As that scandal died or lay down, the *Daily Mail* revived another by doing an expose of corruption in the north-eastern Labour Party and its members in local and national government. Ted Short, Deputy Chairman of the Labour party, on his own admission took cash gifts from a T Dan Smith, also of the Labour party, who has been convicted for accepting bribes from the building contractors firm of John Poulson. Short is in the embarrassing position of being a member of a parliamentary committee on the registration of the financial interests of all members of the House of Commons. Short refuses to resign, even though his integrity is severely in question. Between gentlemen, these things pass for everyday activity, and the Cabinet supports its man. The unions are passing resolutions demanding his resignation. The leaders of the Boilermakers Union, have demanded a full enquiry within the Labour party into the corruption of the party in the north-east. If heads must roll, as the Labour party knows they must, better that the executioners be from within the party itself. The press is not satisfied and the heat is on Wilson. Speculation and bribery are not misdemeanours which bring Western governments down, but they are hardly a good start for a government that claims to be dedicated to a policy of social equality.

If the Labour party is to be the machinery of redress of social inequality, it must deliver the goods. It can't, even in the short term, rely on the tenuous emotional links it has with what it calls "the common man". So far it has only managed to prove that the British parliament is an instrument of pragmatic capitalism. Despite making strong protests against the Chilean military regime when it was not in power, Labour is now willing to sell warships to the junta in Chile. The cancellation of the orders would cost Britain too much too soon and may jeopardise its vital copper imports from Chile.

The main issue, of course, is the basic economic one, the one that brought this government to power. It promised the electorate an end to the statutory

wage freeze and the repeal of the Industrial Relations Act. The repeal of the Act is on the legislative timetable and even with a minority it is likely that the government can pull it off. It has not yet set a date and has so allowed itself to become an unwilling actor in a comedy of spite. The Industrial Relations Court, set up under the Tories to run the Act — which basically deprives workers of the right to strike, takes closed shop powers away from the unions, puts a ban on effective picketing and allows industry to defy the demand for unionisation of the work force — has continued to take the unions to task. The Court recently awarded £ 47,000 damages to a firm called Con Mech, to be paid from the funds of the Amalgamated Union of Engineering Workers (AUEW). The assets of the Union were seized by the Court through the banks from which the fine and costs were to be paid. The AUEW threatened severe strike action if the government did not intervene to stop this sequestration and general looting of union funds. There would once again have been bitter deadlock in the country, with an unwilling government supporting a law it plans to do away with. The good fairies of British Industry saved the day. Five firms, it is said, stepped in and anonymously paid the fine and costs awarded against the AUEW.

All in all, timely interventions of unknowns and the opposition parties have connived to keep the minority Labour government in power. So far the workers have been tilting at the windmills that the previous government set up, and Labour has not yet had a chance to put its programme into practice. Promises, promises. It is yet to be seen if that programme will pull the living standards of the workers up or pull the government down.

Neo-Colonialism at Asian Development Bank Meeting

Harish Chandola

TOWARDS the end of last month, as the Special Session of the United Nations was about to adopt a Declaration placed before it by 77 developing countries on "The Establishment of a New International Economic Order", the outgoing US Treasury Secretary, George Shultz, was outlining his country's plan for continued political and economic domination of the weaker nations, also in the name of establishing a new world economic order. Shultz was doing so at the seventh annual general meeting of the Asian Development Bank (ADB) at Kuala Lumpur, as the head of his country's 60-member delegation, the largest at the meeting, which included members from both Houses of the US Congress.

This report discusses what he said officially in his statement at the ADB meeting and at his press conference, and not his other important statements made informally during his four-day stay in the Malaysian capital, ending April 28, 1974. He began by saying that the old economic order had crumbled the monetary system had been upset, the rise in oil prices had created further monetary instability, there were worldwide shortages of basic commodities, inflation, and the pattern of world trade was changing. The US was for stability and a new world order. It did not want to dominate the world. All it wanted to do was to lay down the rules of a new economic order, according to which all must play.

And what were the rules Shultz wanted to lay down? One of these was that the developing countries should not try to form organisations of producers of raw materials and basic commodities to defend the prices of their exports or to secure favourable prices for them, "as higher prices and conservation efforts dampen demand". He then added: "In the not-so-long-run, however, high prices will stimulate a creative reaction — the world's best people and organisations will join in a concerted effort, which will inevitably result in new supplies and undreamed of substitutes, which may affect prices even more dramatically than we dare contemplate ... One thing is certain, the longer prices stay high in the short run, the more likely it is that they will fall sharply in the long run. This has been the history of every other commodity in the past".

While Shultz was speaking in Kuala Lumpur, the Special Session of the UN was finalising an Action Programme aimed at putting the Declaration on a new economic order into effect. It called upon the developing countries to promote and expand producers' associations and joint marketing arrangements so as to improve their income from export commodities.

But Shultz tried to show that a major power like his country was really not affected by economic pressures like the one exerted recently by the oil producing countries. He said the Arab oil producers attempted to put pressure on the US to change its foreign policy by imposing an oil embargo on it and also by raising their oil prices. The increased oil prices crippled the economies of the developing countries, but did not affect the US much.

However, later in his statement Shultz contradicted himself by saying that a major component of inflation in the US has been the cost of energy which contributed 25 per cent to the rise in US domestic prices. It is also not true that US foreign policy has remained totally unchanged after the Arab oil embargo. One can quite clearly see now that the US no longer relies upon the ability of Israel to function as its policeman in West Asia. A few days before Shultz made his courageous statement in Kuala Lumpur that US foreign policy was totally unaffected by the oil embargo, political observers had witnessed the US, for the first time in history voting for a resolution in the UN Security Council condemning Israel for its raids on Lebanon.

Shultz also stressed that the economic crisis in the developing countries could only be solved by their producing more. For that they needed the inflow of private capital from developed countries. Their problems were not going to be solved by the little loans or development assistance provided to them by the ADB and others. The US, he said, was prepared to provide them with private capital and modern technology. But its attitude toward "development assistance is a closely questioning one", he said. Private capital could however flow to the developing countries only when it was assured of reasonable return and security and conditions were not imposed upon it to "deter its flow".

The other law Shultz tried to lay down was that the developing countries should keep their markets open to goods from the developed. (He obviously meant, from the US.) This, he said, was in the interest of free, unrestricted world trade. The US would legislate for the preferential entry into the US market of products from developing countries. The developing countries should also, therefore, open their markets to US goods because this was their "reciprocal responsibility". He totally ignored the effect this would have on the process of development in the developing countries.

The UN Declaration on the Establishment of a New Economic Order, adopted on May 1, stands against most of the laws proposed by Shultz. The UN Declaration calls for full permanent sovereignty of every state over its natural resources and all economic activities. It says that in order to safeguard these resources, each state is entitled to exercise effective control over them and their exploitation with means suitable to its own situation, including *the right to nationalise* or to transfer ownership to its nationals, this right being an expression of the full permanent sovereignty of the state. It says that no state may be subjected to economic, political or any other type of coercion to prevent the free and full exercise of this inalienable right. It also states that every country has the right to adopt the economic and social system that it deems to be the most appropriate for its own development and not be subjected to discrimination of any kind as a result.

It calls for a just and equitable relationship between the prices of raw materials, primary products, manufactured and semi-manufactured goods exported by developing countries and the prices of raw materials, primary commodities, manufactures, capital goods and equipment imported by them, with the aim of bringing about a sustained improvement in their unsatisfactory terms of trade and the expansion of the world economy.

