consumption model based on the NSS data. But this exercise has brought out the need of achieving better consistency between the 66 sectors used in the input-output model and the 22 product classifications used in the consumer expenditure data of the NSS. While for items like cereals, pulses and foodgrains, the classification is the same in both the models, the problem becomes complicated for items like 'other agriculture' in the input-output model. This item includes many heterogeneous NSS items like (i) fruits, vegetables, spices; (ii) sugarcane, gur, betel nuts and leaves, tobacco, groundnut, home-made vegetable oils; and (iii) straw husk, etc. Further, the NSS classification for collection of data as it stands at present is unnecessarily detailed for agricultural commodities but not detailed enough for consumer durables and for manufacturing items. Break-ups on expenditure for some agricultural commodity groups can be safely avoided: like jowar and jowar atta, bajra and bajra atta, maize and maize atta, etc, various types of vegetables, pan leaf as distinct from pan finished, supari as distinct from pan supari, and so on. On the other hand, there is need to have more homogeneous classifications for manufactured consumer items, in particular, manufactured durables of various sorts. Also, the basis for the NSS broad group classification seems to be final use and not similarity of input structures. The latter criterion may answer better the questions that planners are interested in.

Another major problem is to have the NSS consumption data in more detailed expenditure classes. At present the tabulation is for 12-13 fractile size groups. The top fractile group (90-100 per cent decile) may have to be broken into 90-95 per cent and 95-100 per cent groups.

There can be another type of criticism of these growth figures for the different sectors, *viz*, to what extent the figures given in the Approach Paper for the mass consumption goods items are adequate to satisfy demand which would arise if the assumed degree of inequality is reduced. It is true that the Plan calculations on the two variants — (i) with reduction of inequality and (ii) without reduction of inequality — give different figures for such items. But the question is whether the differences are high enough.

	Growth Rates Percentage With Reduction in Inequality	Growth Rates Without reduction in Inequality
Vegetable oils	5.25	4.45
Cotton textiles	5.10	4.59
Foodgrains	3.99	3.13
Sugarcane and gur	4.94	3.45

Similarly, one can question whether the growth figures given in the Ap-

With Best Compliments

of

BRAKES INDIA LIMITED

Padi, Madras 50

proach Paper for the luxury sector items are low enough considering the objective that the top 30 per cent of the population or at any rate the top 10 per cent of the population should reduce consumption of luxury items. Data should be built up at the macro level to examine the above two hypotheses.

In this context it should be emphasised tha the sectoral classification as made permits at a glance comparison of only one luxury item, *viz*, radios (page 23-24 of the Approach paper) for which the growth figure without reduction in inequality was 9.11 per cent as against 3.46 per cent for the variant with reduction in inequality. The sectoral classification given are not disaggregated enough to show at a glance the growth targets for many luxury items. If the implications of the Plan objective are to be clearly understood, the classification has to be made much finer and the luxury items clearly identified.

There is need to mention another critical data limitation which constrains inter-sectoral allocation of funds of the Plan formulation stage, *viz*, sectoral estimates of incremental capital output ratios. The Approach Paper recognises that "It has not been possible to workout incremental capital output ratios on the basis of observed response of output to investment", and mentions that "work has been initiated in the Planning Commission on the computation of incremental capital output ratios and the delineation of time phasing of investment".

II

Project Formulation and Appraisal

While the importance of a shelf of projects from which really sound projects could be selected for inclusion in the Plan after scientific project appraisal is well recognised now, adequate steps are not taken in advance to see that the data which go in the Detailed Project Reports (DPRs) are of adequate quality. Figures on resource potential and production possibilities are very often assumed without a firm empirical base. The same is true about demand projections. The alternatives about output-mix from the projects are inadequately documented and as a consequence some are lost sight of in project formulation and project appraisal work. In the case of irrigation projects, for example, the assumptions about different cropping patterns in the command areas of the project are not always realistic. The same is true about the yield rates and changes therein over time because of adoption of improved varieties and such other factors. During the screening stage of such projects much time is, therefore, lost in revising the estimates and redoing the exercise.

Similarly, price data are very often not firm in the way project reports are prepared at present. This becomes critical because in project appraisal exercises one finds that the returns (in terms of internal rates of return, or net present value) are very sensitive to output prices. Price analysis needs adequate attention on two counts — one, to build up a proper base for primary data and, two, to determine the proper price concept to be used. The following prices from a recent exercise on a bamboo plantation project in southern UP give an idea of the degree of variation in price figures. [1] A forest project is a good illustration because getting market prices in this sector is complicated partly because of the disorganised market and partly because of long-term contracts.

	Stumpage Prices of Bamboo Per Air-Dry Metric Tonne
(i) Southern Circle U P	Rs 52 (Average for the period 1967-68 to 1971-72, based on auctions of the bamboo; and on prices paid by Rohtas Mills)
(ii) Import substitution price	Rs 65
(iii) Social price	Rs 160

The significant difficulty in getting the primary data on the first price concept relates to the air-dry weight unit of the commodity. The weight of bamboo differs with the extent of driage and prices are not available at uniform driage content. In the second price an attempt is made to estimate how much India would be willing to pay for the bamboo stumpage rather than import long fibre chemical pulp to replace bamboo pulp in paper making. The procedure involved would be to take into account the CIF price of the imported product comparable to the bamboo pulp and to get the value of the raw material 'bamboo stumpage' as a residual item by deducting from the price of the imported pulp the cost of local manufacturing. Further, by deducting transportation and exploitation costs one can find the import substitution price of stumpage. As regards social price, one can take into account the effective protection of Indian paper and pulp industry for which an estimate of 42 per cent is given and add it to the stumpage price of bamboo. While items (ii) and (iii) show also conceptual differences, even getting the primary data for the first and making price projections for the future is an intricate problem.

The last item in the above para brings out the need of estimating a few parameters at the national level like social rate of discount, shadow price of foreign exchange and shadow price of capital, which are critical for project appraisal work. Unless their values are worked out concretely by an appropriate organisation, say the Project Appraisal Division of the Planning Commission (in consultation with the Public Investment Board) and accepted by the Union/state governments and all project authorities and adopted in the selection of Plan projects, scientific appraisal will not be adopted as a routine step in investment-decision making.

In this context it may not be out of place to emphasise that the administrative system should make it obligatory to fulfil certain minimum levels of data requirements; only then will the procedure be automatically followed and the data gap reduced. For example, if the application for licence in required to be accompanied by a feasibility report on the project and as a rule the letter of intent is not issued unless the feasibility report is received and examined by the licence issuing (or any other suitable) authority, the data gaps in the project report would be filled by the applicant and would not be left to be discussed at a later stage as happens very often at present. It is true that such an administrative requirement would throw a heavy burden, firstly, on small entreprencurs who may not be well equipped, technically and financially, to get feasibility reports prepared and, secondly, on the licence application processing authority in terms of examining the feasibility report. This step would, nevertheless, be in the right direction and would help right decision-making on investments. The logical corollary of the step would be simultaneous strengthening of the technical facility both to the small entrepreneur and to the body entrusted with the task of examining the feasibility reports and the DPRs. Another example may be quarterly reporting on orders, deliveries and payments as far as capital goods investments in the public sector

enterprises are concerned. The data will be extremely useful for analysing lags and, thereby, achieving better forecasting of such investment requirements at the time of budgeting.

III

Implementation Evaluation

While in India evaluation of rural development programmes received good attention through the work of the PEO in the Planning Commission right from the inception of the Commission, monitoring of projects has been emphasised only recently. There is imperative need of institutionalising a system of effective project control to reduce time slippages and cost overruns in the case of projects. It is not only important to identify the bottlenecks and causes of shortfall and the lagging areas, through critical scrutiny of the physical and financial progress of the interrelated phases of the projects in question but to do so in advance and to take corrective action in time. This implies a careful watch on the progress (including the physical progress) of inter-related other projects which are to supply the inputs for the projects under consideration at specified times and also on the time requirements of the other projects for which the outputs of the particular projects are to serve as inputs.

The data obligations of this function are progress reporting from the specific projects along with from inter-related projects with the specific objective of periodical (say quarterly) issue of instructions on corrective steps to the project authorities in question. The key-note of the progress reporting should be to bring to the notice of the higher level authorities unanticipated happenings, deviations and exceptions which have to be taken care of. More specifically, there should be a system to prepare quarterly project status reports indicating (a) actual as against planned expenditure; (b) physical and financial progress in terms of critical milestones of the project (like land acquisition, buildings/civil works, machinery/ equipment ordered, received; steel, etc); the progress could be expressed as percentage of the targets for the individual physical items of activity; composite performance indices could also be prepared; (c) the obstacles which stand in the way of timely completion of the project, considering the actual stage achieved by the project — pre-construction, construction, production — and also the consequential steps to be taken by the project authority in question and by the project authorities of the related projects; (d) the consequential revision of the time schedule of implementation of the project and the related input requirements in terms of time from related projects; and (e) the costs of the slippages in terms of overall time and production. The need is to institute detailed progress reporting from the projects, at least the core plan projects; to systemise the analysis of progress data and have 'action reports' on the corrective action needed. Operationally, the critical task is to get the corrective action taken by the executive ministries in time. To this end, the Monitoring and Evaluation Unit in the Planning Commission is being reorganised. Some Monitoring Groups have been constituted to study a few projects (as case studies) with a view to streamlining the monitoring and information system.

The success of the monitoring exercise lies in achieving three steps: (i) identifying in advance the bottlenecks which will result in immediate time slippage and cost overrun in the completion of the project or shortfall of project production; (ii) suggesting corrective action; and (iii) seeing that the suggested action is implemented in time and that the consequential revisions in time scheduling and costs are figured out. For the first step, a suitable data system must be built so as to throw up warning signals. These warning signals should be meant for two different levels (i) for the projects and (ii) for the sectors of the economy and the economy as a whole. The Economic Planning agency [2] in Japan has worked out what it calls 'Business Warning Indicators'. The following 12 items are selected: wholesale prices of raw materials; wholesale prices of industrial products; job-opening received; extra working hours (manufacturing); average outstanding issue of bank note; deposit money; increase of lendings of banks; mining and manufacturing production index; ratio of manufacturer's inventory to shipment; ratio of labour cost to sales (manufacturing); orders of machinery industry (private, excluding shipping); and private construction orders. In the relevant table there runs also a row captioned 'total judgment'. The Economic Planning Agency publishes monthly trends in these warning signals. A similar attempt, but more elaborate and articulate, needs to be made, with clear-cut distinctions in the signals for the economy, for the sectors and for the projects.

IV

Ex Post Evaluation

From the angle of *ex post* evaluation, the planning process requires information on the impact of Plan programmes and a built-in system where the results of impact evaluation are taken into account for improving Plan implementation. The present system seems to fail on both these counts. For the first, the only significant attempt was made by the Programme Evaluation Organisation in 1964 through a detailed study in which the Central Statistical Organisation, the Indian Statistical Institute, the Reserve Bank of India and the State Bureaus of Economics and Statistics participated and data were collected and tabulated at the level of the NSS three-digit level regions on consumption, employment, adoption of improved practices, education, health, etc. The study brought out data on about 37 indicators but the analysis did not go much further. Nor it is being repeated at the end of the Fourth Plan period. Serious thought should be given to having at regular intervals Plan impact studies, preferably at the beginning and end of each Plan.

A scientific impact study requires a well worked out methodology for rating the states/regions on a development scale. The steps involved would be selection of the indicators and determination of proper weights for preparing a composite index of development. For working out the indicators of development, apart from per capita national income the usual procedure is to consider the different components of levels of living like nutrition, health, education, housing, communications, transport and services, and sectors of the economy like agriculture, industry and trade and determine the key variables on which it is feasible to collect regular data. The variables are chosen to throw light on both developmental and structural changes. The exercise would mean starting with a longer list of indicators, say about 80, and then weeding out the 'not-so-sensitive' indicators. Thus by a process of elimination, a small list of very sensitive indicators — the hard core of highly intercorrelated indicators—would be derived. This is the type of exercise [3] done by the United Nations Research Institute of Social Development. But all may not agree [4] with the notion of development adopted in the above document, *viz*, development is, to a large extent, by its nature a system of inter-dependent variables'; 'the factors or aspects whose

change constitutes development must necessarily be correlated with each other in a developmental data array'. Many will dispute that inter-correlation is the right basis for determining the sensitive indicators or for deciding their relative weights. This may not fit in with the other notion that components of levels of living may be given their importance on the basis of the percentage of national income which originates from that item. The above criterion also disregards differences in the relative quality of consumption like consumption of foodgrains *vis-a-vis* of TV, radio, etc. At any rate, the approach of a composite index of development based on suitable weights would be a better basis of ranking different states or region on the development scale than a simple method of assigning scores on the basis of the different indicators and then considering the aggregate scores. The latter approach disregards the difference in the ranges of values for the different indicators. Thus, for having a scientific impact study on the above lines, regular data should be built up for the initial year and the terminal year of the Plan at the regional or district level (the particular area unit chosen for analysis), and periodical analysis made, preferably thrice, first, at beginning of the Plan, then at the end of the mid-year of the Plan, and finally at the end of the Plan.

Employment and Under-employment

In the context of a study of impact of Plan programmes, it may be relevant to stress the importance of indicators of employment in view of the emphasis in the Fifth Plan on creation of employment opportunities as an instrument for reduction of poverty and achievement of income redistribution. A distinction should be made between indicators of (a) level of employment (or more specifically of unemployment and under-employment), (b) structural changes in the pattern of employment (like percentages of economically active population engaged in agriculture, industry, trade and services) and (c) effectiveness of the different Plan programmes in terms of employment generation.

For the first, the Dantwala Committee report had suggested that the use of the single dimensional estimate should be discarded in favour of multidimensional estimates; that in the NSS surveys the system of getting the labour force picture for each day of the preceding week (instead of for seven days as a whole) should be introduced and that there should be supplementary probing questions. The NSS has also accepted the idea of determining 'principal' activity on the basis of total intensity during the reference week; but even with all these improvements, doubts may still linger [5] about the concept being refined enough for conditions in the rural areas. The 27th Round of the NSS, which is to be completed shortly, will estimate the level of unemployment during different seasons in terms of the total number of days unemployed, as percentage of the total number of days in the labour force during the reference week. The Bhagwati Committee on unemployment (May 1973) has not suggested any specific improvement in the concept but maintains that "in our view the estimate of the unemployed should include the persons who are wholly unemployed as well as those who have work for less than 14 hours a week". The Committee's figure of unemployed persons in 1971 comes to 18.7 million. For future improvement, it has recommended that "the NSS should undertake every five years, full scale surveys into employment, under-employment and unemployment, including data on the per capita income and expenditure levels of households, so as to assess the employment situation in relation to suitably disaggregated segments of the population." While there is definite need of such a quinquennial study, in order to have meaningful estimates, the tabulation programme of the NSS must provide for cross classifications on labour time worked, additional hours available for work and expenditure variable. Thus, an attempt should be made in the analytical exercise to combine the time criterion, the poverty criterion and the willingness to work criterion for measuring under-employment.

For building up unemployment and under-employment data, it must be realised that the information is more useful operationally if available at the micro level — say, for the district, block or panchayat. And this can be managed if collection of statistics is linked to the actual operation of the scheme. A notable illustration is the Rural Employment Guarantee Scheme which is being implemented by Maharashtra government since April 1972, which requires that persons who are unemployed or under-employed should go themselves registered with the village panchayat indicating the type of work they seek and the duration for which they seek work. The panchayats are expected to provide employment to those registered persons who want manual work in those areas. The scheme would throw up useful data on the incidence of seasonal under-employment, locality-wise, as a by-product of its administration.

For assessing the effectiveness of Plan programmes in terms of employment generation, there is need to pick out selected programmes for study by special organisations like the Programme Evaluation Organisation and the Bureaus of Economics and Statistics. The Bhagwati Committee has specifically suggested the rural electrification programme in this context to be studied by the PEO. Such a study should really answer two questions. One, whether the target of employment generation has been achieved. Second, whether employment generation has been efficient and permanent. It has to consider the quality of employment generated and whether it was worth the financial and social cost involved. Obviously, such a study cannot fit in a general design of study of the impact of Plan programmes.

The study of impact of Plan programmes is expected to provide data base for preparing a composite index of development. There is, of course, the question of utilising such an index of development (at the state level) in the allocation of central assistance to the states, in addition to the five criteria already in vogue (population, tax effort, backwardness, needs of continuing irrigation and power projects and special problems). Unless the index is operationally used in decision-making the *ex post* evaluation will remain ineffective and would not be utilised in improving implementation of the Plan. On the other hand, if the idea of using this index in decision-making on the allocation of Central assistance funds is accepted, it will be better to supplement the development index with another 'performance index' where the different items of activity for the Plan programmes are taken into account, like the minimum needs programme, employment programmes, rural industries projects, etc.

Besides throwing light on the impact on Plan programmes, *ex post* evaluation has another important function in the field of project planning, *viz*, to analyse divergence between the benefit (or more precisely net benefit after

deducting costs) as originally planned in the project report and as actually received after the project reaches its production stage. Such an analysis is functionally important as feed-back to improve the project formulation exercise, "to refine and develop the *ex ante* evaluation model" [6]; more specifically, to identify the common biases in the detailed project reports as far as estimates of quantum and prices of output and input are concerned as well as the usual lapses in the time scheduling and phasing of the project. The UNIDO Guidelines on project evaluation (1972) emphasised this function of evaluation; "the evaluation of projects formulated may reveal some bias in formulation e g, a tendency to draw on too much imported equipment or too little domestic labour."

V

Conclusion

The above brief review brings to the fore many critical gaps in the data base of the economy — some in respect of national series and national parameters; some in micro level information, particularly at the project and the district (or sub-region) levels; some in analytical ratios, norms, yardsticks; some in classifications and cross classifications; and some in the basic primary data, which can be filled up only through well designed surveys. The planning work in the first stage emphasises the need to build up disaggregated figures for different national parameters like capital output ratios and to achieve better consistency in the commodity classifications of the field enquiries of the NSS and the analytical work of the input-output tables. Data on household savings and investments have to be built up through surveys. Further, the unorganised sector (including household establishments) has to be surveyed to fill up the primary data gap in the national income series. The series has also to be made more up-to-date. A review of the present developments in the second and third stages of planning work emphasies the lack of adequate attention to the quality of project level data, particularly in respect of output and input prices, output mixes and demand projections. Values of national parameters like discount rate, shadow price of foreign exchange, etc, remain to be finalised for project appraisal work. Administrative rules and procedures have to be geared up to build some of the necessary statistics as by-products — for example, by insistence on feasibility studies with the applications for licences or on registration with the Panchayat as in the Maharashtra Rural Employment Guarantee Scheme. For monitoring of projects, effective progress reporting needs to be done through well designed but brief formats and checklists. For *ex post* evaluation, data gaps could be filled through a comprehensive study of the impact of Plan programmes and a quinquennial survey of employment could be usefully linked with it. Proper cross-classifications in the tabulation plan need more adequate attention, as they go a long way to throw up estimates meaningful for analytical purposes in the planning exercise. This is most crucial in the employment sector. While depth studies on effectiveness of employment generation could be planned on *ad hoc* basis separately by suitable organisations, the case for Plan impact studies rests on building up a composite index of development and at a level below the state (say sub-regions, if not districts) so that regional imbalances could be analysed and effective watch kept on the extent to which regional disparities are reduced.

In brief, there is greater need for "new and better data on the distribution of benefits as well as costs of these [Plan] programmes." [7] The data system must support project/programme appraisal. "We must not only redesign our basic unit of observation but we must also conceptualise the entire data system to provide for more accurate descriptive and predictive capacity" [7]. The latter is increasingly becoming more important for planning purposes. The forecasting of exports and imports; of investment requirements for capital goods budgeting; of the leads and lags in agricultural prices; the response behaviour of farmers to different types of improved inputs and dosages (as in the case of fertiliser) are areas where data gaps become critical. Further, the data system must be built up to throw up warning signals for the economy as a whole, for the more critical sectors and for the core projects of the Plan. This will necessitate, on the one hand, building up of micro level data of adequate quality by the project authorities for public programmes/projects evaluation and monitoring and on the other, integration of socio-economic indicators into a "social analogue of the national accounting system". [7]

It should, however, be clearly understood that identification of critical data gaps is only the first step; ordering of priorities in filling up the gaps is the second. And this task is relatively more difficult, if the economics of information is given due weight in the decision making, as it should be. For the identified items costs and benefits of getting 'information' should be quantitatively studied, keeping in mind the alternative strategies and procedures of building up the necessary data. Again, the procedure, extent and form of summarisation of data at the different levels is important because of the triangular nature of the flow of information with the base at the lowest (project authority) level and vertex at the top-most level. The base is largest in terms of quantity but the top has the benefit of maximum purposeful information being presented briefly.

[The views expressed in the paper are those of the writer.]

India and the Market of South and Southeast Asia

Ranjit Sau

There are several forces at work as a result of which the market for industrial goods in India tends to remain inelastic. The pattern of distribution of income and wealth, and the nature of technology imported from abroad are two of the major factors which are responsible for this inelasticity. In any case, so long as output restriction at home is a profitable proposition, who would care for export promotion!

The foreign demand for India's traditional exports is lately picking up, but the buoyancy of these agro-based or agro-related commodities is not likely to offer a long-term solution for India's exports. Among the non-traditional exports the potential strength of India lies precisely in those goods which embody the technology that is suited to Asian conditions.

In its own course Indian industry perhaps would not orient itself in the direction of developing the new technology. A suitable institutional framework has, therefore, to be provided to achieve this objective.

The author here puts forward the broad contours of such a proposal.

THE other day when President Richard Nixon and General Secretary Leonid Brezhnev were shaking hands in the White House a voice rose across the border up north, in Ottawa. It was the voice of the Prime Minister of India who was then visiting Canada. She reminded the countries of the Third World that the other side of the coin of the big power political detente might be big power hegemony over smaller countries. It is no coincidence that the same theme also ran through the fourth non-aligned summit conference at Algiers.

The 1970 is a decade of historic events in south and southeast Asia. The American military withdrawal from Vietnam, the emergence of Bangladesh as a sovereign state, the upheavals in Sri Lanka, Pakistan and Afghanistan, the struggle in Laos and Cambodia, these are all integral parts of an unfolding drama. But the drama can well turn into a tragedy.

I

In large tracts of south and southeast Asia the ravages of war have piled up on the age-old burden of abysmal poverty. The reconstruction and development of the countries in this region is a stupendous task. 'Garibi Hatao' is proving to be a fathomless gorge; when it is combined with the problems of rehabilitation of war-torn refugees, of reclaiming the erstwhile green lands now lying dead with a million tonnes of TNT, and the like, the enormity of it all can hardly be exaggerated. From Dacca to Da Nang, from Kabul to Colombo from Delhi to Jakarta, the picture is not identical, but in essence is much the same.

You can hire half a dozen economists to figure out the material requirements for reconstruction and development of south and southeast Asia. They can even compute for you the areas of comparative advantage for India, and produce a list of goods and services India can hope to export to the region. But the world does not wait for the Indian economists to calculate it. Japan is already preparing to exploit the vast Indo-China market; if it has not gone full steam ahead it is because of the restraining effect of the USA which is bent on promoting its own self-interest. The postwar reconstruction of North and South Vietnam alone is estimated to cost between $ 5 and $ 10 billion, an amount that is equivalent to as much as one-third of India's national income. More than five years ago the United States had made up contingency plans to capture the postwar Indo-China market. If this is not a superb example of long range corporate planning, what else is?

If the giant corporation in London, Paris, Bonn, New York and Tokyo have stacked their drawers with blueprints for exploiting south and southeast Asia, they have also found some economists to supply them the coordinates of a theoretical rationale. Under the auspices of the Asian Development Bank the well known Burmese economist, Hla Myint, now residing in England, has produced a poor man's Pearson Commission report, designed and tailored for Southeast Asia.[1] He has pleaded for completely opening the doors to multinational corporations. The indigenous entrepreneurs are advised by Myint to concentrate on minor irrigation works, feeder roads, simple agricultural tools, and the like, leaving the field of 'incentive' consumer goods as well as 'strategic inputs' — that is to say, the bulk of the industrial sector — to the super-efficient multinationals that will consummate the grand marriage of the economies of large scale production with the celebrated Hecksher-Ohlin theorem.

No doubt, the multinational corporations do have supreme managerial skill, sophisticated technology, and massive resources. Each of the largest four of such companies has an annual sales turnover of over $ 10 billion; that is to say, any one of them has the strength to take up the entire work of reconstruction of North and South Vietnam together. More than 200 of them have crossed the one-billion mark of sales turnover per year. The total book value of investment of all the multinationals in 1971 reached the bizzy height of $ 160 billion. The holdings of hard cash by the multinational corporations of the USA alone aggregate $ 268 billion which exceed twice the total of all international reserves held in central banks and international monetary institutions.[2] For the countries of south and southeast Asia, dealing with such giants is like sleeping with an elephant whose one small twitch can smash all the ribs. After all, Chile is still fresh in many a mind.

The current world monetary crisis but a symptom of deep-rooted malaise of the western countries which are also the home of multinationals outside Japan. There are indications that in the years ahead the conflict among the multinational corporations of the USA, Germany and Japan in particular would intensify; and one of the active theatres of warfare is likely to be in south and southeast Asia. The big power political *detente* is only shifting the front from Europe to Asia, from open political-military hostility to

economic cold war.

Confronted with this world perspective, what can the countries of south and southeast Asia do? Do they have to mortgage their sovereignty, equality and freedom in exchange for the dollar, pound, mark and yen? What is the role of India at this juncture?

II

On October 16, 1973 the Prime Minister, in the course of a press conference in Calcutta, observed that a certain section of the Big Business in India was exploiting the current economic difficulties by further restricting their production in order to reap high profits.[3] It can be argued that this is not a temporary, recent phenomenon. The Indian industry always has had a very narrow consumer base in the sense that the top ten or twenty per cent of the consumers claim most of whatever is produced by industry. Indeed, these consumers are a small oasis of high income in the desert of dire poverty.[4] In such

TO ALL OUR POLICY HOLDERS:

WE OWE YOU AN APOLOGY AND AN EXPLANATION

We are doing the best we can, but it's really not in our hands anymore.

We know you have been tremendously inconvenienced by the disruption of services at LIC. Here are some facts you should know:

Why has LIC declared a lock-out?

The Unions want a wage increase which would add up to Rs. 12 crores extra. Why should the policy holder foot this exorbitant bill? In its counter proposals LIC offered to increase the average monthly income per employee by Rs. 115 and the total wage bill by Rs. 6 crores. What do these Rs. 6 crores add up to? It means, a peon's emoluments go up to Rs. 390/- (minimum) and Rs. 726/- (maximum) and a clerical assistant's emoluments rise to Rs. 467/- (minimum) and Rs. 1447/- (maximum). Plus both Class III and IV employees' DA is directly linked to the Cost of Living Index. Which means, every time the Cost of Living Index shoots up, salaries keep pace with it. Can anyone mistake these for low salaries?

How does the LIC agitation affect you?

People die. Policies mature. Policy holders require their money. But when LIC employees disrupt work, policy holders cannot get their money when they need it most. Our officers are doing their best to cope with the pressure of work in the hope that there will soon be a resolution to the dispute, and things will not only return to normal but improve.

An appeal

LIC appeals to its employees to give up the agitational approach. To give a thought to the fact that while it provides employment to its staff, it provides security to millions of policy holders. And funds for development of the country.

Until LIC and its employees resolve their differences, and may this be soon, we appeal to our policy holders to bear with us.

Life Insurance Corporation of India

circumstances evidently the creation of artificial scarcity rather than mass production is the golden key to super profit. And the Indian situation is very much typical of that in many other parts of Asia. During the early sixties in Pakistan, for example, 62 per cent of consumer goods industry, 78 per cent of intermediate goods industry, and 50 per cent of capital goods industry were working at below two-fifths of capacity. Country after country — Burma, India, Sri Lanka — presents much the same pattern of enormous idle capacity. Incidentally, this is so not only in this continent. In Brazil, for instance, utilisation of capacity, reckoned at one-shift basis alone, is estimated at 53 per cent for capital goods industry and 65 per cent for consumer goods industry. Shortage of supplementary inputs due to administrative failures or foreign exchange shortage is presumably not the whole answer.

Thus the vicious circle is complete. India is a country of paradox where less production pays more. The pattern of income distribution being as it is, the market for industrial goods is limited to a thin stratum of the population. In such a case, the road to high profit lies through low output. Hence employment does not expand much, which in turn reinforces the ominous circle. On top of it, the circle is compounded by the nature of industrial technology, to which we now turn.

As a broad generalisation it is observed that, in the flow of technology in the world, India like many of other developing countries of Asia, Africa and Latin America is at the end of the receiving line. Sophisticated American technology is moving into Europe, and from Europe relatively obsolete technology is being pushed out into the Third World. This is the major current of technological flow in the world today, of course, there are other relatively minor ones. It is now well recognised that the technology of the west, American or European, does not sit well with the resource endowments of south and southeast Asia in particular. In fact, Gunnar Myrdal was once constrained to observe that the "scientific and technological advance in the West has had, and is having, an impact on the South Asian countries that is very detrimental to their development prospect". It is not our costs and our benefits that enter into the cost-benefit calculus of multinational corporations which develop, promote and transfer Western technology. In the fourth Asian Labour Ministers' conference held in Tokyo, India's Labour Minister K V Raghunatha Reddy "cautioned developed countries against exporting their 'obsolete' technology to the developing countries in the guise of 'appropriate technology". He continued: "What we, the developing countries, need is not the outmoded, obsolete technologies of the developed countries, but innovative technologies which are specifically adapted to the requirements of these countries in the different stages of development".[5]

Thanks, partly, to the nature of imported technology the share of wages in industrial income has been steadily going down in India, even though the wage rate per worker, with due allowance for price changes, had remained virtually stagnant during the three decades between 1939 and 1969.[6] And this has helped the top 10 or 20 per cent of the population to further consolidate their economic position.

Much like India, the countries of south and southeast Asia need innovative technology, not technology that creates economic enclaves, but technology that creates jobs for the millions. And, I believe, this is the area in which India has the best potentiality for setting an example.

India has a diversified industrial base, much ahead of many of the countries in this region. It has a relatively vast reservoir of industrial experience, of scientific and engineering skill. India's engineers, scientists, technicians, and artisans are capable of rising to the occasion, provided the government and the industry come forward to accept the challenge. For, innovative technology cannot be bred in laboratories alone, it has to be perfected in the punishment of every day use. It is not a set of formulas to be written on the blackboard; it has to originate from day-to-day experience. It has to take concrete shape in the form of machines, equipment and products which would create jobs, not displace labour. It would give a great fillip to the economy, if, for instance, the technology of small-scale fertiliser plant can be developed and adapted to Asian conditions so that every village could have a fertiliser plant. The Asian market for innovative technology is practically boundless; and one can be sure that the competition of giant multinational corporation will be much less severe in such fields. Should such a strategy be followed on a wide front, the multinationals can be even held at bay on Asian soil. Clearly, this is not the Hla Myint strategy of complementarity with multinationals; but it is one of turning ourselves to the genuine needs of Asia which are basically not in line with the interests of foreign monopolies. India has the means — human, material and scientific — to translate this mission into reality. Whether these means would be correctly deployed is, however, another matter.

III

Recently India's exports are looking up; but it is mostly due to the unprecedented performance of overseas sales in textiles, just and leather manufactures. The revised, upgraded, export target of Rs 2060 crores for 1973-74 expects only a small component of Rs 190 crores from engineering goods, and another of Rs 180 crores from chemicals, rubber products and footwear. That is to say, India still does not have much by way of industrial goods apart from jute and cotton textiles that can be offered to the world in general, or south and southeast Asia in particular. Any likely prospect in future is bound to be overshadowed by the giant multinationals which are waiting in the wings. Besides, the light and medium engineering goods in which India has built up an export potential might be considered inessential imports by some of the importing countries, and therefore they would become the first casualty in the wake of any recession in those countries.

Of course, due to the revaluation of the Japanese yen, Indian exports have lately gained an edge over their rivals in the Asian market. Moreover, the current industrial boom in east Asian countries has set the stage where India can possibly carve out a firm place for its exports. But trade presupposes efficiency. And efficiency is indivisible. You cannot have an export sector which is efficient while the rest of the economy is riddled with wastage and incompetence. That is to say, if Indian industries aspire to make a strong bid for promoting their exports in Asian market in the face of stiff competition from super-efficient multinational giants — Japanese, American and others — the efficiency level of Indian industries themselves has to be raised. It sounds like a cliche; but nevertheless it can be overlooked only at one's own peril. A cliche it may be; but it can also be turned around to justify the inroad of multinational corporations into India's industries, all

in the name of efficiency and export. But one must not forget the lesson of South Korea. In South Korea exports are growing at the fantastic rate of 40 per cent a year, but so much is siphoned off by the foreign capital that the country runs up annually a huge deficit in the balance of payments which is in turn financed by yet more inflow of foreign capital. The merry-go-round continues; and meanwhile the economy sinks deeper into the quicksands of debt and still more foreign debt.

In the wake of postwar reconstruction in Asia, Indian exports of such items as textiles, textile machinery, sugar machinery and leather goods, are expecting a better future. These prospects are of course to be utilised and consolidated; but the fact remains that such goods cannot sustain an expanding market for India's exports in the long run. The relatively transitory buoyancy in a few agro-based or agro-related commodities must not lull the Indian manager into complacency.

It is also not sufficient to think in terms of the export market for non-traditional goods in general as such. The accent has to be placed on particularly those non-traditional export goods which would embody the innovative technology suited to Asian conditions. Only those goods can assure India a firm, growing market in south and southeast Asia. Moreover, it is in the long term interest of India's domestic market as well that industrial technology is adapted to its own factor endowments.

But the logic of the present situation in the Indian economy being as it is, there are doubts whether the Indian industry would reorient itself in this direction. If it does not, then an appropriate institutional framework has to be set up for changing its course. Ignoring the details for the moment let me present to you a proposal which is designed to help achieve three fundamental aims, namely, (a) the enlargement of the domestic market of India's industry, (b) the economic reconstruction and development of south and southeast Asia without surrendering to multinational corporations, and (c) the expansion of India's exports in this region.

It is well known that in all organised activities together, outside agriculture, the employment in public and private sector respectively is in the ratio of 3 to 2. But insofar as only factory employment is concerned the private sector has an overwhelming lead, accounting for approximately 80 per cent of the total.[7] It is also known that the backlog of unemployment has been mounting over the years; that none of the five year plans has been able to absorb the net addition to the labour force in the respective five years, let alone reduce the backlog. In recent years, the volume of employment in the private sector had been actually declining.

Against this background, let the big business houses in India be asked (not merely because they are big, but primarily because they do have the resources) to increase their own employment at the rate of, say, ten per cent a year. In case this proposal is accepted and effectively implemented, three consequences would follow: first, the domestic market of industrial goods would expand, and secondly, and more important, Indian industry would feel the urge for adopting labour intensive technology. The laetter would create an environment which is conducive to developing a new technology suitable to Asian conditions. And as we have argued above, the Asian market for innovative technology still remains largely untapped. So, thirdly, India then can profitably export this technology to the countries of south and southeast Asia.

Should the business houses be unable or unwilling to adequately increase employment, they would be asked to contribute a certain percentage of their annual turnover every year to a fund which would be utilised in promoting industries that are geared towards development and promotion of Asian technology.[8] To be sure, India does not lack competent engineers, scientists and artisans who can accept this challenge.

IV

To sum up, there are several forces at work as a result of which the market for industrial goods in India tends to remain inelastic. The pattern of distribution of income and wealth, and the nature of technology imported from abroad are two of the major factors which are responsible for this inelasticity. In any case, so long as output restriction at home is a profitable proposition, who would care for export promotion!

The foreign demand for India's traditional exports is lately picking up; but the buoyancy of these agro-based or agro-related commodities is not likely to offer long-term solution for India's exports. Among the non-traditional exports the potential strength of India lies precisely in those goods which embody the technology that is suited to Asian conditions.

In its own course the Indian industry perhaps would not orient itself in the direction of developing the new technology. A suitable institutional framework has, therefore to be provided to achieve this objective. We have put forward the broad contours of such a proposal. In a word, it is as follows: the business houses in India must increase their employment at a certain stipulated rate per year; otherwise, they have to contribute every year a fraction of their annual turnover which be then used for development of industries that promote and adopt Asian technology. This is one of the limited number of available options which can break the syndrome of output restriction, as well as the hegemony of Western technology, and simultaneously enable India to establish itself in the market of south and southeast Asia.

Notes

Police in Action

A DISTINCTIVE feature of last month's disturbances in the capitals of Maharashtra and Gujarat has been the persistent charges of police brutality. In Bombay, eye-witnesses have testified to the systematic use of force by the police to suppress peaceful meetings and processions organised by the Dalit Panthers even as those attacking the scheduled castes were more or less left alone to do as they pleased. As if to confirm that this was no aberration, a few days later the Bombay police stood idly by and watched as participants in a Shiv Sena procession looted South Indian restaurants and pavement hawkers' wares and murdered one of the hawkers. But when the hawkers in protest attempted to take out a procession to the Police Commissioner's office, the full fury of the police was turned against them and by the time the blood-letting was over, nearly 150 persons had been injured.

The partiality and high-handedness of the police in these two instances was so blatant that even the Bombay Municipal Corporation adjourned its meeting on January 30 without transacting any business to protest against "the reign of terror resulting in loss of life and property to the citizens and incidents of attacks on innocent people in the presence of the police". The unanimously-adopted adjournment motion alleged that the police "exhibited partiality in dealing with the situation and created apprehension in the minds of citizens that there was a virtual breakdown of law and order in the city". The leader of the Congress municipal party, seconding the motion, demanded an independent enquiry into "police excesses, police partiality and police indifference".

In Ahmedabad, the three-week long disturbances which finally forced the government to call out the army last Sunday were stoked by instances of police atrocities. Early in the sequence of disturbances, on January 5, the police and the SRP are alleged to have stormed into the hostels of the Gujarat University and beaten up students besides looting cash and other valuables.

In all these incidents the question may be asked whether the police was doing what it had been told to do by its political masters or whether it was acting on its own initiative. About the incidents in Bombay there is enough evidence of the Maharashtra government's vicious and vindictive attitude towards the Dalit Panthers — seen, for instance, in the manner in which the prominent leaders of the organisation have been arraigned on one charge after another — and of its close links with the Shiv Sena, to explain the police behaviour towards these organisations as having been government-inspired. At the same time, it is true that in both Bombay and Ahmedabad some of the excesses of the police have embarrassed the respective governments. However, the distinction between inspired and independent police brutality is not very significant, for police behaviour of the two types is closely connected. If recently there have been signs of the police getting out of hand, this surely has something to do with the government's growing need to use the so-called forces of law and order to put down various types of political challenges to it and also with the growing awareness within the police, at different levels, of the government's dependence on it.

The government itself has on occasions admitted to this dependence, though naturally in rather euphemistic tones. Addressing an all-India conference of inspectors-general of police last October, the Union Home Minister referred to the changing role of the police and cited maintenance of peace to ensure uninterrupted industrial and agricultural production as one of the new responsibilities that had devolved on the police. Addressing the same conference the previous day, the Minister of State for Home had in the same vein referred to the role of the police in dealing with socially disruptive forces in a satisfactory manner. By now everyone — and the police most of all — knows what a variety of situations can be brought within the ambit of action supposedly aimed at "maintenance of uninterrupted industrial and agricultural production" or at dealing with "socially disruptive forces".

Nor is it only a matter of the government regularly falling back on the police to tackle situations created by its own multifarious political and economic failures. An equally important factor determining the attitudes of the police has been the government's readiness, when faced by a serious enough threat, to resort to the most brutal and vicious methods, throwing to the winds established laws and proprieties. These range all the way from police surveillance and intimidation, successive arrests on a series of trumped up charges and indefinite detention as undertrial prisoners to straight political murders dressed to look like deaths in encounters with the police or in attempted jail breaks. In every case the police is the government's accomplice. After this, is it any wonder if the behaviour of policemen, individually and collectively, frequently

falls short of copy-book standards, especially when dealing with scum like the untouchable Scheduled Castes or petty pavement hawkers?

The impact of political factors like the above is heightened by organisational frustrations such as the miserable salaries and virtual non-existence of promotion prospects (almost nine out of ten of those who join the police as constables or as sub-inspectors retire in those same ranks) which are the fate of the overwhelming majority of the police force. Besides, not being isolated from the rest of the population like the army, some of the mass distress arising from the lack of food, the spiralling prices and the growing unemployment does rub off on the police.

Immediately, it may be that the impact of these factors is seen in greater arbitrariness and viciousness in police behaviour. However, also exposed in the process are the developing chinks in this particular coercive arm of the government. Fortunately for the government, none of the established opposition parties is likely to be able or anxious to exploit these chinks. After all, was it not the CPI(M) Home Minister of the then United Front government in West Bengal who first despatched the crack Eastern Frontier Rifles to Gopiballavpur to wipe out the Naxalite movement there?

Jute Strike

Vanished Bounty

THE strike now on in the jute industry, which, despite official protestations, is very nearly total, has a particular significance for the trade union movement in West Bengal. Nearly 70 per cent of the workers in the industry are from Uttar Pradesh and Bihar. It is only in the more recent years that they have come under the influence of the unions, but progress has been rapid. The proportion of those who are members of trade unions in now about the same for workers hailing from within the state and for those from outside. The position was altogether different ten years ago. A further shift of tremendous import has come about. Ten years ago, at least four-fifths of the labour coming from outside used to follow the flag of the Indian National Trade Union Congress. Evidently, it is no longer so. The Centre for Indian Trade Unions and the All-India Trade Union Congress can now claim the allegiance of as large a share of the non-Bengali labour as the INTUC.

The main issue involved in the strike is pretty straightforward: the employers and the government are prepared to offer Rs 2 crores per annum additionally to the workers, while the latter are asking for a minimum of Rs 8 crores. After many years of anaemic existence, the Indian jute industry has suddenly looked up. The Bangladesh holocaust proved a godsend in 1971-72; and now the global energy crisis has completely reversed the earlier forecasts of gloom for it. The earnings from jute exports in the current fiscal year are expected to be higher than what they were last year by at least Rs 150 crores. Some of the increase is of course the product of exchange rate fluctuations. But that would only account for Rs 20-25 crores of the gains. As the petro-chemical industry is thrown into greater uncertainties on account of the turmoil over oil supplies, the prospects for jute are likely to improve further in the coming months.

The workers point out that the recent adjustments in export duty have meant a further bonanza of Rs 30 crores per year for the manufacturers. The concessions in export duty, it was assumed, would be passed forward to the consumers abroad. Since meanwhile prices in the world market have firmed up beyond expectations, the manufacturers have found no reason to offer relief to the consumers and have themselves appropriated the extra benefits. Why must not they, the trade unions ask, share their good fortune with the workers? Why should not they offer a better deal to the temporary and casual workers who still constitute 30 per cent of the total work force in the industry? There are some workers who have been with the industry for the past 30 years and are yet not carried on the regular roll and are thus deprived of proper wage-scales as well as provident fund, gratuity and health benefits. Why should not the manufacturers agree to effecting a slight improvement in wage-scales across-the-board and in bonus so that the employees of the jute industry, which still remains the nation's major exchange earner, begin to get at least two-thirds of what the cotton textile workers obtain in Bombay?

The tycoons in the industry do not deny that their profits have bulged in recent months, but these profits, it is being maintained, must be jealously husbanded and ploughed back for modernisation and renovation. Nobody however knows for certain what the jute manufacturers have done with the fabulous profits they reaped in 1971-72. There is little evidence to indicate that these profits were even marginally deployed either for modernisation of the industry itself, or for promoting other industries in the eastern region. On the other hand, given the close links between the industrial and the trading interests involved in jute, a considerable part of the money made in jute, it can be suspected, is finding an outlet in trade and speculation, so much so that the extra profits currently being realised from the processing and the export of the fibre are providing the wherewithal for cornering the stocks of paddy and rice, and thus are partly responsible for the failure of kharif procurement.

The attitude of the Indian Jute Mills Association is understandable. The loss in foreign exchange on account of the strike not being their loss, the manufacturers could not care less. A temporary stoppage in production, on the other hand, is enabling them to dispose of the existing stocks of sacking and hessian at sharply increased prices. They can also now further depress the price of raw jute and buy on the quiet, at low prices, large quantities which would enlarge their rate of return when production is resumed. It is the reaction of the authorities which is totally inexplicable — never mind what happens to the country and its foreign exchange earnnings, since the jute workers have deserted the INTUC and decided to follow the flag of the CPI(M)-dominated CITU, they must be made to suffer.

Indonesia

Counter-Productive Growth

THE fierce resentment expressed by rioting students and unemployed youth during Japanese Prime Minister Tanaka's mid-January visit to Jakarta is only a surface symptom of the deep cleavages in Indonesian society which the military rulers have enhanced by their methods of economic management during their nine years of unfettered power. In crude terms of GNP growth and investment rates the economy may seem sound on graphs and charts, but in terms of benefit to the population the situation has demonstrably worsened since Sukarno's years which were bad enough.

For instance, 35 per cent of a work force of 39 million are unemployed with 1.4 million being added to the ranks of the jobless every year. Capital, predominantly foreign, has flowed into oilfields, mines, plantations, industry and timber, but created only about 20,000 jobs for Indonesians. The profits of the foreign companies are huge and whatever capital is invested is usually repatriated within three or four years. There are hardly any controls on foreign investment for fear of driving it away. The result of such policies is that Indonesia has had to borrow more than 1,500 million dollars from foreign creditors. When Sukarno was divested of effective power in 1965 the foreign debt stood at $ 1,270 million (53 per cent of which was owed to socialist countries): now it is far higher and servicing it uses up almost 20 per cent of Indonesia's annual foreign exchange earnings. Not surprisingly, the balance of payments deficit rose from $ 248 million in 1965 to $ 419 million in 1970.

To demonstrate its sound financial position to foreign investors, the government has sought to balance its budget by cutting public expenditure, while keeping corporate taxes low. To build the basic infrastructure to attract private foreign investment, the government has borrowed heavily abroad. In this way the country has got further into foreign debt in order to increase the profits of industrial organisations, mostly foreign controlled, which have only a marginal effect on the local economy. And the regime has to keep borrowing abroad to keep the foreign investor happy. Whatever few benefits accrue to Indonesians are swept up by the ruling generals and their clique. Often this is done through corrupt deals with the foreign investors.

To cut government expenditure, the regime has picked on items of social welfare such as public health and education. One of the few outstanding successes of Sukarno's time was a widespread and free school education system. Education was once available to almost all children; now it cannot be afforded by half the children of school-going age as it costs 700 rupiahs (Rs 13) a month to be at school. Many Indonesian families cannot afford that. The Indonesian military regime has done all in its power to prove that for the overwhelming majority of the population untramelled and unplanned economic growth is counter-productive.

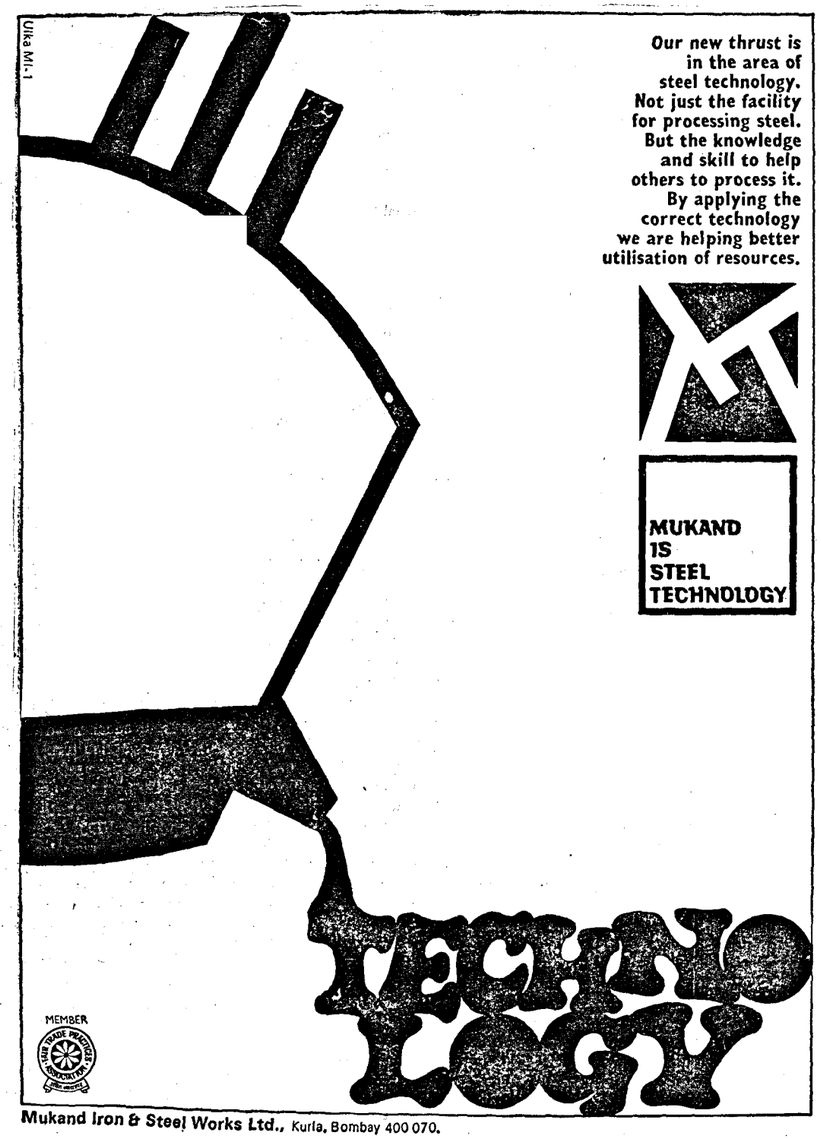
The Joint Float

Three Coins in a Fountain

THE French franc is now out of the European joint currency float. The French decision came as a surprise to many, as the French were known to be champions of fixed parities and were totally opposed to floating exchange rates. It was only as a compromise solution that France had joined the 'currency snake' which ensured smaller variations in exchange parities among the six countries participating in the joint float. In course of time, though, the rules of the joint float were interpreted liberally and a member was allowed to rejoin the snake after altering overnight its currency parity *vis-a-vis* the other member currencies. This facility notwithstanding, France has now decided to remain outside the joint float; the decision to that effect was taken last Saturday at an emergency meeting of the French cabinet.

The pressure on the French franc at the time of the decision was certainly much less than it was only a few months ago. The underlying condition of the French economy is quite healthy. The trade figures for December 1973 indicated a sizeable surplus of Frs 935 million which brought the total trade surplus for 1973 to Frs 6,683 million (or about $ 1.3 billion). The West Germans, moreover, had assured France credits worth $ 2.3 billion with a view to inducing it to remain within the joint float. In rejecting the offer and deciding to have an independent float for the franc, the French were thus taking a political decision of deep significance. While it has been claimed that the franc would float independently for six months, sceptics among the prominent exchange dealers in New York have observed that "it will be the longest six months the foreign exchange market has ever known". There is also no official statement that France will rejoin the joint float at a later date.

According to the French Finance Minister, Giscard d'Estaing, the oil crisis would create serious difficulties for the international monetary system, and France has to take effective measures to protect its own reserves against speculative movements. He has predicted that France would experience a trade deficit of Frs 18 billion in 1974, as against the earlier estimates of a surplus of Frs 8-9 billion for the year. The independent float of the franc is, therefore, intended to ensure its devaluation *vis-a-vis* other currencies. Such a devaluation would be difficult to achieve within the joint float which is influenced considerably by such strong currencies as the D-Mark, the Belgian franc, and the guilder. The French want their franc to find its own level on the exchange markets, and must hope that market forces would help them to achieve substantial increases in exports and a reduction in imports.



Politically, the French have evidently opted for tackling the problems arising from the oil crisis independently of the other participants in the joint float. It is well known by now that West Germany and the Netherlands are sympathetic to the American idea of a joint policy, among the major oil consumers, for the oil crisis. In refusing to co-operate with the others in any such joint policy in which the US is likely to have a dominating voice, the French no doubt want to impress the Arabs. France is aiming to demonstrate its dissociation from the US threat of intervention against Arabs as well as from the other US sympathisers.

The French decision has upset the EEC Commission considerably. For, it means not only the shelving of the concrete proposals for a monetary union for the time being, but also numerous headaches in administering the common agricultural policy which claims a major part of the EEC budget. The French move implies underbidding one another's exchange rates, and the EEC Commission is worried that it may lead to a competitive exchange rate depreciation. Fortunately, for the time being at least, this fear could be discounted, as the remaining five participants in

Annual Number

The Annual Number of *Economic and Political Weekly* will be published towards the end of this month. It will be priced Rs 10 per copy, but will be supplied free to subscribers.

In view of the Annual, there will be no issues on February 9, 16 and 23.

the joint float have agreed to continue to support the currency snake. But all the same, the French decision will give a setback to the efforts of the Commission for greater economic integration.

The floating franc has in fact already depreciated by about 4.5 per cent from its previous parity. The French central bank had to intervene in the market to stop it from falling further, which suggests that the French are not immediately interested in a full fall of the franc. The official intervention also indicates that France was not interested merely in any particular depreciation for its currency as it could have achieved this even by remaining within the joint float and re-entering the 'snake' at a lower parity. Evidently, it wanted to be unfettered by the rules of the joint float, which require members to pay the costs of the support operations for a member's currency in proportion to the various assets — gold, dollars and SDRs — in their reserves. The official price of gold is at $ 42.2 per ounce, and France is clearly unwilling to part with its gold at this low price when the market price is around $ 135-140 per ounce. The lure of gold, along with other political reasons, has persuaded France to opt out of the 'snake'.

West Bengal

Congress Flags and Sten Guns

Our West Bengal Correspondent writes:

WHILE the government has been desperately trying to retrieve its prestige by breaking the fortnight-old general strike of the 250,000 jute mill workers, sections of Congress supporters have begun to strike defiant postures. Women's Congress militants recently gheraoed the WBPCC Executive Committee with the demand for effective action to hold the price line; the Central Calcutta Youth Congress has announced that it will serve a 15-day ultimatum on the Congress government calling for action to alleviate popular misery; the Save Education Committee — a rival body of dissident youth — has gone one better and served a shorter, 10-day, ultimatum to the same effect.

The Chief Minister 'works' mainly in New Delhi and pays only courtesy calls on the state secretariat during his short 'visits' to Calcutta. He even failed to turn up for an emergency cabinet meeting convened by him from his New Delhi headquarters to discuss the virtual collapse of the procurement drive. He was recently sharply criticised by his fellow Working Committee member, Priya Ranjan Das Munsi, MP, for his frequent and long absences from the state.

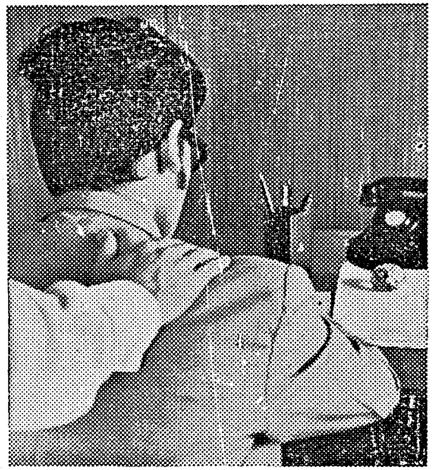
These new articulations of discontent have as their backdrop the pervasive faction fights in the ruling party — frequently developing into bloody clashes on the streets. On January 11, large parts of central Calcutta were paralysed for about seven hours because of the free use of bombs and barricades by the two major factions among the Congress youth. Similarly, on January 17, the rival wings of Congress students clashed violently in two colleges. There are, besides, the less sanguinary, though no less bitter, attacks by the old style operators led by the veteran Congress leader, Bejoy Singh Nahar, who recently told a public meeting that "the government being run with the help of some corrupt people had brought the state to a near-famine condition". If the present leadership of the party failed to deliver the goods, others would take up the responsibility, he added significantly.

The situation within the Congress has reached such a pass today that even top leaders of the party no longer care to conceal its ugly features. One of the general secretaries of the state Congress some days ago spoke of "some Congress leaders carrying the Congress flag and sten guns".

A new feature of the present round of faction fights in the Congress is the interweaving of power politics with certain wider issues, particularly that of the party's relationship with the CPI. One section, led Das Munsi and Subrata Mukherji and blessed by the Union Minister of State, Debi Prasad Chattopadhyaya, has been taking part in some forms of mass action, largely of the ritualistic variety, along with CPI-led organisations, particularly among the youth. It has also been pressing for the revitalisation of the Progressive Democratic Alliance (PDA) with the CPI. However, the rivals of this group, both in Calcutta and in the districts, are becoming more vocal in denouncing the CPI. At the last meeting of the WBPCC, Jainal Abedin, a member of the state cabinet and a leader of the anti-CPI wing of mofussil Congressmen, reacted sharply to Das Munsi's plea for reactivating the PDA. Abedin compared the CPI with "a snake in the bedroom" and declared his determination to split the state Congress if the proposal for closer ties with the CPI was really pressed. The CPI daily, *Kalantar*, for its part, has chosen Abedin as the target of its attacks as the representative of the 'kulaks' and their political allies in the Congress.

The failure of the state's procurement programme has injected a dose of acrimony into the fraternal dialogue between the Congress and the CPI. As against the target of procuring 500,000 tonnes, the government has so far been able to collect only about 60,000 tonnes, though the marketing season has passed its peak. This is about 20,000 tonnes less than the quantity procured from a much smaller harvest during the corresponding period last year. In the meantime, the large landholders have perfected their *bandobast* for concealing their stocks by distributing them among their trusted neighbours, including sharecroppers and landless labourers. Side by side, they have recruited thousands of people from the rural poor — men, women and children — to organise large-scale smuggling of rice to markets within the state and outside. The wide ramifications of these smugglers' rings can be guessed from the fact that when some college students were arrested by the railway police in Hooghly district for smuggling rice, a large crowd gheraoed the local police station to demand their release.

LETTER TO EDITOR



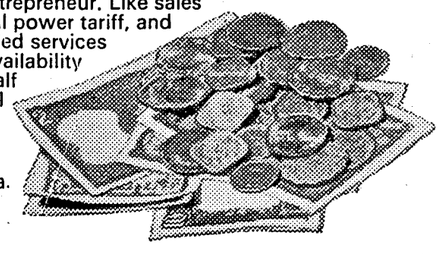
A Fernandes

OLD-TIMERS, who remember Sachin Chaudhuri's somewhat amateurish, but always nonchalant, ways of making a viable journal out of *The Economic Weekly*, will feel deeply sad at the news of Alphonso Fernandes's sudden death. Life with Sachin Chaudhuri and the *Weekly* was always chancy. But Fernandes stayed the stretch; his loyalty to the journal never wavered. *The Economic Weekly* in course of time became the *Economic and Political Weekly*; it was a transition marked by challenges and perils, more so since Chaudhuri passed away so soon after the commencement of the new journal. But Fernandes was around, steadfast in his devotion. A good, kind, conscientious man is now gone. His friends will miss him.

ASHOK MITRA

Calcutta

In Orissa you'll get more than just a pat on the back for a good idea.



You'll get credit for it.

If there is an industrial project that is feasible in Orissa today, there is a financial scheme to help transform it into a profitable unit. Good ideas are worth good money.

Assistanoe for investors covers direct participation in share capital, underwriting of shares, long and medium term loans, and financial assistance in the renovation of plant and machinery.

Numerous other benefits accrue to the entrepreneur. Like sales tax exemption on raw materials, concessional power tariff, and subsidised rates for land and water. Plus added services such as project and product identification, availability of project profiles and feasibility reports at half the cost, plant location advice, and technical guidance in project implementation.

Today if you've got a good idea for establishing an industry, there are a whole lot of good reasons for setting it up in Orissa.

FERTILISERS AND CHEMICALS, TRAVANCORE (*FACT*) has incurred further loss in the year to March 1973 that raised the accumulated deficit to Rs 9.81 crores. The fresh loss is attributed to shortfall in production due to a strike coupled with increases in the cost of raw materials, labour and freight unaccompanied by increases in the statutorily fixed selling prices. The company's annual report says that the financial loss during the period of the strike was Rs 230 lakhs. Regarding the discrepancies in stocks of rock and sulphur mentioned in the previous year's report, it is stated that investigations in respect of officers under the control of the management have been completed and enquiries into their conduct have been ordered and that in respect of other officers the government of India is taking action. A special audit covering all high-value items in the store, including rock phosphate and sulphur, has been arranged by the Comptroller and Auditor General. The auditors in their report say that they were told that on verification of stocks of raw materials conducted after March last, shortages were noticed in the physical balances of sulphur, rock phosphate and packing materials of the aggregate value of about Rs 16 lakhs.

During 1972-73, FACT produced 2.33 lakh tonnes of fertilisers against 2.86 lakh tonnes in the previous year and the installed capacity of 5.65 lakh tonnes. Production of mixtures was 70,747 tonnes against 1.01 lakh tonnes in 1971-72. Output of chemicals was 1.20 lakh tonnes against 1.64 lakh tonnes in the previous year and the installed capacity of 2.56 lakh tonnes. The report adds that there was a section-wise strike and a general strike from May 3 to July 6 last year. Due to the sudden and long shut-down there was serious damage to plant and machinery and heavy maintenance was required and it took considerable time to get the plant to operate at the normal levels of production. This implies that even the current year's results have been affected by the labour unrest.

In regard to the Udyogamandal project, trial runs of the new 150 tonnes per day ammonium phosphate plant was taken up in December 1972, but modifications and improvements to the indigenously procured equipment were found necessary. These are expected to be completed during this year. Improvements to the Chemiebau acid plant are expected to be completed by June next. The delay has been due to late receipt of import licence. The operations of the cryolite plant has also revealed certain deficiencies in some of the equipment. Commissioning trial runs for the Cochin fertiliser project phase I continued last year, but here too defects were found in equipment, requiring major and time-consuming modifications. Progress in

* Before providing for taxation.

commissioning of the plants has been slow and interrupted because of problems with equipment and the sophisticated design of the plants. Meanwhile, the cost of the project is estimated to have gone up by about Rs 7 crores over the estimates revised in September 1972. Besides, levy of income-tax on expatriates and differential excise duty on naphtha may increase the cost of the project by another Rs 6 crores, if the company's representations are not accepted. There has also been some delay in the Cochin fertiliser project phase II, which is now expected to be completed by February or March 1975. A fresh contract has been entered into with Norsk Hydro.

CHLORIDE INDIA's expansion programme of doubling the Chinchwad factory and of setting up a polypropylene container plant is well in progress. Meanwhile, a fresh application has been made for a further expansion of the Chinchwad factory with substantial export commitments and dilution of foreign shareholding as per the government guidelines. The company's application for fuller utilisation of the existing capacities has been approved, and the management is negotiating with government in respect of export stipulations. The collaborator, Chloride Group, has been assisting the Indian company in achieving progressively larger export targets, in import substitution of raw materials and in research and development. Of late it is also assisting in indigenous development of sophisticated plant and machinery. Also, CIL has been enabled to evolve, at economical cost, an optimum balance between lead usage and product life. The company claims that its products give maximum life per unit of lead used and enjoy strong preference in the quality conscious segment of the market. The company has produced good results for 1972-73, with increases in sales and earnings. Both the ratios of inventories and wages to sales have been brought down. Dividend, stepped up two points to 24.5 per cent, has a better cover than in the last year. Since the company's application for a bonus issue on a one-for-three basis had been pending with government for a long period and in the meantime reserves have increased substantially, the company has made a revised application for issue of bonus shares on an eight-for-nine basis. The company's export earnings last year amounted to about a crore of rupees. In terms of volume, exports comprised over 21 per cent of the Company's total automotive battery production. J Sengupta, managing director, is confident that the company will make further progress in the export field.

INDIA CARBON has turned out poor results for the year to June last owing to lower production in the carbon division. The Gauhati and Budge Budge plants together produced 58,700 tonnes of calcined petroleum coke against 92,200 tonnes in the previous year. The shortfall occurred because of the imports allowed by government, lower production of aluminium in the country on account of power-cuts, and Indian Oil's Barauni petroleum coke calciner having been in production. But production and sales of DOP in the chemical division were better at 2,145 tonnes and 2,370 tonnes against 1,775 tonnes and 775 tonnes, respectively. These figures would have been still higher, but for scarcity of phthalic anhydride, an essential raw material, due to a major breakdown in the suppliers' plant. No provision has been made for the tax liability for 1972-73, as it is stated that tax matters are under dispute and that tax would be provided out of the general reserve. Dividend is maintained at 18 per cent. In addition, the board has proposed issue of gift shares on a one-for-two basis. The directors expect better sales and profitability this year, with the restoration of power supply to the aluminium industry. The company has also started to manufacture from September last, for the first time in the country, calcined anthracite coal which is an essential raw material for production of aluminium. An agreement for sale of the ethrolamines plant to 'Amines and Plasticisers' has been concluded. The company has approached government for permission, under the MRTP Act, to hold 50 per cent of equity shares in the new company. A technical assistance agreement has been entered into with 'Goa Carbon' for providing technical knowhow to it for putting up a plant for manufacture of calcined petroleum coke at Goa. As per agreement, that company has allotted 74,925 equity shares of Rs 10 each to India Carbon.

"critcomments"

HOW GOOD ARE YOU AT INVESTING MONEY?

There are many professionals in the high-income bracket whose skills are of considerable help to other people. Surgeons save lives; lawyers help to recover legitimate dues; architects design convenient houses; engineers help industry and transport; and managers look after business concerns to earn handsome profits for their owners.

But when it comes to investing their own money, many of these skilled people falter and fall. They have no clear idea of the investment opportunities open to them; or they cannot identify the investments that will bring them the most benefit under the present tax structure.

They labour under the popular misconception that life insurance is a low-yield investment. Yet in the case of a 30-year-old man earning Rs. 50,000 a year, it was proved that a 20-year Endowment Life Insurance Policy (with Profits) for Rs. 20,000 would bring a gross yield calculated at 19.19 per cent per annum on money invested. This was in addition to the risk cover, which no other form of savings provides!

The secret of course is the tax rebate available on life insurance premiums and the bonus payments accruing to with-profit policies. The rule about rebate: 30 per cent of your earnings (or Rs. 20,000, whichever is less) will get tax exemption at the rate of hundred per cent for the first Rs. 2,000, fifty per cent for the next Rs. 3,000 and forty per cent for the remaining, if it is in life insurance premiums and/or provident fund and/or 10-year or 15-year cumulative time deposits with the post office.

Ask any Life Insurance agent to show you the brochure on "Tax Laws and Life Insurance." If you are in the high-income group, you will be surprised how much yield a life insurance policy can bring you!

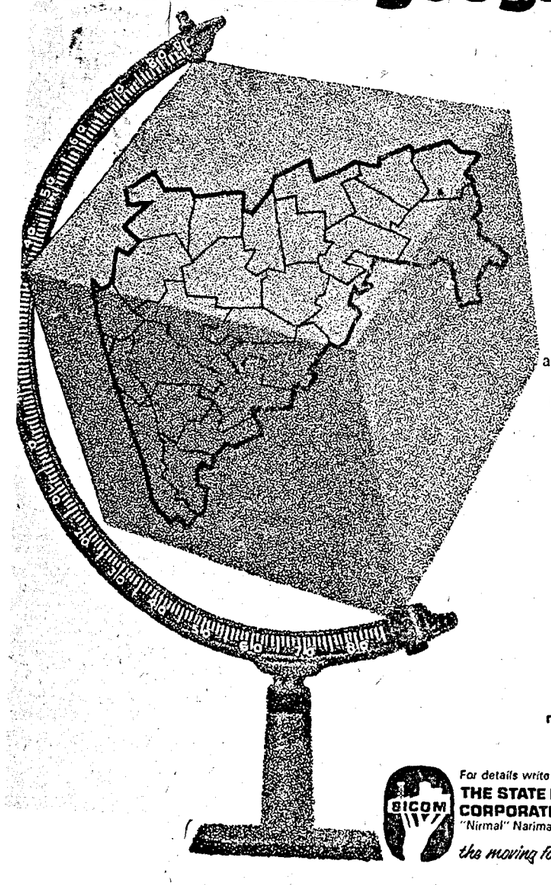
Calcutta Diary

A M

IT is, the doctors would say, perversity of the worst sort, but nothing can be done; there it is: a vast groundswell of vicarious pleasure now that the Congress has got such a drubbing in Maharashtra. The emaciated middle class in West Bengal, a pang of nostalgia in its heart, also scans the news about the turmoil in Gujarat, much in the mood of a down-and-out middle-aged school teacher as he reads in the papers dizzy stories about the successes of a former student of his. It is an odd combination of emotions: a mute confession of one's own impotence; a touch of regret and envy that the discomfiture is being inflicted on the ruling party a thousand miles away, and not here; at the same time though, there is also an outlet of the pent-up venom: at long last, somebody has shown the guts to teach those rascals up there a proper lesson.

This, no doubt, is gross irrationality, and borders on frenzy. A certain clammy, clayey quality attaches to it; as you listen to the conversation pieces, in tram cars, buses and suburban trains, given to gloating over the near-anarchy in Gujarat, claustrophobia threatens to grip you. Every week, more and more things disappear from the market and the ration shops, prices soar still some more, power and gas are cut off for even longer hours, transport is in a greater chaos, administration at all levels sinks to a deeper morass. But the people seemingly take everything in their stride: not a squeak of protest disturbs the air. The leftists — a near-invisible shadow of their former self — now and then emerge from their shell, organise a demure demonstration, or maybe a protest meeting: their supporters and sympathisers drift in, listen, disperse; nothing else happens, one further layer of vacuity merely settles on the ones already there. And yet, the discontent over the lack of the bare necessities of life is no less here than in the western parts of the country; going by 'objective' factors, it should, on the contrary, be more, considering that income levels are much lower here. The fire however has gone out; even the embers have stopped flying. If some railing has to be done against the authorities, some staging of violence, some explosion of fury, let all that take place in another part of the country; at our end, the passion is not dead, but somehow it has mislaid the formula of combustibility.



Depending upon one's point of view, such a denouement could be a good thing. Violence has been, outwardly at least, taken out of the system: as the President of the nation has not failed to tell the citizens on Republic Day, never mind the nightmarish days you are passing through, violence only leads to chaos. But cannot there be a chaos even from the lack of violence? Those who were subscribing to the theory that, for economic prosperity to start gushing forth in the state, what is needed is only to take the Bengalis off the course of killing and knifing and bomb-throwing, have been proved wrong. Since the beginning of 1972, the frequency of violent activities has markedly gone down; such activities are certainly not that overt any more. What has emerged instead is, however, equally terrifying: a deathly pallor, an enervating sickness. If there is no large-scale violence, there is no large-scale creative activity either. A listlessness, out of which nothing conceivably could ever be born, has assumed charge. Take a day out in Calcutta, visit its shops and institutions, its offices and parlours, eavesdrop on its gossip, it would not take long to realise the frightening nature of the calamity which has come about. It is a calamity which does not exclude anyone from its jurisdiction; it shatters the nerves, and extracts the last iota of optimism from even the most lion-hearted. In government and outside, it is the rule of inertia, and just that, which is supposed to provide the staple for survival.

Even as Maharashtra's women take up the angry cudgels and Gujarat is set aflame, West Bengal watches from the sidelines. Things are looking up, you might still say, the epicentre of trouble-making, thank heaven, has moved away from the volatile Bengalis. This is a dubious consolation. The Bengalis are staying away from the spree of violence; they hardly however disapprove of it either. The vicarious pleasure is there and its appeal is pervasive, so pervasive that even those retaining a marginal faith in the formalism described as the parliamentary democratic system would feel like throwing in the sponge. Violence may be dormant, but this denouement is hardly accompanied by any rousing accession of faith. Talk to any lay person, you would be taken aback at the depth of cynicism to which he has sunk. He is prepared to believe the worst about the system. He will take it as datum — or even axiomatic — that all ministers are corrupt, that everyone from the highest one down is busy building a private fortune while the going is good. You will fail to nudge his conviction that if prices go up, it is entirely because the ruling politicians and their functionaries are on the payroll of industrialists and traders. Each single statement of the Government is up for derision; the obverse of what is being claimed by the authorities is, by an instant cerebral reaction, assumed to be the true state of affairs.

Visiting dignitaries, out of politeness, and sometimes for their own private purpose, may praise the quality of the polity sky-high: an ageing Tito has his uses. In the ultimate run, such contrived testimonials are piffles: they do not even lead to any fresh accretion of foreign exchange. The Indian polity is going to be what the Indian people judge it to be. Faith, the school text-books say, can move mountains. What has overtaken the country is a total loss of faith. And one must be candid about it: this is the legacy of the past few years. A nation cannot be run on the credo of public relations men, which is to pack some lies together and present the package as the genuinest thing. Give or take a few years, the truth will be out, and, along with it, the anger of those who are at the receiving end of the confidence trick

From one point of view, what is happening in Gujarat is to be welcomed. A catharsis is at work, and the accumulated hatred is letting itself out: there is a branch of materiamedica which goes flat out in support of such ministrations. The prospects could be much worse for West Bengal, where, for the present, the hatred only simmers inside. With some twenty-five thousand and odd young men and women locked away, and the blanketing of town and country by the forces of law and order, there is little possibility here of a holocaust of the kind which has overwhelmed Gujarat. One cannot honestly decide which way one's preference ought to lie. For the *ennui* currently gripping West Bengal could lead to a total corrosion of not just all external initiatives but also of the moral fibre. Once that happens, it would be a field day for marauding demagogues. Fascism of

Note the latest change in Maharashtra's industrial geography.

This Package of Graded Incentives makes all areas more attractive.

"Grading"— a new advantage

Maharashtra's Package Scheme of Graded Incentives has divided the State into 4 zones—the developed areas and the developing areas. All developing areas have been graded according to existing circumstances and higher scales of benefits apply in areas which are relatively less favourably placed. For instance the Sales Tax Refund is offered for 6 years in certain areas but for 10 years in other areas.

Similar gradations apply to incentives like relief from incidence of certain rates (electricity tariff, octroi, water royalties, and non-agricultural assessment) and preferential treatment under the government purchase programme.

There's something else

This scheme is implemented by SICOM—the people who work hard with expertise and guts. What's more, you can take advantage of SICOM's flexible financial assistance and plant location, project investigation and project implementation services. All given to you in SICOM style.

Avail of the Maharashtra Government's Package Scheme of Graded Incentives. Now!

course could lurk in the corner. But, much worse, where by brute force you prevent the masses from taking recourse to collective political action in protest against the many ills of administration, you are in fact invoking anarchy. In case not the slightest heed is paid to the people's anger over the price rise, the corruption and the growing income inequalities, this anger would in any case be out, and no quantity of repression would then succeed in putting it down. Since, however, the option of collective modalities has meanwhile been deliberately throttled, the arena would be taken over by disorganised chaos. The President of the Republic will not like that, but, by then, he and his Rashtrapati Bhavan would become an irrelevance. Admittedly, an unsavoury thought, but, pray, which aspect of Indian life is at the moment brimful of aesthetic virtues?

CAPITAL VIEW

Uttar Pradesh Casts Its Shadow

Romesh Thapar

UTTAR Pradesh seems to be in everyone's consciousness. With essentials disappearing from the markets all over the country, the popular belief is that Uttar Pradesh is wallowing in a glut which will last until the elections are held on February 17. In Uttar Pradesh, no such glut of goodies is developing; indeed, it's assumed that Jan Sangh traders will release their stocks after the elections. Quite a merry situation, I must say. In the politicking, the fact that everyone has forgotten is that traders of various political hues are putting up the vast sums of money for the elections, and naturally they have to reimburse themselves. Shortages? Well, for a while. Long live democracy!

Yes, Gujarat is terribly upsetting. It looks as if strongman Patel cannot hold the situation. The betting is that soon we will see President's rule in this part of the country — but only after the army has brought order and the Uttar Pradesh contest is over. Nothing is to disturb Uttar Pradesh. Uttar Pradesh, believe it or not, provides balance and stability to our federal polity. ar Pradesh is decisive to the policies of India. This is more than a bad joke, but we have to live with it.

Well, what is happening in Uttar Pradesh? We are hearing of all manner of defections from the ruling Congress, defection which include colleagues of none other than Tripathiji himself. They could not be accommodated in Bahuguna's list of prospective candidates, so they are now back seeking their fortunes in the old Congress. What this means to the caste-ridden voting of Uttar Pradesh, no one tells us. It is assumed that the Centre has the skill to deal with such mundane threats.

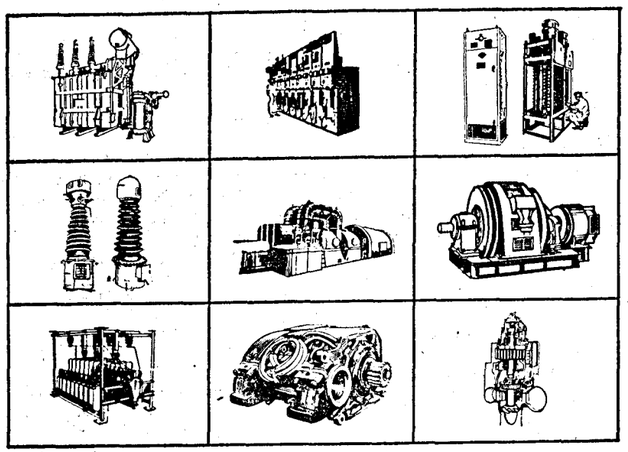
But all is not so tickety-boo in Uttar Pradesh. Independent reports speak of a ground-swell against the ruling Congress in the towns. The Jan Sangh is licking its chops, so to say. It expects a major sweep in the urban areas. The Muslim vote, if it can be so described, is also scattered and largely lost. Put these two whispered facts together with Charan Singh's capacity to gather votes in western Uttar Pradesh, and you have the makings of a problem which might cause not just tiny political ripples.

Apparently, so much money is in use that the electorate has come to see these exercises in democracy as a kind of popular sweepstake. Attitudes are bemused. "Operation Grab" is on. The relationship between taking money and voting for the chap who has given it is tenuous to say the least. Some sample surveys suggest that both hands are being used, and in different directions. So startling is this monetary corruption of the election procedure in the heartlands of Bihar, Uttar Pradesh, Orissa, Madhya Pradesh and Rajasthan that political scientists are abandoning their field studies of voting behaviour. They require new "paradigms"!

I've been trying to get a reliable figure of the election fund in operation in Uttar Pradesh. No such assessment is possible, but the figures range from three crores to thirteen to thirty. We certainly do everything with a certain amount of style, don't we? However, the donors who are in this game point out that they must get the facilities to make three times as much to prepare for the next operation. Gujarat? Andhra Pradesh? Not Orissa. That's been written off already. Biju Patnaik is obviously too tough a character to challenge with money.

The chiefs of our rattled Planning Commission are wondering how long this game of black money is to last. The speculators thrown up by our political style are on the rampage and can kill their patrons, just by playing the market, doing for ever what they have been permitted (it appears!) to do until Uttar Pradesh "is settled". In other words, for those who want plain statements, hot money is going to set the Plan and the Commission on fire.

If there is any lesson to be learned from events in Uttar Pradesh at this moment of writing — that is, before the unlovely politicians of the state discover whether they are in or out — it is that we must resolve to reform immediately the funding of elections. The play of black money has to be cut before our economy is destroyed by it. If this lesson goes home, the cost would be immaterial.



But what will make it "go home"? A setback for the ruling Congress. Yes, that is what so many reasonable men and women are saying. Sad, isn't it. And only two years after the massive mandate for the ruling Congress in the 1972 poll. Maybe, this is exactly what the present national stir is about. A rejection of the sort of democracy we are indulging in.

It's important for us to get our teeth into the problem, Uttar Pradesh or no Uttar Pradesh. The newspapers, short of paper, are fighting shy of printing the material they are receiving. The "scandals" spread by word of mouth. This makes the follow-up even more impossible. A challenge for the political scientist? But what makes us conclude that they are over-eager to burn their paws? Revolutionary chatter about tearing down the system? The responses to the challenge could be simple, and, what's more, effective.

I suppose we will carry on as we are, happy to be strangulated in easy stages. And, then, there is always the possibility that Uttar Pradesh may spring a surprise on the ruling Congress. A decisive majority, the 275 seats that are being "claimed" already. We will then be able to keep jogging at a fixed point after all, with or without the Planning Commission. If that happens, there should be a supplementary list of Republic Day awards ...

Uttar Pradesh certainly casts its shadow — a terrible shadow.

January 28

BHEL
BHOPAL

a big name in the POWER game

From modest beginnings, BHEL (Bhopal) has grown into a huge, dynamic and vigorous organisation. Today, BHEL (Bhopal) is a name to be reckoned with in the field of Heavy Electrical equipment for generating, transmitting and utilizing power.

At BHEL (Bhopal), teams of skilled engineers and technicians operate through specialised self-contained research and production units. These units are geared to meet specific demands for all types and sizes of heavy electrical equipment required in any part of the world.

Here's our range:

- Water Turbines and matching generators upto 200 MW;
- Steam Turbines, Turbo-Generators and Condensers;
- Transformers of unit ratings upto 400 MVA and for voltage upto 400 kV;
- High Voltage switchgear upto 220 kV
- AC and DC Motors upto largest sizes envisaged;
- Control gear and Control panels;
- Electric and Diesel Electric Traction Equipment;
- Rectifiers and Capacitors;
- Voltage Transformers (Electro Magnetic and Capacitor types) and Current Transformers for voltages upto 400 kV;

NEW DELHI

Victory for Rich Farmers and Traders

B M

UTTER helplessness, bordering on fatalism, pervades the government in New Delhi. The failure to respond to the critical situation created by the food riots in Gujarat for nearly three weeks, resulting ultimately in the army having to be called out in Ahmedabad, reflects the state of the government accurately. There has not been even talk of trying to relieve the situation by rushing more food to Gujarat, as was done at the time of the food riots in Maharashtra last year. It is frightening to contemplate what might happen in the next three or four months before the rabi crop. The situation in many other parts of the country — among them Bihar and Maharashtra — is not very much better than it is in Gujarat.

The Food and Agriculture Ministry maintains that the kharif crop has been good, particularly the production of paddy. The Ministry estimates that rice production has touched 45 mn tonnes in this kharif season itself as against the expected production of that order during the whole of the agricultural year 1973-74, including the summer rice crop. The total kharif crop is estimated at not less than 67 mn tonnes. Thus the food is there, according to the Ministry.

On this basis, the Ministry maintains that it is not necessary to continue the public distribution system on the same scale as in a drought year when there is a physical shortage of foodgrains. Thus, 10.7 mn tonnes of foodgrains were distributed through the public distribution system in 1972 and 11.6 mn tonnes in 1973 which was the worst year from the point of view of availability of foodgrains. Now, with the bumper kharif harvest, the Ministry has been contending that the public distribution system does not have to undertake a responsibility of this order. In fact, it has already decided to make a sizeable cut in the public distribution of foodgrains and, since November 1973, the monthly reltases have been brought down to 7 lakh tonnes. The Ministry seems to think that releases can be further reduced. Also, open market prices being very high, the Ministry believes that a good part of what is issued through the system does not go to the consumer but leaks out to hoarders and black marketeers. In these circumstances, according to the Ministry, issue of larger quantities will not benefit the consumer; hoarders and black marketeers will take advantage of the subsidised supplies.

It is by this logic that the Ministry has come to the conclusion that the real solution to the problem is not to strengthen and expand the public distribution system, but to remove controls on the free movement of foodgrains. Hence the decision to abolish restrictions on inter-district movement of foodgrains within states. In addition, states have been permitted to enter into arrangements among themselves for supply of foodgrains by surplus to deficit states. Free movement of foodgrains, according to the Ministry, will help to stabilise prices in the open market much more effectively than the distribution of larger quantities through the public distribution system. For the same reason, the Ministry does not think that more import of foodgrains would be needed.

Given this approach, the Ministry does not have to worry too much about the procurement position. The shortfall in procurement compared to the target does not, therefore, cause it much concern. This stance is fortified by the expected arrival of an average of 3 lakh tonnes of foodgrains from abroad every month till May — from imports already contracted for and from the wheat loan from the Soviet Union. The Ministry is thus satisfied with the 2.4 mn tonnes of rice procured so far, of which one-half is for the Central pool. Only 3 lakh tonnes of coarse grains have been procured out of a target of 16 lakh tonnes, but it is felt that some more will be procured in the next four months. Thus, even if the procurement target is not fulfilled, enough will be procured for nearly 4 lakh tonnes to become available every month for the public distribution system from this source. The distribution system can thus be kept going on a restricted scale, in accordance with the Ministry's plans. Later, the rabi crop will arrive in the market. The expectation is that it will be a good crop and that total foodgrains production during the year will come up to 114 mn tonnes.

With a good rabi crop, as the Food and Agriculture Ministry sees things, the public distribution system will become even less necessary. The question of procurement will cease to be a pressing one, and whatever procurement has to be undertaken can be taken care of by offering a good price for wheat in the next rabi marketing season. The Ministry currently seems to favour a price of Rs 95 per quintal. The most important thing, according to the Ministry, is thus to negotiate smoothly the transition to a position in which the open market can function freely. Procurement from then on will be for building up buffer stocks, when the crop is good, and not for running a public distribution system on any significant scale. It follows that, according to the Ministry, no purpose will be served by persisting with the take-over of wholesale trade in wheat.

In all this, the problem of high prices of foodgrains in the open market, which is the crux of the matter, is simply brushed aside. It is ignored that the distribution of foodgrains out of government stocks through the fair price shops was supposed to be a device to make available at least a part of the requirement of foodgrains of at least a section of the population at prices lower than those prevailing in the market. In fact, the Fifth Plan had made a song and dance about the extension of public distribution to other essential consumption goods. According to this approach, the need for supplies through the public distribution system become greater as prices rise in the open market — as has happened in the case of foodgrains.

It is no secret that the objective of the large farmers and traders, who have been witholding foodgrains from the market on a large scale, has been to defeat the government's efforts to procure foodgrains and supply them through the public distribution system. In this, they appear to have succeeded. The Food and Agriculture Ministry's arguments, described above, in support of reducing supplies through the public distribution network are an *ex post* rationalisation of a situation created

by the collapse of procurement, despite supposedly excellent crops. It is this collapse which has left the government with no option but to drastically cut the supplies through the public distribution system. With the virtual dismantling of the public distribution system thus ensured, the large farmers and traders can now bid up foodgrains prices with even greater freedom.

The further rise in food prices will have its inevitable impact on the general price level. This will naturally result in increasing the burden on the wage and salary earners. Industrial relations, ailready strained, should therefore be expected to worsen in the coming months. But the government evidently feels that it is easier to get tough with industrial labour and white-collar workers than to persuade the rich farmers and traders to part with their stocks.

MAHARASHTRA

Contractors' Opera

Amrita Rangaswamy

THE season of unrest is beginning in Maharashtra's sugar industry. Along the sugarcane belt, the cry for higher wages for harvesters and cartmen is heard. The labour unions, a little tired of the dogged fight through the courts, are brooding on a strike. A token strike is being planned for February 5. The Government of Maharashtra, which dawdled on the issue through the famine years, is beginning to feel that further delay would be unseemly. The Committee on revising rates for harvesters and cartmen, set up under the chairmanship of Shankarrao Patil, Minister of State for Labour, has come to life and promises its recommendations shortly. In Kopergaon last fortnight, the lords of the industry met in a quiet conclave — "to raise the wages," stated Shankarrao Ganesh Kole, president of the Federation of Maharashtra Sugar Factories. But he was not prepared to indicate the measure of the sacrifice they were ready to make.

Around the factories where the cartmen gather, the tension is beginnnig to communicate itself. The alarums of battle that are being sounded are customary — save for one comic touch. Standing at the vanguard of the agitators and cheering them on are the lackeys of the hacienda, the contractors of human labour. In the yard outside the giant Rahuri Sugar factory in Nagar district there were contractors from every district. "There has been no increment since 1968," exclaimed Eknath Nana Misal, contractor from Ashti taluka in Bhir district, sounding for all the world, like a labour leader. Small-made, fair, there was a flash of gold from ear and finger as he spoke. "Bajra prices were Rs 75 a quintal; now they are Rs 150," argues Valmik Konkar Sonone from Chalisgaon in Jalgaon district. Sonone is dark, plump, smooth of countenance, with a cavalier moustache and eyes as sharp as a peacock's. Misal is master of 14 carts but his men harvest and deliver the cane directly to the factory. Sonone has seven carts, but his harvesters load the cane at truck centres; so he needs more harvesting hands than Misal. A truck can take an eight-tonne load but a cart carries only one tonne. Besides Sonone sits Eknath Vishnu Kapse, also from Chalisgaon. In these parts of Maharashtra, where agriculture is a wretched business, to be a contractor, 'mukaddam', is coveted status. The high turbans these men wear (layer upon layer of cloth dyed a gorgeous sunset pink) seem symbols of that status. These are old and well-established contractors of Rahuri. The factory has a daily crushing capacity of 2,600 tonnes, which means a harvesting and transport labour roughtly (at the rate three hands per tonne) of 7,800 workers to keep the plant working.

"We must have double", their voices rise, high, militant, but the faces look pleased, flushed, like a bunch dowagers presiding over the ball of the season. "We must have double" said Tukaram Bhau Tanpure from Pathardi taluka. He was walking at the head of a caravan laden high with cane moving slowly towards the Sanjeevani factory in Kopergaon. He seemed to belong to the younger generation but he was also identifiable. His shirt was a bright white and the gold-capped pen and diary he wore in his pocket were conspicuous. Tanpure together with a partner was managing 35 carts.

These have never done a hard day's labour in their lives. They are middlemen and in Maharashtra's sugar industry they are indispensable. This industry has a peculiar characteristic; in order to be eligible for hire, its workmen have to offer their own capital. This implies, naturally, that they borrow the capital from the factory. The contractor is the vital intermediary in this transaction. At the start of the season, the worker has to invest in a pair of bullocks. The bullocks might cost roughly around Rs 900. These together with his cart he places at the disposal of the factory for the next six months. He and his family, a husband, a wife and a grown-up brother or son, form the harvesting and transporting unit — "the koytha".

Do they have to take a loan every year? "Let us say, I take Rs 1,500 from the mukaddam," a cartmen at the Malegaon factory in Poona district explained, "and I buy my 'own' cart and bullocks. Suppose I pay back the loan during the season, the bullocks and cart are mine." "This year I took Rs 2,000," another cartmen spoke up. Most of the good cattle had died or had been sold to the butcher during the famine. Truck rates had gone up and bullocks were now reported to be selling at Rs 2,000 a pair. "If the season is good, no doubt, I will make some money. But if there is a balance, the contractor will say 'sell the cart and bullocks and pay me back'." If the wages covered only maintenance, the loan would remain as outstanding. "I lost my bullocks in the famine year," the cartman at the Sanjeevani factory said. "This had happened in Niphad taluka, in Nasik. I owed the mukaddam Rs 450 and the bullocks were sold at Rs 525," he grieved. Occasionally the loan can be a transaction on paper. "What did you do with the thousand rupee loan?" I asked a cartman at Malegaon. "I gave it back to the mukaddam, he gave me the bullocks," he said. There was a ripple of laughter from the men around him.

There was an alternative to selling the cattle. They could pay the interest during the factory's oft season. Interest rates, according to the Baramati cartmen, were 10 per cent per month. "If I don't want to sell the bullocks I have to pay 10 per cent," the Baramati cartmen stated. Contractors disagreed violently. "It is only 4 or 5 per cent", Misal cajoled. Most contractors agreed that it was around 5 or 6 per cent. Tanpure from Pathardi, younger and more wily, flatly denied that he charged any interest. "There is an outstanding of Rs 18,000 from my workers," he said. But one of his men had told me earlier that only last year he had had to sell his land to pay back Tanpure. "I owed him Rs 1,250, and I had to sell one acre out of the five acres I own". How much had he borrowed? "I really don't know what the capital was, and what the interest" he said.

If the outstanding was low at the end of the season, the workers preferred to pay interest. So with every new season, the loan tended to grow. "I owed Rs 150 at the end of the last seeason," said Umaji Lakshman of Georai taluka. "This year I borrowed Rs 700. Together with the unpaid portion of interest I now owe Rs 950." The interest was a kind of "retention allowance" that the contractors earned when the plant was idle.

It also helped to cement the bonds of service with the workers. "We are begging them to take us to the factory," farmers of Patoda taluka in Bhir district told me earlier this season, "but they are only taking those who owe them money."

Did they know how much the factory paid them as wages? No one seemed to know. They recited the cartage rates, mechanically. What did they get as advance? "That's Rs 300 per cart they all acknowledged. This amount varied in parts of Kopergaon, but it was never stated to be more than Rs 300. Contractors at Rahuri declared that they were paid only Rs 300 per cart. "I got Rs 4,500 from the factory" said Eknath Misal, "but I have paid Rs 14,000 as advance". "I was given only Rs 1,750 by the factory," stated Dada Mahajan, "but I have paid the workers Rs 4,080." At least one factory denied this flatly. "There is no fixed rate for advances to contractors" said B B Bhonsle, managing director, Someshwar Sugar Factory. "Advances can range from Rs 300 per cart to Rs 1,000, depending on the contractor." The advance was given interest-free. All factories deducted the advance in equal instalments from the wages of the cartmen. Apparently, this could only be done by paying the wages directly to the mukaddam.

Why could not they recover the advance from the contractor's commission? "The commission is too small an amount," Shankar Rao Kole explained. If a cart earned Rs 250 a month the commission was hardly Rs 25. So the commission was small incentive for organising supply of cane to the factory. The real earnings of the contractors came from the interest.

Did the workers get any wages? "Ek paisa naahin dilath," the women at the settlement outside the Sanjeevani factory complained. Except for a little money on the weekly bazar day for vegetables and spices, ranging from Rs 2 per 'koyta' to Rs 10. What did the men do if they wanted to buy bidis or have a drink? "Sometimes we steal the sugarcane tops", they laughed.

But no one went hungry, they assured. The contractors arranged credit with the grain dealer — and they had enough to eat. The quota was roughly 2 payalis (30 kgs) for a fortnight. So the factory, after deducting the instalment towards the advance, pays the wages to the mukaddam. He pays the merchant and retains the rest towards payment of his own loan. "Supposing a koyta earns Rs 125 during the fortnight, I keep Rs 100," stated one of the contractors.

Harvesting and transport rates are Rs 4.20 per tonne for harvesting and Rs 3.20 per tonne for the first mile with 75 paise for every additional mile. The Bombay Industrial Court worked out that a cart on an average transports cane over a distance of 8½ miles. This would work out to an average wage of approximately Rs 14 per day per cart. This means Misal with 14 cart makes Rs 196 per day. He spends approximately Rs 2.80 on 2 kilos of grain per day per koyta. He might spend another rupee or two on payments to the blacksmith or the carpenter. The remainder is adjusted towards the loan of capital. Only one contractor at Malegaon (among those I met) claimed that he paid cash wages to the cartmen. He showed the accounts he was maintaining. "I take my share after the factory takes its," he said. "Supposing they earn Rs 200 — I take Rs 50. It is all according to a scale," he said. The leading grain merchant at Kopergaon, Shantilal Rupchand Golecha, was reluctant to show his accounts. He sold 'kulthi', a cheap grain, as feed for both cattle and men. Kulthi was selling at Rs 80 per bag of 60 kilos. Groundnut cake was now selling at Rs 1,400 per tonne and was beyond most cartmen's reach. He acknowledged that he gave the grain on credit. He claimed that he charged no interest. And there was always an outstanding at the end of the year. "... about 25 per cent remains unpaid," he stated. "The merchants take interest," a contractor said. "I pay Rs 3 per hundred."

In the sugar industry in Maharashtra the 'contractor' thus has the following functions:

For the factory:

(1) He stands guarantee for the loan given to cartmen.
(2) He organises labour; supervises field operations, assures continuity of supply of cane to keep the plant working.
(3) He assures continuity of supply of labour every year without retention liability.

To labour, the contractor offers the following services:

(1) He stands guarantee for the loan given by the factory.
(2) He stands guarantee for credit extended by the grain dealer.
(3) He assures them continuity of service with the factory.

There are two conditions for the efficient functioning of this system. The first is that the workers must be *migrants* to the factory area. Ahmednagar district (and Poona and Sholapur) is in the heart of the sugarcane belt. It is also in the rain-shadow area. During the scarcity years Nagar and Sholapur had over 5 lakhs of people on relief works. Yet Nagar district labour will seek employment in the sugar factories in Kolhapur and elsewhere. And cartmen from Kolhapur stray as far afield as Athani taluka in Belgaum district. It is quite true that the bulk of the migrants come from the dry farmlands of Bhir, Jalgaon and Aurangabad. But there is considerable inter-district migration during the crushing season. The farmer by leaving his village becomes dependent on the contractor even for the services of the blacksmith, the carpenter and the harness-maker. "Who will give us advance in our own village?" asked an old woman in the harvesters' camp outside Sanjeevani. The advance is the 'bait', offered to the farmer to leave his village.

The second condition is that the worker should be credit-worthy. In Maharashtra there are bands of nomadic tribes such as the Lamande and the Vanjara who wander from one district to another, seeking work. These are also employed as harvesting labour, but they form a small percentage. The 'worker' must have security, preferably land, in his own village before the contractor will offer him credit. The Maratha, the small farmer, with a few acres of dry land forms the majority of the harvesting and carting labour in the factories. He alone could be expected to respect the conventions of debt servitude.

A small group remains outside the system. Not far from the Someshwar factory, a small caravan of seven carts was hauling in cane. "We are from Wadagaon, a village nearby," they said. "We take no advance from the company and we are paid our wages directly," one of them said. They also claimed to be on the muster roll of the company. "We have been coming here for nearly nine years," they said. "We get Rs 4.50 for harvesting and Rs 3.20 for the transport and and we make Rs 2 every day by selling the top leaves of the sugarcane." Uttam Jagannath Bhagat and Kisan Rao Saheb

Jadhav, from Koralibhudru village in Baramati taluka also said that they had no 'mukaddam'. "We make about Rs 200 a fortnight." They declared that there were not many of them. "The number of carts coming from outside Nagar is very high", they said.

Then there are the cartmen who are also 'mukaddams'. Pandu Yeshwant Jadhav of Amalner from Bhir was one of them. "Last year, bullocks were cheap; so I had eleven carts. This year I have bought only five," he said. He was clearly not adept at this game. Last year he had advanced money for 13 carts but only 11 had turned up. He claimed to have lost Rs 2,600 on the deal. "There are some gangs like these," G R Lagad, General Secretary of the Baramati Taluka Rashtriya Sakhar Kamgar Sangh, stated. "But there is always a sarpanch or a grain dealer who is their real 'mukaddam'," he said. Paradoxically, the unrest that is beginning has not challenged the system but has strengthened it. At least one factory management is seeking to legalise the 'system' by describing the contractors as "relatives and family members of the cane growers, who have their own workers". The labour unions, perhaps in a bid to strengthen their case for privileges as workers, have defined the 'contractor' as "invariably himself a workman, who drives a cart along with the other cartmen and whose family members work as harvesters". The contractors of Pathardi and Bhir and Chalisgaon are naturally jubiliant. The prospect of arrears of wages from the years from 1968 is now being held out to them.

There is only one discordant note. The Malegaon award (April 18, 1972) made by the Maharashtra Industrial Court does not seem to fully accept the definition of the contractor. R D Tulpute, Member of the Industrial Court, has in the judgment referred to the definition. "According to the Sabha [the Baramati Taluka Sakhar Kamgar Sabha], the practice of the karkhana is to pick up a workman and describe him as a contractor and enter into a contract with him while the work is being done by the entire gang. The contractor himself is also a cartman and harvester." Yet while awarding a higher wage rate for the year 1965-66 and directing that arrears be paid from that year, Tulpule has observed: "The amount on account of the increase in rates is directed to be paid to the actual workmen and not to the so-called contractors." But it will be difficult to change the method of payment of wages unless the factory is made to accept responsibility for the capital expenditure incurred by the workmen and for the cost of maintenance of equipment. Tragically enough, the labour unions have failed to collect data on the system of advances. It is not as though Tulpule has not given the lead. "As I pointed out, a large number of factors which would be relevant have not been either considered earlier, or evidence in that behalf adduced before me in this case. For instance, the expenses on account of shoeing of bullocks, repairs to harness, grease, petty repairs to bullock carts and major repairs, the capital cost both for bullocks as well as for bullock carts and the loss which might result on account of working reducing the efficiency and serviceability of these animals." Tulpule has stated that he has adopted the first wage board recommendations of Rs 115 as the minimum earning of the unskilled factory employee and fixed the earning of a koyta of 3 persons at Rs 345 per month. This, he has made it clear, has been fixed, by "ignoring the various other factors, namely, [that these workmen] have unspecified hours of work. They also have to meet sundry expenses on equipment, including the feeding of the animals."

How would it be equitable to award the minimum wage of the factory employee to workers who have to buy groundnut cake for their cattle at Rs 1,400 per tonne? Why should they have to borrow money on interest for this purpose? Tulpule has censured the Malegaon and Someshwar sugar factories on moral grounds: "It may be seen ... that the Malegaon Sahakar Karkhana in the year 1967-68 had paid a very high rate to its grower members, namely, Rs 123.00 and Rs 112.50 for ex-field sugarcane when it was Rs 83.50 and Rs 84.40 for gate cane fixed by the government. ... It will thus be seen that the co-operative societies are for mutual benefit of its members. There can be no objection to this but if the mutual benefit is reaped at the cost of justice and humanity to a section of workmen who bring in that benefit to them, then I do not think that that can be permitted."

But the price of cane represents accurately the measure of political support that the system enjoys. It is a virtual guarantee of the continuation of the system, and the chairmen of the sugar factories, shrewd politicians, are quick to grasp this. "The fundamental issue," stated Shankar Rao Motite Patil of the sugar factories of Akluj taluka of Sholapur, "is whether the income of the growers should at all be brought in on any discussion of wages of factory labour." There were nods of assent from the assembled chairmen and managing directors around him, gathered for the meeting at Kopergaon. "Eighty per cent of cane growers are small holders and if the demands of labour are accepted then the farmer is prepared to do the harvesting and the transport and let the migrants do the farming," he declared. "What labour is demanding, is it the real demand of the cartmen?" they asked. Why didn't they deal directly with the workmen and not through the contractors, I wondered. "Because then they will become our labour," Kole said flatly. It seemed as though the tiring fight through the labour courts had never been. Dismissing the writ petition of the Kolhapur Sugar Mills the Bombay High Court had observed that "the admitted facts in the case leave no room for doubt whatsoever that the work in question was work which was ordinarily part of the undertaking of the petitioner company, the contractors and their team of workers are employees of the petitioner; that the petitioner company was their employer.

The Supreme Court had also held (in the dispute between the Godavari Sugar Mills and the Kopergaon Taluka Sakhar Kamgar Sabha, Sakharwadi) that the employees of the contractor were to be deemed direct employees of the main employer and that all conditions and terms of employment to the direct employees could be made applicable to the employees of the contractor.

The chairmen of the factories, many of them legislators themselves, are confident of support both from the legislature and from the government. There is one other reason for their ignoring the courts' strictures with impunity. The Courts, slow and ponderous, have only recently settled the issues for 1965-66. Since then the pace of growth of the industry has been startling. It might take a while for the Courts to catch up with the industry.

The 12 carts moving abreast, darkened the horizon as they descended the ridge near the Sanjeevani factory. In the harvesters' settlement outside the factory the women were watching the carts draw nearer. Their little huts (cane leaves propped up against each other and tied at the top in an absurd ponytail knot to form a tent) were just large enough to let a child and its dog crawl in. "What do you get when you go back to your village?" I asked. "We get baksheesh." they said gratefully — "every family gets a hundred rupees".

GUJARAT

Beyond the Ken of Organised Politics

(From a Special Correspondent)

IT is not a law and order problem which faces Gujarat. What started with the incidents in three talukas of Surat district — Bardoli, Kamrej and Palsana — on January 3 has engulfed literally the whole of the state, from Surat in the south to Palanpur in the north and all districts of central and western Gujarat including Saurashtra. If imposition of curfew is an indication of the seriousness of a situation, at one time most of the urban places, as defined by the Census, in 15 out of the 18 districts of the state, were under curfew on a single day. In addition, there were orders prohibiting the assembly of four or more persons in other places. More than 75 per cent of the total urban population of Gujarat has been at one time or the other under either a 'bandh' or a curfew in the last three weeks or so.

Clearly, this is not a situation that can be treated as a law and order problem. Nor is it simply a question of dissatisfaction with the performance of the government. Were the government headed by another Chief Minister, or were there a Congress(O) or Jan Sangh government, or were there even Governor's rule, the food situation would not have been very different or the price spiral less pronounced. Probably under Governor's rule the army would have been called in much earlier. This is not to minimise the responsibility of the state government for the way it has handled the situation. The point is that the root causes of the recent developments go deeper than the errors of omission and commission of the present government, or the sympathies and antipathies evoked by individual members of it.

The political and economic ramifications of the recent developments in Gujarat are so wide-ranging that no cut and dried report covering all these aspects is possible. Only some notes on a few of the salient points are attempted here.

*

The developments of the last few weeks have served to expose some misconceptions about Gujarat. One of these is the belief that the people of Gujarat are relatively well fed, well housed, and well clothed. This is a myth, notwithstanding the statistics of per capita income, industrialisation, urbanisation, investment, etc. The riots are an expression of the long-standing and widespread economic distress and the worsening disparities in the living standards and styles in the urban and rural areas. Yet there has not been any marked sharpening of class conflict. The organised political activity required for that has been completely lacking.

The second myth that stands exploded is that the people of Gujarat are 'wise'. Whenever political leaders, whether from Gujarat or from other states or from the Centre want to pacify the people of Gujarat, they employ the cliche that the people of Gujarat were 'wise'. This cliche was the product of the business culture of Gujarat, sustained by the business class and its political, economic and social allies and agents. It will not work any longer.

*

Rioting has taken place in practically all the corporation and near-corporation-size cities and in a very large number of towns with populations upto 10,000. Detailed reports on the spread of disturbances in the rural areas are not available, except in the three talukas of Surat district. These reports are an indication of what could happen in the rural areas and what the problems there are.

In the urban areas, the organised industrial working class is conspicuous by its absence from the disturbances. Casual and temporary workers and others like hand-cart pullers and pavement vendors have also not been active in them.

No political party or group and no individual leader has tried to give any direction to the disturbances. P G Mavlankar was invited by the students to lead them, but he stayed out.

Students have been active in the riots, upto a point and in a particular manner. But the most active non-student groups belong to the age-group 15 to 30. These groups are mainly from the intermediate and lower castes. They are employed in industries in which their occupational positions have the approval of their reference groups. They are mostly employed in small-scale industries and are not organised in unions or associations. They are supported by similar employable, but unemployed, groups, most of them literate, being educated upto matriculation.

These participants in the riots have militancy, but they do not have a strong sense of purpose and direction. They do not have the discipline of organised industrial workers or of white-collar bank or insurance clerks. They are also not subject to the discipline in their homes that, say, the clerks are subject to. They are probably experiencing the freedom of an urban area for the first time.

In terms of bringing about political or social transformation, this is an inconsequential category. It could be best designated as 'the urban crowd'. It is incapable of a sustained action, but can play this sort of sporadic role with some incitement. This group can be contained when strong-arm methods are used against it and when slowly the rest of the people begin to get fed up with the inconveniences to which they are put. Though all sections of the population have sympathy for what this group is protesting against, the industrial workers and a very large number of daily-wage earners are hit by the bandhs and the curfew. The white-collar workers and the upper crust would also like the situation to return to normal. Sometimes disturbances involving the urban crowd are prolonged by the professional underworld, with connections with politicians and the local authorities.

It is significant that no political party wants to guide or lead this group. In fact the two opposition parties worth the name in the state, Jan Sangh and Congress(O), have dissociated themselves from its actions. They only want to use the disturbances for their activities in the state legislature and for improving their prospects at the time of elections.

*

Among the political parties, the Jan Sangh has been the most active. It has organised the largest number of bandhs in different parts of the state. It has a well-knit organisation and in organising efficiency it surpasses both Congress(O) and Congress(R).

The Congress(O) has been engaged more in issuing statements. It has given relatively few calls for bandhs and other such actions. It has concentrated on attacking the ruling Congress on policy issues, blaming it especially for what it calls its Leftism.

In its criticism of the ruling Congress the Jan Sangh is one with Congress(O). There is little to distinguish the policies of the one from those of the other — they both stand for the social *status quo* and the capture of power from the ruling Congress. Both the Congress(O) and Jan Sangh have better party organisations than the Cong-

ress(R), reflecting the strength of the interests which they represent and defend. These parties, i e, the interests they represent, are on the offensive. They have accused the ruling Congress of failure to protect the 'people', of being unable to provide food or to bring down prices, of having failed to solve the Narmada dispute in Gujarat's favour, of enacting land legislation likely to harm production and of governmentalising trade in general and wheat trade in particular. Their latest is that some Naxalites have come to Gujarat from outside. When it comes to Naxalities, even the newspapers unite against that imaginary danger.

In fact, there is no Left movement of any sort in Gujarat. The CPI and CP(M) exist, but they have no influence worth mentioning. The same is true of Socialists of all brands.

The Congress(R) in Gujarat is a replica of the party at the all-India level. It lacks ideological clarity, and its legislative and organisational wings are ridden with factions. It lives from day to day. It is not even practising pragmatism. It passes the land ceiling bill, but the bill is still to become an act. It passes the education bill, but the statute in its final form turns out to be different. It arrives at an agreement with the oil magnates and gets a promise that the price of groundnut oil would be reduced. The price goes up instead, but free trade in oil is allowed to continue. Again another understanding is arrived at, but the price still does not go down. Restrictions on wholesale trade in wheat are relaxed, but a levy is imposed on paddy. Farmers in only three talukas of Surat in the whole of Gujarat refused to comply with the levy. The government arrested the leaders of the farmers or khedus on January 2. The khedus countered with the threat that if the leaders were not released, Gujarat would be in flames.

The opposition to the levy on paddy was not an economic issue, but a political one. The levy did not even bruise the farmers who, organised under the banner of the newly-started Khedut Samaj, actually promised to give more paddy than required under the government order, provided the levy was abolished and it was made voluntary. Their demand was that the government should have arrived at a 'samjuti', or understanding, with them as it had done with the groundnut and oil magnates. The issue was, who had the power — the government or the khedus.

The government has now arrived at a 'samjuti' with the landowners, though nothing is known about its terms. It is as secret as the settlements reached under the kerchief in the market. The 'samjuti' technique, incidentally, seems to be playing an important role in the private and public life of Gujarat — reflecting perhaps the dominance of the culture of the market.

*

The Khedut Samaj has no organisation in urban areas. The Jan Sangh and the Congress(O) did not come out openly in support of the anti-levy agitation. They made statements which would enable them to say that they were for the levy or against it according to convenience. The levy issue did not directly touch industries, industrial workers, clerks, students or the 'urban crowd'. The grain merchants were probably the only urban group affected.

Whatever might have triggered off the riots, the food shortage and high prices provided the fuel which was available all over the state. The distinctive feature of the riots was that grain shops and godowns were the targets of attack on an unprecedented scale. The state government depends on the Centre for food. The Central government has, however, been more quick to send the Central Reserve Police than foodgrains. But, while the police and the army may succeed in enforcing law and order, food alone will bring peace to the state.

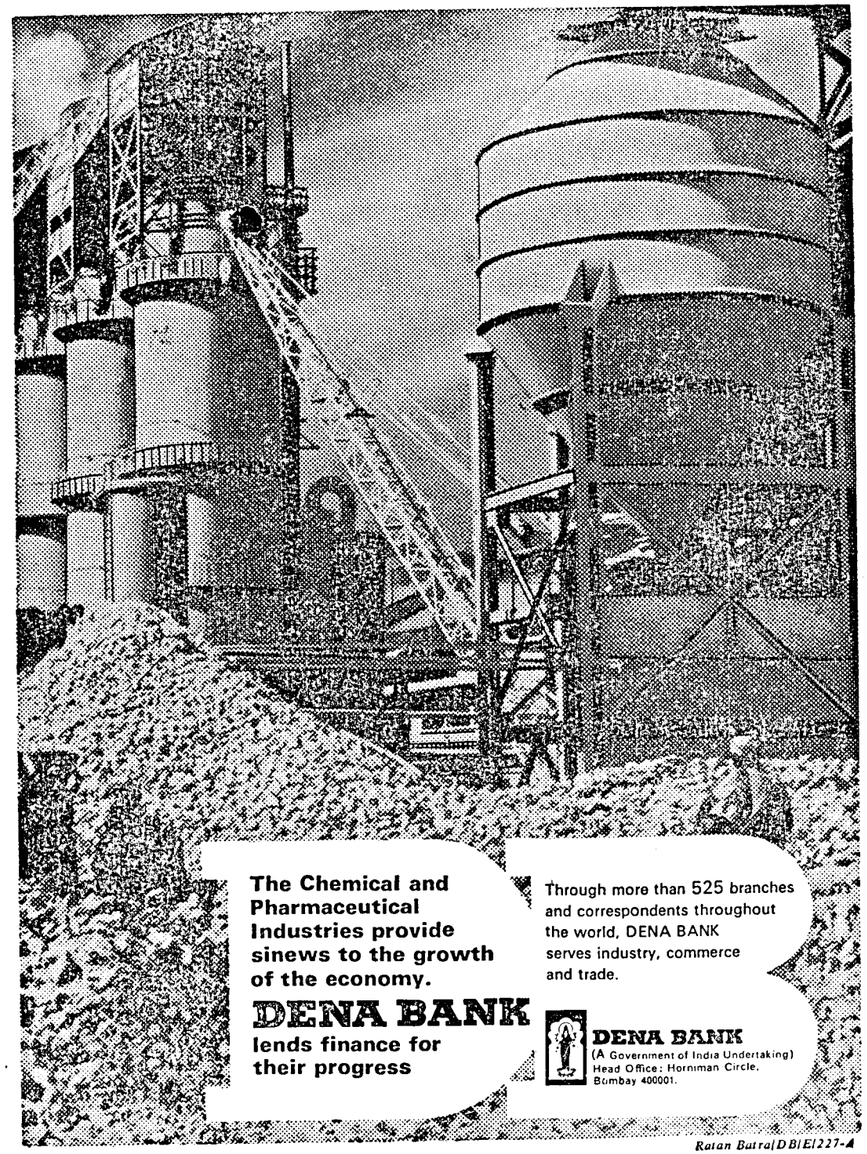
SARKAR COMMISSION

Pre-Emption of Institutional Finance

Procedural Red Herrings

(From Our Industrial Correspondent)

IF the Hazari report on industrial licensing was responsible for identifying one crucial aspect of the large houses' investment behaviour — *viz*, the pre-emption of licences —, the current hearings of the Sarkar Commission might well succeed in highlighting an equally important and associated aspect of monopolistic behaviour — *viz*, the pre-emption of institutional finance. The possibility of pre-emption of finance was indicated in an earlier report in these columns ('Sarkar Commission: Public Money for Private Empires', January 12, pp 15-16). This hypothesis is further borne out by evidence provided during the resumed hearings of the Commission. The Commission is presently enquiring into certain concerns of the larger industrial houses, to which the Industrial Development Bank of India (IDBI) had granted financial assistance.



Pre-emption of licences amounts to reservation of areas of investment without commitment to actually making the investment. From the viewpoint of a large industrial house, pre-emption arises from an excess of its total reserved area of investment over its total ability to invest in a given time-period. The motivation for pre-emption is basically two-fold: first, to reduce potential competition and, secondly, to increase the flexibility of decision-making for the large houses in the face of different kinds of uncertainties inherent in the investment process. Pre-emption of institutional finance reinforces the above tendencies.

The reservation of institutional finance (at the time of its sanction, irrespective of whether it is disbursed) reduces the availability of such finance for other licences. It also increases the individual monopolist's capability to adjust and move, if required, from one investment plan to another. In sum, both forms of pre-emption contribute to the growth of the power of the large houses.

The argument on pre-emption of institutional finance was raised by the Commission's counsel as a sequel to the IDBI counsel's preliminary objection that the Commission was not competent to take up the cases of financial assistance to Birla concerns: Bihar Alloy Steel and High Quality Steel. The objection was that, since the assistance sanctioned to these two concerns was not eventually disbursed, and since the Commission by its terms of reference was required to enquire only into those concerns to whom assistance had been 'given', these cases fell outside the purview of the Commission. The IDBI counsel interpreted the word 'given' to mean 'disbursed'.

Replying to these arguments, counsel for the Commission submitted that the Dutt Committee had equated sanctioning of assistance with the granting of it. Since the Sarkar Commission was entrusted with follow-up action on the Dutt Committee, it should proceed along those lines. In this context, the Commission's counsel argued that, while disbursement was only an executive act, the decision to grant assistance was a policy matter. Once the decision to offer assistance was taken it was a 'legal commitment', and therefore amounted to pre-emption of financial capacity: Others who were standing in the queue were thereby shut out of assistance. The main issue, consequently, was whether the top executives of the IDBI had acted properly in sanctioning the assistance, and whether any undue favour was shown or undue influence exercised in the sanction.

In trying to counter the IDBI counsel's objection, the Commission's counsel needlessly referred to the Dutt Committee's procedures. It was sufficient to look at the terms of reference of the Commission more closely. For, then it is clearly seen that the words 'given' and 'granted' have been used synonymously. According to the terms of reference of the Commission, the Commission was meant to enquire, among other things, into "the financial assistance (by way of loans, underwritting of shares and debentures, purchase of shares or otherwise) given to the Larger Industrial Houses referred to in the Report of the Industrial Licensing Policy Enquiry Committee by certain

financial and other institutions ... with a view to determining the circumstances in which such assistance was granted, whether any undue favour was shown or undue influence exercised in the grant of such assistance or in prescribing the terms thereof and, if so, the concerns, institutions or persons responsible therefor".

The essence of the matter is that the giving or granting of financial assistance is not an instantaneous, indivisible act; rather, it is a process spread over time. 'Sanction' and 'disbursement' are two different aspects of the same phenomenon of 'grant of financial assistance'. The reservation of institutional finance occurs at the initial stage of sanction itself. Thus, it is quite legitimate to enquire into the circumstances in which financial assistance was sanctioned even when it was not actually disbursed and eventually cancelled. In fact, it is logically possible to construe a case where undue favour in the sanctioning of assistance is shown only for purposes of pre-emption of institutional finance. That would, indeed, be an instance of undue favour and, therefore, the case for enquiry is sufficiently strong irrespective of whether or not the financial assistance was disbursed.

Meanwhile, the Sarkar Commission has reserved its orders as to whether it is competent to enquire into the Bihar Alloy Steel and " High Quality Steel cases. In view of the above considerations regarding pre-emption, and especially in view of what is known regarding these two extremely dubious cases, the need for a public enquiry is considerable.

NAGALAND

'Operation Election'

"GENTLEMEN, this is going to be the most crucial and important election for our state." These were the words with which Sashi Aier, Development Commissioner and Chief Electoral Officer of the Government of Nagaland opened the conference of the District Electoral Officers of the state in November 1973. The District Electoral Officers were also District Magistrates of the three districts which comprised the then state of Nagaland. It was explained at this conference that the forthcoming election was a crucial one because it was for the first time that the ruling Naga Nationalist Organisation (NNO) was going to face a united opposition and fight the election on political issues; and it was an important election also because at it would be tested whether or not there was any room in the state's politics for the underground Naga Organisation, as that was the political issue the opposition party, the United Democratic Front (UDF), was really fighting on.

The state of Nagaland is going to the polls in the second week of February for its third general election. The election is supposedly for deciding who will rule the state for the next five years. This is part of the make-believe game of democracy, here as elsewhere in the country. But the make-believe is even less credible in Nagaland where the local population lives under constant surveillance of the army and various other para-military organisations like CRP, BSF, Assam Rifles, etc. For every two able-bodied Nagas in the state there is one representative of the coercive force of the state. It is this fact which is going to decide the outcome of the election.

Election management in the state has assumed a sophistication unheard of in any other part of the country. While the jawans of the Indian Army who come under the Army Act have not been enrolled as voters, all other Indian citizens — whether serving in the Assam Rifles, BSF, CRP and therefore also falling under the same Army Act — as well as the imported labourers of the Border Roads Organisation have been enrolled as voters. The total number thus enrolled is nearly a lakh. As the average number of voters in each constituency is between five and six thousand, the effect of the average of one thousand five hundred voters from these specially created categories on the fate of the election can be readily appreciated.

Hokishe Sema, Chief Minister of Nagaland, has gone on record as saying that in the ensuing elections the Nagas would prove once and for all that there was no real Naga underground problem by returning the NNO to power. Sema could not have been more right; for his administration is going to ensure that the NNO is going to be returned to power. Nagaland, with a population of about 5.5 lakhs, has 33,000 government servants. The polling in the approximately 1,000 booths could, therefore, be completed easily in one day. But, evidently, not too many of the government servants are regarded as being sufficiently reliable; as a result, only about 2,000 of them have been picked to perform the polling duties spread over the three days of February 12, 14 and 16, Each polling party will be assisted by a contingent or 16 persons bearing arms. The areas from which the voters are supposed to come to cast their votes will be commanded by personnel drawn exclusively from the Indian army. Large numbers of Indian army personnel have already started to arrive in the state to take up positions for 'operation election'.

Unfortunately, the UDF seems to be labouring under the illusion that the Naga vote is assured for it. It it were sufficiently aware that Sema's administration under the able guidance of Lallan Prasad Shingh, has done all that is humanly possible to attract the local voters, it would be far more cautious about entering the electoral game. The state has been carefully divided into seven districts so that all the major tribes have a district now: the Angamis have Kohima; the Chakhesangs, Phek; the Aos, Mokokchung; the Lothas, Wokha; the Semas, Zunheboto; the Konyakas, Mon; and so on. Shingh and Sema, moreover, did a thorough job of the delimitation of the 60 constituencies last year: all 'unreliable' groups of people were put together so that certain seats were hard-headedly written off, and at the same time other groups were so combined with the gentry from the BSF, etc, that at least 40 of the 60 constituencies have become virtual pocket-boroughs. Nevertheless, steps are still being taken to attract as many votes as possible. Government being virtually the sole employer in the state, state government employees represent a sizeable section of the voters: the state government has announced a substantial pay-hike for its employees, ranging from Rs 20 to Rs 50 per month. Offering of money by individual candidates may be a crime, but when it comes from the state itself, it is termed 'relief'. Citizens from other parts of the country who are not in state employ require a permit to enter Nagaland and another permit to be able to stay there. A rumour has been gently put afloat here that if the UDF is returned to power all non-locals would be sent out of the state.

Hokishe Sema should be about the happiest man in the state today. With his own unopposed return to the state Assembly and the assured victory of his party at the polls, he and his henchmen must have already started to plan the division of the spoils which will begin to flow in from April in yet another fiction known as the Fifth Five-Year Plan during which Nagaland has been assured munificence of Rs 250 crores. But, then, that is another story.

China's Naval Capabilities

Rahul Burman

THE recent exertion of Chinese authority over the Paracel group of islands in the South China Sea was largely a naval operation involving various arms of the Chinese navy. Missile-boats, landing craft, naval aircraft and marines appear to have been used in a brisk, co-ordinated action against South Vietnamese naval vessels and marines. The Paracels operation seems to indicate careful nurturing and development of Chinese naval strength since 1949.

When the Communists gained complete control of the Chinese mainland in 1949, there was no navy except for a few ships which had been unable to move to Taiwan. The largest one was an ancient cruiser which was sunk by a Nationalist air attack within a month after the Communists took over the ship. What remained was a motley collection of ex-American, ex-British and ex-Japanese ships, all of them World War Two craft or even older. The major units were nine former Japanese frigates which were in a state of complete disrepair. So Communist China's navy at that time had little or no operational capability.

Army Officers as Commanders

The personnel situation was deplorable as there was no nucleus of personnel with naval experience in the People's Liberation Army (PLA). The only naval personnel were those who had defected from the Nationalists and whose dependability was uncertain. Understandably, therefore, the first batch of commanders of Communist China's navy were army officers without any maritime experience who were chosen for their political background. But these army officers and the few Nationalist naval officers who had defected to the Communists could not fill the large gaps in the field of naval leadership, training and planning.

However, as early as September 1949, the Communist Chinese People's Political Consultative Conference resolved to develop a navy. In 1951, the People's Naval Academy was created, followed by two naval air academies. Despite this early recognition, serious naval expansion did not really begin till 1954, when the Soviet Union transferred outright some old destroyers, several submarines, and a lot of small craft, including 50 motor torpedo boats.

It has been estimated that as early as 1954 there were 1,500 to 2,000 Soviet naval advisers attached at nearly all levels to China's navy. Many Chinese naval officers were also being sent to the Soviet Union for training. Soviet aid did not stop with the provision of old warships and technical advice. During 1956 the Soviet Union began assisting the Chinese in the construction of several warships of the latest Soviet types, including long-range submarines. All these ships were designed in 1950 or later.

Quite dramatically, the growth of China's naval power began to slow down with the aggravation of the Peking-Moscow ideological dispute. By 1960, the naval construction programme had lessened considerably and also during the same year there was a rapid withdrawal of Soviet naval technicians and advisers.

But this did not greatly affect overall Chinese military capability as China is essentially a land power, even though it has a long coastline of 7,580 miles with 3,500 large and small islands scattered along it. China's coastline is characterised by shallow waters, innumerable islands, harbours and inlets. This coastline is ideal for both defensive and offensive mining. With the wide distribution of ports and with the long archipelagic coast, the seaward defence of the Chinese mainland can be well accomplished with the use of motor torpedo boats and fast gunboats. The shallow coastal waters, however, are far from ideal or submarine operations.

The headquarters of the three fleets — the North, East, and South China Fleets — are located in Tsingtao, Shanghai and Canton, respectively. The main naval bases included Port Arthur, Dairen, Choushan, Foochow, Swatow, Whampoa and Yulin. Some of these ports are former Nationalist or Japanese naval bases. Additionally, there are many smaller bases with varying facilities which give the navy an adequate number of bases available for operations along the entire coast.

China's navy is the smallest of its three armed services. There are different estimates about its strength, and it is not possible to say which is more correct. According to "The Military Balance 1971-72" published by the International Institute for Strategic Studies, London, China's navy comprises 150,000 officers and men, a figure which includes 28,000 naval air force personnel and marines. A more detailed estimate has been made by Hideo Sekino, a retired commander of the Imperial Japanese Navy, in "Naval Review 1971" published by the US Naval Institute. His figures are: 30 submarines, 27 destroyers and escorts, 535 patrol craft, 50 mine countermeasures craft, 305 amphibious warfare craft, 130 auxiliaries and 300 others. Total: 1,377 vessels of about 260,000 tons.

Attracting world-wide attention is the strength and potential of Communist China's submarine fleet. The Nationalist leftovers did not include even one submarine, but by the end of 1955 China already had 13 submarines. All these submarines were built before World War II, except the M-class. Strictly speaking, they were of little value in the postwar period. Later, around 1956, the Soviets began assisting the Chinese to build W-class submarines, the latest Soviet type at that time. By the end of 1959, the total number of W-class submarines reached 24 and by the end of 1962, it was estimated that China possessed a total of 50 submarines, of which there were at least 30 of the W-class.

The Plan that Failed

The W-class submarines have a capability for both torpedo attack and mine-laying. Some of them also have a deck tank for housing missiles and two deck launcher ramps for surface firing. Relatively small, these vessels have an average radius of 14,500 miles and a missile range of about 250 miles.

When Peng Teh-huai was the Minister of Defence, he talked about a long-range plan to build 300 submarines. At that time, China still enjoyed the full support of the Soviet Union, and so this Plan could not be dismissed as fantasy. However, since the Sino-Soviet split, this plan is unlikely to become a reality in the foreseeable future.

Chou En-lai claimed in 1960 that Peking could build a nuclear-powered submarine in five years and according to a French news source, China did launch its first nuclear-powered submarine in 1965. "Jane's Fighting Ships 1971-72" suggests that the submarines currently being built in Chinese yards may be nuclear-powered; but these guesses should be treated with reserve. Judging from the present state of Chinese technology, it seems improbable that the Chinese can build a nuclear-powered ship before 1975.

In 1964 China built what seems like

a Soviet G-class submarine at Dairen. At that time the Pentagon thought this move might herald the creation of an equivalent of the Polaris fleet. However, no further step in this direction was reported between 1964 and 1967. The first firm evidence that China was building submarines capable of launching ballistic missiles only came to notice in 1968. Since then there have been numerous reports that more such submarines are being built in Chinese shipyards; but if so, the rate of construction appears to be very slow. An effective strategic missile submarine force is unlikely to be created before 1980.

The G-class is a ballistic missile submarine with three vertical missile tubes and six bow torpedo tubes. 320 feet long, it weighs 2,350 tons on the surface and has a combat radius of 22,700 miles. China is believed to have at least two G-class submarines in operation. Conventionally powered, they are no match for nuclear-powered submarines either in speed or in range. However, they still are powerful weapons systems and can pose a considerable threat to many parts of the world.

Psychological Weapon

The range of the missiles carried by the G-class submarines is estimated at 380 miles to 400 miles. China may be planning to build new long-range and larger submarines specifically designed for carrying and launching IRBMs with a range of 1,500 miles. This is a possible explanation for the slow rate of construction of the G-class. China is, however, still a very long way from the possession of a powerful undersea fleet. As a strategic military instrument, the present position of Chinese submarines is only marginal, but their value as a psychological weapon may be much greater.

China's navy is, however, the largest Asian navy. Its fleet of long-range submarines gives it some offensive capability and its coastal region is protected by a large fleet of small ships. Today, China is the only Asian nation, other than Japan, conducting a substantial and sustained naval building programme. Although most of the ships built in Chinese yards are Soviet-designed, the Shanghai-class motor gunboats and the Swatow-class patrol boats are both of Chinese design. A West German news source reported recently that three new destroyers were under construction. If the report is correct, it indicates that China has made major progress in naval technology.

But the major surface units of China's navy consist only of four obsolete Gordy-class destroyers and four Riga-class destroyer escorts. The shortage of large warships certainly represents a weakness in the force. The coastal defence strength lies in the fleet of smaller ships. First in importance are the 15 missile-armed patrol boats of Soviet design carrying Styx missiles. (Some of these missile-boats appear to have been effectively used in the recent Paracels action.) They are supported by a larger number of motor torpedo boats and motor gunboats totalling about 500 as well as 24 Kronstadt-class submarine chasers. There are only 50 minesweepers, which certainly is another shortcoming because China has such a long and easily mineable coast to protect.

Essentially Defensive Navy

The conclusion to be drawn is that China's navy is essentially defensive in orientation. With an emphasis on fast motor boats, however, the Chinese Communists give themselves a tactical offensive power which could be used within close range of their bases. These units are highly mobile, shallow-draft ships which can utilise the irregularities of the coastline to conceal their movements from enemy forces.