The Declaration seeks to ensure that one of the main aims of the reformed international monetary system shall be the promotion of the advancement of the developing countries. It calls for measures to check the inflation already experienced by the developed countries, to prevent it from being transferred to

ANNOUNCEMENT REGARDING THE ISSUE OF 30,000 9.8% REDEEMABLE CUMULATIVE PREFERENCE SHARES OF Rs. 100/- EACH FOR CASH AT PAR.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS. PERSONS INTERESTED IN ASCERTAINING FULL DETAILS MAY OBTAIN COPIES OF THE PROSPECTUS AND APPLICATION FORMS FROM THE REGISTERED OFFICE OF THE COMPANY, BROKERS, BANKERS AND UNDERWRITERS TO THE ISSUE MENTIONED BELOW.

THE SUBSCRIPTION LIST WILL OPEN ON TUESDAY, THE 4TH JUNE, 1974 AND CLOSE ON TUESDAY, THE 11TH JUNE, 1974, OR EARLIER, BUT NOT EARLIER THAN SATURDAY, THE 8TH JUNE, 1974.

HISTORY & BUSINESS

The Company was incorporated on 9th November, 1962, under the name and style of Firth Sterling Steel Company of India Ltd. The Company's name was later changed to Firth (India) Steel Company Ltd. in December, 1972.

The Company set up a plant in 1966 at Thane, Maharashtra, for processing and rolling of Alloy and High Speed Steel billets and has established itself as a major supplier of quality products.

PROPOSED PROJECT

The Company is setting up a plant at Nagpur, with an annual production capacity of 6,000 tonnes of billets of different Alloy Steels — including High Speed, Die, Ball Bearing, Valve and Constructional Steels. As this is an integrating process, the Company hopes to increase the utilisation capacity of the existing plant at Thane to over 90%, with the implementation of the proposed project, as against the present plant utilisation levels.

The Company has entered into Technical Collaboration Agreement with Firth Brown Ltd., the oldest and largest Alloy Steel Plant in the U.K. The Company would receive technical advice and know-how from the collaborators. The collaborators would also train the Company's personnel and depute specialists to render technical aid and advice for the Project.

FIRTH (INDIA) STEEL CO. LTD.

(Incorporated on 9th November 1962, under the Companies Act, 1956)

Registered Office: PLOT No. F-3, ROAD No. 22, THANA INDUSTRIAL AREA, THANA 400 604

PROJECT PLANNING STATUS

The work is progressing fast. Land has been acquired. Civil works are nearing completion. A major portion of the Plant and Machinery have been ordered according to pre-determined schedules. Other infrastructure facilities like power, water, etc. have been taken care of. The commissioning of the Forge Shop, the Rolling Mills as well as the ESR plant and other imported equipment will be progressively undertaken during the latter half of the current year. No difficulty is envisaged in successfully implementing the project in view of the combined resources of the Company's professional management and that of the Consulting Engineers, M. N. Dastur & Co. Private Ltd. who have been retained on a turn-key basis, with a time-bound programme.

PROJECT PROFITABILITY

With 40% of plant utilisation capacity in the case of High Speed Steels and 30% in the case of Alloy Steels, the Company has been regularly declaring a dividend of 10%. With the proposed expansion and diversification of product-mix, the Company expects to achieve 90% of plant utilisation capacity. High Speed Steel and Alloy Steel prices are soaring the world over. There is an acute shortage of special-purpose steels the Company would be manufacturing. Thus, the growth and profitability prospects are very attractive

SHARE CAPITAL

	Authorised	Rs.
17,00 000	Equity Shares Rs. 10/- each. and-	1,70,00,000
30,000	9.8% Redeemable Cumulative Preference Shares of Rs. 100/- each	30,00,000

developing countries and to study and devise possible arrangements within the International Monetary Fund so as to mitigate the effects of inflation in developed countries on the economies of developing countries. It calls for adequate and orderly creation of additional liquidity with particular regard to the needs of the developing countries through the additional allocation of Special Drawing Rights (SDRs) based on the concept of world liquidity needs to be appropriately revised in the light of the new international environment. It seeks favourable conditions for the transfer of financial resources to developing countries, the formulation of an international code of conduct for the transfer of technology and also an international code of conduct for foreign capital in order to prevent its interference in the internal affairs of the countries where it operates.

Disregarding what the UN was about to adopt, the US delegation came to the Kuala Lumpur meeting of the ADB with very clear-cut ideas of what it wanted the Bank to do. It wanted the Bank to be a financial institution for securing most favourable conditions for private US investment and technology in the developing countries of Asia and to restrain them from forming collective organisations for securing better prices for their exports. The US also wanted the Bank to become an established channel for providing loans to stabilise the economies of the US-client states in Indochina. It wanted the Bank to generally help the US in maintaining its hegemony over the developing countries of Asia and to prevent them from acting independently.

What did India want the ADB to do? India is the second largest potential contributor to the subscribed capital of the ADB (the first being Japan), having pledged US $ 280,476,375, which is higher than the US pledge. One would, therefore, have thought that India would put forward some principles to govern the basic policies of the Bank which would be in the long-term interest of the developing countries. But all that India sought was a minor and short-term concession for them by asking the Bank to begin lending funds to enable them to purchase fertilisers, etc, because of their present economic difficulties.

All member countries of the Bank were in total agreement that the oil-rich West Asian nations should be induced to join the ADB. A few days after the ADB meeting, Indira Gandhi left on a visit to Iran to strengthen India's ties of friendship and co-operation with it. In pursuance of this policy, the Indian delegation to the ADB could have proposed Iran for membership of the ADB. But it did not. It was the Japanese President of the Bank, Shiro Inoue, who at the end of the meeting announced that he would soon be paying a visit to Iran to invite it to join the ADB.

Effective Control

What does India get out of the ADB? Unlike other member countries, it does not draw loans from the Bank. The largest subscriber to the Bank's capital, Japan, also does not obtain loans from it. But Japan sees to it that the money given out in loans flows back into Japan in the shape of procurements for the projects for which the loans are sanctioned. A condition of the ADB loans is that the countries or organisations that get them must call for international tenders for both the materials and services required for the projects for which the loans have been sanctioned. Sixty per cent of the total procurements for these projects go to Japan. India gets about five per cent. Japan has effective control of the Bank. The Bank has so far had two Presidents and both of them were from Japan. It is unlikely that the Bank will in the near future have a President from any other country.

Which are the regimes benefiting in a big way from ADB loans? They are: Taiwan, which has received US $ 100,390,000; South Korea, $ 247,700,000; South Vietnam $ 24,200,000; Philippines, $ 183,850,000. Thailand, $ 122,000,000; and several other countries. And most of the loans are not for direct benefit to their peoples, as they are not for education, agriculture or rural development. The loans are often for the direct benefit of foreign private capital and the local rich, for projects like the development of fancy airports and five-star hotels.

PERSPECTIVES

Relevance of Raja Rammohan Roy: Some Moral Implications

Sudhir Chandra

WHATEVER the 'purist' might say about the abuse of his discipline, it is the search for contemporary relevance that accounts in a large measure for the popularity of history. The present provides the perspective for the study of the past. Often it is not even a study of the past, but just a backward projection of the study of the present. Serious methodological objections can be raised to this kind of an academic exercise. Yet, it is possible to practise, at a fairly serious plane, a variety of history that is professedly present-oriented and utilitarian. But this is an exercise which, if it is not to degenerate into sheer propaganda or wishful equations, calls for a candid appraisal of the moral and logical implications of the basic premises of those undertaking such a study. Moreover, since such a dialogue between the present and the past cannot but be valuational, it should be possible to identify where the present is impinging upon the past, and *vice versa*. These assumptions are implicit in the discussion which follows. It is aimed at highlighting some moral implications of the relevance of Rammohan Roy for us today.