Since 1954 there have been several surface engagements between Communist China's naval units and those of Taiwan. It appears that China lost many small craft, but also inflicted serious damage, including sinkings, on a few major units of Taiwan.

The Chinese never committed any unit larger than a motor boat in these battles. Generally, attacks were made at night. Such clashes have continued through the years but with a definite decline in frequency.

The Chinese navy also has a small air arm. This naval air force, believed to be 16,000 strong, includes amongst its 500 aircraft about 100 Soviet Il-28 torpedo bombers and a large number of fighters of the MiG series. Land-based, this force can be employed in short and medium-range over-water reconnaissance and coastal mine-laying. Its bombers and fighters can also be used to attack shipping in waters adjacent to the Chinese mainland.

The navy also has a relatively small amphibious landing force of about 28,000 men, but details of its organisation and equipment are not available. The Communists inherited a heterogeneous collection of landing ships and craft from the Nationalists. Despite the lack of confirmation of new construction of landing craft, it can be surmised that the Chinese have already built new landing craft to replace the old units. Such amphibious ships and craft are relatively simple to produce in quantity. In addition, the navy can requisition several thousand motorised junks and towed barges to augment troop carrying capability.

Despite its notable progress, the weaknesses of the navy remain critical. Although it has a measurable offensive capability, it is still basically a coastal defence force. Major shortcomings exist in minesweepers, large surface warships and operational readiness. The Cultural Revolution may have impaired the normal training and readiness of navy units. A recent article in the *People's Daily* blamed the lack of development of the navy and merchant marine on the former Head of State, Liu Shao-chi, and in the same article Mao Tse-tung was cited as calling for an all-out shipbuilding programme to create both a strong navy and a large merchant fleet.

Asia's Largest Navy

Despite Mao's call for a powerful navy, there seems to be little likelihood of any change in China's immediate naval policy. The principal objective is to protect coastal shipping and to repel sea-borne attack. The expressed aims of "liberating Taiwan" and "furthering the world revolution" should be seen as having at most propagandistic value. An invasion of Taiwan definitely does not figure in immediate Chinese plans.

During the past 20 years China has created Asia's largest navy and a substantial shipbuilding industry. These achievements, during a period when so many other things had to be given high priority in its national programmes, imply that the Chinese leadership is keenly aware of the strategic opportunities and advantages which sea power can afford.

Past and present weaknesses do not indicate that China's navy has only a limited future. The naval development has been delayed for many — mainly transitional — reasons. There is no shortcoming — including the lack of experienced naval commanders — which cannot be overcome with time, and no important barrier to future development appears to exist. There is no doubt that China has the necessary potential to become a great sea power.

The Harijans' Worsening Plight

Leela Visaria

Income Earning Trends and Social Status of the Harijan Community in Tamil Nadu by Alladi Vagiswari; Madras Institute of Development Studies, Madras, 1972; pp 150 + viii; Rs 7.50.

THIS is the first book in the series of empirical studies, planned by the Madras Institute of Development Studies, to enhance understanding of the "urgent problems faced by the Government and people of the State". The study is intended to assist the concerned departments of the Government in strengthening and/or reorienting their programmes for the development of the Harijan community. Since the information collected by the Censuses on the scheduled castes and tribes pertains only to the basic demographic and economic characteristics, an empirical study of the Harijans, which goes beyond the Census, is likely to arouse interest among social scientists as well.

The study covered a sample of 1,000 rural families — 800 Harijan and 200 non-Harijan — selected from four districts (Thanjavur, Chingleput, Madurai and South Arcot) of Tamil Nadu. It attempts to measure, through economic and social status indices, the level of discrimination suffered by the Harijans. It also attempts to study the trends in poverty over two decades between 1950 and 1970. This is done by comparing the income and occupation of Harijans (and non-Harijans) on the basis of their responses about the situation prevailing in the earlier years. (There is no mention of the reservations one would naturally entertain about responses related to the situation 10 or 20 years prior to the interview.)

Position Worsens

It was estimated that the per capita annual income of the Harijans in 1970 was Rs 227, as against Rs 406 for the non-Harijans. The differences in per capita expenditure were, however, much smaller because of significantly higher dis-saving or indebtedness among the Harijans. In terms of all the economic indicators — size of land holding, employment, occupation, income, saving — it was found that the position of Harijans had progressively worsened between 1950 and 1970, also it had deteriorated compared to the non-Harijans during the same period. In spite of the special programmes undertaken by the Indian government for the uplift of the scheduled castes and tribes, the situation of the Harijans does not appear to have improved. The study also indicates that when Harijans and non-Harijans were employed as coolies on daily wage rate, the average income of the Harijans was lower than that of the caste Hindus in 1950 and 1970. This is apparently due to the fact that Harijan coolies were unemployed anywhere between 50 and 150 days in a year. The income of the Harijan owner-cultivators and the non-agricultural workers was significantly lower than that of the non-Harijans in these occupational groups because of the small land holdings and the low-paying menial jobs of the Harijans.

Low Literacy

The level of literacy among Harijans at all ages was considerably lower than among the non-Harijans in the corresponding age-groups. In the age group 5-14, only about 45 per cent of the Harijan children (55 per cent of the boys and 34 per cent of the girls) were attending school in 1970. The corresponding school enrolment rates for the non-Harijans were 76 per cent for all children, 81 per cent for boys and 70 per cent for girls. The author has stated the well known reasons for low attendance in school by Harijan children, such as the ignorance of the parents about the benefits of education or about the Government scholarships, or long distances that the children have to travel to attend school or employment taken up by children to supplement family income. However, it is not clear whether any specific questions were asked to ascertain the reasons for low attendance in school and what proportion of parents or respondents considered each of these reasons important. The subject of people's perceptions of benefits of education and difficulties encountered in attaining it is quite important and needs to be probed.

The information on the perceived social position of the Harijans indicated that there was "significant difference in felt and professed discrimination" according to whether the respondent was Harijan or non-Harijan (p 112). On several issues like, walking in the street whether high caste Hindus live, entry into their homes or eating with them, access to common wells, entry into village temples, Harijans felt more discrimination than was admitted as prevalent by the high caste respondents. However, a somewhat negative relation was found to exist between discrimination and literacy, income and size of land holding. Even though the number of Harijans with higher literacy or income was very small, it suggests that less discrimination was practised against those who were on a higher rung of the economic ladder.

The inter-district comparison of the social and economic level of Harijans shows that the Harijans of Thanjavur were much worse off on almost all indicators than the Harijans of the other districts. This is rather surprising because of the relative agricultural prosperity of Thanjavur. Apparently, the benefits of the high agricultural productivity have not trickled down to the Harijans, the majority of whom work as agricultural labourers. The rigidity of the social customs and the relatively poor bargaining power have kept the Harijans in their caste-ordained position.

Major Recommendation

After examining some of the causes of poverty of Harijans such as low-income earning capacity due to less remunerative occupations, high unemployment and low literacy level along with high dependency burden, the author concludes the book with certain recommendations to alleviate these problems. The major recommendation is to increase the per capita income of the Harijans through education (intensifying adult education, giving more scholarships, building hostels), economic development (distributing land to the poor labourers, increasing farm production through co-operative farming, enforcing minimum wages, etc) and rural works, health and rural housing (extending existing health and nutrition services, integrating housing of Harijans and non-Harijans). These suggestions are not really new and if some of them can be efficiently enforced, the gains for the Harijans can be substantial. However, one wonders whether integrated rural housing is likely to be feasible in the near future without dedicated efforts to alter the outlook of the people.

Although the data presented in the

book are interesting, the book suffers from a lack of proper handling of statistical tools. Percentages and percentage points are confused throughout the book, and as a result, sometimes erroneous inferences are drawn. For example, while discussing the 1961 Census data for Tamil Nadu, it is stated that the difference in literacy between Harijans and non-Harijans "reaches about 27 per cent" among males and it "is much less in the case of females" — approximately "15 per cent" (p 12). Actually, the 1961 Census data indicated a literacy rate of 49 and 22 per cent among non-Harijan and Harijan males and 21 and 6 per cent among females, respectively. Thus the difference was of 27 percentage points among males and 15 points among females. Since the ratio of literacy rates of the two groups was 3.5 for females and 2.2 for males, it seems obvious that the disparity was greater among the former.

Also, the schedules and instructions have been included in the book to infrom the readers about the precise scope of the inquiry and the concepts and definitions of various terms. Although the book does not quite fulfil the expectations roused by the title and the objectives set out in the preface, it is a welcome addition to the few empirical studies on the Harijan community.

International Academic Trafficking

Philip G Altbach

US Infiltration in Indian Education by Binoy K Roy; Perspective Publications, New Delhi, 1973; pp 94; Rs 20.

THIS book concentrates on attacking a range of American foreign aid programmes relating to education and intellectual life in India. The most interesting aspect of this slim volume are two chapters which deal with American book programmes. Roy points out that the United States has financially supported the publication of textbooks for Indian college students and correctly argues that these "PL-480" book subsidies have bad effects both on the educational system and on the publishing industry. He also argues that the conservative biases of American social science have a pernicious effect on the Indian educational system. Comments from various Indian publishers are provided to suggest these contentions. It should be stated, however, that a number of publishers have supported the book programme.

Many Negative Effects

Roy points out that Delhi University has, over the years, received substantial assistance from the Ford and Rockefeller Foundations. He asserts that this aid has had many negative effects. For example, American advisers have tilted academic programmes in a pro-American direction and that American money has somehow tainted the university. Further, the large numbers of Indian scholars who have received training in the United States have developed pro-American political and methodological biases.

Unfortunately, little evidence is marshalled to support the contentions made in this volume. Charges of CIA activity are made, but again little firm data is presented concerning these charges. The most useful element of this book is that it raises some important questions about role of foreign aid and the impact of foreign countries on India's intellectual and academic life. One wishes that Roy had placed his analysis in a broader framework and that he had presented a more complete picture based on firmer factual grounds. For example, it can be argued that Indian intellectual life, in general, is very much oriented toward foreign models. This is not surprising when one considers the fact that the very institutional basis of higher education is linked to British (and more recently American) models. The simple facts that *Time* magazine and *The Readers' Digest* have very large circulations in India and that Indian academics tend to look to the norms of the international scholarly community rather than to indigenous needs and problems are a key to any discussion of infiltration.

Willingly Accepted Aid

There is no question that the Indian intellectual community has, for the most part, willingly accepted assistance from the United States and other countries. The Indo-American Textbook Programme has, for example, been sanctioned by the Ministry of Education and the selection of the books to be printed is made by a joint Indo-American committee. This is not to defend the programme, but simply to point out that, for the most part, American neocolonialism has been willingly accepted by the Indian academic community.

While it is possible that some spying has been done by foreign scholars and aid officials, this is not the main issue. What is important is the overall effect, both positive and negative, of aid programmes. How far has the academic community been deformed by aid programmes? Are Indian Scholars dealing with matters which are relevant to India or are they simply copying the methodological impulses of the West? It is necessary for Indian researchers to begin the difficult and perhaps embarrassing task of serious analysis of just how the Indian academic community has interacted with powerful, wealthy, and often beguiling currents from overseas.

Intriguing Questions

One can point to a number of intriguing questions which might be investigated in order to go beyond generalisations to serious analysis. For example, just how has Delhi University been damaged by aid from foreign countries? It will be necessary to investigate such points as changes in the curriculum, the orientations of key academic leaders, and organisational factors, in order to come to meaningful conclusions. Simply stating that a key Rockefeller Foundation official was on the university staff for several years is not enough. The role of the IITs is another fruitful area for analysis. How have the IITs, with their massive foreign inputs, affected engineering and science education in India?

Roy's book will serve a useful purpose if it stimulates serious research and thinking on a topic of major importance. The nexus between Indian intellectuals and foreign aid and foreign academic currents is an issue of the utmost concern. The point is that this nexus is a complex one in which both the donors and the recipients are involved. The Americans, who are the villains of Roy's book, have certainly contributed in a major way to the foreign impact on Indian academic life. But Roy's volume does not help much to clarify issues or raise important general questions. It is a polemic and a flawed one at that.

The Sixth Finance Commission

An Evaluation of Its Recommendations

N J Jhaveri

The redistributive bias in the Sixth Finance Commission's recommendations, the dovetailing of Plan and non-Plan expenditure and the attempt to reduce 'discretionary' assistance are noteworthy.

The approach adopted by the Commission of devising a scheme of non-Plan resource devolution having the same overall objectives as those of national planning was perhaps the best possible in the circumstances. However, the Commission could have relied on this approach all along and evolved a scheme of need-based resource devolution instead of considering each item of devolution separately.

Further, unless the financial discipline in the form of realisation of revenue targets, restraining inessential expenditure, upgrading the levels of social services, improvement in the financial performance of public undertakings, etc, implicit in the Commission's recommendations, is observed, these recommendations will not have the desired impact.

[The views expressed in this article are the personal views of the author.]

NATIONAL economic planning in India has resulted in considerable centralisation of resources. The Planning Commission (PC) has emerged as an important agency for Central transfers (mainly for developmental purposes) along with the Finance Commission (FC). For the purpose of formulating the Plan, the PC estimates resources that may be available for financing State Plans (as well as the Central Plan); such an exercise, by its very nature, encompasses the entire area of the state governments' financial transactions. Therefore, demarcation of an area of devolution under the exclusive jurisdiction of the FC is not possible. There is an overlap of functions and both the PC and the FC carry out independent resource exercises for estimating each state's position on non-Plan account. However, as the federal financial system has evolved in India, recommendations of the FC relating to shared taxes and grants-in-aid under Article 275 of the Constitution are generally accepted by the Government. The PC independently estimates the balance from current revenues (i e, the excess/shortfall of revenue receipts at pre-Plan levels of taxation over current non-Plan expenditure), the magnitude of which (excluding Central transfers) differs from the FC's estimate of the non-Plan revenue position (excluding transfers from the Centre). In its own estimate the PC does not alter (except for taking cognisance of actual collections from shared taxes) the FC's recommendations (as accepted by the Central Government). But in the resource exercise which forms the basis for determination of the Plan size, presumably the PC's estimates finally prevail. Therefore, the importance of the FC's recommendations consists not so much in the magnitude of the gaps assessed by it but in (i) its approach to the problem of federal finance, (ii) the methodology adopted by it for estimating non-Plan resource gap and (iii) the criteria applied by it for inter-state distribution of resources.

In the matter of evolving rational criteria for its scheme of devolution, the FC, *vis-a-vis* the PC, is in a disadvantageous position on two accounts. One of these is the pervasive scope of the PC in contrast to the restricted purview of the FC (e g, non-Plan revenue account in the case of the Fourth and the Fifth FCs). Secondly, the PC, in devising its scheme of resource transfer and of resource allocation in general, has the benefit of agreed Plan priorities which, in turn, are presumably determined in accordance with the overall objectives of planning. Thus a rational and well-defined basis already exists for the PC's devolution. In the case of the FC, the terms of reference, which may be expected to lay down certain specific criteria, are couched in very broad terms (e g, "the scope for better fiscal management as also for economy consistent with efficiency") rendering formulation of operational criteria rather difficult.

The terms of reference of the Sixth FC mark an improvement over those of the earlier ones in both these respects. For the first time, assessment of the non-Plan capital gap has been brought within the purview of FC thus requiring the Sixth FC to take into account the total resources and expenditure — revenue and capital — on non-Plan account. Further, the Commission is expected to evolve norms for estimating the requirements of resources for maintenance of capital assets. What is more, for the first time, the FC has been asked to estimate requirements for upgrading the "standards of general administration" prevailing in the backward states. These may be considered to provide some definite guidelines to the Sixth FC's scheme of devolution.

Despite the extension in its area of operations, the Sixth FC could have lamented about restrictions on its operations *vis-a-vis* the PC. Though it noted the fact of emergence of the PC as another important channel of Central transfers, displaying commendable pragmatism, the Sixth FC did not consider this development as detracting in any way "from the efficacy of the provisions embodied in the Constitution" (para 3, page 6). Indicative of its constructive approach to the entire problem of Union-State financial relations is its "generous interpretation" of Central transfers as Centre's response to the expanding needs of the states in an effort to ensure the use of national resources in a decentralised fashion. The cornerstone of its own approach to the problem of devolution consistent with this interpretation is expressed in its view that "the resources belong to the nation and they should be applied at points where they are most needed" (para 15, page 7). Resource devolution based on assessment of regional-cum-development sector-wise need as aimed at by the FC may be considered to represent an approach wholly consistent with the requirement

of national planning; the role of FC in this context, as stated in the Sixth FC's Report, "ought to be one of settling the optimal distribution of the recources of the public sector between the Centre and the states" (para 12, page 7). Under such a scheme, the distribution of resources between the Centre and the states would cease to be a primary purpose of the exercise; it would emerge as an end result of distribution of national resources in accordance with assessment of relative needs and relative efficiency of a level of government in satisfying these.

Doubts may be raised regarding the competence of the FC, whose recommendations are confined only to the non-Plan account, in devising an operational scheme of devolution aiming at deployment of "national resources" in accordance with the "points at which they are most needed". A total resource exercise and estimate of needs implicit in this approach can be done only by the PC. One might argue that assessment of needs and resources by the FC would not only be partial and hence inefficient but would constitute mainly redetermination of the non-Plan positions. In the absence of knowledge of the procedure adopted by the PC in assessment of state resources and determination of State Plan outlays it is not possible to examine the force of this argument. But it is significant that the Sixth FC in its recommendations relating to Article 275 grants is required to adopt norms for maintenance of capital assets and assess requirements of backward states in upgrading the standards of general administration. Thus the terms of reference clearly indicate the positive contribution (and not merely the repetitive role of assessing non-Plan positions) that can be made by the FC. The attempt by the Sixth FC to devise a scheme of non-Plan devolution based on certain criteria should be considered an improvement in itself insofar as it is a step in the direction of allocation of resources in accordance with objective assessment of needs. It is against this background that recommendations of the FC may be examined.

TERMS OF REFERENCE

One aspect of the Sixth FC's Report which deserves a special mention is the detailed discussion of each of the items included in its terms of reference. Generally the procedure adopted by the Commission is to define the scope of its terms of reference and then to discuss the procedure adopted by it stating the assumptions made and the estimates arrived at by it and the basis thereof. For instance, in the chapter relating to "Reassessment of the Forecasts of State Governments" the rates of growth adopted by it for different items of revenue and expenditure are indicated. It will be observed from the discussion on this subject in the Report that while the Commission's estimates are based uniformly on 1972-73 price levels, it has assumed different growth rates for state taxes (within a specified range) for different states and allowed for different growth rates for different items of expenditure. Thus, for instance, while allowing generally 5 per cent growth rate in regard to non-development expenditure, it has provided for higher growth rates in respect of sales tax collection and registration (8 per cent) and police (6 per cent). A realistic assessment of resources of each state with a somewhat "generous" assumption in regard to growth rates of non-Plan expenditure are expected to "partly eliminate the risk of budgetary balance being disturbed by inescapable new commitments".

In regard to provision for revision of emoluments of state government employees, the Commission has adopted January 1, 1972 as the bench-mark date. It has, however, made provision for increase in the cost of living between January 1972 and April 1973 on the basis of the proportion of neutralisation as recommended by the Third Pay Commission for the Central Government employees. The 'normative' basis adopted by it thus avoids any penalty on states which exercised restraint in making provisions for pay and allowances. At the same time, in respect of states in which the emoluments of

If you're planning a new project or diversification programme with fixed capital investment of at least Rs. 7.5 lakhs contact us today—we'll make it much easier for you.

First things first with 75% relief :

You first need a comprehensive feasibility study to establish the technical and economic viability of your project. And prepared by competent consultants enjoying the confidence of prospective financiers you will apply to

Not only have we the right and best consultants for your particular assignment, we will also bear 75% of the total feasibility study cost.

Bridging the resources gap :

Provided your project is technically and economically viable and you can meet at least 15% of the project cost, we'll help you fill the finance gap by underwriting or participating in share capital and securing low-interest, long term loans from financial institutions.

Your Sales Tax refunded as loan :

If you're expanding, we can refund the Sales Tax you've paid for the last 3 years as an 18-year interest-free loan. If you're putting up a new unit, we can refund your Sales Tax on raw materials and finished goods for 6 years from the start.

state government employees were below average as on January 1, 1972, it has calculated requirements for attaining the average level and accordingly provided for these amounts in the estimates. The norms adopted by the Commission for maintenance of different capital assets and basis thereof are spelt out in detail in the Report. In other matters such as its suggestions regarding financing of relief expenditure, recommendations relating to upgradation of standards of general administration, etc, the Commission has sought to provide adequate justification for its recommendations.

On the whole, by choosing to make available to the readers a large part of data collected by it and, so to say, its home-work, the Commission has skilfully publicised the thorough, meticulous and judiciously discriminatory approach adopted by it. While this has considerably improved a proper appreciation of the Commission's recommendations, it has made it difficult to cover in detail all the aspects of its recommendations within the purview of a single article. The following paras contain some observations relating to the Commission's recommendations; state-wise details of recommendations and provisions are given in tabular form (in Annexure Tables 1 and 2).

The magnitude of Central transfers as recommended by the Sixth FC for the period 1974-79 (i e, Fifth Five-Year Plan) at Rs 9,609 crores is considerably larger than the accrual of Rs 5,316 crores to states during 1969-74 on the basis of the Fifth FC's recommendations. Shared taxes and duties are expected to rise from Rs 4,605 crores (or 86.6 per cent of FC transfers) during 1969-74 to Rs 7,099 crores (73.9 per cent) during 1974-79.

To a large extent the accrual of additional amounts as shared taxes to the states during the Fifth Plan would represent normal growth in shareable taxes during the Fourth Plan reinforced by a large Central tax effort during that period; these two factors together (as indicated by an annual average compound growth of 14.9 per cent in shareable taxes during the Fourth Plan) would have augmented the size of the divisible pool of taxes as calculated at 1973-74 rates of taxation. The increase in states' share in income-tax — to 80 per cent from 75 per cent hitherto — and in Union excise duties — following inclusion of net proceeds from auxiliary duties, so far excluded, in the divisible pool from 1976-77 — would account for only a small portion of the increase in estimated accruals to states from shared taxes during 1974-79.[1]

On the other hand, Article 275 grants recommended by the Sixth FC at Rs 2,510 crores indicate a major increase over the amounts of such grants recommended by the Fifth FC for the period 1969-74 (Rs 711 crores).[2] This increase is partly on account of grants recommended by the Sixth FC in respect of Himachal Pradesh, Jammu and Kashmir, Manipur, Meghalaya, Nagaland and Tripura which have virtually no resource base of their own and whose requirements have hence to be met almost totally through Central transfers. However, even excluding these states, which are in a special category, the quantum of grants recommended by the Commission was Rs 1,745 crores as against Rs 382 crores received under the Fifth FC's award during 1969-74. This was mainly on account of the provision made by the Commission for maintenance of capital assets and upgradation of administrative and social services in backward states.

In regard to *inter se* distribution of states' share, like the previous Commissions, the Sixth FC worked out the share of each state in each of the shareable items separately. The basis of distribution in respect of income-tax was the same as adopted by the Fifth FC, *viz*, 90 per cent population and 10 per cent assessments. In respect of Union excise duties, the weightage of population factor has been reduced from 80 per cent to 75 per cent; the balance is to be distributed on the basis of per capita incomes (the figure of per capita incomes used by the FC is an average of such figures for the three years, 1967-68 to 1969-70), the low level of which would appear to have been adopted as a measure of backwardness. In the formula used by the Commission for assigning weightage to the backwardness factor, population of each state and 'distance' of a state's per capita income from that of the highest per capita state income were the two components. Thus under this formula, excepting Punjab, which had the highest per capita income, all the others states qualified for a share in Union excise duties under the criterion of 'backwardness'. This, it may be noted, marked an important departure from the procedure and principles adopted by the Fifth FC for giving weightage to the factor of backwardness. In the first place, unlike the Fifth Commission which treated low per capita income as one (though major) of the criteria of backwardness, the Sixth FC considered per capita income as the sole criterion of relative economic position of the states. Secondly, under the method adopted by the Fifth FC to assign weightage to per capita incomes, all states having per capita income above average (even if it was nominally above average) were not assigned any share as per state income component of backwardness factor. Under the Sixth FC's recommendations, as already stated, except Punjab all the other states obtained a share on the basis of backwardness.

In regard to *inter se* distribution of additional excise duties also the Sixth Commission has departed in two ways.

TABLE 3 : STATE-WISE DEBT RELIEF

Category A			Category B			Category C		
State	Amount of Repayment as Per Cent of SDP	Amount of Debt Relief (Rs crores)	State	Amount of Repayment as Per Cent of SDP	Amount of Debt Relief (Rs crores)	State	Amount of Repayment as Per Cent of SDP	Amount of Debt Relief (Rs crores)
Punjab	6.5	15	Bihar	10.7	133	Orissa	20.7	157
Gujarat	6.8	36	Haryana	11.0	33	Assam	24.8	163

West Bengal	9.3	143	Kerala	17.1	110	Manipur	40.7	15
Madhya Pradesh	9.6	87				Nagaland	48.4	6
						Jammu and Kashmir	90.8	134
Total		586			602			782

First, the practice of providing for 'guaranteed amounts' has been given up; the entire amount (and not the excess over the guaranteed amounts as hitherto) is thrown into the divisible pool. Secondly, while theoretically conceding state-wise consumption of commodities subject to additional excise duties as an "incontrovertible" basis of *inter se* distribution, on account of non-availability of requisite data it has, like previous Commissions, adopted "some reliable indicators" of the level of consumption of these commodities as the basis of distribution. According to the Commission, population is a major indicator of consumption and has been given a higher weightage — 70 per cent as against 50 per cent by the Fifth FC — but sales tax collections (either excluding or including inter-state sales tax collections) have been totally rejected as a basis. Instead, the Commission has given 20 per cent weightage to State Domestic Product and 10 per cent to production.[3]

In assessment of requirements for maintenance of capital assets and upgrading of standards of general administration in backward states, amounts provided in forecast of backward states are understandably larger than those provided in respect of other states. The enhanced provision for these purposes in the Commission's forecast has resulted in enlarging the non-Plan resource gap of the backward states and corresponding increase in grants-in-aid recommended for them under Article 275. The actual quantum of grants would have been still higher but for the procedure adopted by the Commission for assessing "sound fiscal management". It evolved certain norms and "marked-up", wherever necessary, states' forecasts of interest receipts from State Electricity Boards and receipts from Irrigation (Commercial) and Multi-purpose River Schemes. These "mark-ups" in respect of backward states correspondingly reduced the estimated resource gaps. But in terms of magnitude, the mark-ups did not add upto large figures.

A scheme of resource transfer in which distribution among states is determined separately in respect of each item may be expected to conform to a pattern only to the extent criteria adopted for different items constitute one. In view of the weightage given to the factor of backwardness, measured directly or indirectly by low level of state-incomes,[4] it would be reasonable to expect close correlation between the magnitude of Central transfers recommended by the Commission and low state incomes. Relevant data are given Table 1; for the sake of inter-state comparison figures are reduced to per capita terms. Seven states, *viz*, Assam, Himachal Pradesh, Jammu and Kashmir, Manipur, Meghalaya, Nagaland and Tripura are excluded from the order of ranking to avoid vitiating of inter-state comparisons. While Assam is excluded because the per capita figure in its case includes that of Meghalaya, the other six states are omitted from ranking because of their weak financial position and consequent recommendations of large transfers by the FC.

POPULATION FACTOR

It will be noticed that the correspondence between Central transfers recommended by the FC and per capita incomes is incomplete. For instance, states occupying the first five positions in ranking by per capita transfers as recommended by the FC, included only two states which occupied positions among the last five in ranking by per capita incomes. Taking shared taxes alone, of the five states which occupied last five positions in ranking by per capita state incomes only one found place in the first five positions in ranking of states by per capita shared taxes.

This raises an important issue, *viz*, to what extent recommendations of the Sixth FC are consistent with its objective of allocating national resources at points where they are most needed. As mentioned already, in its recommendations, factors which have been assigned significant weightage are (i) population, (ii) low per capita incomes and (iii) low provision for maintenance of capital assets and for administrative and social services in respect of backward states. However, population is the factor to which maximum weightage has been assigned, at least in respect of *inter se* distribution of shared taxes. But population furnishes only a "broad" measure of need. (Report of the Finance Commission, 1952, para 27, page 75). The correlation between relatively high population and low per capita incomes of states is not close in all the cases. For instance, while Punjab and Haryana, states with the highest per capita incomes, occupied the last two positions in ranking by population, Maharashtra ranked third both in terms of per capita income and population and West Bengal having fifth rank in terms of per capita income ranked fourth in terms of population. Tamil Nadu which ranked sixth in terms of per capita income was seventh in terms of population.

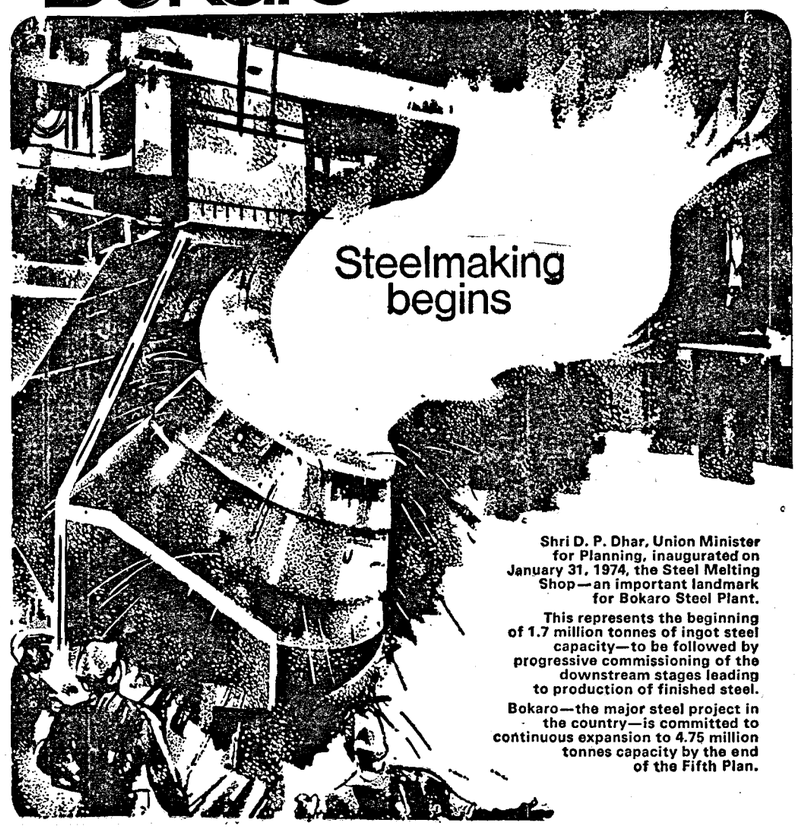
Having accepted low per capita income as an indicator of need, a logical step ought to have been to accord higher weightage to that factor. The terms of reference of the Commission did not preclude adoption of any set of principles in regard to *inter se* distribution; the choice of weightage to different factors was, therefore, the Commission's own decision. Thus for instance, in regard to income-tax the Commission endorsed the weightage accorded to the population factor by successive Finance Commissions mainly (i) to ensure a "reasonable measure of stability in the principles of distribution" in "our complex federal system" and (ii) because "economic disabilities" of some backward states are sought to be mitigated by it through weightage for relative backwardness in the distribution of Union excise duties and grants-in-aid.

One might ask as to what is the sanctity in adhering to stable principles in the matter of distribution of income-tax alone! In regard to Union excise duties the first FC adopted population as the sole basis of distribution. If the successive Commissions had attempted to maintain stable principles, relative backwardness, which has "now" become an accepted criterion would not have found its place in the distribution formula. Even in regard to income-tax at least two Commissions assigned 20 per cent weightage to the factor of contribution. The Sixth Commission accepted in principle the states' claim based on contribution in respect of incomes which "have purely local origin" and assigned 10 per cent weightage to this factor. While it is true that the component of locally originating income is not "clearly identifiable", but surely it is bound to be larger than 10 per cent of the total assessed personal incomes in respect of at least some of the states. Therefore, consistent with the proportion of locally originating income, the weightage to the factor of contribution ought to have been higher. But it is the fear of further aggravating regional imbalances which would appear to have made the Commission assign a low weightage to this factor. Assigning weightage to the factor of relative economic backwardness, in our opinion, would have been consistent with the object of preventing aggravation of regional imbalances.

While raising the share of the factor of relative backwardness in distribution of net proceeds of Union excise duties, the Commission has changed, as was mentioned earlier, the method of determining each state's share. In its concern for not doing injustice to states just above the all-state average per capita income (as was the result under the Fifth FC formula) it has devised a formula which has benefited relatively advanced states (except Punjab) along with those whose per capita income was just above the average. Table 2 presents the percentage share of different states in Union excise duties as per the Fifth and the Sixth FC's recommendations.

It will be noticed that except Punjab, the share of all the states with relatively high per capita incomes (e g, Maharashtra, Gujarat, Tamil Nadu, West Bengal, Haryana) in Union exise duties has gone up whereas that of states with low per capita incomes (e g, Uttar Pradesh, Bihar, Rajasthan, Kerala, Orissa, Madhya Pradesh) has declined. This tilt, presumably unintended, in favour of relatively high income states could have been avoided if the weightage to the factor of 'distance' from highest per capita income could have been reduced with the narrowing of the 'distance'.

Despite these recommendations, the relative share of most of the economically backward states in the transfers by the Sixth FC has improved as compared to their share under the Fifth FC's award (see Annexure Table 1). But the emerging pattern, as was pointed out earlier, is not in conformity with relative needs as indicated by low levels of per capita income. Fragmentation of decision-making as reflected in independent determination of *inter se* distribution of each item of the divisible pool may be considered largely responsible for this. However, this may also reflect, to some extent, constraints on implementing a highly inter-regional redistributive scheme in "our complex federal system". The FC's reference to low disparity ratio between state per capita incomes in India than in other federations is significant in this regard. It is true that "even these disparities, when the absolute levels of per capita income are very low cannot be ignored" (para 18, page 8). But low absolute levels of per capita income, while justifying accent on inter-regional redistribution, imposes, in our opinion, limitations on such redistribution.[5] To put it differently, with the same degree of disparity in per capita incomes, if the absolute levels of per capita incomes were high, more active inter-regional redistribution would have been possible.



Whatever may be the arguments which weighed against adopting a more pronounced bias in favour of the backwardness factor by the FC, an evitable result of compartmentalisation of non-Plan transfers is the emergence of large surpluses in respect of some states. Thus, for instance, under the Sixth Finance Commission's award seven states (*viz*, Gujarat, Haryana, Karnataka, Madhya Pradesh, Maharashtra, Punjab and Tamil Nadu), most of which are economically advanced ones, are estimated to have non-Plan revenue surpluses (after devolution of shared taxes and grants), of the order of Rs 2,176 crores (as against surpluses of Rs 1,273 crores by 8 states under Fifth FC's award). It is true that non-Plan revenue gaps calculated for other states are to be met through grants-in-aid under Article 275 recommended by the FC, thus balancing their non-Plan revenue budgets. But availability of large surpluses considerably improves the 'own' resources position of the concerned states and thereby may confer an advantage in the matter of financing of their plans.

The extent to which the surplus states actually obtain a financial advantage is difficult to ascertain; this would depend, in the absence of a neat compartmentalisation in the area of devolution between Plan and non-Plan, on the independent assessment of non-Plan gaps by the PC. The difference between the assessment made by the two Commissions may arise on two accounts. First, in its assessment the FC adopts certain rates of growth in regard to receipts and expenditure and may raise or reduce or even disallow provisions made for certain items in states' forecasts; 'it may also assume a certain minimum return in respect of commercial undertakings in the state sector. The principles adopted by the PC may differ in one or more of these respects resulting in differences in the estimated magnitudes of non-Plan surpluses available. If, for instance, the PC projects state revenues applying low rates of growth and estimates non-Plan expenditure higher than estimated by FC and revises downward the estimated receipts from state undertakings, then the non-Plan surpluses (i e, balance from current revenues) as estimated by the PC would tend to be lower than the FC's estimate.

Secondly, there may be difference of opinion regarding treatment of a particular item as Plan or non-Plan. These differences, which mainly result in labelling a source of finance as Plan by one Commission and non-Plan by another, would not reduce (or raise) by itself the estimate of *total resources* available for the Plan. It may, however, raise a controversy regarding whether a particular item, considered to belong to the Plan category, lies within the jurisdiction of the FC. With the enlargement in the terms of reference of the Sixth FC there was widening of the area of conflict of this type.

For instance, generally an expansion in the provision of service would constitute a 'new scheme' and hence belong to the Plan category. Recommendations of the Sixth FC regarding upgradation of standards of administration in backward states would natural-

Shri D. P. Dhar, Union Minister for Planning, inaugurated on January 31, 1974, the Steel Melting Shop—an important landmark for Bokaro Steel Plant.

This represents the beginning of 1.7 million tonnes of ingot steel capacity—to be followed by progressive commissioning of the downstream stages leading to production of finished steel.

Bokaro—the major steel project in the country—is committed to continuous expansion to 4.75 million tonnes capacity by the end of the Fifth Plan.

Bokaro Steel
India's largest steel complex

ly involve assessment of resources on the basis of increase in administrative and social services from the existing level. In other words, the FC would step into the conventional Plan category. Likewise, any revision in tax or tariff rates is considered generally as additional resource mobilisation and hence a resource available for financing Plan expenditure. In its computation, the Sixth FC has taken credit for certain revision in water and electricity tariffs, resources accruing from which have been set off against normal expenditure. Unless, as urged by the FC, the PC revises upward the additional resource mobilisation target to accommodate the tariff revision allowed for by the FC, *ceteris paribus*, non-Plan gap of the concerned states would be higher in the PC's computation.

Again, while computing the non-Plan capital gap, receipts by way of net market borrowings are now set off against non-Plan deficits in respect of states which have overall non-Plan gaps (para 11, page 75). In its own computation of non-Plan capital gap, the FC has treated net market borrowings as Plan resource in all cases; the adoption of a similar procedure by the PC would result in enlargement of the non-Plan capital gap in its own computation. The FC has justified the practice adopted by it in this regard under the plea that net market borrowings constitute a draft on private savings and hence are available for creation of new assets. (Incidentally, the same logic has not been extended to State Provident Funds which also represent a draft on household sector savings; receipts from this source have been set off against non-Plan capital gap.)

While these conceptual differences are not irreconcilable, their significance is more than mere relabelling of items and variation in the magnitude of non-Plan gaps. An elaborate exercise conducted by the FC on the basis of thoroughly discussed norms which imply (a) restraint on growth in non-Plan expenditure within certain (not unrealistic) limits, (b) assumption of certain reasonable growth rates in revenues, (c) collection of arrears, (d) revision in tariffs, and (e) reduction in subsidies, etc, involve a certain degree of fiscal discipline on the part of all the state governments.. Recommendations of Central transfers and consequent fiscal balances envisaged in the exercise of the FC are contingent upon the observance of this discipline. Acceptance of the FC's recommendations relating to shared taxes and grants without at the same time adopting its other estimates might defeat the very purpose of the exercise and may disturb the delicate fiscal balance. Therefore, it is of the utmost importance that in regard to non-Plan account appropriate norms are evolved jointly by the PC and the FC.

A close co-ordination between Plan and non-Plan transactions is all the more important during the forecast period of the Sixth FC. The FC on its part has recognised the importance of "an appreciable increase in social consumption for eradication of poverty" during the Fifth Plan and has allowed large sums to backward states for upgrading their administrative and social services. The Commission has also assessed the requirements of different states for maintenance of capital assets on the basis of certain norms. By recommending Central transfers to meet the gap, if any, in the states' resources, the FC would appear to have attempted an equalisation of fiscal capacity consistent with given level of provision of certain administrative and social services.

However, an exercise which assesses states' need in certain areas and provides for Central transfers, if necessary, suffers from at least two limitations in both of which co-ordination with the PC is essential. First, within its terms of reference, while assessing need, the FC could not have either measured systematically the resource base (indicator of fiscal capacity) or the degree of its exploitation by different states.[6] An assessment on these lines, linking expansion in services (through higher Plan outlay) to some additional resource mobilisation effort so as to equalise "severity of taxation" would fall within the pervasive resource exercise of the PC. Unless it is ensured that the degree of taxation (in relation to tax base) in respect of 'own' sources in grant receiving states is at least equal to the all-states' average, lower level of provision of services would be more a result of choice than of paucity of resources. The observation of the FC that "even in a state like Punjab, with the highest per capita income in the country, the outlay on certain essential social services was very low in per capita terms" is significant in this context. In its own recommendation, however, the FC would appear to have assumed paucity of resources as the primary cause for low level of social services.

Another limitation in this regard is lack of any automatic mechanism to ensure that resources provided by the FC for upgradation of administrative and social services and for maintenance of capital assets are not diverted for other purposes. In respect of states which are not recommended any grants under article 275, the provision for upgradation of social services would mean earmarking a portion of revenue accruing to them for this purpose. There will not be any financial burden on the Centre on this account. In respect of states entitled to additional grants on this account, however, diversion of resources for other purposes would mean the use of Central transfers for purposes other than for which they were originally provided. Stressing the need for evolving an "effective mechanism" for preventing such diversion the Commission has proposed that provisions allowed by it for maintenance of roads, irrigation schemes and for upgrading of social services should be assessed together with outlays to be provided in this behalf during the Fifth Plan. "For purposes of regulating Central assistance for Annual Plans" it is suggested by the Commission "only the aggregate expenditure on roads in excess of the provisions allowed by us for maintenance should be reckoned as Plan expenditure qualifying for assistance" (para 6, page 67). The same procedure is suggested for other items.

It is difficult to assess the likely impact of this suggestion on the size of Plan outlays of the concerned states. Assuming that the Plan allocation for different development sectors and for different states is based on an assessment of relative need by the PC, provision for raising the level of social services in backward states would have been normally allowed by the PC during the Fifth Plan in any case. Provisions allowed by the FC in this behalf would in that case constitute Plan expenditure which would have been normally allowed by the PC. However, if the need for additional outlay in these sectors as assessed by the FC exceeds the assessment of the PC, to accommodate the FC's assessments sectoral allocations may have to be modified. Alternatively, the size of the Plan outlay for the concerned states may have to be raised to the extent of the excess.

Again, regulation of Central assistance to ensure the use of funds as envisaged by the FC is likely to prove operationally difficult. One would do well to remember that under the Fourth Plan formula of Central assistance for States Plans, (with certain exceptions)

Why is the Standard Battery like a bestseller?

Because it's a runaway success.

CAR POWER

LINTAS-STB.53-140

the share of each state was computed on the basis of certain objective criteria like population (60 per cent weightage), tax effort in relation to per capita income (10 per cent), per capita incomes below the national average (10 per cent), commitments in respect of major continuing irrigation and power schemes (10 per cent) and the balance was reserved for assisting states in tackling certain special problems like floods and the problems of chronically drought affected areas and metropolitan areas. Further, unlike the different proportions for grants and loans emerging for different states under the pre-Fourth Plan schematic pattern, under the Fourth Plan formula loans (70 per cent) and grants (30 per cent) were to be in uniform proportions. If the basic principles (may be assigning different weightages) of the Central assistance formula are followed for the Fifth Plan the share of each state in the Central assistance would be virtually determined in an automatic manner. The use of Central assistance as a regulatory mechanism may not be possible in this context. Further, unlike the part grant and part loan in the objectively determined formula for Central assistance for state plans, the funds recommended by the FC for upgrading social services, etc, are entirely in the form of grants. In the event of expenditure provided by a particular state falling short of the FC's provisions the question would arise whether Central assistance due to it under the common formula should be reduced. If so, whether this reduction should be adjusted against the grant component of the states' share in Plan assistance is another issue to be decided. If the entire amount is adjusted against grants this would reduce the relative share of backward states, particularly the grant component, in Central assistance.

These difficulties arise primarily because the Commission's recommendations introduce an element of conditional assistance in a system where Plan assistance is otherwise unconditional (in the form of block grants and loans). Providing assistance for specified services in conditional form is one way of ensuring in the use of resources for specified purposes. However, this may give rise to the charge of "encroachment" by the Centre and may create some bitterness in the process of ensuring effective check on the use of resources. Provisions for schemes for upgrading social services as Centrally sponsored schemes, which would serve the same purpose as providing conditional assistance, will suffer from more or less the same shortcomings as conditional grants. In addition, it may not be easy to confine the benefit of such schemes only to a few states and in any case would be contrary to the Commission's plea for pruning such schemes (para 25, page 8). The only hope for success of the "mechanism" thus lies in backward states seizing the opportunity offered to them by the Commission by giving them access, for the first time, to resources on a liberal scale to come up to the national average in regard to administrative and social services.

While weak in its operational aspect the proposal of the FC is noteworthy in several other respects. Under it the onus of ensuring implementation of its recommendations, at least in the area of maintenance of capital assets and upgradation of social services, is placed on the PC. A further extension of this spirit can fruitfully lead to the evolution of a system of close co-ordination between the two agencies in which the PC can act as a follow-up agency. An attempt to dovetail Plan and non-Plan programmes and generally bring all developmental activities, either in the nature of expansion of services or creation of assets, within the fold of the Plan would appear to provide the rationale of the FC's recommendations in regard to financing of relief expenditure. After allowing for a famine relief provision of Rs 50.71 crores a year (as against Rs 14.47 crores allowed by the Fifth FC), it has suggested advance preparation of schemes for permanent improvement of drought and flood prone areas. Some of these sche-

Note : In the above list states from Bihar downwards are listed in an ascending order of per capita income.

mes may be incorporated in the annual Plan in accordance with Plan priorities; when natural calamity strikes a state or a region thereof implementation of such schemes may be accelerated. Additional funds required and provided by the Centre for such an accelerated implementation may be adjusted against Plan assistance due to the states.

In regard to the recommendations of the Commission relating to matters on revenue account considered so far, in a majority of the items the earlier Commissions had given their awards. However, the assessment of non-Plan capital gap of the states was referred to the Commission for the first time. In the light of such an assessment the Commission was required to review the outstanding Central loans to the states advanced upto 1973-74 and "suggest changes in the existing terms of repayment having regard *inter alia* to the overall non-Plan gap of the states, their relative position and the purposes for which the loans have been utilised and the requirements of the Centre".

The revision in the terms of repayment, determined on the basis of the purpose for which loans are used, will have to be normally in a uniform manner and the benefit of this would accrue to all the states irrespective of their overall position on non-Plan account. "A measure of relief" to all the states would be in fact implicit in this (para 13, page 86). Further, it will be "grossly unfair" and would amount to "penalising prudent financial management", if relief to certain states were denied only on the ground of their having non-Plan surpluses. However, since the Commission was required to recommend rescheduling of debt taking into account the relative (financial) position of the states and their (gap) position on non-Plan account, some discrimination was inevitable.

The Commission, after examining the existing terms of loans, has generally suggested consolidation of loans and elongation of their maturity. The Commission has not generally suggested writing-off in respect of any outstanding loan (except pre-autonomy debt and some other loans) because such a course would reduce the size of the outstanding debt which "could be looked upon as a revolving fund fed by the payments due from the past beneficiaries and drawn on by those now in need" (para 24, page 9). A growing size of the revolving fund would "enable the Centre to relend the amounts so realised to states on the basis of criteria that can be revised from time to time to promote certain national priorities and to bring about a progressive reduction of regional disparities" (para 4, page 84). At the same time, to provide immediate relief to financially weaker states during the forecast period, the Commission has recommended discriminatory relief which reduces the quantum of repayments more in the case of these states than in that of the advanced ones. It has selected a few major categories of loans for this purpose.

The percentage of the amount of debt falling due for repayment during the Fifth Plan to the State Domestic Product (the average for 1967-68 to 1969-70) is treated as a measure of debt repaying capacity. States in whose case such percentage was more than 20 (Category C State) were accorded the most favourable treatment (e g, loan repayable over 25 years or moratorium in some cases), states with percentage between 10 and 20 (Category B State) were accorded less favourable treatment (e g, loans repayable over 20 years) than Category C States and states with such percentage less than 10 (Category A State) were accorded least favourable treatment (e g, loan repayable over 15 years). Aggregate debt relief received by Category A, B and C States as per the Sixth FC's recommendations is as shown in Table 3.

It may be of interest to note that not all the states with low per capita SDPs have high debt burden to state income ratios. Notably, Bihar (lowest per capita income), Madhya Pradesh (second from the bottom) and Uttar Pradesh (fourth from the bottom) had debt burden to state income ratios either lower than 10 per cent or marginally above 10 per cent (i e, Bihar).

Note: See Annexure Table 1.

To sum up, like the other FCs, the Sixth Commission had also to provide a purpose to its scheme of devolution within a framework in which there are conflicting considerations. 'Control' over resources as judged solely from point of view of the requirements of a federal political system sharply conflicts with the requirements of national planning. In a federation with sharp differences in fiscal capacities and in the level of provision of essential services, the pursuit of regional redistribution in accordance with the assessment of needs may not be an easy task. Compartmentalisation of decision-making by dividing the area of jurisdiction between Plan and non-Plan may pose further problems.

An ideal solution, one would have thought, which avoids partition in decision-making in a scheme of resource allocation, would be to evolve an integrated scheme which takes into account (a) total availability of resources in the national pool and (b) the requirements of the Centre and the states and evolves a scheme of *inter se* distribution among the states on the basis of certain objective criteria.[7]

Such an approach would be consistent with the objective set before itself by the Sixth FC, *viz*, allocation of "national resources" at "the points where they are most needed". That there is scope for moving in this direction is indicated by the FC's reassuring observation that "despite grievances about inadequacy of resources there was a deep sense of commitment to the concept of national unity" among the states (para 5, page 6).

Perhaps the approach adopted by the Sixth FC, *viz*, devising a scheme of non-Plan resource devolution having the same overall objective as national planning was the best possible alternative in the circumstances. However, the Commission, as has been pointed out above, could have applied these criteria all along and evolved a scheme of need-based resource devolution, instead of considering each item of devolution separately. Nevertheless, the redistributive bias in the Commission's recommendations, the dovetailing of Plan and non-Plan expenditure and the attempt to reduce 'discretionary' assistance are noteworthy. But unless financial discipline in the form of realisation of revenue targets, restraining inessential expenditure, upgrading the levels of social services, improvement in the financial performance of public undertakings, etc, implicit in the Commission's recommendations, is observed the optimum return from the FC's endeavour may not be forthcoming.

Notes

1 A precise estimate of increase in shared taxes on this account is not possible but a rough estimate would indicate the order of this increase to be Rs 250 crores. This can be derived as follows. Shareable income-tax revenue as per 1973-74 Central budget explanatory memorandum was Rs 555 crores. A liberal estimate of the total for 1974-79 may be placed at Rs 3,000 crores. Five per cent of this works out to Rs 150 crores. Collections from auxiliary duties of Union excise were placed at Rs 115 crores (after taking into account revision in rates in 1973-74); for three years, *viz*, 1976-79, revenue from this source may be estimated at Rs 500 crores. Twenty per cent of this works out to Rs 100 crores.

2 This may rise further when net commitment on account of interest liabilities of states on fresh borrowings and lendings during the Fifth Plan are taken into account (para 17, page 71).

3 The manner of assigning weightage to the factor of State Domestic Product is not known. Normally one would expect a positive correlation between demand for items subject to additional excise duties and state incomes. More so because, presumably, the bulk of the revenue collections in the form of additional excise duties would be attributable to superior varieties of textiles and cigarettes/tobacco. Logically, therefore, the weightage assigned to state income should favour states with high incomes rather than low incomes.

4 Indirectly because the Commission has viewed low provision for maintenance of capital assets and low standards of social services mainly as either "causes or consequences" of low per capita incomes.

5 See author's article, "Transfer of Non-Plan Resources to States — A Suggested Approach", *Economic and Political Weekly*, June 7, 1969.

6 While it is not stated categorically, the Sixth FC would appear to endorse at least in principle the need for taking into account tax effort. But the Commission gave up the effort in this direction "on the practical consideration that the application of a formula based on relative tax effort, however designed, would place at a disadvantage some of the states faced with big gaps on non-Plan accounts" (para 3, page 52). Leaving open such a gap, (i e, assigning weightage to the tax effort), however, defensible on theoretical grounds would deprive backward states of resources required for upgrading essential services. Assigning some weightage to this factor in the Plan assistance formula would, according to the Commission, meet substantially grievances of some of the states.

7 The author had suggested such an approach earlier. See "Transfer of Non-Plan Resources: A Suggested Approach", *Economic and Political Weekly*, March 7, 1969.

Indian Aluminium

INDIAN ALUMINIUM is making an issue of 31,90,477 equity shares of Rs 10 each at a premium of Rs 11 per share. Out of these, 12,42,132 shares have been offered for subscription to existing Indian shareholders as 'rights' on a one-for-five basis. The remaining 19,48,345 shares are being offered through a prospectus. Out of these, 3,89,670 shares have been reserved for allotment to UTI and LIC and one lakh shares for allotment to Indian employees of the company, leaving a balance of 14,58,675 shares for public subscription. The subscription list will open on January 29 and close on February 8 or earlier, but not earlier than January 31. Indal is a subsidiary of Alcan Aluminium of Canada which at present holds 65 per cent of the Indian company's equity capital. After the present issue, Alcan's shareholding will decrease to 55 per cent. The object of the present issue is to provide a portion of the funds required for the new Belgaum smelter project, involving increase in the licensed capacity from 40,000 to 60,000 tonnes per annum plus related additions to the alumina and bauxite production facilities. Indal has a good record of earnings and dividends. Keshub Mahindra, chairman, is confident that the company will be able at least to maintain the present rate of dividend on the enhanced capital.

Phillips Carbon Black

PHILLIPS CARBON BLACK is promoting a new company with the object of setting up a plant in UP for manufacture of carbon black and allied products. It proposes to invest upto Rs 40 lakhs in its equity capital. It is also participating in another new company being established in Gujarat for the manufacture of carbon black under the aegis of the Gujarat government. Investment proposed to be made in this company will be upto Rs 32 lakhs.

Conflict of Social and Individual Objectives in Peasant Farming in Asia and Alternative Strategies of Agricultural Development

N K Sarkar

Starting from the finding of recent sample surveys of Asian agriculture that gross output per acre declines at first and then rises again as farm size increases, an attempt is made in this paper, first, to build up a theory of social conflict generated by recent technological innovations in agriculture and then to develop a strategy of agricultural development in Asia which would minimise that conflict and cause the least dislocation and human suffering.

ONE of the basic findings of recent sample surveys of agriculture in the Asian countries is that the gross output per acre declines at first and then rises again as farm-size increases.[1] Starting from this finding, an attempt is made in this paper first to build up a theory of social conflict generated by recent technological innovations in agriculture and then to develop a strategy of agricultural development in Asia which would minimise that conflict and cause the least dislocation and human suffering.

Relationship between Farm-Size and Output

In Table 1, we illustrate with hypothetical figures the relationship between farm-size and costs and returns. Let us assume that a village has under a given technique 1,200 acres of cultivable land of equal productivity: Production can be carried on in this village by dividing the land into 1,200 farms each of one acre, 600 farms each of 2 acres, 400 farms each of 3 acres or, 300 farms each of 4 acres, and so on. What farm-size would be *ideal* under the given technique and factor and output price situation? We shall presently see that the answer will differ according to whether we are defining 'ideal' to mean 'maximum revenue for the farmer', or 'maximum output for society as a whole'.

By taking in more land on lease, the peasant-farmer can increase the size of his farm. Similarly, he can reduce the size by leasing out some of his own land. He will thus try to optimise the size of his farm so that his objective of maximum net aggregate return from the farm is satisfied. His costs, which he will have to deduct from the gross return to arrive at the net aggregate revenue, will consist of expenditures on the following:

(a) imported material inputs requiring expenditure of foreign exchange;
(b) domestically produced material inputs;
(c) rent on leased land;
(d) interest on borrowed capital;
(e) wages on hired labour;
(f) transport, storage and other services.

The peasant-family owns a certain amount of land and capital and can provide the labour of its own members. On these items it does not have to pay to outsiders, and the cost is internal to the family. The peasant's net aggregate revenue, therefore, includes not only profits but also payments for factors that the peasant-farmer and his family members themselves supply. We will assume that the peasant-family owns 2 acres which the peasant can cultivate by using his own resources. The only purchases he has to make from outside are some chemical fertilisers, pesticides, some implements and tools, and improved seeds.

Assuming the technique used in all the farms is the same, the rate of expenditure on material inputs can be taken to remain constant per acre irrespective of farm-size. For the other cost items which the peasant has to buy or hire, we will assume declining cost at first as the farm-size increases followed by rising cost. (Our conclusion will need only slight modification if we assume constant cost instead.) The total costs for farms of different sizes are shown in Column 6 of Table 1, and the net aggregate return or output is shown in Column 8. It will be seen from this column that the net aggate output of the farmer is maximised if his farm-size is 9 acres.

The farmer will try to achieve this size under the given factor supply conditions, by leasing in more land if his own land is less than this optimum size, and by leasing out some of his own land if it exceeds this size.

In actual practice, of course, the peasant-families may not attain this optimum size, owing to changes in prices and supply conditions, miscalculation, ignorance, or change in the technique of production. But there will exist a tendency towards attaining the optimum size; that is, the farmers through their experience over the years will try to achieve this size as far as conditions and circumstances permit them to do so.

Social Costs

From the point of view of society as a whole, the costs paid for the domestically produced material inputs, rent, interest, and wages for hired labour, are internal payments from one group of citizens to another; they do not, therefore, represent any national cost. (There will be a social cost, if such transactions lead to increase in inequality or unemployment, which we will ignore for the time being.) The only cost, which is a national cost, is the payment made to foreigners for imported, material inputs. Assume that the cost of imported material inputs is Baht 1,000 per acre. The net aggregate national output will then be obtained by subtracting these costs from the gross output as shown in Column 5 of Table 2. In Column 6 of this Table, we show the total net national output which will be produced if the total land area of 1,200 acres is divided into farms of different sizes. It will be seen from this column that, from the social point of view, the most desirable farm-size is the 3-acre farm. If the 1,200 acres of land are divided into 400 farms, each of three acres, then the total net national output obtained by the community will be Baht 82,000; whereas, if it is divided into 133 farms of approximately 9 acres each, then the net output obtained will be Baht 68,230.

Thus, the individual farmer's objective will diverge from the social objective: the individual will satisfy his objective of maximising his net gain by cultivating farms of 9-acre size. But the social objective, of obtaining highest

For IOB 1973 was a 'leap year'

That's because IOB deposits during 1973 took a big leap—31½% up!—against 22% deposit growth for the entire banking system in India. And that means IOB deposits grew 43% higher than those of the banking system. Behind this progress is people's faith. Faith in IOB's attractive savings schemes—for everyone who can or should save. Faith in IOB's service.

And faith in IOB's schemes for financial assistance—to the needy, the deserving, the enterprising. To keep this faith growing, IOB has opened as many as 55 new branches all over India during 1973.

output net of foreign exchange expenditure, will be satisfied by keeping the farm-size limited to 3 acres. Only accidentally could the cost-structure be such that the farm-size that yields maximum output is identical with the farm-size that gives maximum private gain.

RESOLUTION OF THE CONFLICT

One method to resolve the conflict is to impose a ceiling on the farm-size. Under the cost and output conditions a 3-acre ceiling will maximise the social objective, though there will be a constant pressure from the farmers for a higher operational landholding because it will be profitable for them to cultivate more land.

An alternative to imposition of land-ceiling is a steep increase in the costs steeply for farmers who wish to cultivate farms larger than the social optimum point. Thus, if the interest charges, wages, or price of material inputs, are steeply increased for those who want to cultivate land beyond the optimum level, the individual optimum may be pushed back closer to the social optimum.

IMPROVED TECHNOLOGY

So far, we have assumed fixed technology. Let us now relax this assumption and see how our conclusions have to be modified. The new technology will increase the productivity of land, so that the marginal gross revenue curve will be pushed up to a higher position. Now the peak position of this curve may be shifted to the right, or to the left, or remain where it was depending on the input-combination required by the new technology and the relative availability and prices of inputs.

Let us first take the case where the optimum farm-size remains the same, i e, 3 acres. If costs remain the same, there will be a rise in farm-income and, therefore, a greater demand for leasing in of land as well as for other inputs. The costs will therefore rise and if there were unemployed men employment will rise; otherwise, wages would increase. There will thus be an all-round prosperity in agriculture. Some of the factor-owners may gain more than the others, depending on the relative factor supply; and this differential may generate some social tension. Thus, owners of land may increase rent far more than proportionately to the increase in prices of the other factors. This change in the relative shares of the cake may cause social tension; but so long as the cake is increasing in size, everybody's share can yet be increased and resolution of the conflict is not impossible.

The second case is when the maximum-output farm shifts on the curve to the left and becomes smaller in size due to technological innovation. This may happen when a very large quantity of inputs is needed per acre of land. The resource availability in this case is such that only small farms can be provided with the required quantities of inputs, so that the yield response is highest in them.

The third case is where the maximum-output farm is shifted to the right on the curve and becomes larger in size. If the shift is very significant, it may happen that the marginal cost curves may cut the marginal gross revenue curve at a point before the maximum-output farm size is reached. In this case, the market situation will be such that the individual farmer will maximise his aggregate net revenue by cultivating a farm of much smaller size than the social objective requires.

In this case, it is obvious that the policy should be to increase the size of the small farms upto the optimum level and to reduce the cost of the factor inputs, such as rent, interest, wages, and to subsidise the price of material inputs.

There is reason to believe that, in most of the Asian countries, where population pressure is very heavy on land and the demand for inputs and for land is very high while the supply of inputs is controlled by monopolistic conditions, the cost of inputs rises too high to permit operation of farms at the maximum output level even under traditional technology. The problem has become much more acute under the new technology, associated with the high-yielding varieties of grain, which is very demanding on the inputs. Through land reform the cost due to rent can be eliminated, and by instituting rural banking facilities the interest rate can be brought down. Machinery and animals, which add to the working power of the farmer's family, will similarly induce him to increase the size of his farm to the optimum level.

BI-MODAL FARM-SIZE

It is possible that the introduction of the new technology has generated not one maximum yielding farm-size but two. The peasant-farmer because of his limited resources may be able to attain the highest per-acre yield in small farms, while the capitalist-farmer may be able to attain the maximum yield with a much larger size because of his command over larger volume of resources. Support for this hypothesis is available from the data presented for the Philippines. The gross yield per acre seen in these data tend to decline at first but to rise when the farm-size is

further increased. This suggests that the larger capitalistic farm in grain production is making its appearance in Asia as well.

The bi-modal maximum-output farm-sizes are the consequence of the introduction of technological innovations — such as represented by the Green Revolution — into an agrarian system with markedly skew land and wealth distribution. Given such unequal distribution of resources, the small peasant-farmers can increase their output by concentrating the application of their own capital and family labour into a small area of land. In view of the very heavy demand on capital and labour resources made by the Green Revolution technology, the peasant-farmer can apply the required proportion of labour and capital that he has at his disposal only on a small acreage. The peak of the marginal output curve thus shifts to the left, to a smaller farm-size. The large capitalist-farmer, on the other hand, with his command over a large volume of resources can cultivate large areas using the Green Revolution technology — employing tractors, machinery and modern equipment whenever it is profitable to do so, in substitution of human labour and animals. Thus, a new maximum-output farm-size develops, with much larger land area. The total land available being limited, these larger capitalistic farms enter into severe competition with the small peasant-farms, for the land. For, the larger the size of these farms, the better can they use the machinery and equipment, reducing the unit cost and squeezing the peasant-farmer more and more, till he is forced to quit by selling the land to the gentleman farmer or is ejected on some pretext or other.[2]

The destruction of peasant farms by big capitalistic farms (of gentlemen farmers) is a well known story in the history of development, both in England in the sixteenth and seventeenth centuries and in the US in the nineteenth century. The ruthless uprooting of the peasant families and the take-over of their land by capitalist gentlemen farmers has been immortalised in literature. With the introduction of the high-yielding varieties and the new technology, the peasant farming system is coming under heavy pressure in Asia. However, the political consciousness of the peasants in Asia today can be much more developed than that of the peasants of England and America in earlier times. It is unlikely, therefore, that the Asian peasants will allow themselves to be uprooted and thrown into the urban pit to suffer decay and death without protest.

The bitter struggle between the rural poor and the new rich which is engulfing the rural population of Asia in ever-increasing proportions, is rapidly destroying the tranquillity of a very ancient and tradition-bound society. The traditional religious and social values which established customary social relationships between classes and groups, by imposing moral restraint on each, and so helped the Asian societies to remain in a stable and stagnant state over several milleniums, are dissolving under pressure of the profit maximisation motivation of the capitalist-farmer. These values, which held the Asian societies together for centuries, started to dissolve under pressure of competition and production for the market. The introduction of the Green Revolution has accentuated the process and sharpened the conflicts between the different interest groups.

If no measures are taken, there is little doubt that these conflicts will take more and more violent forms. Social conflicts which are caused by such fundamental divergence in basic economic interests can not but be reflected in the political developments of the countries. Democracies can hardly be a reality in such disturbed and warring societies. Dictatorships also are bound to change hands in succession as they get discredited by their failure to establish basic solutions to the contradictions and conflicts let loose by the new technology.

In fact, the contradictions and conflicts thrown up by the Green Revolution are so intractable because the gentlemen farmers, operating their large farms, do not necessarily have a significant technological advantage over the peasant-farmers — as is shown by the existence of the bi-modal maximum-output farm-sizes under the new technology. The small farmer has about equal chance of competing with the large farmer in production — provided the State power is not thrown in favour of the latter. Under a democratic system, the small peasants are likely to vote for political parties which can assure them land and credit in which matters they are at a disadvantage compared to the larger farmers. Under dictatorships, which are based on large farmers' support, the small farmers have no alternative but to take resort to subversive methods, or to suffer gradual loss of status and join the rural or city proletariat.

MINIMISATION OF SOCIAL CONFLICT

While the bi-modal maximum farm-sizes generate social conflict, they do provide at the same time a way of resolving the contradiction — if one looks at the development in a historical perspective. Unfortunately, the choices as posed by theorists have been jumbled up in historical sequence. Thus choices have been posed between 'growth *versus* employment', or 'tractorisation *versus* employment', etc. Presented in this fashion, the problem of choice between tractorisation and employment becomes insoluble, because the former adds to productive capacity and development thus generating employment capability, and is therefore as worthwhile an objective as direct employment generation. The employment objective, on the other hand, is an immediately beneficial objective though it may, if not properly planned, lead to the reduction of future employment capability of society. Choice or trade-off between these objectives, therefore, presents a difficult problem. Such problem-formulation is also largely sterile.

Despite this sterility, these questions continue to be asked and debated upon,

because of the political implications that are hidden under the economic verbiage that is actually used. Tractorisation, for example, would imply a larger surplus in agriculture leading to availability of larger domestic capital fund for industrial development and generation of self-sustained growth, while emphasis on employment generation would mean slowing down of the growth process and perpetuation of economic dependence and colonial status of developing economies. It would also mean defusing the revolutionary struggle and perpetuation of the *status quo*. It is possible that the battle between these alternative economic development policies are fought for the related political goals. The social costs of technological advance can be minimised by introducing higher technology into Asian agriculture in several sequential phases, as outlined below:

Phase 1: Land Reform

In this phase, priority has to be given to the smaller of the maximum-output farm size modes. The first task would be to increase the size of the sub-optimum sized farms to the optimum level by taking land away from the large-sized farms through land reform measures. Land reform which can increase the number of optimum-sized farms would not only reduce inequality and increase employment, it would at the same time add to the growth potential of the country. By increasing the size of the sub-optimum farms to the optimum level, the output would rise and thus create a saving potential. Thus, if land reform succeeds in increasing the number of socially optimum-sized farms by reducing the size of the larger farms and by increasing the size of the smaller farms, then through this measure alone and without increasing any input and investment, the initial capital may be generated for triggering off the growth process.

The growth of the larger optimum modes must be discouraged in this phase. For, if policy measures are adopted in this phase to encourage the larger modes, then forces will be released in society which will be destructive of the smaller modes and so nullify the benefits of land reform. Subsidising of tractors and other heavy farming machinery, or cheaper credit to large farms must therefore be discouraged at this stage. Not only that, but strong disabilities must be placed on them by imposing higher taxation, higher minimum wages, and higher interest charges, etc.

The effort to fix land ceilings in India would appear to be a move in the right direction from the point of view of this strategy. What is important, however, is not merely a legal fixation of the ceiling but the implementation of the ceiling law. It has become abundantly clear from the way the ceiling laws have been evaded in India, that the ordinary administrative machinery is altogether incapable of enforcing the law. Enforcement from above by administrative officers is most likely to fail. Because of their social background, class loyalty, upbringing, schooling, and method of selection into the bureaucracy, the majority of bureaucrats will have an emotional resistance to such policies. Those few who are sincere in their support of land reform will find it difficult to detect all the loopholes of evasion because of their ignorance of the local conditions.

The only way that land ceiling laws can have a chance of being implemented, is if the villagers themselves are given the capability and consciousness to do so. For, the majority of them being small and middle farmers, they have a stake in implementing the ceiling law, and, being familiar with local conditions and the family disposition of the rich farmers, they are much better placed to detect cases of evasion. Thirdly, the quality of the land and the optimum size of farms in the village are best known to the villagers, so that the redistribution of land after the reform could be done in the most efficient and just manner by the villagers themselves — better, too, than government administrators coming from outside could do.

This would require the creation all over the country of Land Reform Village Committees. It will be necessary to give an intensive training to these Committee members for proper understanding of the objectives and methods of implementing the land reform programme. This in turn would require the setting up of land reform departments at the state and Central government levels, with suitably selected and trained cadres.

These village committees must be given sufficient administrative powers so that they may act with sufficient authority and in a responsible manner. Occasions when a land reform scheme, developed by these committees for a village, is questioned and altered should be very rare.

For successful working, it will be necessary to exclude the rich farmers from the membership of these committees. For, if they are allowed to enter these committees, the entire programme will be exposed to the danger of being sabotaged. The committees should not only decide who should give up how much land and who should receive which plots, it must also decide how much compensation should be paid to those who give up land. The payment of compensation would not present any difficulty. We have based the entire scheme on the assumption that the market forces tend to establish farm sizes which are different from the optimum. By establishing farms of the optimum size through land redistribution, the output of agriculture will be increased. Those who receive the land should not, therefore, find it difficult to pay for their increased income the price of their newly acquired land in 10 or 15 instalments.

For mobilising the rural savings, generated through land reform, it may be desirable not to pay the price of the land to their former owners in cash but rather in bonds carrying a certain rate of interest. At the same time, arrangements should be made when the land awards are made to impose a tax on the land which should equal the normal economic rent of the land. If these measures are adopted effectively, land reform will act not only as a measure of ensuring social justice and greater employment, but also as a trigger for the process of self-sustained growth by generating surpluses in agriculture and by mobilising these surpluses for further investment.

However, it would be idle to expect that land reform can be achieved without generating any social conflict. What we are suggesting, on the contrary, is the introduction of social conflict in a controlled and purposive manner so that the chaotic and destructive social conflicts that are being generated today consequent to the introduction of the new techniques, and the social upheavals and the consequent human suffering that they are causing, may be replaced by a more orderly and organised transformation of society.

Provision of Credit

The small farmers may obtain land through land reform; yet, without credit, he will not be able to cultivate the land well enough to maximise the output. Since the landlord, the village moneylender, and the merchant have been the major sources of his credit, land reform is likely to scare all of them away and so dry up his sources of credit. Unless an alternative source of credit is provided along with land reform, therefore, more harm than good will be done to agricultural production by land reform.

This alternative source could have been the rural co-operative credit societies. Unfortunately, in most countries of Asia, they have been mismanaged and have become dormant. The few which are active and are functioning well, are generally found to have been captured by moneylenders who use it to augment their own capital by borrowing from them at cheaper rate. The Indian government's policy of encouraging commercial banks to open rural branches may provide an effective alternative. The banks may work in close collaboration with the Land Reform Committees, the latter becoming the guarantor of loans for the farmers.

With land reform, some degree of equality would be established in rural societies, so that it will become difficult for the rural rich to exploit the poor. The co-operatives will have a much greater chance of success in the comparatively egalitarian society. Though land may be cultivated by individual farming families, co-operative effort can be developed successfully in many areas to overcome limitations of scale. For example, in marketing, storing, transportation and purchases, co-operative societies could achieve much greater efficiency of operation — by working on a larger scale through pooling of individual resources and by specialising in certain operations. Even many farming operations can be carried out more efficiently by joint operation. Hence, once the land reform programme is completed, the Land Reform Committees may direct their attention to developing co-operatives in as many fields as possible.

Particular effort will have to be directed towards developing rural industries, not only as an avenue of employment and as a source of supplementary income for the rural poor, but as a method of integrating village life and of stemming the tide towards emigration to urban areas.

Phase II: Co-operative Farming

The growth potentiality of land reform is not large and is likely to get exhausted soon. This is because much of the modern high-productivity machinery, equipment and methods of cultivation require larger farm-size for fullest utilisation. For example, farm sizes of four or five acres may be too small even for an electric tubewell or pump-set. Once the saving potential generated by land reform is fully utilised and the savings are mobilised for improving the capital stock and the technical co-efficient of the farms, there will be need for increasing the size of the farms if further progress is to be achieved. At this stage, a programme of land consolidation, through development of co-operative farms, will be the appropriate strategy.

The seeds of co-operation would have been sown already by the Land Reform Committees for marketing, purchasing, industrial production, development of rural infrastructure, irrigation facilities, and common land development projects. The villagers, therefore, would have knowledge of the technique and would not find its extension to farming too novel or unacceptable. Nevertheless, it may be desirable to proceed cautiously and to introduce common farming in gradual stages. Thus, in the first stage, only labour may be shared on a common basis, each farmer contributing to to the common labour-gang according to the land area of his farm. Gradually, the farmer may be persuaded to contribute his land also to the common pool, the net output being distributed according to the land share, taking due account of the quality of the land. This type of land consolidation can be successful, however, if at each stage the capital intensity of the farming process can be increased so as to add significantly to the yield. For example, the farmers will be more willing to join the common land-pool, if they can thereby obtain an electric tubewell to irrigate their land and thus add considerably to their output. It is clear, therefore, that co-operative farms can be introduced only after the country has reached a sufficiently developed industrial stage where the necessary agricultural machinery and equipment can be supplied to the farmers for bringing about the technological upliftment of agriculture. It is at this stage that tractors and other heavy equipment may be thought of, not earlier.

Conclusion

In summary, what we are advocating is avoidance of the direct introduction of the technological revolution in agriculture by large capitalistic farms. We are advocating that we proceed in stages *via* land reform; small farms, and thence to larger co-operative farms, altogether avoiding capitalist farming at any stage. The former method under present-day conditions in Asia would lead to serious social dislocation, discontent, subversion, civil war, and untold human suffering. In fact, such development strategy carries within it the seeds of international war. The alternative of land reform, and the development of small farms culminating in formation of co-operative farms, we claim, minimises the social costs of the technological transformation of Asian agriculture. It requires, however, supreme organisational effort and far-sighted political leadership. One does not see such leadership yet on the Asian horizon.

Notes

[The views expressed in this paper are the personal views of the author.]

1 For statistical evidence see N K Sarkar and S Tambiah "Disintegrating Village"; Ceylon University Press, 1957, p 46 for Ceylon; Anthony C Koo, "The Role of Land Reform in Economic Development", Frederick A Praeger, New York, 1968, p 166, for Taiwan; P V John, "Some Aspects of the Structure of Indian Agricultural Economy, 1947-48 to 1961-62", Asia Publishing House, London, 1968, pp 289-94, for India.

2 Such situations are a common occurrence in Asia today: "The common parlance, the influential rich who acquired intensive real estate along the Friendship Highway are called 'millionaire farmers'. They are a new type of 'farmers' — some from the past or present cabinet, some ex-politicians, businessmen, bankers, high-ranking government officials, powerful generals of the armed forces.

"What happened to those who owned land in Pakchong before the 'big boys' cut in? They did not have much choice — either they became employees of the millionaire farmers or had to move deep into the jungle to acquire some land to cultivate for themselves.

"But those who destroyed the forests were arrested and jailed in accordance with the law". (Wirasak Salayakanond, 'The Growing Colonies of Bangkok', in *Nation*, March 13, 1973, Bangkok.)

"The villagers, who came from eight villages of Tambon Dan Thaptako, said they would lose their land to four capitalists from Tha Maka District of Kanchanaburi Province. The capitalists have allegedly obtained concessions from the Forestry Department.

"Under the concession, the villagers would be required to plant all acacia trees; the capitalists were the sole dealers providing villagers with modern equipment" they said.

"Those who refused to plant the trees are threatened with a fine of 50 baht per rai", they said.

"This is unfair, since most of us have been living in the area for 20 to 30 years and have grown trees and fruits in the area", they said. *Bangkok Post*, Tuesday, March 13, 1973.

MADRAS REFINERIES LIMITED

Speech of the Chairman, Mr. M. Rama Brahmam, at the Seventh Annual General Meeting held at Madras on 21-12-1973.

Gentlemen:

I welcome you to the Seventh Annual General Meeting of your Company.

The audited statement of accounts for the year ended June 30, 1973 together with the reports of the Directors and Company Auditor are already in your hands and I shall take them as read.

PHYSICAL PERFORMANCE

During the second successive year, the Refinery operated at about the installed capacity despite the fact that there was a major plant turnaround lasting over 22 days. This was carried out after 21 months from the last turnaround in 1971. During this shutdown besides routine maintenance and repair work plant debottlenecking and modifications were also carried out to improve capacity and efficiency. As a result of these improvements a monthly record crude throughput of 247,177 tonnes was achieved in October 1973. The refinery fuel consumption was reduced by over 10% which is a significant achievement in the context of energy crisis and need for its conservation. This amounts to cost saving of Rs. 75 lakhs per year at the current crude oil prices. There have been substantial increases over the previous year in the yields of high valued products such as Cooking Gas by 40%, Motor Spirit by 14.5%, Aviation Turbine Fuel by 23.5%, Light Diesel Oil by 37.8% and Lube Base Stocks by 12.3%, due to partial effect of the above modifications. The full year effect will be felt in 1973-74 operations.

FINANCIAL RESULTS

The total value of sales of products has gone up by 19% to Rs. 6587 lakhs during the year as compared to Rs. 5543 lakhs in 1971-72. The f.o.b. Kharg price of Darius crude had also increased progressively by over 30% to $ 2.51 from $ 1.92 per barrel to an average of $ 2.08 per barrel during the year. The product prices fixed by the Government of India up to June 10, 1973 could neutralise the crude price increase up to $ 1.48 per barrel and thereafter up to $ 1.88.

The average freight rate per Tonne of crude transport has come down by 27.5% to Rs. 17.87 from Rs. 24.71 in 1971-72 due to utilisation of the Shipping Corporation's super tankers (87,000 dwt) "Jawaharlal Nehru" and "Lal Bahadur Sastri" for a period of about 9 months from February to October 1973.

During the year your Company had repaid a loan of $ 1.86 million to foreign lending institutions and Rs. 225 lakhs to the Government of India. The outstanding Dollar and Rupee loans as on June 30, 1973, i.e. after 4 years of operation, stood at $ 10.02 million out of $ 22.32 million and Rs. 1061.8 lakhs out of Rs. 2025.3 lakhs total loan.

The net profit for the year was Rs. 570 lakhs showing an increase of 11% over previous year's profit of Rs. 513 lakhs. After providing Rs. 523 lakhs for development rebate reserve and making adjustments relating to prior years, your Directors have recommended a Dividend of 12% gross amounting to Rs. 154.5 lakhs for the year 1972-73. As you may recall your Company declared a Dividend of 9% for the previous year. It may be mentioned here that your Company paid an Excise duty amounting to Rs. 21.56 crores to the Central Government and an amount of Rs. 7.96 crores towards Sales Tax on the sale of products. This totals up to Rs. 315.44 crores paid to Central and State exchequers during the last four years.

INDIGENOUS SUBSTITUTION

The developmental work on the new high valued products such as Rubber Processing and Extender oils, Ink oil and Axle oil is progressing satisfactorily and some products have found consumer acceptance after plant trials. The Axle oil trials on railway wagons are in progress. This import substitution will save Rs. 3.5 crores annually in foreign exchange and substantially improve the profit position of your Company. In the area of indigenous substitution and development of ancilliary industries, your Company gave good fillip to the local manufacturers. The spares and equipment which, amongst others, included tower internals and trays, furnace hangers, exchangers, pumps, gaskets, valves etc. worth Rs. 27 lakhs were procured.

POWER CRISIS

You will be pleased to note that during the critical period during 1973 of acute power shortage, the refinery generated additional power and supplied almost 4 million units to the State's grid. The Refinery had also maximised the production of Diesel oil at that time to meet the sudden increased demand for the diesel-generating sets installed due to power shortage.

PORT FACILITIES

It is a matter of great satisfaction to your Company that in February 1973, the long awaited oil jetty at Bharati Dock at Madras Port was opened for berthing 42 ft. draft vessels during January-October period of each year. This made it possible to transport crude oil using Shipping Corporation of India's super tanker at a considerable freight savings to your Company. It is hoped that the Port facilities will be further improved to 46 ft. draft required by the SCI's tankers, fully laden and to make it usable all the year round.

PERSONNEL DEVELOPMENT

In the area of Personnel Development and Training programmes, your Company has done well to expose a section of its supervisors to an intensive course on "Laboratory for Achievement Motivation" by the Behavioral Science Centre. As a part of the Technical Assistance to a neighbouring country, two senior tehchnical personnel of your Company continued to assist in the operation and training of the personnel of the Ceylon Petroleum Corporation for the second year. Two engineers were sent to our Collaborators abroad—one to United States for advance training in Process Engineering Design and another to Iran for studying Oil loss Control and Prevention techniques. Your Company had also actively participated in the United Nations Inter Regional Seminar on Petroleum Refining in developing countries in January 1973.

INDUSTRIAL RELATIONS

During the year a scheme for advancing loans to the employees on easy terms towards construction of their own houses was launched and a Welfare Fund was constituted. The Canteen facilities were improved and prices maintained inspite of considerable increases in food prices. The Company made an *exgratia* payment of 20% to its employees. The Employees' Union continued to have effective leadership from within. The employee relations remained cordial.

SAFETY

I am happy to note that your company has completed the first million man-hours safe operation without any lost time accident, and earned the Merit Award from the National Safety council of the U. S. A. This was possible with the active co-operation of all the employees. Individual and group awards were given on completion of safety targets.

The first Safety Audit of the plant was successfully carried out with the assistance of two safety experts from the collaborators in order to assess oparational and design deficiencies from the safety standpoint.

OUTLOOK

Before I conclude, I must admit that despite excellent operational performance, your Company may have difficulty in remaining above water for much longer in the context of sky-rocketting of crude prices. Although the crude oil supplies are assured to your Company, it is anybody's guess as to what level these crude prices will finally settle down. The Government of India will be sending a delegation to Tehran to negotiate crude oil price. I am hopeful that this problem will be resolved satisfactorily.

In the end, I offer my sincere thanks to all my colleagues on the Board and in particular to the Government of India, National Iranian Oil Company and Amoco India for their cooperation and assistance. I take this opportunity to extend my appreciation to all employees who have given their best to sustain progress of your Company. I am confident that their sense of dedicated team work will continue so that your Company can face successfully the difficult times ahead.

With these remarks, I now propose that the Directors' Report and the Accounts be adopted

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Indian Oxygen Limited

Statement of the Chairman, Mr A K Sen

THE following is the statement of Mr A K Sen, Chairman, Indian Oxygen Limited, which has been circulated to the shareholders along with the Company's Report for the year ended 30 September 1973.

A review of the Company's performance during the year to September 1973 calls for a brief reference to the environment in which it operated. Regrettably this was difficult and disappointing from the point of view of the economy. Agricultural production, still the main pillar of our economic structure, was severely affected by drought in many parts of the country. This resulted not only in a decline in the output of foodgrains and commercial crops but had other far-reaching repercussions on the economy. Much of the power supply of the country being based on hydel stations, the drop in the water level led to an acute power crisis in several States : this further accentuated the severe power shortage which had been developing in the country during the recent past due to a number of factors. The need for fairly large food imports caused a severe strain on the country's foreign exchange resources. Most alarming of all was the inflationary pressure that was generated. This, unfortunately, still continues and is having an adverse effect on many spheres of the national economy, including industrial production.

Industrial production during the year recorded a very poor rate of growth because of several problems of a more chronic nature, apart from the factors flowing from the decline in agricultural output. Shortages of many vital industrial inputs and raw materials persisted. The net inflow of foreign assistance registered a sharp drop and a favourable atmosphere for rapid industrial growth continued to elude the country.

In the political field, even if conditions were unsettled in certain parts of the country and Andhra Pradesh, Uttar Pradesh and Orissa had to be placed under President's Rule, the stability established after the elections in 1971 and 1972 was maintained. This has prevented any deterioration in the law and order situation despite the stresses and strains of a stagnant economy. It also gives rise to the hope that the uncertainty and ambiguities in Government policies will be removed and the decision making machinery at Government level will be streamlined and made more effective.

Sales

There was an acute shortage of calcium carbide from June 1973 — which still persists — compelling a cut in the production of dissolved acetylene. The availability of electrode quality wire rods was inadequate until July 1973 when some imported steel was received; however, a curb on production still remains necessary in view of the unsatisfactory steel availability during the current financial year. Power cuts and frequent interruptions in power supply prevented production of oxygen, nitrogen and argon at the required levels throughout the year under review, although there was some improvement in the situation from July 1973. Nevertheless, the Company's turnover for the year at Rs 25.66 crores exceeded the previous year's turnover (Rs 23.63 crores) by 8½ per cent. A major contribution towards this increase was made by the Company's new plant manufacturing activity, which got into its stride during the year : the sales of gas and electric welding equipment also registered significant improvements. The sales of other products were generally maintained, notwithstanding the severe constraints on production already mentioned.

Export sales were higher than the previous year and would have been still better if certain shipments were not delayed by labour unrest at the Calcutta Port in September 1973.

Profit, Taxation and Dividend

The profit for the year, after providing depreciation of Rs 87,93,000 (previous year Rs 78,14,000) amounted to Rs 2,75,08,241 as against Rs 2,50,54,305 last year. The increase in profit was mainly due to a rise in sales and savings in interest charges.

Tax provision for the year amounted to Rs 1,83,00,000 (previous year Rs 1,67,00,000) leaving a net profit of Rs 92,08,241 as against Rs 83,54,305 last year. After transferring Rs 8,00,000 (previous year Rs 4,00,000) to Development Rebate Reserve and bringing back from this account Rs 10,00,000 (previous year Rs 19,00,000) now released, the amount available for appropriation was Rs 94,08,241 which has been transferred to General Reserve (previous year Rs 83,25,305).

After careful consideration of the Company's present and future resources position and all other relevant circumstances, your directors have decided to recommend payment of dividend at the rate of 14 per cent, subject to deduction of tax, on the share capital as enhanced by the issue of bonus shares during the year. If the recommendation is accepted, the dividend will be paid out of General Reserve and will absorb Rs 86,24,000 (previous year Rs 69,30,000).

Finance and Share Capital

A further amount of Rs 4,68,234 was repaid to The British Oxygen Company Limited against the loan granted by them leaving a balance of Rs 28,09,403 at the end of the year.

15,40,000 fully paid up new ordinary shares of Rs 10 each were issued and allotted as bonus shares amongst members of the Company who were on its Register of Members on 12 February 1973, in the proportion of one for three.

Development and Expansion

In my Statement last year, I referred to the new factory in Calcutta for the manufacture of air separation plant and associated cryogenic equipment. It gives me much pleasure to state that during the year under review three oxygen plants manufactured by the Company were supplied to customers. The Company was the first to manufacture such plant in India and thus gained the distinction of being the pioneer in import substitution in another important field. The order book position for this activity continues to be very satisfactory. The Company has recently finalised a collaboration agreement with Cryoplants Limited, London, for acquiring technical know-how for enlarging the scope of this activity to include manufacture of low pressure tonnage air separation plant and nitrogen generators. It is my earnest hope that the Central Government will accord its approval to this collaboration so that the Company is enabled to take yet another significant step towards the country's self-suffi-

ciency in areas which are essential for giant projects in basic industry.

Two new companies have recently been formed within the BOC Group — one to take full advantage of the high growth potential in the world wide market for medical equipment and supplies, and the other to co-ordinate and rationalise the development and manufacture of welding products to take advantage of potentials in new world markets. We are maintaining close association with these two companies and there are already signs of benefits flowing to the Company. Orders have been obtained for the export of certain products to several countries including some in Western Europe.

My Statement last year mentioned that several industrial licence applications were submitted by the Company. While Government decisions in respect of some of these are still awaited, an intensive exercise is under way for development and diversification of the Company's activities, bearing specially in mind the new industrial policy announced by the Government in February 1973. Certain projects have been identified which satisfy all the major requirements of the Government policy. These are currently under detailed study and it is hoped that we should shortly be in a position to submit applications for industrial licences and other related clearances.

I should like to take this opportunity of referring to the new procedure for expediting Government approvals of new projects introduced from 1 November 1973. If the Project Approval Board, the Secretariat for Industrial Approvals and other Government agencies approach their tasks with pragmatism and adhere to the time targets set by the Government, there ought to be a distinct improvement in the pace of industrial development. It is hoped that the Government will bear in mind that in greater production lies the remedy of many of our economic ills.

Management and Personnel

Although there was labour unrest at some of the Company's units during the year, industrial relations in the Company were generally satisfactory. A settlement was signed in June 1973 with the recognised Federation of the employees' unions extending substantial benefits to the employees. Separate settlements on similar lines were subsequently signed with certain unions not affiliated to the Federation. These settlements contained the Federation's and the unions' assurances that they would co-operate with the management in improving productivity and discipline and removing restrictive practices. I sincerely hope that the response of the employees in actual practice — in terms of these assurances — will be encouraging. The pace of our industrial growth depends largely on increased productivity and peaceful industrial relations. We look to our employees and their representatives for greater co-operation in ensuring the attainment of these objectives throughout the Company so that we can successfully meet some of the serious challenges facing all of us. I would like to take this opportunity to thank all those employees, management and non-management, who by their hard work and loyalty enabled us to achieve the satisfactory results for the year.

It gives me great pleasure to mention that two of the Company's executives won international recognition. One of them won the Macnab Medal for 1971 awarded by the Institution of Chemical Engineers, London, for the best design project submitted in that year, and the other was selected by the United Nations Industrial Development Organisation to work as an expert in ferrous extraction metallurgy in Egypt. A third executive has recently received a National Metallurgist Award in welding technology.

Mr K Gopalakrishna retired from the Board of Directors at the last Annual General Meeting on 12 February 1973; we are thankful for the valuable contributions made by him to the deliberations of the Board. Mr R H Mody and Mr K Julian Scott have joined the Board as additional directors. I am sure that their valuable experience will be of great benefit to the Company.

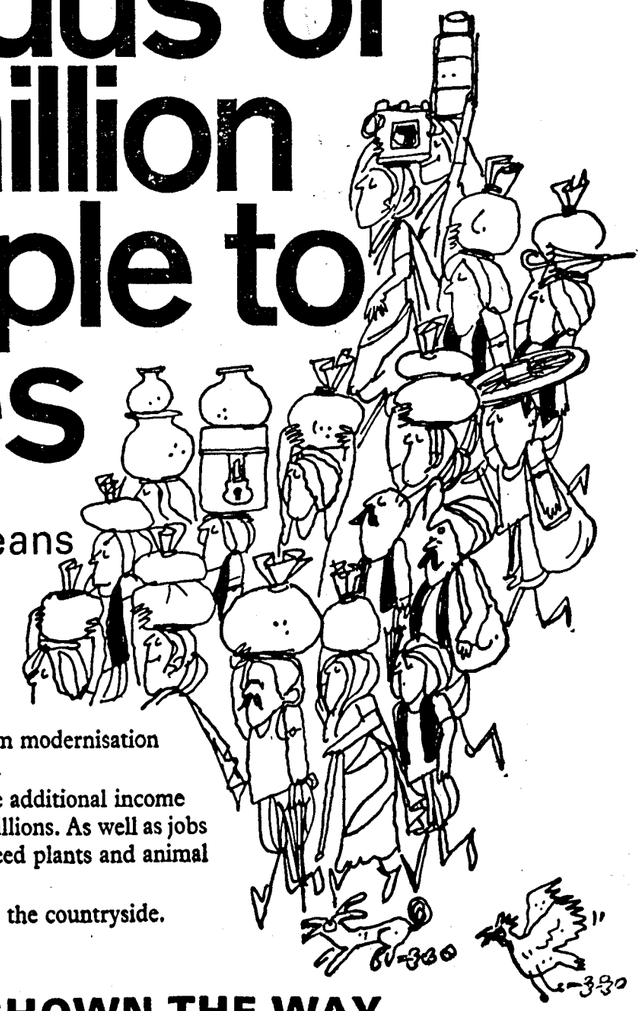
Prospects

The shortages of certain essential raw materials and the apprehended continuing shortfalls in power supply in many parts of the country may well inhibit production at the Company's factories being maintained during the current year at satisfactory levels. If these fears prove unfounded, the Company's immediate prospects can be viewed with optimism.

Under the recently enacted Foreign Exchange Regulation Act, 1973, the Company, in which non-resident interest is more than forty per cent, will be required to obtain the permission of the Reserve Bank of India in many matters relating to its activities. This introduces fresh constraints on the Company and others similarly situated. It is hoped, however, that the Reserve Bank will exercise its authority with a sense of realism so that the restrictions under the Act do not impinge unduly on the Company's operations.

The prospects in the long-term will depend upon the Company being permitted to develop and diversify its activities on a significant scale. As already indicated, the Company expects to submit shortly to the Government for approval new projects conducive to the country's industrial growth and commensurate with the financial, managerial and technical resources of the Company. If these projects are approved by the Government, the Company is likely to derive substantial benefits in the foreseeable future.

A K Sen
Chairman



30 November 1973

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Apollo Tubes

APOLLO TUBES, a new company of the Raunaq group, is setting up in the 'backward' area of Ranipet in Tamil Nadu a project for manufacture of steel tubes and pipes and bicycle tubing with an installed capacity of 25,000 tonnes per annum. The project is being established with technical-cum-financial collaboration of Bharat Steel Tubes, the largest maker of ERW tubes and pipes in the country. This will be a major tube mill in the South where demand for steel tubes and pipes has been on the rise. Construction of the factory buildings is in progress and the plant is expected to commence commercial production before the end of 1974. The project cost, estimated at Rs 164 lakhs, is proposed to be met by share capital (Rs 70 lakhs), loan from IFCI (Rs 54 lakhs), loan from SIPCOT (Rs 25 lakhs) and subsidy for locating the project in an industrially under-developed area and deferred-payment on land (Rs 15 lakhs). According to the chairman Raunaq Singh, Apollo's sales should rise from Rs 396 lakhs in the year ending June 1976 to Rs 942 lakhs in the subsequent three years and pre-tax profit from Rs 20 lakhs to Rs 66 lakhs in the same period. He is confident that the company should be able to pay a maiden dividend of "not less than 10 per cent" for 1975-76 and step it up later.

Halting the exodus of 11 million people to cities

By creating means of livelihood in the villages

Population pressures and farm modernisation are driving people into cities.
Modern dairying can provide additional income and means of livelihood to millions. As well as jobs in collection centres, cattle feed plants and animal husbandry services.
Dairying brings new hope to the countryside.

Fudging—and Worse

THE elaborate exercise of budget-making deserves to be taken seriously only so long as there is reason to believe that the government has at least a fair degree of control over the level and pattern of its expenditure. The last few budgets of the Central government had raised grave doubts in this regard. These doubts have been enormously strengthened by the budget for 1974-75, presented to Parliament this Thursday.

The revised estimates for 1973-74 show how awry the estimates of expenditure contained in last year's budget have gone. The budget had anticipated a deficit of about Rs 240 crores, after taking into account the expenditure arising out of the recommendations of the Third Pay Commission; in fact, the deficit has turned out to be Rs 650 crores. And that after raising about Rs 150 crores more from what are euphemistically called market borrowings but which consist largely of borrowings from the banking system — this year, largely from the Reserve Bank itself.

Against this, on the expenditure side, while the government's total expenditure increased from the budget estimate of Rs 7,626 crores to Rs 8,438 crores, expenditure on the Central Plan met out of the budget actually declined from Rs 1,924 crores to Rs 1,656 crores. The share of the Central Plan in the total expenditure of the government as a result declined from around 25 per cent — in itself nothing much to write home about — to less than 20 per cent. And what were the items the expenditure on which bloomed? That the food subsidy would turn out to be about Rs 120 crores higher than estimated in the budget was known, as was the parlous state of railway finances which has eaten into the Centre's budgetary resources to the extent of Rs 110 crores more than provided for in the 1973-74 budget. To these have to be added loans to states for non-plan purposes under the heads 'assistance towards relief of damage caused by natural calamities' and 'special accommodation for covering gaps in resources' which have accounted for Rs 556 crores or well over twice the budgetary provision of Rs 258 crores.

A deficit risen to three times the budgetary estimate, a reduction of Rs 250-300 crores in expenditure on the Plan and an increase of around Rs 1,000 crores in expenditure of the non-Plan, non-development kind — this is a strange outcome for a budget which, the Finance Minister had claimed, was consecrated to the objectives of control of inflation and promotion of higher levels of saving and investment.

It is against this picture of fiscal chaos that the estimates presented in the budget for 1974-75 have to be judged. Faced with a 25 per cent rate of inflation and an all-round economic crisis, the government's instinctive reaction has been to jettison the very programmes which not so long ago had been advertised as the sheet-anchors of its effort to achieve greater social justice. A whole, separate document titled 'Towards Growth with Social Justice', presented with the budget for 1970-71, had been devoted to an exposition of these programmes. In the budget for 1974-75, however, the various crash programmes for employment, the programmes of family and child welfare and the many 'special' welfare schemes have been left with pittances or been disinherited altogether. In the provision for the Central Plan in the budget, social and community services receive Rs 90 crores, or a fifth, less than the provision of Rs 442 crores in the 1973-74 budget. Considering the enormous propaganda mileage which the government had earlier derived out of its espousal of these programmes, it is hardly possible for it now to turn round and argue, as the critics of these programmes have been doing, that the way in which the programmes had been conceived and were proposed to be implemented, they would have achieved neither growth nor social justice.

The Finance Minister may yet like to claim, however, that while social justice might have been given the go-by, albeit temporarily, the government remains unremitting in its pursuit of growth. In this context he might point to the increase proposed in the allocation for the Plan in the budget for 1974-75. Unfortunately for him, the increase of a little less than Rs 190 crores over last year in the provision for the Central Plan, including from sources outside the budget, really represents no increase at all in real terms, given the rise in prices in the last year, especially in those prices which are most relevant to investment programmes.

It may still be pointed out that even if the increase in the overall Plan expenditure is deemed modest, the allocation for industry and minerals and transport and communications at Rs 1,346 crores shows a smart rise of Rs 418 crores over the allocation of Rs 928 crores in the last budget. However,

a considerable part of even this seemingly large increase in outlay represents overruns in the costs of projects under implementation. Secondly, it is not at all certain that the allocations for the different industries will be fully or effectively used in view of the fact that in many cases there are no projects in the pipeline. Finally, there is some disturbing suspicion about the comparability of the current year's figure of outlay on the Plan with those of earlier years. This arises from the fact that the outlay figures of the Draft Fifth Plan are all in gross terms whereas those of earlier plans were net of replacement expenditure. If the outlay for the current year's Plan are in gross terms, as it should be since this is the first year of the Fifth Plan, then even a 15 or 20 per cent rise in outlay over last year may represent no increase at all once the figures are made comparable. It is peculiar, to say the least, that there is no explicit reference to this matter in any of the budget documents.

The fudging on the expenditure side of the budget seems all too tolerable compared to the dishonesty of the pretension that tax evasion will be checked by sharply reducing the rates of personal income tax. The suggestion for such reduction may have come from the Wanchoo Committee, but its implementation at this stage is a bonanza pure and simple for the salaried bureaucracy in the public and private sectors. The government could not be unaware that the budget for 1957-58 had reduced the highest marginal rate of tax earned incomes from the-then prevailing level of 91.8 per cent to 77 per cent — the level now proposed by the Finance Minister. The reduced tax rates, with the highest marginal rate at 77 per cent, had prevailed continuously for five years up to 1961-62, by which time, according to the Wanchoo Committee's own verdict, income escaping tax had reached the figure of over Rs 800 crores. It is naive to believe that a reduction in tax rates will persuade those bent on tax evasion to cease and desist, since, given the government's kid-glove treatment of tax-evaders, the risks attendant on being found out are so slight.

It is an altogether apt commentary on the government's sensitivities and concerns that at a time when the low rates of investment and growth for years on end, the stagnation in employment and the sharp rise in the prices of the essentials of life have further skewed the distribution of incomes in favour of the well-off, the Finance Minister should have, on the specious plea of checking tax evasion, chosen to make a present of, according to his own conservative calculations, Rs 60 crores annually to the relatively affluent belonging to the tax-paying category.

Nagaland

No New Frontiers

THE hill states adjoining Assam, with the exception of Tripura which is more akin to Bengal, have not yet been integrated into the Congress-loyal opposition syndrome. Regional parties abound in the hill states, both in their governments and oppositions, overground and underground. But one of these territories, Arunachal Pradesh, i e, the former North-East Frontier Agency, does not have any organised political parties. Manipur, on the other hand, has a number of local parties, themselves differentiated by community. These parties include the Manipur People's Party, the Manipur Hill Union and the Kuki National Assembly. The Union Territory of Mizoram is ruled by the Mizo Union and in opposition is the Mizo Congress which would like Mizoram to be given full statehood. The outlawed Mizo National Front is, however, leading an armed struggle for a sovereign Mizo country and has connections with the underground Nagas. In Meghalaya a section in the ruling All-People Hill Leaders Conference tried to bring about their party's integration with the Congress, but was prevented from doing so by other more vociferous sections within the APHLC.

But it is in Nagaland that a parallel political system seems to be developing, somewhat along the lines of the Congress-loyal opposition system in most other parts of India, yet distinctly free of any direct control from any of the all-India parties, whether Congress, Communist or Right-wing. While it is true that the two major parties in Nagaland, the United Democratic Front (UDF) and the Naga Nationalist Organisation (NNO), based their election campaigns on very different lines, both the parties are one in having a strictly Naga identity.

The UDF, which has now come to power, has promised that it will try to arrange a reconciliation with the Nagas who have been fighting for an independent state. But this would be done within the bounds of loyalty to the Indian state. It has also promised to work towards the lessening of the Indian Army's presence in Nagaland. The NNO campaigned on the basis of further planned economic development but did not specifically mention a reconciliation with the underground Nagas.

In last month's election, the UDF won 25 seats and the NNO 23 in a 60-member Assembly. The UDF then managed to woo eight independent members to its side and so formed the government which had been in the hands of the NNO ever since 1964 when Nagaland became a full-fledged state. The election outcome does not clearly indicate whether the sympathies of the Naga people lie with the underground forces or not, although it may indicate a desire for an end to the fighting which has been going on for about 20 years. But now that the UDF has taken over the formal responsibility of power in Nagaland, the more determined underground Nagas may begin to look upon it as a stooge of India, or much the same as their image of the NNO. The victory of the UDF in the election, therefore, does not necessarily mean a quick end to the protracted fighting in Nagaland.

Political Prisoners

Make-Believe World

FOR the people of India today, the Prime Minister is reported to have said in one of her recent campaign speeches, it is no longer a question of facing bullets or going to prison; it is more a question of having self-confidence and determination to face with courage the difficulties and dangers obstructing our path so as to overcome them.

How unreal can one be? If one takes the statistics of deaths by police bullets in the twenty-seven years since Independence, the number of such deaths has been the highest during the last few years, when Indira Gandhi has been firmly in the saddle as Prime Minister. Human lives never mattered so little as today; trigger-happiness has seemingly been given the status of a national ethos. If one were also to look into the data on the number of young men and women locked away for *political* reasons, this too again is at the moment about the highest since Independence: apart from a very brief period in the early 1950s, our jails have never been fuller. Certainly, under the British, deaths from police firings were not exactly few and far between; but they were a piffle compared to the frequency and intensity of the firings taking place now. And while during individual periods, for example, during the phase of the non-co-operation movement in the early 1920s or the civil disobedience in the early 1930s, the number of those imprisoned could have been greater, if the number of prisoners were to be weighted by the length of their incarceration, the record of the present government in New Delhi would surpass what the British were ever able to achieve in this country.

Should one not also mention a few other things? What happens inside the prisons does not remain exactly unknown to those who still are outside. This journal has recently published a detailed account of the medieval barbarities perpetrated on the inmates in such a supposedly *avant garde* prison as the Presidency Jail, Calcutta: none of the details mentioned in the report has till now been contested by the authorities. Insofar as torture by the police both inside prisons and in the lock-ups is concerned, the current practices put into shade the known stories about third-degree methods in British prisons. Part of the reason for this expanding vista of tortures is admittedly secular. The advancement in the technology of torture is a function of time: the police today know of more ways about how inhumanities can be perpetrated on young men and women than were known to the police thirty, forty or fifty years ago.

The point of this particular caveat on our part is to draw attention not even to the factual errors in the Prime Minister's statement, but to a pattern of behaviour that is fast developing. Even were the fact that the Prime Minister must have her secret sources of intelligence about the frequency of police firings and the number of political prisoners in the country to be ignored, she must be each day scanning the newspapers. On the very day she was speaking on the theme of bulletlessness and prisonlessness, the police resorted to firing in Gujarat, Maharashtra, Uttar Pradesh and West Bengal to quell crowds which had gathered to make political demonstrations. The government may make the point that, on each occasion, the provocation for the firing came from the assembled crowd, but that would not still blot out the *fact* of the firing. On the day the Prime Minister was speaking, there were, on a rough reckoning, around the country close to 35,000 political prisoners languishing in jails for months on end without being brought to trial. A certain selectivity would thus appear to have affected the cognitive process among ruling politicians. They take cognisance of facts that are convenient to them, the rest do not exist at all. Given this stratagem, the occasion does not even arise to explain away the facts — the facts simply cease to be. If allowed to spread, this could be a technique full of momentous possibilities. For if you are not to accept some events as facts, there could be no question of analysing them, assessing them, drawing the appropriate lessons from them. If it is to be taken as datum that the police do not fire bullets and therefore nobody dies as a result of police firing, or if it is not to be recognised that thousands of individuals are currently in prison because of their political convictions and therefore there is no need to delve into the genesis of their moral courage, introspection could go out of the government system. If facts themselves are obliterated, the compulsion to draw lessons from them would also not be there. From this, it is also but one short step to refuse to recognise the fact that prices are spiralling or that large sections of the population are groaning under the impact of the inflation. Politicians could therefore continue to live in their world of make-believe, facts becoming un-facts and illusions taking the place of reality. If, after a while, the wrath of people rises to a crescendo and men in authority are unable to face the public and have to flee from public concourses, even that fact might be conveniently ignored.

Tea

The Imperatives of an Agreement

Angus Hone writes:

THE talks in Colombo in early February, between the Indian Deputy Commerce Minister, A C George, and Sri Lanka's Minister of Plantation Industries, Merryn da Silva, would suggest that India and Sri Lanka are thinking of establishing a joint marketing policy to raise world tea prices. World tea exports are dominated by India and Sri Lanka, and such a joint policy may be the answer to the falling unit prices and stagnant exports of tea.

Total world exports were 680,000 tons in 1972: of this, India accounted for 207,000 tons and Sri Lanka for 190,000. In 1973, exports by the two countries would aggregate over 410,000 tons as compared to 700,000 tons of world exports. Only Indonesia (40,000 tons) and Bangladesh (20,000 tons) are significant exporters of tea from the Far East. The dominance of India and Sri Lanka is even greater in value terms, since they export the better qualities of tea. Thus, of world trade in tea of $ 597 million in 1972, more than two-thirds was commanded by India ($ 215 million) and Sri Lanka ($ 194 million). But prices have been stagnant or falling as is evident in the Table below:

VALUE OF EXPORTS PER KG (US cents)

	India	Sri Lanka
1961-1965	123.8	116.7
1966-1970	106.4	96.0
1970	98.2	90.3
1971	100.4	92.6
1972	103.7	101.9

The result has been a rapid decline in the purchasing power of tea exports even as prices of imported items into India and Sri Lanka have risen sharply during the period 1961-1972.

The major reason for the falling prices has been the stagnant demand for tea in the developed countries. In 1972 the developed countries' offtake was 405,000 tons, compared with the average for 1961-1965 of 407,000 tons. In the United Kingdom — the world's largest importer — consumption actually fell from 234,000 tons in 1961-1965 to 193,000 tons in 1972. At the same time, low-cost African producers of tea have expanded their output and exports much faster than the increase in total world consumption. African exports reached the level of 132,000 tons in 1972. In the absence of any significant multinational promotion of tea in the major markets of UK, EEC, and the United States, these two trends have resulted in stagnant value of tea exports at $ 579 million in 1972 against the average of $ 585 million for 1961-65 — and falling unit prices.

The obvious solution would be a pact between India and Sri Lanka to withdraw, say, 10 per cent of their total exports (or about 40,000 tons) from the market. A large number of econometric studies — including those by R J Ball at the London Business School, by the FAO, and others — indicate that the price responsiveness to a cutback

in supply would be large while the likely fall in demand as a result of higher prices would be only marginal.

The tea withdrawn from the market would be a significant quantity, but Sri Lanka should be able to sell an additional 15,000 tons to the USSR and East Europe, while India by reducing the excise on domestic consumption could further expand its already large domestic market from 250,000 tons in 1972-73 to 275,000-280,000 by 1974-75.

The result of this policy might well be a price rise of 40-50 per cent which, combined with the 10-15 per cent cutback in volume would raise export earnings by over 30 per cent.

There are some obvious drawbacks to such a scheme. First, an agreement would have to be secured to prevent Bangladesh and Indonesia from meanwhile expanding their acreage massively as they well could. Second, India and Sri Lanka would have to come to a market-sharing agreement with the major East African producers — Kenya, Malawi, Tanzania, etc — allowing them to expand their acreages and market shares at an agreed rate: East African producers would also gain from the higher prices. Third, to prevent the erosion of tea's total market, a significant portion of the extra revenue (say, 3 per cent of $ 550 million in 1974-75) should be earmarked for a multinational advertising and promotional campaign in major import markets.

There is unlikely to be a major resistance to higher price levels. Coffee consumption in the United Kingdom from 1971 to early 1974 has, for instance, risen in spite of a price rise of over 50 per cent. The other EEC countries, like the United States, are only marginal tea consumers. The West Asian and North African countries are well able to pay sharply higher prices for tea after the 1973 oil price increases. Japan is gradually cutting back tea production and consumers are switching from traditional green to black teas, opening a new export market — though the coffee producers have already achieved significant penetration of this market through discount pricing and promotion.

The more general point is that producers of primary products can achieve significant gains by marginally reducing supplies to world markets. Tea, in fact, is an ideal product for a producers' agreement; but an agreement should be comprehensive and should safeguard the interests also of the African producers whose rapid expansion has undermined prices since 1960. It is also important that India and Sri Lanka should spend large sums in key consuming markets to reverse the falling volumes of tea imports. No agreement to increase total earnings from tea exports can succeed unless adequate attention is paid to the details — such as to the smaller producing countries, the need to expand consumption, and the need to ensure an alternative market for the supplies withdrawn from auctions at Colombo, Calcutta, or London.

Centre-State Relations

Another Major Shadow

A Correspondent writes :

THE Chief Minister of Assam has demanded doubling of the royalty on crude supplied by the state, from Rs 15 as at present to Rs 30 per tonne. Only last year, the Prime Minister had given an award fixing the royalty payable to the governments of Assam and Gujarat for the crude raised in these two states. But last year was last year: the Assam Chief Minister was polite but he firmly stated that he is asking for additional royalty "in view of the special situation created by the crude price going up all over the world" in recent months. In other words, if Saudi Arabia and Kuwait and Iraq and Iran and Venezuela and Indonesia could raise their crude prices and get away with it, why not the government of Assam?

Even a few months ago, the stance adopted by the Assam Chief Minister would have been considered outrageous; he would have been rapped on the knuckles for voicing such treasonous thoughts; he might not even have been able to gather the courage to make the request. Times have changed, however. Irrespective of the outcome of the mini-elections last month, there are other pointers that the Prime Minister's spell of untramelled authority is coming to an end. The Assam Chief Minister has, of course, prefaced his demand for a higher price for crude by inviting attention to the special problems besetting his state. Assam is a permanent victim of the scourge of floods; the Brahmaputra keeps changing its course, which sets at disarray all well-laid plans for a scientific cropping pattern in agriculture. For achieving an economic

The Tamil Nadu Agro Industries Corporation Limited

"Agro House", Industrial Estate, Guindy, Madras-600032.

DISCS FOR SALE

Sealed tenders for the purchase of imported "Horseman" brand Agricultural Discs of 24" diameter (with square centre hole) of good quality, available with this Corporation, are invited from Agricultural Implement Manufacturers, with quantity required, and the maximum rate offered, so as to reach this Corporation on or before 3 P.M. on 11-3-'74. The rate quoted should be for purchase ex. our Stores at Guindy, Madras (excluding taxes applicable). Offers should be accompanied by original invoices (of recent origin) for the purchase of an equal number of approved makes of indigenous discs of similar size. The details of implements manufactured by the tenderer from 1970 may be given. Offers should be accompanied by a Demand Draft for Rs. 25,000/- drawn in favour of "The Tamil Nadu Agro Industries Corporation Limited, Madras", payable at any bank in Madras, towards Earnest Money Deposit. Offers received without E.M.D. will be rejected. Full payment should be made before taking delivery. Concessional sales tax is applicable against production of C Form. The undersigned reserves the right to accept or reject any or all offers without assigning any reason therefor at any stage.

MANAGING DIRECTOR

breakthrough, the state must exploit to the full its power potential and must establish an extensive irrigation network. To bring all this about, it needs additional funds. Where can Assam obtain such funds unless it could get, by way of royalty on its crude, substantially more than the present pittance of Rs 6 crores per annum? It is, however, the hint of the further message implicit in the Chief Minister's statement which cries out for attention.

When one thinks about it, Assam's Chief Minister has proceeded strictly on the basis of precedents. In 1966, during the acutest phase of the drought, the chief minister of one of the states with a surplus supply of rice had gone on record as saying that his state should be paid the same price for the grain as prevailed in the world market, which was then roughly double the domestic price. He even demanded that this payment be made entirely in foreign exchange. That particular chief minister was not penalised; he is now a member of the Union Cabinet. What is more, since currently the price of wheat in the world market exceeds Rs 100 per quintal, sturdy lobbyists from Punjab and Haryana are demanding as much for their grain. The argument, of course, is never reversible. For example, till August 1972, the landed cost of imported wheat at Bombay was only Rs 42 per quintal: no chief minister from any north-western state ever addressed a press conference demanding that the procurement price of the grain must not be allowed to rise above the level of the international price.

A certain wobbliness always prevailed in the system, which encouraged the state chief ministers to explore from time to time the limits of their suzerainty. For a while, in the middle 1960s, the status of the government in New Delhi was nearly reduced to that of a delegatory authority and the chief ministers — at least several of them — did come to occupy the centre of the stage. All that changed as Indira Gandhi gradually gained confidence and increasingly began to assert herself. Following the nationalisation of the 14 major commercial banks, a much more dramatic shift occurred in towards the Centre. The phase of the Prime Minister's overwhelming supremacy continued, and reached its climacteric with the triumphant *denouement* of the Bangladesh war.

But New Delhi's insensitivity to the growing hardships of the people as a consequence of the sharp price increases during the past two years has once more eroded the moral authority of the Prime Minister, and therefore of the Centre. The by-election reverses of the ruling party in a number of states and the almsot total breakdown of the administration in Gujarat have underlined the extent of erosion of the Centre's influence and authority. The situation is thus ripe for a revival of the doctrine of states' rights. The Assam Chief Minister is thus merely probing the field. The Congress party itself is a loose federation of regional interest groups; it is the shared arrangement of spoils which binds its groups together. Every now and then, they come to offer obeisance to a Central leader, but that they do so on the basis of a hard cost-benefit analysis: the material gains accruing to them on account of the charisma of the leader far outweigh their losses, following the limitation of their suzerainty. Once the charisma of the Prime Minister is gone, the clamour for the decentralisation of powers is likely to spread even within the party. After a period of quiescence, the DMK has resumed its strident demand for increased state autonomy: the minister for industries in Tamil Nadu has reasserted the right of the state to issue industrial licences on its own. But the tendency to cock a snook at the Centre will now widen, and will cut across party lines.

Assam's demand for higher royalty, however, can be paid only by increasing the load on the other parts of the country: the plea of the Chief Minister is in a sense a plea for a re-distribution of incomes. In essence, it is no different from the plea mounted by the chief ministers of Punjab and Haryana for higher and higher procurement prices for their grains, since that too implies a demand for redistribution of incomes among states. It is a circuitous process of bargaining and counter-bargaining, each state trying to squeeze as much as it can out of the Centre and the other states. With Assam kicking off with a demand for higher royalty for its crude, it is conceivable that Bihar and West Bengal would soon ask a higher price for their coal and iron or jute, Punjab and Haryana would demand even more fantastic prices for their wheat, Gujarat and Maharashtra would refuse to part with their cotton unless they are offered a higher share of the booty from textile exports, and so on down the line.

If few worry over the overall national interests, it is for the simple reason that few are convinced that the Centre itself, going by past evidence, has ever at all worried over them.

THE FOURTH ESTATE

Taken for a Ride

Nireekshak

SOMEONE is taking the working journalist for a ride over the third wage board. Until 1972, there was just one national federation of working journalists. It had always been led by an elite that had often felt a little leftist and left out. When a Left Establishment emerged, the elite became a part of it. Ironically, the cold war had ended and the *detente* was beginning when the Indian Federation of Working Journallsts split and the National Union of Journalists (India) came into being. The polarisation, broadly, was parallel to the polarisation of journalists between the cold war lobbies, leaving out a large number.

The demand for the third wage board was articulated by the NUJ late in 1972, much to the discomfiture of the IFWJ, which, claiming to represent the committed lot had taken upon itself the task of securing the diffusion of ownership of newspapers and delinking it from big business. The IFWJ enjoyed official recognition and patronage and could not countenance being outsmarted by the break-away body. So it called a one-day token strike to press the demand for a new wage board. With a Labour Minister committed to new wave journalism, the IFWJ's one-up-manship was certain to pay off. The promise of a wage board was sought and secured even before a formal decision was taken by the Union Cabinet. The non-journalist newspaper employees who had their first wage board (non-statutory) with the second wage board (statutory) for the journalists, saw little purpose in a new wage board for them and opted for a bilateral settlement. The IFWJ was all set to take its place in the third wage board and began preparing its case for interim relief. Assured and

reassured by the Labour Minister, it was certain that the NUJ would be kept out of the board to be constituted.

The formal decision took sometime coming. But the new Information and Broadcasting Minister, Inder Gujral, did not talk much of diffusion or delinking and the idea of a third wage board did not seem to enthuse him much. Yet the apostle of committed journalism, who holds independent charge of a ministry which had been headed by the Prime Minister for a long time, is a great friend of the IFWJ which is committed to helping the country's peaceful transition to socialism *via* the state of national democracy.

Nevertheless, the delay in the constitution of the wage board seems to have caused the IFWJ a great deal of embarrassment. It sent a high-powered deputation to Gujral on January 21 to demand early steps on diffusion and delinking the ownership of newspapers and news agencies and the constitution of the third wage board. Gujral told the deputation that the government was still considering the question of delinking the newspapers which were controlled by industrial houses — which means the "diffusion" plan has gone overboard. As for the third wage board, the Union Cabinet had approved its appointment in principle but he could not say when it would be appointed.

It certainly would not add to the joy of the IFWJ leadership to tell itself that Gujral is not sufficiently committed, and that unlike the Labour Minister, K V Raghunatha Reddy, he is backtracking on vital issues. The body of newspaper proprietors, the Indian and Eastern Newspaper Society has opposed the third wage board now on the plea that the newsprint crisis has imposed a severe strain on the industry. No doubt, the economics of the newspaper industry are distorted at the moment as a result of the difficult newsprint situation. The government, however, seems to be using the newsprint crisis as an alibi for not constituting the third wage board immediately, though the scales of pay and rates of dearness allowance recommended by the 1967 wage board had no relation to the paying capacity of the industry and the price level in 1966-67. Newspaper revenues have boomed since 1967 because the advertisement rates have been hiked on four occasions since — the increase being roughly 33 to 125 per cent. The advertisement revenue of ABC members through accredited agencies went up from Rs 13 crores in 1966 to Rs 30 crores in 1972. In 1971-72, newspapers received from the private and public sector (including state and Central governments) Rs 45 crores by way of advertisement revenue. During the last seven years, the proportion of space taken by advertisements has risen. So much so, advertisement revenue has recorded an increase of 245 per cent according to one estimate. The circulation revenue has also gone up during the last seven years, while the wage structure has remained unchanged.

The government has cold-shouldered the IFWJ and the NUJ has reason to chuckle over this in delight even as the proprietors say self-righteously 'We told you so'. Clearly, the IFWJ did not bargain for this — and from Gujral, recognised by the more committed journalists as their patron saint!

By all accounts the plan for diffusion of newspaper ownership is dead as a dodo because the big newspapers have by and large been brought round. The 'delinking' threat is a newspaper tiger. Over a year ago, the *Indian Express* group had thought of its eighth edition from Cochin and possibly its ninth from Jaipur and the Delhi edition of the *Financial Express* too. The Monopolies and Restrictive Trade Practices Act inhibited it from going ahead. There were subtle hints that while nothing would be done to prevent the expansion, the whole issue might be referred to the MRTP body at some stage. But a year later, the MRTP Act had lost its terrors for the *Indian Express* management which in the meantime managed to send the then editor who was a source of embarrassment into voluntary exile and replace him with a homing expatriate. The Cochin edition of the *Indian Express* was launched without fuss and it was described as the establishment of printing facility, obviously to relieve the pressure on the overworked plant at Madurai which had taken care of Kerala circulation in the past. The Bombay-based *Financial Express* now has a Delhi edition. The newsprint shortage makes little difference to the expansion plans of the big chain newspapers if they have bought their peace with the powers that be.

Tamil Nadu Electricity Board

Global Tender Notice No. IDA/T.N.E.B./4.

The Tamil Nadu Electricity Board invites SEALED BIDS from Manufacturers/suppliers located in member countries of the World Bank and Switzerland for the supply of:-

Details	Tower Requirements (Tentative)
Transmission line Towers and accessories for (i) 230 KV transmission lines. and (ii) 110 KV transmission lines.	430 Nos. 300 Nos.

for the Tamil Nadu Electricity Board Power transmission and distribution project which is being financed by the International Development Association. Manufacturers/Suppliers interested in furnishing the above items may obtain Bidding Documents on payment of Rs. 75/- per set (equivalent to Indian Currency) from

The Superintending Engineer,
Technical/Electrical,
Tamil Nadu Electricity Board,
157, Anna Salai,
Madras-600 002.
Tamil Nadu (India).

The cost of Bidding Document (Rs. 75/-) may be remitted either by cash or by Money Order to the Deputy Financial Controller, Madras Electricity System (Distribution), 1/155, Anna Salai, Madras-600 002 (India) noting the specification No. and sending the cash receipt or Money Order receipt as the case may be to the undersigned with a requisition furnishing the complete postal address.

Bids shall be received at the above address till 12 Noon Indian Standard Time on 31st May, 1974 and shall be opened in Public on the same day at 3.30 P.M. Indian Standard Time.

157, Anna Salai,
Madras-600 002,
INDIA.

Superintending Engineer,
Technical (Electrical)

Good Results despite Poor Labour Relations

Hansavivek

VOLTAS, after last year's setback caused by a prolonged labour agitation that culminated in suspension of manufacturing operations for nearly three months, is looking ahead to a fair growth in production, sales and earnings this year. During 1972-73, the value of the works' output dropped from Rs 11.74 crores to Rs 6.66 crores. In the first five months of the current year, the output has gone up by 100 per cent over the same period last year, according to the Executive Chairman, M R Bhide. This trend holds out prospects of an encouraging performance, but the company may have to contend with a number of constraints, such as shortages and rising prices of raw materials, restricted power supply and the credit squeeze. Meanwhile, where licensed capacities have already been enhanced, necessary extensions in the existing production facilities are being made. A bigger model of refrigerator and a wider range of mining equipment are to be introduced during this year. Transport refrigeration and plate freezers for marine products are at an advanced project stage. The long-term outlook has been further brightened by the growing activities of the research and development division which continues to develop new products and improve the existing ones. Of the 45 main development projects handled by this division, 26 were in respect of new products, 9 for improvement of the existing items and 10 for new technology, material substitution, etc. The company has budgeted for an expenditure of Rs 104 lakhs for the current year on research and development, as against Rs 25 lakhs spent last year. The marketing base is also being widened by acquiring new product-lines and entering into new fields of business. A number of proposals in respect of machine-tools, textile machinery, chemicals and consumer products are being considered. When implemented, they should add substantially to the company's turnover.

Considering the industrial relations of last year, the company's working results can be regarded as satisfactory. Dividend has been maintained at 17 per cent, though at the cost of the earnings-cover. Borrowings were brought down significantly and the ratio of inventories/sales declined over the year.

INDIAN OXYGEN, which had applied for several industrial licences, is still awaiting government decisions in respect of some of these applications. At the same time, an intensive exercise is under way for development and diversification of the company's activities. Certain projects have been iden-

tified which, it is claimed, satisfy all the major requirements of government policy; the company intends to submit shortly applications for industrial licences and other related clearances. According to A K Sen, chairman, the company is likely to derive 'substantial benefits' in the foreseeable future if these projects are approved by government. Meanwhile, the company continues to expand activities in existing lines. Last year it manufactured and supplied to customers three oxygen plants. It was thus the first to make such plants in India and has good orders on hand. A collaboration agreement has been finalised with Cryoplants of London for acquiring technical knowhow for enlarging the scope of this activity to include manufacture of low-pressure tonnage air separation plant and nitrogen generators. During 1972-73, IOL's sales were higher than in the previous year, owing mainly to the contribution from the new plant-manufacturing activity — notwithstanding the constraints on production due to shortages of calcium carbide, electrode quality wire rods and power-cuts. Profits were also higher and dividend was reduced by a point to 14 per cent on the capital as enlarged by the issue of bonus shares on a one-for-three basis.

TRIBENI TISSUES has received a revised 'letter of intent' for its expansion project, according to which the first phase will be carried out at Tribeni with an estimated outlay of Rs 900 lakhs. Depending on the product-mix, the new machine will have a capacity of 5,000 tonnes and will enable manufacture of a wide range of speciality and industrial papers. A foreign exchange loan of Rs 60 lakhs, required to finance the project, is expected from ICICI. On account of a four-week strike, TT's production in the year ended September last was lower — with pulp declining from 6,064 tonnes to 5,841 tonnes, paper from 7,682 tonnes to 7,189 tonnes and chalk from 2,449 tonnes to 2,232 tonnes. The installed capacities were unchanged at 7,500 tonnes, 8,500 tonnes and 3,000 tonnes, respectively. Net sales were a little higher and gross profit would have been almost at par with the previous year's but for Rs 11 lakhs set aside for retirement gratuity. Dividend is maintained at 15 per cent, part of which is expected to be exempt from tax, and is just covered by earnings. The company has been operating entirely with its own funds and has no borrowings so far. The ratio of inventories/sales has been brought down over the year. Total remuneration of the managing director and directors (including the estimated value of benefits in kind but excluding sitting fees) increased from Rs 5,45,115 to Rs 6,91,412. The auditors were paid Rs 1,291 by way of reimbursement of expenses and Rs 275 and Rs 9,800 for taxation and other services, respectively, apart from their usual fees of Rs 20,000.

The company's research and development unit, established in September 1971, has been recognised by government and is thus entitled to various fiscal concessions. The company has been able to develop sophisticated electrical insulating papers, hitherto entirely imported. What is more significant is that TT has substituted indigenously available hemp and jute for manila-fibre, not grown in India, on which such papers are traditionally based. The company has so far made and supplied wire-winding, telecom, and a few other varieties of insulating papers. A quality tracing base paper has been recently introduced as a substitute for the imported base paper. Another speciality paper developed by the company is 'twist wrap' that finds uses in wrapping sweets, toffees, pharmaceutical strip-packs, etc. Till recently, better qualities of this paper had to be imported. A suitable base paper has also been developed for cigarette filters. There are numerous other grades which are in different stages of development. The company has been actively engaged in development of sann hemp cultivation in co-operation with UP's department of agriculture. It has been demonstrated that with improved variety of seeds, fertilisers, insecticides, and the line method of sowing, fibre yield can be increased from an average of 200 kg to 450 kg per acre.

GAMMON INDIA has returned to the dividend list with a 5 per cent distribution for the 16 months ended July 1973, following improved results. The accumulated deficit of Rs 105 lakhs has been wiped off by transferring Rs 16 lakhs from the development rebate reserve and Rs 19 lakhs from the general reserve. The dividend is also being paid out of the latter reserve. Employees' bonus has not been provided for, as the company contends that the Payment of Bonus Act does not apply to it. The acturial liability for retiring gratuities, amounting to about Rs 21 lakhs, has also not been provided for in the accounts. Moreover, no provision has been made in respect of the company's share of Gammon-Shah partnership's tax liability, which is disputed. At the close of the accounting year, the balance work in progress amounted to Rs 39.45 crores, including the contract for the construction of the world's longest river bridge over the Ganga at Patna, valued at Rs 21 crores, and the contract for the foundation of the second Hooghly crossing project at Calcutta, valued at Rs 6.09 crores. Additional contracts worth Rs 3.40 crores have been secured in the current year. Capital expenditure on plant and equipment was Rs 71 lakhs last year. The company intends to set up a manufacturing unit for large-diameter impellers for cooling towers. The subsidiary, Freyssinet Prestressed Concrete, suffered a setback last year. The other subsidiary, Gilcon Project Services, was incorporated in May last. It renders consultancy services in all types of civil engineering to firms in India and abroad.

PROTEIN PRODUCTS OF INDIA is experiencing acute shortage of bones, the prime raw material for its products. This situation has been brought about by an 'unprecedented' demand from overseas on account of a world-wide shortage of proteins. Bone prices have more than doubled during the past few months. A D Mango, chairman, has urged government to evolve a formula for suppliers and users, so that bone exports are not made at the cost of the indigenous industry. He warns that this situation, if not rectified urgently, might impose a severe restraint on the industry's capacity to meet the internal demand and export ossein, the intermediary product. During the year to September 1973, PPI's factory remained virtually at a standstill for five months on account of a 75 per cent power-cut in Tamil Nadu, and exports of ossein dropped to 386 tonnes from 833 tonnes in the previous year. Total sales were up from Rs 64 lakhs to Rs 90 lakhs, but the outcome was a bigger net loss of Rs 46 lakhs compared to Rs 39 lakhs. The accumulated loss mounted up to Rs 133 lakhs to stand against the share capital of Rs 120 lakhs. In spite of restricted production, the company was able to meet the demand for high grade gelatine from the pharmaceutical industry. An initial order for a small quantity of photographic gelatine has been secured from Hindustan Photofilms, and further orders are expected this year.