Rammohan came of age during a critical juncture in Indian history. The traditional modes of perception and behaviour tended to become progressively inadequate for effectively responding to the situation created by the multifarious changes occurring in the wake of British rule. The old was threatened. The new was yet to begin. It was a baffling situation. Not many people, either among the rulers or among the ruled, knew precisely what was happening.

But the situation had to be responded to. Some responded to it by withdrawing themselves into a kind of hard shell. This was the orthodox attitude typified by Raja Radhakant Deb and the Dharma Sabha. Then there were those who failed to have sufficient patience with their own society and thought that their salvation lay in denouncing their ancestral faith. The Derozians typified this impatience. That, in the event, this approach did not satisfy is clear from the subsequent be-

If this true story of Sri Balasubramanian of Lalgudi is any indication, India will soon have fully exploited the great potential in the country's youth.

Balasubramanian joined BHEL 10 years ago, as a peon. All he had was a high school certificate and a will to grow. BHEL showed him the way. Intensive on-the-job training, lectures by experienced staff aided by audio-visual presentations — BHEL's training centre took him through quick, successive promotions and helped him to mature into a skilled technician. Today he earns more than four times his initial salary, and sees no limit to his ascent. Like the thousands of his colleagues, whose talents are fully exploited by BHEL, he has shattered a myth and established a fact that Indian workers are among the world's best in skill and efficiency. The emergence of BHEL as a member of the 'International Power Club' is the greatest testimony to this fact.

All days are May Days at BHEL

At BHEL, the employees get the opportunity to qualify themselves further, undergo specialised on-the-job training in a field most suited to their aptitudes. Their achievements are promptly rewarded with promotions to senior positions and financial incentives. This is how the greatest success in industry has been achieved. By never forgetting how important the employees are. By treating every day like the May Day.

Over Rs.10 crores in employee benefits — in amenities and welfare

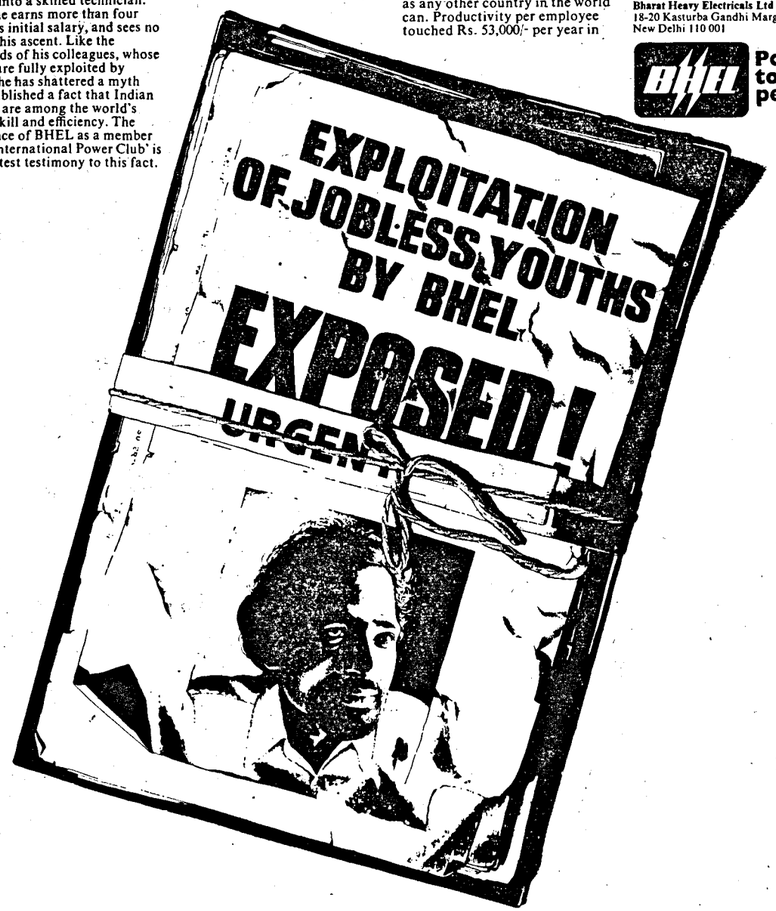
BHEL takes every possible step to give its employees a prosperous career and a happier home. BHEL has gone even ahead of our times by signing a bipartite agreement, a major step towards evolving a national wage policy.

For the first time in the industrial history of India, the staff and the management have arrived at a mutually beneficial settlement — voluntarily and without involving a third party.

Welfare Schemes for the entire families of employees help restore peace and happiness to thousands of homes. Amenities to staff compare with the best anywhere in the country. Technicians are sent all over the world for training in the most up-to-date techniques in power generation and utilization.

Not a single man-hour lost in 2 years

Naturally, today BHEL can turn out power equipment as modern as any other country in the world can. Productivity per employee touched Rs. 53,000/- per year in 1973-74, as against Rs. 36,600/- in 1972-73 and Rs 29,000/- in 1971-72. Another magnificent demonstration of the May Day spirit by BHEL employees is the fact that *not a single man-hour was lost in all the four units in the last 2 years.*



BHEL — a new generation of power and prosperity

Today, BHEL employs nearly 45,000 people in its units at Bhopal, Hardwar, Hyderabad and Tiruchi. Who, by their dedicated labour, are helping the nation achieve self-sufficiency in power and are thus opening up employment opportunities to hundreds of thousands more.

Guided by their spirit, BHEL will continue to exploit more young talents, turning manpower into workpower.

BHEL Power to the people

SAA/BHEL/1369

haviour of men like Rev K M Banerji and Ram Gopal Ghosh.

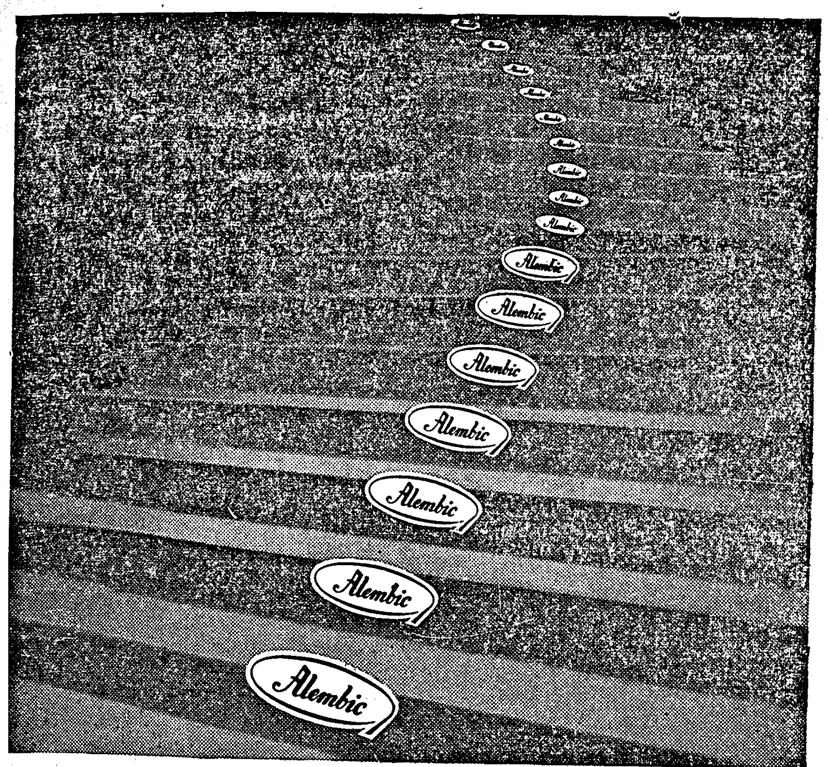
In between these extremes stood Rammohan. He realised not only that human volition ought to influence the development of human society, and that a threat did not cease to operate simply because the people exposed to that threat had shut their eyes to it. He also realised that patience was the necessary virtue of a man who had set out to reform his society. Being thrown out of it as a result of impatient action might be suicidal to the very idea of reform. This was specially so in a society which could employ the powerful deterrent of excommunication.