Calcutta Diary

A M

TRUE, there is nothing explicitly mentioned in the Constitution, nor in the statutes in force in the country. But a parliamentary system sustains itself largely by a set of conventions. When these are flouted, something dies. It is the death of the system's moral code. Once this code is dead, there is little left to hold on to.

Put your hand to your heart, and ask yourself. Let the Prime Minister and her Cabinet colleagues — if any of them still matter — ask themselves. It has been the convention since Independence — forget the fact that it was so even before Independence — that the Railway budget is presented to Parliament around February 20, roughly a week ahead of the General Budget. In the past several years, the *Economic Survey* has come in between. All that was changed this year. The people of Uttar Pradesh, Orissa, and elsewhere were voting on February 22, 24 and 26. The Railway budget could not but add to the burden of the electorate; the *Economic Survey* could not help being a purveyor of gloom whatever gloss you might try to add at the margin. The presentation of either on their due dates would have added to the difficulties of the Indian National Congress. Therefore, scuttle the convention: what can harm the ruling party must be taken to be equally harmful to the nation. The date of the Railway budget was pushed back; the presentation of the *Survey* was delayed till after the polls.

Be indulgent, it could be said; these were minor artifices, and they had only an insignificant impact on the results of the elections. Nevertheless, in the deed, something precious was destroyed. The decisions to postpone the Railway budget and the presentation of the *Economic Survey* were decisions which fell short of integrity. Neither the Indian Penal Code nor the Representation of the People Act could perhaps be stretched to consider what was done a culpable offence. All the same, they were acts of corruption. They strengthened the suspicion that this government cheats. Men by and large are not particularly interested in differentiating the subtle nuances of cheatings of different categories; they do not have the capability for it either. It is the generic nature of the act which goes home to them. They know now that the government's hands are not clean. From this, it is but one step forward for them to conclude that those in authority have forfeited the moral right to preach to others. Even were the Indian National Congress not in the habit of receiving on the sly victuals from profiteers and black-marketeers, it would still stand sentenced, given the fact that it cheated on the dates of the Railway budget and the *Economic Survey*. It would raise a horse-laugh if the party were now to warn assorted ragamuffins to behave, or else. Since the ruling party itself does not behave, it is sheer cheek on its part to ask others to do so.

One must not set impossible standards. Politics is a mug's game. Given the disparate nature of Indian society, its caste and class divisions, its linguistic fissures, its vast stretches of illiteracy, and the proliferation within its fold of pressure groups who will not cavil at making the most unscrupulous use of the people's economic difficulties, it can be quite a strain to maintain the immaculateness of democratic principles. Since blackguards abound, scheming and conspiring all the while to do in your system and institutions, you have to pay them back occasionally in their own coin: so could run the argument. But is not the logic reversible?

There is seemingly a general consensus that the country is going down because corrupt elements have come to control its processes: resources crucial for growth are being frittered away on non-basic uses; the politicians having been played into a corner by the crooked ones, and other socio-economic goals such as reducing the gap between the rich and the poor are being jettisoned too. Does not the solution lie, however, in the politicians extricating themselves from the position where they are liable to be blackmailed? The ministers pontificate to others. The pontifications serve no purpose since their own hands are not clean. There is a dividing line between minor acts of opportunism practised in the election season and the grosser ones which offend morality. Politicians, more than anybody else, should know where this line is.

It is this apparent abdication of sensitivity which causes the greatest concern. 'Maruti' is an embarrassing subject, embarrassing as much to the Prime Minister as to others. Objective considerations tend to get mixed up with subjective ones in any airing of the issue. Still, as the electoral fever subsides, certain things can perhaps be discussed in the open. In the matter of Maruti, the Prime Minister has asserted, no favours have been shown and no rules have been broken. She has not quite stopped there: she wished,

she has added, there were other young men who could emulate the example set by her son and do as well. Can the Prime Minister put her hand to her heart and yet stand by her statement? Suppose, for example, another young man with the same breadth of imagination, the same capability, the same inventiveness, but belonging to the anonymity of an even middle-class home, had come forward; is she sure that he would have been extended the same facilities as have been extended to Maruti? Again, there is no need to indulge in hyperbole. We are living in a milieu marked by inequalities. In this milieu, the dispensation of favours, including favours from public institutions, cannot but be skewed. When somebody is the Prime Minister's son, certain special advantages are bound to flow toward his direction. But is one sure that Maruti is just an ordinary case of discriminatory treatment? Is one sure that nothing more is involved — that there has been no arm-twisting, no overt or surreptitious by-passing of established procedures? Is one sure that the official pay-offs to the Raunaq Singhs and the M A Chidambarans for services rendered to Maruti have not exceeded the built-in norms of inequity? Or that the extra solicitation shown by the government of Haryana to arrange for Maruti's factory site has had no extraordinary element in it? Or that the supply of materials for setting up the plant, including such scarce items as steel, has not been smoother and speedier than would have been possible if it happened to be just any other young man? Finally, is one at all sure that any other young man would have ever succeeded in extracting nearly two crores of rupees worth of advance dealership fees?

Let the point be repeated, the astonishing part of the story is not so much the shower of special dispensations upon Maruti, but the brazenness accompanying it. It is when the Prime Minister goes to the extent of suggesting that what has been done for her son would also have been done for any other individual in society if only the latter had shown the same initiative and cleverness, that one can identify a more fundamental dishonesty. Favouritism can be put up with; the pose of nonchalance struck about such favouritism is a hundredfold more exasperating. Nothing is wrong in the postponement of the Railway budget, nothing is wrong with Maruti — these are expressions encapsulating the malaise that has overtaken the polity. At one end, there is continuous churning of populist jargon and hortatory declamation of faith in a dubious, nebulous socialism; at the other end, there is this inability to even recognise that inequities in the distribution of opportunities as much as of assets and incomes have, if anything, intensified during the last few years, and under official auspices. Insensitivity of a particularly deadening kind has entered the soul.

This is a dangerous situation. The rulers have arrived at a stage where they are unable to see the difference between right and wrong, the correct and the loathsome, the genuine and the sham; big indiscretions and little indiscretions have come to co-exist snugly. One is taken aback by the wholesale exhibition of opportunism at all levels of public life. One prays for a re-ordering of manners. There may indeed be room for feeling sorry for the Prime Minister. As long as the moral and the immoral appear as one, the corrupt elements will contrive to be in the fore, and demand and be paid handsome ransom. Such being the case, the Prime Minister will remain awkwardly vulnerable, and will be incapable of enforcing any discipline on others, including on groups and classes. There could be no greater pity, because one sees in the short run hardly an alternative to the kind of political arrangement she had succeeded in putting together, and yet this political arrangement, based as it is on graft and an absolute unwillingness for self-abnegation, can only spell wholesale economic stagnancy and increasing divisiveness in national life.

TENDER NOTICE

Government of Tamil Nadu State

Agriculture Department

Chepauk, Madras 600 005

The Director of Agriculture, Agriculture Department, Government of Tamil Nadu State, invites tenders, for and on behalf of the Governor of Tamil Nadu State, from manufacturers and suppliers in the member countries of the World Bank and Switzerland, for supply of the following items of Well Drilling Equipment.

Sl. No.	Name of the Equipment	No. Required
	(a) *Well Drilling Equipment*	
1.	Hammer drill 200 psi	4
2.	Percussion drill	6
3.	Air Compressor 200 psi	10
4.	Hammer 200 psi	10
5.	Mud pump	10
6.	Hammer 100 psi	20
	(b) *Spares*	
7.	Drilling bit	100
8.	Drilling Jar	50
9.	Hammer bit (100 psi)	50

2. Indian manufacturers of the above mentioned equipment are also eligible to bid and will be given a price preference of 15 per cent, in the comparison of bits *vis-a-vis* the foreign bidders.

3. The Government of India have received a credit from the International Development Association in various Currencies equivalent to US Dollars, 35.00 million towards the cost of the Tamil Nadu Agricultural Credit Project and it is intended that portions of proceeds of this credit will be available for payments under the contract(s) for which this invitation to bid is issued. Payments by the IDA will be made only on approval by the IDA of an application presented by the Government of India in accordance with the terms and conditions of the Credit Agreement and will be subject in all respects to the terms and conditions of the Agreement.

4. The import licence will be obtained by the Director of Agriculture and payment of foreign currency cost and rupee cost will be arranged to be made by the Director of Agriculture as per procedure stated in the tender papers.

5. Those who are interested are requested to obtain copies of the tender papers from the Office of the Director of Agriculture on payment of non-refundable fee of Rs. 100/- per set.

6. The last date of receipt of tenders is 1.00 PM on 17-6-1974 in the Office of the Director of Agriculture and the tenders shall be opened at 3 P.M. on the same day. If 17-6-74 is declared a holiday, then the tenders shall be received upto 1 P.M. on the next working day and opened at 3 P.M. on that date.

7. Tenders will be opened in public, read aloud and recorded in the Office of the Director of Agriculture.

Director of Agriculture,
Chepauk, Madras 600 005.

Dated 25-2-74

Political Dimensions of the Crisis

Romesh Thapar

EVERY year, the last week of February has its normal quota of budgetary excitements and flurries. This time, the titillation is qualitatively different. The elections being held in various parts, including Uttar Pradesh, have brought into play a thoroughly dishonest democratic style which is directly starting a disruption of the economy and the political system itself. Seldom have I heard such widespread abuse of politicians and their ways in circles closely associated with government.

Obviously the month of March is going to be full of developments. Whatever the Budget offers and whichever way the people vote, Indira Gandhi will be compelled to take stock of the political and economic challenges which have crystallised and placed a question-mark on the credibility of her government. This matter of credibility is important; for, without it there can be no national discipline or motivation. It is inseparable from leadership at any level.

Loss of Principle

The erosion of credibility, which has been rather rapid in recent months, is a major handicap to any political or economic correction. Chaotic strikes, demonstrations, stirs, and incipient revolts against authority are pointers to the widespread conviction that the present leadership is corrupt, cynical, and lacking commitments. Equally strong is the feeling that in the pursuit of its narrow, selfish ends, this leadership has lost its principled positions on national questions and can easily be pressurised. One mood feeds on the other, and creates the free-for-all which characterises the situation today.

If there is anything on which everyone is agreed these days, it is that the return to a broad collective striving for certain nationally accepted goals cannot even begin unless there is a solid purge of the notoriously corrupt and patently inefficient among the politicians, the managers, and the bureaucrats. It has to be a wide-ranging purge, unmindful of friends and admirers, ruthlessly impartial, motivated solely by national interest. The plea sounds unreal but then the situation too has deteriorated to an extraordinary extent. There is, of course, still a certain confidence in the capacity of the Prime Minister to turn hatchet-woman.

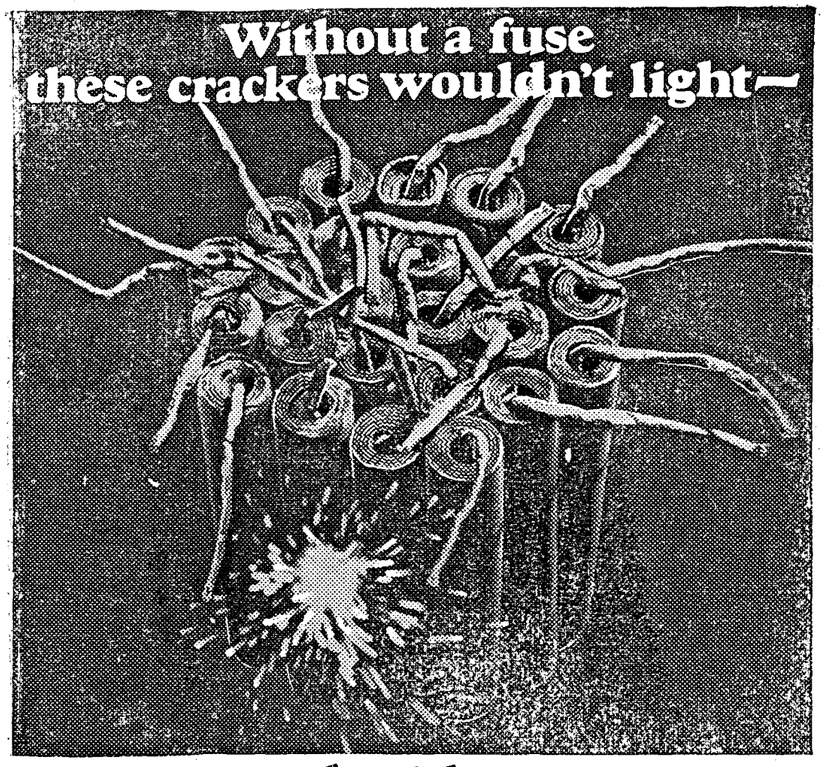
This is not to suggest that observers rule out the drift to perdition. We are quite capable of imagining that the fortuitous discovery of fairly sizeable oil reserves in the Bombay High area, and the very satisfactory nature of the Indo-Iranian economic collaboration now planned, are ample guarantees that the future will be looked after. The tendency to live on prospects is strong in a lazy, incoherent, and corrupted elite. But the mood of the people might still save us from this self-destructive posture.

Steady Reminders

The thesis that Indira Gandhi and the ruling Congress Party is insensitive to the rising anger of the people is far from the truth. What is said at public meetings cannot ever capture the real anxieties expressed in private. The strike wave, the failure to make essential foods available, the Gujarat revolt, the explosions in the tense Maharashtra, and the possibility of disturbances in Uttar Pradesh irrespective of election results, are a steady reminder of what is in store for a leadership which attempts to live by the *status quo*.

The people are not demanding much. Clean, honest government has come to mean a great deal, and this is significantly the rallying slogan. In our conditions, it willy nilly comes to mean an assured supply of necessities — particularly, the products of a carefully coordinated and supported agriculture —, a steady growth of modernising industry in a balanced manner over the subcontinent with capacity utilisation at well over a hundred per cent, and sufficient military muscle to safeguard the dignity of the nation. A simple programme of grassroots consolidation and growth, and very unlike the big-talk-little-action programmes of today.

In other words, simple as the slogans of correction are, the still dominant Congress Party has to gear itself for important structural changes. Purges are certainly required to get rid of those who cannot focus on these perspectives, whether they be of Right or Left. But it is doubtful whether the moves for re-consolidating with certain elements of the old Congress will yield the kind of thrust that is now needed. Indira Gandhi has to find her strength in the new cadres being thrown up in the struggles of the people — young men and women who might transform the content of politics — rather than in endless manipulation between the discredited. This is crucial to the viability of the present political system.



Failure to act will naturally shift the focus of the national debate to whether we can tolerate repeated elections in the states fed by massive doses of black money. Already, there is speculation over whether amendments can be carried to fix elections every four years and to introduce presidential rule wherever a breakdown of the political process occurs. Some talk of the need to move consciously to the presidential system. Others speak of modified schemes of proportional representation. A few even suggest greater powers for the Centre. All this is indicative of deep dissatisfaction, and the desire to cut through the confusions of the present.

To survive, Indira Gandhi will have to provide some of the answers. Upon them will depend the motivation of the work force and the performance of the economy. In other words, in the midst of economic alarums let us keep the political dimensions of the crisis firmly in focus.

February 25

Haryana Coated Papers

HARYANA COATED PAPERS, engaged in establishing a project at Faridabad for the annual manufacture of 1.800 tonnes of art and chromo paper, expects to commence initial production in April or May next. A little delay in completion of the project has occurred owing to delay in the manufacture of one of the machines in the UK on account of a strike in the supplier's factory. Meanwhile, the estimated cost of the project has gone up by Rs 10 lakhs due to increases in the parity rate of French franc, the customs duty on imported machinery, and the cost of land and construction. The overrun in cost is intended to be met by additional financial assistance from bankers and financial institutions.

and without
Tribeni Tissues there'd be
no fuse to light them!

But that's just looking at the lighter side! Tribeni, in fact, is the pioneer in the manufacture of speciality papers in India.

From speciality grades of papers for carbonising, laminating, cigarette manufacturing, printing overseas editions of newspapers, wax matches to even fireworks fuses...Tribeni's list of 'firsts' continues to grow. It's now also geared to meet India's emerging needs with the latest know-how, research and development and quality control.

Today, Tribeni is exporting its products to over 14 foreign markets and earning valuable foreign exchange.

Tribeni
Tissues Limited
—fine papers that matter.

TTC-10

BALANCE OF PAYMENTS

Coming Home to Roost

THE drawing of $ 74.4 million from the International Monetary Fund in the name of 'compensatory finance' is only the thin end of the wedge: India's external accounts are about to enter a period of acute turbulence. Recourse to this particular facility is by itself a matter of considerable significance. Compensatory financing was introduced in the Articles of Agreement of the Fund about a decade ago to offer supplementary accommodation to countries experiencing an unforeseen drop in their export earnings for reasons beyond their control. Going by official protestations, India's exports have risen by record proportions in the past two years. If, despite this, New Delhi has approached the Fund for drawal on Special Rights for compensatory financing, it can only mean one of two things: either that, after allowance is made for the depreciation of the rupee against the US dollar and other non-sterling currencies, the proclaimed buoyancy in exports is a sham; or that, at this stage, New Delhi is determined to prevent any nibbling of its regular credit tranches with the Fund which it hopes to make use of later in view of the impending storm. Compensatory financing, after all, is to be had at only half-a-per cent rate of interest.

Such realism is not a day too soon. The Planning Commission has gone into hibernation after completing its academic chore. Its nonchalance notwithstanding, the prospects for the country's balance of payments have worsened several-fold in recent weeks. A committee of the Commission is supposed to offer its judgment on how alternative sources of energy are to be deployed to ease the country's agonies following the steep rise in oil prices. But there is little evidence in official circles that any drastic re-ordering of energy priorities is being contemplated in the short run. The failure of rabi procurement has now been followed by an equally dismal performance in the procurement out of the kharif crop. While the procurement price of wheat is certainly going to be raised in the ensuing season, there is little assurance that the actual procurement of grain would be any better than last year's. Much noise has already been made about the shortage of fertilisers and the reported lack of winter rains — which very likely is the prologue to a substantial drop in wheat procurement, to as low as 3 million tonnes. Even if one were to do with inordinately low operational stocks, an import of as much as 4 to 5 million tonnes of foodgrains would, therefore, seem inevitable if public distribution is to be around 10 million tonnes during the year.

Including gold and SDRs, the the country's foreign exchange holdings are at the moment only about Rs 750 crores. In view of the larger import bill on account of oil and the need for imported foodgrains, the foreign exchange holdings could get nearly wiped out in the course of the next few months in the absence of additional accommodation from foreign sources. This could happen even if the IMF's various credit tranches are fully made use of. For, the bulge on the import bill would be anywhere in the range of Rs 1,000 to 1,500 crores, depending upon the source of import and the order of fluctuations in exchange rates. The country's export earnings, therefore, would have to go up by more than 50 per cent over the year, if this additional strain on the balance of payments is to be readily absorbed.

Beyond Nation's Capability

This is quite beyond the nation's capability. Since the domestic rate of inflation has now exceeded the rate in most of the countries to which our exports have increased in recent years, hopes of further sales of cotton textiles, jute goods, and engineering goods must be properly temperised. The unheaval in the petrochemicals industries around the world, in the wake of the energy crisis, cuts both ways: it could increase the export prospects for jute and cotton textiles, but it could also contribute to the current crisis of production in the country, and thus cut back on exports — especially as no alternative energy policy seems to be in the offing. Considering everything together, an addition of at most another couple of hundred crores of rupees to the country's export earnings during the next financial year could be looked forward to. This would meet only a fraction of the total requirements. At the other end, with the United States Congress turning down the World Bank's request for $ 1.5 billion for the replenishment of the IDA funds, the Bank's kitty too is going to dry up this year. If no other factor were to intervene, the availability of gross aid from the Aid India Consortium countries could even drop from $ 1.1 billion in 1973-74 to about half of that figure next year. In other words, whether or not India wishes to do so the target of zero net aid might yet be achieved in 1974-75. While the requirements of foreign exchange may conceivably jump by more than a thousand crores of rupees, the availability could decline by something like Rs 400 crores, making for an additional gap of close to Rs 1,500 crores or $ 2 billion during the year.

Which way will the Government turn in search of this extra foreign exchange? The Soviet Union has managed to establish a considerable toe-hold in the country: it will certainly not like to give up this advantage. Nonetheless, its ability to offer economic aid to India beyond what has already been put into the agreements signed last November is limited. The Soviet leaders have their commitments to their own citizenry, whose sights are now set on achieving a spectacular breakthrough in consumption standards. Moscow has, in addition, certain obligations to the Comecon countries, and also, to Cuba and sundry other nations in Asia and Africa whom it would not like to see fall in the fold of the Chinese. Thus, much as the Soviet leaders would like to continue obliging India, there are constraints standing in the way: a further sum of $ 2 billion in a single year in any case would not be considered as practical politics.

A return to the regime of PL 480 would perhaps have suited New Delhi best, and it would have been prepared to say good-bye to all its yesterdays to bring about such a *denouement*. But if the American Congress refuses to oblige, even that escape hatch would no longer be available to the pragmatists who currently preside over the nation's destiny. Whether they like it or not, self-reliance might, therefore, be yet forced upon them. But since this cannot take care of the internal maldistribution either of assets, or of incomes, or of commodities, the kind of self-reliance that is in the offing could be accompanied by economic anarchy as well as acute suffering for the majority.

Now there's a new giant with not just one lounge but two...

SIA 747B

You can see for yourself that our Raffles Lounge is a very special sort of place. And you'll find that our Silver Kris Lounge is very much in the same category. On SIA's new 747Bs there are two lounges instead of the usual one—the 'Raffles' and the 'Silver Kris'. Two extra galleys for smoother meal service. And eighteen hostesses and stewards to look after you (quite a few more than most other 747Bs). As well as standard features like movies and music. It's all part of our aim to maintain a standard of inflight service that's stood out in crowded skies for 27 years. The SIA 747B joined our all-Boeing fleet on October 1, serving UK, Europe, the Orient and Australia. The SIA 747B: a new giant that's more than just another jumbo.

A great way to fly

WEST BENGAL

An Opening to a Joint Front

IN terms of financial benefit, the recently withdrawn 33-day general strike of the West Bengal jute mill workers has been only moderately successful: It has secured an additional lump sum payment of only Rs 55 to each worker, and some other rather minor improvements on the agreement earlier signed by the INTUC leadership. But the significance of the strike for the state's politics is considerable.

First, it has demonstrated that the situation is quite ripe for stable co-operation between the CPI and the CPI(M). Except for a slightly discordant note struck in a press statement issued in the first week of the strike by Indrajit Gupta and Bhabani Roy Chowdhury, leaders of the CPI-led jute mill workers' federation, the entire course of the struggle was marked by full co-operation and mutual trust between the two parties.

Catalytic Agent

Secondly, the strike has demonstrated once again that, in this state, understanding between the CPI and the CPI(M) acts as a catalytic agent to bring about a wider popular front, stretching from the SUC and RSP at one end to large segments of Congress followers at the other. When such mobilisation takes place, the official leadership of the INTUC also loses its cohesion: Important elements in the INTUC leadership then seek to demarcate themselves from the more diehard elements — as witness the conduct of the state INTUC chief, Kali Mukherji, MP, and his closest followers, who maintained an equivocal position throughout the jute workers' struggle.

Thirdly, the jute workers' struggle has imparted the valuable lesson that, if such a wide front of resistance can be forged, it is still possible to withstand official repression and non-official strong-arm violence let loose by the Congress regime against popular struggles. It should be an eye-opener to those who while glibly talking of the semi-fascism of the political system neglect the serious task of building up an active and united front of resistance to the repression.

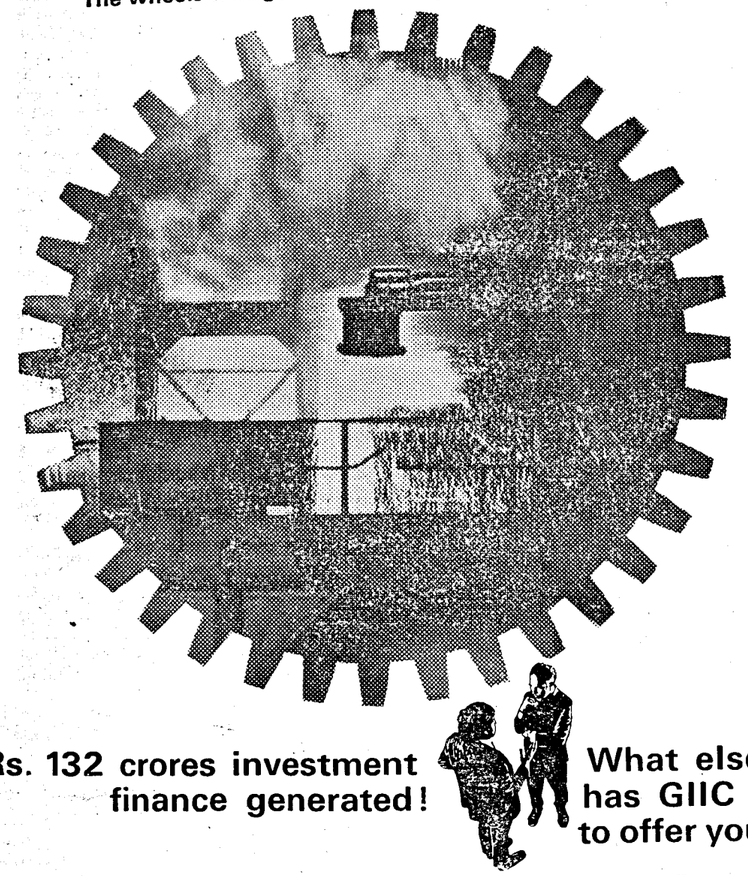
Lastly, and most importantly, the jute workers' strike has shown that popular struggles have their own, irresistible, logic. It was as a reaction to the Congress government's repressive measures against the jute workers' struggle that the CPI decided to withdraw its nominee, Biswanath Mukherji, from the post of deputy leader of the Progressive Democratic Alliance (PDA). It also announced that it would not campaign for the Congress candidates in the coming by-elections for the three Assembly seats. Mukherji and his followers in the state CPI leadership have long been pressing for the withdrawal from the alliance with the Congress; some months back the state council of the CPI adopted a compromise resolution empowering the state executive committee to withdraw Mukherji from the deputy leadership of the PDA if circumstances so demanded. The more militant wing of the CPI was able to bring about the implementation of this old resolution only in the circumstances of an open confrontation with the Congress regime during the jute workers' struggle.

Now, a situation very similiar to the jute mill strike has been developing in the engineering industry. Again, the Left-led trade unions, headed by CITU and AITUC, are ranged against a common front presented by the managements, the government, and the INTUC leadership. It remains to be seen if the pace set by the recent jute workers' strike is sustained and quickened in the struggle of the engineering workers. For, it would be wishful thinking to underestimate the inertia in both the CPI and the CPI(M).

Significant Step

The still powerful gravitational pull of the Congress on the CPI is evident in the fact that, while relinquishing the deputy leadership of the PDA, the CPI has not dissolved the partnership with the ruling party. Similarly, though it has refused to campaign for the Congress candidates in the three by-elections, it has refrained from directly opposing them. Nevertheless, the advance from an overall identification with the Congress and an absolute hostility towards the CPI(M) to functional co-operation with the CPI(M) and, even if somewhat inconsistent, opposition to the Congress, is a significant step in the path of development.

Compared to CPI's tactical resilience, CPI(M) presents a picture of near-immobility. Since its decision on the morrow of the 1972 election debacles to boycott the Assembly and the elections, the CPI(M) in West Bengal has remained in rather narrow, and mostly negative, confines. The party has done little to help the articulation of the mass discontent that has been associated with the deepening economic crisis. On the contrary, the dominant section of the top leadership of the state CPI(M) seems entangled in inner-party wrangling. They frown upon even timid questioning of the party's past and present postures by the rank and file. There have been instances of disciplinary measures and stern admonitions on rather dubious grounds against tested party workers, and many activists have been browbeaten into silence — and inactivity. Unless the CPI(M) leadership opts for a measure of introspection and re-orientates itself for the task of developing the new impulses in the politics of the state, the hopeful growth of new Left front cannot but be impeded.



*

Even allowing for the factional inspiration behind them, the outpourings of Priya Ranjan Das Munsi — MP and President of the All-India Youth Congress — to a recent gathering of students and youth in Calcutta stand out for their outspokenness. "I say without hesitation", said he, "that we made quite a few mistakes in the movement for socialism. There can be no socialism within the present system. We bluff the people when we say that socialism is coming."

This wing of the Congress is in fact closely co-operating with the CPI in some of the programmes of mass action. They took part in the agitation for the extension of statutory rationing to the South-western suburbs of Calcutta, which met with fierce police repression, including firings. Two persons were killed and many others injured. Yet, this wing of Congress youth withstood public pressures from the state Congress leadership seeking to dissuade them from joint action with the CPI.

So, the CPI can claim a measure of success for its policy of Left and democratic unity — ranging from CPI(M) to progressive Congressmen. However, what has been achieved, has been achieved as a result of the confrontation with the Congress establishment and through an opening on the Left towards the CPI(M).

The wheels that gear industrial growth in Gujarat-2

Rs. 132 crores investment finance generated!

What else has GIIC to offer you?

Fresh ideas for solving some tough investment problems. For example you want to start an industry in Gujarat. And you have made your own investment arrangements. But still a gap exists. Or you are sure of a project feasibility. But you would want to know the best financial arrangements without affecting the cash flow and capitalising all available financial accommodation.

That's where GIIC comes in. With some fresh ideas and priming finance put together with your particular problem in mind. By supplementing and complementing your financial arrangements. To see you through.

When you are talking investment needs, we'll be talking long term loans, Sales Tax scheme, subscription to equity and working capital assistance. Whatever the need—100% financial assistance to new entrepreneurs or financing a mini-steel plant. GIIC can help. GIIC is not only a catalyst. But an investment innovator too.

Let GIIC fill that inevitable gap in your investment plan.

KERALA

League in Turmoil

THE stresses and strains of 1973 ended in glory for Kerala when its youthful football team lifted the Santosh Trophy for the first time in its history by defeating Railways in a closely fought match. The day was memorable not for the magnificent victory alone, but also for the opportunity it gave people to watch free of cost the largest number of cars, including the latest model Impalas, ever seen in this part of the country, parked in the maidan outside the playground. The elite class of smugglers, black-marketeers, tax-evaders, corrupt bureaucrats and party bosses were there to demonstrate their wealth and prowess !

•

Meanwhile, the health of the United Front government is causing anxiety. Doctors have seen similar cases lingering indefinitely and at times collapsing unexpectedly. The latest bulletin is hopeful about the patient's recovery as his will to survive continues to be strong. The setback this time was due to the efforts of the Muslim League and the CPI to deflate the Youth Congress. The League has its own internal problems. To cover them up, it has to make common cause with some party — in this case, the CPI. The League has alleged that one of its workers was killed by the agents of a Congressman known as the Lord of Panur. The League has made the murder a major issue of law and order and even wants the Congress Home Minister to be stripped of his portfolio. Congress circles, on the other hand, allege that the League is in secret alliance with the CPI(M) to topple the Lord of Panur. The Congress was, however, asking for trouble when it encouraged a Muslim Leaguer, who had become a member of the Calicut Municipality and later the deputy mayor with the support of the CPI(M), to defect to the Congress group in the Calicut Municipality. That was enough for the League to break away from the alliance with the Congress in the Municipality.

At least one Muslim League minister in the UF cabinet has also come under attack. A public-spirited Muslim gentleman, evidently under inspiration from some unknown source, deposited Rs 500 with the Chief Secretary demanding an inquiry into certain allegations against Chakkeri Ahmedkutty, who succeeded Mohammed Koya as Education Minister. And the irrepressible M M Hassan, the President of the Kerala Students Union (Congress), demanded the removal of Ahmedkutty from the Education Ministry. Not to be left behind the Youth Congress, the CPI demonstrated in a well-organised and largely attended all-India show in Ernakulam that it was not without a following among youth and students. Apparently, this has irked the Youth Congress which does not wish to admit that it is not the sole representative of youth. But, without a proper ideology, Congress attempts to outbid the Communists are not going to take it too far. Having succeeded in making the Assembly take up the Kerala Agricultural Workers Bill, the Youth Congress is launching mass agitations for fixing a ceiling on urban property, for discontinuing overtime payments, for legislation to stop subdivision of estates and for the creation of a Forest Authority. But priorities in taking up these matters have first to be decided by the liaison committee of the ruling parties.

Topical Subject

The two subjects which are of the most topical interest to the people of Kerala, however, are the activities of the Shiv Sena in Bombay and the Kerala Agricultural Workers Bill. Kerala has close links with Bombay. There is hardly any middle class family in Kerala which has no connection with that city which is considered to be the commercial capital of the country. The trend of discussions in the Kerala Assembly was along the following lines: Constitutionally, every citizen of India has the right to accept employment in any part of the country and to carry on a profession of his choice; a state may have practical difficulties in employing people from other states in public services in preference to its own people, but concerted efforts to stop people from other states seeking employment in central and commercial establishments of all-India import are unjust; such efforts become dangerous when fascist methods begin to be used in furthering discriminatory practices; has not the Maharashtra government a duty to protect the life and property of the people of different regions, faiths and languages living in Bombay? The Chief Minister added his bit in true parliamentary style to the emotion-packed speeches of members of all parties and said that the only way out of this dismal situation was to arouse and mobilise a strong public opinion against undemocratic and fascist tendencies. He stated that "it is not enough to pass a resolution and seek the Centre's support. We also have a responsibility to fight against these tendencies in a spirit of sacrifice and see that the reactionary forces are not allowed to destroy the democratic framework". In conclusion, he fervently appealed to democratic sections all over the country and in Maharashtra itself to raise their voice and to create a congenial climate for the minorities to live without fear. He did not, of course, raise any wider issues. He did not care to ask whether a congenial atmosphere could be created in Bombay or elsewhere when growing unemployment, rising prices, chronic food shortages and widening inequalities stare people in the face? Nor did he enquire whether it was possible to isolate the Shiv Sena problem from the economic malaise that the country is passing through or to find a solution by reducing it to a mere problem of law and order.

Laudable Objectives

The other subject that is engaging much attention is the Kerala Agricultural Workers Bill now under consideration by the Assembly. This Bill has been introduced largely due to pressures emanating from the Youth Congress. The laudable objectives of the Bill — fair wages to rural workers, job security, better conditions of service such as fixed working hours, and a contributory benefit fund — cannot be questioned. But it is clear to anyone with any knowledge of the agricultural situation that such objectives cannot possibly be effected through a piece of blanket legislation. Differences in soil conditions, uncertainties of weather, the seasonal character of agricultural operations, multiplicity of crops and their varying earning capacity, and the differing levels of agricultural technology, will make this Bill impossible to implement in practice. Some critics of the Bill even go to the extent of saying

You can rough turn, face, plunge, cut-groove, open-cut, bore, finish turn and ream.

More accuracy

Guaranteed accuracy and interchangeability of parts.

Precise indexing is ensured by the large alloy steel pin held on the hardened guide bush in the saddle.

Hardened steel guideways ensure lasting accuracy.

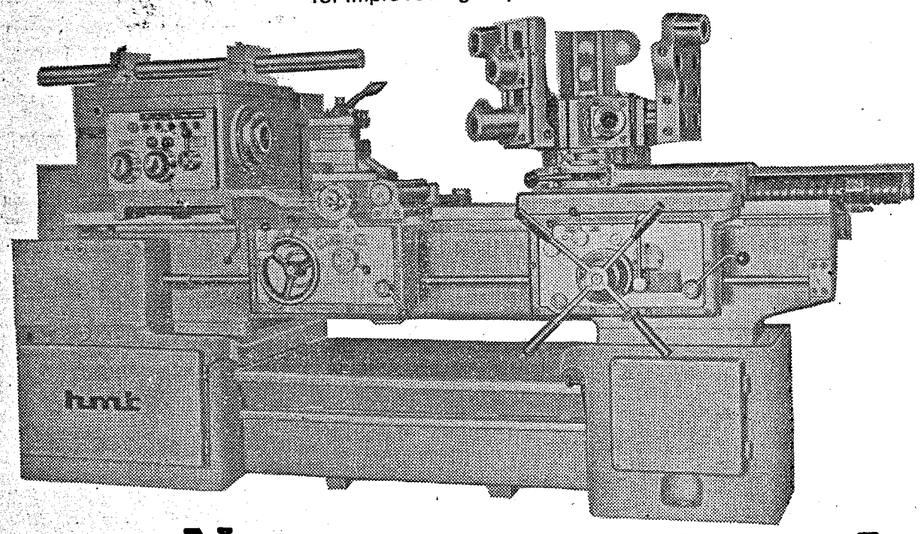
More safety

Drop worm arrangement partnered by indexing drum-stops operates the engagement and disengagement of feeds accurately at the point you want it.

More profit

Round the clock performance for both small lot and long production runs.

Pre-selection of feeds and speeds saves more time.



Lowest price among its class.

Sophistication

Power assist for quick turret indexing available on option.

Plus

1. Improved drum-stoppers for improved rigidity.
2. Gib locking screw for Hex turret redesigned for effective locking.
3. Keeper plate for hexagonal saddle redesigned for rigidity.
4. Hex turret indexing completely redesigned for trouble-free indexing.
5. Positive locking mechanism for Hex turret centre shaft.
6. Bigger hand wheel for square apron.
7. Hand wheel for cross slide.
8. Anti-friction bearings for the feed rod to accommodate higher speed.

Now the L22 TP comes with improved design to handle different jobs more profitably

that in its present form it would bring agricultural production almost to a grinding halt.

The CPI(M) also regards this Bill as ill-advised. However, the CPI(M) feels that the class composition of the agrarian population in Kerala is particularly favourable to building a broad-based militant movement of rural workers and small peasants in the march to socialism. The CPI(M) has arrived at this conclusion partly from an analysis of the 1971 Census for Kerala. Between 1961 and 1971 the owner-cultivator class declined from 20.9 to 7.9 per cent of the total population while the percentage of agricultural labourers increased from 17.9 to 30.7 per cent. Meanwhile, non-agricultural labour decreased from 61.7 to 51.4 per cent. (A good proportion of this non-agricultural labour is engaged in low income primary occupations such as coastal fishing, retting of coconut husk, etc.) Moreover, 59.7 per cent of the owner-cultivators own below one acre of land. And the area of land owned by this group is only 12.4 per cent of the total cultivated area.

There have been attempts to ensure that the Bill is implemented on a selective basis in a few areas, such as Palghat and Kuttanad, the two strongholds of the CPI(M). The intention of these attempts is to weaken CPI(M) influence in its strongholds and to prevent any likely electoral adjustments between the CPI(M) and the Kerala Congress which has a large membership of small farmers. But the Minister for Agriculture, who is piloting the Bill, and the Pradesh Congress chief, A K Antony, claim that it will usher in a new era of peace and prosperity in the agricultural sector which is the backbone of Kerala's economy.

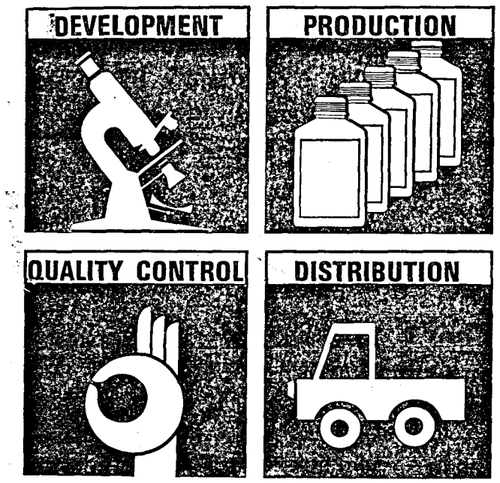
*

In the industrial sector, the Kerala Electronic Development Corporation has assembled its first television set with the technical collaboration of the Electronic Corporation of India, a public sector undertaking. This has been done in record time. ENCOS, an engineers' co-operative, after persistent efforts to develop a scooter on its own, has eventually found it worthwhile to enter into a technical collaboration with Scooters India Limited, another public sector organisation, to assemble Lambretta scooters. A few weeks ago, a telephone cable factory was commissioned in Kerala with the technical help of Hindustan Cables. This, perhaps, is a better way of bringing about industrial development in backward states than sitting in a queue in the waiting rooms of captains of private industry who dictate their exorbitant terms for collaboration.

TAMIL NADU

Election Antics

DURING the past few months, while prices have soared, commodities have disappeared from the market, and government has threatened to raise bus fares, Tamil Nadu's elected representatives have been busy playing at defections — a game, until recently, far less popular here than in the northern states. Mathialagan, the former Speaker, who a year ago had been most unceremoniously eased out of office — his microphone being switched off and his bell being seized — was softly back in the DMK fold. His petition in the Supreme Court, questioning the validity of his removal as Speaker, has been withdrawn. Rumours are rife that he will soon find his way into the cabinet. The Deputy Speaker, on the other hand, who had been the villain of the Mathialagan piece and who would have been the star witness for the government had Mathialagan's case come up for hearing, recently walked over to the ADMK, after prolonged negotiations had failed to procure for him either the post of Speaker or that of minister. There have been several other less dramatic walkovers: a CPI man walked into the DMK, the state secretary of the Swatantra Party joined ADMK, a Congress(O) man and editor of a Tamil daily turned his pen overnight against his erstwhile guru with bitter venom, and Rani Annadurai — wife of the 'Wise One' — candidly declared that she was walking back into the DMK since the government had extended her term in the Council. The Chief Minister was moved to call this last turn-around a victory for 'family ties'! The defection of two ministers from Pondicherry was well-timed to facilitate President's rule in the state just before the election. However, the general trend of defections shows the DMK to be a slowly sinking ship.



The Dindigul election results about six months ago had seemed the swan-song of the DMK. But the government managed to linger on and even to put on a "couldn't care less" facade, though the party's morale was badly shaken. What made things easier for the government was the weakness of the opposition. In particular, the leadership of the major opposition party, the ADMK, has faltered and fumbled under the 'iron hand' of the Chief Minister. ADMK's chief, M G Ramachandran (MGR), used to revolutionary rhetoric only on the silver screen or on public platforms and with no experience whatever in leading a mass movement, seems taken aback and even scared by the tremendous mass enthusiasm engendered by his calls and the ensuing repression of it. His political strategy now seems limited to winning the fourth-coming by-election and waiting for the 1976 general elections when he hopes to teach Karunanidhi a lesson. As for the other mass party, Congress(O), headed by Kamaraj, its long established aversion for mass actions — except when these can be unscrupulously tailored to suit the interest of the 'great leader' — prevents it from undertaking any genuine extra-electoral programme against the government.

Strong Criticism

Despite the ineffectual opposition, Karunanidhi has his hands full. The two judicial enquiries, instituted into the death of a student at Palayamkottai and the Clive Hostel incident of last year, have come out with strong criticism of the police and other state government officials for use of excessive force and dereliction of duty. State wide student agitations, demanding the Chief Minister's resignation on this issue, have led to large-scale suspensions, dismissals, arrests, and finally to the customary closure of schools and colleges. However, handicapped by the absence of a bold leadership — indeed, MGR, who has a massive student backing, appealed to them to leave politics to him and to go back to their books — and riven by the conflicting interests of political parties, the movement has petered out.

Meanwhile, another blow to the ruling party has come in the form of the 'muster-roll scandal' of the Madras Corporation. More than Rs 15 crores are reported to have been involved in graft during the years of the DMK con-

DPQcD
the five-letter formula for the drug industry's four-fold job

India can be proud of the performance of its Pharmaceutical Industry, which has done a good job of developing medicines, producing them in adequate quantities, ensuring high quality, and making them available all over the country.

Once it was a mere importer of finished formulations; today the Industry manufactures almost all the needed drugs from the basic stages, thanks to a progressive policy of emphasising research and development and import substitution. Shortages are rare; a good distribution system makes drugs and formulations available all over the country, round the year.

And practically everyone is agreed that India's medicines meet the exacting demands of international standards. This acclaim has led to growing exports of pharmaceutical products made in India to developing countries and even to the advanced countries of the world.

INDIA'S PRIDE: MEDICINES TO MATCH THE WORLD'S BEST

RADEUS-OPPI-1 7

Sharing India's pride· **Pfizer Ltd**

trol of the Corporation, in the form of fictitious wages to fictitious casual workers. The amount is said to have been shared among peons and clerks and Chief Electrical Engineer and Councillors and Mayor in a highly systematised manner; in fact, in the true spirit of brotherhood, the Congress(O) councillors, too, are said to have been given a share in the spoils.

When the bubble finally burst, the surprise was not that it had gone on for so long on such a wide and organised scale, but that it ever came to light at all. The exposure is attributed to a falling out among thieves. The total number of persons arrested upto now is 68, including 2 former mayors, 1 deputy mayor, and 10 councillors — among them the chairman of the Taxation Appeals Committee and leaders of the DMK and Congress(O) municipal parties. Several of them have evidently amassed lakhs of rupees under public auspices with the customary arrogance of ruling-party politicians. Donning surprise at the extent of the scandal, Karunanidhi has sought to claim credit for having arrested so many of his own party men in an unbiased exercise of justice. Still, the high-powered guilty have gone about scot-free.

It is against this backdrop that the party manoeuvres to arrange alignments for the elections to take place in late February have to be viewed. The elections are for the Coimbatore and Pondicherry Lok Sabha seats, for one Coimbatore Assembly seat, and for the entire Pondicherry legislature of 30 seats.

Bone of Contention

The setting has changed considerably since Dindigul. The merger of the two Congresses — though disguised as a mere electoral alliance — joins Kamaraj's popularity with Indira's resources; but while such unity has made a many-splendoured thing of the election campaign, its ability to ensure success is a different matter. On the other hand, the ADMK-CPI-CPI(M) electoral understanding of Dindigul has cracked up over the question of the former allies' attitudes to the Congress and to the Coimbatore Parliamentary seat. The latter became a bone of contention — the CPI(M) claiming it as its traditional stronghold (a fact not seriously disputed by the other two parties) and the CPI not conceding it allegedly because of 'sentimental' reasons such as that the seat was vacated by the death of its own party man. Neither party was interested in the Pondicherry parliamentary constituency as an alternative to Coimbatore: CPI(M) has no base there, and CPI is reluctant to put up its candidate in a constituency rendered vacant by the death of no less a person than Mohan Kumaramangalam. On the whole, CPI(M) contested the fewest number of seats — one Parliamentary seat in Coimbatore and three Assembly seats in Pondicherry, where it considered it possible to further consolidate its strength through electoral campaigns.

Any possibility of the CPI(M) compromising on the seats question with a view to strengthening the anti-Congress/anti-DMK front of Dindigul had disappeared, given the obsequious overtures to the Indira Congress made by MGR himself. Not that MGR had ever been unequivocally against the Congress. Only the totally unrealistic confidence of the Indira Congress that standing on its own it could sweep the electorate, had forced the ADMK to oppose it in Dindigul. For the coming by-elections, MGR had left the door open for entering into adjustments with the Congress in several constituencies until the last moment, though the Congress had cold-shouldered his advances.

Setback to Progressive Forces

ADMK's fancy for the Congress — united or split — has, however, suited CPI's own prevarications admirably. The entire basis for the latter's alignment with the Indira Congress after the 1969 split, has been thrown overboard by this *de facto* merger in Tamil Nadu. But CPI's pro-Congressism has weathered several such disasters. In this context, the break-up of the Dindigul front is a severe setback to the progressive forces in the state and a pointer to the possible resurgence of the Congress in the future. It is significant that the Indira Congress, which recently labelled the CPI(M), along with the DMK, as the main enemy of the people, is said to have warned the ADMK leaders that any truck with the Marxists would be considered a grave misdemeanour by the leadership.

DMK's nervousness about the outcome of the poll was seen, in its hesitation, until the last moment, to contest the two prominent parliamentary seats. Realising that the ADMK presents a greater threat to it than even the united Congress — the ADMK victory a second time would surely herald a major exodus from the DMK — and urged on by personal hostilities, the DMK made a frantic search for allies. When the Congress turned a deaf ear to its solicitings, the DMK began to woo the Marxists vigorously; but to no avail. Its last desperate bid to support the Socialist Party candidate for the Coimbatore seat, in the hope of gaining the Marxist backing for it, also proved abortive.

Blood-Curdling Speeches

The continuation of the strike by the one and half lakh textile workers since February 1 — despite the Government rendering it illegal by referring the long-pending dispute to adjudication, and the open and familiar betrayal of the workers by the INTUC and the DMK Union leaders — is certainly not likely to brighten DMK's own electoral prospects. As many as 85 of the 208 mills in Tamil Nadu are located in Coimbatore. Even though the Strike Action Committee, including the HMS and AITUC, compromised midway by agreeing to the Government's proposal, and expelled the CITU from the committee for openly censuring the committee for the agreement and for continuing the strike, no solution is yet in sight. Only a fraction of the workers have resumed work.

Once again, the people of Coimbatore and Pondicherry are being treated to wearisome election antics. Overnight, new facilities have cropped up only to disappear the morning after. Quantities of rice have moved into Coimbatore against much opposition, even from a district like North Arcot suffering from acute scarcity of foodgrains and exorbitant prices. Officials have announced that petrol will flow like ditch water in these temporarily blessed places so that Asia's 'largest democracy' can maintain its major democratic traditions without letting minor irritants get in its way. Campaigning politicians are vying with each other to make speeches in blood-curdling 'revolutionary' verbiage. Meanwhile, prices have continued to soar and kerosene has become more difficult to come by. Commodities of all sorts continue to go underground and adulteration flourishes in everything from foodgrains to petrol And the 15,000 strong Simpson workers are getting ready for another round in their three-year old struggle against the state government's policy of victimisation and repression.

Delicate Balance

Mohit Sen

AS Andhra settles down temporarily after its storm, some of the rumble from Gujarat reaches the South. Of course, the character of the movements in the two states was entirely different; above all, the nature of the contending sides. But there is a similarity as well as the difference; and that is the sameness of the Congress collapse. The Congress in the Gujarat Assembly had as enormous and comfortable a majority as it had in Andhra. But this proved to be of absolutely no avail. This is something that all of us have to ponder over.

Within the country the vastly increased radicalisation of the masses, the increasing activity of the organised working class, the start of democratic stirring in the countryside and the unity of the masses in action are all more than hopeful factors. A recent, rapid visit through the states traditionally called 'the South' — barring Karnataka — brought ample confirmation of these trends.

Kerala had been passing through a most difficult time with food shortage threatening to break down the entire system of rationing. The CPM in alliance with the Kerala Congress tried its utmost to bring down the government through the manufacture of chaos — including Namboodiripad squatting inside the Assembly and looking utterly miserable —, but failed to evoke any significant response. Some hot-heads among the Youth Congress sought to push forward their factional interests by issuing somewhat disturbing statements, but had to cool off. It is not that there is no mass discontent in the state. It is there in very ample proportions. But there is also the very widespread feeling that the best chance for change in Kerala lies in the instrumentality of the present coalition government. This is, above all, reflected in the dimensions and the nature of the Chief Minister's popularity. Achuta Menon, a CPI leader, has become the national leader of his people. Not that the government does not bungle. Not that the government is not trammelled by the vagaries and constraints of New Delhi. But it has earnestness and purpose that is beyond any other state government.

In Tamil Nadu, the popularity of the ADMK leader continues and continues to reflect the shift in the mood of the petty bourgeois urban-rural poor continuum which had given the DMK its strength. The DMK is quite clearly a sinking ship going down because of its inability to understand that the logic of its existence required it to be allied with the organised working class and the rural proletariat and semi-proletariat — and not to seek to dominate the latter as the admission fee to the big capitalist club. The attempt of the Congress to redefine its identity and to metamorphose itself into the Kamaraj Congress is still on trial. It cannot be said to have been as crashing a failure as the attempt in Dindigul to go it alone. But the argument, that the Congress cannot play second fiddle to anybody — i e, to the ADMK —, does not hold water since it is the virtual disappearance of the Congress into the Congress(O) which is now taking place. It appears as if this experiment is not likely to pay off in Coimbatore, where the CPM too is likely to find itself cast more in the role of a disruptor rather than of an independent force. In Pondicherry, the going appears to be rougher for all concerned. But, whatever the final electoral result (and to try to predict them is more astrology than scientific prognosis), the decline of the DMK, as it had turned out to be under the quite degenerate leadership of Karunanidhi, is to be altogether applauded. It had become the most clear vehicle of Right reaction. It is more than likely that the Right would now look around for other vehicles — the Congress(O)-Congress alliance being the first preference. But this would take a little time, and meanwhile Tamil Nadu has a chance to shift towards the Kerala pattern. But with one major difference and disadvantage — the weakness of the organised Left and the inability of the working class to play the political role that its position in Tamil Nadu's economy and its sheer numerical strength and industrial composition entitle it to. Incidentally, this working-class lag in Tamil Nadu is not unique to it. On the contrary, it is part of the present danger and sense of impending catastrophe that looms over our country.

In Andhra, the situation is quite specific. The induction of Vengal Rao as the Chief Minister comes after the traumatic experience of the separatist movement which saw the virtual disintegration of the Congress organisation and its coming together again with separatists occupying powerful positions in the Ministry. But Andhra has also been through the experience of the defeat of the separatist movement, i e, of a fierce Right offensive. This has naturally raised the prestige of those sections of the Left, particularly the CPI, which went on the attack against the Right. It has also demonstrated that, if, despite initial wobbling and mismanagement, the Centrists do demarcate from the Right and do align (however discreetly) with the Left, the Right can be contained, curbed, and defeated. This, too, contains immense potential for the future. There is, therefore, reason to believe that the Centre can be pushed to the Left on many issues; not without sharp struggles, not without powerful mass mobilisation, and not without all manner of hitches; but this promising possibility does exist. The crucial issues in this state are radical land reforms and the thrust forward on the development front. Without significant progress on these two fronts, Andhra cannot hope to overcome the recent bitter legacy of the two separatist movements. There is an air of expectancy that something is going to move, after almost three years when hardly any development at all took place. It remains to be seen how much the new Chief Minister is going to do, and how soon, of these two vital tasks. He has a reputation for quick decisions, has been a staunch integrationist, and has certainly delivered good speeches especially in reply to the Assembly debate on the Governor's address. Interesting decisions have been taken with regard to certain corruption cases, some of which seem to involve Brahmananda Reddi and his group. But it is action on the agrarian reform and development fronts that are eagerly awaited. Of course, merely waiting is altogether inadequate. Purpose and programme-based mass actions are the need of the hour.

All in all, taking the country as a whole, the view from the South seems to present a rather more cheerful picture than the rather sullen-laden atmosphere of the North. But while undue pessimism should be avoided in the latter region, there is no reason for complacency in the former area. The balance in India as a whole is so delicate that the utmost vigilance and united mobilisation are required. One should prepare for the adverse tilt, but one's duty is to strain to one's capacity for the tilt to the Left.

New era of Indo-German co-operation. Now in advanced science and technology.

JOINT NUCLEAR RESEARCH PROGRAMME

The Federal Republic of Germany and India are opening up new avenues of international co-operation. As equal partners. In advanced science and technology. Preparing the basis for solving the problems of tomorrow.

India and Germany are pooling their resources in selected fields. Expanding the frontiers of knowledge. For the common good.

India and the Federal Republic of Germany have provided for :

- Exchange of information on peaceful utilization of nuclear energy
- Exchange of scientific and other research personnel
- Execution of joint or co-ordinated research and development projects in reactor and fuel-cell technology, safeguarding techniques and other areas

FOR PROGRESS, PEACE AND SOCIAL JUSTICE

BANGLADESH

The People: Enemies of the Government

M R

POPULIST regimes in South Asia owe their existence to the aroused expectations of the masses. But almost as a rule, the regimes have overplayed their gimmicks and the Left-of-Centre slogans have proved counterproductive. The popularity of the regimes has gone hurtling down and the popularity of the leader has plummetted though less steeply than that of his or her regime. All of them now confront a high tide of popular frustration.

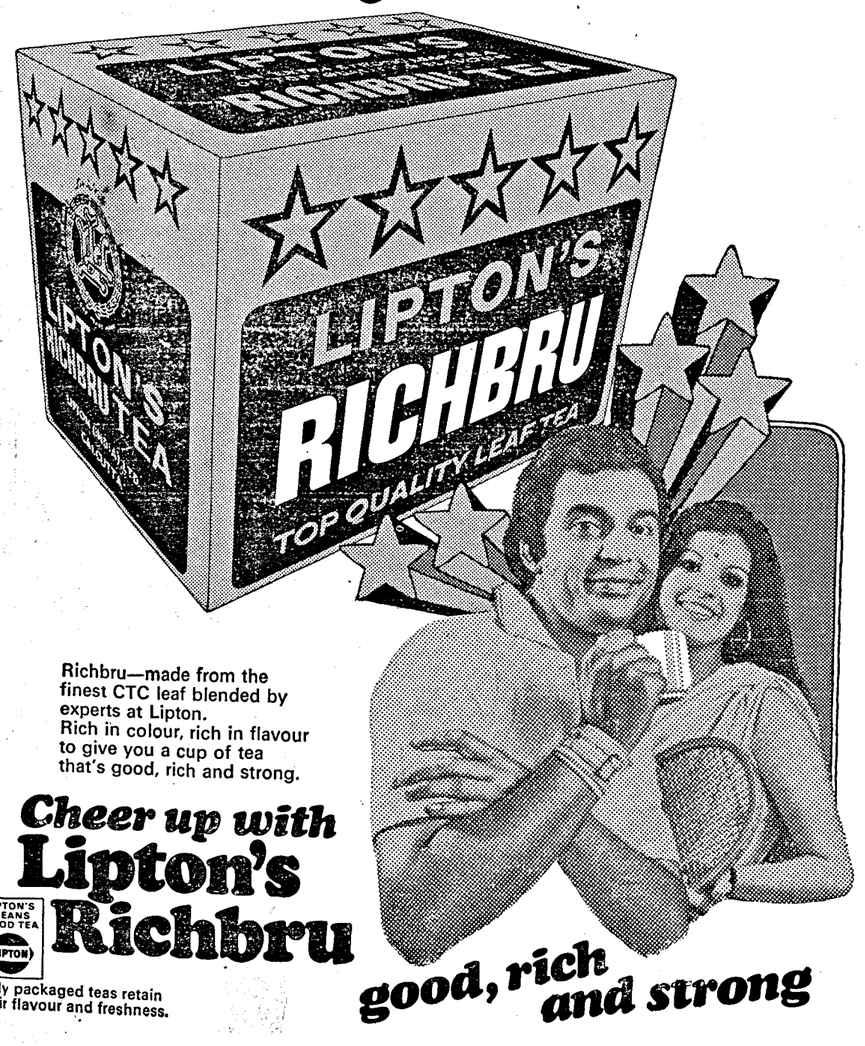
Unable to fulfil their promises to the masses and unable also to contain mass discontent, these regimes would have to seek sweeping extra-constitutional and extra-parliamentary powers for themselves, even though their exercise would imply blatant subversion of bourgeois democratic norms. The bogey of a Chile-like situation is about the easiest thing that can be conjured up as an alibi for the relentless drive towards such new authoritarianism. Yet, whatever his failings and errors, Allende did try to implement his programme, and domestic reaction and United States imperialism were out to subvert his populist regime. In South Asia, on the other hand, there is no threat from the Right or from imperialism to any of the populist regimes — because none of them has had the intention, much less the will, to attempt implementation of the populist programmes that swept them into office. The Chilean tragedy thus becomes a perverse alibi for eroding the democratic rights, and for accelerating the shifts towards new authoritarianism. It is important to note that the drive is against the extra-parliamentary or extra-spectrum Left. There is evidently no need to equate 'Right reaction' with 'Left adventurism' any longer because the extreme Left has been identified as the main enemy by these regimes.

Except for a four-year interregnum, India has been under a state of emergency since 1962. The state can arm itself with enormous powers to supplement the archaic and repressive laws which the British have left behind. In Sri Lanka, an emergency was clamped down even before the Che Guevarist insurgency of April 1971 and it continues to this day. The insurgency only provided the opportunity for acquiring more draconian powers. Bangladesh, barely 27 months old, is well set on the road towards authoritarianism. Its constitution provides for emergency powers, but Sheikh Mujibur Rehman has had no inhibitions about matching President Ayub Khan or President Yahya Khan.

The political preparation for the new authoritarian drive began with the formation of a compact between Mujib's National Awami League, the Moscow-leaning Communist Party of Bangladesh, and the pro-Moscow National Awami Party (Muzaffar group) — ostensibly to meet the combined challenge of Maulana Bhashani's National Awami Party, the petit bourgeois Jatiya Samajtantrik Dal, and various Maoist groups and formations. These latter forces are charged with attempting to destroy the confidence of the masses, to disrupt the administration, and to create a power vacuum for exploiting the popular discontent and the deteriorated economic situation.

For the first time in the subcontinent, the civilian population was armed by the government of a country, while professing Gandhian non-violence. And again, for the first time in the subcontinent, armed struggle by a civilian population acquired legitimacy. Though the Bangladesh guerillas fought the Yahya regime, Indian arms returned the Awami League to Dacca. The freedom-fighters were sought to be disarmed but, according to a conservative estimate, there are at least 80,000 unlicensed arms in Bangladesh and over a 100,000 citizens trained in the use of arms. The arms can be claimed but not the training nor the belief in armed struggle.

How has the Mujib government gone about solving the problems the young republic faces? It has launched an all-out military operation to flush the extremists out; but this is more than a military operation. It is a relentless onslaught on the democratic rights of the people as a whole, under cover of containing 'extremist' subversion.



A few weeks ago, over 36,000 detained for 'collaborating' with the military regime were freed, perhaps to make room for the Lefists to be rounded up. Bangladesh already has 20,000 Leftist political prisoners. The Jatiya Rakkhi Bahini Act was passed to enable the private army of the National Awami League (the Rakkhi Bahini) to search, detain, and arrest any citizen without a warrant. The Rakkhi Bahini men are immune from any judicial supervision in their activities indulged 'in good faith'. In other words, the Rakkhi Bahini men would be free to continue their war against political opponents and even physically liquidate them without sanction from any court or authority. Article 3 of the Act quite simply says: "No suit, prosecution, or other legal proceeding shall lie against any member of the Rakkhi Bahini for anything which is in good faith done or intended to be done in pursuance of this order or rule made thereunder".

During the initial years of Pakistan, the Nazimuddin and Nurul Amin governments had their own private armies in the Ansars. Yahya Khan had his in the Razakars who indulged in rape, arson, and murder, when resistance to the military regime was on in 1971. The Rakkhi Bahini is the National Awami League's version of the Ansars and the Razakars. The need to pass the Jatiya Rakkhi Bahini Act is an index of the isolation of the government from the people. One of the coercive instruments of the ruling party is thus sought to be immunised from the courts which derive their authority from the constitution. This perhaps has no parallel.

The Mujib government indeed excelled the Ayub regime on February 5, when it enacted the Special Powers Act incorporating the most obnoxious provisions of the infamous Press and Publications Ordinance of the military regime and even going farther to empower government to jail or fine anybody for printing, publishing, or distributing 'prejudicial' reports. It also empowers the government to compel the persons concerned to name the author and the source of such a report. And, for good measure, it provides among other things for pre-censorship of the Press.

The people of what now constitutes Bangladesh had their first free elections barely a year ago. The first casuality of the massive mandate the National Awami League is paradoxically the democratic rights of the people even before the year is out! Perhaps the developments in Bangladesh point to the direction in which other populist regimes in the subcontinent will move when they find they cannot fulfil their promises to the masses. Extra-constitutional and extra-parliamentary powers belong to the methodology of the new-style of 'countersubversion'. Nothing underlines the crisis of Left-of-Centre politics better than the latest assault on democratic rights in Bangladesh.

A Triangular Relationship

M S Prabhakar

Politics of Sino-Indian Confrontation by Mohan Ram; Vikas, Delhi, 1973; pp 241; Rs 30.

MOHAN RAM's thesis of course is not very original, since he had formulated the same thesis, in a slightly different context, in two of his previous works on the Maoist trend in the CPI. But the points made in a rather general way in those books — more or less as asides — are more fully formulated in this work. It is of course well known that the differences between India and China over the present border have been mainly a legacy of British imperialism. India tried to present a posture of injured innocence which, initially anyway, earned the country a lot of sympathy in the 'free world'. But the 'revelations' by many of the leading Indian participants in the events that led to the conflict of 1962 have given the lie to this posture of injured innocence. Almost all objective students of the conflict are now agreed that to a large extent, it was India's obduracy that forced the conflict; that this obduracy was hardly matched by military, let alone political, strength; that under the circumstances, the Indian debacle of 1962 was inevitable.

But not all the voluminous White Papers, nor the not-so-secret leaks made by interested self-justifiers in the New Delhi government tell us the whole story. There are indeed murkier aspects to it. That the Soviet Union has been, even from its pre-revolutionary state as Tsarist Russia, closely interested in India's northern borders, is no great secret. But the consistency with which it has kept its interest alive, through all these years, is noteworthy.

Mohan Ram's book is concerned with this Soviet role in the changing patterns of the Sino-Indian relationship. That the Soviet Union's attitude towards its fraternal ally was always rather wary admits, in the light of developments during the last decade, of little doubt. But the extent of the role of India in at least marginally influencing the trend of Sino-Soviet relationships comes as a surprise. This country has been, or rather is, indeed a power of sorts. As long as the Soviet Union considered the transfer of power by the British as a nominal gesture, there was little chance of this assessment of India affecting the Sino-Soviet relationship. But with the endorsement of the line of national democracy under the hegemony of the national bourgeoisie in the newly independent countries, a 'radical' variation — revisionism — was introduced into the Leninist theory of peaceful coexistence. The latter postulated peaceful co-existence as an instrument to sharpen and intensify class struggles; the revisionists, notwithstanding the rhetoric and rationalisations, had abandoned class struggle.

Taking off from this thesis, Mohan Ram traces the seemingly plain and obvious, but inwardly tortuous path of Sino-Indian relations, and the way the Soviet Union, in one way or the other, intervened at each and every crucial stage of this relationship. The differences over the border came into sharper focus almost simultaneously with the first visible signs of ideological differences between China and the Soviet Union. In fact, the existence of a far more serious border dispute between China and the Soviet Union came to be widely known only after 1962, and the Sino-Indian conflict undoubtedly influenced the sharpening of Sino-Soviet differences. In the decade or so since then, the attempts on the part of India to mend its relations with China have invariably been confined to reiteration of meaningless formulas, expressions of vague hope, etc. India's relations with China are now inevitably linked with the ideological differences (as well as differences over the border) between the Soviet Union and China. And the Indo-Soviet Treaty of 1971 has more than ever limited the 'policy options' that, at least in theory, India once had before 1971.

The most interesting part of Mohan Ram's book should have been his account of the impact of these international events on the domestic politics of India, especially their impact on the communist movement in India. But unfortunately, his remarks on this question do not take us anywhere beyond the points he has already made in his earlier books.

The same thing has to be said regarding his account of the impact of this triangular relationship on the events that led to the emergence of Bangladesh. A major flaw, it seems to me, of his treatment of these events, is the insufficient attention he gives to the internal pressures and tensions within Pakistan, especially West Pakistan. Here too, the different ways in which India, China and the Soviet Union have had to react to political trends in West Pakistan, could have been highlighted more sharply. (Though Mohan Ram's concern is with the politics of Sino-Indian confrontation, he would be the first to agree that this question is inextricably linked with the politics of Indo-Pakistani confrontation.)

Particularly noteworthy is the role of the Soviet Union in West Pakistan; its achievement there seems to be far more remarkable than that of China, which is often accused by liberals and progressives as being unduly partial to a regime that is alleged to be anti-democratic. The balancing act of the Soviet Union *vis-a-vis* India, China and Pakistan, is a far more impressive feat of political jugglery than anything that China has achieved in that direction.

Altogether an admirable book. But I have two small complaints to make. The book should have been better read in proof; I stopped counting the misprints after a while. This is a minor irritation for which one cannot perhaps hold the author entirely responsible. But the jargon at least could have been avoided or at least used sparingly. Jargon provides an easy way out from the strain of clear thinking. It should be possible, especially for political analysts as gifted as the author of this book, to write a book dealing with current problems without stuffing the book from end to end with meaningless expressions.

The Great Migration of 1971

I—Exodus

Partha N Mukherji

This is an exploratory study of the evacuees who left East Bengal after the imposition of martial law on March 25, 1971, and sought refuge in India. According to official statistics, by the second week of December 1971 about 6.8 million evacuees had been housed in camps and another 3.1 million were staying with friends and relatives. As many as 827 state camps and 19 Central camps accommodated one of the largest migrant movements in history.

This three-part study concentrates on those who were temporarily settled at the Chandpara and Bokchora camps in the district of 24-Parganas in West Bengal. Part I deals with the socio-economic background of the evacuees, the events leading to their uprootment and the trek to sanctuary. Part II will examine the organisational set-up of the camps, the relations between hosts and guests in and around the camps and the adaptive capacities of the evacuees in their new environment. Part III will deal with the migration back to Bangladesh and the manner in which it was achieved.

[I am thankful to the Department of Sociology, University of Delhi, for having given me a small grant and duty leave for my field work. I am also thankful to J P S Uberoi and to Andre Beteille for having taken a helpful interest in my work. My thanks also to the members of the Sociological Research Colloquium seminar. I am most grateful to Jayaprakash Narayan, the Bangladesh Legation in Calcutta, Abhoy Ashram, A P Sinha, and the Ministry of Labour and Rehabilitation, all of whom gave me invaluable help in doing my field work.]

THE time available for this study was approximately six weeks, which included not only the period of field work but also the time for the organisation of research. The period of field work included ten days in Bangladesh of which five were spent in a village in the interior of Jessore district.

Since the investigation had to be conducted by me single-handed, I had to move in such a way that the data I would collect from a few persons in an ocean of ten million would nevertheless make some sense with reference to the problem I was investigating. I selected the Bongaon region of West Bengal for two reasons. Bongaon being one of the towns nearest to the border would have received evacuees right from the beginning of the immigrant movement. Secondly, the liberation of Bangladesh would inevitably register its first impact in these camps immediately close to the border.

The next stage of selection left little choice and offered little difficulty. I decided to work in the two camps which were under the relief jurisdiction of the Abhoy Ashram, my hosts. This solved the problem regarding my bonafides as a genuine researcher and helped establish rapport without any difficulty with the people in the camps. These camps were Chandpara Camp Number 2 and Bokchora, both located in the Bongaon sub-division of the 24-Parganas district.

In each of these camps I tried to locate specific villages in Bangladesh. I had decided to concentrate on one village from each camp. While this was possible in Chandpara, where I selected the village of Mullakandi in Faridpur district, this was not possible in Bokchora. So I did what I thought was the closest approximation to this, namely, I interviewed people from villages which formed a very close cluster in the Chhianobboi Gram region of Jessore district.

Such a mode of selection of respondents served a dual purpose. Not only would they provide information relevant to rural Bangladesh but also relating to their status as evacuees. It may be countered that such a mode of selection could have led to a biased understanding of the evacuee situation. This problem was tackled by the technique of group interviews. Detailed interviews were conducted with the aid of an interview guide. The questions were mostly open-ended and only suitable cues were suggested to clarify the questions when necessary. This left the main respondent and the group audience a lot of leeway to consider and respond consensually to the various aspects of the problem. The process of consensual understanding also enabled me to observe and note the various slants to the discussion (whenever such a discussion took place), from which a resultant emerged. It also enabled me to intervene whenever I felt that there was some obstacle in the consensual process. Hence, the interviews not only yielded responses to questions, but enabled me to record the entire process of response.

Fortuitously, the field work (which was conducted immediately after the liberation in the third and fourth weeks of December 1971) was happily timed at least in one very important respect — the evacuees spoke frankly and freely on several topics about which at any other time they would have felt inhibited.

Finally, the limitations of an exploratory study should not be underestimated. I had not gone to the field prepared to study a problem which had been worked out fully in terms of its theoretical implications. I did not have any clear anticipations of the kind of sociologically relevant empirical reality that I was likely to encounter. Hence it was like visiting an uncharted field.

The Guests

Of the two camps that I studied I was able to do a base-line survey only

TABLE 1: PATTERN OF EMIGRATION OF THE EVACUEES ENCAMPED IN CHANDPARA 2 AS ON DECEMBER 20, 1971

District	Villages	Towns
Jessore	33	2
Khulna	35	—
Faridpur	14	2
Barisal	6	1
Kushtia	—	1
Total	88	6

for Chandpara 2 camp with the help of one of the camp inmates. Chandpara had evacuees from five districts of East Bengal — Jessore, Khulna, Faridpur, Barisal and Kushtia — covering a relatively wide area in what is now Bangladesh. These evacuees came from as many as 88 villages and six towns (see Table 1).

Assuming that the relatively better-off immigrants would have either stayed with their kinsmen and friends or improvised their own shelters at places having better advantage, the economic condition of the campers, we can reasonably accept, represented, by and large, the poorer strata of the immigrant population.

However, how representative such data would be of the respective regions is a matter of conjecture. It is certainly not a representative sample of the villages/towns from where Chandpara campers came, nor does it include Muslim inhabitants of the same regions. And yet perhaps some knowledge of the socio-economic background of the evacuees in this camp is not altogether irrelevant.

Table 2 shows that an overwhelmingly large percentage of the Chandpara campers owned some land of their own (90.1 per cent). Of those who owned land of their own, again an overwhelmingly large percentage were owner cultivators or owner cultivators-cum-shareroppers (90.7 per cent). Only 9.3 per cent were either in a position to give land for sharecropping or were compelled to do so. Nearly 69.3 per cent of those who owned land, owned and/or cultivated more than one acre.

The pattern of landownership does not necessarily indicate the real economic status of the group. For, quite a few in addition to owning land (for no land at all), engaged in petty and medium scale rural-based trade and business. Indirect evidence indicating this was adduced from statements of losses incurred as a consequence of looting of shops (see Table 3).

At least 16.4 per cent of the campers in Chandpara had engaged in some kind of trade or commerce. 85.6 per cent of these traders have been owners and/or cultivators of land upto five acres. Hence it would appear that there was a tendency amongst these small landowners to supplement their income by trade.

A glance at the distribution of cattle wealth clearly indicates that a very large percentage of those who possessed land also owned some cattle (79.4 per cent) and that the cattle wealth increased along with an increase in landownership and/or cultivation.

The point I am trying to pursue is simply that the evacuees in the camps had strong rural roots and most of them had *some* economic stake which they had left behind. At the level of qualitative assessment, the same impression was gathered for both the camps. If we add to the above indicators the fact that these regions in Bangladesh are rich in numerous varieties of fruits and vegetables, and in fish and poultry, some idea of the economic background of the people I met can be understood.

Whatever the reliability of the data for the regions of Jessore and Khulna, I for one would be extremely curious to know the pattern of landholdings among the Muslim and Hindu communities in the overall landownership pattern of the two districts in general. More specifically, I would suspect that the economic status of Hindus in terms of landownership, especially in Hindu populated areas, was higher than that of the Muslims.

Another point that I would like to mention is that all the evacuees in these two camps were Hindus. There was not a single Muslim family in the two camps with a total population of 17,500. The camp populations were almost wholly scheduled caste, the largest number were Namasudras followed by Rishis and Pods.

TABLE 2: PATTERN OF LANDOWNERSHIP AND CULTIVATION IN EAST BENGAL OF THE EVACUEES IN CHANDPARA 2.

(numbers)

Land	Own Land	Own Land + Give Land for Share Cropping	Own Land + Do Share Cropping	Total
				(Per cent)
Upto 1 acre	106	—	—	106 (30.7)
More than 1 and upto 2 acres	62	2	8	72 (20.8)

(Total N=379)

7 and 24, the nationalist movement was so intense that black flags fluttered from almost all housetops in Jessore. When the East Pakistan Rifles and East Bengal Regiment mutinied on March 25 and reversed the direction of their guns, the Pakistan army was truly perplexed by the massive popular support against it. Almost all Bengalis, Hindus and Muslims alike, rallied round the Bengali soldiers and other volunteers and contributed generously with mainly cooked food, fruits and eggs. A nationalist sub-divisional officer summoned the people of the region to join in the liberation struggle. The response was heartening and since the area had a large Hindu population, the group which banded round him consisted of a large proportion of Hindus. The 'Bihari'* Muslims on the outskirts of Jessore and inside the town, whose role had been identified as against the nationalist movement, fell a prey to the frenzied violence of this liberation group. It seems many Bihari Muslim families had to pay with their lives for having identified with the Pakistani authorities.

This event is being isolated and simplified for the purposes of this analysis with a view to understanding the massive influx of Hindu refugees into India. For, soon after the army regained complete supremacy, the objective of flushing out the Hindus became a definite policy of the official machinery, the Bihari Muslims playing a dominant role in it. It was widely circulated in that region that Hindus had killed Muslims in large numbers and this propaganda caught up with the Bengali Muslims as well, especially the more fanatical elements. It is in the context of this backdrop of events that we have to understand the uprootment of Hindus, at least from the Jessore region.

I must give a brief description of of the two regions of Jessore and Gopalganj. The district of Jessore is characterised by a number of thickly populated Hindu pockets. Chchianobboi Gram (literally, "Ninety-Six Villages") and "Egaro Khan" (literally, "Eleven in Number") are two such pockets. They are supposed to be clusters of 96 and 11 villages, respectively with a Hindu population only. That is why these areas, particularly the former, had acquired appellations like "Chchotto Hindustan" (Little Hindustan) and "Pakistaner Hindustan" (Pakistan's Hindustan). However, on the outskirts of Chchianobboi Gram there are villages with mixed populations of Hindus and Muslims. In contrast, the Gopalganj region in the district of Faridpur, has a clearly mixed population. But since Sheikh Mujibur Rahman's village is in the Gopalganj region, it is an Awami League stronghold.

Having declared martial law, the state legitimised its use of force to control the 'disruptive' elements of the state. By barring the majority party (Awami League) and characterising its leadership as traitors, it could convict any of them on charges of treason. This threw the Awami League organisation into complete disarray. Subsequently, the other nationalist parties, the National Awami Party (Bhashani group) and the National Awami Party (Muzaffer group) also had to operate under cover. Sweeping powers were given to the army and the civil authorities to use force as they deemed fit. The opportunity was not lost to use the Hindus as scapegoats for rationalisations of deviant behaviour of the Muslim Bengalis. Hindus were projected as the corrupting influence and the Awami League as their prey, for both had the objective of destroying Pakistan. Such an ideology found favour with the dominant fanatic minorities everywhere, who having lost the battle of the ballot, were happily poised for the battle of bullets.

It is in the context of these swiftly moving political events, that the exodus of the Hindus from Chchianobboi Gram has to be perceived. It is interesting to note that Chchianobboi Gram itself did not face the ordeal of mass killings or abductions; rather the Hindus on the fringe villages set the alarm. It testifies to the high level of integration of such a large population, that they were able to take decisions about the entire cluster of 96 villages with a population estimated at nearly 1.4 million. Several meetings were held in Mashihati, Sundali and Panchbaria schools, where the leaders of the Hindu community got together, assessed the developments, and deliberated upon possible courses of action. They ruled out any collective resistance as they knew that to challenge the might of the army with an unarmed population would be an exercise in futility. When the fringe market of Dhakuria was looted and burnt, and the houses of the Hindus of Champakona looted for the second time in quick succession, that the Hindus from the adjoining areas came into Chchianobboi Gram. And when even the well-meaning Muslim neighbours expressed inability to give them any security or moral

* All non-Bengali Muslims are covered by this blanket appellation. However, it is true that most 'Bihari' Muslims were from the state of Bihar in India.

support because of danger to themselves on that account, the Hindu leaders decided that everyone would leave on the same day. It seems likely that the anticipated wrath of the kinsmen of the Bihari Muslims killed in Jessore weighed heavily on their minds. Thus sometime around the first or second week of April 1971 (presumably the 5th) began the four column deep, eight mile long, exodus with every family taking whatever it could at the shortest notice imaginable.

Many evacuees testify that there were sympathetic Muslim Bengalis in the fringe villages and all along the flight line, some of whom even shed tears at their plight, helplessly witnessing a tragedy of such dimensions. Many such Muslims provided shelter and gave them security during their flight. However, the evacuees, without exception, were at a complete loss to explain the behaviour of many Muslim Bengali neighbours, with whom their relations had always been cordial, indulging in indiscriminate loot of whatever they could lay their hands on, from cattle to cooking utensils to metal crockery. The more discreet vied with each other to assume charge of the property during the absence of the owner-friend neighbour. This appeared to have been a universal phenomenon. (The exodus must have had a tremendous demonstration effect both on those who wanted the country to be rid of Hindus, and on the Hindus themselves.)

The flight was characterised by stray incidents of anti-social elements trying to loot or abduct women. That is why the women were put in the middle columns flanked on both sides by males. A number of volunteers, youths from the Awami League and school teachers, served as Pathachalaks (guides). They rendered invaluable service to the scared refugees. In this human flood, husbands got separated from wives, and parents lost track of children, but the evacuees took care of such problems and the volunteers tried to be of help in such matters.

At a place called Baghachora, they had their first encounter with the newly constituted Peace Committee which had set up a picket there. The Committee collected Re one per head, Rs five per bicycle and Rs ten per bullock cart, and disarmed them of anything with the remotest suggestion of lethal value, including agricultural implements and bamboo staffs.

The four day flight covering about

TABLE 4: DISTRIBUTION OF CATTLE WEALTH AMONG THE EVACUEES OF CHANDPARA 2

Land	Cattle (in units*)			
	½—2	2—4	4+	Total
				(per cent)
Upto 1 acre (N=106)	45	15	2	62 (22.6)
1–2 (N=72)	45	15	1	61 (22.3)
2–5 (N=124)	45	46	21	112 (40.9)

10–15 (N=4)	—	1	2	3 (1.1)
15+ (N=6)	—	2	4	6 (2.2)
Total	145	92	37	274
(per cent)	(52.9)	(33.6)	(13.5)	(100)

* Cow or bullock or 3 goats=1 unit. Calf = ½ unit.

36 miles on foot, was not a directionless movement of the masses. There was always a group of leaders deciding the suitability of halting points, arranging with the local leaders for the security of the emigrants, and providing relief to persons who needed it, to the extent that this was possible.

While the retaliation in Jessore was swift and the evacuation wholesale and abrupt, the Gopalganj region being an Awami League stronghold and because of its defensible position, did not face any intervention for some time. The Mukti Bahini (Liberation Army) had established a training centre and was preparing for a showdown with the Pakistan army. The fear that the army reprisals on them would be all the more severe due to the hospitality accorded to the Mukti Bahini, prompted some Muslim Bengali elders to meet the Muslim League leader (also a Bengali) who had earlier suffered a crushing defeat at the polls but who was now enjoying the protection of the army. The leader assured them that if they were able to remove the Mukti Bahini from there they would be safe or else danger was imminent. The Mukti Bahini in deference to the wishes of the people, withdrew to some unknown place. This was to let loose a strategy of terrorism.

In the first week of May, the army made its first appearance. The soldiers came on a gunboat, stationed it at Manikda station at three a m and then marched on to Gopalganj at seven a m (a distance of one mile), looted the bank, destroyed the Awami League offices and set fire to the houses of the party supporters. They burnt the nearby Boltola Hat (biweekly market), seven miles from Gopalganj. Thereafter, they split into small groups of ten and visited nearby villages, shooting, and burning houses indiscriminately.

The visits of gunboats and the indiscriminate shooting in which Hindu and Awami League settlements were the favourite targets, became a frequent occurrence. For instance, the people of Mullakandi had to leave their village by eight a m for the paddy fields with their women and children and with food for the day. They kept themselves submerged under paddy standing 3 feet high, in knee-deep mud water, and returned home only after dusk. They would then hold a meeting with the village leadership and take stock of the situation. They kept on playing this terrifying hide-and-seek game for a fortnight. It was only when the neighbouring Muslims of Nijra village expressed helplessness in giving them security and some of them turned Razakars and directed the army to villages and homes which had to be destroyed, and when the neighbouring village of Tentulia was burnt and machine gunned, that they decided to leave for India — a decision made collectively for the entire village.

They trekked 150 miles, crossing three rivers (Madhumati, Naboganga and Kapathakka) to reach India in ten days. Once again the same pattern of looting by the Muslims of the neighbouring village(s) was reported.

The central point to be noted is that the uprootment of the Hindus was not sporadic. The decision to emigrate was collective, taken by the leadership of the Hindu community. This decision, again, was taken only when the Muslim community was compelled to delink its ties or common social bonds with the Hindus. This observation acquires added importance in view of the fact that in the case of at least one village that I visited, where Hindu-Muslim ties were strong, the village tided over the storm in spite of similar kinds of terrorism by the Razakars and the army. Also there were many instances of Hindus in predominantly Muslim villages remaining undisturbed. This gives rise to certain basic questions like: (a) Is such a delinking of ties between the two communities a result only of the state's coercive power, and so is the case mentioned above exceptional? (b) Do these happenings also provide a basis for studying the nature of social integration between the two communities?

Finally, it is clear that the policy of the martial law government was to uproot the Hindus, not to eliminate or exterminate them, and in this they seemed to have succeeded admirably.

However, it needs to be underscored that my respondents were all Hindus and their manner of uprootment is only relevant to two small regions. It does not include the situation faced by the uprooted Muslims, nor does it include the Bengali Muslim — Bengali Hindu interaction in contexts different from those described above. Therefore caution should be exercised not to extend the generalisations beyond the boundaries of this study.

(To be Continued)

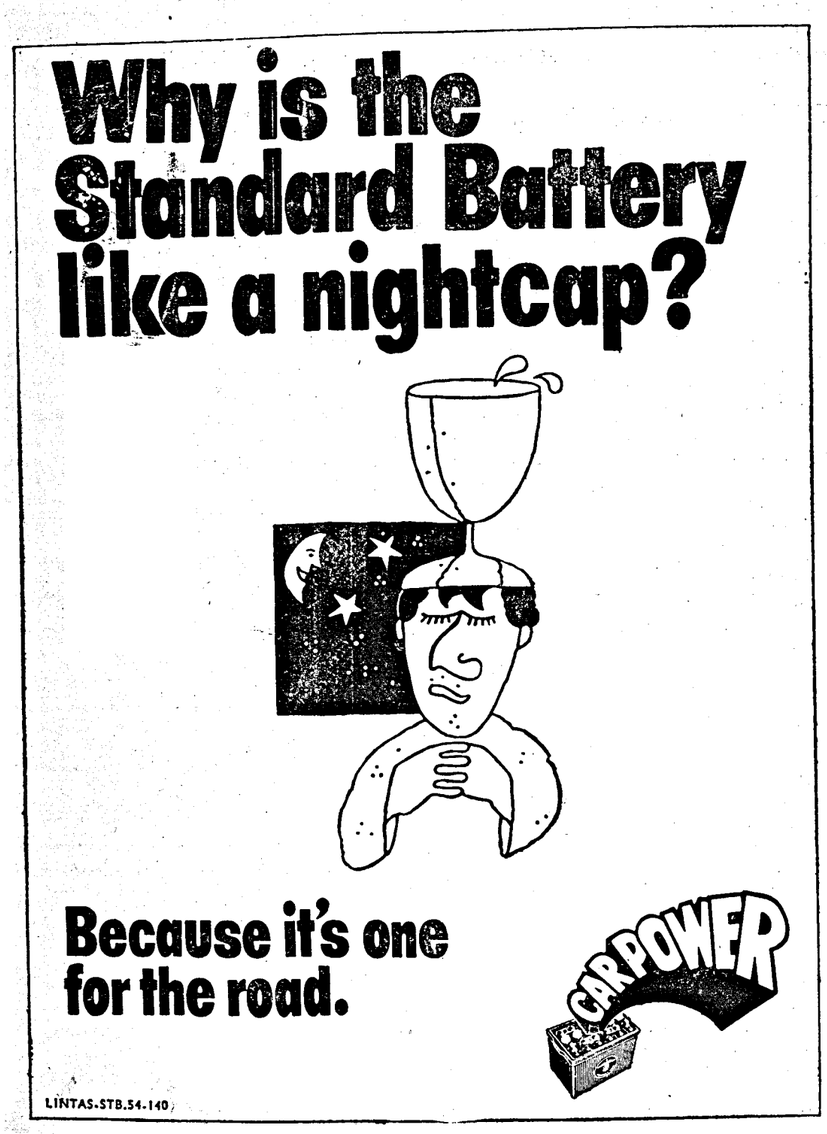
On 'Welfarism' vs 'Radicalism' in Planning

Pranab K Bardhan

In a polity like ours, the planner cannot be a mere technical adviser. He is an integral part of the political process. In his capacity as a planner, he has two basic options. One is the easy way out of essentially playing the game as the politicians want him to and of providing them the opportunity to wrap their designs with the respectability of his technical expertise. The other option is ultimately that of exposure.

The planner can translate the radical slogans of the political leadership into concrete programmes, sharply differentiate them from assorted gimmicks (like nationalisation), leave little scope for endogenous failures to be blamed on weather gods, Arab sheikhs or CIA agents, and in general spell out the hard choices and unpleasant policy implications in clear concrete details easily recognisable by the public, so that the next time around it is slightly more difficult for the leaders to get away with the slogans, or to unanimously approve of the Plan in the party or in cabinet meetings and then merrily go about flouting its priorities when it comes to action on detailed programmes.

Such a planner's tenure may be necessarily brief, but he should utilise this time towards building pressure groups for the constituency of the unorganised poor. Effective redistribution cannot come from voluntary abdication by the top, it has to be bargained for, and, if necessary, grabbed by the bottom. There is no substitute for the countervailing power of massive organisation of the poor.



On the long and arduous road towards that goal, the planner's may only be a didactic role, raising the level of public education and consciousness and improving the ability of the poor to see through the empty slogans dished out by the rich.

THE cold days of December and January in Delhi this year became particularly bitter as one sadly watched the bizarre antics and rituals of the cannibalistic tribe of economists and assorted journalists over the Draft Fifth Five-Year Plan. The level of public discussion reached an all-time low. One could criticise the Plan only at the risk of inviting volleys of slander from the press of the ruling party and of its various lackeys. Agents of MacNamara or other supernational (or supernatural) authorities were unearthed and characters were merrily assassinated accompanied lackeys. Agents of McNamara or socialism. While the critics of the Plan were mostly at the receiving end of the vicious public attacks, they in turn were often blaming the planners for the numerous failures of the other branches of the government. None of them was prepared to provide a fully worked-out and viable alternative scheme and there were some who, while being quite generous in their admiration for some of the earlier Plans and their architects, were indiscriminately making uncharitable remarks about a Plan which in its basic structure is not all that different from those earlier Plans.

If one brushes aside all the frothy rhetoric, the venom of personal animosities and the mumbo-jumbo of more-socialist-than-thou commitments, one would find that there are a few substantive issues regarding the basic approach to redistributive planning which need much more serious debate. One such issue relates to the desirability and feasibility of redistribution through massive programmes of direct transfers to the poor in the form of provisions of essential consumer goods (public and private), welfare services and mainly employment-generating public projects. Those who support such transfer programmes as a crucial part of what should be the basic strategy of planning are essentially extending the liberal-Fabian idea of a Welfare State in the context of a very poor country like ours; frequently they find allies in the advocates of Gandhian programmes of rural development. Needless to say, the supporters of these programmes encompass a much larger set of people than those adhering to liberal or Gandhian ideas of welfare socialism. As opposed to these ideas stands the current planning orthodoxy in India by which the steel-cement-fertiliser-power-transport complex forms the core of the Plan and various welfare and essentially employment-generating programmes remain at the periphery. Both sides emphasise the need for curbing luxury consumption and both are by and large agreed on the prior political postulates

that a drastic overhaul of the property structure in the country is infeasible and that we have to operate in the existing framework of a mixed economy with all the trappings of political democracy. In our subsequent discussion here we shall ignore the arguments of an important minority of people in our country who do not accept these political postulates.

The welfare socialists claim that in spite of more than 20 years of planning, with the chapter on Objectives in each Plan volume regularly emphasising redistributive goals with resounding rhetoric (except that the rhetoric has markedly deteriorated over time, from Nehru's rousing prose in the First Plan to the atrocity of paragraph 1.68 on page 13 of the Draft Fifth Plan, Part I), by most estimates nearly half of the Indian population continue to live in abject poverty and the date by which all of them are to be raised above

even the barest minimum level of living, if the economy grows at the expected rate of growth, tends to recede into the never-never future. So staggering are the dimensions of Indian poverty and so dark is the future horizon, if one goes by growth projections, that the welfare socialists feel compelled to point to the immediate priority of substantial transfer programmes for the poor. Varying estimates of the minimum total outlay involved in such programmes are available; one such estimate of outlays on minimum needs and employment-intensive programmes presented in the now-defunct Towards An Approach to the Fifth Plan document came to the order of Rs 11,000 crores over the Plan period (as opposed to a maximum of about Rs 3,500 crores in the current Plan); similarly, a self-appointed one-member Planning Commission in Tiruchirapalli last December has suggested a figure of Rs 7,500 crores on Rural Employment Guarantee schemes alone.

Not Quite Fair

It is not quite fair to argue against this sort of a position, as has been done, that one is overlooking the fact that this will compete with the finance required for the 'core' programmes of the Plan; it is even more unfair to suggest, as has been suggested, that the advocates of such programmes do not bother about the domestic resources mobilisation problem or that they are in some sinister design to increase the economy's reliance on foreign aid. They are as serious as everybody else in underlining the importance of mobilising more domestic resources, but they are inclined to assign to these welfare-cum-employment programmes almost as much importance as given to the usual priority programmes in planning orthodoxy. On the other hand, they seldom work out even a rudimentary consistency exercise taking account of the required bill of intermediate goods, capital goods and infrastructural facilities involved in such massive programmes of direct transfer. It does not suffice to point out that those simple minimum needs and rural works programmes are not intensive in their direct use of scarce intermediate goods like steel, cement, etc, or capital equipments. Any substantial transfer programme will appreciably add to the demand for food, with a matching rise in the requirements of fertilisers, fuels, power and transport. Of course, one may immediately turn the following striking result of the current Plan model in favour of those who are advocating massive transfer programmes: according to calculations on alternative variants of the Plan model the growth rates in the core sectors are reported to be 'largely invariant' to the specification of the inequality parameter for distribution of consumption expenditure. If this result is valid, then an expansion of welfare programmes should not have a significant impact on the growth targets of the core sectors. But if one looks into the details of the Plan model calculations one finds that the 'invariance' property holds mostly for investment goods sectors (electrical, non-electrical and transport equipments, iron and steel and non-ferrous metals) whereas for a number of other core sectors like fertilisers, coal, organic heavy chemicals and infrastructural facilities like electricity and gas, alterations of the inequality parameter do have a significant impact on the required growth rates. Besides, in the current Plan model the aggregate quantum and the composition of investment by sectors of origin are completely exogenously specified irrespective of changes in distribution. Neither the welfare socialists nor the current planners have worked out the impact of their suggested programmes of redistribution on growth rates in the core sectors when one goes beyond the static input-output framework and introduces sectoral linkages through capital-account deliveries. Even within the static framework, it is also important to look beyond the given input-output ratios and to carry out careful assessments of, for instance, the feasibility of alternative technologies in irrigation, fuel production, etc, which economise on the scarce inputs.

Greater Control over Procurement

Apart from the question of scarce inputs, a substantial transfer programme also implicitly assumes a much greater control over procurement and public distribution of food than the present government with all its political alignments has ever achieved or is likely to achieve. Here both the sides in this controversy on redistributive planning strategies are banging their heads against the same political walls: the same power realities of the political system, which do not permit substantial mobilisation of additional resources to support massive programmes of direct transfers simultaneously with an expansion of the fertiliser-fuel-power-transport base of the food economy, are also likely to frustrate an effective public distribution system for the existing supplies of food. More generally, it is the paucity of surplus yielded by the Indian rich and the consequent slackening in the rate of public investment which largely explain why in recent years we had a particularly miserable performance in overall growth as well as in mitigation of poverty.

Despair of Reformers

Even if the political constraints on the generation and mobilisation of surplus were not there, a major source of frustration for the redistributive planner is that in our system whatever scheme of redistributive public investment he designs the relatively rich manage to appropriate a disproportionate share of the benefits. The ubiquitous sucking power of the rich, the strong and the 'well-connected' has been the despair of many a pious reformer with their programmes of welfare and social justice. In this context it becomes highly important to assess the alternative planning strategies in terms of the leakage (into non-target groups) potential of their respective redistributive programmes. One planning strategy may be more ambitious in its anti-poverty programmes than another, but if the nature of these programmes are such as to leave a lot of scope for leakage the former strategy may not be ultimately more effective than the latter. Of course it is possible to take a position that given the general nature of politics of scarcity and given the more specific nature of the corrupt oligarchy that may control these programmes, all alternative redistributive programmes will turn out to be equally leaky. While there may be elements of truth in this position taken at a global or macro-level, if one goes into the micro-level working of individual programmes it is not difficult to show that there are important variations in the effectiveness of the redistributive impact of alternative programmes carried out even within this generally constraining framework.

Judged from this point of view it is not always clear which of the alternative strategies — that of the 'welfarist' transfer programmes or that of the allegedly more 'radical' current planning orthodoxy — has a potential of delivering the goods with less leakage into non-target groups. It is easy to catalogue the various leakage possibilities in a minimum-needs-cum-rural-works programme. Money sanctioned for rural works projects partly goes into the

pockets of labour contractors (to whom the necessary work of labour mobilisation and organisation is frequently entrusted) or to petty bureaucrats (who charge a 'fee' for including one in the list of those who are eligible to work on the projects). The benefits of minimum needs programmes like low-cost housing or slum improvement schemes have often been usurped by those groups in the top income decile whom we keep on referring to as the 'middle class'. The benefits of rural roads or rural electrification go disproportionately to the rich. Even in the case of provisions of drinking water facilities in dry villages there have been reports of rich farmers diverting the water for the purpose of irrigating their fields. One can easily multiply these examples from actual evidence. In general one can classify the various leakages of these transfer programmes essentially into two kinds, one is the leakage from the pipeline itself in the form of absorption by the delivery infrastructure (middlemen, contractors, bureaucrats, etc.) and the other is the recipient leakage in the form of benefits misappropriated by the wrong groups; sometimes these two kinds of leakages are inter-linked, the rich recipient bribing the middleman to divert the flow of benefits in his favour.

Qualitatively Different Exercises

On the other hand, the various leakage possibilities of the core-sector dominated current Plans and the spoils of the elaborate system of licensing and regulation are well documented and need not be repeated here. It may be all right to say that a substantial transfer programme cannot be carried out without a substantial addition to the availability of essential consumer goods and the latter in turn needs as a precondition an expansion of some of the core sectors. But in an economy where the last 20 years of planning have repeatedly shown that planners have little control over the generation and disposal of income by the rich, an expansion of the steel-cement-power-transport complex in the name of ultimately supporting redistributive programmes can hardly be a guarantee that these basic intermediate and capital goods once produced will not be diverted to 'non-priority' uses, as has blatantly been the case all these years. Of course, one should not always project the past into the future to judge a Plan since planning and projection are qualitatively different exercises. But planners may also learn from past mistakes and past failures. The starting point of our current Plan should be a post-mortem of our earlier Plans if we want our planning not to be reduced to mere quinquennial displays of our rich fantasy life.

Planners' Role

If the political and economic power realities have not substantially changed today compared to the recent past, the gaping leakage possibilities in the redistributive strategies of the current planning orthodoxy cannot be plugged with sheer moral exhortations and the over-used battle-cry of socialism any more than in the past; just as the manifold leakages in direct transfer programmes cannot be stopped by some of their Gandhian advocates by mere appeals for a rejuvenation of our moral and cultural values. If we take our existing political and moral framework as given at least for preparing a Plan for the next five years, we have to be on the look-out for least leakage-prone projects. Viewed from this angle, it is possible that some of the welfare programmes (like rural employment guarantee schemes or those for minimum needs for public health and sanitation facilities, nutrition programmes for children and mothers during pregnancy and lactation, drinking water to villages in dry areas, home sites for rural landless labourers, elementary education) may lose in leakages a smaller amount per rupee spent than some of the more grandiose schemes in the Plan. No sweeping empirical presumption may, however, be warranted here and each programme may have to be scanned individually in this respect. If a particular programme is judged to be able to deliver the goods immediately to the poor with some certainty and minimum of leakage one should not cite finance as a constraint, while pre-empting the limited amount of finance available for some other project which may have even a larger and longer time-stream of benefits but one is not at all sure if they will actually flow to the poor or will largely be intercepted on the way. The current practice quite often works in the opposite direction. Whenever the government is faced with a financial squeeze the axe inevitably falls first on the welfare programmes.

A planner may be impatient with the nagging emphasis on the question of leakage in the preceding discussion and may take the position that, after all, his is essentially the role of a technical adviser and it is for the political and administrative machinery to take care of the mundane problems of implementation, of ensuring the proper delivery mechanism and of stopping leakages. But many of the so-called problems of implementation are inherent in the nature of programmes themselves and some are inevitable in the context of the social and political framework and as such could be anticipated right at the planning stage and the planner cannot honestly wash his hands of the responsibility.

Two Basic Options

More generally, in a polity like ours the planner cannot be a mere technical adviser. He is an integral part of the political process. He certainly cannot change the political and institutional constraints on planning. But in his capacity as a planner he has two basic options. One is the easy way out of essentially playing the game as the politicians want him to and of providing them the opportunity to wrap their designs with the respectability of his technical expertise. The other option is ultimately that of exposure. The periodic exigencies of political democracy have impressed on the leadership the increasing need for radicalising the slogans. The planner can translate these slogans into concrete programmes, sharply differentiate them from assorted gimmicks (like nationalisation), leave little scope for endogenous failures to be blamed on weather gods, Arab sheikhs or CIA agents, and in general spell out the hard choices and unpleasant policy implications in clear concrete details easily recognisable by the public, so that the next time around it is slightly more difficult for the leaders to get away with the slogans, or to unanimously approve of the Plan in the party or the cabinet meetings and then merrily go about flouting its priorities when it comes to action on detailed programmes. Such a planner's tenure may be necessarily brief, but he should utilise this time towards building pressure groups for the constituency of the unorganised poor. Effective redistribution cannot come from voluntary abdication by the top, it has to be bargained for, and, if necessary, grabbed by the bottom. There is no substitute for the countervailing power of massive organisation of the poor. On the long and arduous road towards that goal, the planners' may only be a didactic role, raising the level of public education and consciousness and improving the ability of the poor to see through the empty slogans dished out by the rich.

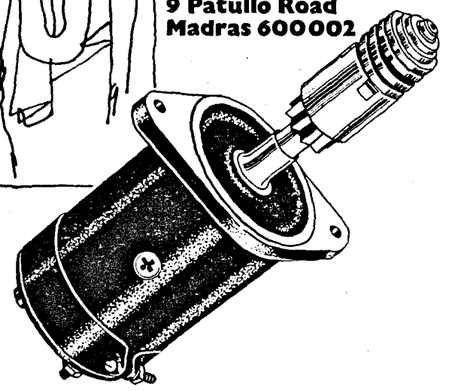
PARTNER FOR LIFE:
YOUR LUCAS-TVS STARTER ONLY STOPS WHEN YOU DO

Each day, over 7,00,000 quality Lucas-TVS starters spring to life. Starting cars, commercial vehicles, tractors, earth-movers, stationary and marine engines.

Available in a range of 6, most of these 7,00,000 starters are fitted as Original Equipment.

With Lucas-TVS reliability built into each, your starter is a partner for life.

And should one of the many components of a Lucas-TVS starter ever need replacement, ensure that you fit only a genuine Lucas-TVS part.



Because when you buy from Lucas-TVS, you buy a total integrated electrical system. Perfectly matched to the needs of every make of vehicle.

Yes, a Lucas-TVS starter proves that not all marriages are made in Heaven.

FREE FOR YOU! Informative leaflet on profitable vehicle maintenance.

Write today to: Lucas Indian Service Ltd., 9 Patullo Road Madras 600002

Note the latest change in Maharashtra's industrial geography.

This Package of Graded Incentives makes all areas more attractive.

"Grading"— a new advantage

Maharashtra's Package Scheme of Graded Incentives has divided the State into 4 zones—the developed areas and the developing areas. All developing areas have been graded according to existing circumstances and higher scales of benefits apply in areas which are relatively less favourably placed. For instance the Sales Tax Refund is offered for 6 years in certain areas but for 10 years in other areas.

Similar gradations apply to incentives like relief from incidence of certain rates (electricity tariff, octroi, water royalties, and non-agricultural assessment) and preferential treatment under the government purchase programme.

There's something else

This scheme is implemented by SICOM—the people who work hard with expertise and guts. What's more, you can take advantage of SICOM's flexible financial assistance and plant location, project investigation and project implementation services. All given to you in SICOM style.

Avail of the Maharashtra Government's Package Scheme of Graded Incentives. Now!

REVIEW OF MANAGEMENT

The world could not add up to much without India

India gave the world the number series. If numerals are called Arabic to this day, the credit goes to Mohammed Ibn Musa Al-Khowarismi—the Arab mathematician. He adapted an Arabic translation of the Brahma Gupta into a later work. The Latin version was published under the name De Numero Indorum—"concerning the Hindus' numbers".

In mathematics and other spheres, Indian talents have enriched the world. We at L&T try to continue the tradition by enriching life through industrial development We design, manufacture and instal plant and equipment for every vital industry—steel, cement, fertilizer, paper and pulp, nuclear...

Together with our subsidiary, Engineering Construction Corporation Limited, we have helped to build major projects like the Nagarjunasagar Dam, Neyveli Lignite, Rourkela Steel Plant, Gauhati and Madras Oil Refineries, the hot lab for the Bhabha Atomic Research Centre.

We continually take up challenging jobs with confidence. After all we are a major industrial complex with vast resources of technical know-how and manufacturing skill accumulated over 35 years. The success of our service lies in the individual talents of over 10,000 people in our associate and subsidiary companies and our network of offices all over India.

Cruel Balance

THE government, it has to be conceded, has been fairly successful in creating the impression that if it has not budgeted for a larger Plan outlay this year it is because it is anxious to keep down deficit financing and curb the raging inflation. The Finance Minister's claim, that the figure of the Plan outlay contained in the Budget "represents a difficult compromise between two conflicting considerations, namely, to keep deficit financing to the minimum and to keep the wheels of production moving", appears to have been accepted without much questioning. The government has to be ruefully complimented for having been able to get away with so palpably distorted a view of the inflation and its causes, especially its relationship with the Plan outlays.

Looking at the problem in the most aggregative terms, it is simply not true that Plan outlays, or developmental outlays more generally, have been the cause of the admittedly sharp rise in the government's total expenditure in recent years. It has been repeatedly pointed out in these columns that, as a proportion of the government's total expenditure, both Plan and developmental outlays have been consistently and significantly below the levels reached almost ten years ago, towards the end of the Third Plan. Quite to the contrary, it can be convincingly established that many of the current shortages, and the consequent rise in prices, are in fact the direct consequence of the cutback in investment in a number of sectors. The acute shortage of cement, fertilisers and paper, for example, and the flourishing black-market in them can be explained only in these terms. For the Finance Minister to pretend that the choice is between a little larger outlay on the Plan and a little less inflation is, therefore, downright dishonest — not just misleading.

While, in aggregative terms, Plan and non-Plan expenditures of the government equally add to the total demand in the economy, quite different sections of the population are affected by a curb on Plan as against non-Plan expenditure. The government's classification of Plan and non-Plan, or developmental and non-developmental, are arbitrary enough to preclude very categoric assertions. But broadly, it can be said that investment resulting in expansion of output and employment has a relatively greater effect on the incomes and hence the demand of the poorer sections of the population. On the other hand, government expenditure on account of payment of higher procurement prices to farmers with surplus foodgrains to sell or larger subsidies on public irrigation works obviously benefits a quite different set of people. The impact of this latter kind of expenditure on the demand for — and, therefore, the prices of —, say, foodgrains, is bound to be quite different from that of expenditure which results in larger employment. In this case, the beneficiaries, the larger farmers, are unlikely to increase their consumption of foodgrains very much; nevertheless, an increase in their incomes could have a sharp enough impact on the prices of foodgrains as it makes it possible for them to withhold foodgrains from the market and build up larger stocks. For this reason, cut in government expenditure which impinges on the incomes of this section of the population could have a salutary effect on the prices of foodgrains. Obviously, tax proposals which reduce their disposable incomes will also have the same effect. It is a comment on the government's close alignment with particular interests in society that neither of these anti-inflationary devices has found favour with it. The increase in the food subsidy last year may be attributed to the higher prices of imported foodgrains, but this year it will be wholly on account of the very substantial increases already allowed in procurement prices. Similarly, the subsidy on irrigation and multipurpose river schemes has continued to go up, contrary to the exhortations of successive Plans, and it was Rs 170 crores in 1973-74. Most conclusive of all is the fact that according to the government's latest Economic Survey, over the Fourth Plan period "the mobilisation of additional resources from the agricultural sector in the form of land revenue and agricultural income-tax shows a negative figure of Rs 30 crores"!

Of course, the affluent in the agricultural sector have not been the only beneficiaries of the government's expenditure and tax policies. Elsewhere, too, large incomes have been created and then left virtually untouched by taxation. If one may make a sweeping generalisation the effect of the government's fiscal policies appears to have been on the one hand to provide the wherewithal to the larger farmers, traders and industrialists to bid up prices of a wide range of commodities and on the other hand to augment the money incomes of certain other relatively well-off sections of the population just sufficiently to enable them to pay these higher prices. Whatever the polite explanations offered by the Finance Minister, the sharp cut in income-

tax rates all along the line, making a present of Rs 60 crores this year and more in every succeeding year, to those affluent enough to qualify as income-tax payers, has to be understood in this overall context. At the other end, on those, the majority, who fall outside this charmed circle, has fallen the entire burden of balancing supply and demand for the necessities of life. This has been achieved, quite simply, by keeping down the growth of employment and incomes among them — the other side of the Finance Minister's "difficult compromise". Together with the rise in prices this has made sure that their consumption of the essentials of existence like foodgrains is pushed even further below their already sub-human levels.

Government Services

Keeping Them Lily White

THE particular news item has remained un-contradicted. Any association with the CPI(M), CPI(ML), Jamiat-e-Islami and the Rashtriya Swayamsevak Sangh, it has been decided by the authorities in New Delhi, will debar people from entry into government services. These political groupings have been adjudged as undesirable and persons leaning towards them would be precluded from getting government jobs or, if already in such jobs, would be in danger of losing them. Even a casual expression of sympathy for these political groups within three years prior to the date of enquiry would be considered as tantamount to association with them and would therefore invite the application of the fiat.

According to the government's own explanation, political undesirability has two aspects. If any group or organisation has been declared unlawful, association with it, after it has been so declared, would clearly be undesirable, under the existing laws of the land, and one aspiring for employment must not harbour any illusions on that score. None of the four organisations referred to have till now however been declared unlawful by New Delhi, not even the various versions of the CPI(ML). The criterion of undesirability applied in the present instance is therefore an extra-juridical one. The authorities must have made up their minds that the groups named by them are indulging in activities which either aim at the subversion of the Constitution, or preach violence, or are prejudicial to the sovereignty, security or integrity of the country, or promote feelings of enmity or hatred between different sections of the people on grounds of religion, race, caste or community.

Clearly, these four political — or quasi-political — organisations, association with which would deprive people of the opportunity of employment in government, have come under the shadow because they are being suspected of each or any of these activities. It can only be a matter of suspicion, for if the government had fool-proof evidence of their guilt, it would have moved against them in the courts of law, or have banned them. There is thus a gross anomaly here. The CPM is one of the recognised 'national' parties: it also happens to be the largest opposition group in the Lok Sabha. It is extraordinary that, for purposes of the parliamentary process, the CPM is considered to be adequately national, while viewed from another angle, it is to be regarded as anti-national and association with it is to preclude people from holding government jobs. One can demonstrate the absurdity of the position quite easily. Since, for electoral purposes, the CPM is accepted as a national party, it is conceivable that it could come to power even at the Centre through participating in the elections. The party could therefore form the government in New Delhi, and ministers owing allegiance to it could come to preside over the operations of the various official agencies. Following the rationale seemingly being applied by the Union Ministry of Home Affairs, it may be all right from the point of view of the security, sovereignty and integrity of the nation if a functionary of the CPM were to become the Defence Minister of the country, but not all right if an applicant for the post of a petty clerk in the Ministry of Defence had shown some stray sympathy for that party on a fleeting occasion three years ago.

There could be other absurdities. If the writ handed down by the Ministry of Home Affairs is not acceptable to any or some of the state governments, one set of criteria would then be applied by the Centre to judge the political suitability of would-be employees and yet other sets by the individual states. Thus members of the CPM might come to hold important positions in the civil service hierarchy in Kerala and West Bengal, while they would be considered untouchable in New Delhi; a member of the RSS might play a crucial role in the Home Department of the government of Uttar Pradesh while he would be regarded as a security risk by the Union Home Ministry.

True, under the Civil Service Conduct Rules, government servants, under all circumstances, must not be members of political parties and must not maintain also any association with such parties. But till as long as Articles 14, 15, 16 and 19 have not been removed from the Constitution and till as long as a particular party has not been declared illegal, no discrimination between different political parties can be made under the law; to attempt to make such a discrimination in the service rules is nothing short of outrageous. That the Ministry of Home Affairs nonetheless assumes that it would get away with framing such absurd rules merely reflects the creeping authoritarianism of recent years. As a consequence of the developments since 1971, men in authority have taken it for granted that they will rule for ever. The Constitution of the country is however unambiguous in the matter. It is not for some individuals sitting in some corner in New Delhi to decide whether x or y, because of his private political views, would or would not be suitable for public employment or whether he would be loyal, upright and impartial in service. A judgment on this cannot be pre-empted by anybody. A more honest course would be to declare that, under the pretext of the Emergency and the Defence of India, henceforth the rule of law is going to be substituted by the rule of whimsy all along the line.

Balance of Payments

Costly Face-Saving

AFTER repeated heroic statements that the country's balance of payments position did not warrant resort to borrowings from the International Monetary Fund, the government quietly announced a fortnight ago that it had borrowed $ 74.4 million from the IMF under the facility of compensatory financing. The IMF's compensatory financing facility can be drawn upon by a member-country whenever its exports suffer a temporary setback from the trend observed in the previous couple of years. It is a great mystery, therefore, how the government of India has been able to prove to the IMF that the country's exports declined over the last year or so. DGCIS figures show spectacular performance by the export sector in 1972-73; and it has been claimed that exports in 1973-74 are likely to be higher by another 20 per cent. Even if aid-financed exports to Bangladesh are not taken into account, DGCIS statistics reflect a positive growth trend in exports, certainly no decline.

If despite this India has been allowed to draw on the compensatory financing facility, either some statistical jugglery

must have been used to prove to the IMF that exports have declined from their trend path or the IMF, which was experiencing a great slackness in its lending business since the currency crisis started in the middle of 1971, was prepared to relax its usual rigorous standards of scrutiny for appraising requests for loans. The IMF is equipped to provide temporary financial accommodation on reasonable terms to needy nations. That the floating exchange rate regime has so far minimised the need for countries to intervene directly on the market or to resort to borrowings from the IMF for augmenting their reserves position has no doubt helped India's request.

India's needs cannot, however, be satisfied by the meagre amount availed of through the compensatory finance drawings and India would have to approach the IMF again for further accommodation. The rate of interest to be paid on IMF borrowings, at 3 to 5 per cent, is relatively low and depends on the length of the period for which accommodation is sought. There is thus good reason why the government should give preference to drawings from the IMF over credits from the oil-exporting countries or borrowings in the Euro-currency markets. However, India has sought credits from Iran and Iraq for its import of crude from these two countries and the government has remained tight-lipped about the terms and conditions of these credits. Unconfirmed reports indicate that the price at which crude is to be supplied to India by Iran, for instance, is higher than what we would have to pay if we were not buying the crude on credit. Thus even if Iran agrees to an interest rate on its credits much below the rate ruling in the Euro-currency markets, the whole deal could yet prove costly.

Borrowings from the Euro-currency markets are inadvisable in view of the considerably higher rates of interests and the relatively shorter duration for which these funds are available. Interest rates are likely to harden further in the Euro-currency markets in view of the anticipated spurt in demand for funds. According to estimates made by the OECD, the industrially developed countries of the world would be faced with current accounts deficits of about $ 35-40 billion during 1974, primarily on account of the steeply rising crude import bill. A large number of European countries and Japan are planning to borrow heavily to meet their balance of payments deficits. France has just borrowed $ 1.5 billion on the Euro-currency market as its first instalment. The UK too has become a habitual borrower on the Euro-currency markets, and has already borrowed nearly $ 3 billion through its various public-sector undertakings, including public utilities, during the last one year. It is anticipated that the UK's borrowings from the Euro-currency markets would be much higher this year. Its current account deficit in the three months, November 1973-January 1974, was running at an annual rate of nearly $ 7 billion as against the deficit of $ 3.5 billion in 1973.

India may thus be forced to fall back on the IMF. That we would soon face a balance of payments crisis and would have to approach the IMF for a stand-by credit was evident as far back as in December 1972. If the IMF was not approached earlier it was because of favourable developments in the invisible account of the balance of payments. The Economic Survey for 1973-74 has conceded that "the fall in reserves in 1972-73 might have been greater but for the improvement in the invisible account due to reduction in leakages of foreign exchange", as a result of a fall in demand for foreign exchange for financing smuggling activities.

The delay in approaching the IMF may, however, prove costly. A large number of industrially developed countries, as mentioned above, are expected to queue up before the IMF for accommodation. Thus Italy has been already assured of stand-by credit of $ 1,200 million; the UK is expected to ask for a much larger stand-by credit, possibly in the range of $ 2.5 to $ 3.5 billion. It would not be surprising if by the time the government makes up its mind, the IMF is no longer flush with funds and we are, as a result, forced to borrow at heavier cost from other sources.

Nagaland

A Bad Beginning

THE strange goings-on in Kohima immediately following last month's elections in Nagaland deserve to be commented upon, if only to illustrate the limits of clumsiness to which New Delhi's emissaries to the country's outlying frontiers can proceed. Whatever contorted interpretations may now be placed upon the results, the Naga Nationalist Organisation, there is not the least doubt, has received a drubbing in the elections. The NNO has been New Delhi's protege, shored up by the Ministry of Home Affairs as good boys against Phizo's bad ones. The implicit contract was that the Congress would stay away and the Sema tribe, as long as it behaved, could have a free run in Nagaland through the NNO. It was thus the ruling party's surrogate in Kohima: most of the dirty work on behalf of New Delhi was done by it.

For the past ten years, the NNO was ensured an artificial majority in the state legislature through the device of the government nominating members for areas where elections could not allegedly be held because of disturbed conditions. This year, with the claimed for restoration of law and order, voters in these areas could no longer be denied the privilege of choosing their own representatives. The circumstances were nonetheless not entirely conducive to free elections. Battalions belonging to the Central Reserve Police, the Border Security Force, and the Eastern Frontier Rifles were marching up and down the state. Personnel of the Central Bureau of Intelligence were not altogether scarce either, apart from there being the fairly ubiquitous presence of the army.

The outcome of the elections has been altogether unpalatable to the government of India. The United Democratic Front, which is in favour of resuming a dialogue with the rebels, has won a fairly decisive victory. While the number of seats directly won by it fell short of a majority, it is on record that more than half-a-dozen of the candidates elected as Independents were supported by it. Following the elections, these Independent members signed a pledge and made a public declaration about their association with the UDF. In view of all this, the extraordinary conduct of the Governor in delaying the invitation to the leader of the Front can have only one explanation. The gimmickry of claiming to meet each of the successful Independent candidates and ascertaining their views is by now a standard device of procrastination; at least seven of them had already made clear where their preferences lay. Even otherwise, since the UDF had won 25 seats as against the NNO's 23, conventional decency too would have indicated that the former should have been invited straightaway to explore the possibilities of forming the government.

The gnat New Delhi was hesitating to swallow could not be more obvious. The leader of the UDF, Rano Shaiza, happens to be a niece of the rebel Phizo. To acknowledge her as the leader of the majority group, and to allow one of her nominees to take over

as Chief Minister of the state, would be tantamount to admitting to the world that the government's past policies in Nagaland are in a shambles. It could scarcely be a question of national security involved in the transfer of the reins of administration of a border state to a group whose friendliness toward the government of India cannot be one hundred per cent vouchsafed for. The back of the Naga resistance is already largely broken. The Union government has a hundred different instrumentalities to take care of the nation's security along the border. Kerala and West Bengal, among other states, have demonstrated the illusory nature of the delegatory powers enjoyed by the state governments, and a UDF regime in Nagaland can at most be a minor irritant.

The main issue standing in the way of the Governor's issuing a prompt invitation to it to form the government was therefore that of ego. The very thought of Phizo's niece reigning supreme in Nagaland must be galling to many in New Delhi. It is only following Rano Shaiza's warning that the Centre would have to suffer the consequences if the UDF was denied the chance to assume power that New Delhi relented. But grace was still missing; the Governor, altogether pompously, had to tell the press that he agreed to swear in the UDF ministers only on their having 'categorically assured' him to stand by the Constitution and integrity of India. The oath of office each minister has to take before assuming office itself contains a pledge to uphold the Constitution of the country; if the UDF is determined to act otherwise, an oral assurance to a peripatetic Governor would not hold it back. The Governor's negative gesture was therefore as pointless as it was unseemly.

This is hardly the kind of stuff reconciliation is made of, and the Angami and Chakesang tribes will now be free to reach their own conclusions. There could not be a worse beginning to what once promised to be a new chapter in Nagaland.

Jute

No Scope without Joint Strategy

Angus Hone writes :

INDIA and Bangladesh hold a virtual monopoly of the world trade in raw jute and manufactured jutegoods. A producer-based agreement between the two countries could be very effectively used, therefore, to raise prices and to expand marketing efforts, promote product usage, and co-ordinate research into crop yields and processing techniques.

The price of jute has been depressed in recent years and the overall market for jute has been declining as possibilities of bulk handling, paper and plastic sacks and packaging materials have made their indent in jute's traditional markets. Even the 'growth' jutegood of the 1960s — *viz*, carpet-backing — came under severe pressure between 1967 and 1972 from polypropylene-woven backings which were able to replace jute as primary backing material for tufted carpets: tufted carpets account for more than 90 per cent of the carpet market in the West. Jute retains a significant portion of the small market for woollen-woven carpet-backing. Jute is still the most important secondary backing used, although foam-rubber, acrylic latex, and polypropylene have reduced its share of even this market.

The outlook for jute seems to have been transformed, however, by the rise in the price of oil — the raw material for virtually all synthetic fibres and plastics — from $2 to over $8 per barrel. But not dramatically. Since the process by which oil is converted into carpet-backing is highly complex and the value-added by manufacturing or selling, etc, is high, the net impact of the initial rise in oil price is considerably dampened: Oil is first refined; naphtha is then converted into ethylene from which a number of polymers can be produced; a by-product of these processes is propylene, which is converted into polypropylene resin; the resin is then converted into tape and finally into the synthetic backing. The profit margins of the chemical companies and the backing manufacturers have been high even though the price of the synthetic backing has been pegged down to make it competitive with jute backing. The effect of the oil price rise will very likely be only a 25-35 per cent increase in the costs of polypropylene carpet-backing. This can be easily absorbed in the present profit margins, and need not be passed on through higher prices. The major gains of the oil situation for the jute from India and Bangladesh will not be in terms of price but in terms of availability.

Feedstocks and conversion capacity for oil will be desperately short in Western Europe, Japan and North America during 1974-76. The two jute-producing countries could, therefore, exploit this material shortage by holding prices and improving technical and marketing services to end-users. In 1972, India and Bangladesh supplied 955,000 tons of the total world exports of 1,230,000 tons; even of the residual exports the bulk comprised manufactures from Europe using Bangladesh fibre. The total value of jutegoods exports in 1972 was about $500 million; with improved prices, this rose to an estimated $560 million in 1973. Bangladesh exports an additional $150 million worth of jute fibre.

The Rs 500-crore jute industry, as between the two countries, has as yet no joint marketing strategy, no joint research programme, and virtually no programme for pricing or market-sharing. A year has passed, but the anticipated 'Jute International' is not yet established, nor has the meeting held in Dacca in January 1973 led to any carefully and jointly planned product strategy in key markets. Yet, 1974 could be a very good year for the natural fibres — provided the dominant supplying countries combine to maximise their long-term ventures for the various jute products: Oil-based synthetics have not been able to supply the total market requirements, and prices have risen very sharply at the margin.

Jute could, in fact, continue to be an important and growing source of export earnings for India and Bangladesh if the two countries work out a joint strategy on fibre production and yields and on shares of world markets for jute manufactures. This would have to be combined with a joint pricing and promotional strategy in the major markets to assist users and to compete with synthetics. On the other hand, in the absence of such policies, there will be continued price-cutting, as the output of Bangladesh carpet-backing is expanded and there is a gradual switch to synthetics in the United States and Western Europe. Today, the jute industry involves millions of farmers and over 300,000 mill workers. To safeguard its prospects the two governments must sign a producer-based agreement. Though India and Bangladesh can never constitute a jute producers' organisation parallel to or as powerful as OPEC and while the scope for raising prices is likely to be extremely limited, the likely gains from a joint strategy for the next seven to eight years are too crucial to be ignored.

Share Cropping

OUR attention was recently drawn to some comments made by Amiya Kumar Bagchi ("Some Implications of Unemployment in Rural Areas", *Economic and Political Weekly*, Special Number, August 1973) on our model on share-cropping published elsewhere ("Cropsharing Tenancy in Agriculture: A Theoretical and Empirical Analysis", *American Economic Review*, March 1971).

(1) Bagchi's major comment seems to be that the Bardhan-Srinivasan model implicitly assumes unlimited supply of land. He asserts, without proof, that "with conditions of land-scarcity in general, there will be no equilibrium in the market for leasing of land as specified by Bardhan and Srinivasan". This, we are afraid, indicates that he has misunderstood the model. Our model *explicitly* assumes the supply of total land as given; in fact each landlord is assumed in our model to have only one unit of land and in equilibrium the demand for land by tenants is exactly equal to this given supply.

In our model the tenant tends to drive the marginal product of land to zero — this may have suggested to Bagchi that land supply is not scarce. Actually in this model the price of land (service) is positive, even though the marginal product of land (service) is zero. This one may easily find out by varying the given amount of land specified in the model and noting the consequent change in total income.

(2) Bagchi approvingly quotes Gale Johnson ("Resource Allocation under Share Contracts", *Journal of Political Economy*, April 1950) where the latter gets around the allegedly unrealistic condition of zero marginal product of land under share-cropping by assuming that the rental share is a decreasing function of labour-intensity. This obviously goes beyond the competitive model, since each individual agent does not take the rental share as given but as something influenced by his own action. We have nothing against non-competitive models and in fact in order to capture some aspects of reality it is important to introduce some specific kinds of market imperfections (as we commented towards the end of our paper). All we wanted to point out is that if one takes a competitive model — and in this our frame of reference was the model of Cheung ("The Theory of Share Tenancy", University of Chicago Press, 1969) — one may not be able to escape the tenant's maximising condition of zero marginal product of land in the interior solution.

(3) A related point is that regarding allocational efficiency under share-cropping. Cheung claims that in a *competitive* model of share-cropping there will be no inefficiency in resource allocation. Bagchi contends that Cheung's conclusion will not hold "mainly because of deep imperfections in the different factor markets". This is somewhat irrelevant since nobody is disputing the inefficiencies following from those "deep imperfections". The question is: is there any extra source of inefficiency in the institution of share-cropping that will show up even in a competitive world? Economists have claimed for long that under share-cropping the tenant will not put in as much labour as he would otherwise. Of course this question of under-application of labour does not arise if the tenant does not have any choice in deciding how much labour he should put in either because (a) the landlord dictates it for him (and enforces it accordingly) or (b) the technology of crop production is such that there is no choice, e g, if there is a fixed-co-efficients production function. Cheung assumes (a) and therefore, by assumption, rules out the question of inefficiency. In justification of this assumption Cheung cites the clauses of some actual contracts in pre-Communist China (see pp 76-77 in his book) where the amount of tenant labour (in terms of "so many bodies of men") is specified in the share-contract. In our opinion this does not conclusively establish that even in those cases the tenant did not have any *ex ante* choice in the matter of labour application: (i) a contract is the *ex post* outcome of a negotiation — it cannot prove the lack of *ex ante* choice on the part of the tenant and (ii) specification of the number of "bodies of men" does not ensure the actual quantity of labour hours, not to speak of the quality.

It is quite possible that in the real world the landlord ensures that the tenant does not under-apply his labour by brandishing the stick of tenurial insecurity, the threat of stopping credit to him if the landlord is also a moneylender, etc. But then the model is no longer competitive as Cheung wants it to be. We may also note here that there are some economists who frequently assert in the same breath that landlords have monopoly power and that share-cropping is inefficient. If landlords have monopoly power they will usually be able to control the application of labour and other variable inputs by the tenant and share-cropping as such should not lead to under-application of these inputs.

P K BARDHAN
T N SRINIVASAN

Fumbling with the Oil Crisis

I FIND myself unable to agree with the editorial, "Fumbling with the Oil Crisis", in the issue of January 19. A case has been made out for India's inability to negotiate supplier credits and again, if such supplier credits are available, India's inability to service its debt.

Oil supplier countries have severe problems in finding investment opportunities for their oil earnings. Two areas have been recognised as suitable. The first being totally integrated manufacture of finished products, from oil and natural gas — refined products, petrochemicals and fertilisers. The second to develop industries based on high energy inputs — for example, integrated aluminium production from Indian bauxite; such production already exists in Bahrein. Potentially the oil producing countries could dominate world markets in these two areas.

India can assist by providing engineering, management and operating services in formulating and implementing such projects which would aid the regional development of the Arab world. India can also export surplus materials such as bauxite and iron ore for processing and re-export resulting in increased foreign exchange earnings.

The emphasis would be on India providing services, not only goods, for the regional development of the Arab world. India has definite capabilities in this area. Negotiation with the oil producing countries on this basis would be a useful lever in arranging long term soft loans for financing oil imports. On this basis, there is hope that appropriate credits can be obtained.

R PURKAYASTHA
Bombay

Progress against Heavy Odds

Hansavivek

ASHOK LEYLAND had to contend with a 25 per cent power cut from October 1972 and this was increased to 75 per cent in February 1973. On the removal of power restrictions in July last, production was stepped up to the "highest level ever reached", to offset the loss of production in the earlier period. The effort proved successful and in the year ended September 1973, AL's sales of Comets increased to 4,735 from the previous year's 3,651, of heavy vehicles to 495 from 197 and of industrial/marine engines to 523 from 186. Net sales were substantially higher and, with margins widened, gross profit more than doubled, even though over Rs 72 lakhs were provided for the full gratuity liability as at the year-end as against the actual accrual provided for in the previous years and also about Rs. 62 lakhs were set aside towards royalty payable to the holding company based on the figures for the year apart from that paid on the basis of the figures for the previous year in accordance with the method hitherto followed. Borrowings were brought down by a crore of rupees and the ratios of inventories and wages to sales showed substantial declines over the year.

The programme to increase production of Comets to 10,000 per annum and to further increase the indigenous content of the company's products is being carried out. Capital expenditure of Rs 289 lakhs was made last year.

Exports were not satisfactory last year, but efforts are being intensified this year. Total firm orders received up to the second week of January were already 300 per cent of the level achieved in 1972-73. The company has also started to export components to the UK. A testing centre is being built up gradually in the research and development department and facilities have already been provided for testing bought out items such as electrical equipment, oil seals, bearings, shock absorbers, radiators, cooling fans, propeller shafts and gearboxes.

The company has developed and supplied to the army a medium gun-towing tractor chassis which is in regular production. A prototype of a heavy gun tractor is under trials. The 10 and 16-ton dumper vehicles, developed by the company on its own, are in great demand in the market.

The company has fared even better in the current year so far. According to S Ranganathan, chairman, despite a severe shortage of raw materials and ancillary items, the company produced and sold almost 2,300 vehicles in the first 4 months. This is an all-time record. He, however, is not sure whether the company will be able to maintain production and sales at this level in view of the ever-increasing problems of obtaining raw materials and bought out components, etc. He says that production of commercial vehicles in the country is limited due to various constraints and that only AL and one other manufacturer are producing at over 80 per cent of installed capacity. Demand is growing and government is keen that investments already made in this key sector must be allowed to earn reasonable returns. The chairman adds, however, that there has been a sharp rise in prices of all items used in the automobile industry such as steel, copper, aluminium and other non-ferrous metals and forgings and castings. Besides, the industry is dependent on a large number of ancillary suppliers. Unless, therefore, there is all-round price discipline, it will be extremely difficult to hold the prices of the end-products alone. Ranganathan hopes that, as a result of the current discussions with the Ministry of Heavy Industry and the Bureau of Industrial Costs and Prices, there will be a satisfactory solution to the problem which, while providing a certain amount of price stability to consumers, will also leave adequate retained surplus to be canalised for the long overdue replacement of old equipment and for investment on plant and machinery for increased production. The company is seeking government sanction for import of plant and machinery valued at about Rs 150 lakhs required for expansion.

ANDHRA SUGARS has secured an industrial licence to double the crushing capacity of the sugar factory to 5,000 tonnes per day and a 'letter of intent' to expand capacity of the caustic soda unit from 100 to 140 tonnes per day. The expansion of the sugar factory has been taken in hand and is expected to be completed within 2 to 3 years. Meanwhile, the company installed last year two mills for dewatering purposes and added this year four evaporators. Last year the company crushed 3,81,731 tonnes of sugarcane and produced 3,71,042 quintals of sugar with an average recovery of 9.72 per cent as against 3,45,362 tonnes of cane crushed and 3,50,310 quintals of sugar produced with a recovery of 10.14 per cent. The company produced 16,644 tonnes of superphosphate against 14,085 tonnes previously. Production of sulphuric acid was 5,799 tonnes against 6,584 tonnes. The cost of production this year may go up "substantially", as MMTC has stepped up prices of imported rock phosphate and sulphur. The distillery produced 44.18 lakh litres of industrial alcohol against 38.33 lakh litres. Production of acetic and anhydride was 548 tonnes and 634 tonnes against 325 tonnes and 446 tonnes, respectively. Production this year is likely to be higher because of regular allotment of alcohol to the plant. Demand for these products has also gone up. The ethyl acetate unit produced 456 tonnes against 315 tonnes. The two caustic soda units produced 7,984 tonnes against 10,396 tonnes, the output having been affected by the heavy power-cut. With the contribution from the second unit, which was commissioned towards the end of September last, production of caustic soda is likely to be higher this year. The chlorosulphonic acid unit could produce only 35 tonnes on account of shortage of raw material and certain technical problems, but is likely to show a better performance in the current year. The overall results of the company have been satisfactory, with modest increases in sales and gross profit. Net profit was considerably higher owing to saving in tax. Part of the dividend, maintained at 12 per cent, is expected to be exempt from tax. The distribution is covered more than four-fold.

ALFRED HERBERT (INDIA) has submitted to government revised proposals for manufacture of machine tools. The company received approval for manufacture of rubber processing machinery, but out of 7 items included in its application for manufacture of a selected range of machine tools, approval was received for only two items. There has been a delay of about 3 months in the construction of the company's factory building at Bangalore on account of non-availability of certain construction material. There was also a considerable delay in receiving licences for imported machine tools. In addition, the main suppliers of foreign equipment informed at the last minute that machines would not be available under deferred-payment terms. Alternative arrangements are being made for financing the purchase of these machines. The company expects to be largely involved in assembly during the first year of manufacture. The management expects the setback in the country's industrial production to continue in the current year not only because of the acute shortage of steel and other industrial raw material and power-cuts, but also because of the international oil crisis. It is felt that investment expenditure is likely to show some reduction causing an adverse repercussion on the demand for machine tools and industrial machinery. Even so, sales of the company should increase this year because of the wider range of machine tools and industrial machinery that it is now able to offer. During the year to October last, orders received advanced by 24 per cent to Rs 551 lakhs while sales increased by a mere 3.5 per cent to Rs 382 lakhs. This was mainly due to the disruption on account of industrial unrest for a period of 2½ months at the factories of the main supplier. Margins shrank and earnings were lower than in the previous year. Dividend, maintained at 10 per cent, was covered 1.75 times against 2.33 times previously.

RECKITT AND COLMAN OF INDIA has been allowed deregistration as a 'dominant undertaking' within the meaning of the MRTP Act. The company's plant for the manufacture of soluble analgesics was commissioned last year and the product under the brand name 'Disprin' introduced in selected markets. The first phase of expansion and modernisation of the ultramarine factory at Dhadka was also completed. The additional capacity provided for sizeable exports and also contributed to domestic sales. A plant for manufacturing Para Chloro Meta Xylenol, the basic ingredient of 'Dettol', has been set up to develop self-reliance. Previously PCMX had to be imported. The company produced good results for the year to October, with higher sales and earnings though gross margins were a little lower. Over the year, borrowings were reduced and the ratio of inventories/sales came down. Dividend is stepped up a point to 12 per cent. The accounting year has been changed to conform to that of the holding company in the UK. The current accounting period will cover 14 months upto January 4, 1975.

WHITCO, a new company, is establishing a synthetic detergent plant at Kalol in Gujarat with a capacity of 10,000 tonnes per annum. The plant is expected to go on stream by May next and the management hopes that it will produce about 4,000 tonnes in the first year and reach the installed capacity in the third. The project cost, estimated at Rs 118 lakhs, is proposed to be met chiefly by share capital (Rs 33 lakhs), loans (Rs 53 lakhs) and deferred payments (Rs 29 lakhs). The main raw material is alkyl benzene, which is at present imported, but is expected to be produced by Indian Petrochemicals by 1975-76. According to P B Dave, chairman and managing director, the company's turnover will rise from Rs 220 lakhs in the first year to Rs 610 lakhs in the third and gross profit from Rs 26 lakhs to Rs 107 lakhs in this period and shareholders could expect a dividend out of the profits of the very first year of production.

Post-Election Thinking

Romesh Thapar

THE reverberations of the recent elections are going to be felt for some time. At the moment, the reaction is amusing. The so-called situation-watchers are baffled that the Congress party has done so well in these wretched times, particularly in Orissa. As for the Congress chieftains, they had given up Orissa for lost and concentrated on Uttar Pradesh; the UP result, considering the input of time, talent and finance, has proved very disappointing. All in all, Indira Gandhi can still pull the votes, but the magnet is beginning to lose its power.

It is clear that the Congress party is unchallenged where the scheduled caste vote is concentrated. In addition the women are still, despite the crushing inflation, unable to see an alternative to "Indiraji". These two factors salvaged the ruling party. Had the Muslim vote operated traditionally, a comfortable majority would have been thrown up. This pattern is likely to prevail in the heartlands, so long as Gujarat-like situations do not develop. I say this because even in UP there is talk of teaching the manipulative Congress a lesson in the streets.

The Prime Minister must be relieved to find a wafer-thin majority. At one stage, this majority appeared most unlikely. Then, with a Congress-Communist alliance mooted, the fat would have been in the fire. Within the messy Congress party, powerful groups resent the dependence of the party on the Communists who are considered "untrustworthy" and "opportunist" — and the variety of CPI alliances and and adjustments certainly suggest this. As for the CPI, it would have been a traumatic experience to get involved with a Congress government in the explosive Uttar Pradesh situation. Better to be bandwagoners.

Other trends are also discernible in these elections. First, there is the rejection of revivalist parties like the Jan Sangh, which seek all-India status, and a marked preference for local formations. This marked development in eastern India found a reflection in the revival of the Jat-based BKD in Uttar Pradesh. Second, the utter irrelevance of the Swatantra line. It just doesn't seem to make any sense to anyone. Third, the frustrations of the Muslims and other minorities may well be mobilised by the new formations in the states. Fourth, no meaningful radicalism has arisen to challenge an unsatisfactory *status quo*. The demand is essentially for more efficient, responsive government.

The inflationary spiral, now reinforced by the budgeting of the Indira Gandhi government, is certainly going to spark a series of changes in class and caste alignments which will find their reflection in day-to-day politics. At our present level of performance, a price rise of 40 per cent a year is forecast. Imagine the turbulence in store for the country so long as it pursues the present mixed up policies, and the political will is lacking to order the correction.

Observers in the Capital are keeping their fingers crossed hoping that with the conclusion of this round of elections the Central leadership will move to order co-ordinated action to salvage the economy. The possibility that an obsession may develop over the Gujarat situation, where elections could be forced during the summer months and before the presidential election in August, is strong despite the expulsion of the notorious Chimanbhai Patel. The people of Gujarat, despite the unsubstantiated charge of Jan Sangh conspiracies, seem determined to deliver the Congress party a massive defeat. So far, a localised political formation, cutting across the familiar party labels, has not taken shape. It will be interesting to see what happens.

Those who keep their eyes on problems, and they are not a few in the labyrinth that is the GOI, have been so demoralised by election diversions and such like that they are convinced that we will just keep plodding along. The recent budgeting shows a lack of capacity to follow through any idea which is going to transform our jhuggi-jhompri situation. Even the titillators, who believe that a major Cabinet reshuffle is in the offing, are reluctant to get too excited. Cabinet reshuffles only excite the lobbyists who have files to process. The people want a purge of the corrupt and incompetent, and they want to see new faces.

Indira Gandhi, now that she has proved her continuing political relevance in this year of wretchedness, has a sizeable job ahead of her. The Congress party can no longer function in the manner that comes most easily to it. A new style of functioning will have to be evolved — and behind the new style, a new temper of co-ordinated administration, planning and implementation. The days of invocation and the "big lie" are fast disappearing. The mob is becoming hard-headed and can turn hostile within a matter of months. This thought should haunt Indira Gandhi.

Looking over one's shoulder there's Bangladesh with many more lessons . . .

March 4

TENDER NOTICE

Government of Tamil Nadu State

Agriculture Department

Chepauk, Madras 600 005

The Director of Agriculture, Agriculture Department, Government of Tamil Nadu State, invites tenders, for and on behalf of the Governor of Tamil Nadu State, from manufacturers and suppliers in the member countries of the World Bank and Switzerland, for supply of the following items of Well Drilling Equipment.

Sl. No.	Name of the Equipment	No. Required
	(a) *Well Drilling Equipment*	
1.	Hammer drill 200 psi	4
2.	Percussion drill	6
3.	Air Compressor 200 psi	10
4.	Hammer 200 psi	10
5.	Mud pump	10
6.	Hammer 100 psi	20
	(b) *Spares*	
7.	Drilling bit	100
8.	Drilling Jar	50
9.	Hammer bit (100 psi)	50

2. Indian manufacturers of the above mentioned equipment are also eligible to bid and will be given a price preference of 15 per cent, in the comparison of bits *vis-a-vis* the foreign bidders.

3. The Government of India have received a credit from the International Development Association in various Currencies equivalent to US Dollars, 35.00 million towards the cost of the Tamil Nadu Agricultural Credit Project and it is intended that portions of proceeds of this credit will be available for payments under the contract(s) for which this invitation to bid is issued. Payments by the IDA will be made only on approval by the IDA of an application presented by the Government of India in accordance with the terms and conditions of the Credit Agreement and will be subject in all respects to the terms and conditions of the Agreement.

4. The import licence will be obtained by the Director of Agriculture and payment of foreign currency cost and rupee cost will be arranged to be made by the Director of Agriculture as per procedure stated in the tender papers.

5. Those who are interested are requested to obtain copies of the tender papers from the Office of the Director of Agriculture on payment of non-refundable fee of Rs. 100/- per set.

6. The last date of receipt of tenders is 1.00 PM on 17-6-1974 in the Office of the Director of Agriculture and the tenders shall be opened at 3 P.M. on the same day. If 17-6-74 is declared a holiday, then the tenders shall be received upto 1 P.M. on the next working day and opened at 3 P.M. on that date.

7. Tenders will be opened in public, read aloud and recorded in the Office of the Director of Agriculture.

Director of Agriculture,
Chepauk, Madras 600 005.

Dated 25-2-74

Calcutta Diary

A M

TAILS you lose, heads I win. Nobody in New Delhi bothered when the Wanchoo Committee recommended demonetisation; in fact, much energy was at one point expended to suppress the fact that, scandal of scandals, it had been foolhardly enough to make such a recommendation. Never mind, the Committee has its residual uses. Rates of personal income tax have to be lowered for the affluent ones. It is a palpably regressive step, and mocks the draft Fifth Plan's well-intentioned inanity about reducing the absolute level of consumption of the top 10 per cent of the community. Like the polemicists never at a loss for a quotation from Marx, Lenin — and — if you will — Stalin or Mao Tse-tung, whatever the position to be defended or refuted, the government too can always come up with a justification for whatever sleight-of-hand it is currently indulging in. The not-much-lamented Wanchoo Committee's report is therefore dusted up. Quote scriptures, and you will be forgiven your disreputable meanderings.

Anti-Egalitarian Exercise

There could rarely be a more anti-egalitarian exercise. A poor clerk or artisan, reeling under the impact of inflation, will get nothing out of the slashing of the tax rates; a rich industrialist, with an annual personal income of 10 lakhs of rupees, will get something like an extra one and a half lakhs bulging in his pocket. The nearly sixty crores of rupees worth of revenue thus given up at one stroke can be recouped only through additional excises, or additional deficit financing. The consequences of either will be severest for the poorest sections; they will have to bear the burden of the government's generosity to the rich. The theory is of course well known: following the lowering of the marginal rates of taxation, tax-evaders will undergo a change of heart, this will lead to a proportionately larger collction of revenue, and what the government will lose on the rates swing will be gained back on the realisation roundabouts. In the present permissive climate, no such thing is likely to happen: having tasted blood, the habitual tax-dodgers will on the contrary now go for a larger kill, and the demoralised government will watch from the sidelines.

Smokescreens are nonetheless smokescreens. It has decided to raise the rates of the wealth tax, the government claims, as counter to the lowering of the personal income tax rates. Must one abdicate one's sense of proportion? Pray, how much extra revenue is going to be netted from this measure, anywhere near the sixty crores of rupees that are being given up? In a full year, the adjustment in the wealth tax rates is unlikely to yield much more than nine crores. This, who knows, is perhaps what is known as the Law of Unequal Exchange. Other such examples of diversionary tactics — increases in the imposts on cars, refrigerators and air-conditioners — are also there. The budget comes down heavily on the rich, screams the obliging headlines in the class-aligned newspapers. Does it? How many, even amongst the rich, buy new cars, refrigerators and air-conditioners every day? Ordinary men and women, on the other hand, have to battle with the inflation every second of every minute of every hour of every day.

In parliamentary democracy, politeness ought to be *uber alles*. It may therefore be considered ungentlemanly to say so, but could it be that those who put the Budget together had themselves, almost exclusively, in mind? Industrialists, surplus-raising farmers and traders are not afraid of inflation; they have nothing to lose but their inhibition to mulct, even more fiercely, the rest of society. It is the small farmers without any surplus to sell, the unorganised landless cultivators whose real wages keep shrinking, the urban working class whose compensation for the price rise is always partial and always with a time-lag, and the fixed salaried groups, who are at the receiving end when prices begin to spurt. Class interests being class interests, of all these groups, only the top layer of the fixed-income category is usually offered some hedge against inflation by the government. So it has been with this Budget. Till now, for example, a so-called senior civil servant was getting tax relief to the extent Rs 2,900 annually — Rs 2,400 for his car and Rs 500 for buying books; because of the gesture announced on February 28, he will get a further relief of Rs 600, over and above what he will in any case get from the across-the-board reduction in tax rates.

The Kind Budget for the Rich

The richer you are, the kinder the Budget has been for you. A new philosophy has been ushered in. Enough is enough, socialist evocation has had its day, somehow industrial output has to be pushed up, there is no other way of either reviving general

economic growth or curbing prices. So placate the affluent, restore their confidence in you, in such uncertain times you must not throw away the trust of those whose class interests are closest to yours.

Dyke is Burst

But will it click? Will industrial output pick up? Even assuming that the comfortably placed have investible funds tucked away here and there, what higher law of patriotism will induce them to bring these out and pump-prime growth? If the rate of inflation remains what it is at present, resources will continue to yield much more if sunk in speculation. And if the rate of inflation remains what it is, threats and cajolings and moralisings will be of no avail, organised labour will continue to be disgruntled. The Budget, after all, does not make the least pretence of being anti-inflationary. The uncovered gap of Rs 125 crores is only a curtain-raiser. Simply apply the rule of three: if last year's initial gap of Rs 87 crores could end up into a final tally of Rs 650 crores — and that too after some fudging —, a deficit of Rs 125 crores to start with assumed for next year could reach anywhere around Rs 1,000 crores by the time it is the ides of March, 1975. For consider the ingredients of the assumption. Food subsidy is being promised to be brought down from around Rs 250 crores this year to Rs 100 crores next year. How? Even before the season has properly commenced, Maharashtra has raised, unilaterally, the procurement price of wheat to Rs 105 per quintal. The gentlemen-farmers in the north-western parts of the country will now demand as much, if not more, for their wheat; after all, despite the final outcome of the elections, Charan Singh and his ilk remain in full cry in Uttar Pradesh, and their comrades-in-thought are unlikely to lag behind in Punjab and Haryana. If 5 million tonnes of wheat are to be procured in the coming months, this itself may thus cost Rs 100 crores more to the exchequer, unless issue prices are to be further raised. And the ripple is bound to reach rice and paddy and jowar and maize. If issue prices are raised, cost of living goes up, so that more and more dearness allowance is to be handed out. The Budget piously sets aside Rs 120 crores for additional payment of dearness allowances during the year. Depending on how the inflation progresses, the ultimate figure could be three times as much: New Delhi had for long maintained the fiction that if state governments want to offer their employees dearness allowance at the Central rates, that is their business, they must not however expect any additional financial assistance from the Centre on this score. This high principle has been scuttled this year for the sake of ensuring Hemavati Nandan Bahuguna's continuance as Chief Minister of Uttar Pradesh, where the state government employees were promised last December dearness allowance at the Central rates. The dyke is now burst: since UP's need for extra funds is to be met by New Delhi, each of the other states will also decide to be generous at New Delhi's expense.

The merry season was already on because of the elections. It will now extend. Some other pretensions will gradually fall by the wayside. In view of the ample provisions made by the Finance Commission in the matter, there is no further need, according to the Budget, to provide for relief to the states on account of natural calamities. Just you wait. Gujarat's affections have to be bought back. Besides, if 1974 is here, can 1976 — when the drama of Lok Sabha elections will have to be enacted — be far behind? Alibis will therefore not be lacking to pour money into the states. If not anything else, one should always be able to think up such sturdy perennials as emergency programmes for raising the output of farmers or lowering the magnitude of unemployment amongst the educated.

So there it goes. You scan the hapless Finance Minister's Budget speech. The usual collage of cliches apart, it does not mention one concrete measure about how to bring down prices. The notion of alienation has been lifted to the highest possible plane: the Budget has been assumed to be totally dissociated from the processes of the economy, and perhaps *vice versa*. Haven't you taken note of the official spokesman's claim that its impact on cost of living will be 'negligible'? A more honest statement will be difficult to come by: cost of living will, rest assured, keep mounting despite the Budget.

It is witticism of a particularly ghoulish species that the Budget still finds space to talk of the Plan, which, malicious gossip notwithstanding, apparently still exists, *vide* speeches of ministers on the floor of Parliament. Even in terms of the draft Fifth Plan's scheme of financial outlay, public expenditure on the Plan in 1974-75 should have been larger by more than Rs 1,000 crores than what it is likely to be in the year now ending. As laid out in the Budget, the proposed rise in money expenditure is only about half of that, and that too as a result of some accounting gimmickry with the provisions for depreciation. As months proceed, the actual Plan outlay is likely to be even less, for, by then, the exigencies of the short-term would begin to pre-empt most of the government's available finances.

Expenditure on Armed Services

But at least something has been salvaged from the ravages of inflation. Others abide the questions, the defence outlay is free. From year to year, expenditure on the armed services, that greatest holy cow, after Mahatma Gandhi's concept of non-violence, in the Indian polity, has been raised. Nearly 5 per cent of national income, yours and mine, will be spent on guns and tanks and missiles and destroyers and fighter-bombers and contractors' cuts. You have no right to ask, what for. For ensuring external security, someone has convinced New Delhi two reasonably hostile Islamic countries across your border are better than one. If yor are still determined to stay facetious, maybe you should be reminded of the Emergency and the Defence of India Rules. That war in December 1971 was on for a bare thirteen days, from the third till the sixteenth of the month, and Sheikh Mujibur Rehman has now promised to mediate between us and Pakistan. So what, our government has the prerogative to feel insecure, and hence blow as much money as it wants on military toys. As personal income tax rates have been brought down, even if prices have not been, the leader-writers in newspaper offices will cheer it and its Budget along. At least for the next couple of months.

Cynicism, let it be readily admitted, leads to nowhere. But to what heights of positive thought is this Budget capable of lifting one? The fault, dear Cassius, is not in ourselves, but in the philosophy of our ruling class, which asserts that the cure for runaway inflation lies in allowing the rich to retain more of their excess profits.

THE BUDGET

A Tale of Two Committees

ACCORDING to all objective assessments made so far the Wanchoo Committee's Report was shallow and superficial. Yet this is the one Report that the government has taken closest to its heart. Compare to it the fate of the Report of the Committee on Taxation of Agricultural Incomes. A comparison of their major recommendations is instructive. The Wanchoo Committee had found that the evasion of direct taxes was not only high but mounting over the years. So it recommended that the best way of tackling the problem of evasion was to reduce the rates applying at the highest levels. The Committee noted that the non-taxation of agricultural incomes was inequitable and also provided a ready avenue for evasion of income-tax on non-agricultural income. So it recommended that agricultural income should be aggregated with other income and taxed as such. The Wanchoo Committee noted also that "the institution of the HUF is widely used for tax avoidance" but still recommended that the HUF should continue to be treated as a separate tax entity, though it should be taxed at higher rates than individuals. Also, it was brought to the notice of the Committee that even among 'individual' tax-payers there was a widespread practice of diverting their incomes to members of their families, but the Committee could not bring itself to recommend the clubbing of family incomes.

The Raj Committee was to concern itself only with the taxation of agricultural incomes, but some of the major problems it faced were no different. Accepting that the exclusion of agricultural incomes was inequitable, the Committee found that mere aggregation with non-agricultural income might not effectively reduce the inequity. So it suggested separate taxation of agriculture. On the question of calculation of taxable agricultural income, the Raj Committee opted for what may be called presumptive income based on the productivity of land which is objectively measurable rather than rely on the individual assessee's statement of his actual yearly earnings. The Raj Committee too had to contend with the questions of HUFs and clubbing of family income. On both these questions, it made very clear recommendations rejecting the Wanchoo Committee's approach. The Raj Committee suggested total de-recognition of HUFs for tax purposes because in its opinion the Wanchoo Committee's solution of taxing HUFs at higher rates could be easily circumvented. As regards clubbing of family incomes for purposes of taxation, the Raj Committee regarded it as a most necessary as well as desirable reform.

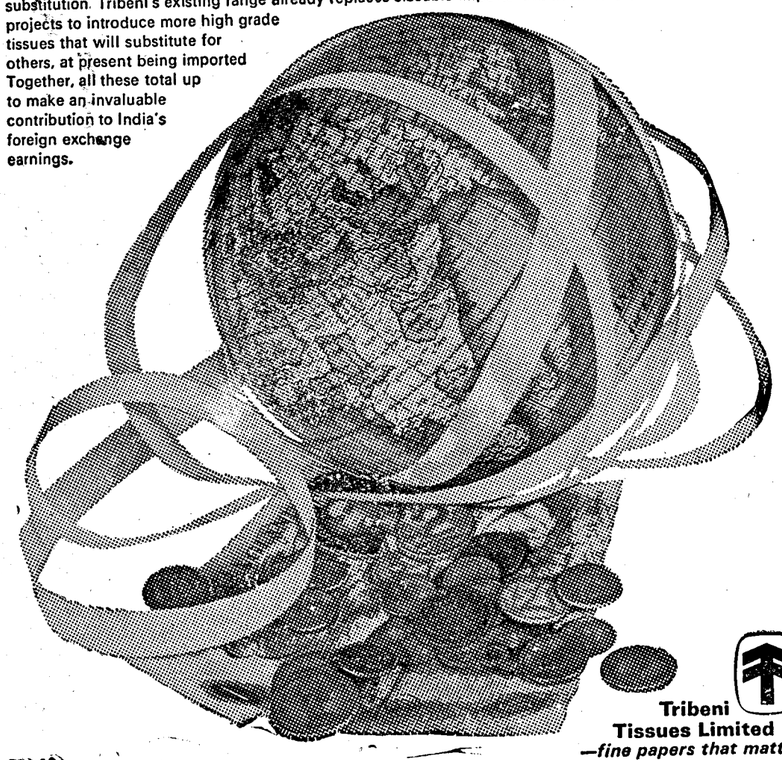
The latest Central Budget, however, puts its final seal of approval on the Wanchoo Committee's recommendations in absolute disregard of the Raj Committee's arguments to the contrary. The drastic reduction in the rates of income tax applying to the highest slabs of income is evidently the culmination of the process started some time back of implementing the Wanchoo Committee's proposals. As far as the 1974-75 Budget is concerned, this is the single thread by which it hangs; everything else in the Budget follows from it.

In the space of a little over four years and five budgets (including the interim budget presented before the 1971 elections) Y B Chavan has reversed his position on income tax rates. In his 1971 interim budget he had spoken of "larger social objectives" and the need to "redistribute incomes and wealth by suitable changes in the fiscal system". He not only raised the personal income tax rate from 82.5 to 93.5 per cent but also referred to "the task of widening and deepening the resource base" and of enlarging the tax base. Later he raised the personal income tax rate further to 97.75 per cent. Of course, he never applied himself seriously to reforming and enlarging the tax base.

Now the highest rate of personal income tax has been scaled down to 77 per cent on the strength of the Wanchoo Committee's recommendation. The Wanchoo Committee had expressed the view that "prevalence of high rates is the first and foremost reason for tax evasion because this is what makes the evasion, in spite of attendant risks, profitable and attractive". The Finance Minister has evidently been won over to this point of view. But "in order to ensure that the effectiveness of the fiscal instrument for reducing disparities in income and wealth is not impaired" he proposes both to increase the rates of wealth tax as well as "to rationalise some of the exemptions available at present under the Wealth Tax Act". Thus he appears to be balancing the one against the other. But does he? The changes in the wealth tax yield only Rs 9.5 crores in a full year while the reduction of rates of personal income tax are to cost Rs 60 crores. A nice balance indeed!

Of course, Chavan is hopeful that there will actually be no loss of revenue on account of the reduction in income tax rates as he expects that the reduction in the rates of taxes will lead to better tax compliance, and full disclosures of incomes by all tax payers. What this really amounts to is to expect that a person who was formerly paying 97.75 rupees by way of tax on his declared (or detected) income of Rs 100 will, now that he would have to pay Rs 77 by way of tax, disclose a further Rs 27 so that the exchequer can collect an additional Rs 20.75. This might have happened if the reduction in tax rates were backed by an effective measure or two to widen the tax base.

Perhaps what the Finance Minister really meant was that with the coming into effect of the Taxation Laws (Amendment) Bill, 1973, the enforcement of the tax laws would become more effective and as a result enough additional revenue would accrue to make up for the loss on account of reduction in income tax rates. But then he ought to be aware that serious doubts exist not only about the rationale but also the revenue implications of the major provisions of the aforesaid Bill.



Take, for instance, the provision in the Bill allowing non-salary earners a deduction of upto 5 per cent for house rent (excess of house rent upto 15 per cent over and above 10 per cent of total income, subject to a maximum of Rs 300). This provision is based on the Wanchoo Committee's recommendation and is ostensibly intended to place non-salary earners on an equitable footing with salary earners. But surely no one can seriously suggest that in the matter of income taxation the balance of advantage ever lay in favour of salary earners in comparison with non-salary earners. Even in countries with far more effective taxation of personal incomes, salary earners are at a disadvantage *vis-a-vis* non-salary earners for the single most important reason that the former do not enjoy the privilege of

Light weight tissues that are big earners in 10 export markets!

Tribeni Tissues export one-sixth of their total output.

Not surprising. Because Tribeni Tissues' expertise goes a lot farther than manufacturing tissues that match up to world standards. Knowledge of international markets coupled with pioneering experience in introducing tissues in India enable Tribeni Tissues to successfully meet the needs of countries with similar marketing conditions. To earn big money returns.

Add to this the vast sums of foreign exchange saved by Tribeni Tissues' successful import substitution. Tribeni's existing range already replaces sizeable imports and in hand are projects to introduce more high grade tissues that will substitute for others, at present being imported. Together, all these total up to make an invaluable contribution to India's foreign exchange earnings.

Tribeni Tissues Limited
—fine papers that matter.

TTC-3R

returning their income. The proposal now made that salary earners getting Rs 1,500 a month and less would not be required to submit returns is a mere sop and does not meet this point. It only relieves the Income-Tax Department of some bother and that too only if one accepts that these returns were at all being attended to it in the past. That consideration apart, the cost to the exchequer is conservatively estimated at Rs 30 crores of just this provision.

Then there is the provision to allow deduction of interest on loans taken for paying taxes, again as recommended by the Wanchoo Committee. This is a measure which is open to considerable abuse. Even on its merits, the measure's rationale is highly questionable because the accepted principle of deduction is that the items of expenditure must be one which is incurred in the earning of income. Again, to put it conservatively, the cost to the exchequer of the provision might be of the order of Rs 20 crores a year.

True, the Taxation Laws (Amendment) Bill contains much more than that. But will it help the exchequer to bring in some sizeable additional revenue? Neither the Finance Minister nor any of his spokesmen has come up with such an estimate, though one hears corridor talk that the government expects to collect about Rs 300 crores a year additionally when the provisions of the Bill come into effect. If this rumour is correct, then the government is being taken for a ride as it has been in the past in the matter of measures adopted from time to time whereby the tax authorities were given the widest powers which they never really invoked effectively enough. It must be conceded though that such measures did raise the possibilities of blackmail and therefore the scale of hush money and bribes.

FIELD DEMONSTRATIONS

Ineffective Show-pieces

THE National Demonstrations, regarded by the government as the king-pin of the extension strategy to spread HYV-based technology in the rural areas, will complete 10 years of its existence this year. The period is long enough to evaluate the 'demonstration effects' of the programme.

Field demonstration of agricultural innovations is a valuable tool in the extension man's kit. The demonstration method has been extensively used for educating the farmers in the country ever since the 'compost pit' days. But field demonstrations have assumed new importance with the introduction of the HYV-based new technology. This technology calls for greater precision, punctuality, and standardisation of farm management practices less crucial to traditional farming, and field demonstrations are best suited to communicate these requirements to the farmers.

Nation-Wide Programme

It was thus in 1964, on the advice of its panel of scientists, that the Ministry of Food and Agriculture initiated a nation-wide programme of demonstrations known as 'National Demonstrations on Major Food Crops' as a component of the New Strategy in Agriculture. These demonstrations were different in three major respects from the demonstrations that were already being conducted by our extension agencies. First, the demonstration would be conducted by the scientists themselves. Secondly they would be conducted on the fields (one hectare plots) of the actual cultivators. And thirdly, there would be specific yield targets and no control plots. It was assumed that the striking contrast between the crop in the demonstration plot and that in the rest of the area of the whole block would ensure the desired impact on the farmers.

In 1966 the Department of Agriculture in the Ministry of Food and Agriculture decided to have, as part of the International Rice Year Programme, 1,000 demonstrations for rice alone. The demonstrations were said to have proved 50 effective, that it was decided to continue them as 'first-line demonstrations' by the research workers. The administrative responsibility for them was transferred from the Department of Agriculture to the ICAR. Since then the ICAR has operated the All-India Co-ordinated Project on National Demonstrations.

The ICAR has added several dimensions to the programme. The whole approach of the National Demonstrations Programme has been re-oriented by introducing the concept of 'productivity per day of crop stand' in place of mere productivity per acre. Multiple cropping — the greatest natural asset of the tropical and sub-tropical areas — has been made the key-note of the demonstrations. Consequently, demonstrations now cover practically all field crops, including vegetables. In 1968, the demonstrations were extended to the unirrigated areas too. Demonstrations on problem soils, e g, saline soils, etc, have also been added. Thus, demonstrations now aim to go beyond the HYV-technology to other technological innovations relating to dry farming, problem soils, etc. To make the demonstrations more effective, the farmers' training programme too was reoriented in 1970, to centre around the demonstrations. In 1971-72, nearly 28,400 farmers were involved in the programme in 24 districts in eight states. In the same year, 1,731 national demonstrations were conducted throughout the country. There were 57 agencies — agricultural universities, colleges, central institutes, and some state departments too, collaborating in the programme. Of the total, 769 and 943 were three-crop and two-crop demonstrations, respectively; only 19 were single-crop demonstrations. Wheat was covered by 1,337 demonstrations. Paddy was covered by 1,238 demonstrations. Other important crops included in the demonstrations were maize (269), bajra (265), moong (215), jowar (95), and groundnut (130). The potential of the new technology and methods of harnessing it were demonstrated through one-hectare plots — including on the problem soils — in districts throughout the country.

Forerunners of Changes

The National Demonstrations are claimed to be the forerunners of changes, as an effective mechanism for linking the scientist with the extension worker and the farmer, and as a necessary channel for facilitating the two-way flow of information between farm and laboratory. However, if the actual field experience is any guide, the above claim would have to be qualified.

The demonstrations are certainly a step towards bringing the farm scientists out of their ivory towers to test for themselves the validity of their recommendations on the cultivators' fields. Similarly, the demonstrations have been able to persuade the farmer as to the miracles the new technology can perform — given adequate resources and technical support. But if their real success lies in the 'demonstration effect', to be judged by the extent of

adoption of the demonstrated package of technology by the farmers, then we find that with respect to this crucial test the national demonstrations have not been successful. Their success seems to have been restricted mainly to popularising the HYV seeds in the initial phase.

Indeed, there are no data available to evaluate the success of the demonstrations by the criterion of actual adoption of the demonstrated package. The ICAR's own reporting system is completely silent on this. It indicates the success of the demonstrations only in terms of the production on individual plots in relation to the targeted production on them. The reports underline that most of the plots have exceeded the targets; the percentage of such plots was 87, 69, 80, 78 and 59 in the case of paddy, wheat, maize, jowar and bajra, respectively, in 1971-72. In the case of groundnut, jute, and tobacco, the corresponding proportions were even higher — above 90 per cent. Average yield (quintal per hectare) was 55.18, 45.01, 39.17, 42.61 and 26.61, respectively, in the case of the major foodgrains listed above. These yields were substantially higher than the normal yields in other areas.

Slow in Adopting New Technology

Had the basic premise, that the farmers having seen such sharp contrast in the crop yields on demonstration plots and on other farms, would readily adopt the demonstrated technology, been true then the adoption of the package of new technology including multiple cropping, etc, should have been highest in the areas saturated by national demonstrations — mostly around the agricultural universities and central institutes — in the various states. In fact, however, even a casual observation would show that farmers in the 'demonstration' villages or areas are as slow in, or as indifferent to, adopting the package of the new technology as are the farmers in the rest of the villages in that region. Levels of adoption, of recommended practices and doses of inputs, are hardly different in the two situations. Even the farmers whose lands have been adopted as demonstration plots seldom adopt the demonstrated package of technology for the rest of their land or even for the 'demonstration plot' in the ensuing seasons. While most farmers evidently admire the high yields on the demonstration plots and are convinced about the miracles the scientist could perform in their very neighbourhood, they do not find it possible to replicate the same in their own fields. It is important to recognise that this failure of demonstration effect is largely built into the *modus operandi* of the National Demonstrations.

Unlike the generalised 'package of practices' normally doled out to the adopters of HYV, the National Demonstrations aim to be 'site or location specific'. The operations and inputs at various stages of crop production are determined by the scientists themselves on the basis of thorough analysis of various site factors — such as slope, depth, texture, drainage characteristics, fertility status, presence or absence of soluble salts in soil and water, etc, of individual plots. Services of various concerned specialists are readily available throughout the crop season for this purpose. Moreover, the required quantities of material inputs, such as new seed, plant nutrients, and insecticides-pesticides, are readily and punctually supplied by the demonstrating agencies. Thus the National Demonstrations differ from the research institute's farm trials only in that they are conducted on the cultivators' plots and the cultivator supplies the conventional inputs like labour, water, etc, according to the detailed recommendations of the scientists.

The 'demonstrations' are consequently too contrived to be operationally relevant to — or normally within the reach of — an ordinary farmer, who has to depend on district-level or area-level recommendations of fertiliser doses, etc (in place of the scientist's plot-specific recommendations), who is unable to receive attention of even the VLW (who will ordinarily replace the team of subject-matter specialists), who has to completely go without or manage with limited, untimely, and at times adulterated, supplies of crucial inputs at black market price, and finally who has to bother about the real economics of the whole enterprise — unlike demonstrating scientists whose sole preoccupation is the physical performance of a single plot.

Another Major Hurdle

The economics — operating both from the cost and the returns side — is thus yet another major hurdle for the farmers in adopting the technology as demonstrated. By ICAR reports, per-hectare net returns (in Rs) from the demonstration plots during 1971-72 for different crops worked out as follows: paddy 2,318, wheat 2,355, maize 1,539, jowar 1,552, bajra 1,338, ragi 1,525, groundnut 2,233, fodder crops 2,420. The figures are quite impressive, and, if true, they show the potential of the new technology for making most small farmers viable. However, one does not get in the reports any details of costs and their components. Even if the heavy cost of technical component (*viz*, the services of scientists and vehicles used by them) is excluded, the cost of replicating the 'demonstrated technology' on all fields would be too enormous to be afforded even by richest of the farmers. Thus the high capital intensity of the demonstrations tend to reduce their demonstration effect. Any demonstrations to be effective, would need to be re-oriented to take into account the physical and financial constraints on real-life farmers. Failing this, the demonstrations would continue to be ineffective show-pieces.

FOOD CROP PROSPECTS

Without Plan or Calculation

THE bumper kharif harvest came and went leaving little impact on foodgrains prices or foodgrains availability. The phenomenon falls into a by now well-established pattern. Following the failure of the monsoon in 1972-73, the government launched a special programme for the rabi crop of that year which cost it nearly Rs 200 crores. Yet the rabi crop yielded only 24.92 million tonnes of wheat — as against 26.40 million tonnes of rabi wheat produced without any special campaign in the preceding year. Before too many questions could be asked about the negative pay-off of the special programme, the good monsoon of 1973-74 brought with it the usual flood of optimism. The government confidently forecast the foodgrains production for 1973-74 to be 115 million tonnes (67 mn tonnes of kharif output and 48 million tonnes of rabi output). But, despite the bumper kharif harvest, people in most areas got hardly any relief.

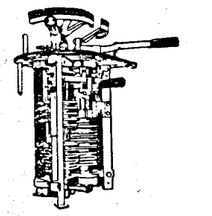
Will the forthcoming rabi wheat crop afford any hope of relief? That would depend both upon production and procurement. It is clear by now that one can hope for little on the procurement front. The government declared last week in parliament that foodgrains shortages would continue even in days of plenty unless the link among speculators, hoarders, and big farmers is broken. The government itself evidently does not see this as its own role. As for production, optimists had initially put the likely wheat output at around 30 million tonnes. This would now have to be drastically scaled down in view of the many factors which threaten to reduce wheat production this year.

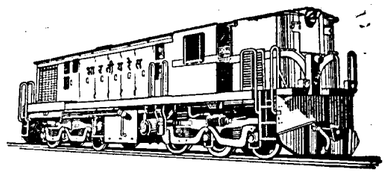
While actual production would be more accurately known within the next two months, an analysis of the factors affecting the wheat crop would give an idea of what is in store. It has to be noted that most of the factors which had contributed to the poor wheat crop last year — the costly rabi campaign notwithstanding — have been compounded with others this year.

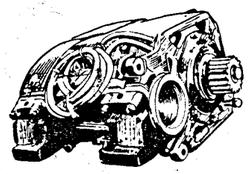
Take the weather conditions first. Weather — in terms of residual moisture and availability of canal water and recharge in the wells — was more favourable this year; but weather conditions at a later stage of the crop have adversely affected it in the north-western wheat-growing regions. Reports are that the growth of wheat has been stunted by the severe cold in December and January and by the absence of winter rains. Nor are the rains in February in some regions likely to help any. The frost in several areas has also damaged irrigated wheat far more then rain-fed wheat. In some areas of Haryana, the farmers are reported to have burnt the wheat crop already killed by the frost.

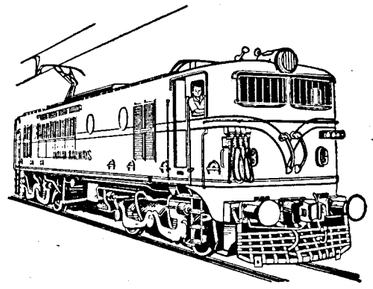
The Punjab Agricultural University scientists had warned earlier that low temperatures and humid conditions, prevalent in December-January, were conducive to the spread of 'rusts'. The rusts were widespread last year too, but their impact is more damaging when they appear at an early stage of the crop as has happened this year. Appearance of yellow and brown rusts has already been reported from major wheat-growing areas such as Gurdaspur, Patiala, Rupar and Hoshiarpur districts in Punjab, and Kurukshetra and Ambala districts in Haryana. In parts of Rajasthan, as investigated by ICAR experts, rusts had assumed alarming proportions about two months ago, apparently due to the early sowing of Kharchi — a local variety of wheat.

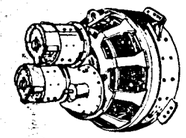
Fertiliser Shortage











In supplies of crucial inputs, such as fertiliser and irrigation from tubewells, the current season is worse off than last year's. Chronic shortage or irregular supplies of often-adulterated fertilisers, is common. For instance, UP's fertiliser requirement was estimated to be 5.5 lakh tonnes; the actual quantity made available — despite the special concessions in the pre-polling period — was only 3 lakh tonnes. Requirements for basal dressing were 60,000 tonnes; only 34,000 tonnes were made available. Haryana's estimate of its own requirements of nitrogenous fertiliser was one lakh tonnes; this was pruned to 76,000 tonnes by the Centre and the actual quantity allocated to it was 72,000 tonnes — 18,000 tonnes of it being made available at the end of January. Punjab's actual allotment (1.85 lakh tonnes from August to January) matched the Centre's estimate of the state's requirements, but the very slow pace of supplies, touching as low as 500 tonnes a day, as against the normal supplies of 2,000 tonnes a day (ostensibly due to railway strikes) during the crucial stages of the crop made the allocations meaningless.

These shortages at the state level tell only part of the story. Their impact the farm level in the major wheat-growing areas was far worse. Not only did adulteration, underweighments, and transfer of fertilisers to the black market even by the co-operatives, take place (as was discovered by studies carried out by the Punjab Agricultural University and UP's State Planning Institute), but government had to go back on its undertaking to supply fertiliser on a priority basis to 'coupon-holders' who had sold their wheat to the procurement agencies since the wheat trade take-over last year. Moreover the oil crisis has added to the high price of fertilisers and pesticides; compared to last year, the prices of 'contact' pesticides like Malathion, DDT, BHC, etc, have increased by 20 to 30 per cent.

The oil crisis through its impact on diesel has also aggravated the already acute energy problem for tubewells. As a result, even during the critical stages of the crops, power was made available to the tubewells for only three to five hours a day in Haryana, Punjab, and Western UP. The consequences of these shortages for the wheat crop — especially since the winter rains had failed — hardly need elaboration.

A serious shadow on the wheat prospect, which has emerged only this year but has longer term implications, is that of the suspected shrinkage of wheat acreage — particularly the acreage under HYV-wheat. The Farmers' Forum claims that the area under wheat has declined by about 20 per cent in Punjab and by about 20 per cent in Haryana. No information is available about the other wheat-growing stages. While one may not take such reports at face value — especially as they are presented as part of the Forum's claims to success and its attempts to dissuade farmers from growing wheat as a protest against the government's decision to take over its wholesale trade — the decline in wheat acreage this year is quite credible.

Take-over of wheat trade has completely changed the relative profitability of the different crops. The net profitability of wheat (despite its high yields) has declined substantially, especially due to the high blackmarket prices of crucial inputs and the controlled procurement price of the crop. A shift in the acreage is thus a response to this situation. HYV-wheat

ELECTRIC TRACTION EQUIPMENT FOR INDIAN RAILWAYS

★ Five out of every six suburban trains operating in CALCUTTA AREA are equipped with BHEL-built electric traction equipment.

★ One out of every three suburban trains operating in BOMBAY AREA is equipped with BHEL-built electric traction equipment.

★ Over 250 Diesel Electric Locomotives hauling freight and passenger traffic all over the country are equipped with BHEL-built electric traction equipment.

★ BHEL manufactures Motors, Motor Generator Sets, Generators, Transformers, Rectifiers and various types of Controlgear such as Pantographs, Master Controllers, Reversers, Contactors and Relays for Indian Railways.

★ BHEL-built traction equipment worth over Rupees 35 crores supplied to Indian Railways is rendering satisfactory service in different parts of the country.

Power to the people

has been replaced in several areas by gram, barley, and mustard, which involve much lower input cost and have a free market. An evidence of this is the sharp increase in the area under barley in Punjab and Haryana: in Punjab it has increased from 55,000 hectares last year to 73,000 hectares this year; the corresponding figures for Haryana are reported to be 1.5 and 2.5 lakh hectares. Barley needs less fertiliser and only two or three waterings compared to at least six for HYV-wheat. Further, barley fetched nearly Rs 130 per quintal last year, whereas wheat was to be procured at Rs 76. The demand for barley from distilleries and breweries no doubt contributed to this shift of acreage to it in some areas, but in other areas the alleged reasons are the take-over of wheat trade and the non-availability of inputs.

A farmers' representative, recently invited by the Agricultural Prices Commission to discuss wheat prices, put it acidly thus: "How long can one expect the farmer to grow wheat in circumstances where he is compelled to sell his product at official price after having been earlier compelled to pay exorbitantly high black-market prices for all the crucial inputs for raising the same crop?" Even in terms of its own strategy then — *viz*, of focusing on the large farmers to obtain higher production of foodgrains — the government has evidently failed to ensure results.

DHULIA

Over a Century of Tyranny

S D Kulkarni

WHAT will probably be a prolonged conflict is now going on between the Bhils and the Gujars in some parts of the Dhulia district of Maharashtra. Adivasis constitute about 37 per cent of the district's population,[1] and a majority of these are Bhils. Some of them work as 'saldars' — i e, labourers on a contract of one year — on the farms owned by the Gujars, Leva-patils, and Rajputs. Gujars are now the main land-holders. But Gujars, Leva-patils, and Raputs have, by force and fraud, expropriated most of these lands from the Adivasis in the past.

Ruthlessly Exploited Bhils

Bhil saldars, though formally on contract for a year, are in effect near-slaves. Landlessness and poverty have forced them to work on Gujar farms, for very low wages and for very long hours of hard work. They are usually bogged down in debt to the Gujars who have used that indebtedness to dispossess the Bhils of their lands and to ruthlessly exploit them. Instances of flogging of Bhil labourers, rape of Bhil women, burning of Bhil huts, and other atrocities are not uncommon. Since the rich Gujars virtually control the administration, their crimes against the Bhils go unnoticed and unpunished.

During the last few years, efforts have been made to organise the Bhils to resist such treatment at the hands of the landlords and the administration. Under the leadership of the late Ambarsingh Suratvanti (who died on February 25 after a prolonged illness), and with the help of some social workers now working in the area, the Bhils have started to demand better wages and working conditions. This has evoked stiff resistance from the Gujars and their allies in farming, trade and the bureaucracy.[2] Their attempts to raise a private army, under the guise of a 'Crop Protection Society' have not succeeded so far, mainly, it would seem, on account of pressure of public opinion. But clearly, the struggle will be a prolonged one, since it has a long history of oppression behind it.

In fact, the present conflict between the Gujars and the Bhils began in the 1850s, when the Gujars made near-slaves of the Bhils, using the laws and legal procedures constructed by the British. It is, indeed, very revealing to study the evolution of the relationship between the Gujars and the Bhils — what made masters of the former and gave them power to treat the latter as slaves.

Gujaratis were living in Khandesh[3] long before the establishment of British rule. But, in the last few years of Maratha rule and particularly during the terrible famine of 1803, they returned to their areas. After the establishment of British rule (1820), many of them returned to Khandesh. It is, however, noted in the Gazetteer that "In 1837, it [Khandesh] was still miserably populated, large tracts being held by Bhils".[4]

Gujarati 'vanis' were the first to settle down in various parts of Khandesh. Gujarati 'kunbis' settled down in these parts mainly after the establishment of British rule. They were attracted by the fertile lands in the Tapti valley, and they settled down as cultivators. Gujars are one of the prominent sections of Gujarati kunbis. It is noted in the Gazetteer that "Guzars from a great portion of the cultivators in some of the northern sub-divisions" (p 136). It is also noted that "Dhangars, Mhars, and Bhils are found here and there tilling on their own account". In addition to undertaking cultivation, Gujars operated as moneylenders.

Rapid development of agriculture in Khandesh started after the establishment of British rule. Cotton was one of the chief crops. The Government made systematic efforts to encourage the cultivation of cotton between 1830 and 1880. In 1831, the Collector bought £ 1,500 to 2,000 worth of cotton. In 1832, £ 800 worth of cotton was bought to be sent to China. New varieties were introduced. Cotton gins were established. All these efforts helped the commercialisation of agriculture in Khandesh.

Capitalist Farming

The process was further aided by the development of roads and the opening of railways. "The portion of the line, about 142 miles, within Khandesh limits was begun in 1852, and opened for traffic between 1861 and 1865" (Gazetteer, p 210). The Gazetteer notes: "Since 1852, by the opening of the railway, the trade of Khandesh has greatly changed and developed. Between 1868 and 1878, the figures show an increase in passengers from 4,75,406 to 7,27,505 and in goods from 43,121 to 1,14,540 tons" (p 215). This encouraged capitalist farming in Khandesh. The Gazetteer mentions that, in north-west Khandesh (where the Bhil-Gujar conflict is currently taking place), "the land-holders are mostly Guzar capitalists, not peasant proprietors". It is also mentioned that they engaged Bhil labourers for actual cultivation. This was done in two ways:

(1) A Bhil was engaged as saldar (or Awtya), or
(2) He was given a field on hire on the share (gavand) principle (and was called Gavandya).

Saldars were near-slaves, and breach of contract of service was a criminal offence. Government of India Act 13, of 1859, — an Act to provide for the punishment of breaches of contract by Artificers, Workmen, and La-

bourers in certain cases — laid down that the Magistrate might order repayment of advance or performance of contract in certain cases of breach of contract of service (Section 2). However, under the Act, the Magistrate had power to exercise an equitable discretion whether to or not enforce a contract of service.[5] To evade such a scrutiny, the Gujar resorted to a different trick. Government of India Act 8 of 1859 (Code of Civil Procedure) made a provision for execution of decrees by attachment of property or "by imprisonment of the party against whom the decree is made" (Section 200). They started to take bonds from the Bhils for sums of money said to be advanced, so as to bring the case under the Civil Procedure Code.

This is described by Pritchard as follows:

"Every Guzar has a bond on stamped paper purporting to be executed by his servant, acknowledging the loan of a sum of money the man can never by any chance repay. Directly an Awtya shows a disposition to leave a Guzar's service, his master files a suit against him in the civil court for the amount set forth in the bond. The Bhil, knowing he has no chances of success, does not appear to defend the suit. The Court accordingly decrees against him, and a distress warrant follows; the poor wretch's few household goods are seized, any little ornament his wife may possess is taken from her, and he himself is arrested and carried off a prisoner to the Munsif's Court. These *his master, having reduced him to a state of utter helplessness, offers him his choice of returning to work or going to Dhulia jail.* [Emphasis original.] He returns to service with his liabilities increased by the costs of the suit, of his own arrest, etc, and with no proper arrangement with his master. It is no part of the duty of the Court even then to see that his master is bound down to treat him fairly. He serves on for a few more months, or perhaps years, on a pittance of grain and the smallest quantity of clothing that will cover him, until tired out, he again strikes work; again his master rushes off to the civil court, and this time the Bhil is not even invited to have his say; the former decree is still unsatisfied, and another distress warrant is issued without further inquiry. The first the Bhil hears of it perhaps is from the *sepoy* who has come to arrest him. And so it goes on from year to year. What is this man but a slave? What hope has he? What redress is there for him? He cannot appeal to the judge, even if his friends manage to provide the money necessary, as he did not defend the suit originally brought in the Munsif's court. He is a mere chattel to be disposed of whenever his master wants money. It is *a common occurrence for one Guzar to sell his Awtya to another under the pretence of a transfer of the Awtya's debts.*[6] [Emphasis original.] A well encumbered Bhil, with a decree of the civil court out against him, is a more valuable commodity in the west than one whose liabilities are limited". (Report by Pritchard, First Assistant Collector, Khandesh, dated July 1, 1870, quoted in Deccan Riots Commission Report, Appendix B, p 166.)

Cruel Method

The Gujars used a very imaginative and cruel method to enslave the Bhils. Very often, in addition to the Bhil debtor's name, his mother's name was also entered in the bond and this increased the Gujar's hold over the Bhil. It is remarked in the Gazetteer that "as a Bhil will suffer anything rather than disgrace his mother, the threat to send his mother to Dhulia jail is at any time enough to make the Bhil do whatever his master wishes."[7] Such was the state of affairs of the saldars or Awtyas. The story of the so-called Bhil partners who hired fields from the Gujars on the share (or gavand) principle was not very different.

To avoid recourse to a suit for breach of contract under Act 13 of 1859, Gujars made Bhils partners in their farm under a stamped agreement.

"The Guzar agrees with the Bhil that the Bhil is to till the Guzar's land and that they are to share the produce. An advance is made to the Bhil to buy bullocks, and a bond is drawn up with a premium of 25 per cent. The Bhil grows the crops and is fed by the Guzar. At the end of the year the Guzar takes the crop and puts off the Bhil on the ground that he has to pay for the bullocks. Next year the Bhil again gets clothes and food and is told he has still something to pay. He asks for a settlement of account, and as a preliminary for a new stamped paper. With few soft words, some money to buy a robe for his wife, and a little liquor, a new bond is made, the meaning of which the Bhil does not understand, and he goes back to his work hoping for better luck next year. After struggling on for a year or two he determines to leave. Then he finds that his partner, or master, has his acceptance for £ 20 (Rs 200) or more; that the bullock he had toiled for is not his, and that he and all he has are at his master's mercy. A decree is made and the Bhil's goods are seized and sold. Then his master offers him a chance of return, and he serves for some time more. Again he grows tired of his position and refuses to work. The master has still some outstanding debts, and the threat of the civil court again brings the Bhil to order. Thus things go on from year to year."[8]

Some "instances of gross oppression of Bhil Awtyas and Gavandyas by Guzar and others" are mentioned in the Report of the Deccan Riots Commission, Appendix B. They are described here in brief.[9]

(1) A Bhil, Hoga Gaytya, served Eerjee Patel Guzar, Patel of Murwad, Taluka Talode, for 14 years and received Rs 10 only and his food. According to the Gujar, the Bhil worked for him for 13 years and was given Rs 30 when he first came and nothing but food and clothes afterwards. The Gujar held a bond executed in 1868 for Rs 175, and obtained a decree for it. He explained to the Assistant Collector that his agreement with the Bhil was for food only and so he had charged against him every year the cost of his clothes, and that these charges, with the original advance and interest at 24 per cent, mounted up in 1868 to the amount entered in the bond. The Gujar was told by the Assistant Collector that slavery was not allowed by the British government and that 13 years' good work was a sufficient return for an advance of Rs 30. He agreed and gave the Bhil an acquittance.

(2) Nuthoo Kesho Guzar, Patel of Sinda, Taluka Nandurbar, bought a Bhil Nanda Lakrow from his former master four years before for Rs 42. The Bhil served for two years only and refused to work longer. The Gujar had his acceptance for Rs 96 and obtained a decree for the amount. He admitted that many Bhils were receiving a wage of Rs 8 a month at that time. A compromise was reached and the Bhil was given an acquittance in full.

(3) Ram Guzar, Patel of Moda, Taluka Talode, admitted that the Bhil Bajya Jayta served him for 14 years and the Bhil Chablya served him for 12 years. He gave Bajya Rs 12 and Chablya Rs 40, both sums being paid when the Bhils entered the service. He had Bajya's bond for Rs 60 and Chablya's for Rs 100. According to the Gujar, the agreement was for food only, and the bond amounts included the cost of clothes and interest at compound rates. According to the Bhils, they were promised Rs 12 a year, besides food and clothes. They wanted to leave for some years but were afraid to do so due to the threats of the Patel to bring actions against them and sell up their households. With the help of the Assistant Collector, a compromise was reached and the bonds were discharged.

(4) Nana Guzar, Patel of Moda, Taluka Talode admitted that he advanced the Bhil Rewka Garkya Rs 40 only. Garkya served the Gujar for 3 years and he recovered Rs 21 from another Gujar who cultivated the village inam land in the year in which Rewka had a share. However, even after the recovery of Rs 21 and three years' work against an advance of Rs 40, the Gujar had obtained a bond from the Bhil for Rs 40. Inquiries revealed that the Bhil had done further work for the Gujar under threats of action. Eventually the Gujar agreed to give the Bhil one map (measure) of grain and a discharge from all liability.

(5) Hari Oomed Guzar, Patel of Moda, Taluka Talode admitted that the Bhil Raju Fakeera served him for 10 years. He gave Raju Rs 50 (Raju said that he got only Rs 16) in the beginning and nothing subsequently but food and clothes. After 10 years of service, Raju refused to serve the Gujar any longer. A suit was filed and a decree for Rs 50 was obtained. Raju had to return to the Gujar.

(6) The same Gujar engaged another Bhil Dewlya Dussya after executing a bond. The Bhil served for one year and received Rs 10 only and food. He left after one year. The Gujar filed a suit and obtained a decree against him for Rs 15.

(7) A Bhil Boodya Kagra, who was 30 years old at the time of enquiry, said that he had served Ramdas Patel of Nizar in Taluka Nandurbar for all his life and his father had served the Gujar before him. The Gujar spent Rs 40 on his (Boodya's) marriage and thereafter gave him nothing but food and clothes. He worked first as cattle-herd and later as Awtya. Some five years before the Gujar agreed to take him as a Gavandya and advanced him Rs 80 to buy a pair of bullocks and made him sign a bond for Rs 200 with a lien on bullocks and on the whole of the Bhil's share of produce in partnership until the amount was paid. After two years, he was sold to Nana Nandram, another Gujar of the same village for Rs 200. The Gujar who sold him again bought him the next year for the same amount. He held a bond for Rs 172 with interest at 24 per cent and a lien on cattle and share produce. When Boodya refused to remain a Gavandya, the Gujar seized his bullocks and grain and threatened action and imprisonment. With the Assistant Collector's intervention, and after admitting that the Bhil had been a very good and profitable servant, the Gujar restored his bond and freedom.

The rationale in all these cases has been summed up very ably by Major Probyn as follows:

"A Bhil in the first instance receives from Rs 20 to Rs 50 advance from a Guzar for the purpose of getting married, he then engages to serve the Guzar at so much a year, generally about Rs 24, his food, and a pair of shoes, cumbly, and pugri, but the Guzar never allows a debt to be worked off. At the end of the first year, or perhaps, after two or three years, the Bhil will ask for a settlement. By the time Guzar will have made an account against him which the Bhil cannot dispute, and the Guzar will then give him a few rupees to appease him; a fresh bond will be drawn up, and the Bhil will be lucky, if by that time his debt is no more than Rs 100, though probably he may not really owe Rs 20. The fate of the Bhil is then sealed; he may work on contented or discontented, according to the treatment he receives at the hands of his master; some are treated well, though, in a pecuniary point of view, unfairly, while others, what with being cheated, abused, and bullied, live a life but little better than slavery, and when too old to work, the son takes the father's place. The debt of the Bhil saldar does not go on increasing year after year. *When the Guzar has got a bond up to two or three hundred rupees he is satisfied, his chief object being to secure the services of the man, which is done by holding out threat of imprisonment for breach of contract under Act 8 of 1859, and for debt through the civil courts.*"[10] [Emphasis original.]

Thus, though the British abolished slavery in India, it was under their very law, ironically named the Civil Procedure Code, that the Gujar made the Bhils half-slaves. This abuse of law has been commented upon from time to time. The following remark in the Gazetteer is worth noting.

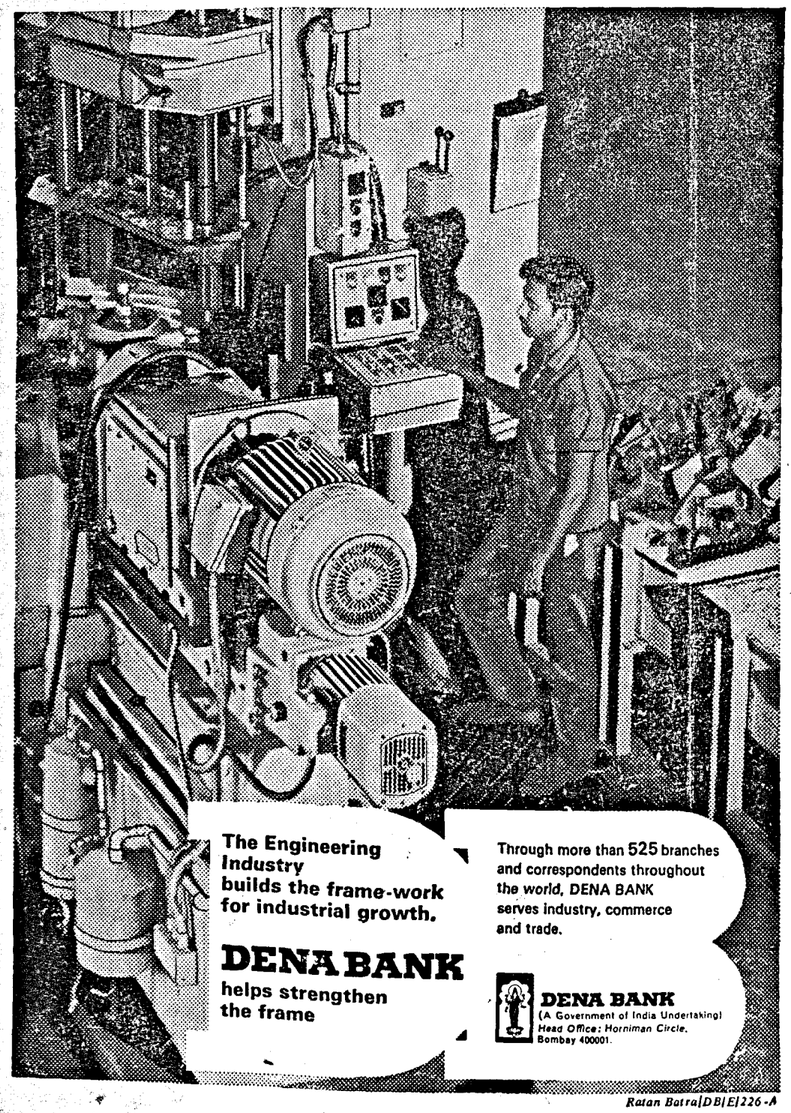
"The whole machinery of the law courts is worked by the Guzar to keep his debtors in his power, and in spite of the great rise in the value of their labour, the Bhils work on, except that they are fed between seed-time and harvest and are given an occasional turban or robe, little less poor and degraded than they were in former times of trouble and disorder"[11] (that is during the last years of the Peshwa rule).

Ashburner, Collector of Khandesh, has expressed in very poignant words:

"I could give these poor people no redress. Yeshwantrao Holkar and his Pindaris could not have plundered them more effectually; but *it had all done with most careful attention to the forms of the Code of Civil Procedure* (italics added), with one trifling omission. They had had no notice that a suit had been filed against them; the decree had been passed *ex parte*. Had this formality been attended to, however, it would not have altered their position.[12]

Major Probyn, Western Bhil Agent and Pritchard, First Assistant Collector, Khandesh, have described the working of the law courts in this matter in a letter addressed to Ashburner, Collector and Magistrate of Khandesh. "We beg to append statements showing the number of suits filed by Guzars and moneylenders against Bhils in the Court of the Sub-Judge of Nandurbar during the years 1867, 1868, and 1869, and how they were disposed of. It will be seen from this statement that, of the 635 suits that came to inquiry during those years, 612 were decided in favour of plaintiffs, and only 23 in favour of Bhils, and that Bhils appeared to contest the claims brought against them in 29 cases only. In 594 suits judgment went by default against Bhils. ... We rely on these figures in support of our statement that the ordinary civil courts are not suitable tribunals for the decision of such claims. It is a significant fact that during the same three years no suits whatever were filed by Bhils against Guzars or moneylenders for breaches of contract, for shares of produce, nor for settlements of accounts, though they crowded our camps in hundreds imploring our interference in such cases."

One cannot explain why there was no rebellion against this tyranny as there was by the Santhals of Bihar in 1855 when they rebelled mainly against moneylenders and zamindars who had practised fraud similar to that of the Gujars. Even the Deccan Riots of 1875, in the districts of Poona and Ahmednagar, found no echo in Khandesh. Indeed, the ruthless exploitation of the Bhils has continued till this day. In fact in the years since Independence, the new laws of independent India have been used to dispossess the Bhils and to keep the Gujars' economic stranglehold on them. It is against this background that the Bhils and their leaders have begun to organise themselves against the perversion of law and justice.



Notes

1 Of the Adivasi population in Maharashtra, about 31 per cent live in Dhulia district (as per the information in the 1971 Census).

NORTH

End of the Wheat Bonanza?

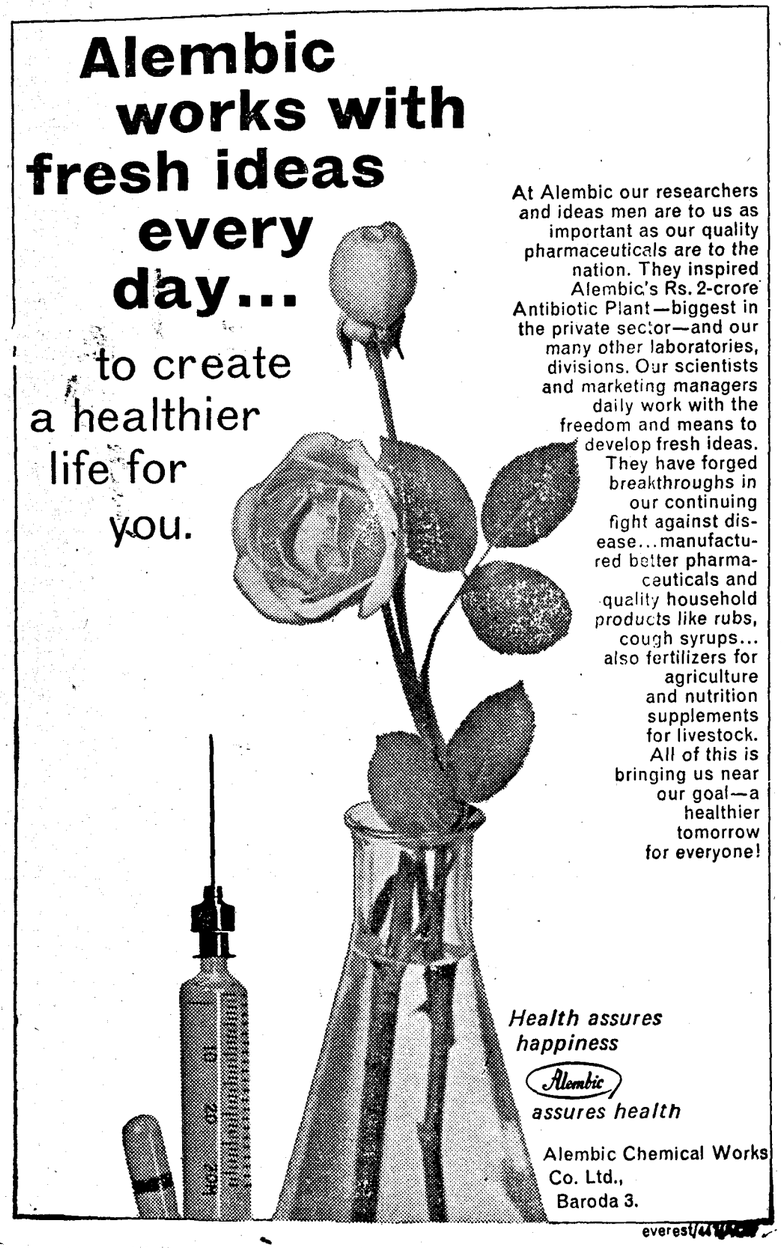
THE overall deficit of Rs 38.39 crores in Punjab's budget for 1974-75 is Rs 1.18 crores more than last year's. However, no taxes have been proposed apart from the 50 per cent enhancement of the Market Fee — from Rs 1.50 to Rs 2.25 for every Rs 100 worth of foodgrains — two-thirds of whose total proceeds, estimated at Rs 8 crores, will be earmarked for rural roads and bridges. The Finance Minister proposes to realise Rs 5 crores by "greater economy and austerity in contingent and unproductive expenditure", and another Rs 2 crores by "further tightening and plugging of loopholes in the tax collecting machinery". The state government also expects Rs 2 crores more from devolution of the buoyant Central taxes and duties. Together, these measures are expected to reduce the deficit by Rs 17 crores. The remainder (Rs 21.39 crores) has been left uncovered in the hope of larger Central subventions and more market borrowings and negotiated loans. Significantly, there is no reference either to the Raj Committee's recommendation for agricultural taxation or to any enhancement of power and irrigation tariffs. What is more, receipts from Land Revenue are low and are gradually decreasing. They have declined from Rs 1.72 lakhs in 1969-70 to Rs 1.35 lakhs in the current year; it is estimated that they will be even lower in 1974-75 at Rs 1.16 lakhs and will account for barely 0.2 per cent of the state's total revenue and 1 per cent of the state's receipts from taxes and duties. This has occurred side by side with the mounting prosperity of the farmers on account of the green revolution.

New Fiscal Policy

In his budget speech the Finance Minister has nevertheless expounded on the new fiscal policy: The government is alive to the fact that "wasteful and unnecessary expenditure should be avoided to minimise inflationary pressures, or at least kept under control by effecting economy" in non-essential and non-functional spheres. Stringent economy measures were ordered during the current year. A saving of five per cent will be effected in the next year — by pruning the non-plan programmes and restricting the expenditure on furniture, air-conditioners, heaters, cars, telephones, travelling, etc. Special measures have been planned for the coming months to create an adequate infrastructure for both farm and factory sectors. The 1974-75 budget will help step up the state's compound growth rate, from 5.7 per cent to 7.4 per cent per annum. Since power is the major constraint on growth, the government has earmarked nearly 50 per cent of the Rs 126-crore annual plan outlay for electricity projects.

New Breweries Hit

Meanwhile, precisely because of the current shortages of power and diesel oil, the governments of Punjab and Haryana have been thinking of drastically lowering their wheat production targets for the current year. Last season, production in the two states was 53.61 lakh tonnes and 21.60 lakh tonnes, respectively. Unless the rains oblige within the next few days, this year's output may not exceed 52 lakh tonnes and 20 lakh tonnes, respectively — against the targets of 58 lakh tonnes and 26 lakh tonnes. The state's contributions to the Central pool would be correspondingly less. The 'diesel riots', stemming from the acute shortage and inequitable distribution of this fuel, constitute a new phenomenon in Punjab. Haryana has already lost most of its barley crop, as a result of which the new breweries are hard hit; the gram and oilseed crops have also suffered serious damage. Since Punjab and Haryana are among the major contributors to the national foodgrains budget, their performance will directly affect foodgrains availability.



Haryana has belatedly realised that excessive reliance on neighbouring states for its power supply is unwise. Today, the state's own generation is negligible, and despite the power shortages in recent years no major scheme to generate power within its own boundaries has progressed beyond the blueprint stage. This season Haryana has suffered the worst-ever power crisis, during which factories in industrial complexes have had to come to a grinding halt. In the much-acclaimed Faridabad complex alone, the production losses run into crores of rupees. The Faridabad Manufacturers' Association has ascribed to this the laying-off of over 75,000 workers for several days in February.

The state's power consumption, already slashed from 7.3 million units to 5 million units a day, is difficult to meet on a regular basis. Sudden shutdowns and trippings are a daily occurrence. The State Electricity Board spokesmen have warned that the current power shortages will persist for some time. Though the state's industrialists are the worst affected, the farmers constitute the more powerful lobby that has been adversely affected. The agricultural sector's requirements are about 30 lakh units of power per day. If not too much noise is being made about the power shortage it is because only 20,000 tonnes of fertilisers have been made available to the farmers so far, as against their requirement of 76,000 tonnes, so that irrigation water has had to be applied to a lesser extent.

Merry Smuggling

In some wheat-growing areas of Haryana, near-drought conditions continue to prevail. The arid belt constitutes 21.77 per cent of the state's total area. In fact, the southern half of Haryana is part of the Rajasthan desert. But the prospects of achieving the wheat production and procurement targets (2.6 million tonnes and one million tonnes, respectively) appear dismal at present, though the state has exceeded its rice procurement target of 3.5 lakh tonnes. The severe and dry winter months of December and January have already badly damaged the rabi crops, and the absence of rain since then has further sharpened the anxiety of the state's farmers.

The smuggling of foodgrains across the borders goes on merrily nevertheless. Haryana has a special anti-smuggling squad (food and supplies) under the charge of a Superintendent of Police with headquarters in Chandigarh. Raids and seizures of truckloads of rice, for which there is much demand in Delhi, UP, and Himachal Pradesh, are quite frequent. Despite these seizures and the arrest of about 220 persons to date, smugglers are active and find their activities quite remunerative: prices in the adjacent states are far higher and official sources admit that foodgrains valued at over Rs 6 lakhs have been successfully smuggled out of the state in recent months and that more may yet find its way out.

Thriving on Shortages

PREOCCUPATION with the inflation has tended to obscure the dismal state of industry. That there was little, if any, growth in industrial production in 1973 is now known; but what has not been adequately appreciated is that this was not an aberration attributable wholly to some specific circumstance such as the power shortage, though shortage of power was acute in 1973 and did seriously affect production in a number of industries. The industrial sector has been in poor shape for many years now. As the government's latest *Economic Survey points out, the year 1966* was a sort of turning point for industry. During the period 1960-66, industrial production had expanded at an average annual rate of over 9 per cent. By contrast, in the period 1967-72 the rate was only 4.5 per cent. It will be lower still if the performance in 1973 *is taken into account.*

Many factors — shortage of power, transport bottlenecks, scarcity of critical raw materials like steel, etc — can be adduced to explain the trends in industrial production and investment. In addition, industrialists have naturally sought to make much of the deleterious consequences of government controls. Whatever the real merit of the criticisms on this score, the government at any rate appears to have taken them very seriously. As a result, in the last year or two a number of steps have been taken to liberalise industrial licensing and to speed up the operation of various controls, including licensing. Inevitably, this has involved a further fudging of industrial priorities so that a significant part of such investment and increase in industrial production as has taken place has come about in what are patently low priority industries producing goods of upper-class consumption. In its desperation to show higher industrial production, the government has even regularised illegally installed industrial capacity. The curbs, more threatened than enforced, on the expansion of the large houses have been relaxed. Foreign companies have similarly been encouraged to use the scheme for dilution of foreign equity holding to expand into industries into which there is no technical or economic justification for allowing them.

None of this has, however, had the desired impact on industrial production and investment. It was ruefully conceded by the government itself recently that the flood of letters of intent and licences handed out following the so-called streamlining of licensing procedures has yielded no corresponding upsurge in investment. The record of a number of industries such as cement, paper and fertiliser, in which there are any number of unimplemented letters of intents and licences, should have prepared the government for some such outcome and persuaded it to view with scepticism the propaganda that it was tardiness in the grant of official sanctions and permission which was holding up industrial expansion.

The experience of these same industries should explode another myth — that it is the unremunerativeness of the prices fixed under, formal or informal, price control which is preventing the flow of fresh investment into industry. A case in point is cement. Both the government and the industry are currently keeping up the pretence of anxiously waiting for the Tariff Commission's report which will clear the way for raising the controlled price of cement. In fact, however generous the increase that is allowed, the official controlled price will still be far below the price that the cement manufacturers are already getting — so large is the so-called 'unofficial premium' over the government-fixed price.

Indeed, given the superlative profits — most of it tax-free and beyond the reach of shareholders besides — which are there to be made out of shortages, is it at all suprising that manufacturers have little interest in expanding production themselves and will do everything they can to prevent new entrants from doing so? At one time it was naively believed that the answer to this sort of situation was for the public sector to enter such industries in strength. The ambitious programmes of public sector units like the Cement Corporation of India and the Hindustan Paper Corporation, at the time of their launching, bear testimony to these hopes. Equally, the subsequent evaporation of these programmes testify to the futility of the expectations. Established producers in different industries, it has been proved, are as capable of sabotaging the plans of potential public sector units as they are of keeping out other competitors. In fact, as the example of sugar — where, despite higher output, a situation of shortage has been sustained through the system of government-controlled monthly releases of stocks — shows, they can even get the government to actively co-operate with them in perpetuating and making the most of shortages.

MBO in Non-Business Organisations

B L Maheshwari

Management by Objectives in Local Government by J W Glendinning and R E H Bullock; Charles Knight and Company, London, 1973; pp 255.

MANAGEMENT by Objectives has emerged as one of the popular themes and there is a growing literature on the subject. However, until recently, most books on this subject were of "do it yourself" type. John Humble's "Management by Objectives in Action" (1971) represented a departure because it described the practice in several organisations. Then came "Management by Objectives : Applications and Research" (1973), by Carrol and Tosi, which represents the first serious attempt at research in the practice of Management by Objectives. The book under review would qualify for membership in the group of the second generation books on Management by Objectives because it contains a record of practice in an area which, for MBO application, still remains a new frontier. It reports on MBO application in Local Government in Britain. In a way, it opens a new area and attempts to reinforce the universal applicability of the concepts and methods of Management by Objectives.

Since MBO developed essentially in the context of business situations, it is necessary to adapt it to the particular circumstances and needs of public administration at different levels. In his foreword, John Humble has highlighted the differences between business and government systems as far as application of MBO is concerned:

> "Of course, the uncritical importation of business methods into Local Government may hinder more than it helps. The *raison d'etre* of a Local Authority is service not commercial profit, and the ultimate power for decisions lies properly in the value judgments of the electorate. Quantification and measurement of results is important, but enormously more difficult than in the commercial sector" (p vii).

Humble, however, goes to state that in spite of these differences, Management by Objectives can be used as an approach to management of organisations in both profit and non-profit sectors.

This book is divided into four parts. Part I provides the background, both to the general concept of MBO and its application in Local Government in Britain. The second aspect is very useful but unfortunately very short (only 7 pages). Here we are told that the stimulus for MBO in Local Government was provided by the Local Government Training Board. The Greater London Council was the first one to start a pilot exercise in 1969. Eight departments were covered. Soon after, the Somerset and Sheffield County Councils and the London Borough of Hillingdon followed. Thus, during the last five years, local government organisations have accumulated considerable experience with the practice of MBO.

Part II entitled "Commentary on the Project" describes the essential process of implementation but adds very little to existing knowledge. It emphasises the well known elements of the process and does not bring out the differences of emphasis in the implementation in different units. In a short chapter on "Results of the Project" (4 pages) the authors point out that the general reaction to MBO was that it helped in the development of result-oriented attitudes, increased delegation, disciplined review of performance and improvement opportunities, improved communication and interpersonal co-operation, and development of managers. These are some of the usual results expected from MBO practice and the authors have rightly indicated that the benefits would be much greater when MBO application covers the entire system.

Part III, the shortest part of the book (13 pages), highlights the implications of the MBO experience in Local Government and provides guidelines for action. In terms of research significance, this should have been longer and more analytical.

Part IV containing three case histories is the longest part of the book and accounts for three-fourths of the volume. It is useful but unnecessarily repetitive. The case histories dealing with MBO applications in (1) the office of the County Architect, in West Riding, (2) the Department of the Town Clerk in Manchester and (3) the Department of Education in Somerset, describe the process of MBO implementation. These case histories have too much detail of the process and could have been drastically reduced. Moreover, in all the three cases the appendices are much longer than the case drafts. Whereas, the three drafts take only 51 pages, the appendices go into 118 pages. Some of these appendices are interesting but most of them add very little. For example, appendix 1 to case history 2 contains notes on MBO and appendix 2 to case history 1 gives a detailed syllabus for the advisors' training. It seems that each case has been written independently on the basis of a common format but the editing effort has been weak.

It is interesting that on the basis of the description of MBO application in Local Government, the authors have found it necessary to emphasise some of the important points which have earlier been highlighted in the MBO experience in other organisations. They rightly put stress on the quality of MBO advisors, the importance of preparatory work and the commitment of the top management. The authors have stated that "The key to success of MBO is the commitment of the managers themselves and not the activity which the department carries out" (p 55). They have also pointed out that the MBO approach could be used for establishment of community needs in case of the local government organisations.

The book thus contains details about the process of implementation but does not provide much analysis. There are very few evaluative statements and one does not find an indication of what happened in terms of responses of the system. Although the book does not make much contribution to the knowledge on MBO, its real value lies in the fact that it contains a record of the practice of MBO in important and difficult units of public administration. One would expect that this should help in establishing the potential of MBO for application to government. It should have the demonstration effect of persuading the managers of non-profit, non-business organisations that the basic concepts and methods of MBO have great deal of relevance for them.

As there was no issue on February 23 on account of the Annual Number, the February Review of Management is published this week.

Environmental Scanning for Corporate Planning

Charan D Wadhva

Analysis of the external environment is cruci al to the process of strategic planning of a large and diversified enterprise in this country where government policy is a dominant force in shaping the future of such enterprises.

The task of environment analysis for corporate planning becomes difficult because of the frequent changes in government policies. Yet it is necessary to formulate an operational framework for environmental analysis for a systematised attempt at strategic planning.

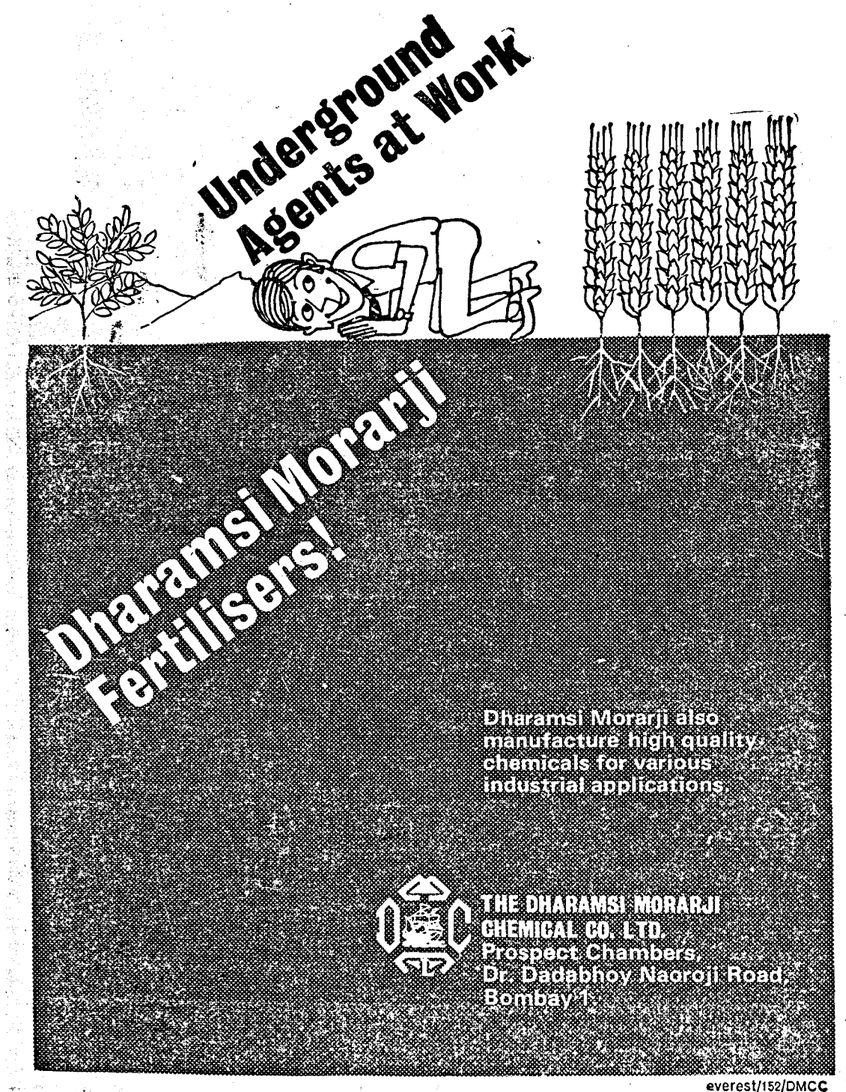
We have presented in this paper a list of selected economic and regulatory conditions which have been empirically found to have a significant impact on the business operations of a large and diversified industrial enterprise.

THE importance of environmental scanning for corporate planning is well recognised by now.[1] The existing and potential opportunities, threats and constraints for the operation of the corporation are likely to be shaped by the external conditions with which it has to live. However, the subject acquires special significance in the context of a developing country like India where the government is constantly trying to influence the level of economic activity in the country to simultaneously achieve the objectives of economic development and social justice in a planned manner. The purpose of this paper is to analyse some of the relevant external conditions for environmental analysis in the context of strategic planning of a large-sized corporation in India and to present an operational framework for such analysis with reference to investment decision-making for diversification of the activities of the corporation during the period of next five years coinciding with the country's Fifth Five-Year Plan (1974-75 to 1978-79).

I

The Corporation and Environmental Analysis

Theodore Rubin has characterised the environment, present or future, as a "set of outcomes, situations or social conditions which is the policy consequence of the interaction of technology and social institutions". According to him, the purpose of environmental analysis is "to establish the linkages among these outcomes and the institutions, policies and technologies which shape them".[2]



The task of external environmental analysis can be enormous in view of the multi-dimensions of the environment variables to be analysed. In its broadest form, as S K Bhattacharyya has pointed out, "it involves the scanning of the entire spectrum of the social, political, technological and economic forces likely to have a bearing on the future performance of the organisation, the industry to which it belongs, the business generally, with a view to determining what the organisation can reasonably seek to achieve during the strategic plan period".[3]

Strategic planning is concerned with determining the fundamental objectives of the corporation and the activities which it must undertake to achieve these objectives in an integrated and harmonious pattern. A comprehensive analysis of external conditions would serve as an essential input to the top management for charting the future of the corporation. Environmental analysis would include not only study of past behaviour of the variables constituting "environment" and current trends in their behaviour, but also forecasting the changes in these variables in the future within the horizon of strategic planning. The latter task, though vital in the planning process, is certainly a very difficult one in view of the uncertainties attached to the behaviour of the variables of the environment set under dynamic conditions in a world of interdependence among the actors across firms, across industry, across sectors of business within a nation and across nations. This requires the continuous review of environmental analysis in a systematic fashion as an aid to long-term corporate planning.

The Relevant Environment

It is here that the concept of the *relevant* "environment" for the user becomes very useful. Each user (actor) of environmental analysis is interested in his own "environment" (rather than with the totality of the environment) which he can affect through "adaptation or control". This concept agrees very well with the notion of a firm as a "system", composed of a number of parts, whose activities is seeks to integrate for the achievement of its objective.[4] As Rubin has pointed out, "The totality of the environmental system has relevance to no single actor". As a corollary, the relevant environment for any particular actor is equivalent to only a small part of the environmental system. As a result of this narrowing down of the concept of 'environment' the environmental analyst is in a much happier position. According to Rubin, this is so because this fact reduces "the potential of error by omission in environmental analysis". However, Rubin rightly adds that the same fact also "places a responsibility on the actor to 'know himself' so that he may know what environmental information is relevant to his social purpose".[5]

The fact that each user of environmental analysis is interested in his "own" relevant environment does not preclude the existence of a common sub-set of his environment with the environment of other actors in a similar position who are his competitors even though none of them is interested in the global concept of environment which can cover anything and everything in the world. It is this sub-set of environment which is common to large sized corporations in India that we are interested in. We will specifically be interested in the common part of the environment for those large companies who wish to diversify their output (a strategic decision involving investment planning). We will thus be mainly concerned with the analysis of one aspect (though a very important aspect) of strategic planning of a corporation based on environmental analysis.

II

Scanning for Corporate Planning

In the Indian context, governmental policy has a dominant role in the relevant environment for corporate planning for large enterprises. We may now conceive of the corporation as a part of the larger economic system where the Central government is responsible for controlling the operations of the large corporations with the twin objectives of promoting growth in priority areas and reducing the degree of concentration of economic power. These objectives are often conflicting.[6]

The complexities of the relevant variables for environmental analysis for corporate planning are probably much more in an economy like India operating under a regime of administrative controls extending to many areas of corporate decision-making in the industrial sector of the economy. An approach to the information system for analysing external conditions has been proposed by Philip Thomas.[7] However, his approach is merely classification-oriented in the sense that he lists in a table in matrix form the environmental information system classified at one side by content level (such as political conditions, social conditions, etc) and at the other side by resolution level (such as global level, national level) and lists some of the factors falling under each box. It is not our purpose here either to prepare a comprehensive list of external factors afflicting the business operations of the corporation at the international level, at the national level, at the sectoral level, at the industry level and finally at the firm level (or in combination at various levels simultaneously) or to critically examine the attempts made by other researchers at preparing such a list. Undoubtedly, it is necessary to know the various factors constituting technological conditions, social conditions, demographic conditions, political conditions, national economic conditions, competitive conditions, international economic conditions and governmental regulatory conditions within the country (countries) in which the particular firm is operating and to understand the resolution level at which each of the relevant factors qualitatively influences the firm in question. But much more important is some quantification (however crude it may be in view of the state of our knowledge in model building in these areas) of the degree of influence of each of the relevant external environmental conditions on the business operations of the firm in the past and currently and to attempt to forecast the influence of these and "other new" relevant variables on the business operations of the firm in the future during the period of the strategic plan. The difficulties of forecasting changes in external conditions and estimating their impact on the firm are multiplied manifold in a country like India where the impact of governmental regulatory conditions is pervasive on the business operations of a large enterprise and where changes in such regulations are a very frequent affair. As Philip Thomas has rightly pointed out, "The thicket of regulatory conditions is particularly dense in India and constitutes probably the single most important obstacle to forecasting for the purpose of corporate planning in the country".[8]

In the context of a recent study of environmental conditions for strategic planning of a large industrial enterprise in India (producing a number of industrial products) with a planning horizon of five years, we analysed the input-output structure of the products and product lines, the end-users of the products and the nature of competition faced by this enterprise. On the basis of such an empirical study of the economic structure of the enterprise and a look at the external conditions affecting the business operations of this enterprise in the last ten years, and more so during the last two years, we found that economic and regulatory conditions constituted the two most important groups of external factors mainly operating at the industry-level which affected the operations of this enterprise.

Through this empirical study based on time-series analysis, we were able to identify the following selected macro-economic indicators of environmental conditions which had significant effect on the business operations of this enterprise :

(1) Government expenditure in the economy;
(2) Level of industrial production in the economy and degree of capacity utilisation in the "industry" (to which this enterprise belonged to);
(3) Availability of steel;
(4) Availability of power; and
(5) Foreign exchange situation (in the country).

On the basis of the above-mentioned study, we identified the following selected micro-economic indicators to be the major external influences on the business operations of the enterprise:

(1) Growth and profitability of end-user industries;
(2) Changes in the (technical) characteristics of the products required by the end users;
(3) Behaviour of government as a buyer;
(4) Nature of competition offered by the public sector units as supplier of competing products; and
(5) Nature of competition offered by the competitors in the private sector with special reference to quality, price and efforts at development of new products through research and development.

We also looked at the major governmental regulatory conditions affecting the business operations of the large enterprise for which we undertook environmental analysis. We found that the following regulatory conditions were exerting significant influence on the operations of this enterprise :

(1) Industrial licensing policy;
(2) Monopolies and Restrictive Trade Practices (MRTP) Act;
(3) Allocation of foreign exchange (for import of capital goods and strategic raw materials and components normally not available indigenously);
(4) Policy on export obligations and import substitution (including incentives and/or obligations for expenditures on research and development); and
(5) Policy on technical collaborations with foreign companies.

III

Operational Framework for Planning Diversification of Output

We now propose to go to the specific case of addition to the existing lines of manufacture by a large enterprise and construct an operational framework for analysing the possibilities and choices for planning the diversification of output of a large industrial corporation coming within the purview of the MRTP Act during the planning horizon of the period of our Fifth Plan (1974-75 to 1978-79). For this purpose we have made the simplifying assumption that the corporation makes the strategic decision of adding a new product to its product lines on the basis of three criteria, namely,

(1) What is the potential growth rate of demand for the product?
(2) What is the potential profitability of the product?

(3) What is the likely degree of governmental control in decision-making for managing the production, pricing and marketing of the product?

The next problem in making this analysis operational is to decide as to how to measure the potential growth rate of demand, profitability and intensity of governmental control for a product (called an "industry") and to rank industries in order of their performance with respect to each of the above-mentioned three criteria. Thus a market segmentation approach can be used as a systematised aid to strategic planning by a corporation.

Even though several sophisticated methods of demand projections are now in use by researchers of corporations for short-term forecasting (say for one to two years), they are not likely to be very reliable for longer periods. It is here that we can make use of the information provided in a document like the Five-Year Plan. The target rates of growth of output of industries set by the macro-planning authorities reflect the minimum rate of growth of demand for output of those industries expected during the horizon of the plan. Schollhammer has summarised the benefits of effectively using the general information which the national plan offers to a firm's specific situation in the following words:

> "A national plan is a kind of large-scale market survey which provides business executives with consistent information about future developments and anticipated governmental actions. It conveys not only what is probable but also what is desirable; it shows what the objectives are and specifies the means by which the public authorities intend to attain them. Consequently, business executives can make strategic decisions under reduced uncertainties, which result in less wastage, a higher economic efficiency, and increased freedom in the form of wider opportunities for growth of the individual firm in an expanding and co-ordinated economy."[9]

The effective use of the general information on the sectoral growth envisaged of the national income as well as the specific information on the target rates of growth of selected industries in the document of the Five-Year Plan requires the skills of a competent analyst. In view of the fact that the achieved rates of growth of output do differ from the target rates of growth of output of various industries, a continuous review of the likely rate of growth of output will have to be made by the analyst and supplemented with his knowledge of all other available information in the framework of an input-output model of the economy.

The profitability of an "industry" can be measured by several alternative criteria. For measuring the potential profitability of a product, we have chosen the criterion of the average rate of return on the net worth [measured as the rate of profit-after-tax (PAT) to net worth (NW) expressed in percentage terms]. We have chosen this criterion over other criteria (such as the ratio of gross profits to total capital employed) since we believe that this criterion reflects the rate of return on shareholders' funds. Information about the behaviour of this ratio during the recent past is usually available from the sample surveys of the performance of the public limited companies. In India, the Reserve Bank of India publishes every year the estimates of alternative profitability ratios of 1501 selected public limited companies operating in various industries. Another source for such empirical studies is the report of the *Economic Times* Research Bureau on the performance of 714 public limited companies covering various industries. Even though the sample surveys by these two sources cover different companies and different industries, their coverage in terms of the total paid up capital of all the public limited companies is nearly the same (around 80 per cent).

For illustrating the analysis of market segmentation of industries on the basis of the potential profitability criterion as chosen by us, we have made the highly simplifying assumption that the average rate of profitability of the industries to be analysed obtained during the last two years for which the data are available at present will be maintained during the period of the strategic plan of the next five years. A more realistic analysis of such a study would require continuous updating of information supplemented by the experience of other firms in similar position.

It should be theoretically possible to evolve a formula for measuring the degree (or intensity) of governmental control on the production, pricing and marketing, assigning weightages to the various elements constituting the controls in these functional areas. There can be differences of opinion on the empirical measurement of this concept due to arbitrariness of the weights involved. We have chosen only one element of control, namely, whether there is price control on the final product, to illustrate the segmentation analysis of industries on the basis of the criterion of degree of control and neglected all other elements for the sake of simplifying our model.

We have to define the relevant set of industries for which the market segmentation analysis needs to be carried out for the consideration of the top management of a large enterprise for making investment in a new product. Such a decision is subject to the regulations of the industrial licensing policy of the Government of India. The search for the relevant set of industries for the consideration of large enterprises must, therefore, be made in the context of the role envisaged for such enterprises in the current industrial licensing policy announced by the government in February 1973 which reflects the national priorities for investment in industries to achieve the objectives of economic development, social justice and self-reliance envisaged in the Fifth Plan (1974-75 to 1978-79).

A controversy had been raging in government quarters regarding the role of the joint sector for quite some time. The concept has been clarified to some extent in the industrial licensing policy statement of the Government of India. We quote below the relevant segments of this statement relating to the joint sector: [11]

> "Government's policy regarding the joint sector is derived from the industrial policy resolution, 1956 and the objective of reducing the concentration of economic power. In appropriate cases, the central and state governments have taken equity participation either directly or through their corporations with private parties. Some joint sector units have come up in this way. This type of joint sector unit is a device which may be resorted to in specific cases having regard to the production targets of the Plan. Each proposal for establishing a joint sector unit of this nature will have to be judged and decided on its merits in the light of government's social and economic objectives. The joint sector will also be a promotional instrument, as for instance, in cases where state governments go into partnership with new and medium entrepreneurs in order to guide them in developing a priority industry."
>
> "Government specifically wish to clarify that the joint sector will not be permitted to be used for the entry of larger houses, dominant undertakings and foreign companies in industries in which they are otherwise precluded on their own. In all the different kinds of joint sector units, the government will ensure for itself an effective role in guiding policies, management and operations, the actual pattern and mode being decided as appropriate in each case."

For the purpose of illustrating the licensing policy of the government regarding new industries to be set up during the period of the Fifth Plan of relevance to large corporations, we may consider the total set of new industries to be set up during this period. Leaving apart the problem of decision-making on dominantly export-oriented industries where the large enterprises can enter any industry open to the private sector including those reserved for small-scale units, our market segmentation study would be concerned with the list of 19 categories of industries given in Appendix II which have specifically been mentioned in the new industrial licensing policy announced in February 1973 as the ones where the government would entertain and welcome applications from large industrial enterprises in consonance with the objectives of national economic policy set in the Fifth Plan. We have grouped these 19 categories of industries into 11 major industries as shown in Table 1 along with the market segmentation analysis of these industries using the three criteria of potential growth rate of output, profitability and degree of price control on output as mentioned earlier.

For the purpose of the segmentation of industries on the basis of the growth rate criterion, we have used the information on the target rates of growth as published in the official paper on the Approach to the Fifth Five-Year Plan published by the Planning Commission. We have arbitrarily used a cut-off rate of growth of 10 per cent per annum for dividing the industries into high growth (HG) and low growth (LG) industries.

While using the profitability criterion, we have segmented the industries into high profit (HP) and low profit (LP) segments on the basis of a cut-off rate of 10 per cent since this rate represented the average rate of return on net worth of all the industries during the last two years for which data are available.

Finally, we have labelled those industries in which governmental price control on the selling price of the final output is imposed as highly-controlled (HC) segment and those on which there is no such price control as less-controlled (LC) segment of industries.

The market segmentation analysis of the kind that we have presented in Table 1 above would serve as an aid to decision-making by the top management for considering the addition of a new product to the product line of the large enterprise. We have assumed that it would be rational for the top management to normally prefer the high growth-high profit-less controlled (HG-HP-LC) segment of industries for entering into a new industry unless there are other considerations in the objectives of the enterprise (than those reflected in the three criteria which we have chosen here for illustration). Table 2 presents the information contained in Table 1 in a more convenient form for review by the top management of a large enterprise for the purpose under consideration.

TABLE 1: SEGMENTATION ANALYSIS OF INDUSTRIES NORMALLY OPEN FOR ENTRY BY LARGE ENTERPRISES FOR THE FIFTH PLAN PERIOD

Industry	Annual Growth Rate of Output (Per Cent)	Profit after Tax / Net Worth (Per Cent)	Segment
(1) Special steel	10.0	5.6	HG-LP-HC
(2) Non-ferrous metal and their alloys	14.0	14.7	HG-HP-HC
(3) Industrial plants and machinery	16.0	8.0	HG-LP-LC
(4) Electrical equipment and electronic equipment	12.0	11.0	HG-HP-LC
(5) Small ships	10.0	11.7	HG-HP-LC
(6) Commercial vehicles	7.0	7.9	LG-LP-HC
(7) Agricultural machinery (tractors, power tillers, etc)	9.0	7.3	LG-LP-HC
(8) Chemicals (inorganic, organic, others)	12.0	12.8	HG-HP-LC
(9) Drugs and pharmaceuticals	5.3	17.4	LG-HP-HC
(10) Paper and paper products	9.9	14.0	HG-HP-HC
(11) Cement	8.3	11.7	LG-HP-HC

Note: The estimates of growth rate of output of the above industries are based on the target rates for the broad industry groups formulated by the Planning Commission as published in the official paper on Approach to the Fifth Five-Year Plan. The estimates of profitability are the average derived as averages of the rates prevailing in 1969-70 and 1970-71 for these industries by splicing information provided in the *Reserve Bank of India Bulletin*, September 1972 and in the *Economic Times*, November 30, 1972.

IV

Inter-Relationship between Macro Planning and Action at Micro Level

The inter-relationship between macro-economic planning and micro decision-making needs to be stressed. As Chamberlain and others have pointed out, the firm has social utility which the government can regulate in the pursuit of social objectives.[12] But the relationship between the firm and the government is not one-sided. The firm's actions in a mixed economy ultimately determine whether the social objectives (including the objective of rapid economic growth) set by the government are likely to be achieved or not and to what degree. To quote Chamberlain again, this is so because to "some extent government can specify the firm's activities by legislation and regulation. But to a larger extent it can only secure the behaviour it wants by appropriate inducements, usually of a fiscal or credit nature. The firm retains areas of independence of action which the government cannot invade without jeopardising the social values flowing from the existence of numerous points where change can be initiated".[13] We may add here that instituting changes in social system are awfully slow in a political system governed by democracy as prevails in India.

Samuel Paul has pointed out that the interface between macro planning and micro level decision-making has remained a "neglected area" in India. This he calls the failure of 'micro planning' and distinguishes it from the problems of aggregative planning which is concerned with basic national goals and broad strategy in micro terms.[14] The failure on the front of this 'micro planning' can be held responsible, among other things, for the relative poor performance of the Indian economy in terms of the attainment of the objective of rapid economic growth,

TABLE 2: INDUSTRIES OPEN TO LARGE ENTERPRISES CLASSIFIED BY SEGMENTATION ANALYSIS FOR THE PERIOD OF FIFTH PLAN

I *High Growth-High Profit-Less Controlled (HG-HP-LC) Industries* (i) Electrical equipment and electronic equipment (ii) Chemicals (iii) Small ships	II *High Growth-High Profit-Highly Controlled (HG-HP-HC) Industries* (i) Non-ferrous metals and their alloys (ii) Paper and paper products
III *High Growth-Less Profit-Less (HG-LP-LC) Industries* Industrial plant and machinery	IV *High Growth-Less Profit-Highly Controlled (HG-LP-HC) Industries* (i) Special steel
V *Low Growth-High Profit-Less Controlled (LG-HP-LC) Industries*	VI *Low Growth-High Profit-Highly Controlled (LG-HP-HC) Industries* (i) Cement (ii) Drugs and pharmaceuticals
VII *Low Growth-Low Profit-Less Controlled (LG-LP-LC) Industries*	VIII Low Growth-Low Profit-Highly Controlled (LG-LP-HC) Industries (i) Commercial vehicles (ii) Agricultural machinery

V

Conclusion

We conclude that the analysis of the external environment is crucial to the process of strategic planning of a large and diversified industrial enterprise in India where the governmental policy is acting as a dominant force in shaping the future of such enterprises with the twin objectives of accelerating the rate of economic growth and reducing the degree of concentration of economic power in the economy. There are cases where there is a clash between these two objectives which leads to contradictions in governmental policy. The task of environmental analysis for corporate planning with a horizon of the next five years (or so) becomes quite difficult in view of the frequent changes in governmental policies and regulatory conditions. Yet it is necessary to formulate an operational framework for environmental analysis for a systematised attempt at strategic planning. We have presented in this paper a list of selected economic and regulatory conditions which have been empirically found to have a significant impact on the business operations of a large and diversified industrial enterprise in India. We have also proposed and illustrated the use of an operational framework for environmental analysis for providing an input to the top management of a large enterprise for decision-making with reference to proposals for adding a new product to its existing product line(s). We have pointed out that the importance of continuously updating relevant information on external conditions supplemented by practical experience of other companies in similar position cannot be exaggerated for making the exercise more realistic. Finally, we conclude that the significance of the inter-relationship between macro-planning and micro decision-making should be sufficiently realised by the policy makers in the country to avoid the failures on account of 'micro planning' for the achievement of objectives of national economic policy.

Appendix I

SCHEDULE A (AS DEFINED UNDER INDUSTRIAL POLICY RESOLUTION, 1956)

(1) Arms and ammunition and allied items of defence equipment.
(2) Atomic energy.
(3) Iron and steel.
(4) Heavy castings and forgings of iron and steel.
(5) Heavy plant and machinery required for iron and steel production, for mining, for machine tool manufacture and for such other basic industries as may be specified by the Central government.
(6) Heavy electrical plant including large hydraulic and steam turbines.
(7) Coal and lignite.
(8) Mineral oils.
(9) Mining of iron ore, manganese ore, chrome ore, gypsum, sulphur, gold and diamond.
(10) Mining and processing of copper, lead, zinc, tin, molybdenum and wolfram.
(11) Minerals specified in the Schedule to the Atomic Energy (Control of Production and Use) Order, 1953.
(12) Aircraft.
(13) Air transport.
(14) Railway transport.
(15) Shipbuilding.
(16) Telephone and telephone cables, telegraph and wireless apparatus (excluding radio receiving sets).
(17) Generating and distribution of electricity.

Appendix II

'CORE' AND 'HEAVY' INDUSTRIES OPEN TO 'LARGE INDUSTRIAL HOUSES' (as under MRTP Act 1969)

[Note: The classification of industries follows the first schedule to the Industries (Development and Registration) Act, 1951. Items of manufacture reserved for the public sector under schedule A to the industrial policy resolution, 1956 or for production in the small-scale sector as may be notified from time to time will be excluded from the application of the list.]

(1) Metallurgical industries: ferro alloys; steel castings and forgings; special steels and non-ferrous metals and their alloys.
(2) Boilers and steam generating plants:
(3) Prime movers (other than electrical generators): industrial turbines and internal combustion engines.
(4) Electrical equipment: equipment for transmission and distribution of electricity; electrical motors; electrical furnaces, X-Ray equipment, and electronic components and equipment.
(5) Transportation: mechanised sailing vessels up to 1000 Dwt; ship ancillaries; commercial vehicles.
(6) Industrial machinery.
(7) Machine tools.
(8) Agricultural machinery: tractors and power tillers.
(9) Earthmoving machinery.
(10) Industrial instruments: indicating, recording and regulating devices for pressure, temperature, rate of flow, weights, levels and the like.
(11) Scientific instruments.
(12) Nitrogenous and phosphatic fertilisers falling under inorganic fertilisers.
(13) Chemicals (other than fertilisers): inorganic heavy chemicals; organic heavy chemicals; fine chemicals, including photographic chemicals; synthetic resins and plastics; synthetic rubbers; man-made fibres; industrial explosives; insecticides, fungicides, weedicides and the like synthetic detergents and miscellaneous chemicals (for industrial use only).
(14) Drugs and pharmaceuticals.
(15) Paper and pulp including paper products.
(16) Automobile tyres and tubes.
(17) Plate glass.
(18) Ceramics: refractories, furnaces lining bricks — acidic, basic and neutral.
(19) Cement products: portland cement, asbestos cement.

Appendix III

CORE INDUSTRIES

The list of "core" industries issued by the Government of India includes the following industries.

(1) Agricultural inputs:
  (a) Fertilisers
    (i) Nitrogenous
    (ii) Phosphatic
  (b) Pesticides (basic chemicals only)
  (c) Tractors and power tillers
  (d) Rock-Phosphate and pyrites
(2) Iron and Steel:
  (a) Iron ore
  (b) Pig iron and steel
  (c) Alloy and special steels
(3) Non-ferrous metals

(4) Petroleum
  (a) Oil exploration and production
  (b) Petroleum refining
  (c) Selected petro-chemicals
    (i) Integrated petro-chemicals complexes
    (ii) DMT
    (iii) Caprolactum
    (iv) Acrylonitrile
    (v) Synthetic rubber
(5) Cooking Coal
(6) Heavy industrial machinery (to be specified)
(7) Ship-building and dredgers
(8) Newsprint
(9) Electronics (selected components, testing and control equipment, wireless and micro-wave equipment)

Notes

[This paper is based on my experience of undertaking studies of environmental analysis for a large corporation and a commercial bank. I have greatly benefited from the work of Samuel Paul and S K Bhattacharyya in these studies. Ravi Matthai also gave some useful suggestions for improving the contents of the paper.]

Cash Working Capital vs Balance Sheet Working Capital

An Analysis Based on Four Cases

S K Chakraborty

The conventional definition of working capital adopts a balance sheet view of resources for sustaining the current operations of the firm. However, the balance sheet is a static position statement of the firm on a certain date. It fails to indicate the dynamic flow of values occurring in the firm throughout a period.

The real dynamics of the pressures on cash flows are contained in the firm's income or profit and loss statement. This statement contains all the operational inflows and outflows of values—cash or credit —during a period.

The operating cycle concept of working capital discussed here is basically a profit and loss account-based tool.

I

Working Capital in Common Parlance

THE conventional definition of working capital in terms of offsetting the current claims against the firm against the current claims of the firm seems somewhat confusing. The surplus left after such offsetting is in fact equivalent to a portion of the long-term claims against the firm. One has only to visualise the Balance Sheet layout to appreciate this point. Working Capital so defined is thus really a part of long-term finance used to support current activities. This is the working capital margin money which is treated as fixed investment for project appraisals. The following simple illustration will make the point clear:

	Period 1 (Rs)	Period 2 (Rs)
Sales	1,000	1,500
Working Capital — say, ¼ of sales	250	375
Constituted as Current Assets	350	525
Less, Current Liabilities	100	150
	250	375
Financed by Bank Overdraft (70 per cent)	175	262
Long-Term Finance	75	113
	250	375

Thus larger the amount of working capital so derived, greater the proportion of long-term capital sources siphoned off to short-term activities. It is difficult to say whether this is right or not. Apparently, when firms are worried about tight working capital situation, the logic of the above definition would perhaps indicate diversion of long-term finances for short-term purposes. For, if bank overdraft were substituted for trade creditors the current assets, less current liabilities (including bank overdraft) calculation would simply leave working capital at its previous figure. Liquidation of debtors and inventory into cash would also leave the working capital level unchanged. And so would payment of current liabilities in cash. Similarly, a relatively large amount of working capital according to this definition may produce a false sense of security at a time when cash resources may be negligible, or when these may be provided increasingly by long-term fund sources in the absence of adequate profits.

Three points seem to emerge from above. First, the Balance Sheet definition of working capital is perhaps not meaningful, except for indicating the firm's current solvency in repaying its creditors. Second, when firms speak of shortage of working capital, they in fact imply scarcity of cash resources. Thirdly, in funds flow analyses increase in working capital, as conventionally defined, represents employment or application of funds. Conceptually, a rise in working capital is thus at par with an increase in, say, fixed assets or repayment of loans. With the cash definition of working capital, however, it is difficult to see how an increase in cash is an application of funds. There seems, therefore, to exist the need for a more direct and relevant measure of cash working capital needs.

The Balance Sheet is a static position statement of the firm on a certain date. It fails to indicate the dynamic flow of values occurring in the firm throughout a period. These value flows in a going concern centre mainly around the operational activities of the business in any period. For a manufacturing concern these operations are related to procurement of materials, their conversion, sale of finished goods and realisation of debtors. Part of material and labour resources may be used on credit terms. Similarly, sales could be partly in cash and the rest on credit. In the ultimate analysis, however, it is cash flows which will keep the firm going in the long-term. Creditors and debtors and similar items are merely transient stopgaps. The firm will keep itself working and solvent so long as cash flows are not unduly upset. And the real dynamics of the pressures on cash flows are contained in the firm's Income or Profit and Loss Statement. This statement (or account) contains all the operational inflows and outflows of values — cash or credit — during a period. The conventional definition of working capital adopts a Balance Sheet view of resources for sustaining current operations. The operating cycle concept to be developed below is, however, basically a Profit and Loss Account-based tool.

II

Operating Cycle Concept

If we shift away from the Balance Sheet definition of working capital, we have to focus attention on the Income Statement and on the cash version of working capital. The transition to this vantage point is achieved through the operating cycle concept (OC). In doing so, however, the Balance Sheet is not completely cast aside. As we shall examine below, the calculation of the OC period in itself acts as a link between the Balance Sheet and the Income Statement. Underlying the application of the OC concept is a more functional interpretation of the role of working capital. It is argued here that the basic function of working capital is to support all operational activities of the firm, and costs thereof,

A dream today, a reality tomorrow

Today at Mithapur, young India, conscious of the past, urged on by the present, confidently dreams of a glorious tomorrow.

Their immediate dream is of a new complex—massive, self-sustaining, long-range and innovative—harnessing the sea, the sun and ultimately the atom to banish hunger from their land and to generate greater economic self-sufficiency, more and more independence.

There is a beginning but there is no end to the work of bringing purposeful prosperity to the people of India. Harness the sea, the sun, the atom and from Okhamandal—the land of salt—fertility will flow to the entire country.

TATA CHEMICALS LIMITED

TATA CHEMICALS

GMTC-10-74

over a period. It is only a part of this function to be able to meet the current liabilities as and when these fall due. The cash version of working capital fits appropriately in this wider perspective.[1]

The systematic exposition of the OC concept is contained in Park and Gladson's work.[2] The main thrust of their work has been in using the OC period for a business to define its current liabilities and current assets. This definition, quite logically, is suggested as a finer criterion to judge the funds flow pattern through working capital items, than the conventional one-year time-span. Calculation of the OC period by following through the successive stages of committing cash in the operations and finally getting it back into the stream again to begin another cycle, is quite tailor-made to the individual characteristics of a firm. All specific technological as well as commercial features of an enterprise are provided with a sharper analytical focus while deriving the duration of the OC. Thus, the nature, age, and mix of technical processes employed in a firm shall be the dominant influence on the conversion period of manufacture. Similarly, the credit period allowed to and by the firm for purchases and sales will determine the length of materials acquisition and storage and debtors' collection periods. In all these phases, the firm will have its own specific strengths and/or weaknesses, quite apart from some general intra-industry uniformities. It is such specificities which get highlighted in the OC period.

Having derived the OC period for a firm, those items of assets or liabilities alone which liquidate themselves into or by cash within that period are classified as 'current' ones. Working capital computed from such items will be very different — and more relevant — from the one based on items classified as current on a one-year basis. It is surely more useful for a firm to know how soon a unit of money put into operation is going to be recouped again in cash for use in a fresh cycle of operations. The OC period indicates precisely this time-interval. In other words, the OC concept has a built-in stress on the cash interpretation of working capital for ongoing operations. Thus, Sagan's 'money manager' could gainfully use the OC tool as one means to escape the discomfiture of being presented with "a satisfactory working capital ratio when he does not have funds to meet an immediately due payment".[3] Since many of the valuation bases adopted for current asset items are subjective assessments flowing from accrual income accounting, the OC approach to cash forecasting (as demonstrated later) should provide a stronger focus on the key resource of cash.[4]

Another point should be mentioned here. The concept of cash working capital is being employed for the four case studies below to indicate cash needed for manufacturing and selling operations only. Cash outlays involving capital expenditures, dividend payments, etc, are being ignored.

III

Computation of Operating Cycle Period

In the study presented below the following methodology has been used in determining the length of the operating cycle period. The calculations are all based on published account figures. In all cases we shall be dealing with manufacturing concerns. (Instead of taking 365 days in each year as below, it may be more realistic to assume a figure between 250 and 330 working days a year.)

(1) *Materials in Storage Period*: This measures the average time bought items remain in store prior to being released into the production stream. The following steps are involved in calculating it.

(a) Materials consumed during the year, say, M.
(b) Average daily rate of materials consumption, M/365.
(c) Average materials inventory during the year, i e, (opening inventory + closing inventory)/2, say, I.
(d) ∴ Number of days materials remain in store = I/(M/365).

Materials consumed during the year could be readily found out with the help of opening and closing stock and raw materials purchase figures.

(2) *Conversion Process Period*: This measures the time taken on average to carry out the basic manufacturing processes, converting material inputs into finished goods. The steps involved are:

(a) Cost of finished goods production during the year, say, C.
(b) Average daily cost of finished goods produced = C/365.
(c) Average work-in-process during the year i e, (opening w i p + closing w i p)/2, say W.
(d) ∴ Average conversion time = W/(C/365).

Into cost of finished goods produced will go opening w i p, materials consumed and all manufacturing expenses including wages, less closing w i p. The manufacturing expenses may have to be unearthed from schedules attached to the Profit and Loss Account. The pace of the conversion process is determined largely by the state of technological efficiency and supervisory abilities in the firm.

The degree of completion of work-in-progress on the opening and closing dates will influence the number of days for this phase of the operating cycle. This is illustrated below with simple figures where the same quantities of opening and closing w i p's are assumed 50 per cent and 25 per cent complete, for the first period, and for the second period 25 per cent and 50 per cent complete, respectively.

	Year 1	Year 2
Opening w i p	100	50
Manufacturing expenses	600	600
	700	650
Closing w i p	50	100
Cost of finished goods produced	650	550
∴ Conversion period	$75 \div \frac{650}{365}$	$75 \div \frac{550}{365}$
	i e, 42 days	i e, 50 days

This difference of 8 days reflects the relative efficiencies of conversion in the two years.

(3) *Finished Goods in Storage Period*: Some time usually elapses before finished goods move out of the manufacturers' warehouse to the customer. This is particularly so for firms which produce for stock and not against orders. How speedily this movement takes place depends upon the nature of the product(s), market(s), the season of the year, the effectiveness of sales and marketing tactics, etc. Calculation of this period follows the sequence given below:

(a) Cost of finished goods sold during the year, say, F.
(b) Average daily cost of finished goods sold = F/365.
(c) Average finished goods inventory during the year i e, (opening stock finished goods + closing stock of finished goods)/2, say, G.
(d) ∴ Average period during which finished goods remain in warehouse = G/(F/365).

Cost of finished goods sold during the year is obtained by adding to cost of finished goods produced in the year

Productivity Science fulfils its function only when it aims at the greatest good for the greatest number.

PRESYN

[already calculated in 2(a) above], the opening stock of finished goods and all administrative and selling expenses, and deducting the closing stock of finished goods at the end of the year. The splitting of administrative expenses into manufacturing and selling expense categories has been regarded as not being practically very meaningful in this context. It is also assumed that finished goods inventory valuation is done on full cost or absorption cost basis.

(4) *Debtors' Collection Period*: Depending on the commercial conventions of trade for an industry in varying economic environments, and also on the firm's own credit policies, the conversion of debtors into cash (stage 3 above being that of conversion of finished goods into debtors) will consume some time. Since published accounts do not usually show the break-up of sales into credit and cash categories, we shall assume for our purposes all sales to be on credit. The calculation then is as below:

(a) Average daily sales during the year, i e, (total net sales during the year/365), say, S.

(b) Average debtors' balance during the year, i e (opening balance + closing balance)/2, say, D.

(c) ∴ Average collection period of debtor's balance = D/S.

Since excise duty is payable by the firm on its sales, which is later on recovered from customers, two alternatives are possible. Either sales net of excise duty be considered, in which case the excise duty amount should be excluded in computing cost of goods sold. Or, gross sales value including excise duty be taken, in which case the duty amount should be added to cost of goods sold. There will be some variation in both the finished goods in storage and debtors' collection periods according to the particular alternative adopted.

(5) *Creditors' Liquidation Period*: The same mix of commercial and policy considerations as in stage (4) above also governs the period of credit obtained from the suppliers of the firm. The computation is as follows:

(a) Average daily purchases during the year, i e, (total net purchases in the year/365), say, P.

(b) Average creditors' balance during the year, i e, (opening balance + closing balance)/2, say, C.

(c) ∴ Average credit period obtained from suppliers = C/P. This period goes to the advantage of the firm, and to that extent is to be offset against the sub-total of the first four phases of the operating cycle period.

Thus taking together the above five calculations, the operating cycle period is derived as follows:

I/(M/365) + W/(C+365) + G/(F/365) + D/S — C/P = OC.

IV

Four Cases

As already mentioned, the analysis reported below is intended to demonstrate the use of the OC concept based on published annual reports of the firms. In this section the analysis alone will be presented. The next section will draw attention towards some of the highlights and limitations of the analysis done here.

The study covers four companies over a five-year period from 1965 to 1969. These companies are Union Carbide of India Ltd, Hindustan Lever Ltd, Dunlop (India) Ltd, and Guest, Keen and Williams Ltd. The first and the third firms belong mainly to the consumer durable goods industry. The second is a consumer goods producing firm. The fourth one is in the producers' goods industry. Published final accounts for all these firms for the 5-year period provided all data used below.

In each case the length of the OC period has been computed for each of the five years. This, in turn, has been converted into the number of operating cycles completed by each unit of money in a year. In the third step we have computed from the Profit and Loss Accounts the total operational expenses on account of materials, wages, etc, for each year, excluding depreciation. Although depreciation is a non-cash charge, yet it goes into the valuation of work-in-progress because of the absorption-costing basis assumed earlier. But since this is an expense not requiring cash outlay, we are excluding it in computing operational expenses. Other administrative and selling expenses are included. Taxes and dividends are not considered however in computing operational expenses because these are appropriations subsequent to the accrual of profits from operations. These outlays are not meant for supporting the operations of the business. The next step is to divide the total operational expenditure for each year calculated above, by the number of operating cycles for the relevant year already figured out in step two earlier. The resultant amount indicates on an *ex post* basis the *cash working capital* that should have been required to sustain the year's operations. This figure will in all probability not equal the average working capital amount as conventionally derived from Balance Sheet items of opening and closing current assets and current liabilities. Let us examine Table 1.

The following points emerging from Table 1 are significant:

(1) The year 1967 seems to be the 'hump' year for nearly all phases of the operating cycle. This is reflected in the longest OC period — 159.5 days — in that year during the 5-year period covered. And following from this, the number of OC's completed in 1967 is also the least, i e, 2.5 approximately. The years 1968 and 1969 have registered consistent reductions in all the first four phases of the OC. The credit period allowed to suppliers has, however, shown a slight rise in 1969 over 1968. Consequently, the OC duration

TABLE 1: UNION CARBIDE (INDIA) LIMITED

(8) Cash working capital requirement	65.0	86.4	107.3	104.1	102.7
(9) Average working capital as per balance sheet	51.7	72.2	87.9	105.5	116.6

for 1969 is the shortest in the five years — 101 days only. This, in turn, gives the greatest number of operating cycles for this year — 3.6 times. The preliminary inference from this situation is: relatively less cash working capital should be needed in 1968 and 1969 to sustain the same volume of business.

(2) The difference between cash working capital requirement and Balance Sheet working capital may also be investigated by examining the pattern of working capital behaviour during the year. The averaging of opening and closing working capital figures could very well obscure the seasonal or other periodic influences like pre-budget buying, procurements against import licences, etc. Possessing internal information, one could also adjust Balance Sheet working capital for obsolete stocks, old debtors, doubtful claims, etc, which should not influence the operating cycle. These points would be equally applicable to the three following cases as well.

(3) By dividing the total operational expenses during each year by the respective number of operating cycles, we arrive at figures of required cash working capital shown against row 8 in the Table. It is interesting to observe that upto 1967 there has been a substantial excess of cash working capital needed over the average working capital amount derived from the Balance Sheet. This leads to a preliminary hypothesis that upto 1967 the OC periods were too long with the result that more cash was necessary to carry on business. In 1968, when the number of OCs completed during the year showed marked improvement, the gap between cash working capital and Balance Sheet working capital is almost nil. And in 1969, with further sharp reduction in the OC period duration, the Balance Sheet working capital substantially exceeds cash working capital. This comparision may be better understood if we consider the 'cash value' of Balance Sheet working capital, i e, all non-cash current assets realised at their full money value, less cash payment of all current liabilities in full.

If excess cash working capital were needed for three years upto 1967, where could it have been drawn from? A *prima facie* answer probably lies in that such additional needs were met out of long-term fund sources of the firm.

(4) The two preceding points are a sort of *post mortem*. But a forward-looking analysis is also possible with the help of information contained in Table 1. It has been suggested earlier that cash working capital requirements are a function of the volume of activity, given a certain duration of the operating cycle. If sales volume is regarded as an indicator of level of activity, then it may be hypothesised that cash working capital needs would be a positive function of sales volume. In the absence of a common denominator of physical sales for a wide variety of products, we have to accept sales value as a surrogate measure of activity level. This will, however, cause distortions due to changes in selling prices which may not necessarily have any impact on cash working capital needs. A regression equation could be fitted to, say, the past 10-15 years' sales figures with those of corresponding operational expense amounts. With the help of this equation, for the forecast sales level for a particular year, the corresponding operational expense figure could be readily obtained. Although the amount so obtained would by itself have covered the inflationary factor to some extent, quite apart from reflecting the direct correlation between activity level and operational expenses, we may add a further margin to allow for anticipated inflationary price increases.

Thus, sales, less excise duty, for Union Carbide increased steadily from Rs 165.4 million in 1965 to Rs 387.3 million in 1969. This represents an average 27 per cent increase in activity level per annum over the quinquennium. If we allow for the fact that during 1968 and 1969 — just following the recession — the rates of increase were much more than normal, then we might assume that sales would register a rise of around 15 per cent in 1970 over 1969. Of course, estimates of future changes affecting sales in 1970 would also be used to refine the forecast based on past average behaviour of sales. Assuming, however, that a 15 per cent rise is expected in 1970 in the final analysis, sales would be around 435.4 million.

In 1969 the number of operating cycles completed by each unit of money was 3.617. Assuming this could be marginally improved upon to 3.7 in 1970, then cash working capital requirement is established at (Rs 435.4 million/3.7), i e, Rs 118 million approximately for 1970. As the rate of inflation per annum is of the order of 6 per cent now, an additional 6 per cent margin on Rs 118 million would yield an estimate of cash requirement at Rs 125 million. The benefit of this calculation is that it focuses clearly on the demand for liquid money for next year's manufacturing and selling operations (not capital expenditure, however). Such an estimate, we feel, is crucial because the conventional working capital figure by itself may be misleading, despite the fact that cash resources are generated through the realisation of current assets. In fact, non-cash current assets could be managed better if we know the amount of cash working capital needs. Decisions about overdraft facilities could also be better taken if the extent of gap between direct cash realisation through sales plus through realisation of current assets, and operational cash requirements could be more rationally forecast in advance.

We have mentioned above the possibility of improving upon the number of operating cycles per year to 3.7 in 1970. More explicitly, it implies a reduction in the duration of the OC period. It may be observed from Table 1 that except in 1967, the durations of

TABLE 2: HINDUSTAN LEVER LIMITED

each of the first four phases have shown a falling trend. It is for management to go deeper into each phase and to try to look for possible further economies in any or some of these phases. And, of course, attempts may be made to prolong creditors' repayment period without jeopardising goodwill.

The following points need highlighting from Table 2:

(1) The difference in the nature of industries to which Union Carbide and Hindustan Lever respectively belong seems to be clearly demonstrated by the marked variation in the length of their OC periods, and hence the number of operating cycles completed each year by them. Union Carbide manufactures mainly dry cells and torches of various specifications under the famous brand name of 'Eveready'. Hindustan Lever, on the other hand, produces consumer goods like soaps, baby foods, beverages, etc. Viewed in this light, lesser time-spans involved in each and every phase of the OC period for Hindustan Lever, compared to those of Union Carbide, seems inherent in their respective product ranges. A tentative hypothesis could thus be suggested: firms belonging to the consumer goods industry are likely to have shorter OC periods than those belonging to the consumer durable goods industry — at least for the sale-of-finished-goods and realisation-of-debtors cycles. Sometimes, however, bulk-buying of seasonal crops may cause the raw materials-in-store period to be relatively long for consumer goods firms, e g, tobacco or tea.