This explains substantially why Rammohan scrupulously avoided doing things which might have been in consonance with his convictions and personality, but would have brought upon him the wrath of his community. It is difficult to say whether the later Brahmos could have possibly adhered to this watch-word of their spiritual mentor. But the effectiveness of the Brahmos in terms of reforming Hindu society as a whole was definitely reduced as a result of their becoming a separate community. One might argue, though, that the extent of reform achieved by the Brahmos within their own little community would have become well-nigh impossible if they had tried to carry the vast and apparently immobile Hindu society along with them.

This may seem a matter of mere tactical importance. From that point of view much can be said both for and against the approach followed and prescribed by Rammohan. But this also raises a moral issue of great importance for us today. It relates to the obligation of the individual to carry with him the generality of the society in which he finds himself born. It also relates to the social unit to which he has to consider himself accountable. For example, Rammohan was content to confine his solicitude to the Hindus of Bengal. This is not to criticise him. Maybe in the times in which he flourished it was the natural psychological reaction of an Indian to view himself as belonging to his religious community within his own region. There also were reformers, in fact, who could with legitimate pride work for the reform of their own caste. This more or less compulsive limitation of vision regarding the social unit of belonging in early 19th century India explains why Rammohan did not think it incumbent on him to reform the Muslim community of Bengal. But he did consider himself accountable to the society of which he viewed himself as a member.

This moral issue of accountability is one that faces all of us today; that is to say those who are not content with the existing set-up. A number of attempts have been made in recent years to bring about major changes within the existing set-up. All these have failed. The discontent remains. So does the quest for a less inegalitarian and more just social order.

It may be argued that given the unevenness of economic development and political consciousness in different regions of the country, this quest may not be successful if changes have necessarily to be brought about in the whole country at the same time. Political workers and radical thinkers in the more progressive parts of the country may in course of time begin to feel that the whole country being unprepared for the new ideas and the proposed new set-up, they should confine their endeavours to their own particular region only. Implicit in this is a potential dichotomy between national solidarity and the just aspirations of people within certain regions of the country.



The choice, though at present only hypothetical, is not political. It is a moral choice. For some national solidarity may be just a means to ensure the welfare of man. To some others it may be an end in itself. But whatever be our basic premises and prejudices, it may one day be incumbent on us as thinking men and women to opt for the one or the other choice.

Rammohan was basically a rationalist. As a rationalist he appreciated the limits of rationalism. It was this appreciation which prompted him to work out a compromise between freedom and authority. Freedom was dear to his heart. Born in a traditionally authoritarian society, he was one of the first Indians to breathe in the relatively expansive atmosphere of western concepts like freedom, equality and social justice. Passionately attached to the idea of freedom, he took it to mean not only political but also personal freedom. Reason and freedom went hand in hand. Rammohan could see that in view of the limitations of reason and of human knowledge, no man could be completely free. He had ultimately to fall back upon some kind of authority which provided the starting point for the exercise of freedom. The devotee of freedom and reason in Rammohan thus succumbed to the need for finding ultimate sanction and sought it in the Hindu scriptures. It was not entirely a result of the deliberate assumption of a posture intended to strike a sympathetic chord within orthodox Hindu hearts. Rammohan, it appears, genuinely believed in the pristine purity of Hinduism, and sought in it the foundation for the exercise of freedom and reason.

Rammohan was a cautious reformer. He was a conservative. He would not take ideas to their logical end. Perhaps he realised the importance of the irrational and extra-rational forces within man. Though capable of logical rigour, he realised that perfect logical models existed only in the realm of speculation whereas man lived also by emotions and instincts, and was capable of unpredictable behaviour. Compromise, in these circumstances, became essential for Rammohan. Compromise not for its own sake but as a necessary step towards the final achievement of the set objectives.

We are living in a society which is moving towards totalitarianism. Freedom, which has not yet become with us a habit of mind, is being progressively constricted. Authority of the state, supported by a few shibboleths like socialism, may soon acquire a respectability which it would become sacrilegious to question. Ideas like order, progress, non-violence and democracy are likely to be employed to retain the *status quo,* and to equate with treason any serious attempt at a major institutional change. Rammohan's approach to the question of freedom and authority may suggest interesting parallels and possibilities in a society characterised by the erosion of the democratic process and the persistence of the illusion of justice and welfare.

Which of these parallels and possibilities one chooses will depend on one's frame of mind. That will influence one's understanding of and reactions to both Rammohan Roy and the contemporary situation. For present-oriented utilitarian history is essentially a creative subjective process. But it too has some essence of objectivity. To that extent, whatever one's particular choice, it would not be possible for those studying the relevance of Rammohan today to ignore the threat to human freedom and welfare. For it was these that he earnestly championed and fought for under the rule of an alien and ruthless trading corporation.

Alembic—where the pursuit of progress is endless!

Sixty-one years devoted to easing human pain, allaying suffering, bringing health to the people, fertility to the soil ...this has been Alembic's mission.

Alembic has placed in the hands of doctors the means to fight almost every disease. Alembic's antibiotic plant is the first in the private sector and the most modern in India. Alembic's home remedies, tonics and nutritional and cough preparations have become household words. Alembic also produces fertilizers, pesticides, cattle and poultry feed supplements to invigorate the land and livestock.

Alembic does not rest on its laurels—its endeavours are continuous. In its up-to-date, well-equipped, well-manned research division it carries out fundamental and applied research in Organic Chemistry, Biochemistry, Pharmacology, Chemotherapy, Microbiology, Immunology...to discover more potent weapons against disease, to find new ways to promote health and growth, and to set ever higher standards for further achievements.

Health assures happiness. Alembic *assures health*

Review of Management is published four times a year, on the last Saturday of February, May, August and November.

Manuscripts intended for publication should reach the Editor at least six weeks ahead of the date of publication.

And One for the Market

THERE has been, statistics have been adduced to show, an impressive rise in the assistance sanctioned and disbursed by the term-financing institutions for industrial projects in the private sector. This and the larger number of industrial licences and letters of intent issued have been taken to indicate a revival of activity in the private sector segment of industry. The appearance is, however, misleading. Rough and ready estimates show that there has been a decline of about 40 per cent in the retained earnings of the private corporate sector. Fresh capital raised was also lower by about Rs 20 crores in 1973-74, having declined from Rs 90 crores in 1972-73 to Rs 70 crores. And if allowance is made for the sharp rise in the cost of investment, in real terms investment by private sector industry will almost certainly turn out to have shown no rise at all.

Other circumstantial evidence too supports some such conclusion. A major factor influencing investment in the private sector is government or public sector investment. Here there was a further setback last year. Thus the Central government's developmental expenditure, as a proportion of its total expenditure, is likely to have declined to about 46 per cent in 1973-74 compared to 51 per cent in the previous year and nearly 60 per cent at the end of the Third Plan. Similarly, revised estimates put the share of capital formation in the total expenditure of the Central government at 33 per cent in 1973-74 compared to the Budget estimate of 38 per cent and the figure of 48 per cent for 1964-65.