(2) The range of fluctuation in the length of the OC period between 1965 and 1969 is much less for Hindustan Lever (17 per cent, i e, $\frac{65-54.1}{65} \times 100$) than for Union Carbide (36 per cent, i e, $\frac{159.5-100.9}{159.5} \times 100$). Although we are not here going to suggest an answer to it, yet a question may be raised: is this difference in amplitude of fluctuation attributable to the greater sensitivity of consumer durable goods industry to business cycles, compared to that of consumer goods industry? For, the Indian economy suffered a recession between 1965 and 1968, following the Indo-Pak war of 1965 and crop failures.[5]

(3) It will be noticed from Table 2 that cash working capital requirements are consistently less than average working capital as per Balance Sheet for all the years except 1965. This may be contrasted to the changing relationship of these two amounts for Union Carbide shown in Table 1. It was argued there that such changes were possibly due to too long an OC period for Union Carbide until 1967 which caused more cash resources to be deployed to run the business. When in the last two years the efficiency of the OC improved we found relatively less cash resources were needed to sustain higher levels of activity. Following this line of reasoning, it seems Hindusthan Lever has been able throughout the period to maintain such a minimum level of OC efficiency that there has been no occasion when cash requirements exceeded Balance Sheet working capital (except in 1965). This is perhaps a healthy sign because it indicates that the rate of conversion or realisation of non-cash current assets adequately meets the cash requirements of business operations.

(4) Sales, less excise duty, for Hindustan Lever stepped up from Rs 662.1 million in 1965 to Rs 1,020.0 million in 1969. This represents an annual average rate of increase of about 11 per cent. Since this firm belongs to the consumer goods category, and hence is liable to a lesser degree of fluctuation in activity level, we assume that 11 per cent rate of increase would be maintained for the next year also. Based on this prognosis, estimated sales for 1970 is Rs 1,132 million approximately. Assuming that the 1969 level of operating cycle efficiency is maintained for 1970 also, then the number of operating cycles for 1970 will remain at 6.75. Dividing Rs 1,132 million into 6.75, we get an estimated figure of cash requirements at Rs 168 million nearly. Adding a margin of 6 per cent for inflation, the final estimate is Rs 178 million.

Comparison of Table 3 with Tables 1 and 2 throws up the following interesting points:

(1) The lengths of the OC periods of Dunlop are more in line with those of Union Carbide, whereas their disparity with the OC period of Hindustan Lever is substantial indeed. The most plausible explanation for this seems to be the fact that Dunlop and Union Carbide fall in the same industrial category, i e, consumer durable goods. Hindustan Lever is in an altogether different kind of business.

(2) Pursuing the comparison between Union Carbide and Dunlop a bit further, it is noticeable that except for the finished goods in store period, all the other four phases of the OC are of quite disparate lengths for the two firms. This only substantiates the point that the technological and commercial characteristics of the firms are quite different. A tailor-made OC period is, therefore, a more precise guide to cash needs. However, that the two firms belong to a common industrial category is shown by the overall closeness of their net OC periods (row 6), particularly in the year 1969.

(3) Compared to Union Carbide, the range of fluctuation in the duration of OC periods for Dunlop is very much less — only about 8.6 per cent $\left(\frac{111.7-102.3}{111.7} \times 100\right)$ over the five-year period. However, this is also half the extent of fluctuation experience by Hindustan Lever during the same years. Apparently the argument made earlier that such differences may be attributable to the greater sensitivity of con-

TABLE 3: DUNLOP (INDIA) LIMITED

When we accept a challenge, our generation must forgo something. This is a time when each one of us has to make a sacrifice for the sake of a better future.

INDIANOIL

Indianoil has assumed a dual role— as a pace setter for economy and austerity and as a torch bearer in fulfilling social objectives.

INDIAN OIL CORPORATION LIMITED

Dattaram-IOC-46-B

sumer durable goods firms to business fluctuations in contradicted by the behaviour of OC period in Dunlop. The answer to this riddle may lie in a closer analysis of the relative impact of the 1965-68 recession on a firm like Union Carbide compared to that on a firm like Dunlop, even though both of them belong to the consumer durable group of industries.

(4) The cash working capital requirements of Dunlop have consistently exceeded the average Balance Sheet working capital in all the years. This is so despite the fact that it has had each year a bigger number of operating cycles except in 1969, than those of Union Carbide. The reasons may again be specifically firm-oriented. In other words, there is possibly scope for further reductions in some or all phases of the operating cycle for betterment in the efficiency of operating cycle turnover. The excess of cash needs over Balance Sheet working capital also indicates that such excess is likely to have been supported from long-term sources of funds. However, from the standpoint of computing the conventional 'return on capital employed', which includes working capital in the denominator, lower Balance Sheet working capital figure indicates relatively efficient employment of resources. And following this reasoning, Hindustan Lever should be bearing an unfavourable comparison with Dunlop.

(5) Dunlop's sales (less excise duty) increased from Rs 397.2 million to Rs 644.4 million over the five-year period, i e, by nearly 62 per cent. This means an average annual growth rate of 12.4 per cent. Considering the fact that this firm belongs to the consumer durable goods group, and that therefore it had responded to a greater extent to business fluctuations than Hindustan Lever, it may not be possible for Dunlop to maintain the average rate of 12.5 per cent, which bears the impact of relatively high growth rates in 1968 and 1969 immediately following the recession, into 1970. Let us, then, assume it to be 10 per cent for 1970. Estimated sales is, therefore, Rs 709 million. As the OC period is showing very slow improvement, let us also assume that for 1970 the efficiency achieved is such as to yield 3.75 operating cycles in the year. The corresponding cash working capital estimate is therefore Rs 709 mil/3.75, i e, Rs 189 million approximately. Topping it up with a 6 per cent inflation margin, the final figure is Rs 200 million.

The important points to emerge from Table 4 are:

(1) GKW belongs to the engineering producers goods industry which weathered the worst blast of the 1965-1968 recession. This fact is worth bearing in mind while interpreting data contained in the above Table. Thus, for GKW too, like Union Carbide, the 'hump' year for the duration of the OC period is 1967. Preceding and following this year, the OC periods behave in a similar pattern for both these firms. This similarity lends again some support to the point made earlier that, as we move up the scale from consumer goods industry to producers' goods industry, there is an overall tendency for the respective OC periods to be more sensitive to cyclical fluctuations in economic activity. But the range of variation for GKW is almost 50 per cent

$$\left(\text{i e, } \frac{190-95.9}{190} \times 100\right).$$

This possibly reflects that a firm in the producers' goods industry will tend to be even more sensitive to business cycles than a firm in the consumer durables industry.

(2) The gap between cash working capital and Balance Sheet working capital for GKW has not, however, behaved the way it has done for Union Carbide corresponding to changes in the OC period. Like Hindustan Lever, GKW's cash resource needs seem to have remained consistently less than Balance Sheet working capital for the five-year period. For GKW too, therefore, it could be suggested that the rate of conversion of non-cash current assets has been more than sufficient to satisfy the cash needs of business. This line of argument seems to have some weight when judged against the reverse situation where cash working capital needs are greater than Balance Sheet working capital, e g, Dunlop's case. In the latter instance it would appear that net non-cash current assets are by themselves inadequate to meet the level of cash requirements dictated by the existing state of efficiency of the operating cycle.

(3) The fact that average Balance Sheet working capitals are far in excess of cash working capital requirements for both GKW and Hindustan Lever has another implication. This could mean that return on capital employed measures for judging managerial efficiency in managing the firms assets are shown in a poorer light due to larger-than-necessary working capital appearing in the Balance Sheet. In other words, sharper focus is thrown on the need for effective management of current assets against the background of estimated cash requirements. And the latter estimate is made possible on an overall basis by computing the operating cycle period.

(4) Sales (the product mix of GKW is such that excise duty on its sales is almost negligible) for this firm increased from Rs 285 million in 1965 to Rs 320 million in 1969, i e, a 12.5 per cent rise in 5 years. The annual average rate has, therefore, been of the order of only 2.5 per cent. Since GKW was worst hit by the recession, and since the producer goods industry group takes longer time to pick up momentum, we may assume that next year's rate of sales will be more in line with the rates experienced in 1968 and 1969 which were about 4 per cent and 8 per cent respectively, rather than with those of the earlier years. On top of that, with industrial activity picking up, it may be presumed that 1970 sales will register a 10 per cent improve-

TABLE 4: GUEST, KEEN AND WILLIAMS LIMITED

Particulars \ Years	1965	1966	1967	1968	1969
	Days	Days	Days	Days	Days
(1) Raw materials in store	90.5	126.4	141.4	127.3	71.0
(2) Conversion period	13.6	14.5	15.8	14.1	17.9
(3) Finished goods in store	25.4	34.6	41.2	39.9	22.8
(4) Debtors' collection period	63.9	75.7	78.9	87.8	70.8
Less	193.4	251.2	277.3	269.1	182.5
(5) Creditors' payment period	80.6	93.2	87.0	119.7	86.6
(6) Operating cycle period	112.8	158.0	190.3	149.4	95.9
(7) Number of operating cycles per year (365 ÷ Row 6)	3.235	2.310	1.921	2.443	3.806
	Rs/mil	Rs/mil	Rs/mil	Rs/mil	Rs/mil
(8) Cash working capital requirement	82.1	117.8	141.2	94.2	73.2
(9) Average working capital as per balance sheet	105.8	142.2	171.7	161.6	126.4

ment over 1969. Based on this premise, next year's sales estimate is around Rs 352 million. If the number of operating cycles for 1970 is improved to 4.0, then the estimated cash working capital need for the year is Rs 88 million. A 6 per cent addition for inflation makes the estimate approximately Rs 93 million.

V

Consolidating Comments

(1) In the workings presented above, we have included cash in Balance Sheet working capital computations. It may have been more appropriate to exclude cash from such calculations because we were comparing cash requirements with current assets, less current liabilities. The implication in conventional working capital computations just mentioned is that current assets get converted into cash during the financial period which, after paying off the current liabilities, provides for meeting other operational expenses. The paradox, however, is that such current assets as are relied upon to yield cash, themselves need to be supported by funds until conversion into cash. It is worthwhile to remember that increase in working capital represents an application of funds, and not a source. In other words, large amounts of current assets need not necessarily be a rational source of financial comfort. The method of computing the operating cycle period outlined above in fact leads to longer OC periods for larger inventories, debtors, etc. This, in turn, implies slower turnover rates, dictating more cash requirements, to support intervening operations. Unless, therefore, the length of the OC period is shortened, increasing balance sheet working capital could induce cash requirements which exceed such capital. This hypothesis seems to be corroborated in the case of Union Carbide. Until 1967 when the OC period ranged between 150 and 159 days, cash requirements consistently exceeded Balance Sheet working capital, despite the steady rise in the latter amount too. When, however, in 1968 and 1969, the OC periods came down sharply, cash requirements were almost equal to and less than (respectively) conventional working capital despite continuing increase in the latter. Guest, Keen and Williams, however, presents a different picture. Although the OC periods varied from a high of 190 days to a low of 96 days, cash requirements seemed always to be less than Balance Sheet working capital. There could be two reasons for this. First, the level of OC efficiency has always been at a consistently high pitch. Second, as this unit in our sample was most affected by the recession, the scale of operations did not expand as much as it did for the other three firms, and so called for relatively less stretch in cash resources.

(2) The principal theme of this article has been the stress on the significance of cash requirements for business operations, relatively to that of conventional working capital. Some moderation is, however, called for in this emphasis too. In times of continuous inflation it is not wise to hold high cash balances than necessary. Quite apart from being a sign of inept management of the firm's growth, continually surplus cash balances are bound to suffer erosion in real value due to persistent inflation. Paton argues in this context that a 1 : 1 ratio (instead of the usual 2 : 1) between cash and near cash items and current liabilities should be striven for in most business situations.[6] The computation of the OC period, and its application in the manner indicated above, seems to provide an even clearer and firm — relevant measure of the zone of tolerance for holding judicious cash balances on a continuing basis. This is not to suggest that current assets are to be or can be eliminated. The point is that having estimated annual cash requirements on a more systematic basis, the management and conversion of non-cash current assets could be effected in such a manner as to ensure that the cash level norm is maintained fairly consistently.

(3) The estimation procedure for cash requirements outlined above relates only to the operating aspects of the business, i e, buying, manufacturing, selling, etc. Cash is required for at least three other major activities namely, repayment of loans, investments in capital items, and dividend payments. Provisions for these have to be super-imposed on cash needs for operations. And the proper context for doing this is the overall funds flow analysis carried out at the beginning of each period. While dividend payouts and loan repayments could be known fairly correctly — the former being based on standard company policy, and the latter being governed by contract terms — the capital expenditure programme is a matter of careful decision-making. Total cash budgeting shall have to await the capital expenditure decisions which may in turn have significant financing implications — both short and long term.[7]

(4) It is generally recognised that firms tend to suffer cash shortages during periods of growth and expansion. Correspondingly, due to lagged effects, onsets of decline in business activity are likely to be associated with surplus cash. We, therefore, tried to interpret the calculations for the four firms chosen for this study in terms of the industrial recession during 1965-68. In our sample, Guest, Keen and Williams was the worst hit firm, while Hindustan Lever was perhaps the least affected by the recession. Both firms exhibit lesser cash requirements than Balance Sheet working capital, except in 1965 for Hindustan Lever. But the significant fact is that the gap between the two figures is consistently very much larger for GKW — both in absolute amounts and in percentages — than for Lever. This seems to lend support to the phenomenon of surplus liquid funds (*via* withheld capital replacements, scaled down purchases and inventories etc) during declining business activity.[8]

In comparing Dunlop with Lever, however, we find that explanation through recession loses some force. Dunlop belongs to the consumer durable goods (or intermediate goods, according to RBI) industry, while Hindustan Lever is a consumer goods firm. The impact of recession on Dunlop should, therefore, have been more pronounced than that on Lever. Dunlop should, accordingly, have produced evidence of cash surplus (i e, lesser cash requirements than working capital) to a greater extent than Hindustan Lever. The figures, however, produce a very contrary picture. Dunlop's cash requirements have always been in excess of working capital. The average increase in sales over 1965-1969 for Dunlop and Lever were nearly equal, i e, 12.4 per cent and 11 per cent respectively. It cannot possibly be forcefully argued, therefore, that Dunlop's operations expanded at a much faster rate than Lever's (although one would have expected Dunlop's sales to have grown in fact at a smaller rate than Lever's). A better explanation may, therefore, lie in the relative efficiencies of the OC periods for the two firms. Given the industrial categories to which they respectively belong, the OC period for Dunlop is perhaps so high as to require excess cash than warranted by working capital — even during recession. Correspondingly, Lever's OC efficiency being high, it is able to do with less cash than indicated by the cash value of its working capital. This may indicate lowering the amount of working capital investment for improving the rate of return on capital employed.

(5) We have used sales forecast (the method for deriving it could of course be much more refined in practice than here)[9] as the independent causal variable in estimating cash requirements for the year 1970 in each case. In fact, it is in the projection of cash requirement, along with sales forecast, for the next period that the OC period should prove more useful than in performing the kind of *post mortem* analysis outlined above.

How does working capital, as conventionally computed, relate to sales or turnover in comparison with the cash requirement-turnover relationship? Working capital is the net resultant of balancing between several items, and of varying valuation bases for some of them. Grass has listed several points why working capital may not vary directly with sales, some of which are mentioned below:[10]

(1) Level of work-in-progress depends on the length of the manufacturing time-cycle, and therefore on the products and the product mix.
(2) Work-in-progress is geared to output at manufacturing cost, not turnover.
(3) Finished stock levels depend upon commercial factors.
(4) Debtors levels depend on credit terms and liquidity of customers.
(5) Creditors are geared to purchases rather than turnover, etc.

It is precisely such factors as Grass has highlighted which have been explicitly incorporated in the operating cycle methodology elaborated above. Each step in the OC period computation leads to the assessment of the impact of the transformation process of each current asset item on the firm's cash resources. The operating expenses for the next year, derived from sales forecasts and adjustments for inventories and work-in-progress, are then used to estimate cash, and not so-called working capital requirements. The derivation of cash requirements through this process seems to be more obviously linked to sales or turnover, than is the link of conventional working capital to sales, although over the long term the latter relationship should also broadly hold good.[11]

(6) It may be argued that it is an anomaly to use the same current asset and current liability figures from the balance sheet for computing the length of each phase of the operating cycle, calculating the OC turnover rate from thence and finally the cash estimates, and then comparing it with working capital derived by netting the same current item groups. A little reflection will show that no such anomaly exists in fact. Balance Sheet working capital (interim or annual) is a static picture of the net current assets position, including cash. When the opening and closing balances of these items are linked with the relevant operational activities of the firm in the process of computing the OC period, these figures get re-interpreted in a dynamic context. And an estimation of cash needs for operational purposes is feasible only through such linking of current items to the technological and commercial dynamics of the firm.

(7) The foregoing analysis is subject to the basic limitations of an external investigator having to rely on published information alone. Thus, the use of average working capital on the basis of opening and closing balances only is liable to errors because the levels of working capital during the year could be quite different from the opening and closing figures. This may be especially true of seasonal businesses.[12] But for the kind of firms analysed in this paper ignoring the seasonality factor seems realistic. There is no apparent reason to think that the year-end Balance Sheet figures for these firms represent the culmination of a 'natural' business year with rock-bottom inventories and accounts receivables and high liquidity. Again, different product lines within the same firm might exhibit distinct operating cycle characteristics. Cash estimates could be more refined and accurate if the OC calculations are done separately for each product line. However, the basic intention in the article has been to demonstrate the use of the OC concept, and not to throw up definitive conclusions about the management of cash working capital or current items in the four firms analysed.

(8) It may be suggested that after having forecasted 1970 cash working capital needs above, why not compare these with actuals as available from 1970 published accounts. This has not been done for the simple reason that the blanket assumptions made by us about various elements of the OC computations and sales projections, without entering into any dialogue with the firms, are only illustrative in nature. Comparisons of forecasts in this paper with the actuals would, therefore, convey little meaning. It is, however, likely to be a useful exercise for the internal analyst. Besides, the period 1965-69 was chosen to cover the recession spell and to relate Balance Sheet and cash working capital movements over that period. Otherwise, more recent years could have been considered as well.

(9) Banks in India are reported to make use of the OC calculations for seasonal industries like tea, tobacco, sugar, etc. They do not rely upon the annual Balance Sheet figures to ensure security of overdrafts in relation to these industries. Many well managed firms themselves also employ these calculations to watch their own cash movements. However, it does not seem to be a widely used approach in industrial houses. The simple presentation of the method in this paper may contribute to a better monitoring and managing of cash working capital.

(10) Finally, in our computation of the OC periods above, we have assumed collection of debtors to result directly in cash-inflow. In most cases in practice, however, this is not so. For, much of such realisations constitute cash-in-transit, cheques to be cashed and the like. In consumer goods industries this may be an important factor. A calculation of cycle period for cash inflow on the same basis as for debtors' collection shown above may, therefore, be made and added as a sixth element in the OC period.

Notes

[This paper has benefited from the comments and suggestions made by A Sen. Any shortcomings are this author's.]

1 Some writers, however, prefer not to include cash in working capital since cash is the effect rather than the cause of working capital changes. For example, see "Control of Working Capital", (ed) M Grass, Gower Press, Essex, 1972, p 6. But the cash view of working capital seems most effectively supported for a firm which is planning to start its operations for the first time. Evidence for this interpretation seems also to be contained in assertions like "working capital is to be provided for to the extent of 6 months' works cost of production". Only a cash view of this amount can carry clear conviction. See Report on The Fair Ex-Works Retention Prices of Steel for the Period 1st April 1960 to 31st March 1962, Tariff Commission, Government of India, Bombay 1962, p 43. Correct comparison seems possible only when we have an estimate of total cash requirements for operations during a period, as distinct from conventionally defined working capital.

3 Sagan, J, "Toward a Theory of

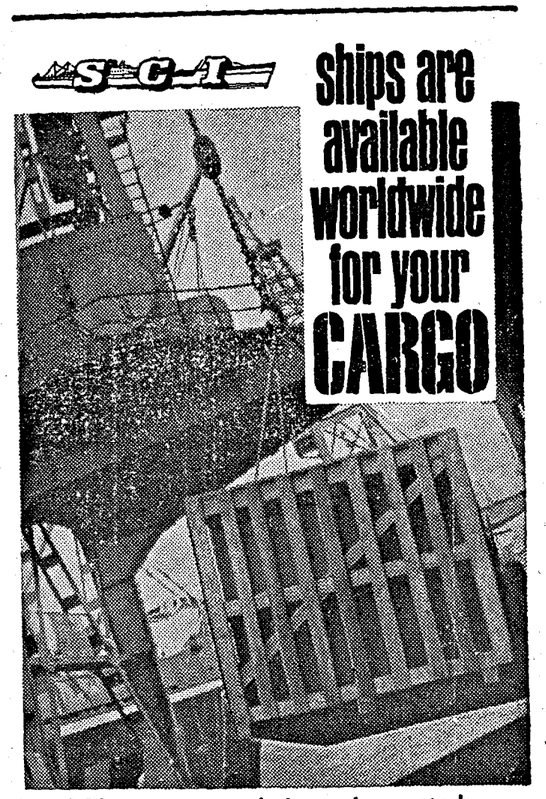
Working Capital Management", in "Financial Management — Policies and Practices", (eds) F J Corrigan and H A Ward, Houghton Mifflin, Boston, 1963, p 186.

4 Lee, T A, "A Case for Cash Flow Reporting", *Journal of Business Finance*, Volume 4, Number 2, Summer, 1972, pp 27-36.

5 See "On Recent Recessionary Trend in Organised Industry", *Reserve Bank of India Bulletin*, July 1968, pp 862-69. The RBI industrial classification is different from ours: its categorisation being Basic Industries, Capital Goods Industries, Intermediate Goods Industries and Consumer Goods Industries. The study has contrasted the wide fluctuations in growth rates of output of basic and capital goods industries gained the nearly steady declining rates of the last two groups. GKW, which falls in the capital (our producers') goods industry, has thus shown the widest fluctuations. Dunlop and UCIL fall in RBI's intermediate goods group, although a distinction based on durability is also logical.

6 Paton, W A, "Observations on Inflation from an Accounting Stand", *Journal of Accounting Research*, Volume 6, Number 1, Spring 1968. p 84.

7 For a simple methodology of assessing overall cash surplus (or shortage) situation in the context of funds flow analysis see Jackson, A S, and Townsend, E C, "Financial Management", George Harrap, London, 1970, pp 157-62.



8 See for example, Cohen J B and Robbins, S M, "The Financial Manager" Harper and Weatherhill International, Tokyo, 1968, p 300: "[The] tendency for companies to become cash-poor as the tide of economic prosperity rises and cash-rich as it runs out is a well known economic phenomenon."

9 See Weston, J F and Brigham, E F: "Managerial Finance" Holt, Rinehart and Winston, New York, 1972, pp 73-77. They have refined the 'percentage of sales method' by computing the ratio of each item of *current asset* and *current liability* to sales. The use of these ratios for forecasting working capital needs is suggested after duly tempering them with an understanding of basic technology and the logic of sales-to-current items relationships for the firm. We have, however, suggested only one relationship in the OC concept above — cash to sales. All current asset items are transformed into cash as it were. Weston and Brigham suggest more refined forecasting techniques also, e g, linear regression, multiple regression, etc.

10 Grass, *op cit*, p 7.

11 Most authors seem to hold the sales-to-working capital causal relationship to be true. Thus, Archer, S H and D'Ambrosio, C A, state: "In general it is possibly safe to say that the size of *working capital* ... is usually a *function of sales*, as are fixed assets", "Business Finance: Theory and Management", Collier Macmillan International, New York, 1972, p 313. Weston and Brigham also emphasise the same point, *op cit*, p 72.

12 This point has also been highlighted by Jaedicke, R K, and Sprouse, R T, in "Accounting Flows: Incomes, Funds and Cash", Prentice Hall, Englewood Cliffs, New Jersey, 1965, pp 109-114.

SCI caters to varied requirements by operating a uniquely diversified modern fleet comprising cargo liners, bulk carriers, tankers, colliers, ore/oil/grain carriers, timber carrier, and passenger-cum-cargo ships.

Growth of Manufacturing Companies in Japan, 1961 to 1970

Madan Gopal Jajoo

This paper discusses the place of 1,001 listed manufacturing companies in the growth of Japan during 1961-70.

The companies are divided, first, into major industry groups and, then, into major products groups. These companies together account for between 30 and 75 per cent of the output of the major industry groups.

The growth of output in the listed companies has been more rapid than that in the relative industry group. Industry groups which did not achieve the average growth are mainly companies engaged in the basic consumer goods producing industries which have been long-established.

The further analysis of correlation of the growth in output with the increase in fixed assets shows that in several product groups the increase in fixed assets did not result in a matching increase in output.

I

THE Japanese economy achieved a phenomenal growth in the decade 1961-1970, surpassing the growth rate previously recorded by any other country under peace conditions. Tables 1 and 2 show the sectorwise growth of Japan's GNP during 1961 to 1970: Table 1 contains data based on Total Product (gross output of each sector without any deduction for inputs) while *Table 2 shows Net Domestic* Product — in both cases, at current market prices.[1] This growth of the Japanese economy has been hailed as a miracle. Nature has not endowed Japan very generously with the material resources that are required to *sustain an advanced industrial economy.* Despite this handicap, Japan has made tremendous progress in industrial production. Japan ranks third in production of steel, second in production of automobiles, first in shipbuilding, and similarly in many other industries. Growth of industrial production and growth of other sectors have been well balanced. It is also remarkable that, while achieving *this record growth, the* rise in price levels has been considerably lower than in many other developed countries. In fact, when adjustment is made for the change in price level during the decade, the growth of GNP in Japan in real terms appears even more impressive.

Another significant aspect of the economic growth of Japan has been the rapid expansion of exports. Exports increased from $ 4,236 mn in *1961* to $ 19,318 mn in 1970; the balance of foreign trade which, in 1961, was a deficit of $ 1,575 mn changed, in 1970, to a surplus of $ 437 mn. Consequently, foreign exchange reserves which were $ 1,486 mn in 1961, rose to $ 4,399 mn in December 1970. It *is a widely shared* belief that the growth of the Japanese economy has been based on the growth of its exports. This is, perhaps, to put a wrong perspective on what actually happened. Paul Samuelson made this very remark in a lecture delivered in Tokyo in October 1971 but hastened to add that what he really meant was that the growth of exports was commensurate with the growth of the economy. The correct view would be that lack of *adequate growth* of exports would have acted as a constraint on the growth of the Japanese economy—as *has happened in every developing* economy.

A break-up of manufactures is available in National Income Accounts

TABLE 1 : SECTORWISE GROWTH OF GNP IN JAPAN
(Total Product Basis)

(In billion yen, at current prices)

Sector	1961		1970		Increase 1961-1970		Average Annual Growth Rate Per Cent
	Amount	Per Cent	Amount	Per Cent	Amount	Per Cent

for industry groups based on Standard Industrial Classification (SIC)[2]. Table 5 shows such classification on the basis of Total Product (gross output without deduction of inputs) while Table 6 shows the classification based on Net Product (in both cases at current market prices). This paper purports to study the growth of manufacturing companies in Japan, listed with any of the stock exchanges, during 1961 to 1970.

The census of manufacturing industry undertaken once every three years by the Ministry of International Trade and Industry (MITI) contains a wealth of data. However, the unit for the census purpose is a factory or establishment. A very large number of firms have numerous separate factories/establishments. It is not possible, therefore, to correlate the growth of an industry with the growth of several firms comprised therein. An attempt is made in this paper to study the growth of firms *vis-a-vis* the industry in which these are engaged.

II

A significant industrial growth presupposes the existence of well-developed companies and an active capital market. Generally, every large company will have its stock (shares) listed on a stock exchange — exceptions being either subsidiary companies, or joint-venture companies in which shares are held by two or more companies. Industrial activity carried on through the agency of companies varies directly in proportion to the stage of economic development. Consequently the output of industrial units owned by individuals or non-incorporated enterprises becomes a diminishing proportion of total industrial production. Another significant feature is that, as the economy grows, big companies become bigger — sometimes absolutely and at the expense of smaller companies, but more often relatively to the growth of smaller firms. The various factors which favour the growth of large companies are a commonplace of economic literature.

The criteria for measuring the growth of the entire economy are now clear, but not so the criteria for adjudicating the growth of individual firms/enterprises. The FTC study, ranking 100 biggest companies, has adopted the basis of paid-in capital. In companies which have been established for some time, various reserves (and other retained earnings) would add up to a substantial amount and are therefore a significant proportion of the shareholders' equity. For this reasons net worth (capital + reserves) would be a better yardstick — both for any ranking *inter se*, for determining relative growth.

In contrast to earlier periods, industrial growth since the 1950s has been financed largely with borrowed funds. This has been so not only in the case of German and Japanese industries which are based, on institutional finance;[3] even in the United States only 7 per cent of the fixed capital expenditure between 1948 and 1960 was met by issue of fresh equity capital. In case of Japan, it is well known that industrial enterprises have been dependent to an even greater extent than formerly on bank finance for expansion.

The financing of the growth of the listed manufacturing companies, during this period, is studied in a separate paper. For the purpose of this paper, it would suffice to say that total funds employed (total assets/total capital employed) may provide as significant a criterion as net worth/shareholders' equity.

Another criterion, more directly related to the growth of GNP, is the value of output. It can be worked out on basis of either total production or net product — to correspond, respectively, with Total Product or Net

Domestic Product (value added basis) in National Income Accounts. The problems involved in adjusting the production of a company to conform with the Net Product in National Income Accounts are complicated; hence, as an easier substitute — total sales — has been adopted as the basis. On the assumption that inventories (semi-finished and finished products) are roughly of the same magnitude at the beginning and close of the period, the value of sales may well be taken as the value of output produced by an enterprise. However, this assumption about inventories is far from correct[4] because, with larger sales, inventories would also become significantly larger over a period of a few years. However, inventories have in the long run a more or less stable ratio to sales, and if comparison is made on the basis of the ratio, adoption of sales rather than output as the criterion would not materially affect results.

III

The principal stock exchanges in Japan are Tokyo and Osaka. The other stock exchanges are at Nagoya, Kyoto, Fukuoka, Sapporo, Hiroshima and Niigata. Large companies are generally publicly owned, and their shares are listed with one or more of the stock exchanges. As of December 1970, the total number of companies listed with the stock exchanges exceeded 1,500.

Every listed company is given by the stock exchange a four digit numerical code number based on its main field of activity. Though this code is different from the four digit SIC, the industrial groupings under the SIC and stock exchange code are generally similar.

However the groups 'Primary Metal' and 'Metal Products' in SIC are combined and divided into two groups on a different basis in the stock exchange code. The stock exchange groups are termed 'Iron and Steel' and 'Non-ferrous Metals'. Both groups comprise companies engaged in manufacture of primary metals and metal products (ferrous and non-ferrous, respectively). The companies covered by this study bear stock exchange code numbers, 1801 to 7999. The total number of these companies as of 1970 was 1,125.

According to a study by the Japanese Fair Trade Commission[5] the total number of companies in Japan as of July 1971 was 825,605. For the same year, the Statistical Survey of Incorporated Enterprises, published every quarter by the Ministry of Finance, gives 343,000 as the number of companies with paid-up capital exceeding yen 2 million. (Thus, it is clear that the remaining 482,000 companies have paid-up capital each of less than yen 2 million.) About 30 per cent (252,693) of the total number of companies are classified in the FTC study as 'manufacturing companies'. The FTC Study gives a list of the biggest 100 manufacturing companies, ranked on the basis of their paid-up capital. These 100 companies have 2,544 subsidiaries. In July 1971, the biggest 100 manufacturing companies and their subsidiaries accounted for about 48 per cent of the total paid-up capital and 40 per cent of the total assets of the 252,693 manufacturing companies. The biggest 100 companies, ranked by FTC, are all listed companies and include 2 companies in the Printing Industry and 3 in the Petroleum Processing Industry. These two industries have been excluded from the scope of manufacturing industry in this study, though the Construction Industry is included (despite the fact that National Income Accounts show it separately from manufacturing industry).

Of the 1,125 listed companies classified as manufacturing companies, it has not been possible to obtain data relating to 124 companies for 1960-61; this is because in many cases these were listed for the first time after 1961.

A large number of companies in Japan adopt the half-year for closing their financial accounts. Of the 1,001 listed companies covered by this study, 693 companies closed accounts half-yearly (of which about 400 companies closed their accounts in September and March). The remaining companies closed their accounts yearly; of these about 35 per cent had their year ending on March 31.

In the present analysis, growth during 10 years is considered. The period 1961-1970 was chosen because 1961 was the first year of the income-doubling plan enunciated by Ikeda who was then Prime Minister of Japan. India's Third Five-Year Plan also commenced from 1961, and adoption of a common base year would facilitate comparative study. In case of companies which close their accounts on March 31, the year (or 2 half years) ending March 31, 1971, was (were) taken as termination point; the starting point was 10th previous year. In case of companies which closed their accounts on a date other than March 31, generally the period which covered the

Source : Economic Planning Agency (EPA), Government of Japan.

major portion of the calendar year 1970 was taken as the terminating point, and (correspondingly) the tenth previous year as the starting point. In case of about 87 per cent companies, it has been possible to obtain exactly 10 years' data. In case of the remaining companies, the period covered has varied from nine and a half years to a little over 10 years. These slight variations in the period covered would not, however, materially affect the comparability of the data as a whole.

The principal source for the data[6] used in the present study has been Nikkei Kaishanenken (Financial Yearbook of Companies) published yearly by Nihon Keizai Shimbun (Japan Economic Journal). Other sources utilised for the data are : Yearbook published by Yamaichi Securities, Diamond's Yearbooks, and in a few cases Yuka Shoken Hokokusho (a statutory report filed with the Ministry of Finance by all large listed companies). Daiwa Securities also kindly made available data from their data file. Nikkei Kaishanenken of 1972 contains financial data for 1970-71 which is, for about 80 per cent companies, reproduced from their computer tape, and is thus in a standardised form. For the base year 1961, the data in Nikkei Kaishanenken had to be processed to make it comparable.[7]

Another point regarding the data analysed herein may also be noted. Regulations governing the Profit and Loss Account and Balance Sheet were revised by the Ministry of Finance in 1964. Until then, it was common practice to show, e g, fixed assets at gross valuation with relative depreciation appearing as a liability, or the amount of Bills discounted on both (Assets and Liabilities) sides. It was also a usual practice, to show under the heading of net worth, the amount of profit for the period without deducting therefrom the relative tax provision/liability. (Necessary adjustments have been made to the 1961 data to bring it on par with current practice.)

The data analysed are based on the companies' published accounts for the years, 1961 and 1970. Hence the time series is at current prices. It might have been feasible to deflate these to constant prices, but it is not usual to use a deflator for comparison of company finances. Possibly comparison with National Income Accounts would have been more meaningful had a deflator been used. However, no such effort has been made in this paper, *inter alia* because use of a single deflator for wide-ranging products may produce other distortions while improving comparability in macro terms.

Another problem in regard to comparability of data is the effect of mergers. In common with the developments in other advanced economies, Japanese manufacturing industry has been undergoing major structural changes. The Government of Japan has been actively assisting modernisation of enterprises by extending guidance, technical advice, and provision of liberal finance on specially advantageous terms. More significant has been the official encouragement to — and in cases such as automobile manufacturing or shipping companies, insistence on — mergers of companies to form bigger units. Growth by mergers has strengthened the tendency of big enterprises to grow into gigantic units. Treatment of the merged companies in a comparative time study poses a problem. The general approach in Japan has been not to deflate the growth of the merged company by comparing the two (or more) pre-merger companies as one unit. This approach is based on the logic that merger, or acquisition, is also a form of growth. Though normally this logic would be unassailable, there may be special cases which justify a different approach. The mergers of Yawata Steel Corporation and Fuji Steel Corporation into Nippon Steel Corporation, Mitsui Chemicals and Toyo Toatsu Chemicals into Mitsui Toatsu Chemicals, Nippon Rayon and Toyo Boseki into Unitika, are examples of two more or less equal partners merging into one very big entity. Between 1961 and 1970, there have been about 60 mergers, in which the listed companies in the manufacturing sector were involved and in which shares of the merged company issued to the shareholders of the merging company exceeded yen 100 millions each. One may devise a formula to deflate the growth of the merged companies during the period 1961-1970, possibly on the basis of the period for which assets of the merging company were used in the business of the merged company. However, *prima facie* it appears that the proposed deflator would not significantly affect the average rate of growth. The merger of Nippon Steel Corporation, for example, took place just two years before close of the 10 years' period (1961-1970) covered by this study; a deflator adopted on the basis may not yield a result materially different from the result obtained without a deflator.

IV

Table 7 shows the industrywise output of 1,001 listed companies (grouped according to SIC) and the output of all the sectors of the economy for the respective industry group (in National Income Accounts). The latter two groups, *viz*, Metal Products and Others, contain a much larger proportion of output, outside the sector represented by the listed companies. A reference has been made earlier to differences in groupings in respect of Primary Metal and Metal Products. Other differences in groupings probably account for the output accounted under the residuary grouping 'Others' in National Income Accounts being larger.

Growth of output of listed companies does not follow the pattern of growth of output of respective industry groups in National Income Accounts. In case of food products, pulp and paper, glass and ceramics, metal products and general machinery, the growth of output of listed companies during the decade 1961-1970 has been slower. In some of these, peak growth was achieved before 1960 and, because of a bigger base, their subsequent growth has been comparatively slower. Another plausible reason may be that the listed companies manufacture basic products in their respective fields, whereas the small enterprises (mainly non-incorporated sector) cater to the refined products range. Economic progress would normally result in greater demand for more refined, and hence costlier, products. Thus, in the paper industry, the listed companies produce writing, printing, wrapping or coated papers. However, paper products for use by the final consumer are made mainly by smaller companies or non-incorporated enterprises. Naturally, the growth rate of this sector appears to have been higher. The glass, cement, ceramic products, and metal products industries are more or less on par with the paper industry. In case of general machinery industry, however, there is probably another explanation. The machinery industry is now so organised that the bigger companies are becoming assemblers of plant, while manufacture of components for final assembly is being increasingly undertaken in smaller enterprises. This accounts for the greater development and growth of the small-scale sector.

In these four groups, the output of the listed companies is a small proportion (about one-third) of the total output. In other industry groups, *viz*, chemicals, transportation machinery, electrical machinery, textiles, and precision machinery, the output of listed companies is a much larger proportion of the total output. The rate of growth is also considerably higher than that of the respective group in National Income Accounts. This suggests that the growth of the smaller enterprises in these industries has been slower. Two circumstances probably account for this. First, technological developments in these industries are making it increasingly necessary for production units to be larger and also more integrated. Secondly, products of these industries reach the consumer mostly without any significant processing by intermediary small-scale enterprises. Until recently, the textiles industry would not have been included in this category. However, the development of man-made chemical and synthetic fibres has brought about a transformation of the textile industry in less than two decades. Production and processing of these fibres is done by large-scale units and where the manufacture of these into end-products is not done directly by these units constitutes a small proportion of the total output of the industries group.

V

Changes in the composition of output of manufactures may be seen in Table 8. A few industry groups have achieved better growth than the average growth of manufacturing industry. Accordingly, the output of general machinery, electrical machinery, and transportation machinery industries, in 1970 formed a larger proportion of the total output of manufactures in National Income Accounts. However, all industrial groups have registered increases in their output. In no group has the output been stagnant: the growth has been a little slower in the case of Food Products, Textiles, Pulp and Paper, Chemicals, and Glass and Ceramics industries.

Two factors appear relevant in this connection. One is that the industrial

TABLE 8 : GROWTH OF INDUSTRIES, 1961-1970

Grand total	1001	9,316,213	35,386,188	379	10,136,172	38,688,671	381	3,349,836	11,319,274	334

grouping adopted (2 digit SIC) is very broad and contains many sub-groups. Because the classification is broad, it does not separately account for new products or old ones which newly become significant in consumer expenditure. The continued growth of the textile industry is accounted for by this circumstance. New chemical and synthetic fibres have become prominent in the field of clothing apparel, partly displacing natural fibres (cotton, wool, etc) but more usually augmenting the range of consumable articles. This pattern is evident in practically the entire range of consumer expenditure. The other reason is that the propensity to consume does not increase in proportion to higher real incomes. Because of larger income, some of the items — say of the food products group — which are now bought are higher priced (or the share of this group in the aggregate expenditure is higher). Hence, in monetary terms, output continues to increase absolutely though growth relatively to other industries may be less.

The crux of industrial development probably lies in anticipating the growth of, and changes in, consumer demand. Demand has to be fostered and stimulated, while it is being continuously reshaped; this may be because of changes in fashion or ideas but more usually it is because of development of new products based on recent innovations. To meet this situation, the strategy for industrial growth has to meet a plurality of objectives. In some cases, resources are withdrawn from existing products, demand for which may be stagnating or even declining. It involves also a modification of existing equipment or processes to create modified products. Last but not least is the establishment of entire new industries for meeting the demand for new products. The phenomenal growth of the Japanese economy is based largely on its positive response to this dynamic of development.

VI

Analysis of the growth in the past decade in the context of changes in output or structure of demand would require a study of the various groupings in greater depth. For this purpose, the industry groupings adopted in the above classification (based on 2 digit SIC) are further classified into distinctive sub-groups on the basis of principal products (4 digit SIC). However, the various companies listed (with a 4 digit code related to different products) do not in many cases produce those products exclusively. The products' range of a large number of companies covers a few product groups. In case of the largest companies, it encompasses main industry groupings or extends to two or more industry groups. Thus a few companies listed under the textiles group have products classified in the chemical industries' groups. Rather interestingly, producers of aluminium metal are, with one exception, companies which are classified under the chemical industry. In most of the product groups, the largest companies are grouped under a general range. In case of 26 companies, the principal products are now in an industry group which is different from the code originally allotted to them. Accordingly, in Tables 7 and 8 these companies are shown in the industry group related to their products and not related to their Stock Exchange Code.

Because of such a diversified pattern of production, any conclusion that could be drawn from the data in the Tables would necessarily be in general terms. If all companies grouped under one product group show a uniform rate of growth, a general inference regarding the growth of that branch of industry may be valid. However, if there are significant variations in the growth of companies classified under a particular product group, it may be difficult to say whether these variations are due to innate differences in efficiency or different product-mix of companies showing better growth record. With all these limitations, significant trends can be discerned from the analysis in Table 8.

VII

Some of the salient features of the analysis are considered below.

(1) Food Products :

Index of growth : 1970=282

Product groups which have done well are meat products, bakeries, milk and milk products, feedstuffs, and the residuary grouping (other food products) Better growth record of these groups reflects mainly changes in the food habits but it also reflects increasing affluence. Groups of conventional food products have a poor record of growth. The case of the sugar industry is especially noteworthy. There are 12 companies in this group of which 9 have incurred substantial loss and of the 3 companies which have made profits, 2 companies have made only nominal profits. Despite this, the companies in the sugar industry have not lagged behind the other groups in expanding total assets and tangible fixed assets.

(2) Textile Industry :

Index of growth: 1970=302

Groups which have done better are: knitting, silk textiles, and synthetic and chemical fibre manufactures. The last group comprising the 6 biggest firms accounts for half the size of textile industry, and therefore its achievement pushes up the average growth of the industry. Companies making conventional fabrics out of wool, cotton. and other natural fibres, appear to have been losing ground.

(3) Pulp and Paper Industry :

Index of growth: 1970=312

A high level of growth is probably accounted for by the good growth achieved by the bigger companies in this group. Paper products group (2 companies) has the highest rate of growth.

(4) Chemicals and Rubber Products:

Index of growth: 1970=360

Products-wise groups which have grown faster are ink manufacture, cosmetics, petrochemicals, agricultural chemicals, photo-chemicals, and industrial gases. However, these groups have each a small number of companies. Two groups with a large number of companies are plastics manufactures and pharmaceuticals. Both these have expanded considerably. Product groups which have a record of especially poor growth are chemical fertilisers, soda, and other organic products. Stagnation of the chemical fertiliser group is significant in view of the importance attached to its growth in India.

(5) Rubber Industry:

Index of growth: 1970=297

The industrial products group has the highest rate of growth. It is significant that the tyres and tubes group (exclusive of the biggest companies grouped under 'General Range') has the lowest growth rate, and 2 of the 3 firms have made losses for this period.

(6) Glass and Ceramics :

Index of growth: 1970=299

Highest growth is achieved by the sanitaryware group, followed by glass industry and chinaware (a single company, the renowned Noritake). The cement industry has, during this period, grown at a slower pace because of the large expansion completed prior to this period. The cement products group has done better.

(7) Iron and Steel :

Index of growth : 1970 = 385

Integrated steel manufactures group (including Nippon Steel Corporation

Continued overleaf)

which is the biggest steel producing company in the free enterprise economies) account for 75 per cent of the output of the group. Their range of products is very wide. This growth record is bettered only in the case of ferro manganese and the other ferro alloys group. Growth of other companies with a narrow products range has been considerably slower.

(8) Non-Ferrous Metals:

Index of growth : 1970 = 368

Primary non-ferrous refiners and wires and cables group — both comprising very big companies — account for approximately 40 per cent and 35 per cent output of the industry, respectively. Consequently, the growth record of these two product groups influences the average for the group.

(9) Metal Products :

Index of growth : 1970 = 311

A large number of companies are engaged in bridge work or other structural steel fabrication. Growth of this group has been at the same pace as that of the entire industry. Companies manufacturing small tools and other specialised products show better growth.

(10) General Machinery and Equipment:

Index of growth : 1970 = 392

As there are a large number of companies, efforts have been made to make numerous, distinctive product groups. Twenty-seven companies are in the machine tools group which, however, has a low growth record. The highest growth has been achieved by the makers of construction machinery (in alignment with the growth of the construction industry). The other groups with better than average growth comprise companies classified as general range, chemical plant manufacturers and pumps and compressor manufacturers.

(11) Electrical Equipment :

Index of growth : 1970 = 394

This industry covers two distinctive types of companies :

(1) those which make finished products and

(2) those which make components for finished products made by the first group.

It is difficult because of interconnections to draw an exact line between component makers and finished product makers. The 4 largest firms, comprising the general range group, cover about 38 per cent of the total sales. However, then growth index is only 294. The explanation for this slow growth probably lies in the fact that these companies have many subsidiaries or affiliate companies, and any conclusions about these companies in isolation from their subsidiaries or dependent enterprises would not give a correct picture. The other big group of household equipment products, such as TV sets, transistor radios, tape recorders, turners, etc, accounts for about 33 per cent of the total sales, and its growth is much higher than average. It is to be noted that the 4 companies in the general range also manufacture these products. They also manufacture heavy electrical plant growth of which has been slower, the companies in the electrical plant manufacturing group having an average growth index of 266. There is another important group of 14 companies under communications equipment which accounts for about 12 per cent of total sales and whose index of growth is 548. Some, but not all, the component groups have achieved a very high growth rate.

(12) Transportation Equipment :

Index of growth : 1970 = 530

This comprises many diverse products. Seven companies are in the shipbuilding group and 15 in the automobile manufacturers group, respectively, accounting for about 28 per cent and 60 per cent of the total assets. Many of the remaining companies manufacture automobile components. Unlike the electrical industry, automobile component makers have achieved better than average growth. This industry also includes manufacturers of bicycles and railroad equipment, both of which groups have a poor record of growth.

(13) Precision Equipment:

Index of growth : 1970 = 458

Manufacture of camera and other optical instruments accounts for 40 per cent of the total sales, with an index of growth of 538. Growth rate of the other groups, *viz*, watches and clocks, metres and measuring instruments, has been slighly lower.

(14) Construction :

Index of growth: 1970 = 451

Though companies have been grouped according to the nature of the specialised jobs, the index is approximate and its significance is limited. Growth of the biggest firms which undertake the whole range of jobs has been less than that of smaller speciality firms.

TABLE 9 (CONTINUED)

Economies of Scale Positive : Increase of Output more than Proportionate to Increase in Net Tangible Fixed Assets	Economies of Scale Neutral : Increase of Output of the Same Order as Increase in Net Tangible Fixed Assets	Economies of Scale Negative : Increase of Output Less than Proportionate to the Increase in Net Tangible Fixed Assets

VIII

Lastly, it is proposed to consider, in the context of the high rate of growth achieved by the companies, whether such growth has yielded economies of scale. It is suggested that the ratios of turnover (times) of assets and capital would provide satisfactory criteria for this purpose. The ratios used in Japan are :

Turnover of total funds employed,
Turnover of total assets in operating use,
Turnover of fixed assets,
Turnover of property-net,
Turnover of buildings, machinery, and equipment,
Turnover of shareholders' equity,
Turnover of capital stock,
Turnover of liabilities
Turnover of loans payable

Either of the two ratios — *viz*, turnover of fixed assets in operating use and turnover of tangible fixed assets — would show whether growth has resulted in economies of scale. Because of the difficulties in obtaining precise data regarding deferred charges, construction in progress, and also investments (which in Japan are grouped under fixed assets), it has not been possible to adopt the ratio of fixed assets in operating use.

The analysis below is based, first, on tangible fixed assets, and secondly, on total assets. The ratios are worked out for each product group for 1961 as well as for 1970.

In a growing economy, with no constraints on expansion with a view to achieving economies of scale, it would be normally true that the increase of output is more than commensurate with the increase in capital equipment (tangible fixed assets) or capital employed (total assets). Thus, assuming the ratios of $\frac{\text{Total Sales}}{\text{Net Tangible Fixed Assets}}$ or $\frac{\text{Total Sales}}{\text{Total Assets}}$ for 1961 to be unity the ratios for 1970 should be more than 1. The tabulation on the basis of $\frac{\text{Total Sales}}{\text{Net Tangible Fixed Assets}}$ ratio is made in three columns in Table 9:

(a) Growth in output which has resulted in improvement of the ratio: economy of scale is positive.

(b) Growth of output with no perceptible change in ratio : economy of scale is neutral.

(c) Growth of output with an unfavourable change in ratio: economy of scale is negative.

If the ratio $\frac{\text{Total Sales}}{\text{Total Assets}}$ had been adopted instead, the results may have varied in some cases with some groups changing the placing. These are marked with an asterik.

There are several reasons for economies of scale being negative. Expansion which results in modernisation of production facilities may not lead to increase in output: in some cases, the immediate gain may be improvement in the quality of the product. In other cases, increase in output may be achieved after a time-lag. In other cases, increase of fixed assets may be in the nature of modernisation, which will reduce the cost of production, with a given output, and thus improve the profitability ratio. In the short run, increase in output depends on a firm's share of the market. For all major firms in Japan, the test of success is whether they are able to increase their market share. Simultaneous effort in this direction by leading firms has provided the real impetus to the growth of the economy. Business leaders in Japan realised that, to be competitive even in the domestic market, they must have modern efficient production facilities. And further that to meet the competition of western industrial giants in the international trade, their own units must be comparable in size. This realisation was shared by all; the industry, banking and financial community, as well as the government, all of whom then gave the necessary support in their respective fields. It was a national goal for the attainment of which all interests worked in harmony.

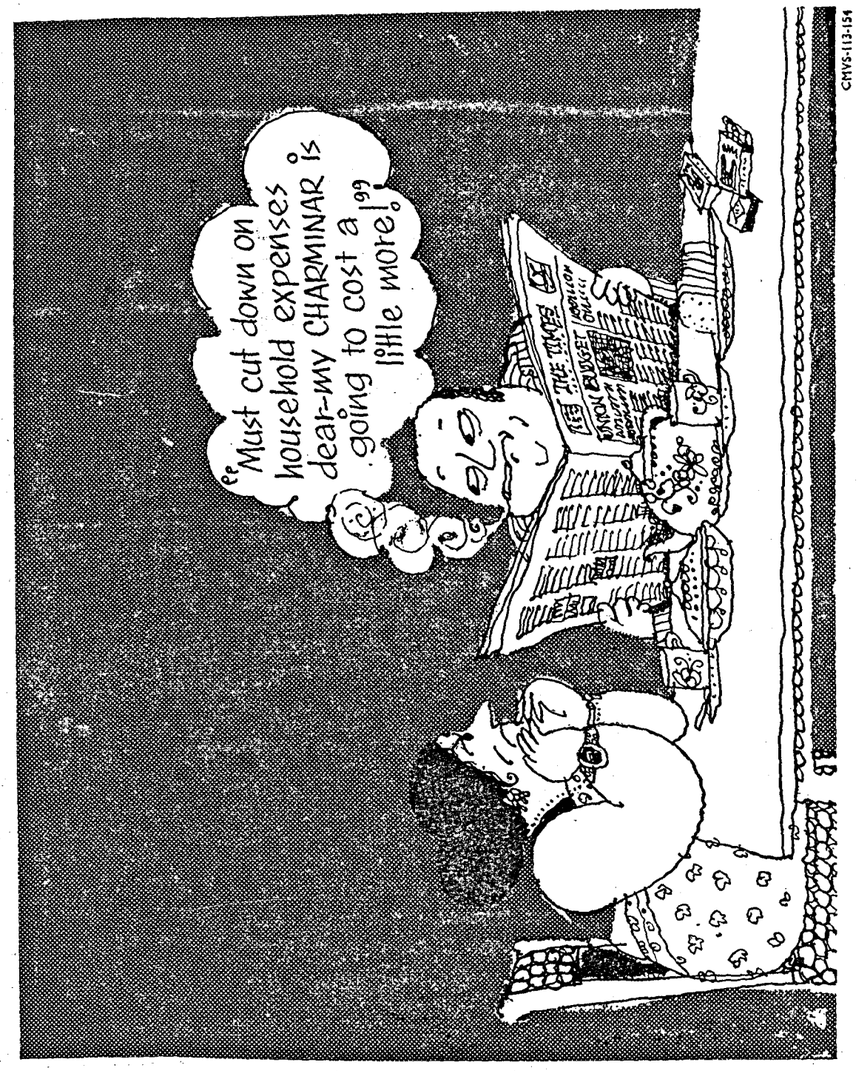
IX

We have considered in this paper the place of listed manufacturing companies in the growth of Japan during 1961-70. This study covers 1,001 companies. These are divided: first, into major industry groups (2 digit SIC); and then, into major products group (4 digit SIC). It is seen that these companies, together, account for between 30 and 75 per cent of the output of the major industry group, and that the growth of output in the listed companies has been more rapid than that in the relative industry group. Industry groups which did not achieve the average growth are mainly companies engaged in the basic consumer goods producing industries which have been long-established. We have also analysed the growth on the basis of the principal product groups, highlighting the products which have attained high rate of growth. In the further analysis of a correlation of the growth in output with the increase in fixed assets, if was seen that, in several product groups, the increase in several product groups, the increase in fixed assets did not result in a matching increase in output.

Notes

1 For international comparison the basis usually adopted is Net Domestic Product. However, assessment of the share in total output, of listed companies (which are the subject of this study) and their contribution to the growth of the economy will be clearer if the basis adopted is Total Product.

2 The SIC in Japan more or less conforms with the SIC recommended by UNESCO for census of manufacturing industry and other statistical purposes.



3 Anderson: "Corporate Finance and Fixed Investment", (Harvard 1964).

4 *Output* = value of sales + inventories at close — inventories at the beginning; if inventories at close are consistently larger, output would be larger than the value of sales.

5 "Enterprise Concentration in Japan".

6 The leading Japanese companies are now known all over the world. Investors in Western countries are increasingly buying shares of these companies. Hence a number of Japanese companies now print their Reports and Accounts in English. However, the number of these companies is small and these have started the practice only recently.

7 This was not an easy task because of the language problem. A visitor to Japan realises the great difficulty in obtaining English versions of Japanese publications. In the present study despite considerable care taken in compiling and adapting the data it is possible that small errors may have crept in. These, however, would have minimal significance in the aggregate.

Mea Culpa!

Economic Survey, 1973-74, Government of India, February, 1974; pp 107; Rs 5.

HAVING grossly mismanaged the economy, the government now apparently wishes to disarm its critics by conceding their criticisms. At any rate, this is the impression one gets from the government's latest Economic Survey. Apart from silencing its critics, this tactic, in the government's view, perhaps absolves it of the responsibility for finding effective solutions to the various problems.

According to the Economic Survey, everything has gone wrong with the economy and with the government's policies and programmes. The most serious problem has been the sharp acceleration of the rise in prices. Although the 1973 kharif crop was much better than that of the previous year, "this has not made any visible impact on prices". Nor have the measures adopted by the government. According to the Survey, "that [the government's] policies have not made a significant impact on the price situation is too obvious a fact to need any elaboration".

There have been significant gaps in the agricultural performance. But even more culpable have been the lapses in the management of the food economy, with procurement of wheat and rice falling short of targets by large margins. "It is ... obvious that the active opposition of landed interests and private traders, and a lack of effective administrative arrangements in some states, hampered the procurement effort." Under the mistaken impression that the unsatisfactory progress of procurement was the result of unremunerative procurement prices, these prices were raised substantially. Yet the shortfall in procurement continued. The Economic Survey now concedes that the supposedly low procurement prices may not have been to blame, after all. Thus, "the fact that the shortfall in procurement was relatively less marked in a state like Punjab, which has higher cost of production than many other states, indicates that this factor could not be a sufficient explanation of the shortfall ... how far a higher procurement price will help in achieving the procurement targets for the kharif cereals is yet to be seen."

The government's policies were responsible for the rise in prices of commodities other than foodgrains, too. For instance, in regard to sugar prices, the Economic Survey writes: "On the face of it it is somewhat surprising that higher production of sugar did not stabilise prices. However, it is not difficult to explain this phenomenon since total releases of sugar for sale in the domestic market in the sugar season 1972-73 were lower than in 1971-72." And why, pray, were the releases lower? Could it have had something to do with the Congress party's drive to collect funds for last month's elections in UP, Orissa and elsewhere?

Cause of Stagnation

The Economic Survey brings out how in 1973 there was a decline in output of certain crucial industries like steel and fertilisers. Other important industries like textiles, chemicals, basic metals, cement, mining, petroleum and light electricals were also adversely affected. Only a few industries like heavy electricals, transport equipment, metal products and leather manufactures showed better production. The most important cause of the stagnation of industrial production was the widespread shortage of power. But the power shortage could by no means be entirely blamed on the failure of the monsoon in 1972. This, as the Economic Survey points out, is borne out by the stagnation in electricity generation in thermal power units. Quite clearly, "inadequate maintenance and insufficient attention to operational efficiency in generation and transmission of power" were important factors contributing to the shortage of power.

Industrial investment continues to stagnate. To quote from the Economic Survey, "In 1973-74, public sector investment is unlikely to be higher than in 1972-73. Partial information available for a section of the private corporate sector shows that any increase that might take place in private corporate investment in 1973-74 is unlikely to make up for the stagnation in public sector investment". For the Fourth Plan as a whole, total public sector investment in industries and minerals is estimated at Rs 2,700 crores against the Plan provision of Rs 3,050 crores. "In real terms, the shortfall in public sector investment during the period is much larger because of price rise." There have been substantial shortfalls in crucial sectors like iron and steel, non-ferrous metals, fertilisers and coal. And the growth of employment in industry has been negligible.

The equally glaring failure in fiscal management have been responsible for the vast deficit financing and the consequential increase in money supply. Credit policy in respect of the private sector also went completely out of gear. As the Survey points out, "The fact that, despite a sharp decline in kharif output in 1972 and a deceleration of the growth of industrial production since the close of 1972, bank credit recorded a significant expansion in the early months of 1973 indicates a build up of inventories with the help of bank credit".

On the balance of payments front, while exports have increased, imports have gone up much more. To offset some of the disadvantages faced by the non-traditional exports, a comprehensive framework of incentives operates. However, these incentives have not been uniformly effective. A case in point is export of engineering goods. As the economic Survey points out, "all these measures have not yet been sufficiently effective in imparting the required momentum to our engineering goods".

The Economic Survey's assessment of the prospect for the immediate future is distinctly bleak. "The balance sheet of the economy thus looks distinctly unfavourable, and there is little point in minimising the task that the country faces in the coming year." There are misgivings regarding the achievements on the foodgrains front. The estimate of foodgrains output in 1973-74 (which will largely determine availability in 1974) has been slashed from 115 mn tonnes to 110 mn tonnes. The survey places the 1973 kharif output in the range of 65 to 68 mn tonnes. Rice output may be close to 40.5 mn tonnes, but there has been some shortfall in the production of coarse grains. It is true, as the Survey points out, that the targets at least for summer rice and wheat involve much higher production in a single year than observed in the past. Thus, while the output

of summer rice fluctuated between 2.7 and 3.1 mn tonnes from 1969-70 to 1972-73, the target for 1973-74 is 4.5 mn tonnes. Likewise the 30 mn tonnes target for wheat represents an increase of 5.1 mn tonnes, which order of increase in a single year has been achieved only in 1967-68 and that too over an exceptionally low base. However, even if these output targets are achieved, "output in most cases in 1973-74 may not be significantly different from the corresponding output in 1970-71". The Survey also admits that "recently ... while the growth of productivity in the case of wheat has slackened, there has correspondingly been no acceleration in the growth of productivity in the case of other foodgrains".

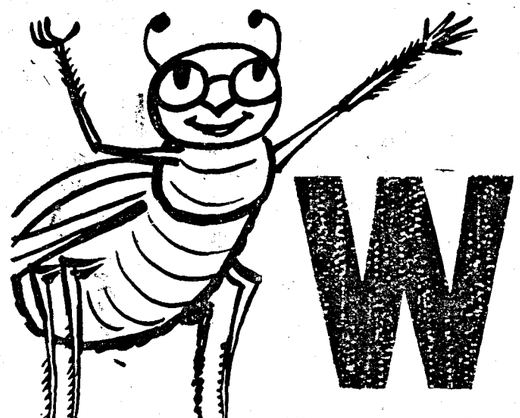
On the industrial front too the prospects for 1974 are uncertain. A significant rise in industrial production will be conditional upon increases in steel, coal and power output and the overcoming of the rot that has set in in the railways. Equally important, however, is the need to step up investment in a number of basic and capital goods industries. Of this the Economic Survey makes no mention.

In regard to the price situation, the Survey points out that there is no alternative to stepping up procurement of foodgrains — and successive increases in procurement prices offer no short cut to achieving this objective. As the Survey puts it, "it has to be recognised that, while producers have to be offered remunerative prices, a continued escalation of procurement prices will either lead to a massive increase in the burden of food subsidies or, else, to a level of issue prices inconsistent with the objectives of providing foodgrains to the more vulnerable sections of society at reasonably stable prices". Referring to some of the cash crops, the Survey says, "in respect of raw jute and raw cotton, the procurement activities of the State agencies are designed to stabilise prices. But the objective of ensuring stable prices does not imply that prices in a year of bumper crop have to be stabilised at near peak levels reached under conditions of acute scarcity".

On the budgetary front, the state governments have failed to mobilise additional resources from the agricultural sector. During the Fourth Plan period, there was a decline of Rs 30 crores in the collections from land revenue and agricultural income-tax. The state governments' net losses from irrigation and multi-purpose river schemes also continue to rise. They were Rs 170 crores in 1973-74 (BE) as against Rs 153 crores in 1972-73. The State Electricity Boards too failed to earn even one-half of the rate of return on capital employed of 11 per cent recommended by the Venkataram Committee.

These and many other criticisms of the performance of the economy are contained in the Economic Survey. It remains to be seen whether this official confession of failures is intended to prepare the ground for a break with some of the policies to which the government has been hitherto committed, in words if not in action. In particular, there appears to be a move to soft-pedal the role of the public sector in different spheres of economic activity. State take-over of the wholesale trade in wheat that been virtually given up. Free trade in coarse grains has been reinstated. There is a move to further increase procurement prices on the ground that prices in the open market have gone up. It is ignored that the rise in open market prices has been the result of hoarding and speculation and that to raise procurement prices in step with the open market prices is to defeat the very purpose of procurement and public distribution. In industry, in the name of speeding up the issue of industrial licences, licences have been liberally handed out for all manner of industries and to all and sundry, including the largest industrial groups. Permission to diversify into allied areas has similarly been granted liberally. Illegally built up industrial capacities have been regularised. All this has been done without the slightest concern for Plan priorities.

In any case, when it comes to offering solutions for the problems facing the economy, the Economic Survey fails to see the logic of its own analysis. The Survey considers "control of inflationary pressures" as the foremost task of economic management in 1974-75. Achievement of this objective is seen to be crucially linked to the increased production of wage goods and hence it is emphasised that the highest priority will have to be given to maximising agricultural production. This is to ignore the logic of the Survey's own earlier analysis which showed how higher foodgrains output had failed to influence prices, largely because of the break-down of distribution arrangements. Immediately, therefore, the accent has to be on distribution. However, what the Survey has to say on, for instance, procurement prices in this context sounds very different from its earlier comments on the subject. While the importance of building up buffer stocks is conceded, it is pointed out that "so long as there is a wide gap between the procurement and open market prices, the procurement effort cannot succeed". But how are open market prices to be influenced except through larger procurement and a more viable and widespread public system.



Even on the subject of increasing agricultural production, the Economic Survey can only suggest larger and more effective application of fertilisers. The lessons to be drawn from the field reports that the use of chemical fertilisers with the high-yielding wheat varieties has depleted soil fertility and already adversely affected productivity of wheat are apparently still lost on the government. The Economic Survey fails to see the implications of the phenomenon of declining productivity to which it has itself drawn attention and which should have led it to emphasise the need for building up an adequate public distribution system.

To attack the problem of inflation "at its roots", in addition to increasing the production of foodgrains, according to the Economic Survey, it is necessary "to control more effectively the growth of aggregate demand in the economy". This text-bookish approach to aggregate demand can have very unhappy consequences. The analysis in the Economic Survey itself brings out clearly enough that in the last eight years or so the government has failed to use its enormously increased command over financial resources, acquired through tax and non-tax means, including deficit financing, to give a push to investment. Had the rate of investment been higher during this period many of the crucial shortages which are seen today may not have arisen.

It should have been obvious to the authors of the Survey that there is a vital difference between (1) augmentation of demand in the hands of the general masses as a result of higher and more productive investment and larger employment, and (2) augmentation of demand through vast govern-

ment disbursements for unproductive purposes and through grant of bank credit to private parties for stockpiling of goods in short supply, which accentuates the imbalances in the economy both in the short and the long run.

If the economic development of the last few years have a lesson to offer it is that what is important is not controlling the growth of aggregate demand but altering the distribution of financial outlays in favour of productive investment. This is what the government has failed to do, above all. Despite the very much larger financial resources at the command of the public sector, total investment in the economy, according to the CSO's latest estimate, was Rs 2,640 crores in 1965-66 (at 1960-61 prices) and it remained Rs 2,683 crores in 1970-71. For all its disarming frankness about the state of the economy, the Economic Survey has missed the importance of a sharp increase in the rate of investment, especially in the public sector.

The Great Migration of 1971

II — Reception

Partha N Mukherji

This is an exploratory study of the evacuees who left East Bengal after the imposition of martial law on March 25, 1971, and sought refuge in India. According to official statistics, by the second week of December 1971 about 6.8 million evacuees had been housed in camps and another 3.1 million were staying with friends and relatives. As many as 827 state camps and 19 Central camps accommodated one of the largest migrant movements in history.

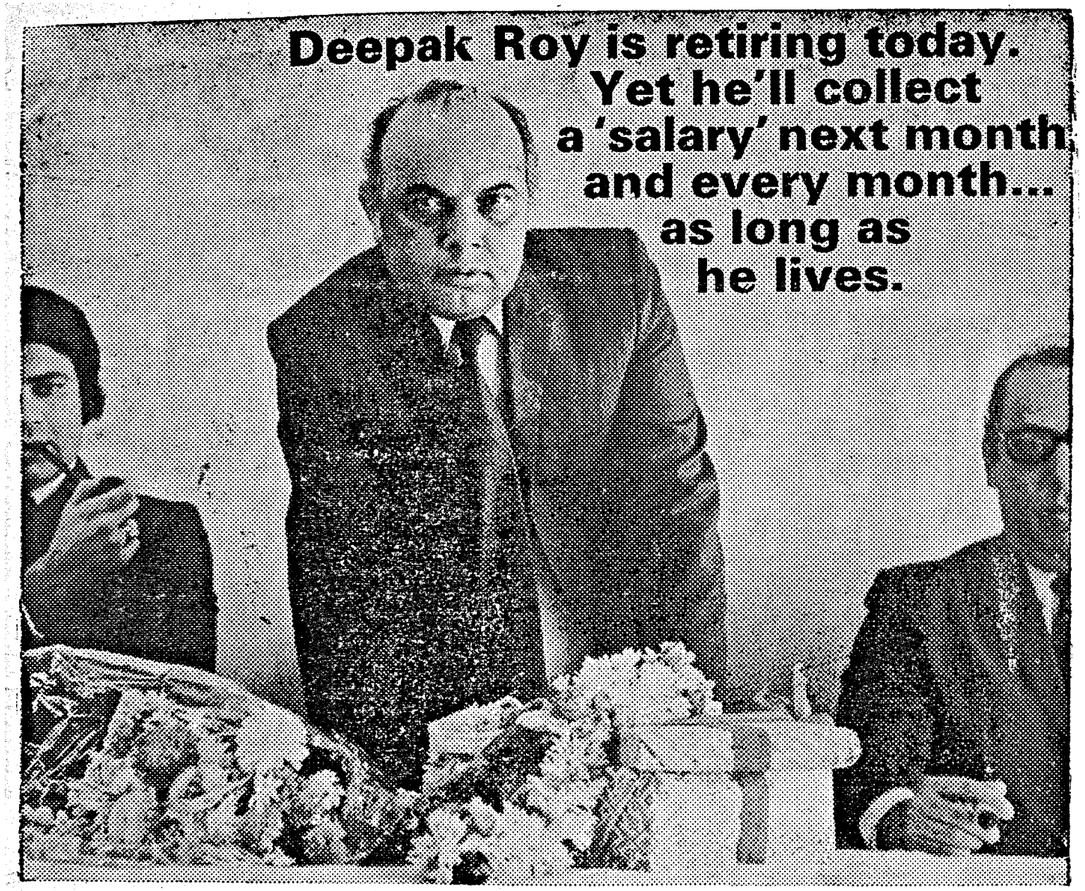
This three-part study concentrates on those who were temporarily settled at the Chandpara and Bokchora camps in the district of 24-Parganas in West Bengal. Part II examines the organisational set-up of the camps, the relations between hosts and guests in and around the camps and the adaptive capacities of the evacuees in their new environment. Part I dealt with the socio-economic background of the evacuees, the events leading to their uprootment and the trek to sanctuary. Part III will look at the migration back to Bangladesh and the manner in which it was achieved.

IN a sense the situation of the refugees of 1971 was unique. A refugee generally carries the connotation of a permanent immigrant who has been forced to leave his country of birth out of fear of extreme persecution and possible death. The country which receives refugees, therefore, is aware of the implications of accepting a non-returnee population. The question of rehabilitation and resettlement becomes either a national problem for the recipient country, as in India[1] and Pakistan in the past, or an international problem for the world community as in the case of post-war European refugees.[2]

In contrast, the Bangladesh migrants of 1971 right from the beginning were clearly and unambiguously defined as a temporary group which would be accorded hospitality by the host country only until such time as they were able to go back to their country of permanent residence with dignity. Hence, the question of their rehabilitation, integration and absorption in India did not arise. It was made abundantly clear that they were to be treated as foreign nationals.[3]

This, therefore, presented a unique situation where the evacuees would receive food, clothing, shelter, medical care, etc., but would not be expected to seek any occupation or engage in any economic activity. In effect, they were reduced to an economically idle and stagnant group, residing in clusters of various sizes (called camps) in identifiable areas. Not only were the evacuees economically isolated, they were also cloistered from political influences and activities to the extent that this was possible. Thus in the administration of relief as a matter of official policy no political party was allowed any role, nor were foreign relief agencies permitted to function at the level of evacuee camps.[4] The evacuees were formally isolated as a group distinct from the surrounding 'external' environment.

It is evident that the evacuees found themselves in a situation which was already defined for them. Adherence to these norms was the condition imposed by the 'hosts' in exchange for which the evacuees received 'hospitality'. For the evacuee, this was the 'price' he had to pay to 'earn' the hospitality of his hosts. Clearly, the sanction involved was the withdrawal of hospitality should a violation of norms occur.



The formal pattern of relationships between the host system and the guests was essentially asymmetrical. The acceptance of the imposed norms was clearly a function of the unequal relationship between the hosts and the guests. The guest's status was peculiar in that he hardly had any rights. But he had a few clearly defined obligations which he had to accept with gratitude and deference.

The reason why the host system imposed such restrictions is easy to discern. It tried to minimise the deleterious impact of an immigrant population of such magnitude on its own system. Struggling to manage its own inner strains, the host system attempted to isolate the new problem rather than allow it to combine with the already existing complex of problems. More specifically, the evacuees were allowed to remain as a non-competitive group in the economy, thus keeping the balance of the labour market undisturbed.

In their own country, the evacuees had been faced with imminent crisis. To them the choice clearly was between a future of uncertainty in a neighbouring country in which they could at least look forward to security of life and a future of certain persecution and possible death in their own country. Apparently the character and direction of political events in East Pakistan was interpreted as a crisis of such magnitude that the instinct of self-preservation decided for them the choice between the two alternatives. This crisis, therefore, was the causal generating factor which led to the massive exodus of nearly 10 million immigrants into India.

Forced into economic sterility and isolated in densely clustered enclosures the immigrants were likely to generate new problems. The questions that naturally arose were: In an environment not altogether alien, to what extent did the formalised structure of norms guide the actual behaviour pattern? What was the nature of the host and the guest systems? What kind of relationships emerged between the two systems?

To answer these questions, I concentrated on examining the organisation of relief and the social conditions in Chandpara Camp Number Two and Bokchora Camp. The former camp was near a town of the same name with some local businesses and offices, including the Development Block Centre, Gram Panchayat (local self-

Both he and his employer have gained through LIC's Superannuation Scheme.

LIC's Superannuation Scheme is the perfect incentive for your higher paid employees. Because it gets you a lot more in return. For one thing, it helps you attract and retain talented and experienced employees. And, when they are free from worries about the economic problems of Old Age, they will do better justice to their jobs. This means a big boost to your business efficiency, which will in turn mean higher profits.

The Superannuation Scheme enables an employee to retire, on the due date, with a guaranteed monthly income for life... or a guaranteed pay cheque for his dependents in case of his premature death while in your service.

Additional benefits to employees

- Income-tax concession in respect of employee's own contribution to the Scheme.
- The cash lump sum available in exchange of part of the pension is tax free upto limits specified by the Income-tax Act.
- The annuity or pension payable to dependents is exempt from Estate Duty to the extent of the equivalent of Rs. 15,000/- per annum.

Big gains for you

Your annual contributions to the Scheme are deductible as "Normal Business Expense"—so you save tax on your profits as well!

Moreover, the Superannuation Scheme is the kind of security your employees appreciate—so that their morale, efficiency and loyalty are maintained at a remarkably high level.

For further details, contact any of our Divisional Offices or Group and Superannuation Schemes Department, Central Office, LIC, Yogakshema, Bombay 400 020. Telephone · 296262.

Life Insurance Corporation of India

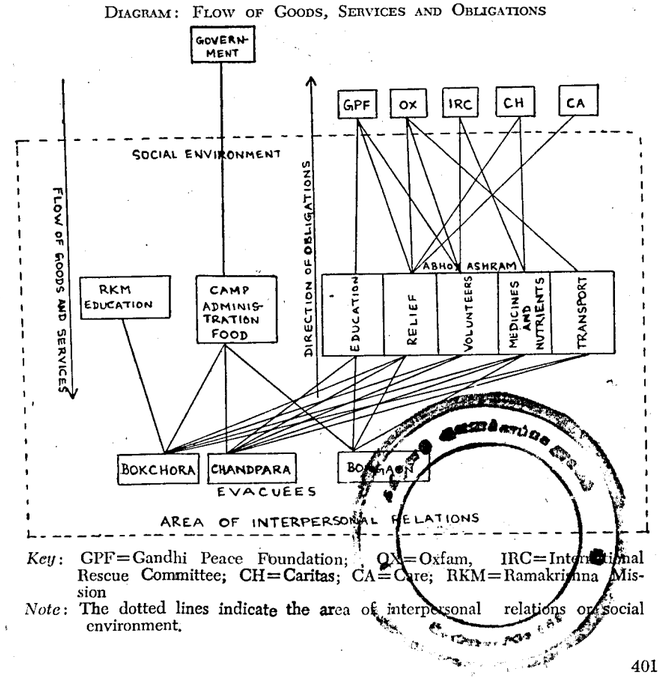
government) office, and so on. The latter camp was near Bokchora, about four kilometres from Chandpara. Although containing a few shops, a charitable dispensary and hospital by kindness of the local landlord, Bokchora is in fact a well spread out dispersed village. They both lie on the Jessore Road linking Calcutta and Jessore — Chandpara lying about 10 kms and Bokchora about 14 kms from Bongaon. And both are in the Bongaon sub-division of the district of 24-Parganas.

Chandpara Camp Number Two was a small camp housing a population of 2,041 (755 men, 786 women, 500 children) in 16 large tents and 50 small huts. Bokchora Camp in comparison was relatively large with a population of about 15,000 (4,500 men, 4,500 women, 6,000 children), sheltered in 50 large tents and 500 small huts. Both the camps had tubewell, latrine and garbage disposal facilities. Each of the camps had an improvised clinic where a doctor would come periodically for medical aid.

The Organisation of Relief

The concept of the host system is bound to vary depending upon the different frames of reference within which one examines it. One could conceptualise the entire immigrant population as 'guests' and the total mobilisation of resources by India for the evacuees as the 'host system'. I have, however, chosen to confine myself to the evacuees and their social network extensions in the two camps as representing the 'guests', and all the relevant organisations that had a direct or indirect bearing on the maintenance of the guests as the 'host system'. Four major constituents of the host system can therefore be identified, *viz*, the government and its newly set up camp administration, the voluntary Indian organisations, the voluntary foreign organisations and the social environment surrounding the guest population.

The Bongaon complex of camps was taken over by the Branch Secretariat of the Ministry of Labour and Rehabilitation around September 1971. A fresh cadre of officials and employees drawn mostly from ex-Army officers and servicemen, except for the volunteer-level recruits who were drawn from the native population, formed an almost parallel administration. The role of the camp administration *vis-a-vis* the evacuees was to act as reception, attend to medical preliminaries, provide adequate shelter, administer supply of rations, provide for medical care, arrange for education of children, project the government's viewpoints and efforts for providing relief to them, and finally, to give them protection from unwanted elements.



While the government did either take up or intend to take up these roles, it also sought the co-operation of non-sectarian and non-political voluntary organisations to relieve itself wherever possible of some of its functions. During the initial stages, when the government was trying desperately to come to grips with reality, it was the voluntary efforts of these organisations and the native population that sustained the early waves of immigrants. However, at the time of field work (December 1971) the camp administration was working more or less on the formal pattern indicated earlier, except that some of its functions were apportioned to non-sectarian, non-political voluntary organisations.

A number of voluntary organisations figured in the total complex of relief roles. The Abhoy Ashram had taken up practically all the major relief roles in the two camps, barring the supply of rations, which was undertaken by the camp administration, and the children's education in Bokchora, which the Ramakrishna Mission had taken up. The Gandhi Peace Foundation, Oxfam, the International Rescue Committee, Care, Caritas, contributed relief materials and/or services.

The structure of relationships between the host system, comprising a constellation of organisations and the social environment, and the guests, can be seen in the flow Diagram included. The one-way flow of goods and services from various relief organisations to the guests was matched by a reverse-way movement of obligations.

It is important to note how this system of relationships was maintained. It would appear that the 'investment' made by the host system was without expectations of any 'returns'. This is not entirely true. The investment was made in consideration of certain values like humanitarianism and the return came in the form of the intangible non-material reward of universal social approbation from the world community. Furthermore, in the context of international relations, the form of acceptance of the humanitarian role also amounted to a rejection of conditions thrust upon India by its political neighbour. This was manifested in refusing the immigrants the status of co-na-

tionals and considering them politically as aliens. Therefore, the universal social approbation of the humanitarian role played by India, in effect amounted to an implicit rejection of certain conditions imposed by Pakistan on India. In fact, the form of the humanitarian role had built-in symbols of rejection of the conditions imposed by Pakistan. This rejection in turn had dangerous implications for relations between India and Pakistan.

Presumably it can be worked out that the form of investment in the immigrants involved a definite entrepreneurial risk in expecting favourable political and economic outcomes. The possible alternatives before the host system from which a choice had to be made were as follows:

(1) to give the immigrants the status of co-nationals and rehabilitate them into the Indian social system — an experience not alien to the subcontinent; (2) to grant the immigrants asylum but transfer the responsibility of their maintenance and future rehabilitation to the international community; (3) to take up the responsibility of their security and maintenance with the co-operation of the international community but deny them co-nationality in consideration of prevailing social and economic conditions in the country. In the past, the subcontinent has always favoured the choice of the first alternative for major and minor influxes. It has never shirked its responsibility to the international community nor is it likely that the international community would have been able to take up the problems of such a large population. But, and this is important, in the past such movements of populations large or small, were always a matter of two-way traffic. They had the important characteristic of countervailing forces balancing each other. The last influx was not only one-way, but its magnitude was way out of bounds of permissive limits.

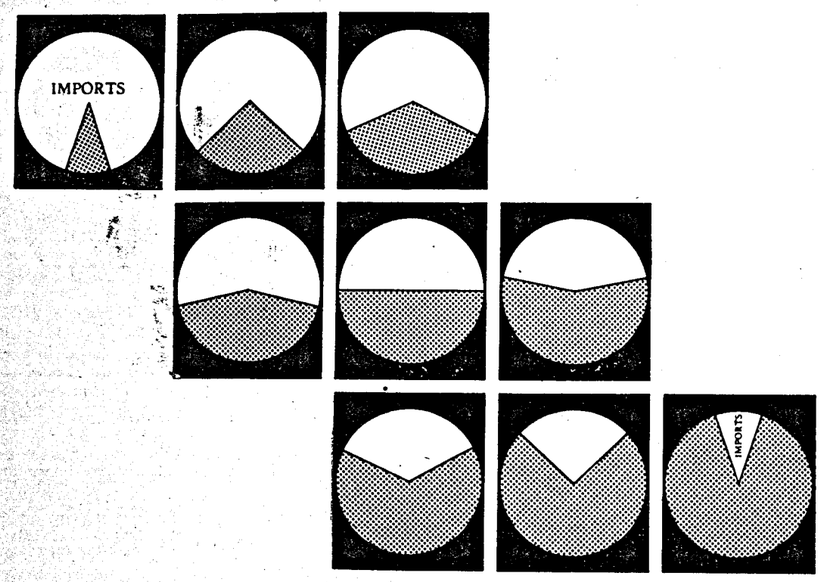
The choice of the first alternative would have several clear implications. (1) This would be more economical as the cost of maintaining a 10 million immigrant population with a likely increase in its strength would be prohibitive. The Government of India was spending at the rate of more than Rs 18.5 million per day.[5] (2) It would have meant accepting a situation thrust upon one country by another. (3) It would leave the country of asylum with less powerful symbols of rejection of the imposed conditions. The choice of the third alternative, therefore, seen in the perspective of the first, had a more compulsive orientation towards an early solution, though at greater risk.

These alternatives do not exhaust all the logical possibilities open to India, though they include all the major ones. India could have refused asylum to the immigrants forcing them to return or not allowing them to cross the political boundary. This would have been in direct contravention of the accepted principle of *non-refoulement* enshrined in the Declaration of Territorial Asylum based on the Declaration of Human Rights, which states that a refugee cannot be returned "in any manner whatsoever to the frontiers of territories where his life or freedom would be threatened on account of his race, religion, or membership of a particular social group or political opinion".[6]

Therefore, it seems clear that the proper enactment of the humanitarian host role not only had structural props in the immediate host-guest interactions, but also involved a whole range of bilateral and multilateral nation-state interactions directed towards the attainment of an explicit goal — namely, the return of the refugees to their homeland.[7]

Inner Tensions in the Host System

Even a cursory perusal of the flow Diagram will indicate that the Abhoy Ashram at the grass roots level voluntary organisation had to play a more-complex role than the other organisations *vis-a-vis* the two camps examined here. Goods and services from several voluntary organisations were funnelled through the Ashram.



There were two principal social workers who ran this institution in Bongaon. At the instance of the Gandhi Peace Foundation, the Abhoy Ashram volunteered to play an active role in relief operations. Consequently, it became a centre for co-ordinating the activities of the various relief agencies.

The group that constituted the relief team at the Ashram focal point presented a heterogeneous lot with ill-defined and inconsistent role obligations. Thus the Gandhi Peace Foundation volunteer clearly defied the Ashram authorities, claimed allegiance only to his principals and interpreted the hospitality extended to him by the Ashram as his right for the services he was rendering to the evacuees. The Ashram, he claimed, was merely a receiving point for goods to be distributed. It had no clear claim on how the goods were to be distributed. As far as he was concerned, he considered himself independent and autonomous with respect to goods received specifically for the camp he was looking after. The Ashram held the view that since the relief goods were despatched in the name of the Ashram, the Ashram had a right to take a total stock of the situation of all the three camps under its relief jurisdiction and allocate these materials and others according to the intensity of needs in the different camps. This conflict was not resolved during the days I watched them as their guest and in fact it frequently erupted in unpleasant tensions.

The doctors and their medical staff had more clearly defined roles, but on occasions the specificity of their roles created problems. For example, on one occasion the driver belonging to Oxfam reported to his principals that transport had been misused on one or two occasions. This resulted in a unilateral withdrawal of the transport by Oxfam without any enquiry into this allegation and without any explanation, causing the medical and relief services to the two camps to come to an abrupt stop. In such a situation the doctors felt very critical of Oxfam behaviour but declined to report anything in writing either to their principals or to Abhoy Ashram or to Oxfam. On this occasion, I felt compelled to intervene and helped the Ashram take up the matter and protest to Oxfam.

The tensions in the Ashram resolved themselves largely because of the two kinds of leadership. While the Ashram, as a whole, functioned as a task-oriented group, the leadership roles among those working at the two camps were clearly differentiated. For instance, the role performance of the social worker from the Gandhi Peace Foundation could be identified in terms of behaviour and attitudes generally associated with the instrumental leadership of a task leader (e g, in giving suggestions, directives, opinions, taking important decisions and so on). In comparison, the lady who was formally in charge of the Ashram clearly acquired the expressive leadership of the 'sociometric star' (characterised by "expression of emotions, supportive behaviour to others, the desire to please and be liked and a more generalised liking for other members").[8] This is not to say that the latter did not perform any instrumental role, but only that she was better equipped as an expressive leader. On one occasion the Gandhi Peace Foundation volunteer went on fast as a protest against her action in not supplying

Smaller,& smaller,& smaller

In the 25 years since Independence, India's production of medicines has grown dramatically, while the percentage of imports has dwindled. Primary drugs, intermediates and finished formulations are now made in India—with 90% indigenous material.

In import substitution, India has achieved greater success in pharmaceuticals than in many other fields. This is due to the continuing emphasis on Research and Development, and the industry has achieved an excellent record in product development and process improvement and formulations to suit local needs and conditions.

The result: India is producing medicines of world-class quality with largely indigenous material.

INDIA'S PRIDE: MEDICINES TO MATCH THE WORLD'S BEST

enough blankets for distribution in Bokchora camp. But her expressive leadership controlled the situation with the help of tearful and impassioned appeals and by taking recourse to a counter-fast. It was largely because of the existence of these two types of leadership that an unco-ordinated relief group was able to function with reasonable efficiency in spite of inner contradictions.

The Pattern of Resettlement

The pattern of resettlement of evacuees led to the dispersal of villages in three types of settlements: in camps, outside camps but in independent units, and with friends and relatives. The new formations were not 'transfers' of village communities *en bloc*, nor even 'transfers' of extended kin groups except accidentally. Only the household maintained its unity and identity.[9] In fact, single villages on the other side of the international boundary got fragmented into many parts. The camps thus were formed of several and sometimes many fragmented villages. This is clear from the data presented in Part I of Chandpara camp inmates.

One of the earlier processes amongst the evacuees was to re-establish the network of community ties. As soon as the evacuees got allocated to specific camps, they took the first opportunity to establish communication and contact with kinsmen and acquaintances spread over many camps. It is amazing how within a brief period of 8 to 12 weeks the extant ties of the Chchianobboi Gram region were re-established. Almost all relatives and friends were located within the district of 24-Parganas although they were scattered in at least three camps each in Basirhat, Barasat and Bongaon subdivisions, 12 camps in Gaighata and one camp in Barrackpore sub-divisions. Once the contacts were re-established the network of social ties was re-activated although under vastly changed circumstances.

Thus the *jajmani* relationships became operative as soon as deaths occurred or marriages took place. Each of the scheduled castes seemed to have their own 'Brahmins' or priests. The priests of the Rishis and Namasudras informed me that they were called by their *jajmans* several times from different camps, generally to perform the *shradh* (cremation) ceremony. Occasionally they presided over stray cases of marriage. The customary gifts and fees which they received in the village were greatly reduced in the camp situation, but they performed their duty.

The compounder turned 'doctor' moved in camps which housed his clientele and treated patients. He was also sought sometimes in spite of the clinics. The 'doctor' did not ask for any fees; they gave him anything they could, ranging between nothing at all to about 25 paise or more. They however tried to meet the expense of the medicines which he generally gave them.

Frequent visits of relatives and friends and overnight hospitality extended to them, helped to retain the community structure at the abstract level of inter-personal relations. The restrictions on any kind of economic activity for an able-bodied population, the imbalanced unnutritious diet and the consequent diseases which took an epidemic form, must have had a very demoralising effect on the personalities of the evacuees. And yet no cases of disorganised or mentally imbalanced individuals were reported to the doctor attending the clinics in the two camps. This can be attributed to the mechanism of the revival of the community structure which played a significant tension-management role.

It is also important to note that the void created by a ban on economic activities generally tended to be filled by increased social interaction. Thus time expended in the exchange of goods and services was now expended on an exchange of visits. Such exchanges were facilitated by violations of norms which were overlooked. Thus they could travel free of charge in the trains. Private buses however could not afford to overlook such violations.

The purely non-economic interactions were the first phase of the reactivation of the community structure. Once the visits became a normative pattern of mutuality of expectations and sharing of common experiences, they developed normative sub-structures of economic interactions. Thus if the ration of one camp included potatoes and not pulses whereas a physically distant but socially promixate camp had its ration the other way round, such visits also facilitated an exchange of ration items to vary their stereotype diet. Also, by November, they were being given cash at two rupees per head per week. This enabled some circulation of money and allowed some economic exchanges not only with the external market but also among relatives and friends. Apart from the cash they received as relief, many were able to bring some money across the border, which also circulated in the market.

The political institutions of the erstwhile village communities also became operative. The institution of *matabbars* (or village influentials) and the Union Councils (the grass roots official political institution) also moved from camp to camp where they enquired about their people and their difficulties. The higher status leaders from among these, who usually stayed with relatives or friends in the towns, maintained relationships with the camp administration and other civic authorities, and were able to articulate some of their difficulties to them, with or without results. Although the Union Councils were defunct, they carried some of the status associated with their office, and this helped in articulation between the two formal leadership structures. They were repositories of information, because they were in a position to receive, collate and disseminate information through many channels. One of the pressing problems of the community structure was scarcity of information about other members of the community, about the situation across the border, about their future prospects and so on, and in this the leadership played an important role. It helped to maintain the integrative bonds which kept the community structure well tied.

It will be clear, therefore, that the uprooted population was not in complete disarray as one might have imagined. Along with the transfer of population, the transfer of the rural community structures had also taken place. The re-activation of the community structure essentially took place in terms of its principal normative and political institutions. It lacked one important type of institution, the economic. But this was also discernible in a residual form. The fragmentation of its ecological base and the emergence of new social formations in new settings did not lead either to a disintegration of the rural community structure, nor did the fragmentation make this structure dormant.

New Community Structures

The transfer of community structures and the interactions which gave definition to it in a new context does not imply that new structures did not develop in the camps. The sharing of common experiences of uprootment and the fact of neighbourly placements led to the sharing and solving of common problems. Thus there were problems of sanitation and hygiene, of resolution of conflict among campers, of countering

exploitation by the camp administration, of keeping vigilance in the camp, and so on. These needs threw up a leadership on the pattern of *matabburs* in the village context. They were accepted as the representatives of the camp and decisions *vis-a-vis* the outer environment which affected camp life in general were articulated through them. It is interesting to note that the camp *matabmatabbars* had almost all been *matabbars* in their respective village contexts. The camp population was aware of the norms guiding leader-follower roles. In addition, a group of young men from the camps were trained by the Gandhi Peace Foundation in certain leadership roles involving the maintenance of sanitation in the camps with the co-operation of the camp inmates.

The leadership in the camps was singularly characterised by an absence of factionalism. There was general unanimity and consensus about the decision-making role. However, in the absence of any economic sub-system in any formal or social-institutional sense of the term, the leadership role was limited to a minimal number of areas. These areas could easily be identified. First, quarrels on account of inmates violating hygiene or cleanliness norms were promptly and effectively taken care of. Thus, not infrequently, especially in the earlier stages of camp life, the feces of children defecating in one household unit would surreptitiously be deposited near a neighbouring household unit. In such cases the violator would be identified and made to clean up the mess. This problem improved with the inculcation of new norms and the improvement in sanitary facilities. In this the Gandhi Peace Foundation volunteers recruited from the camps and the *matabbar* leadership of the camps played a useful role.

An important role of the camp leadership was to counter the frequent and often arbitrary use of sanctions by the camp administration. Thus, confiscation of ration cards or partial reduction in the amount of ration for specified periods activated the leadership role. On such occasions the leadership employed emotional appeals — rather than pressure tactics — which took the form of pleadings and apologies to restore the rations. The confiscation of meagre rations for any period of time was a severe blow to the evacuee. Hence the leadership role in this area was most important and valued. Also, the leadership on such occasions arranged for the sharing of rations so that the evacuee under sanction could tide over his period of punishment.

However, it is important to record the sharp cleavage between the volunteer-teachers (also evacuees but not living in the camp) and the inmates of Chandpara camp. There was a general feeling among the camp inmates that these volunteer-teachers were not serious about their teaching role and that the children of the age-group four to 12 were not seriously taught by them although they were being paid by the Gandhi Peace Foundation for this. The undercurrent of tension became manifest when the 'school' was given a transistor radio by the Abhoy Ashram, which was supposed to be in the care of the teachers but which was also supposed to be tuned for the benefit of the entire camp especially for the news and music, etc. The teachers monopolised the radio, played it continuously while their open-air mango-grove classes were supposed to be doing some serious teaching work and took it home with them after school hours (which were about two hours in the morning). This irked the camp and its leadership and they reported the matter to the Abhoy Ashram. The teachers reacted by charging the camp committee of the evacuees with corruption. This led to an unpleasant situation and the teachers became even more indifferent towards their teaching commitments. The Abhoy Ashram investigated the matter and urged the teachers to take their teaching work more seriously, while at the same time they requested the camp committee to be more careful about collecting funds and spending them. During the brief period of my stay, I could observe the sense of superiority which the teachers tried to display in their behaviour and how the camp inmates responded by open ridicule of their superciliousness.

Finally, the leadership of the camp played an important role in surveying and helping to distribute relief material to the camp inmates. Grievances in the matter of receiving relief materials were directed to them and they usually solved them within the constraints of scarce relief materials.

Religious ceremonies were one of the important ways in which the camp inmates felt they could alleviate the drudgery of a static, sterile life. Here the Chandpara camp was better off. It raised small contributions and organised such functions. The leadership played an active role in this. The inmates of the Bokchora camp were less fortunate, at least for a certain period of time, as the Camp Commandant during that period clearly felt that such displays of merriment were not in accord with the miserable status of an evacuee. The evacuee was not only in misery, he should appear to be in misery. Thus Bokchora camp, which was rich in traditional theatrical talents (*jatra*), was considerably subdued in articulating them for fear of the camp authorities.

There were other activities: A few small shops had sprung up in both the camps, providing a skeletal economic institution. At least two marriages had taken place in Chandpara and one in Bokchora. In Bokchora it was reported to be the consummation of the betrothal ceremony which had already taken place before their flight. However, the camp authorities took such a serious view of this act of intransigence that the newly-weds were promptly deprived of their ration for several weeks. In all these marriages, the camp community contributed and participated.

However, it must also be recorded that camp life during the rainy season was one of acute suffering. Many children died. Rain water made inroads into the camps, bringing in floating feces, garbage and filth, exuding the most obnoxious stench. Most of the tents leaked. Many evacuees left the camps to settle on elevated areas near railway tracks and on both sides of the road. Life was utterly disorganised during those two rainy months of June and July. It was only after the rains that camp life once again settled down to some kind of an organised existence. One permanent contribution of the rainy season was the highly infectious skin disease which spared none and which the evacuees carried back home as one of their mementoes.

Thus, through privation and adaptation, the camps acquired the attributes of a community, of 'belongingness' and identification in the sharing of a common state of indefiniteness and uncertainty.

The important questions, which to my mind should guide future research, are: Just as the community structures in East Pakistan were 'transferred' to India without their ecological base, would the community structures of the camp also 'travel' to Bangladesh having lost their ecological base there? What kind of transformations would occur in the pattern of relationships established in India? In other words, would the universe of social interaction of the evacuees back in their natal setting expand to admit the new network of social ties? These are intriguing questions for any social scientist.

Host-Guest Relations

Having discussed the host system and the guests, I shall now discuss the relations between the two. I have already referred earlier to the evolution of infra-structures which deviated from the formally defined norms.

It is important to bear in mind that the Bongaon region has accommodated and integrated a large number of refugees since the time of partition. A fair number of such refugee families are completely rehabilitated and reasonably well-settled. Thus such persons who once were guests now found themselves in the position of hosts, hosting people from the very country they had fled. The region was also one of the politically violent areas, where the institutions of law and order had either become overpoliticised or overwhelmed by political organisations, enough to make them almost ineffective.

When the evacuees started pouring in from the first week of April, the response of the Bongaon community was one of universal sympathy. They organised their reception, arranged for their food, provided for their shelter and so on. But with the overwhelming magnitude of the influx, the government's intervention became imperative. Thereafter, a process was started which attempted to formalise and routinise the settlement of evacuees. Not until around October could the camp administration really come to grips with this colossal problem. Meanwhile a number of voluntary organisations, including the Ramakrishna Mission, Ananda Marg, Milani Sangha, 'etc, performed the role of distribution of rations and other relief materials.

When the government took over the distribution of rations, the volunteers recruited for this specific purpose appear to have been mostly, if not wholly, from Bongaon and adjoining regions of the 24-Parganas district. Experiences in both the camps reveal a uniform pattern of exploitation by such volunteers. The experience of receiving rations short of their quota was universally felt. The confiscation of cards on flimsy pretexts (and also sometimes for genuine reasons) for periods ranging upto several weeks was not an infrequent occurrence, whilst a milder punishment resulted in a reduction of the ration quota for a specified period of time.

Displays of violence and threats of greater violence at times kept the camp inmates in a state akin to terror. Several incidents of violent behaviour were reported, including one in which some camp inmates were so brutally beaten that one of them had to be hospitalised. The alleged crime was their inability to tell the volunteers of the whereabouts of one of their neighbours who was absent from the camp. On one occasion a camp inmate was stabbed and injured. Included in the armoury of some of these violent young men were more sophisticated weapons than daggers, *viz*, bombs and guns. These men were characterised by the camp inmates as *ugrapanthis* or extremists.

There was practically nothing the evacuees could do about controlling such behaviour as the Camp Commandants and their assistants, all ex-Army, preferred to steer clear of violent young men, a species about whom training in military warfare had taught precious little. The prevailing political climate and the asymmetrical relationship in which the guests formally and actually stood *vis-a-vis* the hosts, and the situation of unemployed youth in West Bengal, facilitated the exploitation of the guests.

However, if such a deviant structure characterised the relationship between the camp administration and the guests, this was balanced by compensatory mechanisms of other forms of deviant relationship. Thus the guests were drawn into economic activity because their goods and services were welcomed by various groupings in the society. Thus their services were purchased at a level lower than the market price for agricultural labour. It is true, that this did create some tension between the guests and the host labourers. But the host landlords gave the evacuee labourers security or obtained their services clandestinely. The wage rate dropped down to two rupees per day for the evacuees from 'five rupees. Since this was in effect 'stealing' others' labour, the low wage rate was acceptable. Besides, this was a gain in addition to the social security guaranteed by the host system.

The other major economic activity was fishing and marketing fish. In this sphere of activity the permissiveness was more pronounced as the entire native population stood to gain by it, including the native fishermen. The skill of the Bangladesh fishermen and peasants is infinitely superior to that of their West Bengal counterparts. The variety of fishing equipment in the possession of the guests was far more efficient than those of the natives, including such implements as *achchra kala, jall, dudi*, etc. Nearly 500-600 persons, men, women and children, went fishing. They caught all varieties, and especially small fish, and sold them reasonably cheap at five or six rupees per kilogram. The local fishermen extracted a certain tax on each fishing implement. The native population welcomed this as it had never had such abundance of fish, and in so many varieties, in the market.

The interest of the local small traders in the camp was also evident. The traders or their agents would come to buy pulses and exchange better quality rice for broken Russian rice which the evacuees usually found unpalatable. Also, the foodgrains which found their way into the market from distribution centres brought down the prices of foodgrains in the Bongaon and Chandpara markets.

In addition to these major economic activities, the different occupational evacuee sub-groups engaged in limited economic activities like weaving fishing nets and selling them. In the words of an articulate camp *matabbar*, "Everyone manages to find some means of earning a little bit".

These activities of the guests had started taking place on a scale whose impact on the economy and the labour market was becoming potentially explosive. It is clear that continual adherence to the legal norms set to guide the behaviour pattern of so large a population as 10 million was becoming well-nigh impossible with the passage of time. A decision favouring their rehabilitation and absorption or their return to Bangladesh was becoming imperative.

Notes

1 Although India and Pakistan have the unenviable record of experiencing the largest transfers of population with the partition of the subcontinent, sociological literature on the refugee influx into India, covering the period soon after the influx, is scarce to the point of being non-existent. Among the literature available is: V K R V Rao, "An Economic Review of Refugee Rehabilitation in India", Delhi School of Economics, University of Delhi, 1955; R N Saxena, "Refugees", Asia Publishing House, 1961; S K Dey, "Nilokheri", Asia Publishing House, 1962; Jacques Vernant, "The Refugee in the Post-War World", George Allen and Unwin, London, 1953; Joseph B Schechtman, "The Refugee in the World", A S Barner and Company, New York, 1963.

2 "The refugee problem is essentially an international problem. It can only be resolved by international action. It is by attempting to harmonise the sometimes conflicting interests of the countries of first asylum and those of permanent resettlement by acting if not as referee, at least as counsellor of those

states and to the refugees themselves, by prompting in every possible way the gradual assimilation of the unemployed, and especially of the least adaptable, refugees and their integration in the more prosperous countries on whom nature has smiled, by smoothing the process which normally ends in naturalisation — it is in these ways that the international authority set up for this purpose can best discharge its task" in Jacques Vernant, *op cit*, p 22.

"The Indo-Pakistan refugee problem was different in that the two countries took up the responsibility of rehabilitation of the displaced persons in their respective countries. It was not conceived as an international responsibility", *ibid*, p 737.

3 "Refugees from East Bengal should be got registered under Foreigners' Act, 1946, according to the instructions of the Ministry of Home Affairs to all State Governments and they are required to obtain residence permit for stay at the place where registered for a period of three months. After registration, if any refugee desires to leave the present place of residence unauthorisedly he should be handed over to the police for violation of the provision of the Foreigners' Act. It should be explained to the refugees that their attempt to pressurise Government to obtain additional relief assistance would be fruitless and if they intend to desert, they will have to face serious consequences" in Government of India, Ministry of Labour and Rehabilitation, Branch Secretariat, *Administrative Instructions for Transit Relief Camps for Refugees from East Bengal*, Calcutta, 1971, p 8.

"Refugees will not be given any employment in India as, apart from being foreign nationals, such employment will lead to social and economic tensions within this country", *ibid*, p 12.

4 *Ibid*, p 12.

5 "The per capita recurring expenditure is Rs 1.75 per day. The non-recurring expenditure on per capita basis averaged out over 6 months comes to Rs 1.02 per day. Thus the total expenditure (recurring and non-recurring) comes to Rs 2.77 per refugee per day. Using these scales of expenditure, the total expenditure on 6.7 mn refugees in Camps works out to Rs 1.85 crores daily" in Government of India, Ministry of Labour and Rehabilitation, Branch Secretariat, *Statistical Information Relating to the Influx from East Bengal into India*, Calcutta, 1971, p 19.

It may be noted that the above expenditure is exclusive of that incurred on the three million refugees living with friends and relatives.

The volume of expenditure on refugees can also be visualised from the following statement: "According to an Aide-Memoire addressed by the Government of India on 20th January to the United Nations High Commissioner for Refugees, the cost of refugee relief in 1971 amounted to $ 320 mn. This represents exclusively the work undertaken by the authorities at the reception points and in camps and does not include the aid given by the Indian Red Cross and the Indian Voluntary Agencies nor the assistance provided by the population to the 3 million refugees who were living with friends and relatives.

"Focal Point, on 24th January had received donations in cash and kind amounting to $ 187 million. There have been cancellation of donations of about $ 2 million . . ." *UN Focal Point in India, The Concluding Phase of Focal Point*, New Delhi, February 11, 1972.

6 Quoted in Peter Collins, "A Mandate to Protect and Assist Refugees", United Nations High Commissioner for Refugees, Geneva, 1971.

7 This is adequately represented in the following excerpt: "The efforts of the United Nations High Commissioner for Refugees in his capacity as focal point 'to relieve the suffering of the refugees in India', as requested by the General Assembly in its resolution 2790 (XXVI), have continued without let-up since the cessation of hostilities in the subcontinent on 17th December 1971. At the same time, and to an increasing degree, the activities of the High Commissioner have been redirected to assisting in the refugees' 'return in safety and dignity to their homes', as called for by the Security Council in its resolution 307 (1971)" from *Report of the Secretary General Concerning the Implementation of General Assembly Resolution 2790 (XXVI), and Security Council Revolution 307 (1971)*, Twenty-Seventh Session of General Assembly, February 15, 1972.

8 Morris Zelditch Jr, "Role Differentiation in the Nuclear Family: A Comparative Study" in T Parsons and Bales (ed), "Family, Socialisation and Interaction Process", Free Press of Glencoe, Illinois, 1955, pp 309-310.

9 Thus naturally falling in line with the internationally defined humanitarian norm stated in the following words: "In view of the humanitarian factors involved, the High Commissioner has always attached special importance to this question and he has continued his efforts to promote the unity of the family, which the Conference of Plenipotentiaries considered as "an essential right of the refugees". *Report of the United Nations High Commissioner for Refugees*, General Assembly, Official Records, Twenty-Sixth Session, Supplement Number 12 (A/8412), United Nations, New York, 1971.

Vision 731

Growth, Equity and the Budget

The Central budget for 1974-75 has a two-fold significance.

First, it offers the opportunity to draw up a balance-sheet of the performance of the economy in the Fourth Plan and to take stock on the eve of the Fifth Plan.

Second, since the budget is a major instrument for implementing economic policies, one may reasonably hope to discern in it the policy-frame for the Fifth Plan.

THE Fourth Plan was launched with the objective of putting the economy back on a steady growth path. Against this objective, economic stocktaking at the end of the Plan period is not at all a pleasant task. The Fourth Plan projection of an annual growth rate of 5.5 per cent was attained only in 1969-70. In the subsequent years, the rate decelerated, culminating in a decline of 1.7 per cent in 1972-73. Industrial production increased at an average annual rate of about 5 per cent during the quadrennium ending with 1972-73; however, in 1973-74 the index of industrial production is unlikely to even stay at the 1972-73 level. Agricultural production is hopefully expected to register a substantial increase in 1973-74 so that the overall growth of national income in the year may come to about 6 per cent. Taking the Fourth Plan period as a whole, the average annual rate of growth of national income is unlikely to exceed 3.5 per cent.

While the growth rates of agricultural and industrial production have played hide and seek, not so the rate of monetary expansion. Money supply with the public had risen from Rs 5,779 crores at the beginning of the Fourth Plan to Rs 10,334 crores by January 25, 1974 — a rise of 79 per cent. In contrast to this monetary explosion, the per capita availability of essential items like foodgrains, oilseeds, vanaspati, sugar, etc, either remained stationary or showed a decline. Per capita net availability of cereals and pulses at 418 grammes per day in 1973 was substantially lower than the figure of around 470 grammes per day in 1971 and 1972. The sharp rise of more than 30 per cent in the wholesale price index during the 21 months ending with December 1973 could not, therefore, have come as a total surprise. According to the Economic Survey for 1973-74 the "sharp acceleration in price inflation" was "the most important characteristic of the economic situation in 1973-74".

Wide variations between original Budget estimates and the final outcomes and the emergence of large deficits in government finances have become regular features. Deficit financing during the Fourth Plan, even in the restricted budgetary sense (largely measured by the variation in treasury bills), has far exceeded the original estimate. The economically significant measure of deficit financing and one that indicates the impact of the budget on money supply, viz, net bank credit to the government sector, has shown still larger increases. It increased by Rs 1,147 crores and Rs 1,308 crores in 1971-72 and 1972-73, respectively, and by a further Rs 1,032 crores between March 31 and January 25, 1974 thus exceeding, in each of these years, the total increase in money supply with the public.

Erosion in Real Content

Several factors — such as refugee relief, natural calamities, war — have been singly or jointly held to be responsible for the deterioration in government finances in the Fourth Plan, but larger Plan outlays are not one of them. There has been some increase in Plan outlay in money terms and with the inclusion of special welfare programmes, crash schemes for the unemployed and advance action for the Fifth Plan, the Fourth Plan total outlay, as provided in the Budgets, is expected to exceed the Plan figure of Rs 15,900 crores by Rs 300 crores. However, when the actuals become available, the Fourth Plan outlay target may at the best be found to have been attained in money terms. The fulfilment of the financial target cannot, however, conceal the erosion in real content of Plan programmes; at 1968-69 prices, the Fourth Plan outlay is likely to show a shortfall of the order of nearly 20 per cent.

The shortfall certainly cannot be attributed to lack of resources. On the contrary, the incremental financial resources acquired through taxation, net domestic borrowing (market borrowing, small savings and provident funds) and net external loans was not wholly, or even largely, utilised for stepping up Plan activity. In most of the Fourth Plan years, over one-half of the incremental resources raised through taxation and borrowing was absorbed by increase in non-Plan expenditure. Excepting in 1970-71 and 1971-72, the incremental resources exceeded even the incremental development expenditure (Plan and non-Plan), indicating how resources have been asborbed by non-developmental expenditure.

Neither Plan expenditure nor developmental expenditure by itself indicates the investment activity of the government sector. Data on capital formation in the government sector, which is an important indicator of the sector's contribution to growth, are available only in respect of the Central government. Incremental net capital formation (in money terms) through the Central budget was far below incremental resource acquisition through taxation and borrowing.

This is the background against which the 1974-75 Budget was framed. To set the economy back on the growth path, "a significant step-up" in the rate of investment in 1974-75 "is clearly an essential condition for the realisation of the basic objectives of the Plan". The total public sector Plan outlay for 1974-75 at Rs 4,769 crores envisages a step-up of Rs 405 crores over the provision in 1973-74. This increase, even in money terms, is overstated (by Rs 320 crores, according to one report) because the Plan provision for 1974-75 (as well as the total Fifth Plan outlay) takes investment on a gross basis (i e, new investment plus replacement expenditure) whereas the 1973-74 figure, following the Fourth Plan concept, excluded replacement investment. Again, using the increase of 21 per cent in the wholesale price index between April-December 1973 as a deflating factor (i e, assuming, contrary to the trend in the subsequent months, no further increase in the price level after December 1973), the real content of the 1974-75 plan outlay does not come to more than Rs 3,940 crores. In fact, there is thus a slackening of growth activity in 1974-75.

Enhancement of public sector investment expenditure, one may argue, is only one way of raising the growth rate. The growth rate may be accelerated by encouraging organised industries in the private sector to bridge the gap between the desired growth rate and the one that is feasible through the public sector investment programmes. For this taxation policies rather than public expenditure programmes may be deemed to be the effective instruments.

This is only an Announcement and not a Prospectus

Announcement regarding the issue of 1,75,000 Equity Shares of Rs. 10/- each cash at par. Persons interested in details may obtain copies of the Prospectus and Application forms from the Company's Registered Office, Underwriters, Brokers and Bankers to the issue mentioned below. Applications will be made to the Madras Stock Exchange for permission to deal in and for an official quotation of the Equity Shares in the Company. The subscription list will open at the commencement of banking hours on Wednesday 20th March 1974 and will close at the close of banking hours on Saturday 30th March 1974 or earlier at the discretion of the Directors, but not before the close of banking hours on Friday 22nd March 1974.

SRP Tools Limited

Registered Office/Factory: Lattice Bridge, Madras-600041.

ncorporation and History:

The Company was incorporated at Madras on 12.3.1963 as a PUBLIC LIMITED COMPANY for the objects specified in the Memorandum of Association and in particular for the manufacture of precision Cutting Tools, *viz*, Reamers, End Mills, Milling Cutters, Taps etc, at their existing factory at Lattice Bridge, Madras-600041. This year production and sales will exceed Rs. 60 lakhs. MESSRS. VOLTAS LIMITED ARE OUR SOLE SELLING AGENTS. THE COMPANY HAS ENTERED INTO A TECHNICAL COLLABORATION WITH MESSRS. MITSUBISHI HEAVY INDUSTRIES LIMITED, JAPAN for manufacture of 4000 Nos. of Gear Hobs, 5000 Nos. of Gear Shaping and Shaving Cutters and 2000 Nos. of Broaches. The proposed factory is located at SIPCOT Industrial Complex, Ranipet, Wallajah Taluk, North Arcot Dist., an industrially under-developed area, eligible for Central and State cash subsidy and tax benefits. The Company is maintaining 10% Dividend from the first year of production, i e, 1966.

Prospects:

When the factory comes into full production, the total output of the company will be about Rs. 170 lakhs and will also save considerable foreign exchange since the products to be manufactured are at present being imported. The Company expects a reasonable profit after depreciation and interest to maintain the dividend on the enlarged capital.

The subscription list will open at the commencement of banking hours on Monday, the 18th March 1974.. and will close at the close of banking hours on *Thursday, the 28th March 1974, or earlier at the discretion of the Board of Directors* of the Company but not before the close of banking hours on Wednesday, the 20th March 1974.

GS GANGAVATI SUGARS LIMITED

(Incorporated under the Companies Act, 1956) Regd. Office : 30, Shrungar Shopping Centre, Mahatma Gandhi Road, Bangalore—560001.

EXISTING AND PROPOSED ACTIVITIES:
The Company is a Joint Sector Undertaking with Mysore State *Industrial Investment and Development* Corporation Ltd, MSIIDC one of the promoters, holding 26% of the Equity Shares of the Company and was incorporated on 6th October 1971 as a Public Limited Company in Bangalore and the Certificate of Commencement of Business was obtained on 18th November 1971. The objects are stated in the Memorandum and Articles of Association of the Company. The immediate object of *the Company is to set up a plant for the manufa*cture of sugar with a daily crushing capacity of 2500 *tonnes of sugarcane.*
The Company has already undertaken construction of the factory and orders for the plant and machinery have already been placed with the suppliers. Barring *unforeseen circumstances* and conditions beyond the control of the directors, it is expected that the factory will commence production by October 1974.

LOCATION OF THE INDUSTRY:
The plant is being set up in Marli Village, Gangavati *Taluk, of Raichur District. The location commands* a very wide area of lands growing sugarcane, the chief raw material. This area is classified as a *selected backward area and all the financial con*cessions relating to this are available to the Company.

APPLICATIONS TO THE STOCK EXCHANGES:
Applications have been made to Bangalore, Bombay and Madras Stock, Exchanges for permission to deal in and to official quotations for the existing and also for the Equity and Preference Shares now *being issued*

PROJECT COST
The Project Cost is estimated at Rs. 525 lakhs and is proposed to be *financed as under :*

MCA/GS-1

COMPANY MEETING

Ashok Leyland Limited

Madras 600057

Speech delivered by Mr S Ranganathan, Chairman, Ashok Leyland Limited to the Shareholders at the Twentyfifth Annual General Meeting of the Company held on 4th March 1974 at Ennore Madras 600057

FRIENDS,

It gives me very great pleasure to welcome you to the 25th Annual General Meeting of your Company.

The Directors' Report, Audited Balance Sheet and the Profit and Loss Account have been circulated to you and with your permission I shall take them as read.

GENERAL ECONOMIC CONDITIONS

During the year under review, the nation's economy had to pass through a difficult phase marked by droughts and floods in different parts of the country, power shortage and increasing paucity of *industrial inputs*. The combined effect of all these is an unprecedented inflationary spiral and the effect of this is felt in an increasing measure in all phases of our manufacturing activity.

The recent development in West Asia resulting in the phenomenal increase in world prices of crude oil in a short period has over-shadowed many problems we are facing on the home front. Apart from the difficulty in securing adequate supplies of oil on a short term or long term basis, the most serious problem for the country as a whole is the severe drain on the country's foreign exchange earnings. This major development has rendered the outlook for the future neither bright nor even clear and India, along with most other nations, has no alternative, but to tighten its belt and take all possible measures for the conservation and cautious utilisation of available energy resources. The Automobile Industry in particular will be very much affected by this turn of events in the international scene. I have no doubt our Government is fully alive to this problem, although it is rather too soon to envisage the precise measures that will be introduced to tide over the crisis.

TURNOVER AND PROFITABILITY

You will note from the Profit and Loss Account that sales for the year 1972/73 amounted to Rs 48 crores, which is a substantial improvement over the performance in the previous year. It is gratifying that this increased turnover could be achieved despite the prolonged power cut in our State. This has been possible largely because of the sustained production at the optimum level in the last quarter of the year. Despite this improvement in sales turnover over the previous year, the net surplus, after payment of all expenses and taxation, was only Rs 108 lakhs, which represents only 2.2 per cent of the turnover. (The corresponding figure for 1971/72 was 2.4 per cent and for 1970/71 2.5 per cent.) A total of 5,230 chassis were sold during the year. You will be glad to know that despite severe shortages of raw materials and ancillary items, we have produced and sold almost 2,300 vehicles in the first 4 months of the current year, which is an all-time record. Whether we will be able to maintain production and sales at this level is a moot point, particularly in view of the ever increasing problems of obtaining the necessary supplies of raw materials and bought out components, etc. It is interesting to note that our Company places a far higher percentage of its requirements with ancillary industries than any other. We continue to increase the indigenous content of our models and are in fact as far as possible increasing the pace of our work in this area.

DIVIDEND

You will be glad to know that your Directors have decided to recommend a dividend of 12½ per cent for the year. Whilst we appreciate that this rate of return is only slightly above what can be obtained from investment without any risks involved, we feel sure you will appreciate the fact that it is a considerable improvement on past dividends. Whilst on this subject, I would like to dwell briefly on prices and profits.

SELLING PRICES

The Commercial Vehicles Industry plays a vital role in fostering economic growth. Due to various constraints, the production of commercial vehicles in the country is rather limited and only ourselves and one other manufacturer are producing at over 80 per cent of the installed capacity and their products are also in great demand. Current levels of production simply cannot meet the demand; there is, therefore, urgent need for increasing the production of all manufacturers. In this context, I was happy to read recent Ministerial pronouncements that the Government is keen that investments already made in this key sector of our economy must be allowed to earn reasonable returns. This industry is conscious of its vital role and has expressed its willingness to evolve a price discipline on its own, which could be self adjusting and self enforcing.

At the same time it should not be forgotten there is an upward spiralling of prices of every conceivable item used in the Automobile Industry such as steel, copper, aluminium and other non-ferrous metals, forgings, castings, etc. In India, as in the western countries, the Automobile Industry is dependant on a large number of ancillary suppliers. Therefore, unless there is an all-round price discipline, it will be extremely difficult to hold the price of the end product alone. These matters are currently under discussion with the Ministry of Heavy Industry and the Bureau of Industrial Costs and Prices. I sincerely hope there will be a satisfactory solution to this problem which, while providing a certain amount of price stability and consumer assurance, will leave adequate 'retained surplus' to be canalised for the long overdue replacement of old equipment in a progressive manner and also to plan investment on plant and machinery for increased production.

EXPANSION

I am glad to inform you that the Company has received an Industrial Licence for expansion of the Comet Vehicle production to 10,000 Nos per annum and the Company is already taking active steps for providing the requisite buildings and additional plant and machinery to achieve the expand-

ed output in the shortest time possible. It is hoped that the Company's request for import of capital plant and machinery, valued at Rs 150 lakhs approximately will receive Government's sanction under the simplified procedure and within the target period set by Government for processing such applications. To finance this major expansion of our facilities, it is imperative that we are permitted to ensure reasonable levels of profitability, consistent no doubt with fair and practicable utilisation of installed capacity.

EXPORTS

Our exports have not touched a satisfactory level during the last two years, mainly because of the uncertainties in production arising from the prolonged labour dispute in 1971/72 and the severe power cut last year. Nevertheless, the Company is fully conscious of its responsibilities towards maximising exports, particularly in view of the oil crisis and the high drain of foreign exchange arising therefrom. Your Govpany has given an undertaking to Government of India to export at least 10 per cent of the additional output of Comet vehicles, under the expansion scheme, and in order to fulfil this commitment the Company is already taking measures to explore the markets in South-East Asia and African countries. In this task, Messrs British Leyland Motor Corporation have assured us of maximum co-operation and their global contacts as well as net-work of Agencies in these countries will be available to us. The response so far has been encouraging and apart from current negotiations for substantial orders from Singapore, Hong Kong and other neighbouring countries, we already hold orders for more chassis than were achieved in the whole of last year. I would however like to mention that our export performance in 1970/71 was good enough to secure the Government of India's Export Promotion award and I recently had the pleasure of receiving the award from Government for our outstanding export performance.

ACKNOWLEDGEMENT

Mr R R Jones resigned from the office of Managing Director on 13th September 1973, on completion of his term of appointment, and has taken up another assignment with British Leyland in Australia. I would like to place on record our appreciation of the valuable services rendered by Mr Jones during his tenure of office.

I am glad to inform you that our collaborators, Messrs British Leyland Motor Corporation, have made available the services of Mr R J Hancock for appointment as Managing Director of this Company for a period of two years in succession to Mr Jones. Prior to joining us, Mr Hancock was a Director of the Special Products Division of British Leyland in the United Kingdom. I am confident that with his background and valuable experience, he will make a substantial contribution towards further progress of the Company and the speedy implementation of the expansion programme.

I am grateful to our collaborators, British Leyland Motor Corporation, for their continued guidance and active assistance in the development of the Company, which will be required in greater measure for the implementation of our expansion programme.

I would like to take this opportunity to convey our sincere thanks to the Central and State Governments for their encouragement and support and also the Financial Institutions, and our Bankers for their continued support in the day-to-day operations and advancement of our business.

I would like to express our appreciation of the loyalty and co-operation of all our employees which has made a significant contribution to the satisfactory results we have been able to achieve this year.

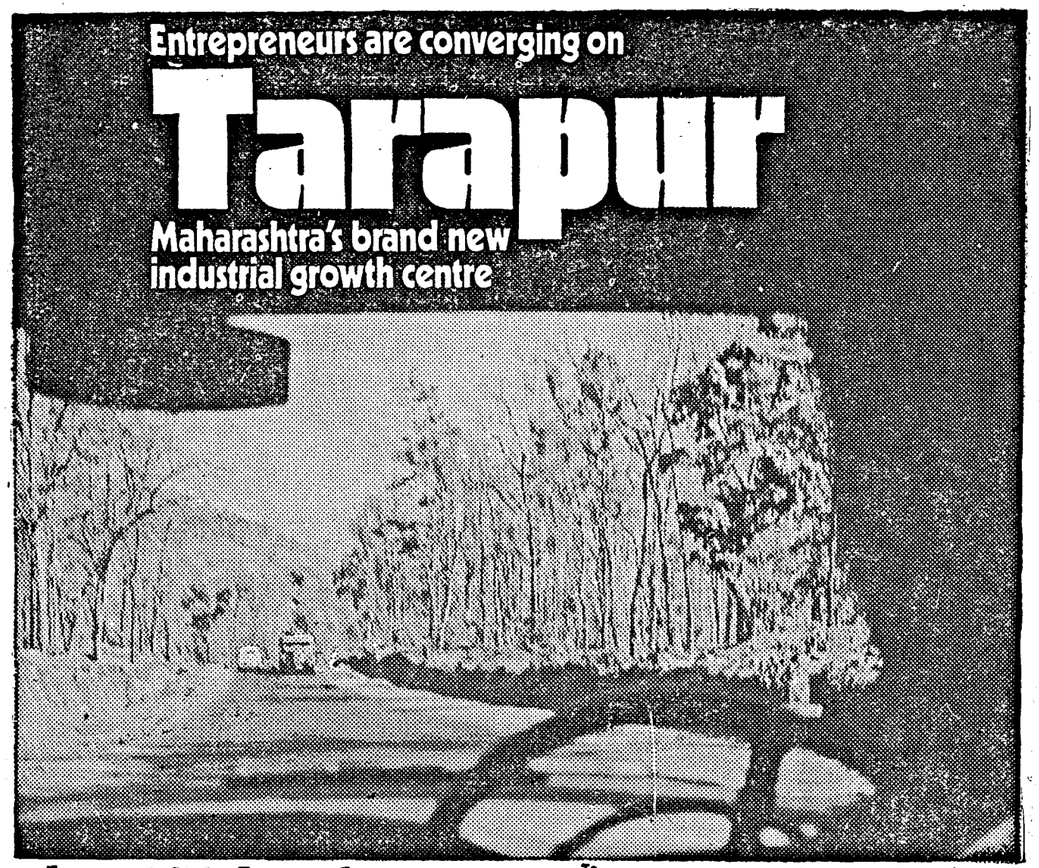
Finally, we must not forget the gratitude due to all our Dealers who are the people who finally sell our products.

In conclusion, on behalf of the Board of Directors and myself, I would like to convey our sincere thanks to the Shareholders for the continued support and confidence they have placed in us

Note : This does not purport to be a record of the proceedings of the Annual General Meeting.

Industrial Countries' Reserves Decline

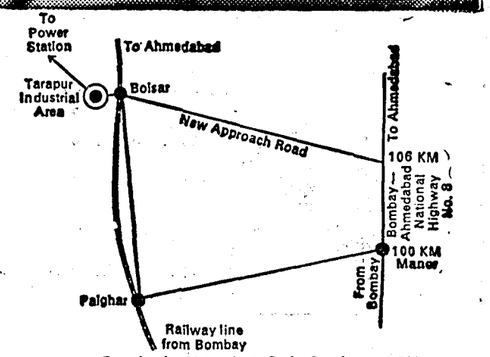
TOTAL international reserves of industrial countries declined to the equivalent of SDR 91.5 billion at the end of January 1974, from SDR 98.6 billion at the end of October 1973. While it may be too early to attribute these reserve losses substantially to the price increases for oil imports, they do reflect the growing weakness in the balance of payments of a number of important industrial countries.



For industrial Europe, international reserves fell from the equivalent of SDR 64.63 billion in October to SDR 59.86 billion in January. West Germany's reserves decreased from SDR 29.04 billion to SDR 26.66 billion, France's from SDR 8.40 billion to SDR 6.87 billion, Switzerland's from SDR 6.10 billion to SDR 5.72 billion, the Netherlands' from SDR 5.22 billion to SDR 4.89 billion and Italy's from SDR 5.12 billion to SDR 4.98 billion.

Significant reserve losses were also registered by Japan, from SDR 11.65 billion in October 1973 to SDR 9.59 billion in January 1974, and by the United Kingdom, from SDR 5.60 billion to SDR 5.12 billion. The international reserves of the United States remained largely unchanged, being SDR 11.91 billion in October and SDR 12.07 billion in January.

The changes of international reserves were almost entirely restricted to movements in foreign exchange, where industrial countries' holdings declined from the equivalent of SDR 57.72 billion at the end of October 1973 to SDR 50.69 billion at the end of January 1974. There was hardly any change in the other reserve assets; the gold holdings of industrial countries remained near SDR 29.76 billion throughout the period under review, the SDR holdings near SDR 6.6 billion, and the reserve positions in the Fund near SDR 4.5 billion.



Exports of the industrial countries reached an annual rate of US 429 billion (f o b in the fourth quarter of 1973, up 13.0 per cent from a seasonally low rate of $ 379.5 billion in the third quarter of 1973 and 38.2 per cent from the $ 310.4 billion rate recorded in the fourth quarter of 1972. For all of 1973, the exports of industrial countries are estimated to have totalled $ 374 billion, an increase of 35.7 per cent over the $ 275.6 billion of 1972 and 60.5 per cent over the $ 233 billion of 1971.

The United States' exports, after growing by only 12.8 per cent from $ 44.1 billion in 1971 to $ 49.8 billion in 1972, jumped by 43 per cent to $ 71.3 billion in 1973. West Germany's exports increased by 44.6 per cent to 67.5 billion in 1973, those of Japan by 28.9 per cent to $ 36.9 billion, of France by 38 per cent to $ 36.6 billion and of the United Kingdom by 25.5 per cent to $ 30.5 billion.

just 100 km from Bombay Airport

Over 30 entrepreneurs have already selected MIDC's Industrial Area at Tarapur for their new ventures. Many more are moving in. Why?
Apart from the proximity to Bombay, Tarapur offers these important advantages:
level land in MIDC Industrial Area (which means low development cost)
adequate water from MIDC's Surya River Water Supply Scheme
power supply from new 132/11 KV sub-station of MSEB
developed ancillary base nearby
location near the sea enables economical effluent disposal
round-the-year goods transport facilities by rail and road, including four train connections with Bombay every day
urban amenities, such as industrial housing, cinema, a bank, shopping facilities for daily needs
in addition: SICOM's varied financial support and project implementation services, and the Maharashtra Government's Scheme of Incentives.

SCIENCE: HOW MUCH AUTONOMY?

MONETARY POLICY WINDOW-DRESSING

Soon you'll have an even better reason for flying Swissair.

Our splendid, wide-bodied DC-10-30s are arriving in April.

From April, you'll find our Swisscare even more enjoyable... because you'll experience it aboard our new DC-10s. Although they're almost as wide inside as the 747s, they fit one less passenger into each row of seats...giving you plenty of elbow-room. Seated, you can rent earphones and listen to eight different stereo programmes or watch the latest colour films.

You can fly on our DC-10s three times a week to the West, or three times a week to the East, from Bombay. Three other westbound and three other eastbound flights weekly will be served by our tried-and-true DC-8s.

SWISSAIR

For particulars, call your IATA travel agent or the nearest Swissair office:

A New Script

THE tripartite meeting scheduled in New Delhi in the first week of April can now be only a ritual. With the recognition of Bangladesh by Pakistan and of Pakistan by Bangladesh, and the hugging and kissing for the benefit of the TV cameras in Lahore, a chapter is ended in the affairs of the sub-continent. The government of India has to put on a brave face and accept the shifts the political relationships now in the offing.