The generally stagnant, or even declining, levels of output of practically all the major investment goods also points against any worthwhile increase in investment in private sector industry. Among the more important investment goods, the output of steel, aluminium and cement has actually declined. There is also acute shortage of other vital items like copper, lead and zinc. Given the severe raw material constraints it is hardly surprising that the output of machinery and equipment has shown a decline.

In the circumstances, any attempt to steer the industrial sector out of stagnation must focus on raising investment in and output of the major capital and intermediate goods. This in turn will require a stepping up of the rate of investment, especially in the public sector. In fact, quite the contrary is happening. The decline in the rate of developmental expenditure and capital formation by the government has been noted. Simultaneously, there has been a progressive dilution of priorities with regard to the allocation of the investment that does take place in the private sector. The so-called streamlining of licensing procedures, which has supposedly yielded such remarkable results in terms of the numbers of licence applications disposed of, is only one aspect of this dilution. As a result, while the private sector has been encouraged to invest in a wide array of non-essential industries — of which the score or more breweries that have sprung up are perhaps the most ridiculous examples — the government has failed to coax private investment into industries like cement, paper and fertilisers. At the same time, public sector projects in these industries as well as in others like steel continue to be stalled for want of resources. Thus it has been estimated that the public sector industrial programmes included in the Annual Plan for the current year will require an additional investment of about Rs 400 crores over and above that provided for. There is, of course, just no possibility that resources of this order will become available. A watering down of the physical content of the industrial programmes is therefore inevitable.

This continuing distortion of the pattern of investment must, among other things, necessarily aggravate the long-term import-dependence of the economy. The allocation of available foreign exchange will get further biased in favour of meeting the so called maintenance import requirements of existing industries, however low priority these may be. A progressively larger proportion of even the aid that is forthcoming will get earmarked for such maintenance imports. Thus far from moving in the direction of self-reliance, the foreign exchange constraint will weigh more and more heavily on the country's industrial development. This is reflected in the government's desperate search for aid and in the bid to woo foreign private investment on various pretexts such as export promotion. However, to focus criticism on these aspects of the government's economic policies would be to mistake the symptoms for the malaise. What is basic to the whole situation is the abandonment of a long-term perspective on industrial development. After all, it is not simply the rise in prices and the consequent difficulties in getting its financial sums right which has persuaded the Planning Commission to give up all attempt to prepare a final version of the Fifth Plan.

Organisational Effectiveness: A Comparative Analysis

Rajesh Tandon

This paper discusses a set of hypotheses about organisational effectiveness. The validity of the hypotheses are examined in the light of a comparative analysis of two units of a company.

In the end, the author makes some further hypotheses which could be tested by future research.

MODERN organisations are complex systems. Faced with the constantly changing internal and external environments, the survival and growth of these organisations depend on the capacity of its different parts and the whole system to effectively and adequately cope with this change. Changing aspirations and expectations of the people, explosions in technology, knowledge and other factors of the external environment present to these complex systems a 'new reality'.[1] The forces dragging the organisation from making a forward thrust have created an 'excellence gap'.[2] If these systems have to survive and grow in a world of increasing changes and uncertainty, "organisational revitalisation has to be achieved through a complex social process".[3] Beckhard[4] maintains that a planned organisation-wide effort is needed to provide positive alternatives to evolution and revolution taking place in and around these industrial systems.

A diagnostic instrument is to be designed which must be capable of providing relevant data about the nature and state of the organisation. To that extent, the instrument must be a balance between generalisation and specificity, that is, it must be able to respond to the specific nature of the organisation on the basis of a valid paradigm to locate its present state. Likert[5] believes that such a facility can be introduced in an instrument by making it capable of measuring the end-result, intervening and causal variables and most significantly, their relationships as maintained in an organisation.

Model

Any model which attempts to outline the state of organisation must be based on certain assumptions about the nature and functioning of organisation. Beckhard[6] has provided some of these assumptions:

[a] The basic building blocks of an organisation are groups.

[b] Reduction of inappropriate competition between parts of the organisation.

[c] Decision-making located at the source of information rather than in a particular role or level of hierarchy.

[d] Parts of organisation manage their efforts against goals and controls are only interim measures.

[e] 'People support what they create'. Participation and sense of ownership is to be developed.

Edgar Schien[7] has mentioned the following necessary conditions for an effective 'adaptive-coping cycle':

[a] The ability to take in and communicate information reliably and validly.

[b] Internal flexibility and creativity to make the changes demanded by the information obtained.

[c] Integration and commitment to the goals of the organisation from which comes the willingness to change.

[d] An internal climate of support and freedom from threat.

Miles[8] *et al* (1966) define the three crucial areas of an organisation:

[a] Task — accomplishment
—clear, accepted, achievable and appropriate goals
—relatively understood communication flow
—optimal power equalisation

[b] Internal integration
—resource utilisation and good fit between personal disposition and role demands
—cohesiveness and 'organisational identity'
—high morale

[c] Growth
—innovativeness
—autonomy
—adaptation
—problem-solving adequacy

James Price[9] has mentioned some propositions:

[a] Greater the articulation, greater the co-ordination and greater the effectiveness.

Co-ordination is facilitated by
—clarity and conformity of norms
—complementarity and sharedness of expectations
—co-operation
—openness of communication channels

[b] Greater legitimacy in the organisation

There are a series of determinant conditions in the particular context of an organisation. Some of these determinant conditions are:

[a] Rapid changes and diversification in the various elements of external environment including higher rate of professional obsolescence.

[b] Highly educated and trained professionals with increased and varying aspirations are joining an organisation.

[c] Changing values at work place for increased democratisation being developed by taking cues from immediate environment instead of tradition and precedence.

[d] Changing nature of job requirements and more complex and sophisticated technology put increasing pressure on the utilisation of latest tools and techniques.

[e] Changing nature of supragoals will provide framework for the goal structure of an organisation.

[f] Social structure of an organisation will acquire greater significance and organic and adaptive structures have to be created to accomplish new tasks.

[g] An integration of individual and organisational goals will provide meaningful tasks to the members.

[h] Appropriate utilisation of finances and accurate audit of all assets will be necessary due to increasing financial constraints.

On the basis of our previous discussion of the conceptual framework, we propose a few hypotheses below. A qualification should be made that not all of these have been tested by our data. But we will raise some issues in the end regarding some of these untested hypotheses.

Hypotheses

(1) High profit records of an organisation do not necessarily indicate a healthy and effective system;

(2) At the managerial level, individual growth is an outcome of group processes;

(3) Individual growth is a function of an effective reward system and future career opportunities;

(4) Frustration and alienation are a function of the gap between aspiration of members and organisational inducements;

(5) Incongruency between authority-structure and centres of power leads on to ineffective decision-making; decisions are deferred, passed on to others and rarely made at appropriate level;

(6) Excessive managerial involvement in routine decisions indicates low productivity;

(7) Authority has to be decentralised near the periphery of the organisation (where emergencies are most likely to arise) to increase its flexibility;

(8) Integration of cultural, psychological, social and organisational levels facilitates communication; (integration here means a meaningful synthesis of numerous differences caused by such variables as personal needs, styles, social groups, etc);

(9) Increased training and developmental efforts will lead to individual growth of members of non-managerial group to broaden their knowledge and provide clearer understanding of organisational goals;

(10) Mutual trust and co-operation will facilitate the building of an image of fairness and rationality of the apex decision-making authority;

(11) The nature and level of technology determines the pattern of employment and personnel practices of the organisation.