Whatever gloss may be sought to be put upon it, what happened at the Islamic Conference does not at all conform to the script envisaged by the Simla Agreement of July 1972. Pakistan recognised Bangladesh, but not in terms of the time-table set at Simla; it chose its own time and its own emissaries to convey the tiding to Dacca. The decision to recognise Bangladesh did not emerge as the end-product of a tripartite arrangement. India's role was played out, and it was left to the brotherhood of Islam to bring about the final act of reconciliation between two essentially Islamic countries. New Delhi may continue to claim the plaudits for this culmination, but even in Bangladesh, New Delhi's claim is likely to evoke derision.

On the face of it, the recognition by Pakistan of what was once its eastern flank as a sovereign independent nation is without strings; but President Sadat has not left anybody in doubt that Sheikh Mujibur Rahman has agreed to waive his right to put on trial the 195 Pakistani prisoners of war. The Sheikh's sudden predilection to dilate on the theme of Bengali magnanimity is much too transparent a ploy; even without the Sadat statement, it would hence have been possible to form a fairly reliable idea about the nature of the deal struck behind the scenes.

One can therefore merely sit in retrospective judgment on the wisdom of the Indian negotiators who chose to drive such a hard bargain with Bhutto twenty months ago in Simla. True, around July 1972, the atmosphere was still somewhat surcharged, and any proposal for dropping the trial of the prisoners might have provoked a hostile reaction in Bangladesh. But there are ways and ways in which a particularly awkward clause in an international agreement can be made saleable; with some persuasion on the part of India, the leaders of Bangladesh could perhaps have been made to fall in line. Were this gesture then forthcoming, Bhutto should have found it possible to recognise Bangladesh straightaway; in the afterglow of that achievement, even the disagreeableness of the fact that prisoners of war accused of the most heinous crimes would go scot-free along with the rest might have been put up with.

The April meeting in New Delhi is to put the formal seal on precisely such a decision. Since the terms have already been tacitly agreed upon between Pakistan and Bangladesh, the government of India will have little room for residual manoeuvres. Meanwhile, Bhutto has been able to consolidate substantially his domestic position. This is as much on account of his economic successes as because of his ability to hold his own in external negotiations. In Bangladesh too, Pakistan has ceased to be the devil it was two years ago. Much of the popular wrath engendered by the spiralling inflation is currently being directed at India.

The fact that recognition came Bangladesh's way through the intermediary of the brothers of Islam would clinch the point that blood, despite the unfortunate events of 1971, continues to be thicker than water. It is now only a matter of time before Pakistani goods, including wheat, fine varieties of rice and cotton cloth and yarn, start flowing into Bangladesh and the latter in its turn sends to Pakistan its surplus supplies of tea and paper. The allegedly unfair competitive practices indulged in by India would, one feels almost certain, henceforth be increasingly referred to by the exporters of jute in Bangladesh. That India has proved to be a generally unreliable supplier of even such commodities in which it is allegedly surplus, for instance, coal, is likely to be incessantly harped upon.

Whatever has happened has happened. The limited objective in New Delhi's policy-making should now be to concentrate on ensuring that, while Bangladesh ceases to be a close friend, at least it must not be provided with the opportunity to turn into a difficult neighbour. For one thing, the government of India must abdicate, once and for all, its ambition to play a special role in Bangladesh. Gratitude is a brittle currency and New Delhi would only make itself more vulnerable if it tries to rub in the fact that, without Indian sustenance, the liberation of Bangladesh could have been a long drawn-out affair. It is pointless to talk in terms of an ideological affinity with that nation either, because the variant of parliamentary democracy

which Sheikh Mujibur Rahman is practising owes little to India. In the course of the past two years, the regime in Bangladesh has exhibited a quality of *pragmatism* which will increasingly draw it away from the snare of Indian neighbourliness. The programme of the Awami League has all along been marked by a robust opportunism and from the point of view of both economics and politics, Zulfiquar Ali Bhutto now has more to offer than Indira Gandhi. In this circumstance, the Sheikh's thoughts are bound to gravitate increasingly toward Islamabad. Having refused during all these months to set up a bargaining counter *vis-a-vis* the Sheikh, the government of India is now left with but little option in Bangladesh. What is more, the continuous harping on the part of the Indian leaders, including Indira Gandhi, that much of their domestic economic difficulties are on account of the Bangladesh war, can only add to the irritation of the people across the border. And, finally, Farakka has already begun to cast its shadow.

Gold

Pampering a Barbaric Relic

THE sudden turn-round in the fortunes of gold has served to emphasise once again how illogical, even insane, the functioning of the international economic system often is. Some months ago when the dual gold market arrangements were ended, the free market price of gold had sunk to almost half its present level. Even the most enthusiastic champions of gold, who want restoration of the medieval gold standard era, could not have imagined then that the price of gold would shoot up in the manner in which it has in the last three months. In the London market gold was quoted at $ 90 per ounce on November 23, 1973; it stood at $ 178 per ounce on February 27, 1974.

The speculators' hold on the gold market which had seemed to weaken in the latter half of 1973 appears to have been strengthened once again. Though the gold price has now come down slightly to around $ 160-165 per ounce, there is talk that by the end of the present decade it will touch the stupid level of $ 1,000 per ounce. It is well known that France and South Africa are behind the powerful gold lobby. But it is surprising that the other Common Market countries should have been persuaded to consider putting gold to monetary use by allowing transactions in it at market-related prices.

The price of gold — whether the official one or the free market one — is a completely artificial price. The commercial demand for gold cannot absorb even 50-60 per cent of the current production. All through the last two centuries the importance of gold has been related to its monetary use. The major stocks of gold are still with the very monetary authorities who have completely dispensed with use of the metal for domestic monetary purposes. During the last year, it is true, speculators have absorbed almost all the gold that was produced. But it is difficult to understand why monetary authorities should play into the hands of the speculators and agree to raise the official price of gold in step with the market price when it is known that the latter is a highly artificial price.

The current difficulties, which have led to almost the shelving of plans to prepare a blueprint for monetary reform, present a good opportunity for slowly demonetising gold. Some central banks have been dissuaded from selling gold on the market by the fear that the Arabs would step in to purchase gold in a big way. The oil exporting West Asian countries are expected to accumulate huge balance of payments surpluses amounting to nearly $ 40-50 billion per annum over the next decade or so, until their demand for imports gradually rises to match their oil-earnings. Such large surpluses will in all probability tempt these countries to purchase gold. However, it is precisely this near-assured demand which makes it a sane proposition for the industrial countries to gradually unload their huge gold holdings on the markets over the next couple of years. This would not only help them to reduce the serious payments deficits which they are likely to face but would also be the best way of disposing of a barbaric relic.

IAS and IPS

Blood Brothers

OVER the weekend in New Delhi the chief ministers will be meeting in concord; the Political Affairs Committee of the Union Cabinet will also be meeting. Both will be discussing the food situation in general and the higher procurement price suggested for wheat by the Agricultural Prices Commission (APC). In neat juxtaposition they will also be discussing changes in the majority report of the Third Pay Commission with a view to narrowing the disparities between the Indian Administrative Service and the Indian Police Service.

It is already perfectly clear that the chief ministers are not satisfied with the higher wheat procurement rates recommended by the APC. These rates have now been raised to between Rs 90 and Rs 100 a quintal for different varieties; last year the recommended prices were between Rs 75 and Rs 85. The chief ministers will be demanding yet higher rates to satisfy their main financial and political backers, the big farmers. The excuse continually trotted out for raising procurement prices is that an incentive must be offered to the big farmers to encourage them to sell their produce to the government. But in practice, of course, more money will be made from direct sales to government and yet more money will be made through yet higher prices manipulated by perpetuating the shortages on the 'free' market. To placate that other winsome backer of the Congress party, the grain trader, the still-born wheat trade takeover will now be given a quiet burial.

But while the rich farmers and traders may temporarily be placated by these helpful measures, what is the likely reaction of millions of consumers of foodgrains going to be to the continued shortages and yet higher prices of these basic items of food? No doubt the chief ministers far-sightedly are also taking precautions against the possibility of unseemingly hungry mobs running amok. Thirteen chief ministers have already suggested that the IPS should be drawn up to a level almost on par with the IAS in its pay scales and status. The chief ministers have reportedly emphasised the increasingly 'onerous responsibilities' of police officers.

Some chief ministers favour complete parity between the IAS and IPS. The Madhya Pradesh Chief Minister, P C Sethi, has publicly expressed this view. But the majority of chief ministers being more realistic, realise that this would be rocking the bureaucratic boat. The top dogs in the bureaucratic hierarchy — the IAS — are not likely to take kindly to another service, the IPS, being raised up to their pay scales and status. Already in West Bengal, IAS officers have protested openly and vociferously against the appointment of an engineer as the Chairman of the Electricity Board, a position traditionally held by an IAS officer. Moreover, it can well be argued that IAS district officers are today as involved in maintaining law and order as are the IPS officers, particularly since the development funds are

dwindling and the people are getting more restless. In this sort of situation the IAS may well agree to the status of the IPS being raised up to a level just below itself but not quite on par.

The chief ministers have already sensed this attitude and are quite firm that no other class I services should be given the same boost as the IPS. They have turned down the demands of other class I services for narrowing the disparities between them and the IAS. The entire *raison d'etre* of the hierarchical bureaucratic structure would disappear if there were no clear stratification between — and within — the government services. But at the same time, compromises must be made to maintain the solidarity among the ruling politicians, the IAS, the IPS, wealthy farmers, and rich traders — and to maintain law and order.

T T Krishnamachari

Wizard in the Gallery

HERE was an unusual man. An educated businessman — one did not come by many like him in his generation — who went into politics early in his life, but there too never really fitted into the usual pattern. If he made the grade in politics, it was less because he had mastered the arts of politics and more because of what he was : a brash, bright person with an ample fund of bravado. That was also possibly why he did not endure long in politics.

TTK was no economist, certainly not in the accepted sense of the word. But his two spells as the country's Finance Minister will be remembered. His total tenure in the Finance Ministry did not add up to more than three years and a half. Still of all the Finance Ministers past and present, TTK stands out, mainly because he was unafraid of experimenting with new ideas.

His introduction of new taxes like those on capital gains, wealth and expenditure has to be seen in this context. Here was Nicholas Kaldor whom C D Deshmukh had invited to come and advise the government on tax reform. But Deshmukh, cautious as he was, had got Kaldor to come to India on an invitation not from the Ministry of Finance but from the Indian Statistical Institute of which he was the chairman. It remains a mystery how, in fact, Kaldor eventually came to sumbit his report to Deshmukh in his capacity as Finance Minister. However, Deshmukh resigned soon thereafter. It is tempting to speculate how promptly, if at all, Deshmukh would have acted on Kaldor's tax reform proposals.

As for TTK, he introduced the capital gains tax through a supplementary Budget within two months of his induction as Finance Minister in September 1956. In the regular Budget that followed, he was ready with his, diluted, versions of the wealth and expenditure taxes. It is doubtful if TTK even met Kaldor when the latter was in India on this particular mission.

The way TTK responded to Kaldor's report brought out the innovator in him. It may be recalled that while Kaldor conceived of a wealth tax purely as a personal tax, subjecting companies also to the wealth tax was TTK's idea which Kaldor subsequently endorsed. It is a matter of argument whether the manner in which he diluted Kaldor's proposals is to be ascribed to TTK's realism or lack of commitment to egalitarianism or to an irresistible urge to put his own stamp on things. Nevertheless he left a mark on the Indian tax system through all the various measures — not just the Kaldor reforms — that he authored during his stewardship of the Finance Ministry.

Despite this, or perhaps because of it, TTK did not endure long as Finance Minister. But for Nehru's tenacity, his political career could well have ended when he was forced to resign almost on the eve of the 1958-59 budget on an issue which did involve a question of propriety and where TTK could not disown his own responsibility. Nehru succeeded in inducting him back first into the Cabinet and then into the Finance Ministry, but only after a gap of some five years. By then Nehru's health was failing him.

What lost TTK the position he had regained is a subject of speculation. That he did not get along as well with Shastri as with Nehru may be true, but that need not have caused him to resign. Could it be that it was his own impetuosity rather than Shastri's lack of confidence in him that brought things to a head? Whatever made him resign then, what prevented Indira Gandhi from recalling him? To many he did seem the answer to her search for a financial wizard. Had she recognised him as such, it may not have made a great deal of difference to the economy whose current problems go far beyond the reach of financial wizardry. But TTK would have died more fulfilled.

Maharashtra

The Maratha Revolt

Our Maharashtra Correspondent writes:

CHIEF MINISTER V P Naik is facing yet another challenge to his leadership. It is ironical that trouble within his own party should have broken out just when it had seemed that he had scotched the attempts of the opposition parties to jointly launch a mass agitation against his government.

Unobtrusively, but effectively, Naik was able to give a non-Maharashtrian vs Maharashtrian twist to the agitation threatened by the opposition parties. In this he was supported by the Shiv Sena. He was able to successfully convert the mass popular discontent into a linguistic issue and to suggest that the so-called 'thali beating' agitation last month had been launched under the inspiration of 'Gujarati capitalists and vested interests' with the objective of detaching Bombay city from the rest of Maharashtra. This was exploiting the Maharashtrians' memories of their bloody struggle for including Bombay in the unilingual state of Maharashtra in 1956.

The strategy paid off; the opposition parties and their leaders, afraid of being dubbed anti-Maharashtrian, quietly withdrew their agitation against the price rise and in support of a ration quota of 12 kgs of foodgrains per adult per month. Of course, it is a reflection of the weakness of the opposition parties that, despite the acute hardships suffered by the working class and by the lower middle class, they were unable to rebut the government's false propaganda.

While he has thus kept the opposition at bay, Naik's undoing has been his attempt to promote the political fortunes of some of his close political and personal associates. He had already managed to induct Jawaharlal Darda, who hails from his home district of Yeotmal, into the Legislative Council. Darda is the chairman of the Maharashtra Housing Finance Society and there have been allegations about his deals with housing and construction societies in Bombay and elsewhere. Naik then proceeded to include N K Tirpude, a Harijan and former Cabinet Minister, among the Congress candidates for the biennial elections to the Legislative Council on March 26. Evidently, it was Naik's plan to eventually bring Tirpude back into the Cabinet.

As soon as the decision to nominate Tirpude became known, Naik's adversaries in the party — particularly Vasantrao Dada Patil, number two in the Cabinet, Y J Mohite, Minister for Co-operation, P K Sawant, Pradesh Congress President, and Sharad Pawar, Minister of State for Home — told him that Tirpude's nomination was not acceptable to them. But Naik

proceeded with his plan and got Tirpude's nomination approved by the Central Parliamentary Board. On his return to Bombay, Sawant, Vasantrao Patil and Mohite threatened the Chief Minister with a revolt in the Congress Legislature Party. They also informed the Prime Minister that if Naik insisted on Tirpude's nomination, he would have to face not only the possible defeat of Tirpude in the election but also a split in the hitherto united Congress party in Maharashtra. The Prime Minister, never very favourably disposed to Naik, asked the Congress President, Shankar Dayal Sharma, to cancel Tirpude's nomination.

The fiasco of Tirpude's nomination is a major setback for Naik, for his opponents were using the issue to prepare the ground for his ouster from the Chief Ministership. The withdrawal of Tirpude's nomination is being used by them to convince the fence-sitters in the Congress Legislature Party that the Prime Minister is not averse to a change of leadership in the state. Y B Chavan's discreet silence over the issue is similarly taken to suggest that Naik no longer enjoys his support as he used to.

The campaign against Naik appears to have been carefully planned. Its sponsors have taken every care to see that, unlike in the case of the move to oust Chimanbhai Patel in Gujarat, the party does not get divided over the issue. With very few exceptions, there is complete unanimity among the politically and numerically dominant Maratha Congress legislators on the question. What is less certain is that this unity will be maintained over the question of choosing Naik's successor. In fact if Naik manages to stay on for a while yet it will be because of differences over the question of succession. Similar differences, it will be remembered, had earned a reprieve for Naik in 1971 when Shankarrao Chavan had staked his claim to the Chief Ministership.

Sugar

A Matter of Irrelevance

THE current sugar season is in its sixth month. It had opened on a note of abundance in contrast to the 1972-73 season. Sugar production had increased by almost 7 lakh tonnes in 1972-73 and initial forecasts placed production this year at 4.5 mn tonnes. On the basis of such optimistic forecasts, pressures were mounted on the government for making large exports and for reducing the excise duty. On February 20 a spokesman of the co-operative sugar factories placed production at 4.4 mn tonnes and exhorted government to restrict domestic consumption to 3.5 mn tonnes and export 9 lakh tonnes. He also urged that the excise duty on free sugar should be cut from Rs 105 per quintal to Rs 30 per quintal. The government, when it considered the sugar situation on February 27, placed the likely output at 4.3 mn tonnes. It decided to watch the situation carefully and promote exports to the maximum.

Subsequent reports have suggested that sugar production this year may not exceed 4 mn tonnes. Production upto the end of February was 25.19 lakh tonnes which was 1.4 lakh tonnes lower than the production during the corresponding period of the last season. There have been no convincing explanations of the decline in sugar output. Reports from the north at any rate indicate that factories are getting ample supplies of cane.

In recent years consumers have been made to pay high prices for sugar by industry and the government irrespective of the level of production. In 1971-72 sugar production declined from 3.7 to 3.1 mn tonnes. The annual average price rose by about Rs 100 to Rs 280 per quintal. In 1972-73, production improved and touched 3.87 mn tonnes. The annual average prices, however, rose further to Rs 395 per quintal. In December 1973 the prices in the Bombay market were around Rs 420. Currently they are around Rs 410. Inspired reports of lower production, larger exports, rise in excise duty and increase in tariff value had kept the price of sugar firm.

In the event, the Budget has not touched sugar; the tariff value has also remained unchanged. Nevertheless, not only have the prices not declined but there has been some further rise in them in the northern markets. The sugar mills are hesitant sellers and speculators are active buyers. It is perhaps irrelevant to blame the mills and the traders for the level of sugar prices. The government is very much a party to their nefarious game.

American Academics

Charity Begins at Home

Dhirendra Sharma writes:

THERE has been strong — and justified — criticism in the United States, particularly in some sections of the press, about the Government of India's attempts at restricting the flow of US scholars. All sorts of motives have been ascribed as reasons for this restrictive attitude, including US policy over Bangladesh in 1971.

Whatever the reasons for the official Indian attitude, it is about time the more thoughtful sections of the American press and academia began to examine their own country's ludicrously archaic policies regarding entry of foreign scholars or, for that matter, ordinary visitors into 'the promised land'. Open door policies must be reciprocal. The US Government, however, ensures that no foreign scholar critical of American political sensibilities enters that country. A foreign applicant is required to disclose information about his political beliefs and declare his membership, if any, of national and international organisations. If the applicant has been to a communist country or ever been associated with a leftist organisation, the US Government generally refuses to grant even a tourist visa. For example, Professor A L Basham, the noted British orientalist and author of "The Wonder That Was India", was denied entry because in the depression years of the 1930s he had belonged to a leftist movement. The Mexican novelist, Carlos Fuentes, has continually been refused transit visas for passing through US territories, due to his leftist writings. Professor Bhagwat Sharan Upadhyaya's visa was revoked by the US Consulate in Paris because in Calcutta he had signed a note against American involvement in the Vietnam war. Professor Upadhyaya, who is a well known authority on ancient Indian history and culture, was *en route* to Ann Arbor to attend the International Orientalist Congress. The assembled American orientalists hosting the Congress at Michigan University did not protest against their government's treatment of an Indian colleague, even though many of them had enjoyed Indian hospitality on several occasions.

Compared to this American orthodoxy, India's entry rules are most liberal. Indian embassies and consulates abroad never ask any American scholar or visitor whether he has ever criticised India's Kashmir or Nagaland policies or whether he has ever visited South Africa, Portugal or Rhodesia, with whom India has no diplomatic relations. Nor do Indian officials enquire whether the American applicant has belonged to the Ku Klux Klan or the John Birch Society. Whereas American scholars openly critical of India and its policies are usually allowed to come here without any fuss, Indian scholars even slightly critical of US policies are brusquely debarred from entering the United States.

The resumption of an open door policy must begin in Washington.

Calcutta Diary

A M

THE democratic process marches on. In the columns of a Calcutta newspaper, letters from assorted readers, offering comments on the relative rates of economic growth in this country and, predictably, China, receive the pride of place. Ah, well, some of these letters are found to grunt, the Chinese might have made better material progress, they might have more to eat, better education and better health, but they have no freedom of expression, they do not have any democracy. Count your blessings, here in India the democratic process marches on. We still can call a skunk a skunk, and get away with it. We can choose, through the exercise of the free vote, our own representatives.

Are Elections Free?

Can we really? Are elections, everywhere in the country, free, unfettered, without interference or hanky-panky on the part of x, y or z? Why don't you, for a change, visit West Bengal? It is wearisome to return to the theme, over and over again. To an outsider, the allegations persisted on by opposition groups about the rigging of elections in this state might appear to be extraordinarily grotesque. The Chief Election Commissioner, very correct, was heard to remark that the kind of extensive vote-tampering alleged to occur in West Bengal is not 'mechanically possible'. The problem one faces is genuine, how does one cross the frontiers of credibility? India, mind you, is an honest parliamentary democracy; stray instances of monkey-business might occur during an election; some tendering of false votes, which mutually cancel out, or some similar subterfuge, is indulged in by nearly all candidates, or at least by their supporters. But the wholesale skulduggery alleged to have taken place in West Bengal — and repeated in the three by-elections last month —, boggles the imagination. And what does not fall within the immediate pale of one's experience is in danger of being ignored. The difficulty lies — didn't John Maynard Keynes say a long while ago — not in new ideas as such, but in getting rid of the old ones. Elections, according to the tepid bourgeois concept, are gentlemanly affairs, in the nature of almost friendly contests. The aberrations from gentlemanliness which have occurred in West Bengal are not covered in the lexicon. It is a common weakness, not to confess one's ignorance. The defence mechanism is therefore set in motion: Who says the elections are rigged; they are all right even in West Bengal.

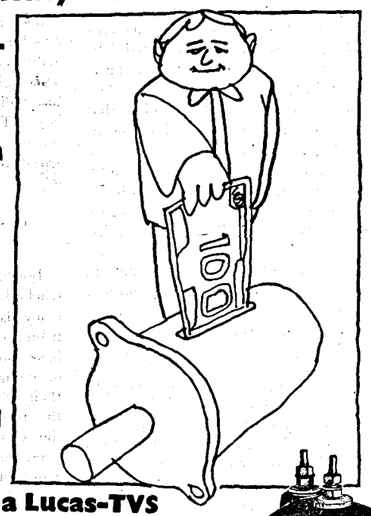
Still, the facts stick out, and should give a queasy feeling. The Congress, according to the Election Commission, was returned with a massive majority in the West Bengal Assembly elections in 1972: on its own, it captured 216 of the total of 280 seats; its poll partner, the CPI, collected 36 seats. The opposition parties, which included that ogre, the CPM, were reduced to smithereens. The Prime Minister's magic wand finally did the miracle. Exactly a year ago, the CPM, along with its close adherents, had secured as many as 125 seats. Now, all those seats disappeared. The CPM's tally was reduced to a bare 13 seats. A revolution, but exclusively brought about through the ballot; so shouted the over-excited newspapers, not quite believing their good fortune.

You can keep on buttonholing people, earnestly telling them that the so-called election held here in 1972 was a sham and a hoax. Outside the state, there will be few takers. And yet, as they say, the record has to be set straight. Things happened in 1972, and again in the three by-elections last month, which cannot be even remotetely reconciled with concepts of parliamentary democracy one has read and heard about.

Threats

Consider the following. Ferocious-looking toughs, armed to the teeth, waving the Congress tricolour, and chanting the Prime Minister's name, visit each household in a particular area and inform the inmates that, on poll day, they will all be curfew-bound; if they so much as dare to stir out before five o'clock in the afternoon of that day, their houses will be burnt down and their limbs will be dissociated from their torsoes. On election day, similar-looking toughs, with sten-guns and daggers slung along their sides, closely scrutinise the assembly of people queueing up to vote outside the booths: whoever does not pass his/her test of personal satisfaction is pushed out of the queue and ordered to go home: these should not worry however; their votes will be taken care of by the toughs themselves. Another few hours pass, the polling agents of the opposition candidates are driven out of the booths, voters still waiting outside are curtly told that, even though it may be only 12 noon, the polling was over and they might as well enjoy a good day's rest. The crowd soon melts away, peace descends on earth. The presiding and polling officers look on — they, for dear life, can hardly do otherwise. The so-called printing press is swung into action. Sheaves of ballot papers are taken charge of by the hoodlums, the crossed mark is systematically rubber-stamped against the name of the Congress candidate, and the ballots are shoved into the ballot box. The job done, the presiding officer is asked to append the appropriate signatures, seal the box, and despatch it.

Obviating the Trials and Tribulations

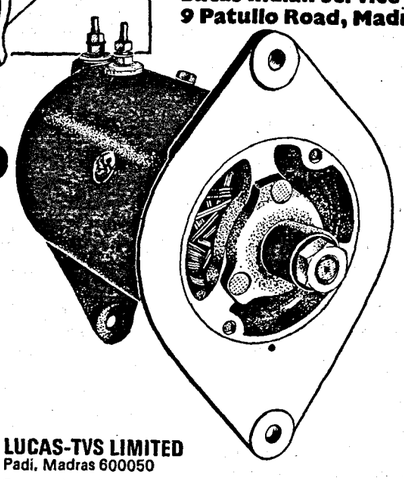


Bourgeois democracy has obviously reached a higher plane here. Democracy is for obviating the trials and tribulations of the people. The people have now been saved the tribulation of going to the polling booth to cast their votes. The thugs belonging to the ruling party have taken charge of the chore. Your suffrage having thus been compulsorily transferred to the gangsters, you can opt out of your obligations and responsibilities. The printing press will see to it that your vote is cast in the proper manner. There is, of course, the silly formality that a voter is suposed to sign — or affix his thumb impression — when receiving the ballot paper. Writing signatures, particularly other people's signatures, can be a time-consuming process, and the point of the printing press is that it can ensure the victory of the ruling party even before it has struck high noon. Thus, as some of the hoodlums mark the ballots with the rubber-stamp, a few of their colleagues are busy affixing their thumb impressions against the names of voters in the electoral list. Thumb impressions, in any case, have an inert, look-alike appearance; so no questions need be raised by anybody, and certainly not by the Chief Election Commissioner. And don't feign surprise if you are told that a number of Ph Ds in West Bengal's various constituencies, while receiving the ballot paper, failed to sign their names and only appended their thumb impression:

BEFORE YOU PUT YOUR MONEY IN A DYNAMO, SEE HOW FAST YOU CAN GET IT BACK...

The Lucas-TVS dynamo is the highest value for your money. Because each one of its several components is precision-made from top-quality material. Components that should withstand heavy stresses have been designed with extra care. So you get extra life out of them. Proven manufacturing techniques also ensure that breakdowns are minimised.

Which is why over 70% of Lucas-TVS products are used as Original Equipment.



And should one of the many components of a Lucas-TVS dynamo ever need replacement, ensure that you fit only a genuine Lucas-TVS part. Because the Lucas-TVS products you buy are perfectly matched to the needs of every make of vehicle. And each one of them carries a 6-month guarantee against any manufacturing defect!

Compare these advantages of Lucas-TVS dynamo with any other. You'll see there's no comparison.

most Ph Ds, who does not know, are illiterates.

This is not rigging: this is highway robbery, and has produced situations which mock all the known and unknown laws of probability. For example, going by the record of the serial numbers of issued ballots, in many booths voters have cast their votes exactly in the same sequence in which their names occur in the electoral list. It will be altogether tiresome to quote the scores of instances where the printing press has pre-empted the democratic process. But a cursory mention of what happened in the constituency of the most prominent communist leader in these parts will suffice. The constituency of Baranagar, in the northern outskirts of Calcutta, returned Jyoti Basu to the West Bengal Assembly, without a break, in 1952, 1957, 1962, 1967 and 1971. In the latter year, his formidable rival was Ajoy Kumar Mukherjee, twice elected Chief Minister of the state. Nonetheless, Basu won, by a margin of more than 13,000 votes, out of a total poll of a little more than 70,000. Barely a year later, in 1972, Jyoti Basu lost, to an obscure candidate, by a margin of 40,000 votes.

The miracle of the printing press is now being openly alluded to by Congressmen themselves, since the contestants in last month's by-elections were confined to different factions within the party. Depending upon whichever faction commands greater muscle power in a particular area, it has, in that area, succeeded in manipulating the printing press. For there are certain objective laws which attach to highway robbery. You cannot claim that the technique of the printing press is to be deployed only for doing the CPM in. The particular technique is bereft of any ideology: if two Congress factions fall out, either faction will attempt to use it against the other, and the one commanding greater support among the hoodlums will win.

Certain Norms?

This was how West Bengal was won in 1972. Certain fascist forces, the point has been made in recent weeks, are trying to take advantage of the situation in Gujarat for their own nefarious purposes. The pot is calling the kettle black. Last week at Santiniketan, the Prime Minister also referred to certain norms of political functioning. Does she have the norm of the printing press in mind, one wonders. The cultured norms notwithstanding, that the electoral process can be reduced to such an atrocious farce may be related to two factors. First, the large-scale terrorisation of the people by the social scum, who are flanked and protected by the forces of law and order. Second, a pervasive demoralisation in all walks of life. The Naxalite ideologues, who wanted to usher in the revolution through terror, have merely succeeded in leaving behind a listlessness; terror has given way to counter-terror. Iron has entered the soul, everybody knows the kind of shennanigan that goes on in the name of elections, but few believe in the efficacy of collective protest any more. Even attempts at organising mass agitation against the goings-on, will, you will be told, be subject to attack by the hoodlums, and the police will benignly watch from the sidelines.

Babe in the Woods

That babe in the woods, the Chief Election Commissioner, has obviously to be informed about the facts of life. What, according to him, is not 'mechanically possible'? To prevent, through the threat of physical liquidation, legitimate voters from trooping to the polling booths? To capture a polling booth and drive out the agents of opposition candidates with the tacit co-operation of the police? Having captured the polling booth, to operate a printing press in the manner described? Each of these phenomena happened in West Bengal in 1972, and they were repeated last month. He who pretends otherwise even when fully posted with facts either does not want to see, or is a fake.

Bourgeois democracy has its plus points, of course. In the nation's capital, Parliament meets, a Bhupesh Gupta indulges in good-hearted banter with a Y B Chavan; in the evening, members of Parliament, including those belonging to the opposition, attend an official reception, maybe they watch a lissome Yamini Krishnamurti dance a *varnam* in Mohini Attam, or listen to Ravi Shankar play a rare *raag* on one of his increasingly rarer visits home. Maybe you even invite a Noam Chomsky come and deliver the Jawaharlal Nehru memorial lecture. When an opposition M P happens to pass her in the corridor, the Prime Minister is charming, solicitous of his health, full of the graces of life. And yet, barely nine hundred miles away, things and events happen, in the name of the Prime Minister, under her implicit authority, and for ensuring the perennial authority of her party — things and events, to find an adequate parallel to which, one has to turn to either Thieu's South Vietnam, or to the fading days of the Weimer Republic in Germany in the early 1930s.

CAPITAL VIEW

The Silly Season

Romesh Thapar

THIS is our silly season. The internal situation of a competing food and oil shortage notwithstanding, almost daily that thing called a VIP is being given the 'red carpet' at Palam airport. Goodness knows why it is so-called in international parlance. I would have thought the diplomatists would have changed the colour by now. However, the scene at Palam is a sampling of what goes on with variations all over the world (yes, even in Peking!) at considerable cost to national exchequers.

Some hundred local VIPs (known in certain places as 'Spivs'!) assemble for the hand-shake led by either the President or the Prime Minister, sometimes both. A couple of thousand motivated clappers and slogan-shouters are already in position, obviously brought there by bus. Everyone is apparently pleased with having 'arrived', as it were.

The ceremonies at the airport are fixed on the basis of protocol. Ambassadors, anxious to get on, do try to press a junior flunkey in the Foreign Office for an extra 'touch' of friendship and joy. The obedient Press corps, never tiring of repetitive ritual, often misses these touches and has to be briefed. The speeches are dull and fatuous. They are designed to be. Smiles and more smiles. Hand-shakes and more hand-shakes. The ever-increasing tribe of high-born on the tarmac remember to wash up later.

Tourist Infrastructure

There is then the drive — ceremonial or otherwise — into town or along

a route which speeds the arrival at Rashtrapati Bhavan, or along roads specially 'manicured' with whitewash and red earth. Portraits of the VIP adorn various road junctions. The flags of the nation visiting are very visible, even among the tattered, coloured bedspreads which hang miserably on other posts. Groups of unemployed hang around for a feeble cheer. The police, the security boys, are everywhere. The gunmen are particularly noticeable. They look like the local bad characters.

The motorcade, as it is called, passes. It consists of large cars imported against Air-India tickets as part of the local 'tourist infrastructure'. Curse that expression! A sophisticated 'T' in a sophisticated circle announces this fact. Feel sorry for the tourist if he wants a car just then. They are servicing VIP tourists.

Well, the visit proceeds. The inevitable ritual at the samadhis of Gandhi and Nehru, occasionally of Shastri, with the power houses in the background polluting everything in sight. Ring Road is a Death Row in more ways than one. But these generalisations are irrelevant, and in bad taste. So, let's get on.

The talks have begun. These are the guts of the business, and are conducted with a certain efficiency. Don't judge this activity from what the *communiques* say. They are intended to 'cover up'. A lot of bally-hoo goes into their phrasing these days. There was a time when Jawaharlal Nehru used to dictate them to his secretary after dinner.

Such Involvement

But this is not all. The extraordinary delegations which accompany these VIPs have to 'involved'. Full programmes are worked out for them. It does not take much staff work. Visiting points are familiar. Places of excellence — at least, as long as they continue to be excellent under the pressure and disruption of VIP visits.

A constant briefing goes on by 'spokesmen of the government'. They are very special people who talk endlessly without revealing anything. The more skilful, the more sought after. We children of the *Gita* are specially adept at this work. We do not reveal. And our statements can be variously interpreted. Radio and TV naturally do the needful.

Of course there are the lunches and the dinners. They get so boring that lists of guests have to be personally supervised by the powers that be to make nations look more than merely bureaucratic. Napoleon set the style. We are still trying desperately to imitate him. As for the menus they taste of every cuisine in the world.

Endless Moronic Round

Everyone breathes a sigh of relief as the final communique or joint statement receives the appropriate signatures. And presents are exchanged. Only nominal? Not really. Sometimes, fabulous. Cost of one: Rs 50,000; only recently, so the story goes.

The flags come down. The slogans are removed. The portraits disappear. For a day or so we are normal — not fully, because the coloured bedspreads continue to flutter. A warning that another VIP will soon be visiting. And then up go another lot of flags and what have you.

This is a kind of shaggy dog story. It is spelt out in this way to try and persuade intelligent, creative leaderships to grow up and behave like mature humans. We do not need all this nonsense and make-believe. The world is aware of what goes on, and who is who. We are not a bunch of children. Let us build meaningful relations and a meaningful peace, but not in this moronic way.

Who is going to set the new style? At least here we can take the lead. Our resources position justifies it. And we will earn the blessings of so many harassed people.

As for foreign policy, let's talk about that later ....

March 11

LETTER TO EDITOR

'Operation Election'

THE article entitled "Nagaland: 'Operation Election'" published in your issue of February 2 gives a picture of the general elections in Nagaland, some aspects of which call for comment from this office.

It is stated in the article that the total number of voters belonging to the Assam Rifles, BSF, CRP and Border Roads Organisation enrolled as voters is nearly a lakh. This information is totally incorrect.

On representations made to the Election Commission in August 1973 in this matter, the Election Commission issued instructions to the Chief Electoral Officer, Nagaland, in regard to the registration of voters belonging to the Assam Rifles and other semi-military personnel. The Election Commission has been keeping a careful watch all the way through on the registration of voters belonging to the Assam Rifles, the Central Reserve Police Force, the Border Security Force and the Border Roads Organisation and has been in close touch with the Nagaland authorities in this matter. A total of 13,406 such personnel applied for registration. The applications were carefully scrutinised and disposed of. Finally, there were only a total of 3,644 such personnel who were registered as voters in Nagaland as they satisfied the criterion of being "ordinarily resident" in Nagaland. The breakup of this figure is as follows:

Military	8
Assam Rifles	1,923
Central Reserve Police	Nil
Border Security Force	120
Border Roads Organisation	1,593

This total of 3,644 personnel is less than one per cent of the total electorate of Nagaland which numbers 3,97,577. It may be recalled that personnel of the Assam Rifles, the Border Security Force and the Border Roads Organisation are often recruited in the region and are "ordinarily resident" in the area.

The Chief Election Commissioner has just returned from an extensive tour of Nagaland and has satisfied himself on the spot that the security forces are deployed only in regard to duties concerning National and State security and have nothing to do with the elections.

A N Sen

Secretary,
Election Commission of India
New Delhi
February 8

The Diversification Round

Hansavivek

RALLIS INDIA, which has been steadily widening its manufacturing base and diversifying its activities, is going further in this direction. It proposes to enter the field of electronics and to manufacture and assemble electronic and electrical equipment of all kinds, including components and accessories. Already engaged in the business of exporting frozen fish and marine products, the company now proposes to take up trawling for fish and marine products as well as processing, refrigerating, and freezing of marine and other products. The government has approved the company's proposal to set up a garment manufacturing unit for export garments and other textile articles; the company has been exporting garments. The company also intends to start production of basic and fine chemicals which will increase the formulation activities of the pharmaceuticals division. As a recognised export house, the company is thinking of establishing offices and branches and of incorporating new companies outside of India as part of export promotion. The company's manufacturing base increased substantially after the merger of Tata Fison Industries (TFI) with it on September 1, 1972. The cash flow generated, according to chairman J D Choksi, will provide resources for the proposed expansion and diversification. The company will shortly reduce its holdings both in Searle (India) and in Boehringer-Knoll to around 26 per cent — from the present 55 per cent and 48 per cent, respectively. The aggregate disinvestment will be Rs 26-27 lakhs. Both companies are proposing to make public issues in the near future, and the holdings to be sold by Rallis India will be offered simultaneously with the public issues.

The company's results for 1972-73 are not comparable with those of the previous year, as the latest figures include a full year's working of the erstwhile TFI. Sales and profits have increased considerably. Dividend has been stepped up by 2 points to 16 per cent. The increase is by way of silver jubilee bonus. The pharmaceuticals division continued to suffer from the price/cost squeeze, eroding profits despite a 20 per cent rise in turnover. The fertilisers and pesticides division had a very successful year, both in respect of turnover and profitability. However, the oil crisis is now casting its shadow on availability and prices of fertilisers. The hydro-sulphite plant is in the course of commissioning, but full commercial production can com-

mence only after the drastic power-cut imposed by the UPSEB has been restored. Mangalore Chemicals and Fertilisers, in which the company is committed to an investment of Rs 40 lakhs, is expected to commence production in the next agricultural year. The merchanting division maintained profitability, though shortage of power affected cotton consumption by the textile industry and consequently sales of cotton. The engineering division maintained its level of turnover; but profitability was slightly below that of the previous year mainly due to pressure on margins on fans. Sales of Wolf portable electric tools continued to rise and of JLO petrol engines showed a substantial improvement over the previous year. Sales of Rockwell machine-tools are steadily on the increase. The ceiling fans, manufactured by Rockwell India, have been well received in the market. The operations of Protein Products of India have been very adversely affected by the severe power-cut and the acute shortage of crushed bones which is the principal raw material.

CHEMICALS AND FIBRES OF INDIA has submitted a proposal to government for permission to import DMT, the basic raw material in the manufacture of polyester fibre, with an offer to earn the required foreign exchange through exports. Imports of DMT were progressively restricted from April 1973, in the hope that the DMT unit set up by Indian Petrochemicals would meet the needs of all polyester fibre manufacturers in the country. The company has serious doubts about the sufficiency of DMT in the coming months from IP, the only indigenous source of supply. Last year, CAFI made strenuous efforts to step up exports and was able to achieve exports worth Rs 94 lakhs against Rs 63 lakhs in the previous year. This figure is quite low compared to the total gross sales of Rs 38.63 crores. The directors point out that continuation of the export activity is entirely dependent on full utilisation of plant capacity and a healthy domestic market. The future in this respect, they say, is "highly uncertain". During 1972-73, production in the first two months was low, owing to a strike at the plant; again in the last one-and-a-half months production was low on account of DMT shortage. Since the plant capacity had been expanded from July 1972, total production of polyester staple fibre was 7,354 tonnes against 5,871 tonnes in the previous year. Profit-margins were slightly shaded. Higher provisions for depreciation and taxation left lower net profit compared to in 1971-72. Dividend is maintained at 25 per cent. The ratio of inventories/sales showed a decline over the year, but that of wages/sales was up. As at the end of the year, 122 employees were entitled to emoluments aggregating Rs 2,000 or more per mensem, as against 118 the year before. Out of 344 employees, who abstained from work initially, 76 resumed work during the year and 15 were regarded as having abandoned service. Approval applications to the Industrial Tribunal for discharging the remaining 253 employees were not granted. The company subsequently filed an application in the Supreme Court against the Tribunal's decision and the appeal has been admitted.

EXCEL INDUSTRIES is engaged in the development of a pesticide generally known as 'Endosulphan', which is at present imported. The company is seeking an industrial licence for manufacture of this pesticide, which is estimated to bring in annual sales of Rs 500 lakhs. The company has been granted a 'letter of intent' for manufacture of aluminium phosphide at Bhavnagar. The project is to be implemented with internal resources and will add substantially to the company's profits. Besides, the unit will qualify for relief in tax. Efforts are being made to increase exports of industrial chemicals. Last year, the company's exports amounted to Rs 8 lakhs. During 1972-73, production of metals, non-metals, and chemicals, was 6,452 tonnes, and of pesticides 1,963 tonnes — against 5,122 tonnes and 1,847 tonnes in the previous year and installed capacities of 9,195 tonnes and 3,950 tonnes, respectively. The Bhavnagar unit for elemental phosphorous showed a marked improvement over the year, but some of the other products suffered a setback on account of drought conditions in the country. Sales and gross profit were slightly higher than the previous year's figures, but higher tax liability reduced profit at the net level. Dividend is maintained at 16 per cent.

KIRLOSKAR-ASEA's production, even in the twelfth year of its existence, has been far below the capacity. Production of starters was 20,189 numbers against the installed capacity of 45,000 numbers, of HT circuit breakers 117 against 480, of LT switches 24 against 10,000 and LT switchboards only 2 against 300. Moreover, though the company has installed capacities for LT (air) circuit breakers (600), HT load break switches (400), HT switch boards (120) and outdoor isolators (320), there has been no production of any of these items. The company showed better results for 1972-73, with higher sales and earnings. Dividend was raised by one per cent to five per cent, and was covered 1.5 times. Production and sales during the last four months of the current financial year have been higher than those of the corresponding period of the previous year.

SWADESHI POLYTEX, encouraged by the good results for the year to September last, is having second thoughts on the question of issue of 'rights' shares for financing part of the overrun of Rs 110 lakhs in the cost of its project, although the company has already received consent of the Controller of Capital Issues. Meanwhile, the company has started accepting deposits from the public. Commercial production commenced in the middle of March, and production during the six-and-a-half months aggregated 2,329 tonnes against the annual installed capacity of 6,100 tonnes. Total sales, inclusive of excise duty, amounted to Rs 859 lakhs. The company earned a net profit of Rs 20 lakhs after providing Rs 68 lakhs for depreciation. The results would have been better still, but for the frequent power-cuts and heavy fluctuations in voltage that resulted in a substantial waste during the initial stages and serious shortage of DMT, the basic raw material, in the latter part of the year. The power shortage was overcome by installing diesel generating sets, but the shortage of DMT continued into the current year. If the supply of this raw material is ensured, the company expects to turn out "much better" results this year. The quality of the company's product, it is claimed, is comparable with that of the best-known brands of the world. The company has been able to produce the finer deniers, 1.2 and 1.4, hitherto not produced in the country. Also, for the first time, polyester fibre has been introduced in the decentralised powerloom sector. The directors believe that they will be in a position to clear all arrears of preferential dividends and also recommend a maiden equity dividend of "not less than 10 per cent" for the year 1974-75.

A Diffused Debate

Nireekshak

AFTER two years and more of prevarication and feet-dragging, the government now finds it expedient to whittle down the issue of diffusion of newspaper ownership to one of delinking the industry from big business. It is no longer fashionable to talk of diffusion, the demand for which was subtly engineered by the government in its rage over the allegedly unsympathetic role of the press when Indira Gandhi wanted to get herself a massive mandate in 1971.

The half-hour Lok Sabha debate on the subject on March 6 (hardly 25 members were present and there was not one visitor in the public galleries) yielded the solemn assurance from Inder Gujral that the bill for the delinking operation was getting ready. Gujral, who holds independent charge of the Information and Broadcasting Ministry, was rather apologetic over the government's backtracking after all its strident talk of diffusing newspaper ownership to instil a sense of commitment in the press to social democratic values. In a speech full of platitudes he tried to diffuse the issue with such aphorisms as "the baby should not be thrown away with the bath water" and newspaper ownership being a delicate matter which could not be dealt with like jute mills or cosmetics factories. He even listed the parameters of the delinking operation: (1) the press should be free from direct or indirect government control or interference; (2) the monetary vacuum likely to be created should not be allowed to be filled by *benami* transactions by vested interests; (3) the new ownership pattern should have regard for the economic viability of newspapers and the measure should ensure that no newspaper would close down as a result of the operation.

The alibi for the delay: A legislative measure should survive the test of legal validity. The Constitution was a hurdle. The uncommitted judiciary was a hurdle. In fact, anybody, but not the government, was to blame for the delay, if one were to go by Inder Gujral's *obiter dicta* in Parliament. The price-page schedule had been torpedoed once. The 10-page rule had been struck down. The Supreme Court's 1,700-page judgment on the 24th and 25th Constitutional Amendments had to be taken into account in drafting the proposed bill.

Surprisingly, all the nagging doubts seem to have arisen after an initial misadventure for which Inder Gujral might not be to blame. One of his ministerial colleagues, described as a friend of working journalists of a certain political hue, got some of them together and produced from under a hat, as it were, a far-reaching draft bill and surreptitiously got it into the newspapers. Everyone was made to believe that it was the government's own draft, soon to be introduced in Parliament. The Chairman of the Press Council wrote to the government to ask about it and the 'draft bill' was promptly disowned. The authors of the mysterious draft bill had gone about the job with the zeal of a demolition squad. But Inder Gujral has to sound cautious and pragmatic, having to backtrack on what someone else had done in his own game of one-upmanship.

The ownership of news agencies is a related issue. It inevitably figured in the debate. The demand for converting the Press Trust of India and the United News of India into public corporations has been a ritual with the Indian Federation of Working Journalists. The demand itself is neither new nor original. The Press Commission had recommended the conversion of PTI into a public corporation. That was some 20 years ago. The other agency of importance of those days, the United Press of India, collapsed and on its ruins arose the United News of India. These two as also the two Indian language agencies, Hindusthan Samachar and Samachar Bharati, owe their viability to heavy subsidies from the Central and state governments. PTI is the older and larger one and is more extensive in its operations because it gets a larger subsidy. Nevertheless, both PTI and UNI rely heavily on Western news agencies for their foreign coverage. Inder Gujral did some kite-flying once about the government's plan for an Afro-Asian news service but no one hears about it any more.

The Centre is now reviewing the subsidies it is giving the news agencies which find their operational costs going up. The Central government's touchiness on the question of converting PTI and UNI into public corporations is understandable. One should remember that less than 10 years ago the Chanda Committee had recommended conversion of All-India Radio into a public corporation and this proved embarrassing to the government. The government can manage news through news agencies as long as they depend on direct or indirect subsidies (in the form of All-India Radio's subscription for their services or in the form of subscriptions by various government departments or offices). It suits the government to let the agencies run in their present form just as it suits the government to keep All-India Radio under its direct control.

Those who zealously demand the conversion of the two agencies into public corporations are not very clear about what they mean. Do they want them converted into public sector undertakings by an act of Parliament or into organisations functioning under a charter from the President? Either measure would mean a sophisticated form of nationalisation, which could prove embarrassing to the government. There will be no way of delinking the news agencies from the government or big business influence as long as they depend on either.

SUBSCRIPTION RATES

	Inland	Foreign (surface mail)
6 months	Rs 40	
1 year	Rs 75	Rs 110
2 years	Rs 140	Rs 210
3 years	Rs 200	Rs 305

Concessional Rates for Teachers and Students

6 months	Rs 18
1 year	Rs 35
2 years	Rs 60
3 years	Rs 80

Concessional rates are not applicable to students and teachers outside India

LIC's Group Insurance Scheme—

If you want to tick off all its advantages on your fingers, you'll have to ask someone to lend a hand!

Today, its protective umbrella shelters over 9 lakh families from economic hardship and uncertainties of the future.

Wouldn't you agree that staff loyalty is a vital asset to your organisation? LIC helps you achieve this. With a proven concept in employee welfare and security—the Group Term Insurance Scheme!

This simple and economical employee benefit plan is specially designed for progressive employers.

Under this scheme, you are able to provide low-cost insurance protection to your employees —even to those in the lower income-brackets who may otherwise find it difficult to afford life insurance on their own.

Benefits to Employees

- Insurance cover automatically granted to all employees who are actively on duty up to a stipulated limit—no botheration of medical examination.
- Benefits payable to dependents are free of income tax.
- Premium paid by the employer is not treated as taxable perquisite in the hands of the employee.

Benefits to Employers

- Enables the employer to attract and retain talented staff.
- Premium paid is allowed as an item of deductible business expenditure.
- No need to sanction ex-gratia payments to widows and dependents in the event of accidental/untimely demise of employees

For complete information on this Scheme, please contact your nearest LIC Divisional Office, or
The Group Manager,
Group & Superannuation Schemes Dept.,
LIC of India, Central Office, Yogakshema.
Bombay 400 021.

There is no substitute for Life Insurance.

Life Insurance Corporation of India

TAMIL NADU

Receding Waves

IF the results of the Pondicherry and Coimbatore elections show anything, it is that the much-talked-of waves, whether of the Indira or the MGR variety, are dying down. This was the first time after the 1969 split that the two factions of the Congress joined hands to face the electorate together. The Dindigul disaster where the ruling Congress polled only 2 per cent of the votes had definitely chastened Indira Gandhi as well as the local leadership and persuaded them of the need to get together with the 'reactionary Syndicate'. Besides, the Congress High Command had one eye on the UP election and wanted to disarm the Gupta coterie there by neutralising Kamaraj, a gambit that appears to have paid dividends. But the great expectations that the alliance had aroused among Congress supporters were largely belied as the two factions together could secure only 12 of the 30 seats in Pondicherry, the ruling Congress winning 7 of the 14 seats it contested and the Congress(O) 5 out of 16. ADMK won 12 seats and its ally, CPI, 2. CPI(M) won one seat, DMK 2 and one seat was won by a DMK-supported independent.

While the combined performance of the two Congress factions was better than what either could have expected to achieve by itself, the total vote shows the continuation of a steady declining trend in Congress popularity since 1964. The 54 per cent of the votes which the party had polled in 1964 went down to 44 per cent in 1969 (prior to the split) and to 35 per cent in 1974. Neither Kamaraj's mass base nor the Indira wave seems to have had much success in resurrecting the party's sagging image.

In Coimbatore, the Congress alliance lost both the Assembly and Parliament elections, but by close margins. The combined votes of the ruling Congress and Congress(O) are only slightly more than the Congress(O) vote in 1971. However, it is not without some legitimate cause that Kamaraj has "welcomed" the election results. Unlike in Dindigul eight months ago, where the ADMK polled more votes than all the opposition parties put together and where the Congress(O) had lagged far behind by 1,40,000 votes, the recent election saw a close race between the two parties. Both the CPI and ADMK candidates in Coimbatore scraped home with very narrow margins of 2,597 and 527 votes, respectively. The Congress emerged as a respectable runner-up. Kamaraj seems sure that all he needs is just one more election to stage a comeback.

For the DMK, the defeat has been total. True enough its position in Pondicherry has never been the same as in Tamil Nadu where it has had deep roots among the lower castes and classes right from its rationalist-atheist Dravida Kazhagam origin. It had no base in Pondicherry before Independence; the Congress and the CPI were better entrenched there. A late-comer to the electoral politics of Pondicherry, making its debut in 1969, the DMK rode the crest of the anti-Congress wave and bagged 15 of the 19 seats it contested, leaving only 10 seats to the Congress. As a divided party the DMK's recent showing was pathetic; it won only 2 of the 26 seats it contested. The only satisfaction that its leadership can derive is that compared to its debacle in Dindigul its performance in Coimbatore is better. A feeler put out by the DMK Mayor of Madurai after the recent electoral rout for merger with ADMK was spurned by MGR.

In Dindigul the ADMK had, in its first electoral appearance less than a year after its birth, swept the voters off their feet securing 52 per cent of the votes cast. And this in spite of the tremendous violence unleashed against its cadres by the DMK. In Coimbatore, where violence was confined to the customary limits, the ADMK-supported CPI candidate polled only 35.8 per cent of the votes, or only 0.6 percentage points more than the Congress(O). In Pondicherry, although it secured the largest number of seats, 12, the two Congresses together equalled its performance. The invincible party of only a few months ago is now forced to seek support from others to form a ministry.

It is possible that the fact of the merger of the two Congresses in Tamil Nadu and the hopes it had stimulated of a 'stable' and better alternative to DMK than what the ADMK could provide has eaten into the ADMK's erstwhile popularity. More significantly perhaps, the initial mass euphoria and hope that the DMK government could be felled by a single blow of the ADMK, reflected in the Dindigul election, has gradually evaporated, given MGR's inability to take the offensive and carry forward the mass protest movement in the face of the DMK government's systematic brutality against its cadres. The frenzied ardour of the masses for MGR seems to have cooled somewhat. The fact of the CPI(M) breaking away from the ADMK-CPI alliance, thus detracting from the latter's left image, must also be seen as a contributory factor.

The CPI in spite of its alliance with what is currently the most popular party — a convenient habit which seems to have become its method of survival — suffered a setback in Pondicherry which it claims as one of its strong bases. Contesting 7 seats both in 1969 and 1974, it won 2 seats and 7.4 per cent of votes this time as against 3 seats and 13 per cent of the votes in the earlier election when it had the support of the united DMK. The loss of the Mudaliarpet constituency, the stronghold of its stalwart and ex-minister, Subbiah, is a serious blow to the CPI. In Coimbatore, where it had mostly basked in the reflected glory of its senior partner, it barely managed to make it to Parliament. Its future prospects, in electoral terms, are bound to fall or rise with the vicissitudes of the MGR wave. It is now comfortably placed in Pondicherry because of the ADMK's failure to obtain an absolute majority. So, for the time being, its favourite tactic of discovering progressives among the Congress ranks is likely to be kept in abeyance to be revived at a time when the Congress faces better fortune. The danger that in the long run the process of shifting sides or its own peculiar interpretation of "unite and struggle" tactics might wipe out its own identity seems to be lost on its leaders.

To complete the circle of all-round poor performances, the CPI(M) fared badly too, ploughing a lonely furrow after its negotiations with the ADMK and CPI broke down over the Coimbatore Parliamentary seat and the attitude to the Congress. Contesting in Pondicherry for the first time, it won only in Mahe, bordering on Kerala. In Coimbatore, where in 1971, opposing the Congress(O) on the one hand and the DMK-CPI-Congress(R) combine on the other, it had polled 52,000 votes, in the recent election its vote went down to 36,000. The charisma of MGR and the possible apprehension among its own supporters that a vote for the

CPI(M) would only indirectly help the Congress to win probably explain its loss of votes.

All eyes are on Pondicherry now. After the usual waiting game, the omin-out reports of the Governor awaiting the Centre's reaction and the sabre-rattling of the CPI, the ADMK has been allowed to form a government which the CPI has joined. It is, however a moot point as how stable this government is going to be, for things could not be more evenly balanced in the Pondicherry Assembly. The ADMK-CPI alliance holds only 14 seats in the 30 member Assembly; with the conditional and critical support announced by the CPI(M) member this still forms only 50 per cent and makes crucial the role of the DMK-supported independent who announced the other day: "I am an independent candidate. What I should do has not yet been decided." The ruling combine has, in addition, to face the 'loss' of one member to occupy the Speaker's chair.

In true political style, making the best of a bad job, MGR went to the extent of publicly welcoming his party's minority status: "... if a party is returned with a huge majority, it might be tempted to ignore the people and behave in a dictatorial manner — Tamil Nadu is an obvious pointer." That a patchwork coalition is likely to be more amenable to horse-trading and shifting loyalties than to popular will has been till now the demonstrated experience in other states, ruled by the most colourful of this hybrid species, the Indira Congress. It is to be seen if Pondicherry will have better luck.

MONETARY POLICY

Window-Dressing

SELDOM, if ever, has the Reserve Bank's monetary policies been the subject of so much discussion. The December 1973 issue of the Reserve Bank's monthly *Bulletin* carries yet another exposition of the content, rationale and achievements of the recent restrictive credit policy measures. These measures may be broadly divided into those which directly raise the cost of money to the commercial banks and their borrowers and those which curtail the resources of the banks and impose an overall ceiling on commercial bank lending.

Among the first set of measures are included the raising of deposit rates, the Bank rate and the Net Liquidity Ratio (NLR) and the imposition of a minimum lending rate on non-priority borrowers. As has been repeatedly argued in these columns, in the immediate context of shortage of commodities and inflation, the operative significance of these measures is limited, though from a long-run point of view the upward push given to interest rates is all to the good. The immediate impact of the measures is bound to be limited because the extent of the rise in interest rates — whether in deposit rates or the Bank rate or the minimum lending rate — has been so small that it can be expected to produce no perceptible impact on bank credit. Even if the commercial banks were highly cost conscious — which is certainly not the case —, their commercial banking sense and concern for the economies of scale would persuade them to continue to expand credit so as to absorb the rising operating costs, including the additional cost of deposits, etc. As for the borrowers from commercial banks, interest costs, at their present level, are certainly no consideration at all for them. This is true particularly of the large borrowers who continue to appropriate the bulk of bank credit. (According to data for December 1972, the latest released by the Reserve Bank, large borrowers with credit limits of over Rs 1 lakh appropriate 80 per cent of total bank credit and those with credit limits of over Rs 5 lakhs about two-thirds.) A recent study based on the Reserve Bank's data on company finances shows that despite the heavy dependence of the corporate sector on bank and other institutional borrowings, interest cost formed a negligible proportion, from 2 per cent to 4 per cent, of total cost of production.

In the immediate context, therefore, it is the other set of measures, intended to restrict the loanable resources of the banks and impose an overall ceiling on their lending which seem more likely to be effective. But, unfortunately, these measures have been formulated and implemented in a half-hearted way by the country's central bank. This comes out only too plainly from the article in the Reserve Bank's *Bulletin* referred to at the beginning.

The article has this to say about the prescription of an overall ceiling on expansion of credit by the banks in the 1973-74 busy season: "The rationale of this new ingredient of policy was briefly this. Against the background of persistent increase in aggregate monetary demand in the economy, it was thought that some overall quantitative limit on expansion of credit was necessary in order to minimise the impact of bank credit on aggregate monetary resources." But what was the connection between the limit prescribed and the working capital and other credit requirements of various sectors of the economy? The article pleads that the assessment of requirements of credit "could not be precise". Quite true. The article then goes on to say that "a plan prepared by the Central Banking Authority, not on the basis of indents from the users and scrutiny thereof, but on general considerations and which moreover has to seek to cover the needs of thousands of industrial and other units, suffers from even greater difficulties and uncertainties". But need it have been so? Have we not been led to believe that the Credit Authorisation Scheme operated by the Reserve Bank is intended precisely to, in the words of the Reserve Bank's Report on Currency and Finance, 1972-73, "align bank credit with Plan priorities" — on the basis of "indents from the users and scrutiny thereof"? Similarly, the Reserve Bank's Annual Report for 1972-73 had claimed that the Bank's credit planning was based not on "general considerations" but on specific factors like the levels of output, stocks, prices, exports, etc.

The expectation that the Central Banking Authority's credit plans and credit policy measures will be based on something more than so-called "general considerations" is not a matter of aesthetic satisfaction alone. After all, a credit plan makes sense only if the actual credit expansion conforms to it, at least broadly. Such correspondence is, however, possible only if in the first instance the plan is formulated on the basis of assessment of actual working capital requirements, particularly of the large parties who come within the purview of the Credit Authorisation Scheme and who account for a large part of total bank credit. This in turn calls for the framing of norms with regard to the permissible levels of stocks, especially of scarce industrial commodities and raw materials like steel, cement, paper, non-ferrous metals, chemicals, etc. Unless the credit plan is based on such specific considerations, it is worthless and will be incapable of being implemented since neither the Reserve Bank nor the commercial bank will have any criteria by which to assess the demands of the large number of claimants for credit and to ration out credit among them so that actual credit expansion conforms to the plan in overall quantitative terms as well as in the allocation pattern.

In trying to establish the success of credit policy the article in question claims that commercial banks' advances against commodities covered by selective credit controls have declined from 11 per cent in 1970 to about 6 to 7 per cent in 1973. However, at the same time, the share of these very commodities at 22 per cent of the total credit expansion in the 1972-73 busy season is justified on the grounds that the credit went to mills and processing units, that these parties had to replenish their depleted inventories in 1973 and that the prices of industrial raw materials were 15.5 per cent higher than a year ago. First, it is factually incorrect to say that in respect of availability of raw cotton and oilseeds, the two major commodities covered by selective credit controls, the year 1972-73 was better than 1971-72. The output of cotton in 1971-72 was the highest and that of oilseeds was only marginally lower than in the previous year. In any case, the output of both these commodities in 1972-73 was hardly large enough to justify the disbursal of bank finance for substantial replenishment of stocks. As for the argument about the credit having gone to manufacturing and processing units, is the Reserve Bank really so naive as to believe that cotton mills, for instance, do not indulge in speculative buying of cotton? Finally, before the rise in the prices of industrial raw materials can be accepted as a justification for larger bank advances against them, it has to be asked what role bank credit itself played in bringing about the price rise in the first place by making possible large inventory holdings. In other words, was not larger bank credit the cause, rather than the effect, of the rise in prices?

The article also argues that the phenomenal expansion of Rs 878 crores in bank credit in the 1972-73 busy season was partly explained by the 7 per cent increase in industrial output. But if the expansion of bank credit is so closely linked to the rate of growth of industrial output, why has the Reserve Bank permitted an almost equally large credit expansion in the 1973-74 busy season despite an absolute decline in industrial output in 1973?

Considering that its so-called credit plan was not based on any serious assessment of the economy's requirements of bank credit, the Reserve Bank has necessarily had to take recourse to window-dressing to establish the success of its policies. It claims that it has been able to impound about Rs 430 crores of bank deposits through the 4 percentage point increase in the cash reserve requirement. However, at the same time, it has increased its lending to the scheduled commercial banks by Rs 230 crores between November 1973 and February 22, 1974. In addition, it has made available another Rs 165 crores to the banks by rediscounting bills under the New Bill Market Scheme. Thus it has augmented the resources of the banks by almost as much as the amount of the impounded deposits. Not surprisingly, therefore, as against the Reserve Bank's target of Rs 400-450 crores of non-food credit for the 1973-74 busy season, the banks have already lent over Rs 534 crores. In addition, another Rs 223 crores have been lent through bills under the New Bill Market Scheme, making a total credit expansion of Rs 757 crores for purposes other than food procurement. Including food procurement, total credit expansion works out to Rs 901 crores.

More recently the Reserve Bank has taken to mentioning the figure of bank credit after excluding export credit. This is an afterthought insofar as the target of Rs 400-450 crores for the busy season was inclusive of export credit. As things are, banks and their clients have used export credit as a loophole by inflating the demand for so-called pre-shipment or packing credit, banks' control over the actual utilisation of which is tenuous in the best of times. However, even if export credit is excluded, the expansion of non-food credit during the current busy season has touched Rs 645 crores already, including bills rediscounted under the New Bill Market Scheme.

The case for the Reserve Bank's New Bill Market Scheme rests on the ground, first, that compared to, say, advances against book debts bank credit extended through discounting of bills is preferable since the compulsion to retire the bills at the end of a fixed period enforces a greater measure of financial discipline and, second, that by creating a negotiable financial instrument which banks can rediscount with one another or with other approved financial institutions it will ease the process of matching supply of and demand for funds in the money market. These in fact were the objectives visualised for the Scheme by the committee which recommended it. But these objectives have not been even remotely achieved, though apparently there has been a sharp increase in the volume of bank credit extended against bills.

The seeming popularity of the Scheme is explained entirely in terms of the opportunity it affords to both the commercial banks and their clients to get round the Reserve Bank's credit control measures. The Reserve Bank, let it be added, has been a willing party to this subterfuge. Ordinarily, bank credit extended through discounting of bills should replace credit extended in other forms, say, against book debts. Actually, bills have been used to increase the total volume of bank advances after the possibilities of expanding credit in the traditional forms have been exploited to the hilt. This explains the spectacular overnight success of the Scheme which had shown few signs of life for three years between November 1970 and November 1973. Similarly, far from circulating among the banks, the bills invariably make a bee-line from the first discounting bank to the Reserve Bank. In effect, therefore, the so-called Bill Market Scheme has become a device for the Reserve Bank to take over a part — a fast growing part — of the credit expansion by commercial banks. Once a bill is rediscounted with the Reserve Bank, it ceases to be a part of commercial bank credit and the accommodation extended by the Reserve Bank through rediscounting it does not also figure in the commercial banks' borrowing from the Reserve Bank.

What could be a more cosy arrangement? The borrowers from the banks are enabled to increase their borrowings beyond what would have been available to them in the conventional forms — and that too at lower rates of interest than those charged on other advances —, the commercial banks are able to expand their operations untrammelled by the restraints imposed by the NLR and the reserve ratio and, last but not the least, while all this goes on, the Reserve Bank is able to claim that its credit squeeze has been a thumping success by pointing to the artificially low figures of increase in bank credit and of the commercial banks' borrowings from it.

What is worse, there is reason to doubt that many of the bills rediscounted by the Reserve Bank are in fact genuine trade bills. The Reserve Bank Governor had told the banks in November 1973 that they should "as far as possible resort to the New Bill Market Scheme to augment their resources". To facilitate this, it was decided to raise the amount, bills below which would not have to be actually lodged with the Reserve Bank, from Rs 2 lakhs to Rs 10 lakhs. The Reserve Bank Governor's injunction encouraged the banks to convert a part of their cash credit and advances against book debts into some sort of bills (signed by another bank by mutual arrangement). The raising of the limit for lodgement has further encouraged the creation of bills which are not genuine trade bills and whose purpose is only to avail of the rediscounting facility so liberally offered by the Reserve Bank.

Well of Violence

(From a Special Correspondent)

ON February 20 Bombay witnessed a mammoth flocking of Buddhists from all parts of Maharashtra for their march on the Sachivalaya to demonstrate their unity and solidarity under the leadership of the Republican Party of India. Precisely on the same day the minority population of Buddhists in Sonavale, a village 60 kms to the east of Kalyan railway station near Bombay, was subjected to a vicious attack by upper caste Hindus of the village.

Village Sonavale comprises three bastis — Sonavale, Khadakwadi and Khanderaopada. Sonavale consists of about 115 households of Kunbis and 16 households of Buddhists. Khadakwadi is situated about a furlong to the north of Sonavale and has a population of about 125, mostly Adivasis. Khanderao pada is about three furlongs to the north-west of Sonavale with a population of about 600 people belonging to the Mahadeo Koli caste.

The main occupation of the village is agriculture. A single crop of rice is grown here. The total land under cultivation is estimated at about 500 acres. One-fifth of it is owned by just four Kunbi families. The sarpanch of the village is from one of these four families. The average land-holding of the others, including the Buddhists, varies from 1.5 acres to 5 acres. None of the Adivasis in the village owns any land. They find employment as agricultural labourers, mostly on the farms of the four families with the largest land-holdings. They are employed either as Saldars or as casual workers on daily wages during the monsoon and Diwali seasons. The Saldars are given Rs 250 to Rs 300 per year in cash, a pair of clothes and meals. They have to work on the farms as well as in the households; there are no fixed hours for work and any holidays they get are entirely subject to the wishes of their employers. For casual workers, the day starts at 8 in the morning and ends at 6 in the evening. This ten-hour working-day fetches a meagre sum of Rs 1.50 for males and Re 0.75 for females. Besides, such employment is available for barely 100 days in a year.

The land in this region being not very fertile, the production is low. Even those with small pieces of land find the produce insufficient to last them for the year. Apart from the four Kunbi families, the rest of the villagers, whether Kunbi or Buddhist, have remained very poor. Invariably, those with small pieces of land do not possess the necessary means to cultivate them. The only flour mill in the village belongs to yet another Kunbi family. Thus the entire economic set-up of Sonavale village is in the hands of a few Kunbis.

There is one school in the village with 125 pupils on its rolls who can learn upto the vernacular final. There are in all five teachers belonging to this village, three of whom are Buddhists and the other two Kunbis. The Buddhist teachers are often transferred to schools far away from the village, thus compelling them to maintain two households, one at their ever-changing place of work and another in Sonavale. It was one such transfer that set in motion events which culminated in the violent attack on the Buddhists on February 20. A Buddhist teacher was transferred to a school seven miles away in October 1973. The teacher who replaced him is a resident of Sonavale and also a relative of the Sarpanch. Around November last year, the teacher who had been transferred out of the village and his family started getting threats to their lives. They lodged a complaint about this with the Foujdar of Munbad, listing the names of persons whom they suspected, all of them Kunbis. It is believed that one of the names was that of the Sarpanch.

In the village there are three wells, one of which goes dry as the summer approaches. Of the other two, it has been a long established tradition that one is used by the Buddhists and the other one by the caste Hindus or the Kunbis. For unknown reasons the water in the well used by the Buddhists started to get dirty and unfit for use around the middle of December. The Buddhists complained to the Sarpanch and some disinfectants were put into the well. But after a few days the water again turned dirty. The Buddhists were, therefore, forced to use the other well which was being used by the Kunbis. The Kunbis reacted very sharply to this. They prevented the Buddhists from drawing water and insisted on drawing water themselves and then pouring it into the vessels of the Buddhists. The Buddhists reported this insulting treatment to the Foujdar on February 7. The Foujdar came to the village on February 14 and held a meeting of the Kunbis and the Buddhists. The meeting decided that until the water of their well was fit for use again, the Buddhists should be allowed use of the well used by the Kunbis.

February 20 was Mahashivaratri. On the previous day a few Buddhist women who had gone to draw water had been brusquely prevented from doing so by Kunbi women who told them that they would not be allowed to draw water from the well as the water was to be purified for the 'abhishek' on the occasion of Mahashivaratri. As the Buddhist women were proceeding towards the well the Kunbi women are alleged to have caught hold of them and started to smash their vessels. According to eye-witness accounts gathered by this writer, in no time the men too rushed out and beat up the Buddhist women. By the time the Buddhist women ran back to their homes, the entire Buddhist area of 16 huts was surrounded by the Kunbis. The Kunbis, it is alleged, ransacked the houses and beat up everyone in the vicinity with sticks and agricultural implements. No one was spared, not even women and children. All the roads of the village were blocked so as not to allow anyone to escape or any outsider to witness the attack which continued for over an hour. Buddhists returning to their homes were accosted on the roads and beaten up. Many of the Buddhists suffered fracture of arms and legs and severe cuts all over the body; one of them lost an ear. Some Buddhists managed to escape through the jungles and by climbing over a hillock they were able to catch a bus to Munbad. Even they were manhandled and sought to be stopped from going to Munbad. It was only through the intervention of the other passengers that news of the attack finally got to the police at Munbad. Even so, the police from Munbad arrived at Sonavale only on February 22 and it was only then that the injured were given medical attention. As many as 26 people, including five women, had to be admitted to hospital. The police arrested 44 persons, including 12 women.

While the situation in Sonavale has now returned to normal, the attack on the Buddhists raises a number of questions. Why did the Kunbis who are themselves on the lower rungs of the Hindu caste hierarchy, launch such a vicious and organised attack on the Buddhists? Could it be because, while they may be low in the caste hierarchy, in Sonavale village itself they, or a handful of families among them, are economically all-powerful? Again, why have the Mahadeo Kolis and the Adivasis remained completely neutral over the attack on the Buddhists? Is it that in their eyes the land-owning Buddhists are no different from the land-owning Kunbis, though in terms of their general economic condition the Buddhists are not much better off than they?

Emergence of Regional Forces

M R

THE shouting and the sunshine have been restored to the hearts of all those trafficking in public credulity. But, in fact, the Congress showing at the mini-general elections, covering a fifth of the population, was neither sweeping nor spectacular; it failed to win even a bare majority in three of the four legislative assemblies it tried to capture with the help of the CPI or the Congress(O). But in Uttar Pradesh it won a victory of sorts. The victory might not be convincing because the majority is wafer-thin and the Congress had 271 members in the out-going Assembly, albeit a third of them defectors. The 1969 tally had been only 211 and the party had split since. Yet the UP verdict is claimed to be conclusive because the Congress has a house majority of its own for the first time since 1962.

More than anyone else, the Congress had attached great 'domino' significance to Uttar Pradesh, the power base of all the Prime Ministers to date. Had it failed there, its ministries in adjoining Bihar, Madhya Pradesh, Haryana, and possibly Rajasthan might have tottered to a crash, transmitting the party crisis to the Centre before the presidential election in August.

In the exultant euphoria of the technical victory, it might suit the Congress leadership to ignore some of the undercurrents in the Uttar Pradesh poll. The Congress vote had dropped steadily at every election since 1957 but it had still managed to get a disproportionately large number of seats. In 1967 the vote was low enough to off-set the multiplier and the Congress lost, getting only 199 seats. The late Ram Manohar Lohia's strategy, relying on anti-Congressism as the weapon, paid off. In 1969, the Congress vote was over 33 per cent and anti-Congressism which can be said to have begun after the 1962 India-China war (revealed at the string of by-elections the Congress lost in 1963), was yet to work itself out. In 1971, at the height of the Indira wave, the Congress raised its vote to 47 per cent for the Lok Sabha seats from UP.

The Grand Alliance of the rightist parties could not win in the Uttar Pradesh Lok Sabha poll and the Congress seemed to have regained the Muslim vote lost in 1967 and knocked together a caste constellation which made a vertical mobilisation of votes — from the Harijans right up to the Brahmins — possible, even if it meant the exclusion of certain intermediate castes. The limited opposition unity was no match for the Indira high tide.

In 1974, the opposition lost because it was divided. The Congress has polled roughly 27 per cent this time — a phenomenal drop since 1971 and therefore by no means a "massive mandate". With 27 per cent of the vote, the Congress has won 51 per cent of the seats. This means that a 35 per cent vote might have meant a landslide for Indira Gandhi just as a united front of the opposition would have meant a landslide against her. Anti-Congressism is back but there is no alternative focus to the Congress yet in Uttar Pradesh.

The Bharatiya Kranti Dal, essentially a party of Jat kulaks, could mobilise a good chunk of the Muslim and Yadav votes and could improve upon its 1969 performance not only in terms of seats but by extending its base to eastern UP. In 1969, its base was limited to western UP. The BKD made a bid for power by fielding over 400 candidates and the other principal opposition contenders for power, the Jan Sangh and the Congress(O), underestimated its strength. The Jan Sangh tried to live down the stigma of allying itself with the Congress(O) in 1971 and decided to bid for power on its own. Enthused by the Congress defeats in by-elections, the Congress(O) thought it could regain the states or emerge as the largest opposition party.

All the three contenders relied on the strident anti-Congress tone among the masses but did not reckon with the arithmetic of the situation. Almost every party of significance in UP has been in office some time or the other and the voter seemed bewildered until the last phase of the election campaign. The impressive BKD performance suggests that a regional party has greater credibility for the electorate than the numerous all-India parties in the field. This is true not only of Uttar Pradesh but also for the three other states and the one Union Territory which went to the polls in February.

In Orissa the Congress no doubt fared better than expected, belying confident predictions of a Pragati party sweep. The Congress could not win an independent majority but then that had happened only once — in 1961. The decline of the Swatantra party, despite its alliance with the Utkal Congress is significant. The Utkal Congress emerged as the second largest party though it had won the same number of seats as it did in 1971.

In Manipur the poll throws up the same pointer. The Congress-CPI alliance was decisively routed and the alliance of the Manipur People's Party and the Manipur Hill Union, both of them regional formations, pledged to greater autonomy for Manipur won a majority in the 60-member house. In Nagaland the Congress does not exist formally, but the party favoured by it, the ruling Naga Nationalist Organisation, lost to the United Democratic Front.

The by-elections from Coimbatore for the Assembly and Lok Sabha seats and Pondicherry Assembly elections are significant for several reasons. The Congress, which sought formal or informal alliances with the CPI in Uttar Pradesh, Orissa and Manipur, fought the CPI in the South.

The pattern of voting in the south defies the vague national pattern. Kamaraj's strategy lay in containing one of his three opponents in a new-found situation — the DMK rules Tamil Nadu, the Congress rules the Centre and the ADMK is emerging as the first party in Tamil Nadu. To a degree Kamaraj's strategy of a joint front with the Congress has succeeded. The DMK has already been pushed to the third position in Pondicherry and a polarisation of forces is indicated. The Congress alliance came very close to winning the Coimbatore Assembly and Lok Sabha by-elections even if it failed in its bid for power in Pondicherry. But the Congress combination still came second to the ADMK-CPI alliance in terms of votes as well as seats. A slow disintegration of the DMK before the next general elections in Tamil Nadu is a distinct possibility. And Kamaraj, who allied with the Congress to fight "anti-national, separatist and secessionist" forces like the DMK and the ADMK, will find himself fighting the ADMK. Even if the Congress alliance gains and edge over the ADMK, the principal challenge to the Congress will continue to be from a regional party and not an all-India party.

Overall, from Manipur to Uttar Pradesh to Orissa and Tamil Nadu, the Congress finds itself challenged by regional parties and not all-India parties. In many respects the picture in Uttar Pradesh might resemble the one that emerged after the 1969 elections. But the more significant fact is the serious erosion of Congress credibility since the 1971 wave which was still at work in 1972.

Though legitimacy and stability have

little to do with the size of a ruling party's majority, the Prime Minister chose to campaign around the slogan of stability in Uttar Pradesh. But Andhra Pradesh, Uttar Pradesh and Gujarat had to go under President's Rule not because the ruling party's majority was in doubt in any of these states. The improved Congress performance in Uttar Pradesh and Orissa does not even guarantee stability, leave alone any more useful benefits.

NAGALAND

Securing for the Sovereign

M S Prabhakar

ONE'S worst prognostications about the nature of the elections in Nagaland have proved to be incorrect. The United Democratic Front (UDF) has scraped through. This victory was undoubtedly due to the fact that, perhaps, for the first time, despite attempts at securing 'safe' blocks of voters in many constituencies, the elections were comparatively free and fair in Nagaland. Also, the fact that the UDF won, despite the attempts of the insurgents to obstruct the conduct of the elections, should give the lie to the belief popularly held outside Nagaland — and fostered by those whose job it is to keep a watchful eye over events there — that the UDF is actually a legalistic cover for the underground Nagas. That such suspicions have persisted can be seen in the extraordinary course of events that followed the elections and the peculiar behaviour of the Governor, L P Singh, before — and even after — inviting the UDF leader to form the new government. The final results were out on February 20, and the UDF (which had grown from 25 to 33 seats) elected its leader on February 23. And yet it took three more days before the Governor could invite the UDF to form a government. According to newspaper reports, "fundamental issues" figured in his talks with the UDF leader, relating to, among other things, the basic questions of sovereignty of the Indian state and the security of its citizens — a rather extraordinary step to take after "democratic" elections held under the aegis of a Government of India agency. But we live in extraordinary times, and Nagaland, very much like the other states in this region ("sensitive, border-regions", as these are tenderly described), is certainly an extraordinary state.

Now the question arising in the minds of most is: What are the prospects for peace in Nagaland? That peace is yet to be achieved is all too obvious — a series of attacks and counterattacks left more than 20 dead during the period of the recent elections. Undoubtedly, the attitude towards the underground was one of the major issues in the elections, and both the Nagaland Nationalist Organisation (NNO) and the UDF are in a sense committed to rehabilitating the 'rebel' elements. The UDF's motto was "By Faith Not Arms"; it never made any secret of its desire to achieve by constitutional means a final, negotiated settlement of the Naga political problem. And apart from the general points of attack on the NNO government — mainly regarding alleged corruption, conspicuous consumption, etc — the UDF tried to project itself as a group which could legitimately govern Nagaland and at the same time attempt a political solution to the Naga rebel problem. The NNO, being the government in power, could not talk of seeking a political solution, for its very basis of existence was that such a political solution had already been achieved with the establishment of the separate state of Nagaland. And yet even the most fulsomely loyal NNO leaders could not after all forget their own constituencies, could not afford to forget that "the erring young men" (as Hokishe Sema described the underground in his last year's Independence Day broadcast) did indeed strike a sympathetic chord even in the breasts of those villagers who had to suffer punitive action at the hands of the Indian army for giving them shelter.

But the winning of elections and the assumption of office brings along with it its own compulsions. The UDF despite all its attributed sympathy for the underground, cannot after all do much, and its actions anyway are going to be carefully watched by the multitude of central agencies operating in and around Nagaland. But even without the watchful eyes of the Governor and his agents, the UDF can be expected to be properly 'sobered' by the 'responsibility' of office. There are anyway fruits enough — nearly fifty crores of rupees — to help the UDF to move its thoughts away from the underground towards the job of 'development' for a while. And so, it would be the turn of the NNO to speak, though in a rather muted manner, about the need to arrive at a political understanding with the rebels. The Governor of Nagaland is soon going to realise that there was hardly any need for him to assure for himself that the UDF would be loyal to the Indian Constitution. The Indian Constitution — God bless it — is broad enough to accommodate within its wide consensus the Governor, the UDF, the NNO, the Independents with pliable consciences, in fact any and every one who does not take up arms against it.

But what about those who have taken up arms, those "erring young men" for whom both Hokishe Sema and Vizol show such tender concern? In fact, a way has already been discovered to contain them (or if you prefer, to 'rehabilitate' them). The large number of those who 'surrendered' on August 16, 1973, have been absorbed into a relatively new Naga Regiment and into the Nagaland Armed Police. Surely, a wonderful way to rehabilitate the erring young men. Those of them who were in the underground without a clear political understanding of their aims may now be expected to make rapid progress in their new pastures; they may even (as indeed they are expected to) become the most effective instrument in containing the really politicalised elements of the Naga underground.

It is no great secret that after eighteen years of army operations in Nagaland, the rebels have not been contained, much less defeated. So taking a leaf from the American book, the Government of India might employ the Naga people to fight the Naga people. Of course, politically and administratively, this has been going on since the formation of Nagaland. But the highly publicised 'surrender' of rebels most of whom had been living openly for years, and their absorption into organisations which are among the most actively repressive instruments of Indian state power, has to be seen as the latest tactic adopted by the GOI to contain and defeat the rebels in Nagaland. One recalls that the 'Vietnamisation' of the war in Vietnam frequently led to wholescale desertions to the 'rebel' side by Vietnamese units, fed, clothed, armed and trained by the Americans. But the walking over the rebel side was not merely a mechanical act of desertion; it was at least partly the result of a political understanding of the issues involved. In Nagaland, such a political understanding is lacking. But despite this lack of a clear political understanding, the GOI is anyway going to be kept on the run, and it will now have to keep a watchful eye on the Naga Regiment and the Naga Armed Police as well, not to speak of the NNO and the UDF. In fact, the entire people of Nagaland will continue to be warily watched by the Government of India.

Is Science Autonomous?

Radhika Ramasubban

Anatomy of Science by A Rahman; National Publishing House, Delhi, 1972; pp 95.

RAHMAN'S intention in writing this monograph-size book appears to be only to give a bird's-eyeview of the functioning of science and scientists in India in all its numerous aspects. For, while the probing tip of Rahman's scalpel touches every part of the anatomy, not a single aspect is dwelt on in any depth. The principal achievement of this tract is Rahman's penetrating observations which throw up a host of interesting questions and hypotheses to which later, more detailed studies can apply themselves. Also, this is the first systematic attempt by a scientist to take up an empirical study of scientific activity as practised in India seen against the backdrop of Indian society. The author's purpose in writing this book "is to draw the attention of the concerned people and start a debate rather than be content with a vague and generalised discussion based on the problems of the advanced countries. Further, such an effort may lead to a better appreciation and critical understanding and be of considerable help in the organisation of science and a better utilisation of the scientists in the country." Though he admits that the paucity of published literature and data on the subject has compelled him to fall back on personal impressions in many respects, one cannot shake off the uneasy feeling while reading the book that his observations prefer to describe manifestations rather than analyse the underlying socio-economic causes of the stagnation of Indian science.

Perhaps the most enlightening chapter is on scientists and the internationalism of science. Rahman is perhaps the only highly placed scientist who is clear about the adverse influence of the Western developed countries upon Indian economic and scientific development. He does not mince words when he talks of the pernicious nature of aid to underdeveloped countries under the guise of the internationalism of science. This, along with the participation of foreign scientists in policy-making bodies, results, on the one hand, in the moulding of the direction of scientific effort in the recipient countries in accordance with the economic policies of the advanced countries and, on the other, in foreign collaboration becoming a substitute for indigenous effort in those areas relevant to the country's basic problems. This, Rahman emphasises, is because Indian scientists and decision-makers *invite* foreign advice through their "open-door" policy. He sees the need for a deep and critical study to see why such a policy should exist in a country with "over a million scientists, a tradition of modern science for more than a century and a vigorous national policy of independence with defined social and political objectives." He wonders whether a deliberate policy of isolation from the advanced countries might lead to a more vigorous Indian scientific community.

Unasked Questions

His dissection of science as a social activity takes into account, among other things, the nature of scientific activity, its internal logic and the differing emphasis placed on different aspects of science in each culture-area in different historical periods, which must be explained "on the basis of social and political links of these areas of research and not on the basis of logical necessity arising from the growth of science." For example the areas in which the British scientists in India contributed were survey of natural resources, agriculture and medical problems directed by colonial British political and economic needs. Similarly, the emphasis on physics in the US today is directly linked with its nuclear programme and space research both of which are in turn related to their defence policy. The major thrust of his argument appears to be that contrary to the erroneous view of science as an apolitical, amoral activity without any social or cultural roots, "the criteria of choice of research problems and the scale of investment are not dictated solely by technical possibilities but by their relevance and need in the context of social and political problems faced by a country or society." He correctly observes that the universality of science and technology lies in methods and techniques rather than in specific solutions. The latter are a result of specific demands made on the scientific community in a given social, economic and political situation. In pursuance of this view of the role of science, he lashes out against those scientists in India who, trained abroad, on their return continue to work on problems in the areas in which they had their training, which are almost always current areas of research in the advanced countries. As a result, in the name of the internationalism of science, "outflows, attitudes and trends of development which are essentially the result of historical and social features of a different culture area are freely advocated and uncritically accepted ... in spite of their irrelevance to India."

However, after making this provoking and forthright observation, Rahman does not go further to ask why our scientists go abroad in hordes and why they are paid — it does not matter how much — by society to carry out irrelevant research if and when they return. Is this an autonomous phenomenon or is it the prevailing socio-economic conditions and the economic dependence of India in relation to the advanced countries which makes this possible? Although in a later chapter, as mentioned earlier, Rahman illustrates and analyses the manner in which the advanced countries impinge upon Indian scientific development and admits the economic and political implications of science, he does not actually show how these facts work out in the Indian context. Is there any such thing as a science policy? If yes, what determines it? How does it tie up with the national plans? What are the actual as against professed goals of these plans? How does the functioning of the Indian economy and its direct and indirect dependence upon the advanced countries affect scientific activity in this country?

In relation to these vital questions, Rahman, in spite of his manifestly radical approach to the role of science and its social relevance, falls into the same trap of a vague and generalised discussion which he is purportedly attempting to avoid. While he speaks of the shift of emphasis from one area of science to another in different "culture-areas" in different historical periods, nowhere does he explicitly or even implicitly attempt to characterise these different economic-social systems. He, therefore, cannot analyse what choices these different economic systems

dictate and consequently the course that scientific development takes under each system.

An important part of this book is devoted to the analysis of the Indian scientific community. His observations seem to indicate that most scientists are satisfied to work within a limited field and with limited objectives and are disinclined to raise either general philosophical or social questions. He finds, moreover, that "there are contradictions between their professed beliefs and their actual work. The instances of scientists opting out for reasons of belief are few." Another striking and paradoxical feature appears to be the widespread religiosity of Indian scientists; while some believe in the broad ideas of a religion, others participate in its ritualism, and some even go beyond and try to synthesise a religion with the latest discoveries of science.

Though Rahman's observations about the Indian scientific community are penetrating, he does not weave these into a theoretical framework which would lead him to look for the causes of manifestations. For example, as regards the fact that science has become a large-scale enterprise where men of science have become mere intellect-workers, masters of techniques with a limited outlook, and their discoveries confined to a specialised area, he only indicates that perhaps a compartmentalised educational system is to blame for this. Rahman does not see the need for going into the background of the introduction of modern science into this country and its subsequent interaction with the social structure in order to understand why "the religious indifference which is so widespread in the educated classes of the West has little counterpart among Indian intellectuals" — an anomaly which seems to perplex Rahman. He does not see that in the West it was the rise of capitalism which weakened the hold of religion and necessitated the growth of modern science. In India, on the other hand, the hold of religion continues due to the predomination of a feudal socio-economic order with its concomitant systems of thought and its co-existence with mere pockets of the more advanced capitalist mode of production which provide only narrow avenues for the growth of modern science. The compartmentalised educational system might be more fruitfully understood if we were to trace the history and objectives of the educational system and the conditions under which the modern Indian, Westward-looking, bureaucracy-minded, status-conscious intelligentsia was created by the British colonisers essentially to enlarge the comprador class. Rahman laments the "social isolation" of Indian scientists. But as he does not go into why they are isolated and from whom, we are left guessing about Rahman's own sociological viewpoint. Are they isolated from the planners? If so, the easiest solution would be to incorporate them into the policy/decision-making structure as Rahman suggests. Or are they isolated from the problems of the mass of the people by their alien language and bastard culture which they espouse following from their upper caste, middle class origins? Further, is not the present direction of science alienated from the basic economic and social problems of the majority of Indian society?

And as for his observation that scientists by and large opt for the *status quo*, this is the dominant characteristic of the intelligentsia depending for its existence as it does on the ruling propertied classes. By virtue of their possession of knowledge, some members of this stratum may be led to profess beliefs which are radically opposed to the ruling order but the objective conditions of their social role lead them to either completely capitulate or to continue to maintain the dichotomy between belief and practice. Only among a very microscopic few might subjective attitudes lead to the transformation of their life-style.

Seeking a Mahatma

Rahman finds that job opportunities and career appear to be the major motivation of Indian scientists as against commitment to the values or objectives of science. Consequent upon this, he observes, is a propensity to follow the dictates of those in power and the tendency for most debates in the scientific community to be limited to administrative matters and personal controversy. He takes care to mention however that a few scientists are exceptions to this rule. "However, till they come to dominate the community and become effective in a social situation they do not set the tone for science." Rahman, in the style of several others, appears to be waiting for a Mahatma, a Messiah to transform the scientific scene. What Rahman fails to see and stress is that the subjective attitudes of scientists as a community can change only when the objective conditions characterising society undergo a fundamental change.

Having outlined the salient features of the Indian scientific community, Rahman goes on to describe the functioning of scientists at four levels: as individuals, as groups of specialists, as social groups and as a community. The details relating to this aspect make interesting reading. To enumerate some: the politicking and infighting in the scientific community with personal social and political factors playing a dominant role; the unscientific manner in which the organised activities of scientists are conducted; the lack of a common code of conduct or value system operating in pratice; marginal issues being exaggerated to further divide the scientists and dissipate their energies. He is quite outspoken in his scathing criticisms of the functioning of organisations like the CSIR; the intrigues involved in by the "top brass" of the CSIR — their bias against independent technical judgment and their attempt to strengthen the administrative bureaucracy, discouragement of pilot plant work on the dubious excuse that it requires considerable investment and is a wastage of resources and efforts; indirect support for increasing import of knowhow and technology. And the committees which are constantly following earlier committees, observes Rahman, have firmly excluded working scientists from the decision-making process and have become instruments for manipulation by influential administrator-scientists in the interest of furthering their own careers.

Towards the end of his book Rahman deplores the lack of awareness of science as a "movement" and consequently the absence of any serious study of the history of science in India. He raises some pertinent questions: "Why science and technology did not evolve in India after having reached a particular level of development? Why the scientific and technological revolution did not take place in India as it did in Europe? Were the reasons inherent in the science of the country, the then prevalent philosophical outlooks or structure of society?" He emphasises the need for "generalists" to study and analyse in depth the involvement of science and technology with social, economic and political issues.

He ends on the hopeful note that perhaps the changes suggested in the working conditions in the field of education and science would lead to the transformation of science, of the role of scientists, and of the dimensions of science and its effectiveness in society.

In this manner, the scientific community would develop a national identity.

Peripheral Suggestions

There appears to be an implicit assumption running through the entire book that in India it is scientists who set the tone for science as a social activity. The fact of the elitist "top brass" cornering the choicest parts of the cake and conversely creating the wretched working conditions of the majority of scientists, according to the author, stands in the way of science becoming a tool for social transformation. One may not object to improving the working conditions of scientists and their inclusion in debates on organisation and policy. But will these reforms by themselves make Indian science dynamic and relevant to the country's problems? Will higher salaries make for greater consciousness among scientists who are a privileged class anyway in a country where economic and educational disparities are so pronounced? Democratisation of the scientific structure cannot by itself have any fundamental impact upon the *direction* of scientific activity in this country and its role in economic development. For in the ultimate analysis who are the decision-makers and in whose interests are the decisions made? Ultimately are scientists autonomous or are they willy-nilly part of the industrial and/or government machinery as long as they are dependent upon private industry or the government for jobs? In an unchanged social frame, Rahman's suggestions can only be peripheral and in no way fundamental. It is only a change in social structure, where science can play a more integrated and dynamic role, that can create the conditions for a socially relevant and purposeful scientific community. To bring about this transformation scientists alone are not the agents. So far as scientists are concerned, the conditions for a more relevant role would be created when they along with other politicised and active sections of society become conscious of the futility of their activity in the present socio-economic environment.

In the underdeveloped countries with their foreign-aided, "mixed-up" economies, where government does all the funding for scientific research, the social role of the scientist is far more significant than his professional role. When a scientist is able to analyse, understand and feel concerned about the nature of his society, he can reach out to other groups and work towards an egalitarian society where science will truly become a tool for a better life and where his research will acquire meaning.

Although Rahman prescribes greater social awareness for scientists, he does not seem to realise the contradiction that if they become socially aware, they will have to make a political analysis of the social structure and the role of science. Perhaps Rahman does not want to face the implications of his prescriptions; perhaps he prefers to remain 'apolitical' himself. On the whole, however, the book provides a valuable insight into the workings of an important area of social activity by one who is himself deeply involved in it. But far too great a wealth of observations has been stuffed into a slim volume which, because the material has not been too well organised, results in slightly disjointed reading.

SPECIAL ARTICLES

World Raw Materials Trade

Trends and Forecast for 1974-1980

Angus Hone

This paper aims to give an account of the present world raw material trade in the context of the 1973 commodities boom.

It also examines the likely development of the world economy in the period 1974/1975, focusing on the possibility of the oil cutbacks producing a serious recession in Western Europe, Japan and North America in 1974 and beyond. It attempts to assess the likely price developments in the period 1974/1980 as the full impact of the 300 per cent oil price increase begins to bite into the competitiveness of synthetic materials and to undermine the balance of payments position of the industrial countries.

Finally, the paper tries to identify the countries which are likely to lose and those which are likely to gain in this readjustment of past trends.

The 1973 Boom

THE extent of the boom in 1973 is immediately obvious from a survey of the major commodity prices and indices (Tables 1 to 6). A commodity-by-commodity examen confirms the basic accuracy of the indices. Metal prices continued to climb from October to December 1973. Only wolfram, nickel and mercury did not experience sharp increases in the course of 1973.

The level of grain prices shown in Table 4 reflects the recent activity in wheat and maize market in Chicago and Kansas City. The price rise in rice has been even more dramatic with Thailand and Burma imposing export quotas and the price levels exceed £ 125 per ton in the free markets. Cereals prices are likely to fall only by 20 per cent in 1974 as grain stocks worldwide are at their lowest level for twenty years, although rice prices may fall more sharply given low "effective" demand (i e, countries who need to import rice such as India and Bangladesh cannot pay for it). The prices of US, EEC and Canadian wheat and maize climbed throughout the 1972-73 crop season, ending 1973 at record levels; the price of soya beans increased by four times before falling back with the 1973 crop; oilcake prices doubled, while

fishmeal (another major protein source) for the animal feed industry (pigs and poultry) is virtually unobtainable after the continuing failure of Peruvian production.

The worldwide shortage of protein for animal feed is also partially reflected in the oilseed and vegetable oil prices shown in Table 5. Prices moved steadily up from October to December taking soyabean oil and copra above $ 500 per ton. The prices of some other major traded commodities have risen slowly (coffee, jute, etc) after sharp price rises in 1971 and 1972, remained steady (tea and sulphur), but in the main have risen sharply as Table 6 shows. Cocoa, cotton and wool prices fell back marginally towards the end of the year; rubber at 50 p per kilo and sisal at £ 375 per ton reached post-Korean War highs.

The distribution of the gains has covered the whole of the developing world from Chile (copper) to Sri Lanka (rubber). The developed countries have suffered deterioration in their 'terms of trade' by 10-15 per cent! Prices have risen in every major commodity group: grains, beverages, oils and oilseeds, fibres, metals and fuels. The gains to individual developing economies will differ enormously, but there is little doubt that the developing world as a whole has gained substantially in 1973 and will gain in succeeding years. The present set of increases in price is most unlikely to be wiped out in the period upto 1980 and the fall as a downturn develops in 1974 is likely to be limited to 20 or 30 per cent of the present price levels.

The extent of the gains in the basic price indices does not reflect the massive oil market price increases in 1973 from $ 2.00 per barrel approximately to at least $ 4.00 per barrel in October with further price increases to $ 8 per barrel now certain for early 1974. Petroleum is the dominant export earner for the whole world and the dominant traded raw material moving in international commerce. All traditional trade indices which do not reflect the rapid 1971-1973 oil price rises tend to underestimate the price rise in basic commodities. The most satisfactory solution would be a petroleum price index compiled separately, but then weighted into a basic index such as Reuters. The HWWA in Hamburg does have an index including petroleum which will be available soon in English.

A second problem accentuated by the 1973 boom is that the gains are inequitably distributed. A number of tiny oil states with a low population base should clearly be excluded when attempting to calculate the gains: Saudi Arabia and the United Arab Emirates do not have the same population base or development problems as Algeria, Indonesia, Iran, Iraq, Nigeria and Venezuela.

Third, a number of very poor developing countries in the Caribbean, Latin America and South Asia face sharply rising fuel and raw material import costs, which will make development exceptionally difficult unless a sensible discount formula is worked out based on two-tier pricing or arrangements are made for an automatic apportionment of some of the price increases to South Asia and Africa in the form of development assistance through an Oil Exporters' Development Fund or something similar.

The starting point of the present commodity boom can be dated from the signing of the Teheran-Tripoli agreements in the oil industry between the eleven OPEC countries and the major multinational oil companies in 1971. The per barrel increase negotiated "is approximately 50 per cent over 1969 as of the middle of 1971, and escalates to about 75 per cent of 1975".[1]

Prior to the 1971 agreements the crude oil price had been declining in real terms since 1963. The ability of the OPEC countries to extract higher prices and compensation from the majors for the depreciation of the dollar in 1972 and 1973 has been extremely impressive. The long-term weakness of the OPEC countries' position is that the marginal cost of a barrel of Persian Gulf crude is between 10 and 20 cents against the October posted price of $ 5.00/5.50 per barrel or the 1974 price of $ 11-12. Clearly any break in OPEC's united front would have the very serious consequence of causing a steep decline from the present floor of tax-plus-cost towards a price based on the marginal cost of production[2] plus a premium for scarcity and the high costs of developing new oil energy sources.

However, increased prices for oil became the basis for a worldwide interest in the environment and the exploitation of non-renewable resources, which was especially reflected in the work of the Club of Rome and the subsequent debate[3,4] arising out of the UN Conference on the Environment in Stockholm. The 'apparent' shortage of oil and the 'apparent' problem of exhaustion of the earth's non-renewable resources and a cutback in investment

Daily Life in Revolutionary China

MARIA ANTONIETTA MACCIOCCHI

An English translation of a book that has been a best-seller in Italy and France, where it has been through many printings and two revised editions. It provides an extraordinary wealth of detail about the daily lives, experiences, thinking, and feelings of the thousands of Chinese peasants, workers and intellectuals with whom the author talked. This is a translation of the most recent edition which carries the narrative through the Nixon visit to China in February 1972.

Disaster in Bangladesh

Health Crises
In a Developing Nation

Edited by LINCOLN C. CHEN

The contributors to this volume, having lived and worked in Bangladesh, present the first comprehensive study of its health problems. *Cloth boards $9.50*

Pakistan's Foreign Policy

An Historical Analysis

S. M. BURKE

The first definitive work on the history of the development of Pakistan's external relations by an eminent diplomat and scholar. In this lucid and scholarly study, from the crucial years of Pakistan's independence to the end of 1970 when she entered a new phase of her existence, most of the important and controversial questions are discussed.

outlays in the chemical industry from 1967-1971 combined to produce the realisation in early 1973 that basic industrial feedstocks such as petrochemicals, plastics and artificial fibres were likely to rise in price and suffer from supply shortages over the period 1971/1976. This shortage has developed rapidly throughout 1973, a year of exceptionally high demand growth.

At the same time, concern with pollution in Japan led to cuts in plastic production (particularly PVC). The whole problem for the chemical industry became critical from October 1973 after the Arab-Israeli war with the cutbacks in shipments by the Arab states and the complete ban on shipments to the Netherlands and the United States. Whatever the final consequence of the October-December 1973 cutbacks, their impact will continue to be felt throughout the first half of 1974 and a worldwide recession in 1974 will be unavoidable if the oil cuts are not gradually lifted early in 1974. Mere restoration of shipments to September 1973 levels would still cripple world growth upto 1980 as rising petroleum imports were a basic premise of the OECD countries' energy planning over the last decade.

The autumn of 1971 and the spring of 1972 saw the beginning of a major industrial and trade boom in the United States and the European Economic Community, which was in marked contrast with the depressed levels of worldwide economic activity (outside Japan) from the end of 1969 to the middle of 1971.[5] This boom continued through to the end of 1973 and accentuated raw material shortages throughout the world.

The failure of the international monetary system to stabilise following the dollar's devaluation and declared non-convertibility in terms of gold in 1971 was followed by the further 10 per cent devaluation in March 1973. The continuing strength of the EEC currencies and the Swiss franc from May-July 1973 was aggravated by the creation of negative interest rate barriers to 'hot money' movements by the European Central Banks and the revaluation of the German Mark at the end of June. Earlier in the year the Hong Kong and Singapore stock exchanges fell back steeply (by 60-70 per cent) from their February-March 1973 peaks and released large quantities of mobile funds for commodity speculation. The large Japanese trading houses had been buying commodities throughout the world from the middle of 1972 with the semi-official blessing of the bureaucracy, who realised that the yen/dollar parities could not be defended for ever and that a stockpile of commodities purchased at low prices in yen terms would be a valuable cushion for Japanese exporters during the subsequent period of adjustment. All these factors interacted with a substantial industrial demand for commodities to produce the present 70-80 per cent price increase in less than a year.

Endless comparisons are made between the present boom and the 1951 Korean War boom, but the similarities are not, in fact, very great. The increase in prices at that time did not affect all commodities — it was a war-based boom producing sharp gains followed by dramatic falls in rubber, metals, and certain key fibres. Second, the commodity indices did not suddenly jump 70-90 per cent within a year (see Table 7). In the last year the commodity index has risen from below 600 to above 1300 (more than 100 per cent) whereas the 1949-1951 increase was slightly less than 50 per cent. Third, the Korean War boom was temporary because it faced the immense US stockpile of strategic materials and metals, which were built up during and just after the 1939-1945 war and after the Korean War. This stockpile is now only a small fraction of annual world demand for rubber, tin and copper (the main GSA stockpile commodities). Fourth, the rate of growth and the size of the annual increase in world industrial output and hence raw material demand is now six or seven times greater than in 1951 and the shortages in key raw materials become evident in a very much shorter space of time. World stocks of all commodities at the end of 1973 are very low: the foodgrain positions in the United States and Canada have been run down from the time of the famines in South Asia and the shortages in China in 1965-1968. Surplus rice is not available as the major exporting countries, Burma, Thailand and the United States had poor harvests. Any remaining stocks of grain were severely reduced by the worldwide crop failures in 1972 and the Russian purchases of over 20 million tons of wheat and maize.

Copper is in short supply as a result of strikes in the United States and Canada and the political difficulties in Chile and Zambia. The stock positions of sugar, cocoa, coffee and oilseeds are low and all these crops have been partially affected by the 1972 or 1973 droughts. Wool, sisal and cotton have suffered from droughts and competition with cereals for land. Rubber expansion and replanting was limited as a result of depressed prices and threats from Japanese synthetic exports in the period 1969-1972. Overall, the position in 1973 in contrast to that in 1951 is one of shortages and low levels of physical stocks confronting a rapidly rising world demand, which is unlikely to decline significantly before the first quarter of 1974.

The oil crisis and substantially high prices charged for petroleum products have helped convince many raw material and fibre producers that higher prices are likely to continue unless there is a 1974 recession as a direct consequence of the oil cutoffs, which followed the Arab-Israeli conflict. The raw material prices may remain high even in the event of an economic slowdown if critical shortages of bunkering fuel prevent world shipping from operating at normal capacity in the first months of 1974. The decision of the Arab oil exporters to rescind a portion of their October cuts from January 1974 and increase shipments to most EEC member states and Japan is important as it makes it clear that the OPEC is fully aware of the interdependence of the world economy.

FUTURE OF COMMODITY PRICES

It is notoriously difficult to predict the future trend of commodity prices. However, there are a number of factors which can be analysed at this juncture.

The 1973 boom is almost certainly

a partial long-run adjustment in the terms of trade in favour of primary producing countries and if that is the case of the commodity indices are extremely unlikely to fall back to the 1972 average levels unless there is a major oil-induced world depression in 1974. Second, perhaps 25-30 per cent of the increase in prices is only a reflection of a fall in the value of the pound and the dollar against EEC and Japanese currencies and gold since the end of 1971. The bulk of the world's commodities perhaps as much as 90 per cent, are traded in dollar or pound prices and a mark-up was inevitable to provide a degree of price parity. Thirdly, commodities from March 1973 onwards become a hedge against falling values and instability in currency and securities markets. Throughout 1973 the two major currencies, the dollar and the pound, have been under severe pressure although the dollar recovered strength in the final quarter of 1973 and ended the year very strong against all other currencies. The stock exchanges had also been thoroughly depressed throughout the world. A large supply of dollars, Asian dollars and even 'all' dollars have spilled over from the stock exchanges and the gold market into commodities, although speculative buying has been much less important than suggested by some commentators.

These temporary factors will become less and less important in 1974 and beyond, but the basic shortages and the growing world demand, stimulated by a 10 per cent increase in industrial output in the OECD world, has led to undersupply and rising prices and it will take three to five years for adjustments to be made on the production side. The pessimism of the 1950s and 1960s boldly developed by Raul Prebisch at ECLA and during his period as Secretary-General of the United Nations Conference on Trade and Development (UNCTAD) has bitten deeply and it will be very difficult for Latin America and Asia to sustantially increase production of food, fibres and industrial raw materials before the late 1970s. At the same time the food requirements of the developing world are likely to be under severe pressure throughout the decade. The expansion of plantation crops involves a 4-10 year wait before new plantings become fully productive. The development of mines and smelters for non-ferrous metals takes even longer whether it is undertaken by national firms or multinational groups. Similarly, new petroleum and feedstock capacity for petrochemical or synthetic industries involves a 3-5 year planning, construction and start-up cycle. All these delays and adjustment difficulties make it very likely that the commodity indices will fall only by a limited extent. The Reuters Index might be expected to stay in the range of 800-900 from 1974 to 1980, although a major world depression would clearly invalidate this projection and the present oil crisis makes zero growth in 1974 a distinct possibility, particularly as Western Europe and Japan have unprecedented balance of payments deficits.

Value of the Indices

The Reuters Index is not wholly reliable (see Table 8). Wheat 14 per cent, wool 11 per cent, maize 5 per cent and soyabeans 3 per cent are overrepresented if it is used as an indicator of the developing world's trade. Their share in developing countries' exports, as a percentage of world exports of these commodities, is small, although these commodities are highly significant in overall world trade. An index for tropical agricultural products was calculated using different weights for 1913 and 1953 by W Arthur Lewis,[6] but this fails to give a convincing picture as it omits metals as well as petroleum (which is excluded from all indices) and a number of fibres. This article will use the Reuters Index as a base adjusted for the products mentioned, with additional consideration given to petroleum, which had become more and more important since 1945, and manufactures, which have also grown very fast from 1960, although their importance is restricted to a group of 12-15 countries concentrated in Asia and Europe with only Argentina, Brazil and Mexico as important Latin American exporters.[7]

In Table 8 the weights used are important as is the omission of tea, timber, hides and leather, jute and sisal from the Index. However, it is a reliable index which only slightly overstates the price increases likely to be obtained by developing countries. It would clearly be useful if a new series of commodity indices were prepared using not world weights but weights chosen to reflect the base-year (1969) pattern of the developing countries' trade for all their export commodities and subsequently with the petroleum and the fuel sector excluded. The HWWA Hamburg indices go some way in this direction.

Table 3: Commodity Prices (Metals)

	5.10.1973	5.10.1972
Copper wire bars (£/ton)	818	425
Gold ($/oz)	99	65
Lead (£/ton)	187	124
Silver (p/oz)	112	75

Barley (home; £/ton)	49.50	27.50
Maize (US; £/ton)	52.50	28.15
Wheat (UK; £/ton)	59.50	33.00

Gains of Developing Countries

There is a group of economists who wish to play down the dimensions of the present commodities boom and its likely dynamic effect on the foreign exchange earning capacity and economic growth of developing countries and the balance of payment losses for the OECD countries. They argue that the real gains are limited. First, the devaluation of the dollar and pound, the major trading currencies, has meant that the higher-priced primary commodity exports will buy less in terms of raw materials and manufactured imports from the hard currency economies of the EEC, Japan and Scandinavia. This argument forgets that US, Canadian and UK exports in 1972 accounted for $ 93 billion out of total world trade of $ 400 billion[8] and that this group of countries and other developing countries selling largely in pounds and dollars supplied more than 60 per cent of developing country imports in 1972.

A second argument is that the foreign exchange reserves of developing countries were largely held in dollars and pounds and that as a result they have suffered losses in terms of their import capacity. In fact, many developing countries hold large portions of their foreign exchange reserves in gold and those countries holding dollars or pounds often trade mainly with other dollar or sterling area economies. In these cases the losses will be rather small and the revival of the dollar against the yen and EEC currencies in the last three months of 1973 has further reduced the validity of this argument.

A more important point is the role that a number of developing countries have as importers of primary products: foodgrains, metal and fuels. The losses to the Indian foreign exchange reserves in 1973 are estimated at $ 700-900 million on account of the purchase of foodgrains and oil alone. In addition, the cost of imported crude petroleum and non-ferrous metals has sharply increased over the last year wiping almost all of India's carefully husbanded reserves. India, however, is a special case with a very large population of nearly 600 million. The bulk of Latin American countries, most West African countries and almost all the mineral, timber, rubber and edible oil exporters in South-East Asia will gain substantially from the boom, although they will need development assistance from an Oil Exporters' Development Fund to counteract the impact of the oil price rise. The petroleum producers were already receiving the price increases negotiated at the end of 1971 and additional currency adjustments. The 1973 price increases have been even more dramatic. The losers are a small group, including South Asia, and unfortunately but predictably a number of the 'least developed' nations.

A more substantial objection is that the price increases reflect a shortfall in production and that most developing countries have suffered export volume losses which will wipe out a large part of the export price gains. There are shortfalls in wheat, rice, maize, soyabeans and wool, but only rice is exported in substantial volume by developing economies. Nevertheless, Argentina, Brazil and Uruguay have gained considerably. The production of fibres and oilseeds did not fall sharply from the 1969-1971 average levels. Cocoa has suffered from the West African drought, but the huge price rise (100-120 per cent) has more than compensated for any volume losses (25-30 per cent). The major exports are well up in volume and value in 1973 over 1972, although individual countries have lost export opportunities through partial supply side failures in copper (Zambia and Chile), groundnuts (Senegal), rice, maize and soyabeans (Thailand). The danger of volume falls wiping out gains has been exaggerated.

Table 5: Commodity Prices (Oils)

	5.10.1973	5.10.1972

The pessimists also argue that the gains in the period 1972-1974 will be spent slowly over the next five years and the value for the purposes of economic development will be diminished as a result of inflation in the prices of the required capital goods and intermediates, which will be largely supplied by the developed capitalist economies currently suffering from inflation of between 7-10 per cent per annum. It is certainly true that most developing countries will find it difficult to expand their development spending in line with export earnings, but part of the foreign exchange could be used to reduce tariffs and quotas at present protecting a number of highly inefficient domestic industries in developing countries and the surplus can always be used to reduce the burden of indebtedness.

A number of these pessimistic arguments were developed in a recent article by Hans Singer.[9] Singer does develop two major arguments which are entirely valid and do diminish the impact of higher prices on the growth of the domestic economies of the poor countries. First, a large proportion of the oil and mineral output is produced by 'enclave' sectors operating within the developing world. The additional receipts to national governments depend on ownership, taxation structure, etc; gross export gains often become quite small net additions to gross domestic product and fiscal resources. Second, a number of multinational companies operate in plantation sector exports and in manufacturing and in these sectors as in extractive industries such as oil and minerals the real gains will be limited by higher profit and dividend remittances. Both these arguments are correct, but in most cases the gains to developing countries are at least proportional to the growth of their gross export earnings which in 1973 has been massive.

It is forgotten by the pessimists that even a turndown in growth in the industrialised countries in 1974 and beyond will have favourable effects on the developing countries. The most dramatic and immediate effect will be a slowdown in the price inflation of 7-10 per cent per annum in the prices of developing country manufactured imports which has been experienced in the period 1968-1973. Second, the 1973 crop predictions indicate that prices of cereals of which the developing world is a large net importer will be considerably lower in the 1974-1976 period. Third, a world slowdown or recession is likely to produce substantial benefits in terms of better credit terms at lower interest rates and a slower rate of import price inflation for those developing countries purchasing capital equipment from and borrowing on the Eurodollar market.

The present year's expansion has taken place in the context of approximate developing world exports of $ 72-74 billion in 1972, which are likely to grow massively to $ 88-90 billion in 1973. Although a number of the poor and least developed countries have not benefited from the commodities boom, the impact on overall economic performance of the developing world will be massive in 1974 and 1975. International aid is currently running at around $ 7 billion per year, but this is dwarfed by the change in commodity price levels. "Speculation and demand in the world's commodity markets have given the commodity exporting nations an increase in foreign earnings that far exceeds the value of any international aid."[10]

The oil price increase alone has completely reversed the world balance of economic power. The 1968-1972 growth rate in world and developing country trade, although it partially reflects the devaluation of the dollar, is impressive and the progress of individual commodities is even more striking if compared with the 1963-65 average exports of the developing world. Table 9 reflects the likely 1973-1975 exports from the developing countries based on "expected" export volumes and a Reuters commodity index at 850 (i e, 35-40 per cent below its level on December 14, 1973).

Trade in certain commodities such as sugar, spices, tea and tobacco has grown slowly and these crops will continue to find outlets difficult in developed economy markets, but the potential for fruits and vegetables, beef and foodgrains and protein sources will be excellent provided the common agricultu-

ral policy of the EEC and Japanese protectionism can be gradually adjusted. Similarly, reasonably free access for labour-intensive manufactures will be dependent on adjustment assistance in the developed economies offering an opportunity for their politicians to grant 'guaranteed market access' to the rapidly growing industrial output of the developing world. The prospects will depend on a cutback in tariff and non-tariff barriers to trade,[11] which will not be lowered as the current account positions in Western Europe and Japan move into chronic deficit.

Unless the developed capitalist countries not only fail in the preliminary GATT multilateral trade talks scheduled to start in Geneva in November, but also manage to begin a trade war by raising industrial tariffs and quotas against each other, it is likely that the trade prospects for developing countries in the period upto 1980 will be good. Those countries able to overcome supply bottlenecks will benefit the most. Even an 8 per cent growth in export earnings will produce the pattern of export earnings for developing capitalist economies shown in Table 10.

A more detailed analysis of the long-term growth prospects of the developing countries and the interaction of trade and aid will be found in a more detailed paper[12] but my projections would have to be revised as they anticipated only a 20 per cent per annum increase in oil earnings between 1972 and 1980.

'Terms of Trade': Long-run Deterioration?

The majority of non-economists with in interest in development are firmly convinced that there has been a significant long-term continuous deterioration in the developing world's terms of trade, although the World Bank's recent "Trends in Developing Countries" (1973) shows only a 10 per cent decline from the 1950 high to 1970 and no deterioration at all from 1948 to 1970 or from 1963 to 1970. This conviction was built up from a very early United Nations study, which drew on an earlier League of Nations report.[13] This report became a key document in the subsequent work of Raul Prebisch and his disciplies in the Economic Commission for Latin America and, after 1964, at UNCTAD.

The reasons for the expected long-term decline were apparently straightforward. The income elasticity of demand for primary products is low. The increases in population in developing countries will force new entrants into primary production thus expanding output at low wages. There is clear evidence that technical progress has resulted in economies of raw material usage while at the same time a number of petroleum-based synthetic fibres have been developed, which have made severe inroads into the markets for natural fibres. Finally, these products are produced by or sold to large oligopolistic business groups who are 'price-makers' rather than 'price-takers'. A very clear statement of this basic position can be found in a short paper by Alfred Maizels.[14]

The Marxist position is represented by the work of Emmanuel[15] whose interesting and original thesis is based on the immobility of labour from the undeveloped world to the developed economies while capital moves freely from developed capitalist economies to the developing world and *vice versa*. Emmanuel is cavalier in his analysis of the long-term deterioration of the 'terms of trade'. He quotes the UN study of 1949 as well as the historical studies of the period 1880-1913 by Schloets, Silverman, Imlah and the Board of Trade for 1880-1916.[16] However, there is no attempt to refute or even discuss the recent work of Morgan[17] and W Arthur Lewis[18, 19] and no use of recent studies.

Morgan concluded on the basis of data reaching back to 1801 that primary product prices rose sharply relative to UK prices up to the 1860s or 1870s, fell slowly to 1913, experienced the full force of adverse world economic conditions upto 1950 and had not deteriorated in the subsequent period. The Reuter index based on September 1931 has shown no deterioration over the last 42 years. Helleiner concludes:[20]

> Effective attacks have been made both upon the data used and the theoretical analysis underlying the 'Prebisch thesis'. One is forced therefore to remain fairly agnostic about historical trends in the commodity terms of trade.

W Arthur Lewis's work ended in 1965 and there was a small but significant deterioration in the terms of trade for tropical agricultural crops. But the continuance of his figures using an average of 1972-73 production and prices and the addition of metals, fuels and manufactures would almost certainly correct Lewis' observed deterioration:[21]

> Between 1913 and 1950 the tropics passed through a long depression, associated with World Wars and adverse terms of trade. The rate of growth of tropical trade fell to 2.2 per cent per annum between 1913 and 1955. However, since 1955 the volume of tropical trade has again grown very rapidly, namely, by 4.5 per cent.

A final document is the UNCTAD paper prepared for the 1972 Santiago Conference in Chile.[22] The terms of trade referred to in this document are the 'net barter' terms of trade, which are defined as the ratio of the export price index to the import price index. The deterioration from 1954-56 to 1968-70 can be seen in Table 11.

There is little doubt that the 1971-1973 averages would show no deterioration if measured today and if the Reuters Commodity Index remains between

1990	290
2000	600

Source: 1972 — UN estimates; 1980-2000, calculated.

800-900 in the period upto 1975 the terms of trade over the last 20 years will not have deteriorated at all and probably will have improved by 5-10 per cent. It is true that the prices of raw material, intermediates and capital goods imported by developing economies have risen sharply in line with world inflation in the period 1971-1973, but they have risen only at 30-35 per cent of the rate of growth in commodity prices. Hence the sharp swing back in favour of the developing world. For instance, the United Kingdom terms of trade in December 1973 were 82 (1972=100), showing the extent of the gains.

This detailed examination concludes by suggesting that there is little reason to suppose that the long-term 'net barter' terms of trade have deteriorated if 1801, 1913, 1938, 1948 or 1954 is the selected starting year. The choice of 1870 or 1950 might show past deterioration, but the choice of base year for purposes of comparative analysis should neither be a cyclical peak nor a trough and if prices remain within 30 per cent of their 1973 peaks no base year could be used to demonstrate deterioration in the 'terms of trade'.

There are also reasons for supposing that psychologically economic policy-makers are interested in reversing the pressure to produce synthetic substitutes. Higher oil prices, energy shortages and pressures to reduce pollution have grown recently. Natural fibres are benefiting from these high prices and non-availability of petroleum and petro-chemical by-products and the partial exhaustion of the clearcut economies of scale which existed in the 1950s and 1960s. The possible taxation of pollution and non-bio-gradeable products will be an additional opportunity for natural fibre producers, while the export of smelting and refining industries will raise the developing world's share of industrial value-added. The long-run shortage of labour in both agriculture and manufacturing industry in the developed world may well encourage the export of beef, feed and fruit and vegetable products, open immense opportunities for expansion of fishing and timber processing and lead to a gradual transfer of labour-intensive multi-national industries to the developing capitalist world.[23]

Prospects for Individual Commodity Groups

This section is not a country-by-country analysis, but an effort to analyse the prospects for major commodity exports of the developing countries.

Food, Beverages and Tobacco

The basic shortages in 1973 span the whole foodgrains sector and affect the developing countries largely as importers. Latin American wheat and maize will become increasingly important but much of this surplus will go to China and the rest of the developing world given a record 1973 harvest in Russia. Rice is likely to continue to be in extremely short supply in the 1973-1976 period in contrast to the predictions of an overly optimistic and outdated article by Ridler and Yandle,[24] which accepted the myth of the 'Green Revolution'. The major problem in this sector is the limited ability of Asia and Africa to cut food imports in the 1970s. To a considerable extent they will benefit from lower cereal prices from 1974-1980 if they can raise exports sufficiently to finance food imports.

The export prospects for proteins and animal feed are excellent. Oilcakes, cassava, soyabeans and fishmeal are likely to be required to feed the increasing Japanese and EEC animal and poultry population. Oilcakes are likely to be a growth market[25] although demand for edible oils will grow only slowly in the rich countries, which complicates the production picture. Cassava has reached $100 million in 1972-73 and is likely to expand to over $300 million by 1976.[26] The market for soyabeans has become sufficiently a problem in EEC/US relations following the Nixon embargo of June 22, 1973 that it produced an article in *Le Monde*.[27] Finally, there are major opportunities for new developing country producers of fishmeal with the medium-term collapse of the Peruvian industry.[28] The long-term shortage of animal feed as well as the protein shortages will continue even after the major recovery of US maize and soyabean exports in crop year 1973-74 and will provide opportunities for newer producers.

The three major beverages, coffee, cocoa and tea, all face different problems. Coffee's price prospects upto 1980 are limited unless major expansion of consumption can be negotiated between the producers and the socialist economies of Eastern Europe and possibly Japan. Cocoa is a growth crop, which has seen expanding usage in the developed economies and the Soviet Union on a major scale. EEC consumption is likely to rise in the 1970s. Tea, in the absence of any multinational generic promotion, will grow at only 2/3 per cent per annum, but increased usage in developing countries could alter these growth prospects. Problems for coffee and especially tea exporters are likely to continue in the period 1974-1980 but some of the difficulties could be alleviated by a series of producers' agreements. Spice consumption is growing substantially, but a market of $150-250 million per annum dominated by pepper is only a small item in international trade. Sugar is a crop of major importance, but very little can be predicted until the negotiations between the EEC and the UK and the cane sugar producing Commonwealth territories are completed.[29] The French, through their Minister of Agriculture, M Chirac, will continue to unsettle world sugar markets until agreement on access for Commonwealth cane sugar and the level of the EEC's own marketable surplus is reached. The renewal of the International Sugar Agreement has become a further problem with the breakdown in Geneva in October 1973.

The world demand for bananas and citrus fruits and juices is unlikely to continue to grow at the same rate as in the period 1967-72, but growth of the Japanese and USSR markets will continue. The market demand and prices for beef, fresh, frozen or canned fish and fruits and vegetables will continue to grow very fast. In these items the developing countries' supply constraints

are more important than developed countries' demand, although reductions in EEC and Japanese tariff levels would be valuable. Finally, the world tobacco market will grow very slowly although the switch, from the high nicotine, United States and predominantly Virginia leaf to a wide variety of low nicotine and dark air-cured leaf from developing countries will continue. India must reduce the nicotine content of its tobaccos.

Raw Materials

The major items here are cotton and rubber (see Table 9). Cotton is in extremely short supply as prices were depressed from 1965-1971 as synthetic usage expanded. It is also a crop forced to compete for agricultural land with grains and oilseeds. Cotton usage in blended fabrics (with polyster) is growing rapidly and prices are likely to remain high,[30] although synthetic fibres may become unavailable if the oil cuts continue and will in any case face temporary feedstock shortages in 1974 and 1975.

The prospects for natural rubber have improved strikingly in 1973. The yen has been substantially revalued upwards, which has blunted the cutting edge of the major synthetic rubber exporters in Japan (250,000 tons in 1972) and this, combined with the oil and tallow price increases, has made the raw material feedstock prohibitively expensive for any new major synthetic rubber capacity. Finally, there is only a very small quantity of rubber left in the US strategic stockpile administered by the General Services Administration which is unlikely to depress prices unduly in the period 1974-1980, even if the United States and the producers do not agree on the phasing of its release.

Leather prices have fallen back from the inflated levels of 1972, but the demand is likely to continue at high levels given the high cost of synthetic substitutes. The world is suffering from a marginal overproduction of oils and fats, but coconut, palm oil and groundnut oil prices are unlikely to fall back to their 1972 lows. The prospects for jute, coir and sisal might even stabilise with the problems facing synthetics if India, Pakistan, Ceylon and the hard fibre producers could work out a joint policy.[31] Iron ore prices are likely to stabilise at 1974 levels as competition between Australia, Latin America and India becomes intense, but volume will continue to rise substantially, even given cutbacks in Japanese steel capacity expansion plans. Finally, timber exports will grow substantially in price and volume after a temporary setback in 1974

TABLE 11: CHANGES IN THE 'NET BARTER' TERMS OF TRADE OF SELECTED GROUPS OF DEVELOPING COUNTRIES, 1954-56 TO 1968-70

(Percentages)

	Total	Africa	Asia	Latin America
Terms of trade	—12	—11	—6	—19
Export prices	0	- 1	+3	— 5
Import prices	+13	+12	+9	+17

as a result of reduced building activity.

The prices for chemical and mechanical pulps for paper and newsprint have been artificially held down by joint pricing action throughout 1973, but Scandinavian and Finnish producers will find it very difficult to raise pulp prices in 1974 if the oil-induced recession deepens. The opportunity to raise newsprint and paper prices in 1973 should not have been missed.

Fuels

The dominant position in the developing world's exports from 1972 to 1980 is held by oil. Of the developing world's exports (at 1974 price levels) in 1980, 65 to 70 per cent or more will be petroleum or its by-products and the price at which this product will move is clearly critical. The present pries of oil exports have been imposed by a group of dominant suppliers, the OPEC countries, who are likely to be more and more important as United States domestic output is outstripped by the quantum demand growth for energy. The unity of the OPEC and Arab oil exporting countries can ensure that the present price level of $ 11-12 per barrel will be held and will continue to rise, but a detailed recent study suggests that[32]

> crude oil prices will decline because supply will far exceed demand even at lower prices, and because — a separate issue — there will continue to be enough competition to make prices gravitate towards cost, however slowly.

The difficulties are such that I shall assume that upto 1980 there will be no downward pressure on price and the OPEC countries will continue to work together. OPEC countries will not begin to refine and market their own crude in competition with the major oil companies, who by restricting entrants are in the happy position of being the OPEC countries' "tax collecting agency".[33] The period after 1980 may be different. The prices agreed from 1971 to 1973 and the prospective payments for 1975 and 1980 have no connection with supply and demand and a major effort is getting under way to develop alternative source of energy. When Adelman writes that prices "reflect no scarcity of crude oil present or foreseen", he may be failing to distinguish between "real" scarcity and "felt" scarcity.[34]

Increased competition might well break all OPEC agreements, particularly as[35]

> The cost of providing capacity and operating it in the big Persian Gulf concessions does not exceed 10 cents per barrel, assuming a 20 per cent return after tax.

The likelihood is that the control of the multinational oil companies will be removed slowly outside Libya. The US will pursue "strategic", high cost energy policies to the 1980s, but the OPEC will not remain united and prices of crude may eventually stabilise at their 1977-1980 price levels.

The present pattern of posted oil price increase, as shown below,

	($/barrel)
1971	2.00
1972	2.50
1973	3.10-5.60
1974	11.65

have been so sharp and such a dramatic reversal of falling real prices in the 1950s and 1960s that the future trend is impossible to predict. This situation is further complicated by the cuts in shipments imposed from October 1973 on Western Europe and Japan and the ban on shipments to the United States and the Netherlands agreed by the Arab oil-producing states.

In the long run a market price of $ 8 per barrel appears to be the likely breakeven point for shale oil in the United States and a further ceiling would be the $ 11-15 per barrel breakeven for petroleum products produced direct from coal. The snag is that the OPEC countries can impose a price of $ 8-10 while the investments are made in shale extraction and coal. Marginal oil could sell at $ 20 per barrel. The fuel sector's prospects will only be clarified later in 1974 when the price level and the supply cuts are disentangled.

Metals

Copper, tin, lead, aluminium, zinc and nickel are linked closely to world demand and prices are likely to fall back in 1974 from their very high December 1973 peaks reflecting the world economic downturn, although there are significant smelting shortages in aluminium, lead and zinc, which are likely to sustain prices above 1972 levels for several years and the limited quantities

of copper wire bars and major supply of tin in the United States stockpile can be absorbed by the market in the period upto 1980 without effecting present price levels too seriously.