We would like to emphasise that our discussion on above hypotheses will evolve around the comparison between two units of Delta Machines. We will try to examine the validity of the above mentioned hypotheses in the light of a comparative analysis between Delta-I and Delta-II units located in the South. In the end, we will make some further hypotheses which could be tested by future research.

Methodology

The questionnaire survey was chosen as the diagnostic instrument to collect data. Though the survey method has certain limitations in terms of the accuracy and authenticity of information obtained, it is still a handy tool. An exhaustive questionnaire was prepared on the following dimensions:

(1) Individual Growth
(2) Group Processes
(3) State of Technology
(4) Organisational Variables, such as productivity, adaptability, etc.

While three parts of the comprehensive questionnaire were common to the different hierarchical levels in the organisation, the part on group processes was given to the members at and above the level of Foreman/Junior Engineer. It was felt that organisation members at lower levels in the hierarchy (supervisors, charge hands and workers) are not generally involved in problem-solving and decision-making groups in the organisation and hence, it will be necessary to attempt to seek data from them on group processes at this stage of the study.

The preparation of questionnaire involved two major considerations:

[a] The appropriateness of questions in relation to the level of members expected to respond to the instrument.

[b] The overall suitability of the instrument to objectively and clearly provide relevant data on the nature and state of the organisation.

On the basis of available data on the formal organisational structure and procedures, it was decided that the design of one single instrument for all the organisational members will not be adequate and effective in eliciting desired information accurately. While no distinction was made between technical and non-technical groups, a distinction was made between managerial and non-managerial groups.

The questionnaire was administered in Delta-I and Delta-II units. It was decided to administer the questionnaire only to one and similar division in each unit so as to provide data for comparison between similar divisions. Production division was chosen in both units. While it was almost 100 per cent sample at the level of Deputy Managers/Managers because of non-availability, block random sampling was done at lower levels by providing representation on the basis of parts, trades and shifts. The break-up of the organisation members included in the survey at the two units is as follows:

Delta-I

Production Division	
Deputy Managers/Managers	10
Foremen/Junior Engineers	10
Supervisors	10
Charge hands 'A'	5
Charge hands 'B'	5
Workers	15
Total	55

Delta-II

Production Division	
Deputy Managers/Managers	5
Foremen/Junior Engineers	10
Supervisors	10
Group Leaders	15
Workers	10
Total	50

Analysis

We are presenting our data and related analysis here. In a further section, we will discuss the validity of our hypotheses based on this analysis. We discuss the data on group processes first as an independent variable for organisational effectiveness.

A *Group Processes*

The responses of the members of the managerial group from the two units are shown in Table 1. Each index in the Table has been calculated on the basis of a series of questions bringing out the essential elements of that dimension. The group from Delta-I seems to be showing a better understanding of the process of problem-solving and decision-making. A further insight can be obtained by the scores of the two groups on the eight dimensions of group maturity:

		Delta-I	Delta-II
(1)	Goals	5.8	5.1
(2)	Participation	5.7	5.6
(3)	Feelings	4.8	4.3
(4)	Diagnosis of group problems	6.1	5.8
(5)	Leadership	4.9	4.5
(6)	Decisions	6.2	5.0
(7)	Trust	4.8	4.8
(8)	Creativity and growth	4.5	3.6

All scores are on a 10 point scale with mean at 5.0

Table 1: Mean Scores on Group Processes

Index	Production* Division Delta-I	Production† Division Delta-II
Problem solving index	2.89	2.49
Decision-making index	2.98	2.51
Communication index	2.92	2.64
Leadership index	2.16	1.97
Inter-group behaviour index	2.56	2.15
Overall index	2.70	2.35

* Sample size = 20
† Sample size = 15
All scores are on a 4 point scale with mean at 2.5

Figure A
Poor sharing of information
(+)

We can make some of the following inferences on the basis of these data:

(1) Low scores for encouragement to new ideas were probably linked to the highly concentrated and task-oriented leadership and low level of trust between groups and individuals.

(2) Low scores on the dimensions of constructive exploration of conflicts and high scores on communication index seem related to the lack of opportunity for taking up leadership roles and a mutually supportive behaviour of the individual members.

(3) Highly technical nature of these groups tends to over-shadow the relevance of group emotion and the psychological needs of affiliation, power and security of the members.

(4) Low scores on cordiality, frankness and sincerity of communication may not reflect lack of mutual trust but seems to be related to centralised leadership and excessive emphasis on formal authority.

(5) Limitation of authentic communication is related to nature of technology. The technology and task-requirements in Delta-II are such that temporary teams and groups are not needed. There is a greater degree of permanence in roles and authority structures in Delta-II. Decision-making process in this unit is very nearly programmed.

(6) In spite of high scores on communication index, member-satisfaction is low. This could probably be due to lack of generation of valid information and ineffective utilisation of available data. Argyris[10] (1971) confirms that member-satisfaction by helpful and usful exchange of information increases if feelings of essentiality, self-acceptance and internal commitment in the group are high.

(7) High emphasis on formal authority in the two units may prove to be helpful in achieving legitimacy in the sanctions and decision-making processes in the organisation, but it is inhibiting members from readily accepting and performing leadership roles.

(8) Leadership is totally based on formal authority and is rigid in Delta-II. This indicates the close relationship between nature of technology and leadership styles. Mott[11] has shown that few leadership skills are needed in a highly structured task situation as in Delta-II.

(9) Dominant differences exist between the two units on the intergroup behaviour index scores. Few members of Unit-II have indicated any understanding of group processes and there appears to be a lot of inter-group conflict in the unit. The scores on sharing of accurate information are very low for Unit-II which results in negative attitudes for other groups. The dynamics of this process is shown in Figure A.

Both these loops are positive feedback loops and tend to reinforce each other. When the trust level between groups goes down and there is a disagreement between groups, the style becomes win-lose power struggle or indifference and smoothing over depending upon the stakes in the situation — from low (passive attitude) to high (active orientation).[12]

(10) While members of Delta-I are performing only instrumental roles in groups, Delta-II members have only developed truncated roles. Members of Unit-II are completely incapable of expressing feelings or handling emotions. Members have failed to comprehend the necessity of dealing with feelings in a highly technical task environment.

(11) Examples of behavioural and primordial roles are plenty in Unit-II. This explains poor scores on growth dimension. The difficulty of members in entering executive roles may be due to fewer conceptual inputs to Unit-II members as shown in Table 2.

TABLE 2: NUMBER OF MEMBERS WHO HAVE BEEN GIVEN OD INPUTS

	Delta-I	Delta-II
Managerial	50	12

TABLE 3: MEAN SCORES* ON TECHNOLOGY DIMENSIONS

All scores are on a four point scale with average at 2.5

A dream today, a reality tomorrow

Today at Mithapur, young India, conscious of the past, urged on by the present, confidently dreams of a glorious tomorrow.

Their immediate dream is of a new complex—massive, self-sustaining, long-range and innovative—harnessing the sea, the sun and ultimately the atom to banish hunger from their land and to generate greater economic self-sufficiency, more and more independence.

There is a beginning but there is no end to the work of bringing purposeful prosperity to the people of India. Harness the sea, the sun, the atom and from Okhamandal—the land of salt—fertility will flow to the entire country.

* Total sample size in each unit is 50
† Sample size = 20
** Sample size = 15
All scores are on a four point scale with average at 2.5

B *Technology*

The mean scores on various technology dimensions are shown in Table 3. On the basis of this data, we can make certain inferences:

(1) Possession and utilisation of technical knowledge is substantially high for both units, with Unit-I scores being relatively higher.

(2) Members from watch factory feel that their organisation has not made any substantial effort to impart knowledge of latest tools and techniques. This need is more deeply felt at the non-managerial levels of the two units.

(3) High efficiency of equipment indicates a high level of sophistication in both the units.

(4) Both units rated poorly on the dimensions of adequacy and utilisation of financial resources.

(5) Lower ratings of non-managerial groups on these two dimensions reflected their lack of information. The organisation seems to have kept them blissfully ignorant.

(6) At the level of professionalisation at Delta Ltd, the scores on the dimension of 'Attitude towards planning' seem to be low. Planning activities are not seen to be linked with better performance.

(C) *Industrial Growth*

The data on the dimensions of this variable are shown in Table 4.

Some inferences can be drawn on the basis of these data:

(1) Clarity of job requirements is rated higher by members of Unit-I.

(2) Overwhelmingly large number of members are willing to accept higher responsibility and are keen to acquire new knowledge.

(3) Perceived career opportunities are rated relatively higher by members of managerial group. But on absolute level these low scores seem to have threatened individual growth and resulted in inefficient performance and and high degree of frustration. Such low scores can be attributed to :

(a) Reward system not linked with performance on the job. 40 per cent members declared good contacts as the basis for promotion.

(b) Sub-optimum utilisation of award system.

(c) Overstaffing of personnel.

(4) Managerial groups' lower scores in relation to non-managerial groups for willingness to take up responsibility could well be due to frustrating past experiences.

(5) Lower scores from both the managerial groups in relation to corresponding non-managerial groups on the dimension of desire to acquire new knowledge could be assigned to :

(a) Already possessed of high level of knowledge.

(b) Sub-optimum utilisations of already possessed knowledge.

ORGANISATIONAL EFFECTIVENESS VARIABLES

The scores on the different dimension of organisational effectiveness are shown in Table 5. On the basis of these data, we can make the following inferences :

(1) There is an emphasis on quality and high standards throughout the organisation.

(2) Efficiency is sacrified for prompt completion of schedules and targets.

(3) Lower levels of co-ordination are leading to lower efficiency in both the units, the state being poor in Unit-II.

(4) While symbolic[13] adaptability is higher in both the units, members find it difficult in 'keeping upto date'. Behavioural adaptability is low due to excessive emphasis on accountability and rationality.

(5) Lower scores of managerial groups from the two units on the adaptability index indicate poor co-ordination and lower inter-personal competence.

(6) Maladaptive[14] behaviour by members of the managerial group of Unit-II leads to substantiate our previous data that inter-group communication is poor and there exist mutual antagonisms between the managerial groups based on distorted perceptions of each other.

(7) Poor integration of the cultural and social-psychological needs of the organisation members and the organisational goals are leading to a langour-prone[15] system in Unit-II.

(8) While managerial groups are expected to possess a greater degree of flexibility, surprisingly opposite result is shown by Unit-II. Inadequate formal co-ordination and centralised decision-making structure may be the possible reasons for this.

(9) Vast majority of respondents from both units regarded their divisions as having fairly centralised decision-making structures.

(10) Appreciable number of members from both units disagreed with the present decision-making structure and wanted greater decentralisation.

(11) Managerial group of Unit-II felt more frustrated by and less involved in the decision-making process compared to non-managerial group.

(12) Utilisation of expertise in decision-making was rated higher by the managerial groups of both the units.

(13) Feeling of inappropriateness of level at which decisions are made is expressed more from Unit-II. There appears to be an incongruence between decentralised authority and centralised power structure.

(14) The legitimacy of centralised structures is governed by the social and cultural values of the organisation members. The respondents did not

TABLE 5: SCORES ON THE DIMENSIONS OF ORGANISATIONAL EFFECTIVENESS

Dimensions	Production Division Unit-I			Production Division Unit-II		
	Overall	MG*	NMG	Overall	MG†	NMG
Productivity index (quality, quantity and efficiency)	3.34	3.21	3.41	3.14	2.92	3.23
Adaptability index (anticipation of problems, promptness and prevalence of adjustment)	3.26	3.36	3.19	3.15	2.92	3.19
Flexibility index	3.48	3.81	3.26	3.41	3.25	3.48
Decision-making index (involvement, use of expertise, encouragement to team work, appropriateness of level, influence of members on decisions)	3.35	3.77	3.14	3.53	3.69	3.43
Co-ordination index (ease in working together and in exchange of helpful information, well-planned work assignments)	3.27	3.27	3.27	3.15	3.11	3.18
Trust index (opportunity to learn by doing, freedom to set own pace, sincerity in dealings, sharing personal aspirations)	3.15	3.72	3.39	3.17	3.15	3.18
Horizontal communication index (ease in initiating and exchanging information, use of peer-expertise, informing mistakes of peers)	3.64	3.82	3.37	3.39	3.34	3.42
Unit-HQ relationship index (understanding of units' needs, fairness, reasonableness, autonomy, to units)	3.32	3.54	3.10	2.82	2.84	3.14
Member-satisfaction index (opportunities to use knowledge and skills)	4.15	4.23	3.90	2.90	2.93	2.88
Structure index (suitability of control mechanisms)	3.10	3.75	2.87	2.51	2.50	2.51
Adequacy of exchange with external environment	2.50	1.99	2.80	2.50	1.86	2.97
Superior-subordinate relationship index (interest in helping, informing, encouraging, listening to the new ideas of and awareness of the needs of the subordinates, planning with and sincerity in dealing with the subordinates)	3.63	3.78	3.57	3.00	3.18	2.91
Overall effectiveness index	3.39	3.52	3.28	3.02	2.97	3.12

* Sample size = 20
† Sample size = 15
All scores are on a five point scale with an average at 3.00

show any great preference for complete decentralisation that Likert's[16] studies could have led us to expect.

(15) Members of managerial groups from both units have indicated lower scores on the index of co-ordination compared to corresponding non-managerial groups. This leads one to expect considerable amount of interpersonal tension and friction at the higher levels of the organisation.

(16) Low scores of Unit-II managerial group members on some of the dimensions of Trust index relates to the lower level of co-ordination.

(17) A culture of competition has generated inter-personal conflict leading to lower levels of co-ordination and trust. Poor career opportunities and lack of career plan for the members is reinforcing this competitive culture.

(18) In the absence of shared expectations, members are operating in a highly ambiguous and uncertain situation which creates a sense of frustration due to excessive suspicion and anxiety.

(19) Inadequacy of communication among peers and insufficient exchange of information are forcing a lower level of trust in the organisation.

(20) Members of the two units seem to feel that mistakes are handled rather punitively which deprives them from learning.

(21) Lower scores by members of managerial group of Unit-II compared to corresponding non-managerial group on the index of horizontal communication confirms our previous inference about lower levels of trust in this group.

(22) Scores of Unit-I are consistently higher on the index of horizontal communication compared to Unit-II.

(23) Members of the two units have experienced difficulty in accurately informing the mistakes of their peers.

(24) Unit-I appears to have better understanding of and relationship with Head Quarter compared to Unit-II.

(25) Extremely low scores on understanding and positive relationship with Head Quarter in Unit-II could be due to:

"Units can develop resentment towards Head Quarter for many reasons. For example, such unit is treated as a profit centre. However, the profitability of the whole organisation may sometimes require that a given unit do something which reduces its own profitability."[17]

The case in point is only opposite to this but very relevant. We have discussed this point later on.

(26) While managerial group of Unit-I has rated higher compared to its non-managerial group on the index of unit-HQ Relationship, opposite trend is visible in Unit-II.

(27) Typically, the overall relationship can be described as acquiring a gradual shift in the directions indicated. (see Figure B).