Chemicals, Transport Machinery and Other Manufactures

More than 40 per cent of these exports at present consist of cotton and synthetic yarn, textiles and clothing. The long-term Textile Agreement already limits access of cottons and major importing countries under the auspices of the GATT have agreed to a new Multi-Fibre Agreement, which could effectively limit market access from 1974 for a wide range of rapidly growing clothing products in the developed capitalist economies. Similar restrictions are either in force or could be imposed on a wide range of processed food products, leather, leather manufactures and footwear, plastic and rubber manufactures, etc. Market access of the developing world's manufactured products is either limited or threatened by the so-called 'voluntary' agreements, but the 1960-1972 growth has exceeded 14 per cent per annum. The 1973-1980 outlook is for somewhat slower growth than in the last 12 years, but the developed capitalist world will gradually remove barriers to trade and establish adjustment assistance for industries affected by low-cost manufactured imports, although the outlook has been dimmed by the worsening OECD balance of payments prospects from 1974 to 1980.

The trade prospects for the developing world are considerably better in 1973 than they were in 1951 or even in 1960. The balance of economic power has shifted towards the primary producers, although any breakdown in the oil price agreements engineered by the Arab exporters and the OPEC alliance would radically alter this analysis. The price of a barrel of oil will be a critical measure in the period 1974-1980. The confrontation between the developed world and its developing counterpart will be about commodity prices — not aid or foreign private investment, although these two are often clearly linked to control of commodities. The producers can work together to obtain higher prices not only in oil, but in copper, coffee, tea, cotton, rubber and a whole range of less important primary commodities.

CONCLUSIONS

The 1972-73 boom represents a real shift in favour of the primary producing world and its export earnings. Commodity prices have risen dramatically as a result of shortages, currency uncertainties, speculation and a major expansion in industrial usage. They will continue to perform differently from prices during the 1950-1951 Korean War boom and are most unlikely to fall back to 1972 levels in the period upto 1975-1980. The developed world is likely to be forced to pay substantially higher prices for oil, metals, fibres and industrial raw materials such as rubber, timber and newsprint from 1974 to 1980. The future price levels will then depend on the speed of offshore oil, gas and shale oil developments as well as on new coal conversion technologies, but these developments can only be fully operative after 1980. For the next five years the OECD world is likely to suffer from substantially worsening 'terms of trade', lower rates of growth and massive balance of payments difficulties as a result of sharply higher raw material prices. An oil-induced recession in 1974 may slow this tendency and lead to temporary falls in raw materials demand and prices but the next five years will involve substantial readjustment problems whether the oil cuts continue or not. The success of the OPEC countries and the Arab exporters will certainly stimulate renewed interest in producer-based agreements for other commodities.[36]

The developed world will find growth more difficult now that the economic power of control of strategic raw materials has been so clearly revealed. However, their own rejection of commodity agreements in UNCTAD and other world forums in the 1960s is responsible in large measure for their present plight. A measure of redistribution of these gains from the Arab and OPEC oil exporting countries to the oil importers among the poorer countries through an Oil Exporters' Development Fund or some similar arrangement will also be vitally necessary if the non-oil poorer countries are not to suffer severe setbacks in the period 1974-80.

Notes

WIN

Rs.20,50,000

THROUGH POST OFFICE SAVINGS BANK

big prizes and interest too!

Open a Post Office Savings Bank Account with Rs. 200 or more before April 6, 1974. Hold on to that balance till September 30, 1974.

If you already have an account make the balance Rs. 200 or more before April 6, 1974.

You can improve your chances for prizes by opening more than one account in your name. (Not more than one account at one Post Office).

Remember, deposits in all accounts in one name together should not exceed Rs. 25,000.

Let each member in the family have an account.

FIRST PRIZE RS. 1,00,000		
5	• 2nd PRIZES Rs.	50,000 each
10	• 3rd PRIZES Rs.	20,000 each
100	• 4th PRIZES Rs.	5,000 each
1,000	• 5th PRIZES Rs.	500 each
10,000	• 6th PRIZES Rs.	50 each

Taxes and Incentives: Myth and Reality

Contributed

The net result of this year's budget will be to give an even larger slice of the national cake to those whose share is already disproportionate to their size or their contribution to its making.

The argument that a cut in personal income-tax rates was necessary to check tax evasion could have been taken a little more seriously had the measure been accompanied by a widening of the tax base and by other steps to make the tax system more equitable and efficient, of which the most urgent was the adoption of the family as the tax unit. In fact, the trend is in precisely the opposite direction.

Similarly, the campaign for lower tax rates on the ground of incentives is a case of special pleading by the already well-off. To think that the economy will be revived by submitting to their demands is to build one's hopes on myth, not reality.

EVER since the Wanchoo Committee picked on tax rates as the 'first and foremost' reason for evasion and called them a disincentive for working and saving, pressure has steadily mounted to get them slashed. Not only will evasion vanish, ran the argument, but people will be glued to work as never before and investments will flourish once again, if only the government promised to take away less out of incomes in taxes. The obviousness of the proposition was driven home by speaker after speaker at august tax conferences and underscored indignantly by financial journalists from time to time, all cocksure of the case for reduction of tax rates. Some economists also lent their imprimatur to this pressure, overlooking what the literature on the subject has to say and what the empirical findings are. And now the government has fallen for this line. There is, however, another side to the story.

It is useful to begin by looking at the way progressive taxation of income influences the supply of work effort in a community for, as one illuminating article on the subject[1] put it, "this question lies at the centre of the controversy" on incentives and shows how illfounded popular notions on economic issues can be. The most commonly held view, of course, is that one's desire to work varies directly with the return one gets and inversely with the tax one pays out of income. Hence the higher the tax on incomes the weaker is the urge to work and the stronger is the temptation to remain idle, the assumption evidently being that work is painful and leisure pleasurable.

But is that so? Can the executives, in the public and the private sectors, who are often so vocal about the disincentive effect of the income tax honestly claim that anyone of them started working less hard when the tax rates for their income brackets were raised? Given the option how many of them would prefer to sit back at home instead of going to work simply because they have to part with a larger portion of their income than in the past? To quote Peston, "Nowadays, one would surely argue that a great deal of work, or being at work, is pleasurable and being at home is not". For "the return from working is not merely income as narrowly defined, but includes items in kind (from luncheon vouchers to trips abroad), power, prestige, security and an almost endless list of interests and pleasures".[2] Besides, for most people who are in employment, the option to vary the work-hours just does not exist and even if they had such option, many would probably react to a cut in their pay by working more to make up the loss rather than less. The nature of the response would of course vary depending on the age, sex and family responsibilities of the earner. A young bachelor may find a particular tax rate a disincentive to effort — though it is difficult to imagine that the number of such young men can be sizeable in a country where unemployment is so high — for a young family man it may be an incentive. Similarly, a man aspiring for promotion is unlikely to work less or less well as a response to income tax.

Even if high taxes deter some from making any extra effort to earn more, for the society as a whole that may not always be a bad thing. If, for example, overworked top doctors decide to see fewer patients, or successful lawyers take fewer briefs, the clients who are lucky to get their services will probably gain more in terms of better attention than the loss suffered by those denied the perfunctory care of expensive experts. Again if some university teachers find it less paying to take up odd jobs like lucrative consultancy assignments because of prohibitive taxes and devote more time to teaching and research would one call that an undesirable outcome?

The response to a tax rise may thus be quite diverse and the total effect is not easy to predict with any confidence. Broadly, however, one may say that in income ranges where the rates are believed to pinch most the disincentive effect if any is unlikely to be pronounced because, for earners in this group the motivating factor is prestige, gross salary and other attractions of the job rather than the net money return.

Empirical evidence on the subject is not conclusive. It is however amply clear that a good deal of what one hears in common conversation is only myth. "What the investigations show is that people *think* the tax system is a disincentive in the sense that they believe it acts adversely on the work effort of others but not themselves." The authors of a recent study on the subject reviewing the evidence declared that the only intellectually honest answer to the question 'do direct taxes have a disincentive effect?' is 'No.'[3]

The effect of progressive income taxation on saving is equally uncertain and difficult to evaluate. Whether a cut in income tax will stimulate the supply of saving obviously depends on the responsiveness ('elasticity' in the economists' jargon) of savers to changes in the rate of return usually measured by the rate of interest. Modern theory and evidence both cast doubt on the assumption of a strong relationship between saving and the rate of interest. So far as household saving is concerned, which is what is sought to be encouraged by the proposed cut in income taxes not much increase may take place as the response of many who aim at a 'target saving' in their life-time may as well be to consume more when their disposable income goes up. Granting that in general the propensity to consume

is less among the upper than among the lower income groups what one finds among the affuent in this country is a mad desire to attain the standards of their counterparts in the West in high living. In the atmosphere prevailing at present one dare say lack of will rather than lack of means is the main inhibitor of saving by those who are in a position to save. The current inflation weakens that will further. Anything that contributes in any way to the inflationary pressures must therefore be regarded as detrimental to saving. A tax cut in the upper income ranges may add to those pressures unless the rich are genuinely prepared to forgo a bit of their comforts.

The effect on investment is even more difficult to analyse as the determinants of investment are several and their interaction too complex for any generalisation. This is how a text-book on public finance which came out in 1973 sums up the position: "The analysis of taxation effects on investment, operating *via* the profitability variable in the investment function, remains among the most difficult aspects of tax policy. Neither theory nor empirical analysis has given a conclusive answer."[4]

Assuming, however, that taxes on income do discourage investment, the Indian income tax provides many incentives to mitigate the incidence of the taxes on profits. When the tax rates are reduced these incentives too lose their sharpness.[5] For improving the quality of investment what is required is more of risk taking. Musgrave and Domar showed long ago that under certain conditions entrepreneurs may take more risk with higher taxes when there is full loss offset. A system of carry-back of losses and liberalisation of the loss-offset provisions which are now somewhat restrictive could perhaps be a better way of encouraging investments than a cut in personal taxation.

As regards evasion the argument that high rates of tax spurs evasion by making that practice highly attractive has some apparent logic that cannot be rejected out of hand. But there are many snags in this argument. After all evasion will remain profitable as long as there is any tax, whatever the rate. At what level of taxation the risk attending evasion would outweigh the probable gain from it in the eye of the intending evaders cannot be measured with any precision and would vary from person to person, depending on the attitude and disposition of each. Here again no generalisation seems possible. More important, a potent source of tax evasion in this country is corruption. No part of the ill-gotten gains is likely to surface whatever be the rates of tax. The fact that there is evasion at all income levels, not merely at high ones, and that evasion had not gone down much when the rates were lower warns against any glib assumption. Nevertheless, one may agree that keeping the rate of income tax as high as nearly 100 per cent is to put too high a strain on virtue both of the taxpayers as well as the administration and some reduction was called for. But it would be understandable if in the present context the step was followed by a widening of the base and other measures towards an equitable and efficient tax system, of which the most urgent was the adoption of the family as the tax unit.

It is the reluctance to take any major step in that direction that makes the proposed concessions in income tax so suspect. If anything, the trend is in the opposite direction, witness the upward revision of deductions from salary income and liberalisation of the exemption of gratuities, which, by the way, has nothing to do with investment promotion or evasion prevention. The 'rationalisation' of the exemptions given in wealth tax is not going to make much difference as the number of wealth tax payers likely to be affected would not be many. An earnest attempt to move away from sharp progression in income tax and turn more to wealth tax on incentive grounds would surely be less open to question. The paltry revenue of Rs 9 crores anticipated from the changes in wealth tax is hardly evidence of that desire.

The net result of the Budget this year then would be to allow an even larger slice of the national cake to go to those whose share is already disproportionate to their size or their contribution to its making and there is little to stop them from eating up that slice either. True, some of the items that fascinate the rich will cost more. There is indeed a case for trying to extract more from the rich in this way when other methods fail. The Budget puts the gain from excise at about Rs 200 crores. But how much of this is relatable to the pockets of those who are benefited from the income-tax concessions is difficult to say. Taking only the clearly identifiable items like air-conditioners, the enhanced levies may fetch about Rs 30-40 crores whereas the loss on account of the income-tax concessions is put even by the Finance Minister at Rs 60 crores. A little consideration would, however, show that this is an underestimate and the loss cannot be less than Rs 100-120 crores.[6]

The campaign for cuts in tax rates on the pretext of incentives is of course common everywhere. It should be clear however while contending with such campaigners, that here one is involved more with "special pleading and a not unexpected desire on the part of the better-off to hold on to their incomes rather than with serious evidence on genuine economic effects."[7] It should not be forgotten that experts who favour low rates usually advocate a much more comprehensive tax base than is in vogue. That the privileged sections of this country could ask for more indulgence when the economy faces an acute crisis should cause no surprise. To think that the economy could be revived by granting them what they want is, however, to build one's hope on myth, not reality.

6 The table on page 18 of the All-India Income Tax Revenue Statistics, 1969-70, does suggest (after taking into account the HUFs) a loss of Rs 60 crores from the reduction in tax rates—the Finance Minister's figure. In fact, the loss will be much higher. There are several reasons for this. First, the number of assessees has gone up in the last five years and so have money incomes. If allowance is made for this, the figure of loss will go up by Rs 20 to 25 crores. Second, the increase in standard deductions will reduce taxable incomes by Rs 600-1,000 for every salaried assessee, yielding a net saving of tax of about Rs 200-300 per assessee on average. As there are one million salary-earners in the tax-paying groups now, the tax loss on this account will come to about Rs 20-30 crores. Then there are other concessions here and there. Thus the revenue loss cannot be less than Rs 100-120 crores.

The Great Migration of 1971

III — Return

Partha N Mukherji

This is an exploratory study of the evacuees who left East Bengal after the imposition of martial law on March 25, 1971, and sought refuge in India. According to official statistics, by the second week of December 1971 about 6.8 million evacuees had been housed in camps and another 3.1 million were staying with friends and relatives. As many as 827 state camps and 19 Central camps accommodated one of the largest migrant movements in history.

This three-part study concentrates on those who were temporarily settled at the Chandpara and Bokchora camps in the district of 24-Parganas in West Bengal. Part III looks at the migration of the evacuees back to Bangladesh and the manner in which it was achieved. It also discusses some theoretical formulations regarding the refugees. Part II had examined the organisational set-up of the camps, the relations between hosts and guests in and around the camps and the adoptive capacities of the evacuees in their new environment. Part I had dealt with the socio-economic background of the evacuees, the events leading to their uprootment and the trek to sanctuary.

WE have observed the circumstances under which the exodus took place from two regions of East Bengal. We have also examined the pattern of resettlement and social interaction in India between the host system and the guests. It is of considerable interest to study, even though briefly, the return of the evacuees to an independent Bangladesh after the victory of the Indo-Bangladesh armed forces.

Almost immediately after the cessation of hostilities there was much movement back and forth across the border. Within a period of less than two weeks several small groups from each of the two camps had gone into Bangladesh, made a quick survey of the conditions in their regions and reported back to the camps. Their reports were surprisingly uniform. These groups were accorded a red carpet welcome by their Bengali Muslim neighbours, who showed considerable sympathy for them and eagerly enquired about their conditions across the border. The neighbours assured them that the property of the evacuees was safe, that is, their landed property. These 'explorer' groups also found evidence of the Mukti Bahini taking strong retaliatory measures against betrayers of the Bangladesh nationalist movement. Many *Razakars* and influential members of Peace Committees were reported to have been killed; the Mukti Bahini was poised to dispense rough and ready justice.

With astonishing rapidity the evacuee also came to know about the extent of damage to his house and property, the chances of recovery of his looted goods and many other minute details of information in which he was interested. All these were further facilitated by frequent visits of the Bengali Muslim neighbours from across the border who were equally curious to see how their Hindu neighbours had fared during the nine month period.

The increased interactions across the border coupled with the glory of the victorious operations by Indian army and the Mukti Bahini generated an unmistakable urge for the evacuees to return to their native country. The emergence of Bangladesh viewed as completely free from the oppressions of Pakistan presented a solution to their problems. In comparison to the prospects of a free life in a newly independent country, camp life appeared to be like a bondage which had suddenly become intolerable. The impatience with which they awaited release from the camps was notable. Another factor which made them feel restless to go was the approaching deadline for the next sowing of paddy which had to be done preferably by January 15.

It is true that they were also concerned about the uncertainties of shelter and food in their own land. But the urge to return was unmistakably stronger and the assurances made by the Indian and Bangladesh governments to provide all that they could to resettle them had the expected impact.

It was utterly fascinating to see innumerable truck- and train-loads of evacuees returning home with joyous shouts of "Joi Bangla" (Victory to Bangladesh). I had the privilege of travelling with a group on a truck to Jessore from where I went to a village on the outskirts of Chchianobboi Gram and stayed for nearly a week.

The reception in Jessore district had acquired a procedural system. College teachers and students in the towns and school teachers and volunteers in the villages were receiving evacuees at their centres and canalising them to their respective destinations. Usually at such centres there was provision for rations and for an overnight halt for those in transit. The entire civil administration seemed to be alive to the need for solving this almost unmanageable problem. All available buses and trucks were ceaselessly engaged in transportation of the evacuees.

But the initial enthusiasm with which the evacuees left India and with which they reached their homes did not require much time to be eroded. Faced with the reality of destroyed and vacant homes, the returnee was immediately faced with a situation whose implications he had not been able to calculate far away from home. The destruction of houses could broadly be classified into three categories: houses with rooftops and walls but practically nothing else, houses with completely burnt out roofs with just the walls standing, and completely gutted houses. Of the three categories, the second predominated in the villages I saw. Some of the returnees I could see had managed to put a roof of sorts over one of their rooms and so start a new life in their own homes.

The pattern of recovery of goods is extremely interesting. It was certainly not uniform in all regions. I shall therefore confine myself to the village where I stayed and to what I saw during a 20-mile trip on a bicycle. The process of recovery was initiated by appeals from the Mukti Bahini command stationed in the village and a few dynamic Muslim leaders. The situation was extremely embarrassing and paradoxical. For the 'custodians' of such goods to openly return them to their rightful owners was to acknow-

ledge having played a highly deviant role. At the same time their collective role in this matter was no secret to anybody. This presented a problem even for those who had had no intention of enjoying their destitute neighbours' goods.

Faced with this kind of predicament some responded to the appeal and deposited the goods with the Mukti Bahini command. A few returned them directly to the owners trying their best to explain away or just keep quiet as to why they had taken them. There were others who showed reluctance to respond to the appeal. However, the returnees were able to identify and get information about the whereabouts of their goods with remarkable speed and accuracy. This was only possible because of the co-operation of their Muslims neighbours who were trying to make amends for their conduct. Pursuing such information the returnee would send a message, generally indirectly, to the custodian of his goods and request him to return it. If the custodian failed to respond, a complaint would be lodged with the Mukti Bahini command, which would expeditiously investigate and recover the goods.

In a neighbouring village, the Mukti Bahini had demarcated an area where the custodians of others' goods were requested to dump them and the returnees were requested to identify their property and take it home. This was supposed to avoid a lot of embarrassment for both the custodians and the returnees. This demarcated area was littered with all kinds of things — beds, almirahs, doors and windows, wooden beams, etc. This procedure met with reasonable success as the extent of recovery was placed roughly at 30 per cent which was considered good within that time span.

In other villages, cartloads of goods being taken from a custodian's house to a returnee's house were not an infrequent sight. However, this pattern was not followed in some villages in the predominantly Hindu populated areas. The Hindus having returned to their original strongholds were forcefully demanding back their goods from their Muslim neighbours. In at least one village an old Muslim was literally in tears describing how in spite of his best efforts in helping recover the looted goods he was being insulted and abused. He complained that one of the returnees had plucked his beard and on another occasion his child was slapped and told that his father was a low-down looter. This old Muslim frankly expressed fear that his life was not safe and he was thinking of moving to some other place.

In this context it has to be noted that the Mukti Bahini was not operating in this area and there was no effective alternative mechanism for the resolution of such problems. This indicates that the Mukti Bahini, in the absence of any of the institutions of law and order, served as a very important agency of social control. And so the Mukti Bahini's absence from an area generated tensions.

In a sense the Mukti Bahini, symbolised as liberators of the country, was playing a role which even normal institutions of social control were presumably not in a position to play. Clear evidence of this could be seen soon after the Prime Minister of Bangladesh appealed to the Mukti Bahini to lay down arms voluntarily and declared that those who did not heed the appeal would be identified or labelled as *Al Badrs* (the infamous masked group which engaged in the mass slaughter of intellectuals on the eve of the liberation of Bangladesh). The role of the Mukti Bahini then immediately received a check and the voluntary return of goods from custodians registered a sharp decline. This shows the status and power the Mukti Bahini enjoyed in the village community where I saw it operate.

Towards a Theoretical Integration

This exploratory study raises certain theoretical problems. One might pose the main question very generally: What is the social response to crises? Certainly, there are likely to be varieties of responses just as one can identify a variety of crises. The social response to crises emanating from natural causes is likely to be vastly different from crises emanating from social and political causes. Thus a community may face challenges from earthquakes, floods, tidal waves or tornadoes — crisis which have been better labelled as disasters. It can also face a crisis of an extremely different nature — where the crisis is not over with the disaster, but in fact is a continuing one. In the former type of crisis, the community mobilises its resources to make up for the losses. If the community is in an earthquake zone or tornado-prone area, it develops certain mechanisms by which it can face the recurrence of such crises and their aftermath. The latter type of crises, in which complete uprootment of a very large group from its soil to an alien country is the most extreme form, is distinctive in that the causal generating factor being socio-political is much more complex and for the uprooted people there is no familiar precedent to fall back upon.

Uprooted from his native soil, torn from his national identity, the evacuee is forced to accept an unstable, uncertain future for himself and his family. The experiences of post-war refugees have shown that neurosis is a common condition among them and "quite apart from symptoms of a definitely pathological character, there is every justification for speaking of a 'refugee complex'."[10] It would be expected that an idle group, forced into apathy, would manifest serious symptoms of personal disorganisation. But this was not so among the refugees I was with. As indicated earlier, neither the doctor visiting the two camps nor the camp inmates reported a single case of hysteria or any abnormal behaviour. There were many persons reporting how shattered their nerves were on account of their shocking experiences in East Pakistan, but they did not show any signs of neurosis. What, therefore, explains the social and psychological stability of this group in such circumstances?

One may infer that either the causes of such tension were successfully resolved or that a tension-management mechanism had come into operation which, in spite of the continuing tense objective situation, nevertheless helped to retain the balance of the individual. It is clear that by denying the then East Pakistan nationals Indian co-nationality and by imposing on them a forced idleness, the situation the evacuees were placed in was conducive to problems of personal disorganisation.

In this context, three processes can be identified which performed the all important function of tension-management. They are: (a) the reactivation of the evacuees' rural community structures; (b) the emergence of the camp community on a model close to that of the village; (c) deviant behaviour which acted as a safety valve. The first two processes (especially the first) enabled the individual to retain or regain his identity in the institutionalised system of status and role in which he had operated. If the evacuee had lost his status *vis-a-vis* the social environment around him, he still retained his social position in the system of social interaction and social solidarity. The individual evacuee was not suffering in isolation torn out of his group. The entire collectivity was sharing a crisis — the challenge was not faced only by the individual but by the entire group.

Here one might refer to the Durkheimian hypothesis which posits that an increase in the integration of a group which faces a crisis causes a reduction in the rate of egotistic suicides. Durkheim states that "great social disturbances and popular wars rouse collective sentiments, stimulate partisan spirit and patriotism, political and national faith, alike, and concentrating activity toward a single end, at least temporarily cause a stronger integration of society".[11] This prompts him to postulate that "Suicide varies inversely with the degree of integration of political society."[12] With a permissible extension of this hypothesis one can see in the instance of the Bangladesh evacuees the reactivated mechanical solidarity functioning as a tension-management mechanism and minimising the occurrence of neurosis and personal disorganisation.

The theoretical implications of the safety-valve mechanism of the deviant infrastructures are far from superficial. While the social system of the community was transferred across the border and new camp communities emerged, it found itself operating or existing in an economic vacuum. This raises the following problem: What happens to a social system which has a social structure but which suddenly is faced with the loss of its economic subsystem? There could be three possible results; (1) the social system may dissolve itself into another socio-cultural system and get integrated with the economic system of the latter; (2) the social system will generate anew its own economic subsystem; (3) the social system will face serious problems of disorganisation and perish, if it is not in a position for possibilities (1) and/or (2).

In the present context, possibility (1) could have resulted from granting co-nationality and rehabilitating the evacuee. This the evacuee was legally denied. Possibility (2) was also legally denied. The third possibility was the one which the evacuee was forced to accept, with the difference that the physical survival and security of the evacuee was ensured. In such a situation, the institutionalised and emerging social structures generated their own deviant economic infrastructures to compensate for the lost economic subsystem.

This study, therefore, provides an important insight into the understanding of the primacy of the economic subsystem for the survival of a social system and its individual members. The superstructures were 'compelled' to generate a base of economic activity, without which the social system was threatened with possible disaster.

As for the speedy departure of the evacuees from the camps, there were important 'pull' and 'push' factors which expedited it. Once the original causal generating factor identified with the crisis was satisfactorily removed, the social systems with their fragmented ecological base strove to regain their ecological unity. The guests' unequal relationship with their hosts — with a vertical one-way movement of obligations defining a low status for the evacuees in the stratification scheme — was a kind of an 'oppression' characterised by severe deprivation, restrictions and humiliations. The liberation of Bangladesh provided an opportunity to 'liberate' oneself from this low-status position and to regain one's status in one's own total social setting.

FROM THE CHAIR

Albright, Morarji and Pandit Limited

Speech of the Chairman, Shri N Dandeker, ICS (Retd)

THE following is the Speech delivered by Shri N Dandeker, ICS (Retd), Chairman, Albright, Morarji and Pandit Limited, at the Eighth Annual General Meeting of the Members held on Wednesday, March 6, 1974:

Ladies and Gentlemen,

I have great pleasure in welcoming you to this EIGHTH ANNUAL GENERAL MEETING.

The Audited Statements of Account for the year ended 31st October, 1973, and the Directors' Report thereon have been with you for sometime now. With your permission, I shall take them as read.

The results of the year's operations have been very disappointing indeed, compared with those of the previous year. There were two principal reasons for this.

Firstly, there were sharp increases in all costs. Rock Phosphate which is the major raw material for the Company's production is imported from Morocco; and because of the very tight freight market and the congestion in the Bombay Docks, the freight on shipments has been sky-rocketing. The other important raw material, namely Soda Ash, being greatly in short supply the Company had to import some of its requirement at a price very much higher than that of indigenous Soda Ash. There has also been continuing increase in the cost of power, furnace oil, kerosene oil and engineering stores. In addition, some *ad hoc* benefits had to be granted to the Company's employees. In the result, the cost of goods produced by the Company as reflected in the Accounts is disproportionately higher than the corresponding cost in the previous year. Nevertheless, your Board quite rightly thought it proper that the Company should for some time endeavour to absorb these cost increases instead of passing them on to our customers.

Secondly, even while the Company was thus making every effort to hold the price line while maximising production to meet the ever-increasing demands from the manufacturers of non-soapy detergents and also other users of Sodium Tripolyphosphate, the workers struck work for eight days in April and indulged in a prolonged "sit-in" strike from 12th October, raising certain wholly illegal and untenable demands. This strike continued into the current accounting year until, finally, the management was reluctantly compelled to declare a partial closure of the company's plant from 3rd December 1973. Work at the factory was finally resumed only on 30th December 1973.

It would be fruitless at this juncture to recapitulate the circumstances in which the strike was resorted to by the workers and subsequently called off. I may emphasise, however, that the management had of necessity to take a firm stand because what was basically at stake was the fundamental principle of the sanctity of agreements solemnly entered into and still subsisting. The Company could not possibly surrender on such basic issues. However, the Company was always ready to make some marginal adjustments in regard to such matters as Dearness Allowances, etc, to alleviate the undoubted hardships of the workers resulting from the present conditions of high prices and acute scarcities. I am glad to say this reasonable stand eventually prevailed.

In June 1973 the Company received the Industrial Licence for increasing the Sodium Tripolyphosphate capacity of its plant from 12,500 to 25,000 tonnes per annum. According to the Company's original plans, this expansion would have been completed in March or early April this year — that is to say well before the stipulated date for securing the full benefit of the Development Rebate; but the recent strike has upset the schedule. However, in view of the saving in costs and tax that would ensue, every effort is being made to make up for lost time.

Meanwhile, with the loss of production due to the strikes, the turnover for the year was lower by 6.74 per cent compared to the previous year; and because of the sharp rise in the cost of raw materials and engineering and chemical stores, coupled with a rise also in operating costs, the profit before taxation decreased by as much as 23.9 per cent.

The dispute with the Customs authorities regarding the classification of Rock Phosphate under the Customs Tariff still remains unresolved. However, the Company's position against any adverse decision has been secured by deposits collected from the Company's customers against the contingent liability on this account.

As the first five years of operations were over by 31st October 1972, the Company is no longer entitled to any concession in the computation of Income-Tax, save only Development Rebate on additions to Fixed Assets, if any. The Company thus being now liable to pay Income-Tax and Sur-Tax at the full applicable rates, the after tax profit for the year under report is lower by approximately Rs 20 lakhs compared to the previous year.

In view of the fact that the demand for Sodium Tripolyphosphate is on the increase, and having successfully achieved complete technical competence in producing quality material acceptable to the detergent manufacturers and other users of Sodium Tripolyphosphate, the Company has applied to the Government of India for an Industrial Licence to increase its Sodium Tripolyphosphate capacity from 25,000 tonnes to 50,000 tonnes per annum. It is hardly necessary to add that your Company is in the best position to achieve the establishment of additional capacity of this magnitude quicker and at considerably less capital cost than any one else. The resulting economies of scale will also enable us to hold down costs.

Messrs Hindustan Lever Ltd, our Company's largest customer for Sodium Tripolyphosphate have thought fit to apply for an Industrial Licence to set up an *integrated project* for the manufacture of Sodium Tripolyphosphate with an installed capacity of 30,000 tonnes per annum. And there are also many other applicants in the field, though none of them is a manufacturer of detergents. Your Company opposed the application of M/s Hindustan Lever Ltd under the Monopolies and Restrictive Trade Practices Act, principally on the ground that it would result in socio-economically undesirable 'vertical integration' by their having a captive plant for manufacturing an essential ingredient in the production of non-soapy detergents, to the grave disadvantage of other manufacturers of detergents. There were, of course, several other grounds for our opposition upon which it is unnecessary to dilate here. However, the Monopolies Commission by a majority of 2 to 1 recommended the grant of an Industrial Licence to Hindustan Lever; and the matter now rests with the Government of India for final orders. I am confident that, in the best long-term interests of the country, the Government will give due weight and full consideration to the representations made by the Company and to the views expressed in the 'Minority' Report of the Monopolies Commission.

Because of our pooling arrangement for electric power with The Dharamsi Morarji Chemical Co Ltd and Messrs Borax Morarji Ltd referred to in my statement last year, the power cut during the year did not adversely affect the Company. So, too, the reduction in the supply of water by the Maharashtra Industrial Development Corporation did not adversely affect the Company because of various economies effected in the consumption and use of water.

The Company's requirements of Rock Phosphate are being met by regular imports made by the Minerals and Metals Trading Corporation of India Ltd. However, both the f o b price and the freight rates on Rock Phosphate have considerably increased in recent months with the result that the selling price of our product had to be enhanced effective from the commencement of the current year to cover some part of the increased costs. While, therefore (if we have no more strikes) the turnover in the ensuing year may be larger, the margins are likely to be more slender in view of the all-round increase costs and prices of our inputs besides the scarcity of certain essential materials like furnace oil, etc.

Messrs Albright and Wilson Ltd (A & W) have sold some of their equity holding in the Company to The Dharamsi Morarji Chemical Co Ltd in terms of an Agreement entered into between them at the time of their collaboration for setting up the Company's project. A & W's present holding in the Company's share capital is therefore now slightly below 40 per cent. In view of the recently enacted (new) Foreign Exchange Regulation Act, 1973, A & W have ensured by this action that your Company will be free of the many disadvantages applicable to a company in which the foreign equity holding is over 40 per cent.

Mr R A Shah, who was a Director on your Board, resigned on 5th November 1972. On behalf of the Board, and on my own behalf, I wish to express our sincere appreciation of the very valuable services rendered by him since the inception of the Company.

I must thank all my colleagues on the Board for their valuable services, assistance and guidance; and I gratefully acknowledge the continued co-operation and technical assistance rendered by our collaborators, Messrs Albright and Wilson Ltd and The Dharamsi Morarji Chemical Co Ltd, both for the current operations and for the expansion projects of your Company.

Ladies and Gentlemen, I now have pleasure in moving the following resolution:

"RESOLVED that the Audited Statements of Account of the Company for the year ended 31st October 1973 and the Directors' Report to the Members be and they are hereby received and adopted."

25th Meeting of

National Co-operative Development Corporation

The 25th meeting of the National Co-operative Development Corporation was held at New Delhi on March 5, 1974. Presiding over the meeting, Corporation's Chairman and Union Minister of Agriculture, Shri Fakhruddin Ali Ahmed disclosed that the Corporation had rendered financial assistance to the co-operatives, engaged in marketing, processing and storage of agricultural produce and supplying farm inputs to the farmers, to the tune of Rs. 16.35 crores during 1972-73. Of the total assistance, Rs. 13.02 crores were provided under various Central Plan Schemes implemented by the Corporation as under:

Sl. No.	Scheme	Assistance Provided (Rs. in crores)
1.	Centrally aided plan scheme	6.00
2.	Centrally sponsored scheme of margin money to co-operatives for distribution of chemical fertilisers and other agricultural inputs	2.00
3.	CENTRAL SECTOR SCHEMES FOR:	
	i) Setting up of small and medium sized processing units	2.01
	ii) Strengthening of share capital base of selected marketing co-operatives	1.01
	iii) Creation of additional Storage capacity	2.00
	TOTAL:	13.02

Besides, the Corporation provided financial assistance amounting to Rs 2.78 crores under various schemes sponsored by it from out of its own resources, such as, establishment of granular fertiliser units, agro-service, centres, units for formulation of pesticides/insecticides and soil testing laboratories. The assistance was provided in the form of loans and grants to State Governments/Apex Co-operative Banks and share capital and grants to the national level co-operative federations.

According to the Report, the NCDC Act was amended by the Parliament to provide its extension to Jammu and Kashmir. Besides, the Corporation opened two more regional offices at Gauhati and Chandigarh in addition to five regional offices established earlier at Bangalore, Calcutta, Bhopal, Poona and Patna. During the year, the Corporation also decided to take up financing of various programmes in Union Territories.

Co-operative Marketing

The co-operatives marketed agricultural produce worth Rs 843.69 crores during 1971-72 as against Rs 648.49 crores in 1970-71. The States of Punjab, Maharashtra, Uttar Pradesh and Gujarat accounted for nearly 3/4th of the total value of the agricultural produce marketed by co-operatives during 1971-72. About 50 per cent of the total sales of agricultural produce by co-operatives in 1971-72 were accounted for by foodgrains. This was due to the concerted efforts made by the Corporation for larger involvement of co-operatives in foodgrains procurement programmes of the State Governments/FCI. With the active interest of the NCDC, co-operatives are also being increasingly involved in the procurement operations of cotton and jute on behalf

Shri Fakhruddin Ali Ahmed

of the newly established cotton/jute Corporations. To enable the co-operatives to handle the increasing volume of business in these two important commercial crops, the Corporation has evolved a scheme for providing margin money to apex marketing federations of major cotton and jute growing States for raising bank finance. This has considerably helped the co-operatives in stepping up their marketing operations in respect of these two commodities.

Co-operative Processing

The number of agricultural processing units organised in the co-operative sector increased from 1,755 at the end of 1971-72 to 1,790 at the end of 1972-73. Under the Central Sector Scheme for providing block capital cost of small and medium sized processing units, introduced in the year 1970-71, the Corporation upto the end of 1972-73 sanctioned assistance amounting to Rs 13.42 crores in respect of 125 projects, which mainly include rice mills, cotton ginning and pressing units, oil mills including solvent extraction plants, dairies, cattle feed plants and cold storages. Of the above assistance, Rs 3.59 crores were released.

The number of co-operative sugar factories licensed went up from 124 at the end of 1971-72 to 134 at the end of 1972-73. During the year 1971-72, 80 co-operative sugar factories were in production and they produced 12.85 lakh tonnes of sugar representing about 41.29 per cent of the national production of sugar.

Distribution and Supplies

Co-operatives recorded significant progress in the distribution of fertilisers and other agricultural inputs. According to the Report, the value of chemical fertilisers handled by co-operatives

increased from Rs 250 crores in 1970-71 to Rs 288 crores in 1971-72. Similarly, the value of improved seeds, agricultural machinery and pesticides distributed by co-operatives increased from Rs 39 crores, Rs 10 crores and Rs 17 crores in the year 1970-71 to Rs 45 crores, Rs 11.6 crores and Rs 19.6 crores respectively in 1971-72. The Centrally Sponsored Scheme of providing margin money to co-operative wholesalers for undertaking distribution of fertilisers and other agricultural inputs, being implemented by the NCDC from the beginning of the Fourth Plan in 1969-70, has encouraged the co-operatives to increasingly involve themselves in this business. The total assistance provided by the Corporation under this scheme upto 1972-73 amounted to Rs 10.40 crores.

The value of consumer articles distributed in rural areas by co-operatives increased from Rs 145 crores in 1970-71 to Rs 180 crores during 1971-72. With the increasing emphasis on public distribution system, the co-operatives are expected to play important role in this activity.

Co-operative Storage

The total storage capacity assisted in the co-operative sector increased to 40 lakh tonnes by the end of March, 1973, out of which 32 lakh tonnes was reported to have been constructed.

NCDC to Play Larger Role

Shri M S Gill, Secretary, NCDC, disclosed in the meeting of the Corporation, that the charter of the NCDC has recently been amended by Parliament so as to broadbase the administrative set-up of the Corporation and to diversify its activities and sources of finance. With larger funds of the order of Rs 86 crores to be supplemented by its own funds, during the Fifth Five-Year Plan, the NCDC is poised to play for more effective role in expanding and strengthening the co-operative marketing infrastructure particularly in the co-operatively underdeveloped States and Union Territories. The Corporation would pay special attention to the rapid development of co-operative poultry, dairy, fisheries and minor forest produce — the activities in which small farmers and tribals are predominantly engaged.

Chairman's Statement:

H.T. PAREKH, ICICI Chairman, calls for faster industrial development under the Fifth Plan

- **Economy poised for growth**
- **Role of Finance Institutions in Promoting Industrialisation**
- **Support for Dual Pricing for Industrial Products**

The economic situation in 1973 was governed solely by the impact of the 1972 drought. The shortfall in agricultural, particularly foodgrains, output had all-pervasive repercussions on the economy. It led to a rise of 18.6 per cent in prices, accounted for mostly by the rise of 21 per cent in foodgrain prices. It led to a resumption, on commercial and barter terms, of foodgrain imports which strained the foreign exchange budget of the country. It also led to a substantial public works programme to provide employment and income to those affected by the drought, financed mostly by resources provided by the Centre and leading to substantial deficit financing by the Central and State Governments.

The drought also had repercussions outside agriculture. There was a substantial fall in the generation of hydel power which, combined with difficulties in thermal generation and the only atomic power plant, led to power-cuts all over the country, in some States and at times ranging up to 75 per cent. These power-cuts affected output not only in power-intensive industries but also in other industries; with delayed action, this will in due course be reflected in the published operating results of the companies.

Fortunately, 1973 has seen unusually good rainfall spread throughout the country, and, despite floods in some parts, particularly in Gujarat, the harvest this year, not only of foodgrains, but also of jute, cotton and oilseeds, is likely to be a record one. Gradually, the food pipeline is getting filled up, and foodgrain availability should begin to improve. Power-cuts have been largely given up, though the situation still remains difficult in some areas like Uttar Pradesh.

There is necessarily a time-lag in India between increased supplies and their impact on prices. Given the nature of a predominantly agricultural production system, precise information on actual output is available with a lag. Moreover, after a bad harvest season, the first impact of increased supplies in a good year is to fill up the distribution pipeline, before supplies reach the market and begin to influence prices. The Government needs to evolve a clear marketing strategy to enable movement and distribution of foodgrains at reasonable prices. Credit policy should also be geared to smoothening the production and distribution process.

The more general beneficial effects of a good monsoon are, therefore, still to be felt. Particularly, the Government's budgetary position remains difficult, initial procurement of foodgrains has been below expectations, and prices have remained at high levels, necessitating stringent across-the-board credit curbs. Apart from the price situation, the dark cloud on the 1974 horizon is the oil crisis.

The country is passing through an unprecedented economic crisis, and very little light is immediately visible. In such a situation it is necessary that all sections of the society combine to meet the problem. The Government needs to break the inflation psychosis in the country, particularly by adjusting excise duties on basic consumer goods to bring down their prices. There is need to induce harder work by labour and a restraint on prices and luxury consumption by industry.

The Fifth Plan provides for an over-all growth rate of 5.5 per cent; this growth rate is the minimum required if we are to show any tangible progress under planning. However, as experience shows, plan targets have not been fulfilled in the past, with the result that the actual growth reached has been much lower than the growth planned: in the fifties, the growth rate was 3.8 per cent and in the sixties the growth rate was 3.7 per cent only. The significance of the shortfalls can be gathered from the fact that had the targeted growth rates been achieved, the *per capita* growth during the last 23 years would have been double the actual growth.

There can therefore, be no controversy about the growth rate planned: it is, as the Plan document says, the minimum that must be aimed at if we are to make a perceptible movement towards achieving the objectives set out under the Plan.

The immediate task before the planners is to remove the various physical bottlenecks which restrict industrial production—particularly fuller utilisation of capacity. The two major areas are power and railway transport; these inhibit production in iron and steel, cement, coal and aluminium industries. Shortages of basic raw materials affect output in engineering and fertiliser industries. Many of these products are vital inputs for other economic activities and are also becoming scarce and high-priced internationally. An improvement in the areas of power, transport and raw materials is likely to raise immediately and substantially output in a broad group of industries. This is the first task to which the Planning Commission must address itself under the Fifth Plan.

The rate of growth planned for industry is not sufficient, and I suggest that, subject to availability of resources, we should aim at a growth rate of 10 to 12 per cent. It is desirable that the Planning Commission monitors closely the progress in the industrial field and, in the light of the evolving situation, makes an attempt to raise the rate of industrial growth in the latter portion of the plan period when we have overcome the present difficulties.

The basic aim of Government policy is to decentralise industry and entrepreneurship in the country. Decentralising industry leads to favouring a policy of promoting industry in backward regions; governments, both Central and State, now back up this policy by providing substantial incentives like capital subsidies, partial tax exemption and sales tax and other rebates. Decentralising entrepreneurship is being done by reserving some kinds of investments, particularly small and medium scale investments, for small and medium entrepreneurs.

In its statement of policy frame, the Fifth Plan recognises the various impediments, procedural and substantive, which impede investment in industry. It specifically suggests that administrative sanctions, where required, should be given expeditiously. If industrial targets are to be achieved, it is desirable that delays and inflexibilities in policies are avoided. Government itself has taken positive steps in this direction, particularly by setting up the Secretariat for Industrial Approvals so as to provide simultaneous unified clearances in respect of industrial licence applications. This is a step in the right direction which should help to expedite project implementation. Other procedural steps, especially enabling flexible use of import licences within over-all ceilings for project imports, need also to be given consideration.

The policy frame also refers to the extension of dual pricing policy, now prevailing in sugar industry, to other industries. This is a suggestion which needs to be given effect to without delay. In many industries like cement and aluminium where prices are controlled, project costs and product prices are so out of line that investment in them has become non-viable and, therefore, has almost stopped. In many industries like fertilisers, paper and cement, scarcities have begun to emerge; at the same time, their prices are not such as to attract investment in these indu-

stries. The Government needs to take a clear decision on its pricing policy to attract investment into these industries, as it has already done in the case of steel.

One appreciates the concern of the Government to protect the not-so-well-off consumers and — as in cement and aluminium — its own costs. The sugar price experiment has shown that such protection to priority consumers can be ensured, without jeopardising the incentive for investment in the industry, through a dual pricing policy, Ultimately the aim of Government policy has to be to ensure that output expands sufficiently to reduce the gap between the controlled and the free market prices. In addition, Government should consider giving such industries excise duty concessions on increased output in priority industries for 5 to 10 years.

Given the scale of capital costs, I feel that the concept of the joint sector is particularly suited to our needs. It helps to combine the financial resources of the State with the managerial expertise available in the private sector. In this area, this Corporation has already provided assistance of more than Rs 23 crores to joint sector projects, many of them jointly with various State Industrial Development Corporations; sanctions to joint sector projects in 1973 alone amounted to Rs 8.19 crores forming 14 per cent of total sanctions in 1973. Other development banks like IDBI and IFCI are also actively engaged in such financing, often jointly with us.

Finance institutions will need to play a substantive role in ensuring the fulfilment of the Fifth Plan industrial programmes. Let me at once say that the finance institutions fully accept the basic objectives, programmes and policies enunciated in the Fifth Plan. The task of assisting in the translation of these into specific projects and in ensuring their implementation will fall on them.

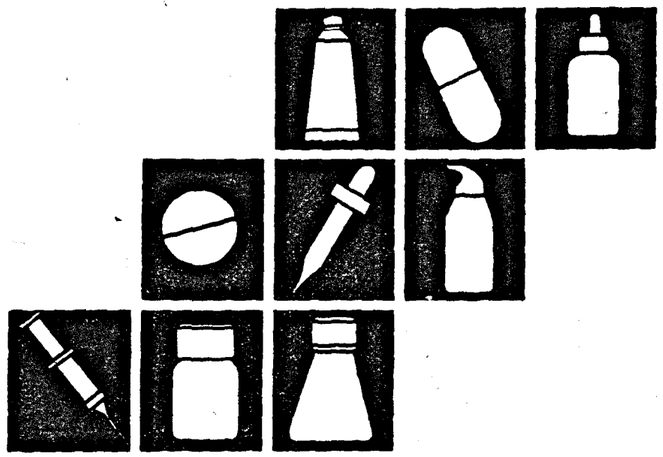
For development banks like our Corporation, this is not a matter of mere conformity but also sound business policy. This Corporation has always been interested not merely in accelerating industrial growth, but also in its decentralisation. The success of its endeavour in these spheres is, however, conditioned by the availability of supporting institutional, technical and infrastructure facilities.

Finance institutions, under the able leadership of the Industrial Development Bank of India, have taken up an active programme of developing and financing new projects, promoting new entrepreneurs and joint sector projects, and financing projects in backward regions. In the development of backward regions, State-level institutions play an active role not only in promoting the projects but in ensuring timely provision of infrastructure facilities. Increasing co-operation between all-India and State-level institutions in the task of identifying viable project ideas, organising and channelling technical consultancy services, identifying infrastructural gaps and mobilising resources and efforts to bridge these should help to give a fillip to the development of backward regions.

As I mentioned above, the Corporation is vitally interested in the broader development of the economy, both as an aspect of its developmental activity and for fostering its future investment opportunities. The Corporation has taken various measures during recent years to strengthen its own capabilities in this area. The Corporation tries to identify investment opportunities in various States; for this purpose, along with other financial institutions, it his also made surveys of various States. Where projects are identified, these are discussed with the all-India and State-level institutions and feasibility studies are undertaken or commissioned in order to turn investment ideas into viable projects.

Arrangements among the finance institutions for joint consultation have been working smoothly now for many years under the leadership of the Industrial Development Bank of India. These arrangements enable a co-ordinated view to be taken on the financing of projects and their follow-up. Finance institutions have been streamlining their procedures and increasingly recognising the need to establish a lead institution concept which would help to avoid duplication of effort, spread the work-load evenly and lead to quick decisions.

The Corporation made a beginning in 1973 to further diversify its sources of foreign currency funds. It signed, with the approval of Government, an agreement with a consortium of Swiss banks, headed by Banque Gutzwiller, Kurz, Bungener S. A. for a public issue of bonds of Swiss Francs 8 million in the Swiss market. The issue was arranged through Lazard Freres et Cie, Banque Nationale de Paris and Deutsche Bank Aktiengesellschaft. The issue was well received in the market and was fully subscribed. I would like to thank the consortium members, advisers to the issue and Government of India for enabling the Corporation to make an entry in the capital market in Europe and for giving it greater international exposure.



As corporate financial requirements become more complex, we also feel that new entrepreneurs and existing companies need assistance in meeting their financial requirements on a comprehensive basis — not only in tying up their financial requirements but also in assisting them through legal and other requirements needed to approach the public for funds. This activity is being done through our Merchant Banking Division; we expect that as companies begin to expand their operations, the operations of this Division will increase.

Bombay, February 14, 1974

This is an extract from the Statement of the Chairman circulated to the Shareholders with the Directors' Report and Accounts for the year ended December 31, 1973. The full text of the Statement can be obtained from the Secretary, The Industrial Credit and Investment Corporation of India Ltd, 163, Backbay Reclamation, Bombay.

A range of drugs for a range of diseases

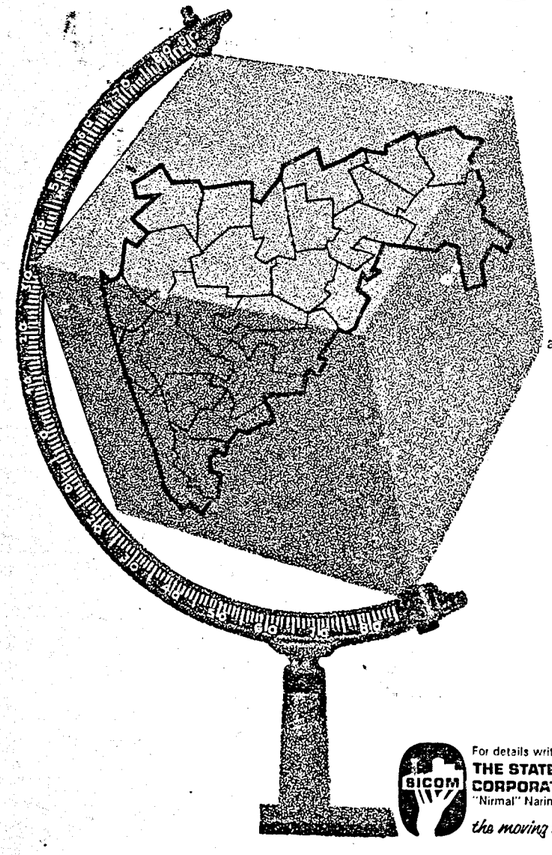
RABEUS-OPPI-3

India today produces medicines to fight almost every disease. In Asia we are second only to Japan in the range of medicines manufactured.

Anti-biotics, anti-TB drugs, anti-diabetic drugs, sulpha drugs, anaesthetics, anti-malarials, anti-dysentery drugs, anti-leprosy drugs, anti-pyretics, analgesics, vitamins, tranquillisers, anti-histamines and a range of other pharmaceutical specialities are all made in India today.

Indigenous material accounts for 90% of production. Import substitution has been achieved with no sacrifice of quality, thanks to Research and Development. In fact we are today exporting medicines to the most advanced countries.

Compare the industry today with what it was, 25 years ago. In 1948, pharmaceutical production in the country was Rs 10 crores; today it is Rs. 300 crores—a thirty-fold increase in 25 years.



India's pride: MEDICINES TO MATCH THE WORLD'S BEST

Note the latest change in Maharashtra's industrial geography.

This Package of Graded Incentives makes all areas more attractive.

"Grading"— a new advantage

Maharashtra's Package Scheme of Graded Incentives has divided the State into 4 zones—the developed areas and the developing areas. All developing areas have been graded according to existing circumstances and higher scales of benefits apply in areas which are relatively less favourably placed. For instance the Sales Tax Refund is offered for 6 years in certain areas but for 10 years in other areas.

Similar gradations apply to incentives like relief from incidence of certain rates (electricity tariff, octroi, water royalties, and non-agricultural assessment) and preferential treatment under the government purchase programme.

There's something else

This scheme is implemented by SICOM—the people who work hard with expertise and guts. What's more, you can take advantage of SICOM's flexible financial assistance and plant location, project investigation and project implementation services. All given to you in SICOM style.

Avail of the Maharashtra Government's Package Scheme of Graded Incentives. Now!

RAW JUTE MARKETING

INTERVIEW WITH DALAI LAMA

DEAR MONEY, INDEED!

A SERIES OF TRADE FAIRS FOR 1974, IN BOMBAY.

An excellent opportunity for buyers to see the latest from the various Indian industries...under one roof

INDIAN OFFICE FURNITURE AND BUSINESS MACHINES TRADE FAIR:

April 23 and 24, 1974.

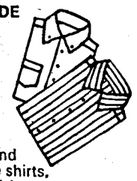
India produces good steel office furniture, inexpensive filing and information systems and hardy copying and calculating machines. A wide array of office and business machines equipment will be on display and more than 20 manufacturers will be participating. The latest and the most extensive developments in the field of office equipment will be on display.

FIRST INDIAN AUTOMOBILE SPARE PARTS TRADE FAIR:

August 16, 17 and 18, 1974.

Sparkplugs, tyres, carburettors, gear boxes, speedometers, differentials, fuel gauges, windscreens etc., will be among the many other items on display.

SECOND INDIAN ELECTRONICS TRADE FAIR:

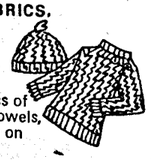


September 6, 7 and 8, 1974.

Items on display will be in the following categories:

a. Consumer and entertainment electronics.
b. Professional and industrial electronics.
c. Medical electronic items.
d. Measuring instruments.

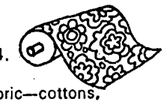
SECOND INDIAN READYMADE GARMENTS TRADE FAIR:



September 20, 21 and 22, 1974.

(In collaboration with the Clothing Manufacturers' Association of India.)

A variety of garments will be on display—of cottons, silks and synthetics—of millmade fabrics and handwoven fabrics. There will be shirts, trousers, safari jackets, ladies bell-bottom suits, guru shirts and what not—a collection representing the cross-section of the current trends in international clothing styles.



FIRST INDIAN KNITTED FABRICS, HOSIERY AND COTTON MADE-UPS TRADE FAIR:

September 24, 25 and 26, 1974.

A vast array of the latest jersey, twinkle jerseys, knitted synthetics of various textures, hosiery items, towels, sheets, pillow cases etc., will be on display.

FIRST INDIAN FABRICS TRADE FAIR:

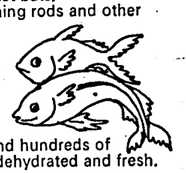
September 27, 28 and 29, 1974.

India's first Fabrics Trade Fair will display samples of every fabric—cottons, handlooms and man-made fibres.

FIRST INDIAN INTERIORS TRADE FAIR:

October 4, 5 and 6, 1974.

On display will be the total Indian concept of Indian interiors including a range of carpets, floor rugs, furniture with brass inlay and decorative lacquer, lamps, paintings and Indian artifacts.



FIRST INDIAN SPORTS GOODS AND SPORTS WEAR TRADE FAIR:

October 28, 29 and 30, 1974.

Items on display will include footballs and other leather balls, hockey sticks, racquets, leather goods, cricket bats, sportswear, sports shoes, fishing rods and other new items.

SECOND INDIAN SEAFOODS TRADE FAIR:

November 1, 2 and 3, 1974.

A range of seafood items including prawns, lobsters, shrimp, oyster, smoked eel and hundreds of other items, frozen, canned, dehydrated and fresh.

SECOND INDIAN LEATHER AND LEATHER GOODS TRADE FAIR:

(In collaboration with the Leather Club of Bombay.)

November 8, 9 and 10, 1974.

Items on display will include a range of processed leather, leather apparel, hand bags, travel goods, fur-skin articles, leather furniture, footwear and particularly harness and saddlery.

** As dates may change, please check with the Hotel, in advance.*

Falling in Line

THESE are tragic days for the Agricultural Prices Commission. A certain emasculation has taken place in its physical strength, but that really is not the central issue. Due to a series of decisions taken by the government since the autumn of 1972, the Commission's functioning has of late been made altogether precarious. Last season, what the Commission recommended as procurement prices for the kharif cereals were converted into a set of support prices by the politicians. The procurement prices suggested by it were considerably higher than what they were in the previous year. But the chief ministers — and those whose interests they principally look after — wanted more, and got away with more: the high procurement prices did not make the least difference to the magnitude of procurement. But this failure to procure is now being advanced as an argument for raising the procurement prices further, and for other crops too.

For witness how the stratagem was repeated with the price-setting exercise for wheat. The APC was hustled, quite contrary to its past practice, into announcing its recommendation for a so-called guaranteed price for wheat for the 1974-75 marketing season as early as in mid-summer 1973. In the wake of the failure of the wheat procurement programme, panic had gripped the government; it was officially announced that the recommended guaranteed price was only a support price, and the APC would be asked to make a further recommendation on the procurement price for the grain on the eve of the harvest. But even before the Commission could report, the government of Maharashtra on its own raised the procurement price for wheat for the red and Mexican varieties to Rs 105 per quintal, an increase of nearly 40 per cent over the year. Not one word has been forthcoming from the Union government in condemnation of such unilateral decision-making. The APC's position was thus hopelessly compromised. While making its recommendations on the procurement price of wheat, the Commission could have ignored what the government of Maharashtra has done, or it could have merely followed the flag waved by the latter. In the event, what the APC has done is more or less to choose the second alternative: the procurement price for the Mexican and red varieties in all parts of the country has been proposed to be raised from the level of Rs 76 last year to Rs 95 this year; the Commission must have surmised that the chief ministers would in any case add another Rs 10 per quintal to the price suggested by it so as to attain the height set by Maharashtra.

Certain data on costs of cultivation of wheat have been made available by the Commission, but the recommended level of procurement price has only a thin relationship to the costs as worked out. The issue in any case is no longer one of a fair return to the farmer; it is whether to offer him as much as he could obtain from the market. The Commission has assumed that the government does not have the capability or the will to procure grain compulsorily. It has therefore reached the altogether conventional conclusion that either procurement prices must move closer to prevalent market prices, or public distribution must be curtailed. Coming from the Commission, such reasoning is quite a *volte face*, for in the past it has generally argued against soft options.

The objective of procurement on the part of public agencies is supposedly to ensure effective public distribution. The objective of public distribution in turn is supposedly to provide grain at reasonable prices to those sections of the community who are unable to afford the high prices which prevail in the market in times of inflation and scarcity. As procurement prices are raised across-the-board, the very poor are to be priced out of even the public distribution system. Of course, even with raised procurement prices, supplies to the vulnerable sections could be maintained provided the government could be persuaded to accept either of the Commission's earlier recommendations, namely, (a) loading a larger proportion of the economic cost, on account of the procurement of the grain, on high-income consumers and thereby keeping the issue price low for the *poorer consumers*; and (b) increasing the quantum of subsidy from the national exchequer. The first suggestion has already been turned down by the government as impracticable. The second suggestion cuts across the logic of Y B Chavan's budget for 1974-75, which has planned for a total reduction in the quantum of food subsidy to the extent of Rs 150 crores. A progressive dismantling of public distribution would accordingly seem to be the message embedded in the Commission's latest recommendation, a message which cannot but gladden the hearts of many a chief minister — and perhaps quite a few Union ministers too.

A wobbliness has obviously begun to to affect the APC's frame of analysis. In the arid tract which is the government, the Agricultural Prices Commission was perhaps one of the few corners where unvarnished truths were in the habit of being spoken out. The integrity of analysis and expression which the APC has demonstrated over the years could well have been emulated by, for example, the Planning Commission. It now seems that all is over bar the shouting. Evidently, the Agricultural Prices Commission has also become a victim of the pervasive defeatism; its latest report is a repudiation of all it had endeavoured to set up in the past. It suits the government to keep the Commission where it is, to use it when it serves its own purpose and to ignore it when it does not. But those who constitute the Commission owe it both to the nation and themselves not to play the government's game. At this juncture, they can serve the cause of both their conscience and their professional conviction by abdicating rather than by surrendering. At any given moment, there will be no dearth of lackeys to say what the government will want them to say. But why should the APC, of all bodies, contribute to this sorry spectacle?

Exchange Reserves

Time to Move Out of Sterling

THE sterling exchange guarantee given by the British government to official holders of sterling balances has been extended upto the end of 1974, though on substantially modified terms. It may be recalled that the guarantee arrangement was first negotiated in 1968 to reassure the official holders of sterling so that they were not tempted to switch to the dollar which, at that time, was still a strong currency because of its gold convertibility. Through this arrangement, which was renewed in September 1971 for a further period of two years, the British government succeeded in minimising speculative pressure on sterling and gave it relative stability for some time. The success of the arrangement persuaded the UK to renew it once again on September 6, 1973 for a period of six months at a slightly improved dollar value of $ 2.4213 compared to the previously guaranteed rate of $ 2.3760 per pound sterling. The new rate, incidentally, represented the average of the rates at noon on the preceding three days. The latest renewal of the guarantee, which is to run upto the end of 1974, makes a substantial departure by linking the exchange rate guarantee not to any particular dollar value in terms of sterling but to the weighted average movement of the pound over the next nine-month period. Under the new formula, variations in exchange rate for the sterling will be measured through sterling's average movement against other key currencies weighted according to their importance in bilateral and world trade.

The latest method adopted for compensating sterling holders for possible exchange losses in the event of depreciation of the sterling is an ingenious one. Under the old agreement, which was effective upto the end of September 1973, compensation was payable if sterling dropped below the guaranteed level for 30 consecutive days. In the subsequent guarantee arrangement which will expire at the end of this month, compensation is payable to holders of sterling only if the average daily rates of the sterling for the whole six months drops below the guaranteed level. Thus the terms of the sterling exchange guarantee have been made progressively less favourable. Under the new guarantee arrangement, which would become effective from the beginning of next month, the terms have been made even more unfavourable. The UK knows that the dollar will continue to remain firm against the sterling and that any guarantee of the value of the pound in terms of the dollar might prove a costly proposition. Since the weighted average rate for the pound *vis-a-vis* the major world currencies would be influenced by a number of weaker continental currencies, the weighted depreciation of the pound is likely to be much lower than that *vis-a-vis* the dollar and also its movements were less volatile.

Most of the world's major currencies may be expected to depreciate, in the immediate future, on account of huge payments deficits stemming primarily from steeply rising oil import bills. Since the pound would be in the good company of several weaker but prominent world currencies in its downward movement and since these currencies would influence the weighted average exchange rate of the sterling, its effective depreciation for computing the compensation payable to holders of sterling under the exchange guarantee would be relatively lower. Secondly, even if the sterling slips sharply against the dollar it would not make much of an impact on the effective weighted exchange rate as only about one-eighth of the UK's trade is now with the US.

The continued dilution of the terms of the exchange guarantee has resulted in a decline in the number of countries offering to be covered under the agreement. While the existing agreement is said to cover 62 countries, the new agreement is acceptable to only about 50 countries. Some countries like Kenya, Malawi, Singapore and Zambia which had participated in the previous agreement, have preferred to opt out.

Given the new terms of the exchange guarantee, there is not much excuse for India to continue to be a party to it and, as a result, keep the bulk of its reserves in sterling. The only string that keeps India tied to the UK is the preferential tariff treatment which it receives. Whether the UK finally becomes a full-fledged, unencumbered participant in the planned European Monetary Union of the ECM countries or not, it is worthwhile for India to diversify its reserves in favour of stronger currencies like the deutsch mark, dollar, Swedish kroner, Swiss franc and Dutch guilder. There is no reason why India should wait till the day the UK gives notice of its intention to liquidate its sterling reserve obligations before changing the currency composition of its reserves. Sterling has lost its vitality as a reserve currency and there is nothing to justify India holding sterling balances in excess of those required as working balances. Since we will have to draw on our reserves quite substantially in the months to come, the opportunity should be used to liquidate our sterling balances first before touching other currency balances.

Ethiopia

End of Ancien Regime?

THE military revolt which broke out on February 26 in the provincial capital of Asmara was quickly followed by military and civilian unrest in the capital city of Addis Ababa. The immediate demands of dissident troops led by junior and non-commissioned officers was for a raise in their pay scales. A similar demand was made by 80,000 unionised white collar and service sector employees in Addis Ababa.

As is to be expected, only the organised — and relatively minute — sectors of the Ethiopian population have shown their discontent with a totally feudal and backward regime. The peasantry, which makes up more than 80 per cent of the population, is so greatly exploited and so unorganised that it has been unable to express the depths of its degradation. The agricultural sector in Ethiopia is largely controlled by absentee-landlords who treat their tenants as serfs. Most of the crop produced by these tenant-serfs is taken away by the landlords and sold at higher prices in urban areas like Addis Ababa.

Last year when the rains failed, at least 100,000 peasants died of starvation alone, not counting the tens of thousands who died of diseases brought on by malnutrition because the landlords and the callous Emperor's regime were unwilling to unload their accumulated stocks on the markets for fear of lowering prices. It seems that Ethiopia even exported food stocks while thousands were dying. This year again, seven provinces have been affected by drought conditions and famine threatens 10 million people or nearly 40 per cent of the total population.

But this major impending catastrophe is not receiving much attention while the newly-formed Cabinet under Prime Minister Makkonnen concentrates on appeasing the 55,000-strong armed forces (the second largest in Black Africa, built with massive American military aid) and the urban employees. The troops and the unionised employees have been granted large pay increases, but it is unlikely that there will be no further changes.

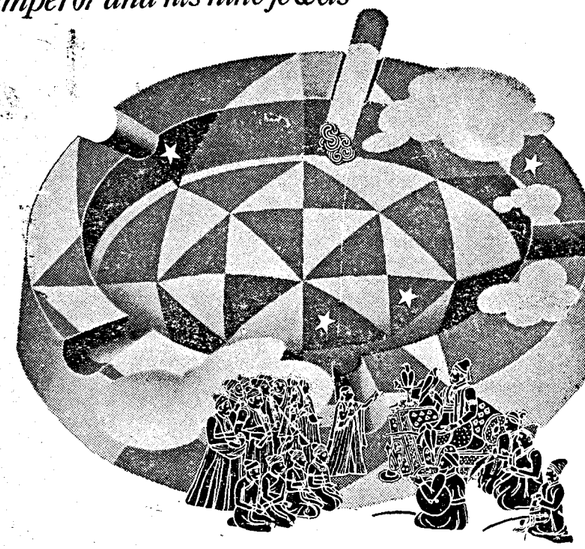
So far, except from some student groups, there have been no demands for the removal of the Emperor. But his removal in the next few months seems almost inevitable, considering that the feudal system which props him up is incapable of meeting even the limited reformist demands of the younger officers. These demands include some degree of land reform and steps towards representative government. The military revolt signifies the beginning of the assault on an ancient feudal system.

CPI

Hunting with the Hounds

A Correspondent writes:

NOW that the curtain has been drawn on the current series of elections, the CPI has reasons to feel happy with its strategy of unity-and-struggle *vis-a-vis* the Indian National Congress. Things went wrong only in Manipur, where the preferred strategy should have been against unity, and for struggle. Otherwise, there are no complaints to write home about. The unity in Uttar Pradesh and Orissa has worked out beautifully. In the aftermath of the elections, in both these states the Congress will now have to depend upon the CPI for sustenance, if not for survival. At the same time, the path of struggle followed in the other states has succeeded no less. From Maharashtra, S A Dange's daughter has been returned to Lok Sabha. In Pondicherry, if only the lone representative of the CPM will behave, the anti-Congress alliance struck with the ADMK ought to sustain the party in the vicinity of power. The successful defence of the Coimbatore Lok Sabha seat is another feather in the cap of the unity-cum-struggle theme.



In terms of its own prescriptions, the CPI has not therefore of late put one foot wrong. If the furtherance of Soviet foreign policy demands that the Indian National Congress ought to be supported along a broad front, the strategy of unity-cum-struggle offers the maximum scope for that. On the other hand, if the preservation of its image depends on the fact that every now and then the party must make populist noises and rail against the Congress, the strategy assures the necessary flexibility for that too. On some occasions, of course, beggars cannot be choosers. In both Tamil Nadu and Pondicherry, the CPI went in search of the ADMK not so much to cater to its notion of struggle, but because the Congress preferred the embrace of K Kamaraj. In this instance, though, even the act of making a virtue out of necessity has richly paid off. Be that as it may, this is an enviable position to be in. With a complaisant Indian National Congress benignly looking on, the CPI hunts with the hounds and runs with the hares. In the process, it has succeeded in both improving its parliamentary strength and enlarging its share of official spoils, besides generally converting itself into a busybody. Since it has sworn to retain for itself the prerogative to strike out on its own if circumstances so demand, its leftist image is also in no particular danger of erosion in the immediate period.

Problems may however arise over the intermediate and long run. Till as long as the foreign policy of the Soviet Union remains what it is today, Ajoy Bhavan would have to go flat out in support of the Congress. In the event of the economy continuing to go downhill because of inept management, the Congress could stand altogether discredited in a few years' time. The CPI would nonetheless have to step in and bail out Indira Gandhi. Would its mass base tolerate such an arrangement? It is the weakest sections of the community who suffer the most under the ravages of inflation. The principal contributory factors for their hardships and tribulations, they could not but conclude, are the policies and programmes of the ruling party. Were the CPI, even at this juncture, to offer succour and sustenance to the Congress, it itself might then become suspect; its rank and file could decide to desert it in large numbers.

The CPI policy of unity-cum-struggle might also provoke a different kind of reaction, this time from within the Congress itself. Quite a few will be prepared to describe the dialectics of unity alternating with struggle as rank opportunism. In West Bengal, there is already a clamour within the Congress for ejecting the representatives of the CPI from all official committees, on the ground that the latter's state unit has been extremely critical of the functioning of the Congress government. Complaints of this nature may snowball. The Congress may need the CPI for the sake of the grain and sunflower oil and equipment from the Soviet Union, but this may not be immediately obvious to Indira Gandhi's infantrymen in the states. Their emotional commitment may be to specific local issues, which, more often than not, are class issues; beyond the pale of Kerala, Orissa and Uttar Pradesh, they may like nothing better than to get rid of the CPI, which many amongst them may consider to have grown too big for its shoes.

As the economic situation worsens, Indira Gandhi's ability to discipline the party satraps in the states is also likely to decline. Where the CPI is concerned, the latter may not exactly feel like oozing with amity and goodwill. By now it is not just the leaders and cadres of communist parties who have read tracts on Marxist ideology and Marxist tactics. The enemies of the CPI know about equally well what the party's objectives are, in the immediate period as well as over the long run, and what stratagems it is wont to deploy to further these. For the present the Communists may be provided with enough rope, but the length of the rope may begin to shrink as soon as the so-called objective situation undergoes a change. The CPI could therefore hardly take anything for granted, including its position of vantage in Uttar Pradesh and Orissa. Once events begin to unfold, the Biju Patnaiks and the Charan Singhs could become the favoured ones in place of the CPI by the decision-makers in the Congress. Its anxiety not to surrender the Chief Ministership in Kerala should be an additional factor inhibiting it from driving too hard a bargain with the Congress. One cannot afford to ill-treat the goose that lays the golden egg. There is thus a distinct possibility that the device of unity-cum-struggle, instead of forcing the Congress to the Left, might only succeed in diminishing the CPI leadership into a bunch of cautious conservatives: the lure of power is a great civiliser, it can waylay even those who have hitherto talked exclusively in terms of seizure of power.

The great Akbar invites you to confer amidst an emperor and his nine jewels

The Akbar experience.

An experience of efficiency and enjoyment. The finest guarantee of a successful conference.

With every facility you require, plus that unique blend of royal tradition and youthful exuberance which is our very own thing.

A choice of conference rooms. The Nauratan, named after Akbar's nine "jewels" or councillors, seats 150, and accommodates 200 guests for cocktails.

The intimate Birbal Room hosts smaller meetings and get-togethers.

You get attentive, personalised service. PA systems, secretarial services, telex, ITDC car-hire and tour facilities.

And cuisine. We offer you two of Delhi's finest restaurants. The shimmering Sheesh Mahal, and our 24-hour coffee shop, Madhuban. Our catering and menu services can be tailor-made to your conference budget. So write to us. We promise you a conference service second to none.

The Gujarat Phase

Romesh Thapar

THE Gujarat crisis is far from resolved. With the Assembly dissolved under massive public pressure, the movement will now gear itself for early elections, possibly before the presidential contest in August even though the legal *pundits* argue that it is not necessary to complete them by that date. The antics of the old politicians, Morarji Desai and the opportunist "leaders" of opposition parties, are designed to push mass discontent in this direction.

The student leadership is not all that naive. Its cold anger at Congress corruption and the incredible mishandling of the situation by the Centre does not mean that the movement is ready to embrace the horrific old politicians who have done so much to destroy the elan of this country. Preferably, the students would like to throw up a new cadre of men and women to shoulder political responsibility. And this may well happen. It may not. But let us not forget that a government has fallen for the first time in India as a result of a student movement.

Those who are cynical about the capacity of a youthful movement like the Navnirman Samiti to provide leadership are unfamiliar with political history, particularly their own when power was transferred in 1947. What was the age of our oldsters at that time? We have got so used to equating experience with the over-fifties that we forget that Nehru mobilised men in their twenties and thirties to lead political formations in the states and at the Centre.

If they can impose the necessary discipline on their excited ranks and build a network of organisation and decision-making in both the urban and rural areas of Gujarat, the activists in Gujarat should be able to throw up some remarkable talent. It will of course consist of many persuasions and tendencies, but then the process of ironing out a political programme will chisel the essential commitments and dispense with irrelevent concepts. The main task is to keep the programmatic approach closely linked to the hard realities of the state's problems. These are not all that terrible, for Gujarat not so long ago had the highest growth rate in India.

It is a pity that Indira Gandhi has been persuaded to run away from embarrassing situations. The failure to visit Bombay city and now the reluctance to view the Gujarat situation on the spot, is in strange contrast to her bold moves ten years ago — visits to the South during the language riots in Shastri's days, to the war front in 1965 and to Tezpur in 1962. Who holds her back? Intelligence work-outs? Bureaucratic concepts of what constitutes leadership? Whatever the truth, it is clear that Indira Gandhi will have to study, Gujarat in Gujarat if the Congress party is to survive as a party.

Those who have their ears to the ground expect a prolongation of the Gujarat-type troubles. Shortages of everything, corruption, high living by the rulers and a never-ending price spiral have turned India into a danger zone. Soon, a foot-dragging government will be facing the kind of dilemma that no government would like to face: shall we import food or oil? Imagine the repercussions each way, political and other. The Gujarat phase is fully entered and has to be confronted with courage and understanding of a special sort, not the caricature of political functioning to which we have become accustomed.

The civil and military observers of the situation are certainly apprehensive about the likely repercussions in areas of adjoining Gujarat — Maharashtra, Rajasthan, and even Madhya Pradesh and Bihar. Discontent is simmering in these regions and the local *dadas* are unconcerned. The Centre's apparent aloofness from these raw facts is all the more surprising now that the presence of a man like the newly-appointed Chief Minister Vengal Rao transforms the mood in much-troubled Andhra.

Admittedly, food rations are not as easily organised as improvements in services and facilities. But our people are patient, terribly patient. They have invariably given silent support to those politicians who have produced some evidence of action-orientation, intelligence, impartiality in decision-making and commitment to a slow and steady improvement in the lot of those who are usually forgotten. Indira Gandhi surely cannot be oblivious of this dimension to Indian politics. Then why are we saddled with so much riff-raff all over the system in her name, creatures who are only committed to making a quick, undeclared rupee?

The Gujarat phase is likely to be tempestuous. Those radicals who always see "fascists" in movements they do not lead had better reform their notions. And if Indira Gandhi is inclined to listen to them to find a convenient cover for the anger that is developing, particularly in urban areas, she too had better re-think the situation. Anti-social elements join every movement, including Garibi Hatao. This fact cannot be used to generalise on an entire situation.

Then, there's that other aspect mentioned factually but not really denounced. There's too much killing going on. Everyday, the newspaper carries this kind of report. It is a commentary on our incompetence to hold situations without bloodshed. After all, when the students of France staged their uprising, paralysing their country for weeks, and indulging in what is described here as hooliganism, not a single person was killed. We need to digest a fact of that kind, we who have chattered endlessly about imperialist-colonialist oppression. I am beginning to wonder what the score would be between us and the British, if someone took time off to compute it!

Yes, there's no doubt in anyone's mind. We have to do a lot of talking to each other if we are going to get through the crises which are building.

March 18

TAMIL NADU ELECTRICITY BOARD

Corrigendum to Tender Specification IDA/T.N.E.B/.2 for Supply of E.H.T. Switch Gear, Current Transformers and Potential Transformers.

The due date is extended from 29th March, 1974 to 29th April, 1974 12 noon. The tenders will be opened on 29th April, 1974 at 3.30 p.m.

Calcutta Diary

A M

THE winter is ended, the season of discontent has however only begun. Nearly everyone, it seems, is walking away from his job and is out in the streets, agitating for higher wages: railway guards, power men, engineers, doctors, teachers, municipal employees. The inert middle class has suddenly discovered the need for organised action to protect their living standards. The once-snooty attitude toward the wretched labouring sections who resort to strikes every now and then is gone. Inflation, evidently, is a great leveller.

The point can no doubt be made — and is being made — that what is happening is absolutely scandalous. The poor in the countryside and the unorganised urban proletariat are suffering a lot more than the middle class from rising prices and the growing shortage of essential articles. But so what? If those who have been hit the hardest by the inflation have not mounted a protest, or have mounted one which does not match in intensity the agitation launched by such tribes as doctors and engineers, that is not because the very poor love the phenomenon of spiralling prices: the feebleness of their protest is because of their lack of organisational strength. Those who can will try to protect their interests. Besides, it is basic human nature to compare one's own state of affairs not with the plight of those who subsist below; comparisons are always turned in the other direction. Even were the threat of absolute penury not there, those earning ten to fifteen thousand rupees a year would still judge how they are faring on a relative scale. They find out how, for example, those who were making thirty to forty thousand a year a while ago are doing now; the latter in their turn worry whether *they* have further slipped away in the relative scale *vis-a-vis* those whose annual earnings were a hundred thousand rupees a while ago. And so it goes. In such an atmosphere, moral exhortations lose their currency. Enrich thyself, spake N Bukharin to the Russian kulaks in the 1920s. Enrich thyselves, so too seems to have been the message transmitted by the regime of the land here to the surplus-raising farmers, traders and industrialists. If it is permissible for these categories to enrich themselves by taking advantage of the inflation — and, in the process, by stoking the inflation further —, the emaciated middle class experiences no moral scruples at all in taking to the streets in defence of their own standard of living. Everything is fair in love and war; inflation is war, no less. Everyone is therefore for himself or herself.

GOVERNMENT HAS CAVED IN

This is the major danger the country is going to face as food supplies shrivel up in the coming months. Inflation is bad, the economists say, because it fouls up investment signals, and those with money to invest feel tempted to go for speculation rather than for increased production; thereby the shortage of goods is aggravated and the pitch of the income velocity of money is further queered. These economic effects are still only a veil and a symptom; it is the social and political implications of the process which are still more lethal. Those who work the wheels of production, those who keep the nation's economic infrastructure going, those who switch on the power plants or the flow of water from the irrigation dams, begin to walk away from their jobs as the scourge of inflation spreads and the adjustment in their money earnings fails to cope with the rise in prices. Where they do not exactly walk away, they perform listlessly, grumbling all the while; they could not care less whether output grows at a satisfactory rate, or whether the equipment is being maintained properly. India is not *sui generis*, the kind of wholesale disruption of productive activity currently being witnessed here has happened elsewhere too whenever wages have been unable to keep pace with prices. To appeal to one's sense of patriotism is altogether pointless in this phase. A practising doctor or engineer or railway guard loves the country in his own fashion, he does so despite the fact that he does not hit the newspaper headlines. Talk to him, he might even come to admit that his demand for more compensation against the price rise could set the regime additional problems. But he has reached a stage where he could not care less. A government can demand, and receive, some consideration from its citizens provided it can convince them that, despite its limited options, it is making an honest effort to control prices, or at least is even-handed in its distribution, as between different classes and groups, of the hardships caused by the inflation. Once this basic conviction has evaporated, the situation is beyond redemption.

As one looks around, it is difficult to get away from the feeling that the government has as good as caved in, and invited the devil to take the hindmost. It needs a particular talent to ride inflation. By now a Latin American country knows how to cope with an annual order of price increase of 30 to 40 per cent or more, for it has been at the job for umpteen years: the country's agrarian structure is insulated from the inflation, and periodic adjustments in the exchange rate and injection of resources from abroad take care of some of the residual problems. Even the Latin Americans, though, are having second thoughts: the rate of inflation in Brazil, for instance, has come down from around one hundred per cent in the middle 1960s to just about 12 per cent at present. At our end, the specific skills which go with the management of inflation, skills which are a function as much of attitudes as of practice, are still missing. In per capita terms, the annual injection of foreign resources in the country is not even 5 per cent of what it is for a Latin American nation. Hardly any step has been taken to insulate the country's agrarian base from the impact of spiralling prices either. Public distributions of foodgrains, at relatively low prices, is supposed to cater to the vulnerable sections: one however doubts whether the rural poor, despite constituting as much as 40 per cent of the nation, receive, through the courtesy of the public distribution system, even 1 million out of the total domestic output of 100 million tonnes of foodgrains.

One thus comes back to the basic issue. In this poor land, if you want to control prices, you must begin with controlling food prices. Something must have gone hopelessly wrong with the economy if the per capita national income can fetch only 4 quintals of foodgrains per annum, or if the earnings of at least half the population are not sufficient for buying even 2 quintals of grain over the year. The chief ministers meet and decide to raise further the prices of grains; since they do not do anything to raise the earnings of the poor, by their decision, they only manage to push, at one stroke, a few more millions below the poverty line. By the same act, several others too have their living standards brought a few notches down. Some amongst them, who are organised and have staying power, refuse to accept without demur this erosion of their level of living. From then on, it is a free for all. Traders and farmers, who have the holding power, keep back the stocks of grain, which enable them to push up prices even higher. The rural poor, who have neither the stocks of grain nor staying power, suffer, and suffer quietly. Doctors and engineers and locomen and municipal workers and all the rest, who have some staying power, agitate, go on strike, interrupt output, and thus also become partly responsible for a limited rise in prices. A government which will not lift its little finger against the farmers and traders — on the other hand, will coddle them further — can however have little moral authority to rail against the latter.

It is only March, the lean months are yet to come. Calcutta's dilapidated streets are nonetheless every day getting crowded by mid-afternoon. They march, teachers, industrial workers, housewives, engineers, doctors, municipal employees; slogans rent the air; each group demands compensatory adjustment in wages or a lowering of prices. They need to be provided with some relief. There is however no dearth of Jesting Pilates. While refusing all other kinds of relief to the public, the Railway Minister has decided to restore the concession for travel to hill stations. If you cannot have bread, you can travel to the hills and cool off.

COMPANIES

Too Good To Last?

Hansavivek

BOMBAY DYEING, equipped with 2.05 lakh spindles and 3,770 looms, including 3,770 automatics, has placed an order for 128 new looms of the latest automatic variety, known as Sulzer looms, for a new factory. The purchase of these looms has been financed by a foreign exchange loan obtained from ICICI, and the unit is expected to go into production in early May. To meet the increased yarn requirements, the company has also placed orders for six draw frames and speed frames and 38 ring frames for its textile mills. Also, two new combers and sectional warpers and a package winder have been added. For the new bleach works, a rotary screen printing machine has been ordered, which will be financed through a Dutch credit. An order has also been placed for an indigenous curing machine and two jiggers are on order for the soaping of reactive dyed fabrics. A new imported diesel generating set of 860 KVA is being installed to be used in the event of cuts in power supply. Capacitors have been installed to improve the power factor to effect a saving in the consumption of electrical energy. Last year the company installed new machinery of the value of about Rs 63 lakhs, of which Rs 28 lakhs will be payable in deferred instalments over 5 years under the IDBI's scheme. The company sold the machinery and plant of its ginning and pressing factory at Umri, which had not been worked for the last few years.

The company's total production of cloth during 1973 was 927 lakh square metres, of which 32.5 per cent was exported and 4.16 per cent supplied to manufacturers for export of ready-made garments. Exports brought in Rs 97 lakhs more at Rs 901 lakhs. Exports exceeded the voluntary export obligation of 13.40 million square metres by 16.33 million square metres. The company obtained a higher realisation by exporting superior quality, finished goods. Except for the small quantities manufactured at its own mills, the major portion of the company's obligation under the controlled cloth scheme was fulfilled by getting other mills to undertake the production on its behalf.

The company has turned out very good results for 1973, with increases in sales, margins and earnings. Dividend, stepped up 4 points to 20 per cent, has a much better cover than a year ago. The ratio of wages to sales rose slightly, but that of inventories to sales was considerably lower. The company has allotted bonus shares on a one-for-five basis. These shares will participate in the dividend from the current year. The liability for retiring gratuities is estimated at Rs 255 lakhs, against which a total provision of Rs 160 lakhs has been made.

The chairman, Neville N Wadia, observes that last year prices and profits for the textile industry throughout the world were the highest since the war and that this phase of prosperity is likely to be short-lived. According to him, prices in all markets have levelled off and demand is slackening while costs are likely to rise "alarmingly". He estimates that prices of dyes and chemicals will go up by 30 per cent and of stores by 20 per cent. The cost of power has already been increased by 25 per cent and of fuel oil by 100 per cent from the beginning of the year. He adds that these four items alone will cost his company more than Rs 250 lakhs over what was spent in 1973. The wage bill will be higher by another Rs 125 lakhs. Other factors to be faced are the rise in the price of cotton which can be further aggravated by the shortage of synthetic fibre and the possibility of an increase in the quantity of controlled cloth which all mills will be called upon to produce. He feels that the major part of these increases will have to be borne by the company and that, if things continue as they are, the picture at the end of the year will be "far from rosy".

MAHARASHTRA SUGAR is setting up a glass bottle manufacturing plant at Tilaknagar in Ahmednagar district of Maharashtra with an installed capacity of 6,000 tonnes per annum at an estimated capital outlay of Rs 55 lakhs. The company will invest Rs 30 lakhs of its own and the balance of Rs 25 lakhs will be advanced by SICOM as a long-term loan. The bulk of production will be taken by the subsidiary, Tilaknagar Distilleries and Industries (formerly 'Maharashtra Radio and Electronics') to which the company's distillery, potable liquor plant and cube/confectionery plants have been sold. TDI has issued in favour of the company 145 debentures of Rs 10,000 each and 5,053 equity shares of Rs 100 each fully paid as part of the consideration for the sale and transfer of these assets. As at the end of March 1973, the subsidiary carried a total accumulated loss of about Rs 10 lakhs. Its share capital is Rs 15 lakhs. Maharashtra Sugar has shown a lower gross profit compared to

the previous year, but this is due to a provision of Rs 14 lakhs for the future gratuity liability. As at the year-end, the company's borrowings stood at Rs 60 lakhs against nil a year ago. The ratio of inventories to sales also increased sharply. Dividend, maintained at 16 per cent, was just covered by earnings. No provision for bonus for 1972-73 has been made in the accounts, nor for income-tax of Rs 41 lakhs on agricultural income of earlier years. The company's appeals against the assessment orders are pending.

MADRAS RUBBER FACTORY's proposal for expansion of the installed capacity of the Madras plant from 6.1 lakhs to 10 lakh tyres and tubes has been approved. The necessary balancing equipment is being installed to speedily implement the project. At the Goa plant, which was commissioned in September last, the company has already achieved production of 600 truck tyres per day. With the installation of the balance of imported and indigenous machinery and equipment during this year, the company hopes to reach the licensed capacity of 4 lakh tyres and tubes. With the progressive implementation of additional capacities at Madras, Goa and Arkonam, MRF's production and sales in the current year have been ahead of the last year. The galloping rise in prices of all major raw materials is, however, causing concern to the management. Efforts are being made to get a price increase in tyres, as selling prices have remained unchanged since 1968. MRF has turned out good results for 1972-73, with higher sales and margins. The unchanged dividend is well covered by earnings.

ASIATIC OXYGEN is paying a maiden dividend of 6 per cent for the 13th year ended September last, when the company turned in better results with higher sales and profits. The performance would have been still better but for the shortage of calcium carbide and cylinders and the unsatisfactory position of power supply. The Durgapur oxygen plant remained inoperative last year also, as the supplier could not ship certain essential components. This plant is expected to be recommissioned by June or July next. The company has also taken up the work of setting up a dissolved acetylene plant at Bhadravati. It is trying to acquire cylinders and also hopes to get supply of calcium carbide during the first half of 1974, as the government has decided to import the material. But the power supply position continues to be "very uncertain".

Science and Indian Society

E C G Sudarshan

THE twenty-five years since Independence have seen a phenomenal expansion of scientific programmes and growth of national science laboratories. The Council of Scientific and Industrial Research (CSIR) and the Atomic Energy Commission (AEC) are major partners in this national undertaking with equally substantial, but perhaps less spectacular, contributions from the Indian Council for Agricultural Research (ICAR). The research undertaken by various university laboratories has grown significantly in quantity. The number of scientific workers has increased phenomenally and equally has grown the quantity of scientific output measured in terms of research papers and reports. The national expenditure on science research has steadily increased, and while it constitutes a smaller percentage of the gross national product than in many of the prosperous technologically developed countries, it seems to be steadily increasing towards that target.

Two Observations

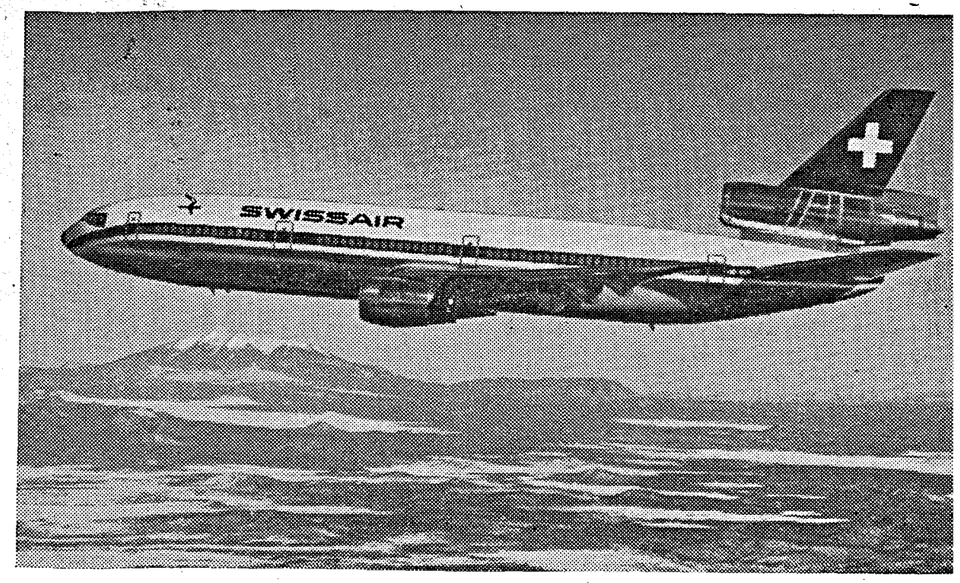
Two observations about science in India are worthy of record. First, the competence of the better Indian scientists in a number of diverse scientific fields is comparable to their counterparts in other parts of the globe. Any visiting scientist from any country can expect to obtain critical appreciation of his work in a number of different centres in the country, however esoteric or up-to-date his work is. Equally there are a number of Indian scientists whose work is as up-to-date as today's *New York Herald Tribune*.

Second, the national government has taken a genuine interest in the development of science in the country. In addition to the creation of a number of scientific-administrative bodies and commissions like CSIR, AEC, ICAR, ICMR, the Electronics Commission and the Space Commission, there is a Department of Science and Technology in the Central government. Not only do many scientists hold senior policy-making positions in the government, but a very large number of them have their views and opinions solicited by the government. The National Committee on Science and Technology (NCST) has been constituted to take up a continuing study of problems of science and technology in the country. States like Kerala and Mysore are setting up state level bodies with a similar aim. There has been some talk of introducing a National Science Act to spell out the nation's commitment to science.

There are a number of articles about science and by scientists in the numerous periodicals in the country. Many scientists consider themselves nation-builders and are concerned with national problems. At least one excellent journal, *Science Today*, devotes itself exclusively to science. Science is in the air!

These are hopeful signs and one might expect that the Golden Age of Science has dawned in India. But in looking at the scientific scene, we find a number of anomalies. As the *Physics News* pointed out in an editorial, if we look at the spectacular Indian contributions to science during the last fifty years, it is more likely that we would pick on pre-Independence contributions! This is despite the spectacular post-Independence growth in scientific output. In a number of areas, while the Indian contributions are very substantial, they do not stand out as essential; and if they are omitted, world science will not be set back significantly. For the scientific contribution of a nation which is as populous as ours, this is indeed disappointing. It is as if in our anxiety to increase scientific output, we have encouraged competent mediocrity to the detriment of the exceptionals. Not only have we eliminated hereditary royalty, but somehow suppressed intellectual aristocracy.

Perhaps a part of the responsibility lies in the coupling together of science and technology, of viewing science as an ancillary to technology and industry. It is perhaps significant that both the names of CSIR and NCST show this view of the government. This coupling does make available to scientists much more money than might have been available if science was thought of as an intellectual *discipline*. But this is a Midas touch. The science used for technology and for industry is not always the intellectual frontier. It need not necessarily be dull science, but it often tends to be in our pattern of industrialisation. But the most insidious aspect of this coupling is the confusion of technology for science. And the fact that many eminent men of science, like P C Ray and H J Bhabha, were also champions of technology abets this confusion. If you were to talk to someone about science in Kerala, he is almost invariably led to mention the Thumba Equatorial Rocket Launching Station as the leading scientific institution. And why not? Is there something more spectacular or better equipped in the state? Sometimes much excellent science gets done under the cloak of technology like at the Bhabha Atomic Research Centre, but these situations seem to be as rare as statesmen among politicians.



Rife with Paradoxes

The Indian scientific scene is rife with paradoxes. We have probably the largest number of unemployed but highly qualified scientists who are gradually withering away like a flower-shop azalea. At the same time many of our universities have members of science faculties whose competence is abysmally low. The science textbooks of our colleges and schools are often put together by even less competent people, yet we have excellently trained people whose talents are not made use of. Many of them are bitter and disenchanted at not being able to find useful employment. Some of the more "fortunate" ones travel from one temporary job to another in various foreign countries like stateless persons. Our better known scientists are overworked, flitting from city to city, from meeting to discussion, spending a major part of their lives away from laboratory and home in airports and vehicles. Yet we have many gifted ones who are not involved in any of these. We have an exploding scientific research output, yet our children learn from imported textbooks or cheap shoddy books; and sometimes the imported books, too, are shoddy.

Recently both the Department of Science and Technology and the Council of Scientific and Industrial Research have offered to involve unemployed scientists in innovative science and technology plans. Technology adapted to a rural mode of life, science education which is more closely integrated with life, both of these prompt original thinking on the part of the scientists. To view physics and chemistry, biology and economics in terms of life of the children in our villages: to be able to show that the

A totally new, matchless experience awaits you in April.

Swisscare aboard the splendid DC-10-30s.

What's so matchless, you may well ask, about flying on our new wide-bodied DC-10s?

Well, it's not just that you have more elbow-room... the body is almost as wide as the 747s, but there's one seat less in each row. Nor the fact that you can rent earphones and listen to eight different stereo programmes, or watch the latest colour films.

It's all these things, plus Swisscare. The world-famous Swiss hospitality no other airline can offer—yours to enjoy all the way, with choice of tempting Continental cuisine or delicious Indian vegetarian meals. We're sure you'll find Swisscare aboard the DC-10 a really unique experience. It's yours from April... our DC-10s will fly thrice a week to the West and thrice a week to the East from Bombay. (An equal number of westbound and eastbound flights weekly will be served by our tried-and-true DC-8s.)

SWISSAIR

everest/811h/SA

most ordinary happenings around us are as much relevant to physical science as experiments conducted in a laboratory filled with gleaming steel and glass cages of sophisticated equipment: to be able to view the world around us scientifically; these are challenges to our gifted and excellently trained scientists.

With the traditional extolling of the integrated man, with the background of *yoga* as the way of life: with all this, how come our scientists are by and large controlled schizophrenics? How come we now lack the leadership of men like P C Ray or C V Raman? Most of all, what is it that we should do so that excellence may find the possibility of surfacing? These are fascinating and important questions. Search for their answers may lead us to re-evaluate our views about national priorities and postures. And it should concern all statesmen.

During my wanderings in the country, I have met a large number of intelligent people who are concerned about these questions; some of them have even partial answers. One of them, the leonine J P Naik, points out that our national concern has so far been in educating the average and not with nurturing the gifted. He emphasises that the sin of omission is at the level of elementary education itself.

Root Cause

Reliance on foreign assessment and acceptance has been cited by many as the root cause for the soullessness of the work of the majority of our scientists. To this, I would like to add our intolerance of the exceptional individual whose social or political philosophy is not in tune with the times. Some people link this with a pathological behavioural syndrome in which people, leaders and the led alike, profess to one set of principles and practise another. We seem to hold up a philosophy of life in which only the rational, the unphilosophic is acceptable. We act as if only a technology-oriented egalitarian socialistic self-sacrificing life style is to be even contemplated. But in practice we destroy our village culture by a society enamoured of gadgets and plastics; we tend to uniformise. Yet most people cherish values of life, common to many, but held on to only privately and guiltily. Does not independence for the nation confer on its citizenry the freedom to examine the philosophy of life?

Science in India is at a crucial stage. It is definitely going to be that there will be more science, much of it directly sponsored by the government. Whether the government will move to eliminate the anomaly of poor science in a country with a surplus of highly trained scientists will depend on the advice it receives from its scientific advisers. But whether science will become integrated with culture, whether India's scientists will become liberated from foreign domination, will depend on the concerted effort of the scientists themselves. And out of this independence may come greatness.

Science and Civilisation

Satyendra Nath Bose

[This article by the late Satyendra Nath Bose was originally published in *Current Thought*, a quarterly published from Calcutta. While sending us the article, A K Das Gupta who was associated with *Current Thought* as a member of its editorial board writes: "The article is an invaluable document — a rare one at that — carrying the views of the great scientist on the prospects of science in the context of modern civilisation. The year was 1941, when the western world was in the midst of a struggle against Fascist Germany; while in our country, as part of the struggle for independence, there was a campaign against western civilisation itself. In this article, one would find Satyendra Nath Bose's reaction to these contemporary tendencies."]

TODAY when a frightful war threatens to destroy the whole structure of modern life, when all the resources of modern science are apparently utilised for destruction and for the enhancement of human misery, such questions as what our civilisation really stands for and what immutable goal we should set before ourselves, naturally crop uppermost in our minds. We have to find out whether modern civilisation and science do promise for mankind blessings of perennial value, which will justify its adoption and cultivation, in spite of the sufferings and woes of war and the complications and tangle in human affairs to which they seem to have always inevitably led. I mention this problem as meriting our immediate and serious attention, as many respected thinkers in various countries have begun to despair of a material civilisation based on science and knowledge. They have concentrated their attention on the darker sides of the present-day existence and hence advocate a return to life of pristine simplicity as the only escape from certain doom. Our immediate surroundings are distressing enough, and immediate prospects do look black indeed. But here the experiences of a single life or a single generation are not sufficient basis for a right estimate of the result of a course of action. The evolution of humanity does not take place in rectilinear paths of progress so as to allow us to predict our destinies from a close-up view of a given situation. We have to forget our personal discomforts and return to long-term records for a right and proper judgment. We cannot ignore that men have fought and killed since the beginning of history, and humanity have often pulled down edifices of brilliant civilisations in the past only to transform and rebuild the structure on a grander scale. Life continually advances through mazes of decreasing complexity, and we must not be frightened by its occasional forbidding outlook and must not release our hold on treasures already acquired. Progress demands a life of vigilant and incessant toil. There is no prospect of indolent repose and carefree happiness on the way — blissful states which we all dream of but never seem to realise except perhaps individually by a reckless renunciation of all human activities.

Resolute Optimism

We work and strive not for leisure, but for a mastery over the forces of nature. We unite and co-operate with a view to greater freedom and scope for our creative instincts. Individuals, communities and nations have already ceased to live if they begin to pine and crave for happiness, feel tired of the miseries and drop down on the thorny way. I should, therefore, plead for a resolute optimism. Stories of the happy past should not lead us astray, nor should we in violence to the spirit of life set our face against the demands of modern civilisation.

I do not, however, say that we should shut our eyes to the obvious defects of our present-day economy, but I feel that we should all respect the spirit of the times. As free men

we should compare the merits and prospects of different courses of action and adopt finally what seems best adopted to our own needs. The evils of the present day are patent to all, but we should not forsake the acquirement of knowledge if knowledge has by improper use temporarily enhanced our miseries. If the discoveries of chemistry are utilised for fabricating engines of destruction during the present war, we should not blame the devoted band of selfless scientists who have sacrificed their valuable lives in discovering secrets of nature. If poisonous gases have been synthesised, so also have been the valuable remedies which bid fair to free men from the scourges of terrible diseases. If motor cars and aeroplanes are now utilised for the destruction of men and property, we should not forget that they have also helped to bring men, communities and nations closer together, and have thus helped materially to dispel prejudices and misrepresentations born of distant isolation. Machinery, factories and modern workshops have made life difficult for people who have not learned how to adapt themselves to modern conditions. They have brought them unemployment, and have helped their exploitation by their more adventurous neighbours. The remedy, however, lies not in a permanent refusal to change and in sticking to primitive ways. Perhaps in some unfrequented spots antediluvian forms of life still continue to survive and raise progenies occasionally. We do hear of the discoveries of monsters and of archean forms of life. The general march of evolution has already left them far behind, and life in its victorious march will not now pause and cogitate on the relative advantages of previous modes of existence. The divine urge has already evolved more complicated forms; and, however unexpected may be the next steps in evolution, we cannot reasonably hope for a direct return to the previous types. The greatest efficiency in machines is realised by a harmonious adaptation of its use to its purpose, and forms that survive by competition succeed only by removing artificial constraints and by adopting better and more economic methods. In the economy of life we have also to adopt a similar procedure. We should have the courage to reject the age-worn customs and adopt methods suited to our modern needs if we are convinced of the necessity of continuous adaptation to changing circumstances in the competition for survival.

The cause of science will require no preaching or persuasion. Science is really the store-house of human experience. The records of innumerable attempts and failures are there to teach us what to avoid, and records of successes are there to guide us in our search. In a sense science is not the product of modern civilisation but is really its progenitor — a symbol of human progress. Its sources are lost in ancient Chaldea and Egypt, as also during those golden days in our country. Even then there were machines and labour-saving devices, and secrets of nature were as zealously sought for by the ancestors as by their modern offsprings. Maybe the secrets were then more closely guarded. Small bands of men in every country perhaps utilised their opportunities which their knowledge provided them to exploit their simpler brethren much in the same way as more advanced nations now exploit the more backward ones. Then, as now, men of science were occasionally called upon to devise means of fighting sanguinary wars, while they devoted their knowledge to further the cause of mankind in times of peace.

Common Heritage of All Mankind

In a certain sense modern times offer for us greater possibilities and call for greater efforts. The secrets of nature are no longer closely guarded within a select coterie but are regarded as a common heritage of all mankind. We need no longer feel helpless in sickness and pray for magic or divine dispensation to heal our sufferings. We need not blindly follow customs and practices simply because our ancestors had found them sanitary and wholesome, nor need we feel ourselves overwhelmed and grovel before the blind forces of nature. It is true that we cannot even now avoid accidental disasters. Earthquakes may even now shake down cities; floods may overwhelm a whole countryside; or terrible visitations of epidemics may paralyse temporarily all activities in a locality. We are, however, better equipped than ever for quick recovery from such visitations. Our pioneers are ceaseless in their efforts for ultimate mastery and control, and in many fights against natural odds humanity has emerged as the victorious master. The peculiar difficulties of any nation need not cause permanent despair. It only needs courage and the will to adopt suitable means to solve its own problems. There are illustrations in history to cheer it in its struggle, and no doubt need arise regarding the ultimate result if it resolutely faces the situation and seeks inspiration from history and human records. Prejudices have always been awkward fetters, and readiness to sacrifice even our most cherished heritages may be the most relentless demand of the time spirit before it blesses its undertakings with success.

Real Hope Rests with Human Spirit

The ultimate success of any civilisation rests not on its fund of knowledge nor on its machinery and laboratories and workshops, but on the quality of its men. It is not the iron discipline and a vast organisation that always succeed in the end. A nation has also to foster the band of free spirits, of bold and indomitable workers and of keen thinkers who, if reason and logic demand, would not shrink from speaking out the most unpalatable truth. Greatness can only be aspired after by free men. The real hope rests with the human spirit and not on material possessions. Illustrious heritages of science will not be of any avail at critical times if, in pursuit of a short-sighted policy of the state, a country has gagged its thinkers and dragooned its people to servile flattery and cowardly complaisance.

Apparent and temporary success often tempts us to deny this simple truth. Examples of immediate success often tempt us to forsake the eternal verities and sing the praises of discipline and organisation at a sufficiently high key to drown the simple notes on truth. We require discipline and organisation no doubt, — the discipline that comes naturally to free spirits who co-operate to realise a common high ideal. The forces of persecution should not be launched against the lone spirit who feels impelled to speak out what he honestly believes to be true. Perhaps each nation feels itself charged with the high mission of working out the destinies of the whole human race! But let us hope that the world is still wide enough to allow different nations to settle down in mutual amity and goodwill, each relying on its own powers and resources to work out its own progress and not on the exploitation of its helots as the only sure means of aggrandisement and glory.

MAHARASHTRA

Land-Grabbers of Malinagar

MALINAGAR is a village in Malshiras taluka in Sholapur district. It is fertile sugarcane area, serviced by the Nira river irrigation system. When the British government first built the Nira irrigation system, the local farmers, long used to raising a single rain-fed crop, would not use the waters of the canals. The authorities then appointed the Kamat Committee to find out why the agriculturists were not using the water. The Committee recommended the import of farmers from outside who were more used to irrigated farming. Thus a few families from Poona district and adjoining areas were inducted into Malinagar.

These new inhabitants took over the lands from the local 'backward' farmers on lease and started large sugarcane farms. To use the cane produced on their farms, they established a joint stock company called the Malinagar Sugar Factory Private Limited. Each of the families owned 150 to 200 acres of land. In course of time, some of the farmers bought the lands taken on lease from the poor farmers. In any case, soon after Independence came the land to the tiller Act which brought the rich farmers ownership of the lands leased by them. The original owners lost their lands once and for all and became landless workers.

Then came the land ceiling legislation in 1960. Under the new Act, the ceiling applicable to perennially irrigated lands, such as those of the rich sugarcane farmers of Malinagar was 18 acres per member of a family. Had the ceiling been enforced, large chunks of the 150 and 200-acre holdings would have been declared surplus. The farmers, therefore, prepared a well thought-out plan to defeat the Act and retain their lands intact with the help of obliging revenue officials, from the assistant collector down. The leaders of the farmers and the officials, it is alleged, simply decided to do away with the land ownership records, called the 'Sat Baracha Utara' in Marathi, and to fabricate new records which would show the ownership of the lands to be so distributed that none of the rich farmers would have land above the ceiling limit.

Having created the new ownership records, the rich farmers and officials set about destroying the earlier records. For this purpose they gathered one day at the sugar factory's posh guest house. The officials had brought the original land records which they ordered one of the village watchmen to burn, while they, together with the farmers, settled down to celebrate the success of their operation. Liquor flowed like water and glasses were emptied one after another. The village Kotwal, however, knew the importance of the documents which had been ordered to be burnt. Under the pretext of tearing off a few sheets here and there, he managed to ferret away the complete records relating to many plots of land. He then went to the original owners of the lands and offered to part with the records for a consideration.

It is said that in return for a few rupees the Kotwal gave the records which had been ordered to be burnt to the original owners who took them to the Peasants and Workers Party legislator, Ganpatrao Deshmukh. With such incontrovertible evidence in his hands, Deshmukh raised the issue in the Legislative Assembly in 1963 and pressed for an inquiry. In the face of his persistent demands, the state government was forced to hand over the matter to the anticorruption bureau for an inquiry. The anti-corruption bureau took about three years to complete the investigation and finally submitted its report to the government. The report went to the Chief Minister himself for action. According to reliable sources, the anti-corruption bureau's investigation showed that the allegations made by Ganpatrao Deshmukh were true. Chief Minister V P Naik did not take any action on the report. In fact, the report remains in cold storage till today.

The anti-corruption bureau is said to have submitted its report sometime in 1966, that is almost eight years ago. Further, it is said that the findings of the report are so conclusive that it would have taken the government's legal department only a few days to frame charges and file cases against the officials and farmers concerned. Why, then, did the Chief Minister sit tight on the report? In the absence of any other even remotely plausible explanation, what conclusion can one draw except that the Maharashtra government and the Chief Minister were so anxious to protect the interests of the rich farmers of Malinagar that they were prepared to tolerate not only the subversion of their own laws but the deliberate destruction and falsification of government records?

Unfortunately for the government, Ganpatrao Deshmukh, who had been defeated in the 1972 elections, returned to the state Assembly through the recent by-election from the Sangola constituency in Sholapur district. Deshmukh once again raised the issue of the Malinagar enquiry through the leader of his party, D B Patil, in the Assembly on March 18. D B Patil brought up the subject through a cut motion on the budget demands of the Home Department. The cut motion was rejected, but an assurance was extracted from the government that it would take action on the basis of the findings of the anti-corruption bureau's report. In the discussion in the Assembly on the subject the government was clearly on the defensive. No explanation was forthcoming as to why no action had been taken for so many years, though the Home Minister, Sharad Pawar, sought to refute the allegation that the Chief Minister had a soft corner for the affluent farmers of Malinagar. He assured the House that the government would proceed with the cases against the guilty as soon as "faultless cases" were framed by the legal department. How long this would take, he was still not prepared to say.

Naturally, the government will not even consider releasing the anti-corruption bureau's report. But according to one guess estimate, about 5,000-10,000 acres of land would have become surplus if the original land records in Malinagar had remained intact. The anti-corruption bureau, it is also reported, had done a good job and had collected a large volume of evidence.

The story of what happened to the land records of Malinagar has to be set against the claims of the Maharashtra government, repeated again and again at meetings of the Planning Commission or in the National Development Council or in the state Assembly that "Maharashtra is the only state in the country where the land records are perfect, up-to-date, with each landowner having his land book in his possession"!

Dear Money, Indeed!

THERE is a general impression — fostered by the Reserve Bank, the commercial banks and industry and trade — that in the last few years the monetary authorities have pursued a 'dear money' policy and that bank credit has been made expensive — some might complain, even exorbitantly so. The Reserve Bank has just released data on commercial banks' advances, compiled on the basis of the first returns under the new reporting system known as the Basic Statistical Returns (BSR) introduced in December 1972. Among other aspects, the data cover the distribution of credit limits and actual outstandings by interest rate. The data relate to a single point of time, December 1972, and so it is not possible to deduce from them whether bank credit had been made more expensive. But they do show that, in absolute terms, credit was anything but expensive. A sizeable proportion of total credit actually carried interest at 6 per cent or less!

The most crucial return under the BSR system is BSR 1 (Part 1), in which commercial bank branches furnish details in respect of every loan account with a credit limit of over Rs 10,000. The details relate, *inter alia*, to type of credit (cash credit, overdrafts, export credit, etc), type of industry and sector (public/private) and interest rates charged. For each aspect, there is information on number of accounts, credit limits and actual amount outstanding. "Banking Statistics: Basic Statistical Returns" (Vol 1, December 1972), published by the Reserve Bank, presents the data tabulated on all of these and many other aspects of commercial banks' advances — size-wise credit limits and state-wise and district-wise advances (and deposits), each classified industry-wise, etc.

According to the distribution of credit limits and advances outstanding, there were credit limits totalling as much as Rs 1,493 crores in the interest range of 6 per cent and below at the end of December 1972 (see Table). This is puzzling, to say the least.

The only two important categories of commercial bank advances which should normally attract such low interest rates are export credit and credits under the differential interest rates scheme. The latter is obviously excluded from the data under discussion since they relate only to accounts with credit limits of over Rs 10,000. Even if a borrower has a total limit of over Rs 10,000 distributed over different types of facilities (e g, cash credit, overdraft, bills, etc), but each of these facilities separately has an individual limit of Rs 10,000 or less, all such accounts are excluded from the coverage of BSR 1 (Part 1). In other words, most really small borrowers, under the differential interest rates scheme as well as others, do not figure in the above data. Thus as many as 39.24 lakh accounts with credit limits of Rs 884 crores and credit outstanding of Rs 502 crores have been excluded. It cannot be suggested, therefore, that the large volume of advances at 6 per cent and less has gone to small borrowers.

The only possible explanation for large credit limits at interest rates of 6 per cent and less is that the limits relate to export credit. A closer look at the data, however, shows that, as at the end of December 1972, limits for export credit (packing credit plus export bills) amounted to only Rs 926 crores as compared with the total limits of Rs 1,493 crores carrying interest at 6 per cent and less. Further, even for export credit the Reserve Bank had increased the ceiling interest rate from 6 per cent to 7 per cent per annum for both pre-shipment and post-shipment credit as early as in April 1971. The only exception to this was credit provided for exports on deferred payment terms for which the old ceiling rate of 6 per cent was continued. But credit for exports on deferred payment terms forms only a very small part of total export credit. For almost all of export credit, therefore, the ceiling rate was 7 per cent at the end of December 1972. Here it may be recalled that the ceiling rate on export credit had been stepped up to 7 per cent in April 1972 after the Bank rate had been raised to 6 per cent in January 1971. According to the Reserve Bank's Annual Report for 1970-71, the ceiling rate on export credit had been raised "with a view to bringing about a proper realignment of the structure of interest rates charged by scheduled commercial banks on export credit". Evidently, this objective was not achieved since the banks seem to have continued to charge interest rates of 6 per cent and below on export credit.

More important, even after all of export credit is excluded, there remain credit limits of Rs 566 crores at interest rates of 6 per cent and below which call for explanation. Some interesting light is thrown on the problem by a two-way classification of credit limits by (i) interest rate range and (ii) industry (occupation). According to this classification, of the amount of Rs 1,493 crores, as much as Rs 544 crores was for wholesale and retail trade, wholesale trade accounting for Rs 519 crores and retail trade for another Rs 25 crores. Under wholesale trade is presumably included credit given to public sector agencies for food procurement, for trading in raw cotton and jute and also for fertiliser distribution. None of these advances, however, falls in the category of advances which attract interest at 6 per cent or less. Food procurement credit was reportedly being given at 8.5 per cent in December 1972. Food procurement credit probably accounts for the bulk of the credit limits of Rs 510 crores for wholesale trade within the interest range of 8 to 9 per cent. Credit for fertiliser distribution is extended at 7 to 8 per cent, while that for public sector trading activities in cotton and other commodities is said to have been charged interest at more than 10 per cent. Who, then, were the wholesale traders who were given credit limits of Rs 519 crores at interest rates of 6 per cent and less?

The manufacturing industrial sector, including mining and quarrying, too appropriated credit limits amounting to as much as Rs 588 crores at 6 per cent and less. While every conceivable industry had been given advances at such ridiculously low cost, the most prominent beneficiaries were cotton textiles (Rs 108 crores) and engineering (Rs 118 crores). It is interesting to note that in respect of both these industries, the total credit limits for export purposes were substantially lower than their credit limits at interest of 6 per cent and less. For textiles, export credit limits were just Rs 41 crores out of Rs 108 crores and for engineering they were Rs 83 crores out of Rs 118 crores. The disparity is particularly glaring for cotton textiles. It would be of interest to know which class of units in the textile industry got such large credit limits at such low interest rates.

Likewise, credit limits at 6 per cent and less for retail trade and under 'personal loans' (including for purchase of consumer durables) amounted to Rs 25 crores and Rs 44 crores, respectively. Possibly a part of the latter amount may be accounted for by loans given against fixed deposits. Credit limits at 6 per cent and below for agriculture amounted to Rs 13 crores. The amount may be small but it is of some significance considering that even small loans covered under Credit Guarantee Scheme or those of the Credit Guarantee Corporation attract interest at rates higher than 6 per cent.

Though only credit limits extended at the lowest interest rate range of 6 per cent and below have been discussed here, as will be seen from the Table, very large credit limits had been extended at interest rates ranging from 6 to 8 per cent and from 8 to 9 per cent, which must be considered low in relation both to the cost structure of the banking industry and to the Reserve Bank's dear money policy initiated in early January 1971. Over 40 per cent of all credit limits extended by banks were at interest rates of 9 per cent and less. If the data are at all reliable, then it is clear that even as recently as in December 1972 the banks were allowing large borrowers to appropriate a big chunk of their advances at interest rates which did not cover their costs so that they were in effect subsidising these borrowers. In the case of the nationalised banks this subsidy was, of course, at the expense of public revenue.

It is interesting that these same banks become acutely cost-conscious when it comes to financing, say, small farmers and artisans or to opening branches in rural areas. As a result of their sustained propaganda about the 'uneconomic' character of rural branches, they have been allowed in the last two years to sharply cut back on the number of branches opened in rural areas and small towns!

TABLE: SCHEDULED COMMERCIAL BANK CREDIT, BY INDUSTRY AND INTEREST RANGE
(As on the last Friday of December 1972)

(Rs crores)

Occupation/Industry	Less than 6 Per Cent		6 to 9 Per Cent		9 to 11 Per Cent		More than 11 Per Cent		Total (Including Unclassified)	
	Credit Limit	Amount Outstanding	Credit Limit	Amount Outstanding	Credit Limit	Amount Outstanding	Credit Limit	Amount Outstanding	Credit Limit	Amount

TAMIL NADU

With Leaders Like These...

THE nearly 1.5 lakh workers of the 208 textile mills in Tamil Nadu went on a month-long strike from February 1, 1974, demanding *inter alia*, 35 paise per point above 340 points in the Madras cost of living index as variable DA and an increase of Rs 10 in the fixed DA and Rs 35 in the basic wage. The strike came more than a year and a half after the appointment of the Arunagiri Textile Conciliation Commission, consequent on a strike in February 1972. The Commission had failed to produce a unanimous report. The proposals put forward by the Commission's chairman, though far from favourable to the workers, were rejected by the millowners. When the government continued to drag its feet over the issue, the workers struck work. Then came promptly the government's reference of the dispute to adjudication which thrilled the hearts of the millowners. Barring the INTUC and the Workers' Progressive Federation of the DMK, all the unions — AITUC, HMS, CITU, ADMK, TNTUC (Cong-O), UTLA and STU — were arrayed against the millowners. The workers, incensed by the unilaterally decided adjudication, overwhelmingly responded to the strike call and a united struggle, on a scale hitherto unknown, emerged. The disruptive role of the INTUC and DMK leadership — the former had announced a later date to go on strike and the latter had openly called for blacklegging — was thwarted by their own followers who, ignoring their bosses, threw in their lot with their co-workers.

Compared to their counterparts in Bombay and Ahmedabad and in the northern states and compared to workers in other industries, textile workers in the south have had a raw deal over the past several years. Their work-load has continuously risen while their strength has fallen. In 1947 in the area corresponding to the present state of Tamil Nadu there were 66 mills with 15 lakh spindles and 1.25 lakh workers; the figures for 1973 are 208 mills, 55 lakhs spindles and 1.24 lakh workers. The figures published by the South India Millowners' Association show that between 1956 and 1970 the productivity of the weaving-cum-spinning factories rose by 66 per cent; taking all the textile factories together, the rise was 100 per cent. Between 1969 and 1970 alone, the average productivity of spindles rose by 21 per cent. Yet the workers' demands, aimed only at minimising further erosion of their living wages as a result of the rising prices, have been persistently rejected by the millowners despite their own rising profits. Oozing concern for the plight of the country's workers, R Doraiswamy, President of the South India Millowners' Association, wrote to the Arunagiri Commission, "Ours is a poor country. When the whole country is passing through a crisis, how can we justify the demand that textile labour alone should be given a better deal? When every worker in this country today is condemned to a life of suffering, where is the need to exempt textile labour alone from this? Does the world exist for the exclusive welfare of textile labour?" (retranslated from Tamil). The Millowners' Association alleged that the minimum wage of Rs 240 of a textile labourer in Tamil Nadu was adequate to ensure him a fair standard of living!

Betrayal by Action Committee

Forced by the compulsions of the election in Coimbatore, where 85 of the mills are located, and sensing the rebellious mood of even the workers shepherded by the DMK and the INTUC, the government quietly forgot about adjudication and invited the parties for negotiation, as in the case of the Madras Rubber Factory struggle three years ago. Ten days after the strike had begun, when the morale of the workers was at its peak, the Strike Action Committee chaired by an HMS representative, did a quick turn-about and accepted the Labour Minister's formula which was in fact the managements' own proposal. The HMS and AITUC leaders had, from the start, acted as the government's brokers, insisting that the Action Committee's Convenor alone should negotiate with the Minister, putting pressure on the other members to lower the demands and making stealthy proposals to the Minister. The CITU, rejecting the Minister's proposal, publicly denounced the Action Committee's "betrayal" of the workers as it had clearly violated the understanding that the consent of the plant level workers' representatives must be obtained before accepting any offer below the already authorised amount. The Committee retaliated by expelling the CITU from its deliberations unless it offered an apology for its "disruptive" role.

The Committee did not dare face the general body of workers after the exposure. When some of the veteran trade union leaders toured the textile centres to explain their acceptance of the proposal, they were greeted with showers of slippers. In Madurai, the union bosses had to change the venue of a workers' meeting at the very last moment to save themselves from the fury of the enraged workers assembled in thousands at the previously fixed place.

Despite this abject surrender, 'industrial peace' was slow in coming. Sensing the pusillanimity of the workers' leadership, 42 of the mills refused to accept even the compromise formula. Faced with such defiance, the Committee could not capitulate fully without at least a touch of bravado. Hence, the bosses put on a show for another two weeks and clamoured that no settlement will be made unless it covered the entire industry. Anybody could tell that all this was a farce. The less hypocritical leadership of the INTUC and DMK called off the strike which they had never in fact backed.

On March 1, the Action Committee on bended knees signed the document which it had rejected two weeks earlier. The INTUC leaders ridiculed, with legitimate contempt, the militancy of the other unions which they claimed had only resulted in further loss of production and wages. The four-year settlement gave the workers a net increase of Rs 30 (29 paise over the present 26 paise in DA from January 1974 and 30 paise from January 1976, rise in basic wage of Rs 7.50 from 1974 and another Rs 7.50 from January 1976 and arrears of Rs 200). The workers of 42 mills, including the 13,000 men of the Buckingham and Carnatic Mill, were left in the lurch with only a promise of negotiations in future to settle their fate. The settlement did not even guarantee that the lock-out in all the mills where the strike had been withdrawn would be lifted but only held out an assurance that the Labour Commissioner would "advise" the mills to do so. The CITU, the lone dissident, which was not a signatory to the agreement, could continue the strike for only one more day, as the large majority of workers had resumed work.

Some trade union circles believe that but for the elections which coincided with the strike period it might have been possible to mobilise the workers better against the betrayers and for a more favourable settlement. To a large extent, electoral politics seems to have overshadowed the issues raised by the strike. This only reiterates the predominance of economism in the textile workers' movement, as in most other workers' movement in Tamil Nadu.

Despite the shortcomings of the agreement one cannot underestimate the significance of the struggle which lay not so much in its militancy but in that it embraced the overwhelming majority of the workers — out of the 208 mills only 26 stayed away —, despite the multiplicity of unions, their rivalries and the treachery and reformism of the big union bosses. In the late thirties and forties the textile workers of Tamil Nadu, and of Coimbatore in particular, had weathered the worst repression — in the 1940 strike of Stanes Mill, 11 workers, including a woman, had been shot dead in a single bout of police violence within the factory — but never before had the mass of workers, split on so many counts, stood so united as in the recent strike.

NORTH

Judiciary's Blow against Land Reform

LARGE and medium landlords in Punjab have hailed as "the happiest news of the year" the Punjab and Haryana High Court's judgment declaring vital provisions of the Land Reforms Act, 1973, *ultra vires* of the Constitution. On March 6, Chief Minister Zail Singh announced in the state assembly the government's intention to appeal to the Supreme Court against the judgment. The state's legal advisers believe that the government's case is a strong one and that the appeal would succeed; if it does not, the new agrarian reforms will collapse.

The High Court has struck down the very basis of the new ceilings law — the unit of ownership for fixing the ceiling on holdings. About 30 writ petitions had challenged the constitutional validity of the Punjab Act and the rules framed under it. The definition of the word "person" given in section 3 insofar as it includes the family has been declared unconstitutional. *Ipso facto*, the court has rejected the prescribed mode of payment of compensation for land that would have been declared surplus if the new basis of fixing the ceiling — the family instead of the individual (in accordance with the Central government's directive) — had been upheld.

To dispel the suspicion of not having defended its case in the High Court forcefully enough, the state government has decided to engage some of the country's topmost lawyers to argue the appeal in the Supreme Court. To make things doubly sure, it has urged the Centre to amend the Constitution so as to include the Land Reforms Act in the Ninth Schedule, thus taking it out of the courts' purview. Under Article 31-B of the Constitution, the provisions of Acts and Regulations specified in the Ninth Schedule shall not be deemed to be void on the ground that they are inconsistent with or take away or abridge any of the rights conferred by the Constitution.

At its annual session last month the Punjab Khet Mazdoor Sabha had criticised the state government for not taking timely steps to include the Land Reforms Act in the Ninth Schedule. The Sabha also deplored the government's lapse in not setting up statutory land reforms committees as has been done in Kerala. The government had rejected the Sabha's plea for cancelling, by a legal enactment, all 'benami' transactions in land effected since 1953. The Sabha had argued that this would "unearth large surplus areas".

Scandals Galore

The post-mortem operations done by the Punjab Assembly's Committees on Public Accounts and Public Undertakings in recent years have revealed numerous acts of omission and commission by government departments. The findings of these committees this year indicate a distinct worsening of the standards of administration. Some of the irregularities and acts of favouritism have cost the exchequer substantial sums of money. For instance, a Rs 10-lakh loan advanced by the Central Bank of India to a well known Bombay film producer was guaranteed by the Punjab government without the requisite sureties, much against the advice of the Law Department and in violation of the relevant rules and regulations. This strange act of patronage has cost the government Rs 13 lakhs, including Rs 3 lakhs by way of interest, following the film luminary's failure to honour his commitment to return the loan.

The Public Accounts Committee has also found that enquiries into 12 embezzlement cases involving lakhs of rupees had not been finalised even after six years. On the contrary, the guilty officials had been given promotions. The present pace of the enquiries, says the Committee, "shows that corrupt officers are having their say". The regular large-scale misappropriation of public funds in the state also becomes evident from the disclosure that 324 cases involving nearly Rs 36 lakhs were pending at the end of March 1971; and the progress since then holds no promise of speedy remedial action.

The Committee on Public Undertakings has found that the Punjab State Tubewells Corporation has drilled 382 tubewells and developed 180 of them since 1970 — an impressive enough performance on paper. But it has since been reported that only three of these wells have been energised, even though the Corporation had supposedly deposited Rs 26 lakhs as security deposit with the State Electricity Board. The disposition of this large sum of money has remained a mystery. And whoever heard of large loans being taken from banks only for the proceeds to be invested in the same banks on the day of borrowing and at a lower rate of interest? The Tubewell Corporation has been guilty of such apparently inexplicable transactions.

No less interesting is the egg scandal associated with the Punjab Poultry Corporation. One of the Corporation's four favoured agents was entrusted with the entire egg sale business in Delhi, even though he had little experience and had not furnished any evidence of his financial soundness. He turned out to be a major defaulter, allegedly misappropriating funds and issuing postdated cheques which were dishonoured. The arrears mounted to Rs 1.21 lakhs, but the Corporation did not pursue the case of cheating registered against the agents. The choice of the next agent proved to be no better. However, through fictitious entries, the major part of the outstanding amount was shown in the official records as "recovered". The report of the enquiry ordered into the affair was not followed up either.

Parmar's Plight

No financial scandals of this magnitude have recently been reported from Himachal Pradesh, but Chief Minister Parmar is in a sorry state politically. After giving him initial support, the Centre seems to have developed a soft corner for the steadfast, 18-strong dissident group. Last November, Parmar

was given permission to drop dissident leader Salig Ram from the state ministry. Parmar had insisted on this in the name of ministerial harmony. But soon afterwards, Indira Gandhi provided unmistakable indications of her disapproval of his move to involve her in the controversy. The first step taken by the Council Parliamentary Board towards the political rehabilitation of Salig Ram was to entrust him with the important task of supervising the Congress election campaign in some parts of UP. Parmar's discomfiture knew no bounds when, on March 13, Salig Ram was accorded an enthusiastic welcome at a largely attended Simla reception organised by the City Congress Committee. It turned out to be a show of strength between the rival factions. Parmar's old rivals, notably former Home Minister Padam Dev, played a leading role at the function. Ministers and other pro-Parmar legislators boycotted the reception.

Confirmation of the impression that Parmar and the official wing of the Himachal Pradesh Congress have fallen from favour in New Delhi also comes through the rejection of the near-unanimous recommendation of the HPCC to re-nominate Satyavati Dang for a Rajya Sabha seat. She has been a staunch supporter of the Chief Minister and has for years been his principal political adviser. Parmar camped in Delhi for nearly a week in a bid to promote her cause. But the Congress High Command has selected Gian Chand Totu, who had been denied the Congress ticket for the Simla seat in the 1972 elections. The dissident Congress MLAs have hailed Totu's nomination. With this second rebuff to the ministerialists within a few weeks, speculation about Parmar's future has been revived. The Central leaders are apparently keeping him on tenter-hooks. The dissidents interpret the developments as clear vindication of their anti-Parmar stand.

Interview with the Dalai Lama

Brahmanand Mishra

THERE has been much speculation during the past few months over the changing attitudes and postures of the Dalai Lama and some of his fellow Tibetan exiles. There are also said to be all kinds of influences — Indian, Chinese, Russian, American, Taiwanese — at work among the Tibetan refugees. During an interview last month at Dharmsala, I asked him about his ideas, plans and hopes.

I first asked him about the much-publicised news story which had appeared in the *Tibetan Review* stating that the Dalai Lama was looking forward to a pilgrimage to Buddhist temples and monasteries in the Soviet autonomous republics bordering China. To this he replied, "Nothing has materialised so far". About suggestions that the Tibetan exiles had decided to lean politically towards the Soviet Union, the Dalai Lama maintained complete silence. However, other Tibetan exile sources tend to confirm that there have been moves towards closer relations with the Soviet Union and Mongolia.

During the course of the interview, the Dalai Lama declared that he was an admirer of Marxist philosophy and that he "firmly believes that there is a common ground between communism and Buddhism. According to the Mahayana school of Buddhism you sacrifice for the benefit of others, for the good of suffering humanity. So is the goal of communism. It aims at, I am told, obtaining for the deprived ones what is due to them".

The Dalai Lama said that he was always trying to tell his "people that there is an urgent need for a suitable and practical change in Tibet. The world is changing fast and every country, big or small, has today become interdependent. Thus it is unwise to think that Tibet will remain stagnant. The old structure cannot remain unchanged and change is bound to come whether one wants it or not. Marxism is one of the most scientific socio-economic systems which promises a suitable new structure so badly needed for the developing world".

But the Dalai Lama added, rather confusingly, that since any social system or structure was meant for the good of the people the way of life of the people must not be disturbed. "Buddhism", he said, "is a way of life for the people of Tibet". He further added, "Buddhism is not meant for society. It is for the individual, for individual good and for the next life. While we try for Nirvana, we must live and exist. And for a just living and existence, communism comes nearest to Buddhism".

In answer to my query that when the Chinese state that they have introduced communist institutions in Tibet and that the Tibetans, along with the people of other nationalities in China, are marching ahead on the path of communism, what prevents him as an admirer of communism from returning to his homeland, the Dalai Lama reacted sharply and firmly stated that the Chinese are not practising communism in Tibet. "What they are doing in Tibet under the cover of communism is not really communism. It is naked colonialism. No doubt they have introduced certain reforms which are good for the people but by and large what they are forcing on the people of Tibet are for the good of the Chinese and not for the good of the Tibetans. With the coming of the Chinese, Tibetans are experiencing new sufferings — mental and physical. They are forced to do hard manual labour with less food. Thousands of Tibetans are dying of starvation. When they fall ill, they are neither attended by the Chinese doctors nor are they allowed to go to the Tibetan doctors. Even Tibetan youth, although communist, cannot close their eyes to these naked facts. If the Chinese today treated Tibetans as their brothers and intended to develop Tibet towards modernisation and socialism, there would be no trouble between us".

"The so-called changes taking place in Tibet which the Chinese shout so much about all over the world are not genuine. Even before the Chinese came to Tibet, there were a good number of Tibetan communists inside and outside Tibet. They participated in the Sino-Japanese War on the side of the Chinese and when the Chinese army marched into Tibet they helped the Chinese authorities enthusiastically. Between 1951 and 1956, when the Chinese were trying to build up their position in Tibet, these Tibetan communists were genuinely helping them, hoping that when the communist revolution triumphed, there would be an end to human exploitation and Tibet, too, would become a modern socialist country. But it was not before long that they were all disillusioned. While their Chinese masters loudly talked about the need for socialist revolution in Tibet, through their actions they opposed every serious efforts to modernise Tibet. When these Tibetan communists wanted to raise this issue at party meetings, they were dismissed *en masse* and one by one all of them disappeared". The Dalai Lama stated that there were thousands of young Tibetans who had had their indoctrination in Communist China, but who after seeing what was being practised in Tibet under the cover of communism, had turned anti-Chinese and a good number of them had recently joined the rank and file of the freedom fighters. "So we are not against communism. The struggle is really against Chinese domination and it will continue till the good day comes and every Chinese soldier leaves Tibet for good", the Dalai Lama declared.

The Dalai Lama was sure that sooner or later the Tibetan people would regain their independence and play their allotted role for the good of humanity. He felt that the freedom movement within Tibet was becoming more mature with the increasing sufferings of the people in his country and that the ultimate strength of the struggle lay with the people of Tibet. "I have repeatedly told my people that independence would not be given to us either by India or by the USA as an act of mercy. It has to be achieved by the Tibetans themselves through long sacrifices and determination".

The Dalai Lama also displayed great faith in the people of India. He thought that though the Government of India, constrained as it was, could not do very much for the Tibetan cause, "there exist between the people of India and the people of Tibet cultural and religious relations with a common heritage. This unique relationship has something to do with the mind and it is much more durable than other relations such as merely economic or political. We feel that India is the land of *Guru* and all of us have a great regard and respect for this land and for the people who inhabit this land ... And the day the Tibetan cause is taken up by the people of India, it will be difficult for any power, let alone China, to keep the Tibetans under its occupation".

When asked to comment on recent news reports that his departure from Lhasa in 1959 was engineered by the CIA, the Tibetan leader looked agitated and burst out, "It is all baseless. The accusation has no truth. My flight was because of circumstances developing in Lhasa and because of Chinese atrocities on my people. I realised that if I remained there, nothing could be done for Tibet and Tibetans. So I left for south Tibet and from there contacted the Chinese. There was still some hope that the Chinese would see reason and respect the assurances given to the Tibetan people. But the way Chinese soldiers were let loose upon peace-loving Tibetans, left me no alternative but to cross over to India, which every Tibetan considers his second home. The Dalai Lama stated that it was also completely wrong to think that American agents provided air cover inside Tibet for fleeing Tibetans, or parachuted supplies, maps and money. When asked what could be behind such false propaganda, the Dalai Lama said that "it is difficult to say, but the Chinese may have a hand in it, because every day the position of the Chinese leadership is becoming more uncomfortable in Tibet".

He, however, concluded by paying a tribute to Mao Tse-tung for leading China from being a tattered country to becoming a really powerful nation in the world. "But everything is not good in China today. It is questionable if the Chinese people are really happy under the present system".

MADHYA PRADESH

Reprieve for the Chief Minister?

THE Congress high command seems to have at last decided to grant a reprieve to the Madhya Pradesh Chief Minister, P C Sethi. It has let it be known that it does not propose to effect any 'immediate' change in the state leadership. The two main dissident groups, led by D P Mishra and S C Shukla, have been asked to extend their support to Sethi. How far they will comply with this request — the Centre is no more in a position to dictate terms in MP — is yet to be seen. At the same time, Sethi has been advised to be more accommodating and responsive to his colleagues and the members of the party.

A change of Chief Minister in the state had looked imminent at one point. In fact, Sethi's main rival in state politics and ex-Chief Minister, S C Shukla, had been summoned home from abroad and the stage was all set for a change of leadership. Sethi, it appeared, would be given a seat in the Rajya Sabha and probably a portfolio at the Centre. Sethi himself wanted to quit and return to Delhi, from where he was imported in 1972 to quell the dog-fight in the MP Congress — a task to which he has proved unequal. The Centre too would have been happy to see Sethi quit. Under his Chief Ministership corruption has mounted and administration has become chaotic. Much of the time, he has been running the government by trunk telephone from Delhi, where he has an official residence.

What has, however, made the Congress High Command decide against a change of leadership is the absence of a clear alternative to Sethi. Shukla would not be acceptable to Mishra and *vice versa*. The High Command's verdict came in the wake of mounting tension between the anti- and pro-Sethi groups. One person had been killed at a food and anti-price rise rally organised by the Youth Congress sometime back and many important Congress leaders had been held at several places for leading food demonstrations. The Congress dissidents called a 'secret' meeting and demanded summoning of a Congress Legislature Party meeting to "consider the food crisis and the deteriorating law and order situation". On his part, Sethi had threatened a cabinet reshuffle to weed out "disgruntled elements".

Patch-Up

The High Command had got worried over this mounting tension on the eve of the budget session of the assembly and had arranged a meeting of the Chief Minister with his detractors in Delhi. At the meeting Sethi had discussions with S C Shukla and a compromise formula was evolved. On his return from Delhi, Sethi denied any plan to reshuffle the cabinet and appealed for unity among Congressmen against the Opposition. Though he rejected the demand for a special Legislature Party meeting to discuss the food situation, he offered to hold talks with party legislators who seemed to have reservations about him. In another gesture of goodwill the Chief Minister declared that the dissident leader, M K Manav, who had earlier been suspended from the party, had been invited to attend the CLP meeting scheduled to be held on the eve of the budget session. Manav had been suspended from the party on a charge of issuing statements demanding the resignation of the Chief Minister after the police firing in Bhopal on August 17, 1973. A signature campaign had been launched demanding the withdrawal of the suspension order and 117 out of 228 Congress MLAs had submitted a memorandum to the Prime Minister and the

Congress president.

Regionalism is the hallmark of politics in MP just as casteism is the distinguishing characteristic of Bihar politics. There are four regions in this state. The biggest of them is Mahakaushal with 146 MLAs, followed by Madhya Bharat (97), Vindhya Pradesh (40) and Bhopal (11). After the death of Ravishankar Shukla, known as the strongman of MP politics, Kailashnath Katju was brought from Delhi to rule the state. But his rival in state politics, Bhagwantrao Mandloi, ousted him and put an end to his political career by engineering his defeat in elections. Mandloi himself became a victim of the Kamaraj plan which brought D P Mishra to power. After a brief spell of rule by a united front ministry, the Congress returned to power, but Mishra could not resume the Chief Ministership as in the meanwhile he had been debarred from fighting elections by the courts for having committed certain poll irregularities. The new Chief Minister, S C Shukla, son of Ravishankar Shukla, was never left in peace by Mishra's supporters. The High Command then sought to impose unity from above and moved P C Sethi from the Centre to the state.

No report on the political situation in MP can be complete without mention of the role of the all-powerful Governor, S N Singh. Though earlier he had gone out of his way to protect Sethi from the dissidents' onslaught, recently he openly attacked the Chief Minister. He is reported to have said, "Sethi does not stay at Bhopal. I am myself a dissident on this point. But I can only make suggestions. How can I force a horse to drink water? He promises and then runs away." In this context, significance is attached to Singh's recent visit to Delhi for talks with the Prime Minister.

Election Victories

The Congress performance in the recent four by-elections in the state has more than made up for the serious setback it had suffered in Mhow in December last. The Jan Sangh had wrested the Mhow Assembly seat from the Congress, which had held it ever since the first general election. The by-election had been necessitated by Chief Minister P C Sethi — who had been elected from another constituency as well in the 1972 elections — vacating the seat on the calculation that the Congress would have a walk-over in this traditional stronghold.

The Mhow debacle came as a blow to the ruling faction of the state Congress, particularly the Chief Minister, who had staked his political prestige in Mhow by giving the party ticket to a candidate of his own choice against the wishes of the dissident groups in the party. The Chief Minister and his supporters attributed the Congress defeat to "large-scale sabotage from within the party". (Three senior Congress leaders of the area had earlier been expelled from the party for six years on charges of trying to sabotage the election of the party nominee.) On the other hand, the dissidents maintained that the Congress candidate was the "single biggest factor" responsible for the elimination of the party from one of its strongholds.

Whether or not the dissidents were behind the Mhow defeat — there were in fact other factors as well —, it impressed on Sethi the need to mend his fences with them. In the choice of candidates for the recent by-elections in the Chattisgarh region, the stronghold of Shuklas, he therefore yielded to them. In the event, the Congress has won three of the four by-elections. Even the one seat, Jarhagaon, which it lost is a traditional opposition stronghold.

But how were the Congress victories achieved? Take the case of Konta, which the Congres wrested from the Jan Sangh by a margin of over 6,000 votes. Konta is considered a Jan Sangh stronghold, but the party lost more than 50 per cent of the votes it had received in the last election. However, both the Congress and the Jan Sangh candidates had one thing in common: they could barely sign their names. Konta is located in the heartland of the country's biggest tribal belt on the Bastar-Andhra border. The electorate, mostly Marias and Murias, are semi-naked, wretchedly poor and completely illiterate and superstitious. In some booths it was found that the voters had *en masse* put the stamp on the tables on which the ballot boxes were kept instead of on the ballot papers. A 'thekedar' holding a licence for some 50 *mahua bhattis* was actively campaigning for the Congress; he is alleged to have supplied free liquor on the eve of the election to the all-powerful mukhias of most of the adivasi villages. The Chief Minister also managed to persuade Vedwati, widow of Pravir Chander Bhanjdeo, to leave Bastar, presumably with the assurance that the government would help her to sort out her property disputes. Similarly, Baba Biharidass, who has been masquerading as the reincarnation of the late Bhanjdeo, was not allowed to enter Konta. The Congress victory in Lakhanpur is likewise attributed largely to the support of the former ruling Singhdeo family of Surguja. The Congress had to get its candidate endorsed by the family.

The use of the administrative machinery by the ruling party was most in evidence in the prestigious Jangir Lok Sabha constituency. The significant point about the use of government machinery on behalf of the Congress was the cynicism with which this was done by the Congress and the sense of resignation with which it was tolerated by the Opposition parties. The Chief Minister and his colleagues openly used the MP government's dakota and helicopter. The Jan Sangh, which had created a hue and cry over this issue during the Mhow election, did not protest this time saying that it did not want to waste its breath.

When the Congress victory in one of the constituencies became known, a senior government official is reported to have exclaimed that his 'responsibility was over!

Rule by Torture

A G Noorani

Amnesty International Report on Torture; Duckworth, London, in association with Amnesty International Publications; £ 1.50 paperback, £ 3.95 hardcover.

"CAN a great nation, liberal by tradition, allow its institutions, its army, and its system of justice to degenerate over the span of a few years as a result of the use of torture, and, by its concealment and deception of such a vital issue, call the whole Western concept of human dignity and the rights of the individual into question?" Pierre Vidal-Naquet asked in his famous book, a Penguin special, entitled "Torture: Cancer of Democracy", published in 1963. It was a hair-raisingly detailed case study, backed by authoritative material, of the methods of torture employed by France in Algeria from 1954 to 1962. No less revolting was the conspiracy of silence on the subject among the French elite.

To its great credit, Amnesty International has long concerned itself with the problem with the thoroughness and impartiality for which it is so highly respected. As well as publishing detailed studies of trial procedures for political prisoners in Iran, reports on the persecution of intellectuals in Czechoslovakia, especially after the Russian invasion in 1968, and, of course, in Russia itself, it approved the publication by its Dutch section of a report entitled "Indonesia Special" on the plight of the more than 55,000 untried political prisoners in Indonesia and of their children, wives, and families.

Last December it held at Paris an International Conference for the Abolition of Torture. The Conference split up into four Commissions, one of which, on the legal aspect, was headed by Peter Archer head of Amnesty's British Section. He was appointed Attorney General in the Labour Government after the general election in February.

The Report on Torture was compiled in connection with AI's Campaign for the Abolition of Torture and as source material for the Paris Conference. It begins with harrowing first-hand accounts of their ordeal by two women and one man who were torture victims; Ayse Semra Exer of Turkey, Maria Dina Roggerone de Greco of Uruguay and Vladimir Gershuni of the Soviet Union.

It goes on to examine historical aspects of torture, the arguments for and against its official use, problems of legal definition, medical and psychological aspects, and the need for legal and other remedies. The lack of adequate legal remedies is underscored by three cases studies: the Middle East, Greece and Northern Ireland.

In a world survey of torture, the report examines allegations made against a further 64 countries and territories, plus countries such as China where corroboration is difficult to obtain.

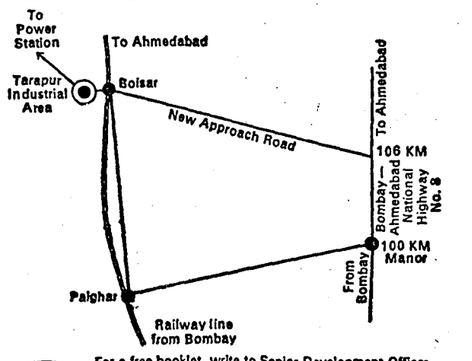
The result is a disturbing catalogue of dehumanising torture practices which include beatings, sexual assault, suffocation, submersion, injections, deprivation of sleep and forced standing in fixed positions for long periods, incarceration of sane people in mental asylums, sensory deprivation and modern audio-visual disorientation and terror techniques.

The Report is a masterly document. The culprits in Western Europe are Belgium, Portugal and its colonies, Spain and Turkey. In Eastern Europe the list comprises Albania, Hungary, Poland, Czechoslovakia, the German Democratic Republic, Rumania, to a certain extent, and the Soviet Union.

Torture in India

The Section on Asia covers India, Pakistan, Sri Lanka, the Philippines, Vietnam, Indonesia and Korea. Of India the Report says: "The Naxalites' selective assassinations of landlords, policemen and other 'agents of the state machinery', which began in the West Bengal countryside in 1967 and shifted to Calcutta in 1970, were met by an increasingly rigorous police programme of counter-insurgency. Thousands of suspected Naxalites were rounded up, and many of them have been held without trial ever since. They are detained under several preventive detention laws, of which the most widely used (the 1971 Maintenance of Internal Security Act) was declared unconstitutional by the Indian Supreme Court in April 1973. On May 15, 1973 *Le Monde* reported that a recent convention of socialist parties in New Delhi underlined in documents presented there 'the bad treatment inflicted on revolutionaries when they are arrested — tortures, burnings with cigarettes — or during their detention — absence of medical treatment, beatings, etc. Several dozen prisoners — and in winter 1972 the head of the Naxalites, Charu Mazumdar — have died during their incarceration or in the course of 'struggles' inside the prisons . . .

"The pattern that emerges is that although incidents of police and prison warden brutality continue to occur, the worst period was in 1970-71, when the threat from the Naxalites was judged to be greatest. While police brutality seems to have stemmed from a desire to extract information about Naxalism, beatings and other abuses of prisoners inside the prisons themselves may have reflected the grossly overcrowded and inadequate conditions of the big Calcutta detention centres such as Alipore and the Presidency Jail.



"Amnesty International has also received allegations of torture and ill-treatment of civilian detainees from two other parts of India, Nagaland in the far north-east and Kashmir in the north-west.

"Since an armed insurrection against Indian rule began in Nagaland in 1956, the area has been marked by bitter fighting, and more recently by sporadic acts of terrorism. (The secession of Bangladesh in 1971 was a major blow to the Naga rebels.) While it was still operative in 1970 the self-styled Federal Government of Nagaland, established by Naga dissidents in opposition to the government in New Delhi, alleged on at least three separate occasions that the Indian Army had perpetrated numerous 'atrocious deeds' against Naga citizens. These included rapings, beatings and other tortures of men and women suspected of helping the rebels. In the predominantly Moslem State of Kashmir, where the Plebiscite Front has persistently campaigned for self-determination, supporters of the Front have often been held under preventive detention legislation and subjected to various forms of oppression, though the situation has improved since 1972. In May 1972, a former prisoner of conscience was interviewed; he had been detained in 1966, apparently because of his leading role in the Plebiscite Front. The man alleged that he had been subject to prolonged torture during interrogation; in particular, he said he had been forcibly kept awake for fifteen days and nights, as a result

just 100 km from Bombay Airport

Over 30 entrepreneurs have already selected MIDC's Industrial Area at Tarapur for their new ventures. Many more are moving in. Why?
Apart from the proximity to Bombay, Tarapur offers these important advantages:
level land in MIDC Industrial Area (which means low development cost)
adequate water from MIDC's Surya River Water Supply Scheme
power supply from new 132/11 KV sub-station of MSEB
developed ancillary base nearby
location near the sea enables economical effluent disposal
round-the-year goods transport facilities by rail and road, including four train connections with Bombay every day
urban amenities, such as industrial housing, cinema, a bank, shopping facilities for daily needs
in addition: SICOM's varied financial support and project implementation services, and the Maharashtra Government's Scheme of Incentives.

of which his eyesight has been permanently impaired."

A passage regarding Pakistan bears quotation. "On 18th July 1972, *The Times* of London reported that the government had confirmed in the National Assembly that instruments of 'torture' were being purchased by the Pakistan Military Attache in the United States. The Minister of Labour said that his government was not the author of the deal, responsibility for which lay with the former regime of Yahya Khan. He added that the Bhutto government learned of the affair only through a press report from Washington and immediately sent out orders to stop it. The 'instruments' were said to include equipment for brainwashing, lie detection and torture of detainees. According to another press report, the Minister disclaimed responsibility, while simultaneously maintaining that 'everyone used these gadgets'. In June 1973, it was reported from Karachi that electric shock machinery existed inside the prisons and had been seen by detainees, but that there was no evidence of its use."

The Report concludes after making a global survey of the prevalence of the vice: "In the first place sophisticated methods of torture are being introduced in many countries. Interrogation techniques are being constantly refined. But torture is not being used for the extraction of information alone. It is also used for the control of political dissent. Often, the two main impulses are combined in one appalling practice. There also exists evidence that the practice of torture is becoming internationalised. Experts and their training, as well as torture equipment, are provided by one government for use in another state. Internally, responsibility for the use of torture is being broadened, involving other authorities than the police or security police."

It adds that "The responsibility for torture is, however, no longer confined to governments. Allegations of ill-treatment and brutality, amounting to torture, have been made against several opposition movements which use the violence and, from time to time, hold prisoners or hostages. Though this is a comparatively recent development, it is a serious one. There is no redress of any kind for the victim. It contributes to the escalation of violence. In such confrontation between the forces of the government and the forces of the opposition, the individual remains totally unprotected. Torture can occur in any society. Certain indications have emerged from this study as to the situations where torture is likely to occur. For instance, it is misleading to suggest that poverty causes and wealth prevents torture. Torture exists in situations of sharp conflict. The legal situation — the observance or the disregard of the due process of law — appears to be more directly relevant. Special powers acts; martial law; state of seige, or of exception: wherever the rule of law has been suspended, torture finds it easy to move in. When the citizen has a free access to *habeas corpus*, to legal aid, to a free press, he is better protected. It is not impossible for the state to torture him: but it is much more difficult."

The maintenance of a free press and an independent judiciary are indispensable for the preservation of individual liberty. For all their limitations, they serve to expose the vice and publicity is what the persecutor dreads worst.

A telling passage in the Report, the like of which abound in the document, reads: "The confrontation between the individual and the limitless power of the state, between the torturer and his victim, takes place in the darkest recess of political power."

The Report throws a flood of light on those dark recesses and is a splendid contribution towards awakening public awareness of the prevalence of the cancer of democracy.

SPECIAL ARTICLES

Raw Jute Marketing: Problems and Solutions

N K Muralidhara Rao

P Ramaswamy

The marketing of raw jute has for long suffered from several inadequacies. A number of Commissions and Committees have examined jute marketing problems and suggested remedial measures. Sporadic attempts have also been made to tone up the marketing arrangements. It is, however, increasingly becoming clear that all have only touched the fringe of the problem.

Marketing of raw jute continues to suffer from various handicaps. Domestic supplies continue to fluctuate from year to year, jute growers do not feel secure about getting a remunerative return for their investment and the marketing system is beset with several imperfections.

An attempt is made in this article to briefly review the present arrangements for marketing of jute and to suggest measures for improving them.

THE marketing problems relating to raw jute can be better appreciated by taking a close look at the special features of production relating to this commercial crop. Unlike other commercial crops, the cultivation of which extends to several states, jute production is mainly confined to the states of West Bengal, Assam, Bihar and Orissa. West Bengal, which is the most important producing state, accounts for about 55 per cent of the total production of raw jute. Assam, with about 20 per cent of the total, is the second important producing state. Bihar follows with about 12 per cent of the production. Orissa accounts for another 7 per cent of the production. Thus, these states among themselves contribute as much as 96 per cent of the total production of raw jute in the country.

The movement of produce from the village is completed within a relatively short period. In West Bengal, more than half of the production is disposed of during the three-month period from October to December. The bulk of

Century Rayon

AN EXAMPLE OF SOCIAL RESPONSIBILITY

Century Rayon sets an example to other large corporations by its policy of synthesising service to the community, fulfilment of its obligations to the employees, the customers and the shareholders. And yet, you will be surprised, it is making the highest contribution to the national exchequer by way of tax payments as well as foreign exchange savings and earnings.

In spite of runaway inflation in the cost of raw materials and other inputs such as labour, spares, fuel and water, Century Rayon sets another example by holding the priceline for its products.

PROFESSIONAL MANAGEMENT:

Besides the philosophy, the *secret lies in its professional* management. Maximum *decentralisation* and delegation of authority and responsibility, has built an outstanding team of managers and workers, with a completely autonomous decision making process in each of its segments.

ASSISTING AUXILIARY AND ANCILLARY INDUSTRIES:

Century Rayon believes in supporting a number of small entrepreneurs. Rightly so. And it has become a benign big brother to a number of auxiliary and ancillary industries. It is helping them in three *segments, viz. a)* the small scale suppliers; b) the small processors who use Century's bye-products and waste, products; c) a large nation-wide community of small weavers dependent on Century's supply of yarn. Century Rayon is helping them in three ways—
a) by providing finance;
b) by giving technical assistance; c) by helping them in marketing.

THE NATIONAL EXCHEQUER:

How much do you think Century Rayon is paying by way of taxes? To the tune of Rs. 8 crores in excise duty and other levies, over and above the *income tax paid* by the parent company, Century Spinning & Manufacturing Co. Ltd., to the extent of Rs. 7 crores per year.

EXPORTS:

Why is it that the Century Rayon Tyrecord is equal to the world's best?
The testimony is constantly rising exports to sophisticated international markets.
The total foreign exchange *earning including* Rayon Fabrics & Chemicals so far exceeds Rs. 5 crores.

EMPLOYEE WELFARE:

Century's workers are happy because of one of the finest housing colonies provided to them, along with a club house, a cooperative bazar and a credit society. They enjoy the best educational facilities for their children, consisting of primary and secondary schools and a college for Arts, Science and Commerce. Its medical care is unique, with a full fledged 50 bed hospital, and free medicine.

Recreation, too, is dear to its heart. Vast playgrounds, beautiful swimming pools and gardens, a large library, its own network of roads and water works and, to top it all, one of the finest *temples in a sublime* atmosphere-all these *amenities* constantly growing in size and quality.

Century Rayon encourages sports both for the amateur and the seasoned sportsman. Century's sports teams have *been winning many* a laurel on the playgrounds.

CREATING EMPLOYMENT:

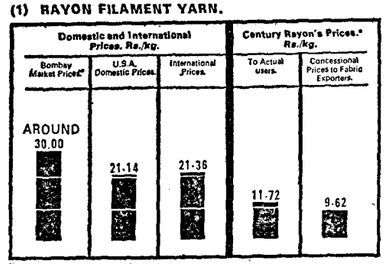
In today's context, Century Rayon's *contribution is* significant, by providing employment to over 6,000 workers directly, and supporting an entire township dependent on it.

INDUSTRIAL RELATIONS:

What would you say for a record of more than sixteen years of uninterrupted production, without losing a single manhour due to strike or strife? Relations with the employees are exemplary because of a direct, frank and honest *rapport with them across* the table, without external intervention.

COMMUNITY SERVICE.

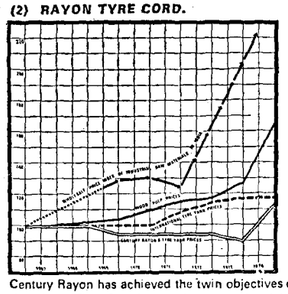
In times of calamities like earthquakes, wars, droughts and floods, Century Rayon has sprung to the call of duty voluntarily extending not only financial help but also providing volunteers and other *relief measures.*



RESEARCH AND DEVELOPMENT.

Well equipped laboratories and a team of dedicated scientists and technicians ensure the position of leadership for Century Rayon—be it the finest rayon filament yarn or the toughest, improved *rayon tyre cord.*

HOLDING THE PRICE-LINE AND ENSURING FAIR DISTRIBUTION.



(1) RAYON FILAMENT YARN.

*Exclusive of Excise duty

Very rigidly adhering to the Voluntary agreement between Viscose Rayon Spinners and Weavers, Century Rayon is selling approximately 60% of its production directly to Actual Users at the low price of Rs. 11.72 per kg. and an additional 20% directly to exporters of Rayon Fabrics, at a substantially low price of Rs. 9.62 per kg.

(2) RAYON TYRE CORD.

Century Rayon has achieved the twin objectives of maintaining the price of Tyre Cord below the international level and supplying directly to Actual Users.

CAUSTIC SODA.

To meet the needs of genuine users in the present acute shortage conditions, Century Chemicals is following a policy of supplying the entire production to Actual Users on the basis of past offtake, at fair prices.

CENTURY RAYON

Industry House, 159, Churchgate Reclamation, Bombay 400 020.

1971-72	11.14	68.38	147.47

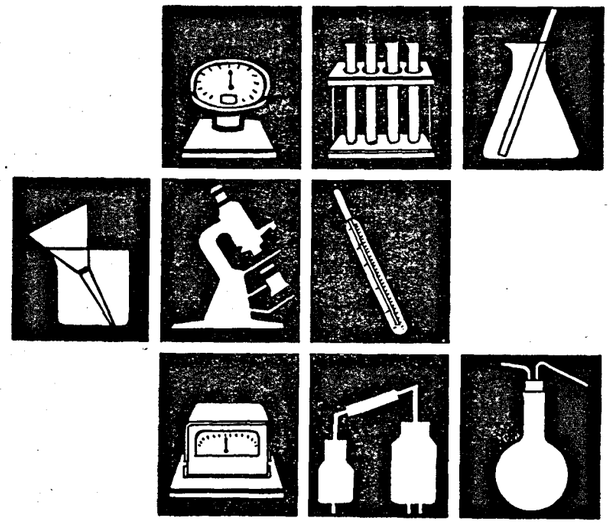
Source : Jute Corporation of India.

the crop has to depend on rainfall; for instance, in West Bengal, only 5.3 per cent of the total jute area is under irrigation. Most of the jute growers, having only a small quantity to market, prefer to dispose of the produce either in the village itself or in the nearby *hat*. Availability of credit to the jute growers is inadequate which also has had its impact on the method of marketing.

FLUCTUATIONS IN RAW JUTE SUPPLY

The serious repercussions of instability in raw jute production have been recognised and several measures have been and are being taken with a view to increasing the production. Even so, instability in production of raw jute continues to be a major problem.

There was a phenomenal increase in jute production in the immediate post-partition years as a result of the grow more jute campaign launched by the government. From a mere 1.7 million bales in 1947-48, production increased to 5.3 million bales in 1952-53. This tempo of growth could not be sustained during the subsequent years. What is more relevant, the increase in production was not found to be steady. There was a record production of 8.2 million bales in 1961-62 but there was also a very low production of 3.8 million bales in 1968-69. The fluctuations in production of raw jute are a result both of changes in the area sown under jute from year to year and of seasonal conditions. Raw jute prices appear to have a profound influence on the jute grower in the allocation of his total crop area for jute cultivation during the succeeding season. The relationship between area under jute in a particular year and the prices received by the jute growers in the previous season may be seen in Table 1 which indicates the area, production and seasonal average prices of raw jute during the years 1951-52 to 1971-72.



The amplitude of the year-to-year fluctuations in the area under and production of raw jute in the country may be seen from Table 2. A direct repercussion of the unstable production has been the intra-seasonal fluctuations in raw jute prices. Unless a certain amount of stability in prices is ensured, jute growers will find it increasingly difficult to allocate land to jute in preference to another crop like paddy where they are reasonably assured of remunerative market prices. For the industry too, production planning and export commitments become a problem when the domestic prices are subject to changes of this magnitude.

Against the back-drop of several production programmes for jute, a comparison of all-India growth rates of agricultural production during the period 1960-61 to 1971-72 indicates a disturbing trend as regards jute. During this period, the compound rate of growth per annum was 2.34 per cent for all crops. For foodgrains as a group, the growth rate was 2.64 per cent and for non-foodgrains 1.77 per cent. A special significance of these growth rates is that, relatively speaking, the increase in production is more due to improved yields rather than to expansion in area. Compared to food crops, commercial crops show a lower rate of growth of 1.77 per cent. The performance of both cotton and jute has been very disappointing, more so in the case of jute which shows a negative growth rate of 0.64 per cent. This is the combined result of fall in the acreage sown under the crop as well as due to failure to increase the productivity to any appreciable extent.

The Fifth Plan envisages a production target of 8 million bales comprising 6.7 million bales of jute and 1.3 million bales of mesta. The production programmes to be implemented in the years to come should aim not only to raise the level of production but also to minimise the fluctuations in the size of the crop in relation to demand. The Government of India has already initiated a number of programmes for increasing the productivity of jute. The Intensive Jute Districts Programme is the latest to be taken up in this connection. The Agricultural Prices Commission in its Report on Price Policy for Jute for 1973-74 season has stated, "The approach to jute development, at any rate in the operational context, does not appear to be sufficiently integrated." For example, under the Intensive Jute/Mesta Districts Programme for 1972-73, the coverage of area under different yield-increasing programmes has been very dissimilar. As pointed out by the Prices Commission, the need is for a package approach to increasing yield and not individual and uneo-ordinated measures.

A remunerative support price for raw jute will act as a powerful instrument in imparting a certain amount of stability to jute production. With a view to introducing stability in jute prices, the Government of India fixed operational minimum prices for raw jute beginning with the 1961-62 season. A minimum price of Rs 80.38 per quintal for delivery at Calcutta was fixed for Assam Bottom quality. In order to give effect to this policy of ensuring a minimum price to growers, the Jute (Licensing and Control) Order, 1961, was promulgated under the Essential Commodities Act. The operational minimum price from 1961-62 to 1965-66 remained at Rs 80.38 per quintal (Assam Bottom, Calcutta delivery). The operational minimum price (support price) was increased in 1966-67 to Rs 93.77 per quintal on the recommendations of the Agricultural Prices Commission. The support price

700 steps to confidence

Public confidence in modern medicines made in India—as good as the world's best—has been won the hard way.

Rigid quality control at every stage of production can mean as many as 700 internal checks on a batch of medicine, with every ingredient checked for purity, stability, efficacy and shelf life.

On an average, one out of every six persons employed in pharmaceutical production works on quality control. The drug industry employs a higher percentage of scientists than most other industries—15 per cent as compared with 4.8 per cent in the chemical industry and 0.8 per cent in other industries. This kind of emphasis adds up to an undisputed guarantee of world-class quality.

INDIA'S PRIDE: MEDICINES TO MATCH THE WORLD'S BEST

1970-71	(+) 7.25	(—) 8.25
1971-72	(+) 3.15	(+) 10.41

was increased again in 1967-68 to Rs 107.17 per quintal and was maintained at that level till 1970-71. In 1971-72, it was further raised to Rs 113.87 and again to Rs 115.00 per quintal in 1972-73. Initially, the operational minimum prices were announced only for Calcutta but subsequently the government started working out and announcing such support prices for upcountry markets also. In order to ensure a reasonable minimum price for the growers in the distant regions and thus sustain their interest in jute growing, the government in 1970-71 introduced a modification in the minimum support price to the effect that the difference between the Calcutta support price and the upcountry support price should not exceed Rs 17.42 per quintal which was reduced to Rs 15 per quintal in 1972-73. From 1972-73 onwards, the minimum prices have assumed a statutory basis. For the current 1973-74 season, the support price for Assam Bottom has been increased by Rs 10 per quintal. The price differential between Calcutta and other upcountry markets has been further reduced to Rs 12 per quintal with a view to protecting the interests of jute growers in markets away from Calcutta.

Notwithstanding the increase in the minimum support price for raw jute during the last three seasons, jute growers continued to feel that the support prices are still at an unrealistic level. The growers feel that the support price for the fibre does not adequately cover the cost of production. Recently, there was a convention of jute growers at Chandannagar in West Bengal which demanded the appointment of a Special Commission to examine the problems of jute growers and re-fix jute prices. A price of Rs 157.60 per quintal has been demanded by the convention. It has been pointed out that relatively, it is becoming increasingly profitable to cultivate paddy rather than jute. A price ratio of 3 : 1 between jute and paddy has also been claimed. The question of relationship of prices of jute and paddy has been gone into time and again in the past. The Bengal Land Revenue (Floud) Commission, 1940 considered 3 : 1 as a fair parity between jute and paddy prices. On the other hand, the Jute Inquiry (Sen) Committee, 1957, put it at 2.7 : 1. Subsequently, a ratio of 2.5 : 1 has been mentioned in several other official documents. The Agricultural Prices Commission in its report for 1968-69 season had pointed out that if the minimum price of raw jute and the minimum price of paddy are considered, a whole series of price ratios ranging from 0.99:1 to 3.10:1 would emerge. Currently, it has been claimed that the cost of farming a bigha (1/3 of an acre) of jute and the high-yielding variety of paddy is Rs 251 and Rs 152, respectively. A bigha yields about 8 maunds of jute with a market value of Rs 400 at the current price paid at the primary market in south Bengal. A similar plot of the high-yielding variety of rice produces 15 maunds of paddy which fetches Rs 675 or even more. Fariahs are prepared to pay at the farmers' door-step as much as Rs 50 for a maund of paddy this year. The situation is said to be more unfavourable for jute farming in north Bengal. The primary markets in those areas being far away from the consuming points, jute sells at less than Rs 40 per maund but the paddy price is as high as in south Bengal. It is claimed that this may result in a switch-over from jute to paddy area and that this trend will be more pronounced in north than in south Bengal.

Table 3 indicates the average wholesale price for jute and rice during the five-year period 1968-69 to 1972-73 in some important jute growing states. It may be noticed that the profitability of jute growing in relation to paddy had gradually dwindled right upto 1971-72 and the trend appears to have been reversed only in 1972-73.

To bring about stability in production of raw jute, the jute grower has to be assured of a remunerative return on his investment. In view of the feeling among the jute growers that it is relatively more profitable to cultivate an alternative crop like paddy, there is urgent need to carry out a detailed and systematic study of cost of production of jute and of competing crops like paddy so that the support price for raw jute could be fixed at a realistic level.

Bringing in more jute area under irrigation will also considerably help in avoiding production uncertainties. For example, in West Bengal alone if 1.5 lakh hectares more of jute area could be brought under irrigation, it will be able to yield 15 lakhs bales. In the six jute growing districts of Murshidabad, Nadia, 24 Parganas, Hooghly, Burdwan and West Dinajpur, the total irrigated crop area works out to 6.38 lakh hectares, including 3.94 lakh hectares presently available and 2.44 lakh hectares expected to be available under proposed new irrigation projects. At present, in these six districts jute is already cultivated as an irrigated crop over an area of about 23,000 hectares. There is a possibility of bringing 30,000 hectares under irrigated jute in new areas with the new irrigation proposed to be made available in the state. There is also a possibility of supplying irrigation to 76,000 hectares of existing jute area (26,000 hectares from the existing irrigation projects and 50,000 hectares from new projects). This means that by the end of the Fifth Plan it will be possible to have a total of 1.5 lakh hectares under irrigated jute in these six districts in West Bengal. This is a programme which offers great potentialities and requires to be pursued vigorously.

DEVELOPMENT OF JUTE MARKETS

In the movement of raw jute from the cultivator to the consumer, three distinct stages can be discerned. In the first stage, the raw jute moves from the villages to primary assembling markets or *hats*. These primary markets or *hats* constitute the first important link in the long channel of marketing of raw jute. About 60 per cent of the marketable surplus is disposed of by growers at their very doors. Only about 30 per cent is taken by them to the primary markets for sale. The second stage relates to the movement of raw jute from the villages or *hats* to the secondary markets which are also usually the baling centres. Only about 10 per cent of the jute arriving in these secondary markets is brought di-

rectly by growers. The movement from the up-country baling centres to the jute mills in Calcutta and other places and to the loose jute markets and pucca baling centres in Calcutta constitutes the third stage. Thus, the primary assembling markets or *hats* and the secondary markets have a very vital role to play in the marketing of raw jute.

There are 194 assembling markets for jute in the different jute growing states. Out of these, only 69 have been brought under regulation so far. The position in each state is as shown in Table 4. In Bihar and Orissa most of the jute markets have already been brought under regulation. So also in Uttar Pradesh and Andhra Pradesh. In West Bengal, 69 markets which include 10 jute markets have been brought under regulation under the old Act. Presently, market regulation is being extended to additional markets under the new Act. In Assam legislation for market regulation is yet to be passed. It is expected that enactment for the purpose will be completed soon. In Tripura, market regulation is yet to be extended to a number of jute markets.

Regulated markets for jute can help not only the jute growers but also the purchasing agencies significantly by making available services and facilities for sorting, grading, storage and processing. But these facilities are lacking at present in most of the existing jute markets. The establishment and development of a chain of assembling points as near the growing area as possible could bring immense benefit to the marketing of raw jute. The emphasis should be not on the development of a few large sized markets away from the points of production but on the development of smaller assembling centres which could become sub-market yards of the main secondary market. These marketing centres could provide processing and short-term transit-storage facilities which could be of great help to the public sector agency in effecting its purchase operations. The total number of feeder markets catering to the 194 secondary markets is estimated at around 400. If efficient raw jute marketing is to be ensured, a programme for the development of the 194 secondary jute markets and the 400 feeder markets requires to be launched on a priority basis. The development of the required facilities and services is roughly estimated to cost Rs 10 lakhs for each secondary market and Rs 3 lakhs for a feeder market. On this basis, an investment of an order of Rs 31.4 crores will be required if this programme is to be put through. Once the market committees are established, it should be possible for these committees to avail of institutional credit supplemented by government assistance. In developing these markets, a co-ordinated programme involving the Jute Corporation of India and the state governments should be worked out so that the Jute Corporation of India can avail of the facilities made available in these markets.

PROCESSING, STORAGE AND TRANSPORT

An examination of the baling facilities available at present in the assembling markets for jute indicates that, by and large, in terms of the total baling capacity the markets do not suffer from any inadequacy. During a season the baling units operate for a minimum period of 4-6 months. The average capacity of a baling unit per day is about 100 bales. The total number of baling presses for jute is estimated at around 1,400 with a capacity of 1.3 lakh bales a day. Therefore, the conversion of raw jute into kucha bales does not seem to be a problem.

The baling facilities are now owned by jute balers who operate in the secondary markets either on their own account or as agents for the jute mills. Therefore, when a public sector agency like the Jute Corporation of India undertakes purchase operations it has to depend on the balers for converting raw jute into kucha bales. Therefore, while there does not appear to be any shortage of kucha baling capacity in the assembling markets, it would be advantageous for the regulated market committees and the co-operatives to gradually expand the jute baling capacities with them as a measure of assistance to the public sector purchasing programme. This will be particularly important in the interior areas where processing facilities may not exist at present.

Unlike other agricultural commodities where the movement from the farm to the consuming centres is multi-directional, in the case of jute almost the entire production moves in one direction only, i e, towards Calcutta where most of the jute mills are located. Further, the movement takes place within a relatively short period after the harvest. From the secondary market jute is despatched to the terminal destination mostly by railways (80 per cent) and to a lesser extent by road (20 per cent). Road transport is primarily confined to areas within reach of Calcutta. It is also resorted to when movement by rail is held up for some reason or the other. About 65 per cent of the total movement by rail goes direct to the mills and the remaining 35 per cent to the railway terminus at Cossipore which functions not only as a terminal railway but also as a virtual market yard.

The mills generally start procurement from the secondary markets and despatches commence from the month of September. During the six-month period from September to February they go on procuring every month roughly the requirement of 1½ month's consumption so that by the end of February they have three months' stocks. The mills also procure from the traders at Cossipore. Movement of jute from purchasing areas in Assam and Bihar involves transhipment from metre-gauge to broad-gauge. Cross-movement from east to west and *vice versa* across the river Hooghly is yet another problem. The problem of transport of jute is further aggravated by the simultaneous demand on the limited transport capacity by other commodities like tea. The North-East Frontier Railway handles the bulk of the railway movement in raw jute. The total quantity of raw jute moved by rail over different railways during the three years 1969-70 to 1971-72 may be seen from Table 5.

Almost every year bottlenecks in the railway movement of raw jute, particularly from Assam and North Bengal areas, have been a recurring feature. During the current year the problem has reached alarming proportions. Owing to floods and frequent heavy rains, arrivals of raw jute at the assembling points during the period July-October have been sparse. Even so, it has been reported, there has been a great back-log in the release of wagons, particularly in the North-East Frontier Railway, for the movement of raw jute.

The fact that the Cossipore Railway Yard is functioning also as a market appears to be aggravating the problem of congestion and release of wagons at Cossipore. It is reported that the merchants often find it profitable to pay wharfage for a short period till the jute is sold to mills rather than transport the stock to godowns nearby. The question, therefore, requires to be examined whether the practice of using the railway yard as a market should be put to a stop. While this may ease the pressure on the railway yard, the giving up of such an established practice will not be welcomed by the trade. A suggestion has been made that with a view to putting the railway's capacity to rational use two measures could be considered. Firstly, concessional freight for transport of raw jute during the off-season can be provided with a view to encouraging phasing of despatches from the assembling points to Calcutta.

TABLE 4: TOTAL NUMBER OF ASSEMBLING MARKETS AND NUMBER OF REGULATED MARKETS

Source: Directorate of Marketing and Inspection.

Secondly, storage capacity for raw jute could be developed by the Central and State Warehousing Corporations at critical despatch points, which can be availed of by the mills, the merchants and the Jute Corporation of India so as to stagger the despatches to Calcutta.

In the railway yard at Cossipore, storage capacity for 23,000 bales is available. In addition, private godowns around Cossipore also have a storage capacity of about 3.5 lakhs bales. Considering that the daily average arrivals at the peak season (Sept-October) is around 6,000 bales (about 1.5 lakh bales per month) the storage capacity in the railway yard at Cossipore appears to be adequate, so long as the wagons are released without undue delay. The mills in and around Calcutta are reported to have a storage capacity of about 10 lakh bales, which is roughly equivalent to about 4 months' consumption. But bottlenecks occur because of the tendency on the part of the traders to hold up the release of wagons at Cossipore which places a great strain on the railways. It is in this context that the development of storage capacity at important despatching points with a view to phasing out the pressure on railway wagons becomes important.

It is estimated that there is transit-storage accommodation to the extent of 44 lakh bales in the assembling markets. Bulk of this is with the private trade and it is used for their own business activities. If the congestion in the Cossipore railway yard due to bunching of wagons and the increased pressure from additional production is to be eased, it would be necessary to build in each main marketing centre storage capacity of around 2,000 tonnes. This would imply creating a total capacity of 3.8 lakh tonnes or 19 lakh bales of raw jute. This capacity could be owned by the regulated market committees which have been established or which may be established in the near future, so that raw jute could be properly stored and the despatches towards Calcutta could be phased out. Keeping in view the estimated targeted production of 80 lakh bales of raw jute, capacity for about 20 lakh bales in the secondary markets appears quite essential.

CO-OPERATIVE MARKETING AND PROCESSING

Co-operative marketing and processing has not played an effective role in the case of jute unlike in the case of cotton and sugarcane. Very little of raw jute is handled by the co-operatives. During 1972-73 the quantity of raw jute marketed by the co-operatives amounted to hardly 28,000 bales. In most of the jute growing states, with the exception of Orissa, the co-operative marketing structure is not well developed. In Orissa, the Danpur Jute Marketing Society has been in the field of jute marketing for the past several years and has been able to handle a substantial part of the total jute produced in the state. In Tripura also the co-operative marketing structure is better organised and the entire jute growing area is served by a network of agencies under the Tripura Apex Co-operative Marketing Society. Jute Co-operatives will have to play a more active role as agents of the Jute Corporation of India so that the farmers can derive the full benefit from the support prices fixed by the government. During 1973-74 co-operatives are expected to handle a much larger quantity of raw jute on behalf of the Jute Corporation. (Co-operatives are reported to have purchased 2.24 lakh quintals of jute so far this season.)

As regards processing, there are only 40 jute baling units in the co-

operative sector, 20 in West Bengal, 14 in Orrissa, 3 in Bihar, 2 in Uttar Pradesh and 1 in Andhra Pradesh. During the Fifth Plan, it is proposed to set up in the co-operative sector 21 more jute baling units. These programmes to strengthen the co-operative processing of jute will help co-operative marketing as well.

Although co-operative marketing and processing of jute is not well developed at present, having regard to the special features of jute marketing the establishment and development of marketing-cum-credit societies of jute growers appears to be the only solution if the jute growers are to be helped to secure higher returns. Only such an arrangement will make it possible to establish a link between the jute growers on the one hand and the Jute Corporation of India on the other. The National Co-operative Development Corporation should prepare a detailed blueprint for developing co-operative marketing and processing of jute keeping in mind the anticipated increased activity of the Jute Corporation of India in the years to come.

An important issue will be the availability of credit to the co-operatives for undertaking the purchase operations. It has been reported that during the current year the purchases by the co-operatives in West Bengal have almost come to a standstill for lack of credit. Situations like this will have to be avoided if the jute co-operatives are to fulfil their assigned role in the marketing of raw jute. It is worthwhile to stress here that adequate production credit should be given to the jute grower so that he does not have to make distress sales of his produce to some creditor who has financed his agricultural operations. This will help him also to market the jute through the co-operatives.

ROLE OF JUTE CORPORATION OF INDIA

One of the major objectives of the Jute Corporation is to conduct purchase operations to ensure the maintenance of support prices. During 1972-73, when it began activities in this regard, the Jute Corporation purchased a small quantity of 1.54 lakh quintals of raw jute valued at Rs 3.11 crores under the price support scheme. Of this, 1.04 quintals or 67.5 per cent were purchased through the Corporation's own purchasing centres and the remaining 50,000 quintals through co-operatives. The bulk of the purchases (more than 70 per cent) through co-operatives was made in West Bengal. Bihar, Orissa and Tripura each accounted for about 10 per cent of the purchases through co-operatives. During the 1973-74 season, the Jute Corporation is operating 30 departmental purchasing centres in all (which number in due course is to be increased to 100). Out of these 30 centres, 13 are in West Bengal, 8 each in Bihar and Assam and one in Andhra Pradesh. In Tripura and Orissa the entire proccurement will be through co-operatives. In Assam, procurement will be both through co-operatives and through departmental centres. The Corporation hopes to procure about 15-20 lakh bales of jute during the current year, both through co-operatives and its own departmental purchasing centres.

Admittedly, buying jute at the growers' level by the Jute Corporation poses many difficulties. The grade composition of the ungraded jute has to be correctly evaluated and its market value determined. In many cases, payment has to be made on the spot and in cash. This involves difficult problems of financial control and security risk since the departmental purchasing centres have to cover a number of weekly *hats* and feeder markets. Further, for each purchase centre, a baling press and a godown have to be hired with the necessary complement of labour. The Corporation has to compete with the trade in a free and fluctuating market and therefore has to be careful about the commercial viability of its transactions. The Corporation is now solely responsible for ensuring that the prices do not fall below the statutory levels. The Corporation is said to be contemplating the appointment of trade agents, to operate in carefully regulated conditions, at places where it is not possible either for the co-operatives or departmental purchasing centres to operate. However, if the price support programme for raw jute has to benefit the jute grower, it is imperative that the jute grower is brought into direct contact with the public sector agency; otherwise there is a danger of the benefit of the support programme not reaching the grower but being appropriated by the middlemen who figure between the cultivator and the public sector agency. This aspect of the price support operation has been clearly brought out by the Agricultural Prices Commission in its report on price policy for jute for the 1973-74 season. The Commission says, "In fact the full impact of the price support operations would not be felt unless the growers are brought into direct contact with the institutional apparatus designed to provide such support. Given operational difficulties involved in forging a direct link between the Jute Corporation of India and individual growers who have only small quantities of jute to market, the need for the establishment and active development of marketing-cum-credit co-operatives of jute growers can hardly be overemphasised. The development of growers' co-operatives should also make possible the provision of scientific grading facilities at the village level thereby enabling the farmer to realise the true worth of his produce."

The efforts of the Jute Corporation in reaching the jute growers will be considerably strengthened by the development of a network of purchase points in the concentrated jute growing areas which can be made the sub-yards of existing regulated markets. In these sub-yards, as mentioned earlier, processing and storage facilities could be adequately made available by market committees to be availed of by the Corporation on payment. In these sub-centres, grading services could also be developed by the state government in collaboration with the Directorate of Marketing and Inspection of the Government of India, so that the Jute Corporation will have a readily available arrangement for correct assessment of the quality of raw jute.

GRADING OF RAW JUTE

For a long time, the marketing of raw jute and price quotation by the trade has been carried on with reference to 27 different commercial classes of jute. Certain characteristics of length strength, colour, lustre, etc, which are peculiar to fibres from the different jute growing areas have formed the basis of this commercial classification of raw jute. This differentiation is based mostly on the area of cultivation. Raw jute is marketed by the grower in unassorted form which may contain jute of different grades. The jute grower does not undertake the sorting of raw jute into different grades. It is only at the assembling markets that raw jute is sorted out into different grades and then converted into kucha bales of any particular grade. The system of grading on the basis of commercial classes is complicated, cumbersome and discriminatory. The regional classification tends to restrict the marketability and the market value of raw jute from a particular area. For instance, a jute grower in Bihar generally gets a lower price although his produce may be better in quality. Similarly, jute from areas traditionally known for quality produce tends to fetch a higher price in the market. This deficiency in the system of grading of raw jute has, however, been overcome with the formulation of revised standards consisting of eight grades each for Tossa and white jute. These have been notified under Agmark under the Jute Grading and Marking Rules, 1971.

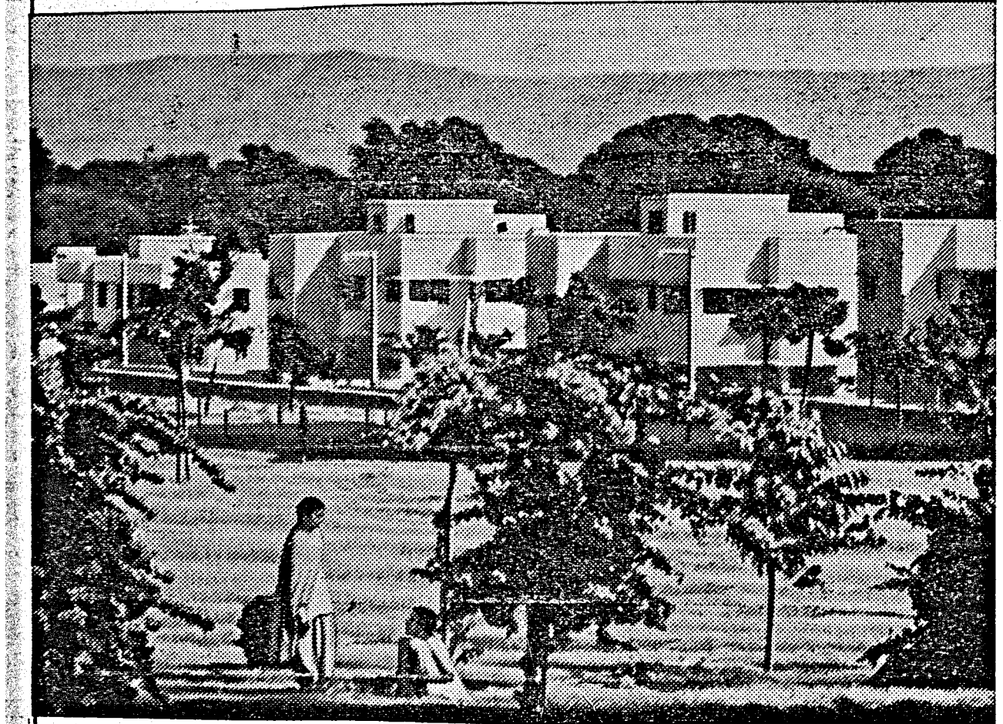
The task of familiarising the growers with the revised system of grading is not an easy one. The state governments in the jute growing areas have no doubt taken steps in this direction. In Bihar, grading staff consisting of 1 Grading Inspector with grading equipment has been posted in important regulated markets for jute. In West Bengal, two schemes are already operating for helping the growers in sorting raw jute. Five mobile jute grading units are already functioning in the districts of 24-Parganas, Malda, West Dinajpur, Jalpaiguri-Cooch Behar, Nadia-Murshidabad, Howrah and Hooghly. Additional mobile jute grading centres are also operating at Kalna, Samsi and Sheoraphuli. If the grading programme is to make any real impact and help the jute grower in getting prices related to quality, the problem requires to be tackled at two levels. Firstly, the jute grower has to be discouraged from selling his crop in the unassorted form. He should be educated to sort raw jute on the basis of grades before sale. Simultaneously, at the secondary market, grading of kacha bales under Agmark on the basis of the revised standards should be encouraged. The success of this programme, however, will largely depend on the readiness of the buyers to pay price for jute on the basis of the revised grades. The reported decision of the Jute Commissioner to fix prices for raw jute on the basis of the revised grades with effect from the next jute season and the reported acceptance of the trade of this revised procedure should give a fillip with scientific grading of jute.

During the Fifth Plan, special emphasis is being laid on the establishment of grading centres for commercial crops including jute. The marketing programmes of the Directorate of Marketing and Inspection, Government of India, include a scheme for the setting up of jute grading centres in the important assembling markets. The jute growing states have also included in their Fifth Plans programmes for organising grading centres for important commodities including jute. This will raise the question of availability of trained personnel for jute grading.

It is estimated that in all, 1200 trained persons will be required if the programme of grading raw jute at the farmers' level or in the regulated markets is to be properly implemented. By the end of the Fourth Plan about 200 persons are expected to complete training in grading of raw jute under the Directorate of Jute Development. The task of imparting training to the remaining 1,000 will have to be taken up on a priority basis to successfully handle the grading of raw jute.

MARKETING COSTS AND MERCHANTS

The participation of jute growers in the marketing of the crop is very poor. A variety of reasons contribute to this situation. The small quantity of raw jute available for sale, insufficient production credit, location of marketing centre away from the producing area, etc, are some of them. As a result, the intermediaries between the jute grower and the consumer continue to appropriate a disproportionately large percentage of the consumers' price for the services they perform. Cost reduction is possible only when there is direct participation by the growers. Although co-operative marketing of jute has not made much headway, that seems to be the only solution in the existing conditions. This has assumed greater importance with the establishment of a public sector agency in the form of the Jute Corporation to undertake purchases from the jute growers. Integrated development of marketing, processing and credit functions by jute growers' co-operatives alone can solve the problem.



In Table 6 raw jute prices at different points of sale in selected markets have been compared. The grower's price in assembling market varied from 72 to 91 per cent of the corresponding Calcutta price during 1971-72 in 1972-73 the percentage varied from 74 per cent to 93 per cent. There is clear indication of the advantageous position of a jute grower situated nearer Calcutta as compared to those situated away from the consuming points. It is in recognition of this handicap that the price differential between Calcutta and

CAN A STEEL CITY ALSO BE A GREEN CITY?

Jamshedpur, the steel city of India, was planned to be a model of its kind.

"Be sure," wrote Jamsetji Tata to his son Dorab, "to lay out wide streets planted with shady trees, every other one of a quick growing variety. Be sure that there is plenty of space for lawns and gardens".

And that's what Jamshedpur is today; as much a city of gardens as of steel. Housing colonies have been planned and are being expanded, keeping in mind Jamsetji's wishes voiced over seventy years ago!

TATA STEEL

AIYARS.TS.58

up-country markets in the operation of the support price is being gradually reduced. This, however, can benefit the grower only when purchase operations are done at the support level. In an open market situation the solution lies once again in organising marketing co-operatives.

Conclusion

After having passed through a period of crisis characterised by short crops and dwindling export demand, the Indian jute industry is now placed in a position to turn the corner. There is a bumper crop of about 80 lakh bales in the current season. The foreign demand for jute goods is also likely to go up, particularly since the competition from synthetic substitutes may not pose such a serious threat, as was once feared, in the coming years. There are indications on the other hand that the production of polyolefin-based synthetics in Europe and America by giant corporations will receive a setback due to the present oil crises.

The demand for jute goods for internal consumption and exports is expected to increase from 7,01,000 tonnes and 6,23,000 tonnes, respectively, in 1974-75 to 9,01,000 tonnes and 5,57,000 tonnes, respectively, by 1979-80. The requirement of raw jute is expected to increase from 63 lakh tonnes in 1975 to 86 lakh tonnes in 1980.

The recent tariff agreement with the UK and the EEC regarding jute goods is also a welcome development and should help in improving India's export performance. But in any measure taken to put the jute economy on a sound footing, there has to be emphasis first on the improvement of the raw jute marketing structure.

Mobilisation of Landless Labourers

Halpatis of South Gujarat

Jan Breman

Halpati is the respectable name given by Gandhi to this caste of agricultural labourers of the Bulsar, Surat and Broach districts of South Gujarat in place of the name 'Dubla' which was considered pejorative. The Halpatis are not really adivasis; on the other hand, they are not considered to be full-fledged Hindus by the caste Hindu population.

The 'hali' system disintegrated in the last few decades before Independence. Increasing market production put an end to the traditional arrangements that were based on widely varying mutual obligations of an economic, political, cultural and social nature. The relations between 'dhaniamo', the landlord, and 'hali', the labourer, gradually became contractual and impersonal.

This paper deals with the political consequences of the change in the relationship between landlords and the Halpatis. The eclipse of the vertical ties that formed an integral part of 'halipratha' facilitated the reinforcement of horizontal solidarity.

Since the thirties, voluntary social workers have been devoting themselves to the improvement of the Halpatis' social position, working from the Swaraj ashram in Bardoli and later from similar social action centres in Surat and Bulsar districts.

Since 1961 social work among the Halpatis has been given an organisational basis in the Halpati Seva Sangh (HSS). However, the Halpatis have little reason to regard the HSS as an organisation that fights for their interests. For them it is an obscure body, affiliated with the government and representing external interests. The HSS cannot be called an emancipation movement at all; rather, its aims and methods prevent mobilisation of the Halpatis.

What possibilities of organised social action other than the HSS are here? To be sure, dissatisfaction among the Halpatis is growing. But it still expresses itself in disconnected incidents, particularly in strikes that flare up suddenly but remain limited to single villages and soon fall flat when landlords engage labourers from elsewhere.

The situation is ripe for an explosion; in fact it has been ripe for a long time. Yet none has taken place till now. Organisation of the latent unrest has been the lacking factor.

Halpatis, a Tribal Caste of Landless Labourers

THE majority of the population of South Gujarat is concentrated in the central plain, the backbone of Bulsar, Surat, and Broach districts. This old and fertile agricultural belt is also the area where the Halpatis live. They particularly inhabit the first two districts where, with over 3,30,000 caste members, they form about 12 per cent of the total population.

The division into *uljiparaj* and *kaliparaj*, light- and dark-coloured, is the main feature of the social structure in South Gujarat. Half the district population consists of "scheduled tribes", and the Halpatis are also registered as such. There are, however, marked differences among the tribal communities. Unlike the Halpatis, who were accommodated at the bottom of Hindu society long ago, the tribals living in the eastern parts — where the country becomes increasingly infertile and hilly — succeeded in maintaining a position of semi-independence well into the nineteenth century. Only gradually were they subjugated as sharecroppers and tenants by penetrating caste Hindus. While the Halpatis form a substantial minority in the central belt, the tribal communities in the eastern region make up 80 per cent or more of the local population. Consequently, tribal elements are more

pronounced in their social structure and culture. It is, therefore, hardly surprising that tribal emancipation movements, which arose in the eastern parts of the districts during the last decade,[1] have not found much support among the Halpatis of the plain.

The Halpatis are not really adivasis; on the other hand they are not considered by the caste population of the central belt to be full-fledged Hindus. The ambivalent way in which the Halpatis are ranked in the social order indicates their dependent and inferior position. Most probably, their low level of existence has prevented a more rapid process of Hinduisation in their case.

Halpatis have no recorded past as peasant owners. It is true that, locally, individual members of this caste own small pieces of land, but the majority has worked as agricultural labourers since long. According to the 1961 census, this was still the main, if not the only, source of livelihood for 73 per cent of them.

Condition of Agricultural Labourers: Past and Present

Agricultural labourers have usually been in the employment of the bigger land-owners. Their masters are nearly always Anavil Brahmans or Kanbi Patidars, members of the dominant castes of Bulsar and Surat districts. The dependence of the labourers was institutionalised in the *hali* system. Elsewhere I have described this pattern of relationships between landlords and their Halpati labourers in terms of bondage and patronage.[2]

Extension of scale during the last few decades before Independence resulted in the disintegration of the *hali* system. Intervention in local affairs by the colonial bureaucracy only played a limited role in this process of change. A more important factor was the commercialisation of agriculture. Increasing market production put an end to the traditional arrangements that were based on widely varying mutual obligations of an economic, political, cultural, and social nature. The relations between *dhaniamo* and *hali* landlord and labourer gradually became more contractual and impersonal. The daily grain allowance which, together with other daily and seasonal perquisites, guaranteed a subsistence livelihood for the Halpatis, was transformed into a wage paid in cash, in exchange for a more specific labour performance. The firm and intimate bonds between the households of landlords and their labourers, often continued from generation to generation, dissolved to be replaced by loose and limited contacts. The percentage of casual wage earners rapidly increased. To the extent that farm servants are still required, they are hired nowadays on a contractual basis.

The abolishment of the *hali* system was an aim pursued by Gandhi and his followers in South Gujarat. The struggle against colonial rule was, in their view, justified only if bondage within the country's own social order was also done away with. 'Halpatis' — literally, 'holders of the plough' — became the name of honour given by Gandhi to this caste of agricultural labourers in replacement of the name 'Dublas', which was regarded as pejorative. Since the thirties, voluntary social workers' have been devoting themselves to the improvement of the Halpatis' social position, working from the Swaraj *ashram* in Bardoli, and later from similar social action centres elsewhere in Surat and Bulsar districts.

The activities of the Gandhian movement were, however, directed at convincing the landlords of the injustice of *halipratha* rather than at mobilising the agricultural labourers toward discontent. But the Kanbi Patels did not even keep to the conditions — unfavourable for the Halpatis though they were — of an agreement that was reached in Bardoli in 1938 through the arbitration of Sardar Patel and with the approval of Gandhi for the purpose of putting an end to the *hali* system. Nor did a new attempt, undertaken by the political leader Morarji Desai in 1948, meet with success.. The change in the relationships between landlords and landless labourers in South Gujarat were, in my opinion, only marginally due to the efforts of the social workers.

From 1962 to 1963 I collected a great deal of data on the condition of the Halpatis in a few villages, and during a second period of fieldwork in 1971-1972 I used the opportunity to supplement and actualise my previous analysis.

On the basis of my first investigation I had arrived at the conclusion that the disappearance of the *hali* system was primarily due to the depatronisation of the relationships between the parties concerned. My opinion in this respect was strengthened by developments in the past few years. One of the most drastic changes in the labour market of South Gujarat is undoubtedly the fact that rural labour has become mobile over large distances. This large-scale migratory labour — it was one of the objects of study during my recent fieldwork — has a wage-depressive effect, and facilitates replacement in cases of, so-called, insufficient performance or 'impertinent behaviour' on the part of the Halpatis.

Labour is available in large supply and the fierce competition for work is enhanced by the enlargement of scale, so that labour comes into the market at prices far below subsistence level. In 1972 the daily wage for agricultural labour fluctuated between Rs 1 and 2. The labourers' dependence of landowners has not disappeared, but the humanising features of dependence under the *hali* system have. In the present relationship pattern, the exploitation of the Halpatis is more evident. Deterioration of the socio-economic condition of the agricultural labourers preceded the Green Revolution in South Gujarat and was, as a matter of fact, more a pre-condition than an effect of this technological breakthrough in agriculture. Social intercourse with labourers has been reduced to an absolute minimum.

Considerations of profitability are not the only explanation why landowners changed to more capital-intensive agricultural techniques in recent years. They have come to dislike personal contacts with their labourers and try to avoid them as much as possible by using jobbers and foremen. The Halpatis have become increasingly isolated.

Pauperisation is usually regarded as an economic phenomenon but in the case of Halpatis the social dimension might even be more important. This paper deals with the political effects of this process of change. The eclipse of the vertical ties that formed an integral part of *halipratha* undoubtedly facilitated the emergence of a common stand among the labourers; in other words, it made for reinforcement of horizontal solidarity. The poverty and exploitation to which the majority of Halpatis are exposed are now nothing but a breeding ground for political unrest. Spontaneous outbursts do occur, but they are local and incidental. Organisation is a necessary pre-condition for any sizeable and durable protest movement to emerge.

As is shown below, it is precisely in a situation of pauperism that the chances of such a development are severely limited. It has been argued by many observers that, in the present Indian situation, political awareness among the landless proletariat can only be fostered by organised action. But even if such action were provided from outside, social emancipation would not follow as a matter of course.

Obstacles in the Path of Self-Mobilisation

The impression that one is left with after talks with Halpatis in their peripherally situated village quarters is one of utter defencelessness in all respects. Their inability to find a way out of the misery and insecurity of their daily life leaves most of them no scope at all for any ulterior thought or action.

In the present social system there are simply not enough means of existence for the rapidly growing number of Halpatis. In the rural districts the labour supply far exceeds the demand; nor do the Halpatis easily find employment outside agriculture. They cannot be absorbed by the urban economy of the region. In the rivalry for the slowly expanding employment opportunities outside agriculture even the urban Halpatis barely come into the picture. As an unskilled category they are only considered for the lowest paid, least valued and most irregular work, and most of them lead lives nearly as forlorn as those of their fellow caste members in the villages.

In a never ending cycle the surplus is thrown out of the rural system. After the rainy season, about October, men, women, and children migrate in large numbers — in the Bulsar villages more than half of all Halpatis may go — to the brickyards and salt pans near Bombay and other cities, to return only towards May, before the beginning of the monsoon. Year after year this seasonal migration is repeated. The splitting up of households — some members stay behind, the others are put under contract by one or different jobbers — fits into the picture of pauperisation. The yearly exodus does not really enhance the employment opportunities for those who stay home : in the slack season the agrarian labour market remains saturated, partly on account of the influx of migrants from other regions looking for work. The Halpatis have become redundant in society. Many of them are drifting and have all but lost their roots in both village and family life.

A coalition with castes of petty cultivators (notably Kolis, Dhodhias, and Chaudaris) might invalidate the Halpatis' isolation, but it is not likely to occur. In a very general sense the land reforms have stabilised the position of the small landowners and most of them have few interests in common with the Halpatis. Although many small-holders have not profited much by the Green Revolution — if their position has not deteriorated —, the social, economic and political advantages attendant on caste membership operate against their early identification with the powerless agricultural labour proletariat. That the demoralising situation, in which the Halpatis are placed, manifests itself in political inertia is only natural. Their need of security and protection, essential to the former *hali* system, is not met by the government.

The huts of the Halpatis used to be on the land of the landowners, but in many villages they now live together in separate quarters. They have usually been allotted the worst parts of the terrain, difficult of access and far from the village centre, where they live as untouchables. Compulsory education has been introduced, but very few Halpati children attend school. About nine in ten caste members are illiterate, the highest proportion in the central plain of South Gujarat. In the second half of 1972, after years of delay, the minimum daily wage for agricultural labourers was at last fixed at Rs 3, a considerable rise. Efficient control is lacking, however, and in practice employers do not abide by the law. But if they did, the amount would still not be enough for the Halpatis to meet the sharply rising cost of living.

The majority of Halpatis believe the only thing they owe the government is obedience, and try to avoid all further contact with its officials. The benefits put at the disposal of "scheduled tribes" do not reach them. "For that you need influence", they say resignedly. The time is past that the votes of the agricultural labourers were returned through their masters, but that does not mean they are now politically emancipated. They lack the awareness that, collectively, they generate power. During the campaign for the state elections in 1972 I found that many Halpatis were not registered in voting lists. Often they had no idea of the differences between the parties; but then, such differences, if any existed, were scarcely relevant if seen from their position. Their votes were for sale at a few rupees, and especially among the higher castes colourful tales were told about it. An often heard opinion among members of the social upper layer, who feared the strength of their number, is that only literates should be allowed to vote.

The Halpatis' passivity is closely bound up with their ignorance. They often turn out to be only vaguely, if at all, aware of slogans such as 'garibi hatao', although these were raised in their name. Illiteracy deprives them of a great deal of information. The combination of indifference and ignorance, both indissolubly bound up with poverty, underlines their exclusion from society. Those of them who have some notion of what is going on have the greatest trouble to explain their point of view.

These drawbacks are partly due to the fact, that the members of castes of landless labourers are not accustomed to function within frameworks which stress collective aims. Their experience with group activities is very limited. The traditional caste panch at the village operates only incidentally, and then it is a question of one or more persons (patels) meeting to settle divorce or other disputes among households. Probably more important as a new organisational form are the *bhajan mandlis* which, stimulated by workers from the *ashrams*, have been set up in the past few years. They are groups that gather one evening a week to sing devotional and Gandhian songs. Finally, group experience is gained by working in gangs, initially composed for semi-industrial work, but now also for agricultural operations.

The Halpatis themselves explain their backwardness from a lack of leaders. It is true that there are no figures among them who are known and prominent in the region as is the case with most other tribal castes in the plain of South Gujarat. Even at the village level there is very often no leader recognised by all Halpatis. Influence seems to be exerted by individuals only within their own hamlet, and jealousy is a complaint heard on every part. Outsiders, experienced social workers, too assert that Halpatis are not capable of collaborating with one another.

It should, however, be borne in mind that landless labourers do not form a homogeneous mass as such. The interests of farm servants, casual wage-earners, gang labourers, piece-workers, and seasonal migrants are partly opposed. Moreover, all of them are to varying extents dependent on landowners and jobbers, their principal employers. The competition for the few favours to be had in a situation of continuous scarcity in each and every respect invalidates any strengthening of horizontal solidarity.

Dependence has, finally, been internalised by the Halpatis. In the

households of the high castes, one Halpati said, our women are daily injected with poison. In conversations with Halpatis, references to their own backwardness are not at all uncommon. Those few that have been educated may speak bitterly of their fellow caste members' lack of culture, but many of the others have a low opinion of themselves too. What other caste, they wonder, lends itself to cleaning the stables and performing the dirty housework for the landowners?

Does the above suffice as an explanation of the passivity among agricultural labourers? Apathy, ignorance, and feelings of inferiority fit too well into theories of a culture of poverty to be altogether acceptable as the sole or even the main reasons.

The Halpatis are certainly aware of the structural conditions that obstruct the betterment of their lot. They show a deep grudge against the high castes in general, and the Anavil Brahmans and Kanbi Patels in particular. "They are the ones who oppose us; not only in the villages, but also in the government offices, where they have to put their signatures and stamps on papers that are important for us." Agricultural labourers used to be able to count on the intercession of their masters, but now they often meet with opposition on the masters' part, inspired by vexation over their labourers' insufficient work performance. To prevent the Halpatis from becoming too independent, the landowners may use their influence with the district officials against them. They often succeed. Aside from this, the Halpatis have their dependence rubbed into them in more direct ways.

As I said above, especially the agricultural labourers are wide open to the various sanctions that the rural elite has at its disposal, particularly that of demoralising their potential leaders, those who testify to an insight into their own situation and adopt militant attitudes. The police, too, is an instrument of oppression. Although the days of individual violence are gone, when every landlord felt entitled to give his farm servant a good thrashing for "misconduct", other kinds of arbitrary behaviour are still common. Accusations of drinking or crop theft, false or not, are an effective way to call Halpatis to order, and maltreatment of the accused by members of the local police force, the hated "brown dogs", is not exceptional.

In the circumstances, submissiveness and avoidance is an obvious reaction. A group of agricultural labourers who had been granted permission to build their huts in a village on government land, concurred with a petition, composed by the large landowners who were afraid to lose their grip on them, in which they cancelled their request. Examples such as this are the order of the day. Their fear of committing themselves is evident, and this explains why only shopkeepers, artisans, and others who enjoy a measure of independence and security, emerge as leaders in the Halpati neighbourhoods. Yet even these self-styled representatives of their own caste are not altogether to be trusted. All too often they have turned out to be agents for outside interests.

The investigator's contacts with Halpatis do not run smoothly. His questions are answered vaguely, evasively, or not at all. The informants are fully alive to their own vulnerability and have learned to put no trust at all in outsiders. They pretend to lead an extremely atomised existence; a striking number of Halpatis denied to me having friends or maintaining social contact with neighbours or others in their hutment area. To some extent this is true, no doubt, but at the same time statements like these indicate the defensive attitude they have adopted. It is the contacts in their own neighbourhood that enable them to form closer mutual ties. And in fact they sit together in groups in front of their huts at night, and thrash out among themselves the forms and degrees of exploitation they suffer at the hands of landlords, shopkeepers, government officials, police, and social workers. The cumulative weight of economic, political, and social dependence invalidates the view that class feelings do not occur among pauperised categories. For them to show any such feelings is imprudent; to act accordingly, impossible.

My conclusion is that this combination of structural and cultural conditions, intra-caste and intercaste contradictions is at the bottom of the Halpatis' inability for self-mobilisation. I hope to show below that not every outside attempt to mobilise them is successful either.

Organised Action: Gandhian Approach

The role played by the Gandhian movement in the disappearance of the *hali* system has been touched upon above. In the early twenties, some of Gandhi's close collaborators made themselves leaders of a reform programme that was to bring about the emancipation of the adivasis in South Gujarat. But the activities undertaken by these people, working from the Swaraj *ashram* in Bardoli and one of its branches in Vedcchi, both in Surat district, were mainly directed at the tribal castes whose members led a semi-independent existence as petty cultivators. Already then there were a few ashramites who took interest in the Halpatis, but under pressure from the local landlords they gave up their attempts to run night-classes for the agricultural labourers in a number of villages. Serious work among the Halpatis only started after Independence, partly inspired by the report written about them by Jugatram Dave, the oldest and most prominent protagonist of the movement.[3]

The *ashrams*, most of which have also become educational institutions, function as action centres that aim at changing the rural system in a Gandhian direction. Apart from this, Gandhi's ideas have penetrated among the population of South Gujarat in a more direct way. In many villages there are persons who perform social work on an individual basis in accordance with the doctrines of Gandhi. They advocate social reforms such as the material and cultural improvement of the tribal castes, abolishment of untouchability, prohibition, women's emancipation, or village uplift in a general sense. For the *ashrams* these social workers are key figures, through whom they maintain their contacts with the local population. The chief task of these social workers is mediation. Their aim is to advance neglected interests and to speak for deprived categories. They try to gain access to those who take decisions or have favours to distribute in the government offices. Most of these voluntary workers are inspired by a mixture of social awareness and political ambition. Their influence on the regional level is needed to gain advantages for the people under their care, while on the other hand they are attractive to political parties owing to the votes they can control.

The older social workers are mostly members of higher castes and, if only for that reason, not acceptable to the Halpatis as confidential agents, even if they are apt to describe themselves as such. In the last few years, increasing numbers of young adivasis, trained in *ashrams*, have succeeded in establishing themselves as social workers. They are practically all Dhodhias or Chaudaris, that is, members of landowning castes that form the majority of the population in their tribal constituencies. They see to it that the benefits distributed on behalf of the "scheduled tribes" in the way of employment, education, agriculture, and so on, go to their fellow caste members. The Halpatis are given the go-by.

The Halpatis live scattered over a large area in which they form a minority and, as I said above, they have no supra-local leaders of any importance. More than half the taluka seats for the state assembly in Ahmedabad have been reserved for tribal candidates, but not one of these seats is occupied by a Halpati. Nor does the weight carried by Halpatis in the district councils correspond in any way with their proportion in the total population. In Bulsar District, for instance, no member of the important Social Welfare Committee through which the benefits for "backward communities" are channelled, belongs to this largest tribal caste but one of the region. The Dhodhias, on the other hand, who are only slightly more numerous, command an absolute majority in this committee.

Whereas some decades ago the voluntary social workers in the villages followed Gandhi in stressing their spiritual guidance, they have since Independence narrowed down their role to that of local-level politicians. In a slightly different way the Gandhian movement itself has undergone professionalisation. I P Desai, in a very interesting study, has described this process of change and its implications.[4] Referring to the *ashrams*' staff workers of today, he says, "The social worker is likely to be a paid worker and organiser, committed to fixed, assigned duties, rather than the Gandhian missionary type, which is becoming a historical type." The transition outlined by him from movement to organisation is very pronounced in the case of social work among the Halpatis.

Halpati Seva Sangh: Organisation and Programme

In 1961, social work among the Halpatis was given an organisational basis in the Halpati Seva Sangh. As early as 1946 a Mahajan had been founded, an association that aimed at emancipation of this caste on the principles of truth, non-violence and arbitration. Those who took this initiative continued to operate from the *ashrams*, especially those of Bardoli and Vedcchi. Jugatram Dave acted as chairman of the Halpati Seva Sangh, in an honorary capacity. Although thus the tie with the institutions was preserved after 1961, that year saw the beginning of a new phase. In Bardoli a head office was established, in which an ever-growing administrative staff now co-ordinates all activities among the Halpatis of South Gujarat. During the years that followed, twenty local branches were founded in talukas where Halpatis form a substantial part of the population. In the survey published on the occasion of the organisation's tenth anniversary[5] it is said that in 1972 almost 20,000 Halpatis were registered with HSS; they theoretically pay a subscription of 10 P a year. Apart from the nearly 500 paid staff members, the organisation comprises about 2,000 unpaid helpers and contributors, for the most part non-Halpatis. There are taluka and district boards, composed of members of the various categories which discuss the activities once a year. The subscription fees are, of course, negligible as a source of income. The broadly conceived programme, aimed at the social abolishment of the caste of agricultural labourers in South Gujarat, is practically wholly financed by the government.

The most important HSS activities are:

—Mediation in the allocation of land to Halpatis to build their huts on, so that they depend less on the landlords. The striking of wells or pumps in the new quarters. The founding of co-operative housing societies to enable them to build better huts. The government has only granted subsidies for this purpose since the great floods of 1968, and until now on a limited scale.

—Foundation of schools of their own, to make up for backwardness in education. In the new village quarters, over a hundred kindergartens have been opened. Distributed over the districts, there are also five primary residential schools and four secondary schools. In spite of the provision of free books, clothing, food, and accommodation, the schools do not generally attract many Halpati pupils. To avoid losing the government subsidies they therefore accept children from other tribal castes, who in some schools account for more than half the total number of pupils. This also applies to the seven hostels that accommodate boys and girls who attend the ordinary village schools.

—Employment opportunities. A limited number of young people are enabled to be trained as artisans. After completion of their training they are given a modest amount of equipment needed to practise their skills. The khadi household industry, much less propagated now than it used to be, has failed to take root among the Halpatis. The establishment, after years of preparation, of eighty-five agricultural labour co-operatives seems to be more promising, but none of these has as yet developed into a going concern.

—A wide range of socio-cultural activities. Propaganda is carried out for prohibition, till now without much success. It is encouraged indirectly by *bhajan mandlis*, which spread Hindu values. Young people's clubs campaign to attract pupils for the schools. Women's groups are formed, which apply themselves to learning *garba* and other high-caste dances. To prevent crippling expenditure for marriage festivities — often the beginning of increasing indebtedness — garlands are presented to couples in substitute marriage ceremonies. In case of illness, Halpatis are entitled to either medicines or the cost of medicines. Agricultural labourers who are in serious conflict with the police or their landlord can count on legal aid. A few times a year, *sibhirs* are held, meetings of one or more days, to which Halpatis with leadership qualities are invited. To widen their horizon, they occasionally go on tours to other parts of South Gujarat.

Although on paper this look impressive enough, various components of the programme are only moderately successful. It is, however, not at any shortcomings in the implementation that our criticism should be directed, but at the ideology underlying the programme and the policy of the organisation.

To begin with, it may be stated that the HSS has become the executive body for all provisions and regulations intended to benefit the Halpatis. Besides the activities enumerated above, the salaries of the staff members and other overhead costs are paid by the government. This means that the organisation is an extension of the bureaucratic apparatus without, however, possessing its authority. In the circumstances, any real consideration of the Halpatis' interests is an illusion. The HSS, as a semi-government body, cannot possibly act as a pressure group which is a *sine qua non* for winning the confidence of the people whom the workers are supposed to represent.

Secondly, the work of the HSS has aggravated the isolation of the agricultural labourers rather than relieved it. According to the law they cannot be

evicted from the land on which they have built their huts. Instead of supporting the valid claims of the Halpatis in this respect, the organisation promotes their removal to separate village quarters. In remote and often badly drained neighbourhoods, deprived of the most elementary public facilities, the Halpatis live together with a stain of untouchability. Separate educational provisions contribute to their apartheid. Young people who have been educated in these schools complain that the Gandhian bias in the curriculum damages their chances, which are weak to begin with, in the labour market.

Thirdly, the HSS is above all a welfare organisation. Most of its activities are ameliorative in character. They are aimed at relieving the worst distress, and at the same time, at educating the Halpatis to be better Hindus. This, especially, seems to be the nature of the emancipation the HSS strives after.

The HSS advocated higher wages for the landless proletariat. But when agricultural labourers go on strike somewhere to reinforce their claims, the social workers intervene in order to prevent rising tensions and to reach a compromise. Self-respect and class-consciousness are not taught. On the contrary. The organisation does not aim at making the Halpatis able to stand up for themselves, aware of their exploitation and oppression, but envisages their adjustment to the social system without any fundamental change in their dependence. It is true that the rural elite does not take very kindly to the existence of the HSS, even if no threat to the *status quo* emanates from it. But, says the present leader meaningfully, it is due to the absence of communist influences among the Halpatis that the organisation is assured of support by the government and does not meet with more obstruction on the part of the landlords.

The mobilisation of the labourers is non-antagonistic in nature. The Gandhian principles of arbitration, compromise, and avoidance of open clashes between the parties concerned form the basis of this policy. In the Gandhian ideology, the class struggle is not so much strategically unjustified as immoral. In the conservative South Gujarat, to speak of an unbridgeable cleft between rich and poor is nearly viewed as sinful.

In the strongly harmonious Gandhian view of the social order, the landlords are placed as guardians of the rural riches, ideal patrons, who are expected to take good care of their subordinates. There are, of course, contrasts, but these should be neutralised by persuasion and reconciliation. Capital and labour should co-operate. In spite of disappointing past experience, the HSS persists in this approach. But in the prevailing, socio-economically sharply polarised system, such an ideology plays the game of the landlords. Attempts to persuade them to treat their labourers better are of no avail. Yet the labourers are invariably urged to be patient and moderate in their demands. The HSS, in short, is a movement of accommodation rather than emancipation.

Political Leadership

Ever since its foundation, the HSS has been a stronghold of the Congress party. As early as 1963 I attended a meeting, at which Morarji Desai, a man from the region, announced that times were changing for the Halpatis. Now that, after the disappearance of the *hali* system, the labourers' votes can no longer be controlled through their employers, the existence of the HSS makes it possible for a party that serves the interests of the landlords to acquire the support of the labourers.

The 1969 split in the Congress party seemed to initiate a more radical course. The majority of the HSS top, and most of the voluntary social workers, fairly soon declared themselves for Indira Gandhi's party, while the regional government was still solidly in the hands of Morarji Desai's supporters. Promptly the subsidies to the HSS were stopped. But the time of adversity did not last long, for in 1972 the Congress(R) came to power in the region, and the interests of the HSS and the ruling party ran parallel again.

The split has further strengthened the tendency towards polarisation. The HSS leaders became very prominent in the Congress(R) of South Gujarat. Fearing that the Halpatis would take the 'garibi hatao' seriously, and follow Indira Gandhi's supporters in a body, members of the Congress(O) founded a new organisation, the Halpati Vikas Sangh. They put forward a number of discontented Halis as figureheads. One of them, whom they suspected of having political aspirations of his own, was already sent home before the election, the others were dimissed afterwards. In none of the talukas of Bulsar and Surat Districts were locally influential Halpatis put forward as candidates. They were only required for canvassing among their fellow caste members.

The HSS is an organisation for the Halpatis, but not of them. The leadership is solidly in the hands of members of high castes. Among a delegation visiting Indira Gandhi early in 1972 to request her to allocate more money for the work among the Halpatis, only six of the 30 members belonged to this caste themselves. The hierarchical order is also evident at the meetings that are held in the districts. The senior social workers sit in the front rows with the local notables. They address the agricultural labourers, who are standing at some distance. The social workers from the higher castes attach great importance to excessive drinking, lack of self-discipline, etc, as explanations for the Halpatis' poverty. In fact they agree with the translation of the Halpatis' former name of Dublas as "weaklings". As one of them remarked, "You can always see which of them are landlords' bastards: they have more courage and intelligence."

The Gandhian veteran Jugatram Dave has entrusted the daily management of the HSS to Arvind Desai. The transition from semi-religious to political leadership could not be better illustrated. The aged spiritual leader is held in great veneration. Those who meet him derive moral inspiration from the contact. He is far above the parties. The contrary is true of Arvind Desai, a "boss" if ever there was one, who leads the organisation with a strong hand. His word is law, and he leaves no doubt about it. His attitude is recognisably that of a member of the dominant Anvil caste. Not afraid to evoke the wrath of the landlords, paternalistic in his behaviour towards the labourers. He acts like a *rajah* in his domain. When, for instance, the rendering of the song of welcome by the pupils in honour of our visit to a Halpati school was not wholly perfect, he gave vent to his displeasure in no uncertain terms.

The HSS cadre — the local staff members and teachers — consists for the most part of Halpatis. They are generally young people who have been educated at secondary schools, some of them even at the Gandhian Vidyapith College in Ahmedabad. The organisation is strongly centralistic, keyed to one-head leadership. The staff members at the local level are not authorised to take decisions on their own; they have to refer for the smallest details to the directives issued by the Bardoli head-office, where policies are determined. Those who act on their own authority run the risk of being instantly dismissed. The lack of security — in the lower echelons, the staff members do not hold permanent appointments — virtually enforces submissiveness and unconditional obedience. One of the workers described the HSS succinctly as *halipratha* with Arvind Desai in the role of *dhaniamo*. They have to take second place, and regard this as a conspiracy of the high castes, of which they are able to quote many examples. They are not always right, but figments of the imagination may be quite as illustrative of the prevailing social relationship as facts. These staff members dream of taking over the leadership of the organisation, or discuss plans to form groups in secret, in order to offer resistance to the established interests inside and outside the HSS. There were vague references to the Naxalist movement and — very topical at the time of my fieldwork — the Mukti Bahini fighting groups in Bangladesh. But most of the staff members in the lower echelons have resigned themselves to powerlessness and dependence, are under no illusion as to the power of their number, and also show little compassion for the miserable lives led by their fellow caste members. They cling to their jobs in the certainty that they cannot find any other employment.

Contacts with Halpatis

The local workers represent the HSS in the villages. The contacts with the agricultural labourers are indirect, that is to say, through those who have come to the fore as leaders in one or more neighbourhoods (phalias). They are visited in the villages or asked to come to the small office of the local branch in the taluka for consultation.

As I said above, this informal leadership can only be fulfilled by Halpatis who are not directly dependent on the landlords.[6] Another condition is that they must have enough time to maintain their contacts. A Halpati is not recognised as a leader either inside or outside his village until he proves that he is functional to both levels. Since communication is nearly completely verbal he has to be out most of the time, keeping up with the news, maintaining and extending his channels of information. Some ability to read is a real asset, and he must at least be able to put his signature. Finally, all my informants asserted that a certain amount of "culture" was required: a leader must know how to behave in his contacts with outsiders.

The leadership in question is of a different kind from that exerted by the panch patel and the bhagat (medicine man). Their roles have traditionally been attuned to the needs of the Halpatis themselves, whereas the mediation of the leaders in the village quarters is primarily a question of dealing with outside influences. They themselves have none of the scarce resources at their disposal, but they know how to get access to them. Their intervention is badly needed, especially since the landlords have come to refuse to promote the interests of their subordinates. Through these intermediaries the isolation of the agricultural labourers is somewhat mitigated.

The leading position of the local influentials finds recognition by and through the HSS. They are invited to meetings at which social workers of a higher level lecture on the abuses of alcohol or propagate education. All those present are asked to introduce themselves and tell something about their own background. In this way they get acquainted with each other, and a loosely structured network of supra-local relationships grows. The HSS staff keeps them posted on the various activities; the distribution of possible benefits — allocation of land for huts, issue of scholarships, the striking of wells — takes place through their intermediacy.

These local leaders form the backbone of the HSS. In the latest election campaign they functioned as the real mobilisers of the Halpatis. But as it turned out, their political preference was inspired by very pragmatic considerations: they selected the candidate who stood the best chance of winning. There was no question of any ideologically motivated choice. Most of them were inclined to regard the differences within and between the parties as conflicts between persons and factions of the elite. Being aware of the fluctuating course of coalitions, these Halpatis tried to behave politically as neutrally as they could.

Are they recognised by the Halpatis as their spokesmen? They are, as I said above, the only channel through which the labourers can obtain benefits. But very clearly they have their own interests, and these do not always run parallel to those of the labourers. They are often blamed for being agents of those in authority. It would, therefore, be incorrect to believe that the Halpati influentials enjoy the confidence of their fellow caste members. This goes even more for the workers of the HSS, who are in fact identified with the government officials and scornfully called *chamchas* (lackeys) of the high castes. The local staff members also behave like minor officials. Dressed in terylene trousers, shoes, socks and shirts, and armed with plastic briefcases and with fountain-pens in their breast-pockets, they address the Halpatis on their rounds through the villages. Reprimandingly, because they do not send their children to school, or encouragingly when it is a question of a *bhajan mandli* to be formed, but always as their superiors. Their audience is silent, smiles diffidently, or shows signs of muted agreement. Behind their backs the Halpatis — those at least that know about the existence of the HSS — complain of the carelessness, arrogance, and also the corruption of the cadre. The Halpatis are as wary of them as they are themselves of voluntary social workers and politicians from the higher castes.

The Halpatis have not much cause to regard the HSS as an organisation that fights for *their* interests. For them, it is an obscure body, affiliated with the government and representing external interests. It is therefore doubtful whether the HSS may be called an emancipation movement at all. Its aims and methods rather seem to prevent mobilisation.

Conclusions

With the above, the HSS would seem to stand condemned, but any such judgment should be modified by an appraisal of possible alternatives. First of all, the situation of pauperism as such prevents the agricultural labourers from reaching solidarity on a class basis. In a situation of such extreme scarcity, how could we expect them to mobilise on their own? To be sure, dissatisfaction among them is clearly growing. But it still expresses itself in disconnected incidents, particularly in strikes that flare up suddenly but remain limited to one village and soon fall flat when the landlords engage labourers from elsewhere. There is further, little likelihood that the bargaining power of agricultural labourers will be strengthened by their joining forces, on their own initiative, with castes of small landowners. Their economic interests differ too much for that, and their social distance is too great.

What possibilities of organised social action other than by the HSS are there? The political Left has barely found a foothold in South Gujarat. The Praja Socialist Party is as good as liquidated. The cadre of this party had collectively gone over to the Congress party in the early sixties, in exchange for the promise that the large grassland area in the south of Bulsar Dis-

trict, which was in the hands of big landowners, would be distributed among the petty cultivators of tribal castes (the Pardi Grassland Movement).

The Communist movement, which has always been weak in the region, lost even more power after the split in the Congress party. Its most prominent leaders went to the party of Indira Gandhi, taking part of the rank and file with them, and they adjusted themselves without difficulty. Only in the cities of Surat and Bilimora there are small CPI nucleii left. The section in Bulsar district has less than a hundred members. They are practically all urban factory workers, an exceedingly privileged category in comparison with the landless paupers. In the rural regions the CPI is not very active. Bulsar and Surat districts have never known a strong kisan movement. A handful of members in a few villages of Chikhli taluka — the red flags fluttering from long poles over their huts does not make them difficult to trace — led the illegal occupation of some fields belonging to big landowners at the time of the Land Grab Movement which took place all over the country in the autumn of 1970. Some hundreds of Halpatis joined in the short-lived, badly prepared action. The HSS staff had received orders not to support them, nor were they allowed to aid the victims of the ensuing police terror. Rumour has it that the recent murder of a CPI cadre member in this region was staged as a drunken brawl. The CPI leader of the Bulsar District stated that the factory workers are much less militant than the landless Halpatis for fear of losing their jobs. In explanation of the lack of political awareness among the peasant population in the area he said, echoing the words of a national party leader, that Gujarat was the Taiwan of India!

Nor is it to be expected that the Halpatis will join the tribal movement, which reached a peak towards the end of the sixties. The chances of a religious revival based on simple Hindu doctrines, however, are much greater. Literate Halpatis feel strongly attracted to the popular devotional tracts that are distributed on a large scale. The rise of sectarian movements — for which the *bhajan mandlis*, too, prepare the way — is to be explained as a protest against the social discrimination of the Halpatis, but also as an escape from the misery of daily life. It does not look as if the situation of the landless proletariat will soon improve. What are the perspectives for betterment envisaged by the Halpatis themselves? They are not expressed collectively. In any case they should not be measured by those of the HSS. It is believed that pauperised categories tend to hark back nostalgically to the past, and to some extent they do. They claim that they are entitled to the security that was inherent in the *hali* system. Does this mean that they long for the old order to be restored? Not at all. They value security of enough work at a wage that enables them to keep alive. But they are certainly not interested in a return to the dependence and bondage that formed the basis of the relationships of former times. Landlords show boundless irritation over the fact that agricultural laboureres no longer know their place, that is, no longer wish to behave obsequiously. It would seem that precisely the hopeless situation in which the Halpatis now find themselves enhances their militancy. But mobilising agricultural labourers requires more than that. An increased capability to organise themselves is crucial, and this is done, albeit with other ends in view, by the HSS. The establishment of agricultural labourers' co-operatives, and the leadership training courses for Halpatis who, owing to the efforts of the HSS, have been elected village headmen, widens the organisational experience of a growing number of Halpatis. It is an experience which may in the future be used in a way that leads to real progress.

From this point of view, the growing impatience of a number of social workers inside and outside the HSS is equally promising. Disappointed in the landlords' unwillingness to offer the Halpatis a decent existence, they are inclined, in imitation of some movements based on Gandhian ideology elsewhere in India, to set a different and more radical course. It is the course of so-called non-violent direct action in which, if necessary, a confrontation with the landlords is not avoided. The supporters of this view may succeed in adapting, in this way, the Gandhian strategy to the actual situation, that of a polarised rural system. An important fact in this connection is the organised radicalisation of the rural elite. Their representation in the political arena till now was mainly based on caste, but their dominant position is gradually changing in quality. They are increasingly manifesting themselves as a class, and the emergence of economic-interest organisations — such as the rapidly growing Khedut Samaj in Surat district — confirms this tendency. The landlords are opposed to any movement, however moderate, that aims at improving the condition of the agricultural labourers. The aggression of the large farmers is heightened by the organised pressure they exercise nowadays, and this in turn leads to a further escalation of conflicts.

The situation is ripe for an explosion; in fact, it has been ripe for a long time. Yet none has taken place till now. Not because things can be worse still: there are limits to the absorption capacity of a demoralised proletariat. Organisation of the latent unrest is the lacking factor. It will probably be after the event that we will know at what moment the optimal combination of factors came into being. But it would be frivolous to assume that, on account of their pauperism combined with Gandhian conditioning, the Halpatis cannot be mobilised in a more antagonistic way. How this will come to pass, and what will be the outcome cannot easily be predicted. In view of the present situation in India, however, there is little reason to be optimistic about an early emancipation of the agricultural labourers.

Notes

[My fieldwork during 1971-1972, which forms the basis for this paper, was sponsored by the Netherlands Foundation for the Advancement of Tropical Research. The material presented here was gathered in conversations with some hundreds of Halpatis and repeated meetings with about 15 of their local leaders in towns and villages, mainly in Bulsar District. Apart from that, I obtained much information from the regular contacts I maintained with functionaries of the HSS and social workers who do not belong to the organisation and are active among the Halpatis. This category consists of over 25 informants both in Bulsar and in Surat District. Finally, some of the data I gained from interviews with 15 politicians of various parties and with a number of officials from the district bureaucracy.]

The world lacked a certain metal until India produced steel

In the ancient world, India was the first to produce carbon steel. Highly priced in world markets, ancient Indian steel was called 'Wootz'. Allusions to iron and steel in the Rig Veda lead to the belief that the Iron Age began in India 3,000 years before the industry was known in Europe.

In metallurgy and other spheres, Indian talents have enriched the world. We at L&T continue the tradition by enriching life through industrial development. We design, manufacture and instal plant and equipment for every vital industry. Steel is one.

Our subsidiary Utkal Machinery Limited (UTMAL) manufactures sophisticated equipment for the steel industry. Technical know-how comes from Gutehoffnungshuette Sterkrade A.G. (GHH)—a world leader in iron and steel plant design and manufacture. That explains why UTMAL was called upon to manufacture vital equipment like blown oxygen furnaces for the steel plant to be set up by the State Industrial and Investment Corporation of Maharashtra. In addition, UTMAL will furnish the conceptual design and layout for the steel melting shop and manufacture a hot metal mixer, rolling stock, waste gas stacks and two LD converters complete with oxygen lancing equipment.

Form Is All

NOT even two years have elapsed since the government was bowled over by the idea of holding companies. The panacea for all troubles in the public sector, it was argued, was to integrate the different units in the same line of production under one big company, to accord the latter proper autonomy and to provide it with a general set of guidelines. Once this was done, output would pick up, unit costs would go down, marketing efficiency would improve, inventories would be rationalised and so on and so forth. Accordingly, the Steel Authority of India Limited was set up for integrating the activities of the four units operating under Hindustan Steel, Bokaro Steel and the sundry mini-steel plants coming up in different parts of the country. A chairman was imported from outside to preside over SAIL and was given the status of Secretary to the Government of India. Very soon, the part swallowed the whole; when the incumbent Secretary in the Ministry of Steel departed, the Chairman of SAIL was inducted as the full-fledged Secretary to the Ministry. This last step, according to a few, diluted considerably the original significance of SAIL, since one objective of the Authority was to insulate the units under it from excessive interference by the bureaucracy. Once the Chairman of SAIL was made Secretary to the Ministry, the bureaucracy in fact got embedded in the organisation itself.

Having taken the plunge, the government, one would have thought, would have the courage to pursue the task of reorganising the steel units to its logical conclusion. With the establishment of the Steel Authority, there was on the face of it little point in persisting with the organism of Hindustan Steel, which accordingly deserved to be wound up. A most peculiar reason was found for not doing so. If Hindustan Steel were disbanded, it was solemnly suggested, each of the production units would have to be recognised as separate corporate entities; since the gains of some could not any longer be set off against the losses of others, their total tax liability would rise, thus leaving them with so much less funds for ploughback. But this was essentially a matter of paper accounting; if the government had so willed, an alternative procedure could have been easily devised by which the predicament could have been saved for the HSL units and the rationalisation of the system carried a further step forward.

The basic reason for not dismantling Hindustan Steel must have been different, namely, the pressure and the counter-pressures operating upon the government and within the Ministry itself. Once Mohan Kumaramangalam was removed from the scene, uncertainties over the future arrangements for the Steel Authority and HSL, instead of diminishing, actually multiplied. Rumours began to flow freely that, in this matter, the views of the minister put in temporary charge of the affairs of the Ministry of Steel were altogether different from those of the Chairman of SAIL. The disbandment of the HSL, hitherto considered imminent, was not carried out during all these months. And now, with K D Malaviya's induction as Minister of Steel and Mines, instead of the HSL, it is the Steel Authority of India which seems to be in danger of emasculation. Inspired leaks to the Press have fed the story that the Minister considers the holding company to be unwieldy; there is apparently a proposal for breaking it up. In any case, the Minister has gone on record that the production units need to be given elbow room for independent initiative. The rationale of the decision to realign SAIL has not been shared with the public, nor have the latter been informed about the precise parcels into which it is proposed to be divided. What the fate of Hindustan Steel would be under the new dispensation has also been left in the dark.

This is an extraordinary situation. Even following the establishment of SAIL, none can claim that the production of steel in the country has at all improved. The factors which had impeded the rate of growth of the steel industry in the earlier years continued to be there. The reasons are obvious. The factors holding back the growth of steel output are not specific to the steel industry as such nor even to the public sector, but pertain to the general industrial and economic climate. They are external both to the steel industry and the public undertakings, and have to do with such things as the volume of investible funds available, the broad trends in industrial relations and the overall economic and political situation. Unless these are sorted out, there can hardly be any scope for raising the output of steel or, for that matter, of power or coal or heavy chemicals. While the basic issues are incapable of instant solution, Ministers perhaps find it politic to play diversionary games and shuffle and reshuffle structures and organisations. What is now being proposed for overhauling SAIL would, according to the Minister's statement,

be proposed in the case of the Coal Mines Authority as well. The rash may spread, and affect activities in other directions too. Every minister may turn out to be the propagator of some new managerial and organisational culture. None of them would, however, have much to contribute once the debate shifts to issues of content.

Wheat Trade

Returned with Thanks

A Correspondent writes :

IT was only a year ago that the government had taken over the wholesale trade in wheat. At that time this was seen as a major step to free the country's food economy from the clutches of the private trader whom the government charged with creating artificial shortages through hoarding and speculative activities. The take-over was pushed through in a hurry, without even the most elementary preparation, on the ground that if private trade was permitted to operate, the difficult food situation created by the failure of the kharif crop would be aggravated. Now apparently the government has an altogether different view of the role of private trade. It has been argued, in favour of handing back the wholesale trade in wheat to private traders, that the situation created by the meagre procurement in the last rabi and kharif seasons and the continued rise in prices of foodgrains required the government to enlist the help of private traders. Thus, from being an element which created and aggravated shortages through hoarding and speculative activities, private trade has been transformed into an ally which will bail the government and the country out of the difficulties on the food front.

The motions of debating and deciding upon the policy with regard to the wholesale trade in wheat were going through at the Chief Ministers' conference and the meeting of the National Food Advisory Council on March 12. However, the decision to abandon the take-over was taken and the modalities of its implementation were worked out really through discussions between the government and representatives of traders. It is significant that the government has by and large accepted the terms proposed by the Federation of All-India Foodgrain Dealers' Associations in its memorandum to the Prime Minister. The Federation had offered that the traders would hand over 50 per cent of their purchases in the surplus areas as a levy to the government at a price ranging between Rs 105 and Rs 110 per quintal. The government had been assured that in this manner the traders would deliver 5 to 6 mn tonnes of wheat to the Central pool. The rest they undertook to sell in the open market at Rs 1.60 per kg in any part of the country. If there has been any modification of these terms, it seems to have been in favour of the traders insofar as the government has chosen, perhaps realistically, not to pin down the trade to its commitment to sell wheat at Rs 1.60 per kg.

As an aside it may be noted that the retreat from the take-over of wholesale trade in wheat also marks a settling of scores between the Planning Commission and the Agricultural Prices Commission. It was the APC's grouse at the time of the take-over last year that the government had taken the decision without consulting it. Nor was the APC associated with the implementation of the take-over scheme. The government had plumped for the take-over largely on the advice of the Planning Commission, particularly the Planning Minister, D P Dhar. However, in its latest report on the price policy for the current rabi crop, the APC advised the government against taking on responsibility for operating an extended public distribution system. This advice, coming from a supposedly expert body, provided a timely cover for the government's decision to go back on the take-over of wheat trade. This time it was the Planning Commission which was left out in the cold. An ambitious public distribution system, covering not only foodgrains but also other items of mass consumption, has been accorded an important place in the Commission's strategy for insulating the Fifth Plan's investment programme from price increases. This supposedly important aspect of the Fifth Plan strategy has now been quite casually thrown overboard by the government. It is indicative of the current state of morale in the Planning Commission that this has not elicited so much as a squeak from it.

Basically, of course, both the Planning Commission and the APC have been irrelevant in the changes in the government's policies towards private trade in foodgrains. These have been achieved through systematic and sustained pressure by farmers and traders. The results of the activities of the farmer-trader lobby were visible in the discussions of the concerned Parliamentary Consultative Committee as well as at the meeting of the National Food Advisory Council. And at the Chief Ministers' conference the memorandum submitted by the foodgrain dealers is reported to have been the only document on the subject distributed for study.

All in all, the reversal of the take-over of wholesale trade in wheat must be seen as one of the clearest instances so far of the use of pressure tactics by an interest group to secure change of a major government policy. The achievement is the more remarkable because the group in question is a relatively large one, spread over many parts of the country and apparently not very tightly organised. The sabotaging of government procurement in the last rabi and kharif seasons and the consequent emasculation of the public distribution system and the continuous rise in prices in the so-called 'free' market had forced the take-over to be watered down through a series of relaxations in the different states long before the decisions to formally abandon the policy was announced. The government's refusal to extend the take-over to rice during the kharif season just over was itself an indication that it had lost its appetite for assuming larger responsibility for distribution of foodgrains. The announcement of the formal decision this week was therefore only for the record. What remains is the legacy of distortions in the distribution system and the significantly higher prices which provide private trade with an ideal base situation for its official re-entry into the wheat trade.

The opposition parties have failed once again to mobilise the people against the government's surrender to private trade. These parties find it far easier to get a hundred people killed in so-called agitations over non-issues than to systematically educate the people on, for instance the linkages between the government and rich farmers and traders and to mobilise them over issues such as the break-down of the public foodgrain distribution system and the rise in prices of the necessities of life. It is typical of the method of operation of even the so-called Leftist parties that just when the government was preparing to abandon the takeover of wheat trade, the CPI(M)-dominated All-India Kisan Sabha was passing a resolution urging the government to take over the trade in all foodgrains! Formal resolutions and speeches, in Parliament and outside, and other antics calculated to attract the attention of newspapers have become well accepted substitutes for mass organisation and action within these parties.

Industrial Finance

Chasing Figures

HOW is the performance of an industrial term-financing institution, such as the ICICI which has just released its annual report for 1973, to be judged? The figures of assistance in different forms, sanctioned and disbursed, are at best only slightly more revealing than, for instance, statistics of the number of industrial licences and letters of intent issued. And when investment costs have been going up as sharply as they have been recently, these figures are scarcely comparable from year to year.

The responsibility may be primarily that of the Planning Commission, the licensing authorities and other agencies of the government proper, but financial institutions too have some role in enforcing industrial priorities. In evaluation and selection of particular projects over others their role may be even preponderant. That is why development bankers, from Robert McNamara down, trade with ease in the jargon of project appraisal, social cost-benefit, and the like. However, very little of this concern is seen to be reflected in the actual operations of development banks.

The industry-wise distribution of the ICICI's assistance given in its annual report conveys no idea of the scheme of priorities, if any, it has followed in deploying its resources. The classification of industries is too broad for that. Thus what is one to make of the information that 'metals and metal products' accounted for 18.4 per cent of total assistance sanctioned by the ICICI upto the end of 1973 or that 'machinery manufacture (other than electrical)' accounted for 9.1 per cent and 'rubber products' for 3.6 per cent?

The unilluminating classification is, one fears, only the symptom. The disease which it reflects is that of believing that, at least in most cases, one need not look much beyond the pedigree of industrial proposals. This conviction is shared by all financial institutions, including the commercial banks. If a project has been mooted under the right auspices and has secured the necessary official permissions and clearances, the argument goes, then it is irrelevant for the financial institutions to bother about the relative priority to be assigned to it. True, the original sin may be that of the government, but this nevertheless constitutes abdication of responsibility by the financial institutions. Even where priorities cannot be pushed to the point of stark rejection of proposals, cannot the rate of interest at least be moved up and down? Must all comers — no application for assistance, the ICICI's report for 1973 informs us, was rejected during the year — be served up funds, including foreign exchange, at the same unvarying interest rate?

The same unconcern with policies is manifest in other directions as well. According to the Chairman of the ICICI, the term-financing institutions "have taken up an active programme of developing and financing new projects, promoting new entrepreneurs and joint sector projects and financing projects in backward regions". The Dutt Committee had showed how large industrial houses had got away with a disproportionate share of assistance extended by all the three all-India term-financing bodies. Has there been any change in this respect? The ICICI's annual report is silent on the subject. In fact, a cursory scrutiny of the list of companies financed suggests continuance of the preponderance of large and established industrial groups.

With regard to the joint sector, the information is provided that the ICICI "has already provided assistance of more than Rs 23 crores to joint sector projects, many of them jointly with various state Industrial Development Corporations". In the ICICI's view, the joint sector is a device "to combine the financial resources of the State with the managerial expertise available in the private sector". But in this sense the joint sector has always been there, since the government and public sector institutions have, in one form or the other, provided a large part of the funds to finance industrial projects the managements of which have been completely in the hands of the private sector. More recently, the joint sector label and association with state Industrial Development Corporations have been used by private entrepreneurs, especially the large houses, to smoothen the flow of various government sanctions and favours and to camouflage their entry into areas from which, in terms of the government's formal policies, they are barred.

The joint sector is worth talking about only if it is seen as a device to give the government a larger share in the management of the enterprises, in keeping with its financial contribution to them. A related policy instrument is that of the conversion of loans given by financial institutions into equity. To what extent and purpose has the so-called 'conversion clause' been used? There is conspicuous silence on this subject as well in the ICICI's report.

As for the objective of promoting industry in backward regions, just four states — Maharashtra (34.3 per cent), Gujarat (13.1 per cent), Tamil Nadu (11 per cent) and West Bengal (7 per cent) — account for two-thirds of all assistance sanctioned by the ICICI till the end of 1973. (Incidentally, it is not quite clear whether the state-wise classification of assistance is according to the registration of companies or location of plants. If it is the former, then the data are virtually meaningless.) That there are backward areas in even these four states — after all, practically the whole country may be considered backward — can scarcely justify the all-India financial institutions' preoccupation with them.

There is, we are told, growing coordination among the all-India term-financing institutions. However, this does not seem to have led to consideration, let alone formulation, of policies on any of the major issues referred to above. The pattern of financing of industrial projects is one other such issue. Should the financial institutions bear as much as 60 per cent or even more of the cost of the projects they assist? According to the ICICI's annual report, of the total cost of Rs 222 crores of the projects financed by the ICICI in 1973, Rs 113 crores were to be financed by long-term loans and debentures. Even in the share capital of Rs 59 crores, the term-financing institutions would have a share. Besides, there would be term-finance contributions by the commercial banks.

What justification is there for this pattern of financing of industrial investment in the private sector? Even if one sees nothing at all wrong in the building up of private industrial empires

with public funds, should not pure free enterprise concern for the growth of the capital market dictate pushing project promoters, especially the established ones, to rely more on equity?

Petroleum

Not All Roses

THE Indian subsidiary of the world's largest oil company has now come under government management. The President has given his assent to the Esso (Acquisition of Undertakings in India) Bill 1974. The agreement between Esso and the Government of India, providing for the immediate take-over of 74 per cent of Esso's equity by the latter and its extension to 100 per cent at the end of a seven-year period has also been signed. This move has been hailed in Parliament, the Press and elsewhere as being of "historic significance", as a "major breakthrough" in the government's oil policy and as a great step in "the country's advance towards socialism".

Esso's proposal to the government for take-over of its assets and operations in India was submitted about 18 months ago. After protracted negotiations, an announcement was made in January 1974 that agreement had been reached between the government and the company. Events moved rapidly after that; the Esso Bill was introduced in the Lok Sabha on February 26 and in about two weeks it had been passed by both Houses and had received Presidential asset. Such criticism of the government's action as has been voiced has been on the ground that the compensation to be paid to Esso is too generous. There has also been some criticism of the government's reluctance to publish the details of the agreement.

As far as can be judged from newspaper reports, the essential aspects of the agreement are as follows:

(a) The 100 per cent foreign ownership of Esso refining and marketing enterprises in India will be reduced to 26 per cent immediately and to nil in 1980. The current 50 per cent foreign ownership of Lube India (a joint undertaking of Esso with the Government of India) will also be similarly reduced.

(b) The compensation payable to Esso for the acquisition of its equity (74 per cent now and the balance in 1980) will be a total of Rs 18 crores. This amount would be paid in six equal annual instalments commencing from 1975.

(c) Interest at 6.5 per cent per annum would be payable on the outstanding balance of the above amount. A total amount of Rs 4 crores has been mentioned under this head.

(d) With the immediate acquisition of 74 per cent of Esso's equity, the dividend remittances by the company's refining and marketing enterprises would be reduced to 26 per cent of what they would have been otherwise. The remittances by Lube India will also be nearly halved. This would be the position from 1974 to 1980. With the acquisition of 100 per cent of Esso in 1980, dividend remittances will cease altogether. An amount of Rs 2 crores has been mentioned as the outgo under this head from 1974 to 1980. (This seems to be an under-estimate since, according to the Finance Ministry, Esso would have repatriated at least Rs 27.2 crores during the next seven years had it not been taken over.)

If these figures are accepted as correct, i e, repatriation of Rs 27.2 crores over the 7-year period if Esso were not taken over and, alternatively, a total repatriation of Rs 24 crores as a result of its take-over, even during this period there will be a net saving in foreign exchange outgo of over Rs 3 crores. Of course, after 1980 there will be no remittances at all.

The agreement with Esso brings out the complete change in the crude supply situation. Earlier, it used to be held that what was most important from the country's point of view was to deny the foreign oil companies operating in India the right to buy crude from sources of their choice. This, it was thought, would enable the country to buy crude at a cheaper price than that at which the oil companies were getting their supplies. By contrast, in the agreement now signed with Esso, it is the government which was apparently anxious to bind the company to supplying crude at least for some years. The company has agreed to supply crude oil to the refinery at the rate of 2.75 mn tonnes per year for the first three years and at half that rate for the following four years. How the final balance-sheet of the take-over of Esso will look will therefore depend on the government's ability to buy crude oil at prices comparable to those at which Esso would have been able to secure it. So far, the government has generally had to pay more, sometimes substantially more, for its crude than the foreign oil companies. Newspaper reports suggest that under the agreement signed with Iraq this week, the 2.8 mn tonnes of Iraqi crude to be imported this year is going to cost India $ 10.86 per barrel, $ 5.86 of which will have to be paid in cash and $ 5 will be adjusted against the $ 110 mn credit extended by Iraq. This is very much higher than the price which the oil companies are currently charging. The oil producing countries maintain that the oil companies have been charging an artificially low price for crude. These countries, while they may offer credit liberally for purchase of their crude, are therefore likely to price the crude they sell higher than the oil companies. Thus in its search for crude oil, the government will have to look beyond the governments of the oil producing countries.

SUBSCRIPTION RATES

3 years	Rs 80

Concessional rates are not applicable to students and teachers outside India

Who Is Anti-People?

Romesh Thapar

WHAT goes on is very puzzling. Prices are rising almost every week. Food is no longer available at ration shops over large parts of the country. There are minor battles at milk queues, where there are queues. Buses are hijacked by angry students unable to get a seat. Coal is not reaching the power stations, industrial establishments, and even the railway depots themselves. A strike fever is building in critical areas of the economy and no one moves to settle or crush these confrontations. Whenever these issues are debated in Parliament, there are scuffles, fisticuffs and what have you. And now the people in the towns are taking the law into their own hands. Headed by students and teachers, they have toppled the government of Gujarat and seem to be moving to do likewise in Bihar, albeit a little more ferociously, a little more crudely, because political parties are taking a more active role.

The flames of revolt are being fanned by many disgruntled elements in the sick politics of India, but the revolt carries a certain passion which we have not witnessed during the past twenty-five years of freedom. Actually, there is flavour of the long forgotten tempest of the freedom struggles of the thirties and forties — and even then Gujarat and Bihar were the experimental grounds for mass action. The country watches in a kind of stupor. Today, riots shatter towns. Tomorrow, the fear is that cities will be sacked. There is a refusal to believe that we are going the way of bloodshed and anarchy. The killings are startling, either a pointer to the panic among the forces of law and order or a commentary on the inefficiencies of our administration. We are assured that it is the "fascists" — the Jan Sanghis, the RSS, the Anand Margis and the formations of the extreme Left — who have declared war on our system of democratic functioning. But since when did we come to the conclusion that anything like "fascism" lives in India? And how do we reconcile the strange marriage between the extreme Right and the extreme Left as "fascism"? We are more than puzzled. We are bewildered. And, naturally, there is a great debate going on about what causes these strange happenings and whether we have to get used to the idea of living with chaos.

We turn to "our leaders". They all talk the same kind of clap-trap, the same kind of meaningless, contrary mumbo-jumbo. We turn to the governments at the Centre and the states. We see no confidence stirring to confront the problems which are rising all around us. We turn to the Union Cabinet, and discover that during the past year this august body has not bothered to discuss the Bharatiya situation. Fortunate are those who can take to *sanyas*. Most of us have to live in the horrible mess that is our India.

No, the peasants do not feel it just now. They have always lived on bare levels of subsistence, and the food today is for once in the rural areas. But they, too, will start reacting when they realise that electric and diesel power to get at the water under the ground and to turn their machines will not be available, and that the vistas of "Garibi Hatao" are no longer visible.

The entire nation, whether we like it or not, is certainly drifting to perdition and has been so drifting for the past year. Why do Indira Gandhi's geniuses not see this? Ask them. They now command a wide variety of expertise. Or are they not listened to? Surely, we, the poor voters, have a right to know. A resignation here or there is not enough to suggest that there is a bankruptcy or paralysis of political will. Who is going to tear the mask of make-belief. Indira Gandhi? Her ministers or minions? Her bureaucrats? Her lieutenants, whatever that may mean? Where does responsibility for the next step lie? With the "fascists", with those who take to the streets, with those "progressives" who are systematically disrupting our railway system and the vital supplies it carries, with the engineers, the doctors, the sweepers and what have you?

Who must act? Pause, and ask yourself this question. Think over it. Action must be on a scale that it will discipline the anarchy that is now overtaking this land despite the day-dreams and opiates of All-India Radio. Let's not refer to television; it is just a middle class titillator — expensive, but little else. Yes, pose this question to yourself. You will be nonplussed. Indira Gandhi cannot act because she will have to destroy her closest collaborators who have destroyed the credibility of the ruling party. If she cannot act, who can? Certainly not the President. He gave up these pretences ages ago.

So ... the people, whoever they are, "fascist", "progressive", moronic and otherwise, will continue to act, to turn themselves into threats, to force action in piddling doses. Tragic. Indeed, more than tragic. We are at the mercy of a situation which at this moment appears incapable of correction. The point of no return was crossed sometime ago. Now what? We cannot return to the good old days because too many heads will have to fall. We will, nevertheless, have to move forward, *via* turbulence and disorder, to evolve a new path, new political forms, to carry out the corrections, to re-establish normal disciplines and to make work a permanent task, honest work, not the cynical, corrupt operation which drowns us today. We will have to act for this in various ways, and then ask: who is anti-people? There is no other way. Maybe then, the jigsaw will begin to resolve. Who is going to be "anti-people"? Who is going to set the style? Excuse this "thought process". We are living in exciting times. The only trouble is that not enough people are exciting themselves. They could, you know ...

March 25

Ramacast

RAMACAST, an existing company having a cast iron foundry at Motihari in East Champaran district of Bihar with a capacity of 12,000 tonnes per annum, is diversifying into manufacture of ingot moulds and bottom plates required for the production of steel. The project, estimated to cost Rs 75 lakhs, is expected to go into production by September or October next. The company is making a public issue of equity capital of Rs 25 lakhs in shares of Rs 10 each at par to raise part of the finance required for the project. The subcription list will open on April 8 and close on April 18 or earlier, but not earlier than April 11. Technical know-how is being provided by Tata Consultancy Services. The factory will have initially a capacity of 11,000 tonnes with built-in provision to set up production to 20,000 tonnes with a marginal additional investment.

Calcutta Diary

A M

ONE rages, helplessly, against the dying of the day. Buddhadeva Bose could not make it. During the past few years, he had been scrounging for money, some extra money which would see his household through while he resumed his magnificent opus on the *Mahabharata*. The annotation of the epic was turning out to be the quintessence of his creative genius. The once-and-past *enfant terrible* of Bengali literature had entered the zone of tranquillity: yesterday's stormy petrel was almost unrecognisable. These pieces on the *Mahabharata* were poetry and philosophy rolled in one; their chiselled prose had a severe beauty; their canvas bore witness to an overwhelming imagination.

But there it was. This man had remained, over the span of nearly half a century, a compleat *litterateur*. Literature was, to him, much more than passion; it was faith, his only allegiance. It still failed to ensure for him a reasonably comfortable livelihood — despite his having something like one hundred fifty-and-odd volumes to his credit. If you leave out Tagore, none else in Bengali literature has covered the total spectrum in the manner he did: you begin with poetry, and go on to list short stories, novels, essays, literary criticism, plays, travelogues, *belles-lettres*, children's tales, nursery rhymes, and translations — not to mention his great contributions as editor. But money was always short. This is a much reduced Bengal, and in more senses than one. With the splitting of the country, the market for Bengali literary output has in any case shrunk.

An even more basic factor has been at work. Buddhadeva Bose was a punctilious writer. He was finicky not only about the words he used to sculpt, but also about how his volumes were produced, and under what auspices. However, quality is a forgotten premise in a milieu where hucksters have invaded literature. Finance capital conquers all that it surveys; the industry of literature, too, has been taken over by it. Unless you are prepared to act as a lackey to one or other of the newspaper combines, your livelihood is in danger. Literary success is now a derivative of propagation. Your volumes sell only if one of the leading newspaper establishments is prepared to act as your patron, not otherwise. In case it condescends to do so, it is roses all the way: sales of your works begin to climb, and newspapers underwrite your victuals.

In his years of innocence, Buddhadeva Bose, the great fundamentalist who would never compromise on standards, used to make gentle fun of those ensnared by the newspaper chains and writing for dubious journals brought out by the latter. Yet, by the time he died, the wheel had come full circle. He had to turn for his daily bread to persons whom he used to detest — the vulgarians of the newspaper world, the unscrupulous lot who could not care less about literary ethics. Fundamentalism was given a quiet burial. Buddhadeva Bose had to compromise; it was, as they say, an arrangement. He tolerated them, put up with their whims and obscenities, humoured them; in return, they saw to it that he did not quite starve. But just about. In the system as it has emerged, hangers-on are kept on short leash. Buddhadeva Bose was aware that he was racing against time. The first part of the tract on the *Mahabharata* was ready. He had collected the notes and references for the second part, which, he had no doubt, woud be his proudest contribution to Bengali letters. He needed an uninterrupted spell of one or two years for this round of writing. He must, therefore, make adequate financial provision for that period: the wolf must be kept at bay while the personages from the *Mahabharata* — with their grandeur and their pettifogging, their majesty and their meanness — were being assembled and analysed.

A man with more than one hundred and fifty not altogether inconsequential volumes to his credit, a man whose commitment and integrity were beyond question, should not, one would have thought, have to worry in the twilight of his career about money matters. That was not to be. The government was not moved. The newspaper combines, currently the supreme arbiters of literary judgment, paid him what can only be described as bare sustenance. Therefore, the man, till his very last day, kept churning out pot-boilers, even for disreputable cinema magazines, in the hope that he could chalk up some savings on which to subsist during the writing of the final part of the *Mahabharata* commentary. The home stretch eluded him. He collapsed and died before the money could be in.

This, in a way, epitomises the objective reality of the times. Illiterate politicians of assorted hues, and those who hover in their proximity, make pots of money. Through their shady deals, they collect in the course of a single month perhaps as much as Buddhadeva Bose could earn in ten years. Journalists, who cannot get the syntax right for even a single sentence, belong to this side of the establishment; there is no dearth of the appurtenances of good living for them. Characters belonging to the underworld, whose only creative talent is the throwing of the knife, nonchalantly splash crisp hundred rupee notes; don't ask how they come to their funds. But Buddhadeva Bose was unable to put together some puny savings which could last him while the tract on the *Mahabharata* was being completed.

A matter of some irony, Buddhadeva Bose did not realise, and therefore failed to grapple with, the fate which overtook him. For the past thirty years or thereabouts, he was a great one for 'cultural' freedom. A gullible person, given to instant emotions, he fell into the trap set for him by professional communist-baiters. The alleged inequities rendered toward writers and artists in the socialist countries would enrage him. He would work up a passion, write indignant articles, snap links with friends who were across the barricade. The tribulations of a Boris Pasternak or an Aleksandr Solzhenitsyn would exercise him for days on end. There was this curious myopia, he would miss the longer significance of more proximate things. In the society where he lived and worked, opportunities were scandalously unevenly distributed, including those which came the way of writers and artists. He himself had to be deferential to eleventh-rate journalists, because they belonged to newspaper combines, who possessed the assets and could ordain some extra income for him. While he got excited over the abstract concept of freedom, he went on missing the relevant clue: Freedom is not an independent variable, it is a function of the distribution of wealth. A man, be he a poet or a novelist, who is unable to provide for himself and his family, is not free. He is not free to write what he wants to write. A substantial part of his time has to be set aside to write pot-boilers or to humour the agents of finance-capital, and his great ambitions have to be postponed. This was so with Buddhadeva Bose, and will be so with other writers; because, irrespective of the label by which you describe your milieu, till as long as it does not ensure your food and clothing, there can be no free writing on your part.

Since Tagore, there has been no greater talent in Bengali literature. Others have written better poetry. Manik Bandyopadhyay was a noble writer of fiction, a natural genius, who composed what is perhaps the greatest novel in the language. Yet others have written essays which, in depth and purposiveness, possibly surpass most of Buddhadeva Bose's efforts. There are others too, whose incisiveness in literary criticism may have outstripped Buddhadeva Bose's. And certainly, in this neighbourhood, there have been more competent playwrights. If you consider all aspects together, however, and also take into account his magnificent role as editor and catalyst of literary urges, his position is *non pareil*. Nevertheless, in the system of which we are all prisoners, he was denied decent minimum wages.

He would not have agreed that the answer to the predicament lies in the writers joining the barricade. Man is free, the writer too is free, free to choose. Buddhadeva Bose chose. He chose to cast his vote against those who were for a social revolution; in his later years he railed against them, and with gusto.

The manner of his dying proved, if any proof was ever needed, that he had picked on the wrong target. Now that he is safely dead, even his death has become an occasion for brazen commercial exploitation by capitalist-publishers who monopolise the Bengali literary trade. This is outrageous, for it is they who killed Buddhadeva Bose. By their perversity and self-aggrandisement, they have pushed literary standards down to a filthy nadir, so much so that writers like him had no chance of an assured market — and were, therefore, reduced to scrounging for food. Assassins all, they have now the cheek to appropriate for themselves the mantle of principal mourners. Even as others still rage against the dying of the day.

COMPANIES

Cost No Bar

Hansavivek

MAHINDRA AND MAHINDRA, with better cash generation than originally estimated, is holding in abeyance the earlier proposal to make a rights issue of equity shares of Rs 110 lakhs and 9.5 per cent redeemable preference shares of Rs 100 lakhs to raise a part of the finance required for carrying out the next phase of expansion. The company has an industrial licence to expand its annual capacity to 25,000 vehicles. The scheme is to be implemented in the next 4 to 5 years. It is now proposed to make a public offer of one lakh redeemable cumulative preference shares of Rs 100 each carrying dividend at 9.8 per cent per annum. The company has approached IDBI, ICICI, LIC, and UTI for financial assistance in the form of term loans/subscription to privately placed debentures to the extent of Rs 300 lakhs. The financial institutions have laid down a condition that they will have an option to convert a part of the loans/debentures, not exceeding in the aggregate Rs 67.5 lakhs, into fully paid up equity shares of the company of the face value of Rs 45 lakhs — that is, at a premium of Rs 5 per Rs 10 share. The option will be exercisable during April 1975 to March 1977.

Meanwhile to make efficient use of available resources, separate units are being formed for Jeep assembly, truck assembly, foundry, engine and transmission and axles. A new facility for assembly of station wagons and trucks is intended to be created at Nasik. This should be in operation by the beginning of 1976, when production capacity will have reached 18,000 vehicles per annum. The activities of the instruments division at Calcutta are proposed to be housed in a larger plant to meet the increasing demand. Because of delays in the receipt of 'letters of intent' and industrial licences for the various projects, the electronics division has been largely confined to manufacture of a variety of defence equipment. At Nasik, where the principal electronics factories are located, construction of the factory buildings is nearing completion and erection of indigenous equipment for manufacture of capacitors is in hand. The research and development unit has been making efforts to improve the reliability of the engine and other parts required for the automotive division. The directors expect to introduce engineering changes in the vehicles well before the end of the current year which will bring about substantial saving in fuel consumption. A wide range of defence equipment and industrial control and electro-medical equipment has been developed.