(28) Member satisfaction was rated much higher in Unit-I than in Unit-II. The low score in Unit-II is largely due to the extremely routine and mechanised nature of work in Unit-II conditioned by the nature of its product and its technology.

(29) Members of the two non-managerial groups feel more dissatisfied in the two units.

(30) Control mechanisms of Unit-II are causing hindrance to effective work-performance.

(31) Wide discrepancy between the responses of two groups from Unit-I indicates ineffective implementation of these control mechanisms at the lower levels.

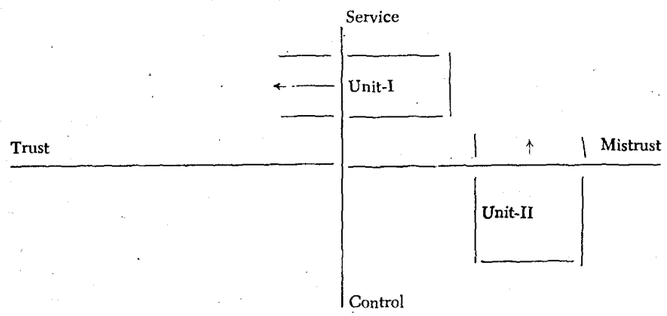
(32) Scores from the two units indicate ineffective exchanges with the different elements of external environments.

(33) In spite of good external image of the total organisation, exchanges across the boundary are ineffective.

(34) Responses from Unit-I on the index of Superior-Subordinate Relationship are high and indicate greater co-operation, help and recognition characterising this relationship.

(35) Superior-Subordinate Relationship in Unit-II is marked by distrust, poor encouragement and recognition and lack of help and communication.

(36) Communication seems to be the basic inhibiting factor leading to distrust and circumscribed behaviour in Unit-II.



(37) Confused and disorderly relationship in Unit-II appears to be hinder-

TABLE 6: MEAN SCORES ON DIMENSIONS OF ORGANISATION CLIMATE

Dimension	Unit-I		Unit-II	
	Actual	Desired	Actual	Desired
Non-conformity	3.7	6.9	4.8	5.8
Responsibility	5.3	8.4	4.2	8.1
Standards	6.2	7.8	4.7	8.0
Rewards	4.1	8.8	3.4	8.0
Organisational clarity	4.5	8.8	4.9	7.8
Warmth and support	4.6	8.9	4.9	8.4
Leadership	4.4	8.9	3.9	8.0
Conflict resolution	4.8	8.3	4.8	7.7
Overall mean	4.7	8.3	4.3	8.0

Total sample size is 50 in each unit. All scores are on a 10 point scale with an average at five.

FIGURE B

ing the efforts of increased production and member-satisfaction from their work-place.

ORGANISATION CLIMATE

Table 6 indicates the scores of the two units on the eight dimensions of organisation climate:

(1) Wide gaps in actual and desired states of Unit-I are indicated on the dimensions of rewards, organisational clarity, warmth and support, leadership and conflict resolution.

(2) Wide gaps in actual and desired states of Unit-II are indicated on the dimensions of responsibility, standard, rewards and leadership.

(3) Mean actual and mean desired scores are lower for Unit-II compared to Unit-I.

(4) High scores on conformity in Unit-I indicate excessive emphasis on rules, procedures and policies which are hindering the creativity and circumscribing the freedom of its members.

(5) There appears to be a great emphasis on high standards in Unit-I.

(6) Rather low scores are indicated for the desired state of the units on the dimension of conformity.

DISCUSSION

Previous analysis leads to the validity of some of our hypotheses. We shall now go through these hypotheses in the light of our analysis.

Unit-II is a monopoly organisation in the country. Its products are highly popular mass consumption items. It has been consistently making profits because of this monopolistic nature of its products. Unit-I is engaged in the product line which faces high competition and the nature of technology is such that its profitability is low. During the past few years, Unit-I has not been making any profit. However, the overall mean scores on different organisational effectiveness indices indicate that Unit-I is a more effective system in comparison to Unit-II. This gives support to our first hypothesis.

On performing a regression analysis, the equations for the managerial groups of Units-I and II are equations (1) and (2) respectively:

$$Y = -6.39 + 5.03x_1 - 2.71x_2 + 1.23x_3 \quad (1)$$

$$Y = -1.89 + 0.84x_1 + 0.60x_2 + 0.13x_3 \quad (2)$$

where Y = organisational effectiveness
x_1 = group processes
x_2 = technology
x_3 = individual growth

Similar equations for non-managerial groups of Units-I and II are (3) and (4) respectively:

$$Y = -0.19 + 0.34 \times 2 + 0.48 \times 3 \quad (3)$$

$$Y = -1.62 + 0.57 \times 2 + 0.03 \times 3 \quad (4)$$

This indicates that in the managerial groups, the major contribution to organisational effectiveness is made by group process. Relatively, the co-efficients of individual growth are much lower in the presence of group processes. At non-managerial levels, the incidence of individual growth acquires greater significance. Moreover, in our previous discussion of Group Processes, we noted the inability of members to experience a supportive relationship, mutual recognition and encouragement to take up more complex leadership roles. Few members of the managerial group were able to perform executive roles due to poor comprehension of group processes. The effect was more in Unit-II where level of conceptual inputs in group processes was also low and most members of its managerial group were confined to primordial roles. This lends sufficient support to our second hypothesis.

The reward system of the two units has been indicated to be ineffective and inefficient. Comparatively, the scores were lower for Unit-II on the reward dimensions. Scores for perceived career opportunities were extremely low on an absolute basis, and comparatively Unit-II scores were lower than in Unit-I. The extent of individual growth has already been established to be lower in Unit-II in comparison with Unit-I. This lends support to our third hypothesis.

Members of Unit-II are relatively more frustrated, indifferent and alienated. Low scores on the dimensions of decision-making, willingness to take up more responsibility and poor involvement in problem solving and decision-making substantiates our above contention. Members of Unit-II have also shown a wider gap between actual and desired states of their unit on the dimensions of responsibility, reward and standards. Organisational inducement in the form of interpersonal recognition, collaborative peer relationship, supportive superior-subordinate relationship etcetra are almost non-existent in Unit-II. This shows that on the one hand members of Unit-II are finding greater gaps between their aspirations and organisational inducements and on the other hand they are experiencing greater frustration and alienation, thus validating the fourth hypothesis.

As we have discussed earlier, there appears to be a highly centralised decision-making structure in the two units. At higher levels, the authority is more decentralised in the two units but more decisions are deferred or passed on to next higher levels or not taken in Unit-II as compared to Unit-I. Members of Unit-I find it easier to accept and take decisions in comparison to members of Unit-II. This indicates that power of decision-making is more centralised

in Unit-I, and there appears to be a mismatch between decentralised authority and centralised power structures in Unit-II. Moreover, managerial involvement in routine matter has been indicated to be higher in Unit-II and the executive functions of gate-keeping and interface control are concentrated in a few key individuals in this unit. Unit-II has also indicated lower productivity in comparison to Unit-I on all the three dimensions of quantity, quality and efficiency. This validates our fifth and sixth hypotheses.

Our data show that the two units are rated slightly above-average on the dimension of flexibility. This may indicate the increasing need for making the organisation more flexible. Since we did not make any detailed analysis of authority structure, specially near the periphery, we cannot prove the seventh hypothesis. However, it is appropriate to mention that our data do indicate a centralised authority structure (in general) and rigid leadership styles, more so in Unit-II.

While scores on communication indices are not very encouraging from either unit, we cannot establish eight hypothesis in the absence of any data about the cultural and social-psychological environment of the organisation. However, we do feel that the poor integration between different groups of the two units (as shown by the data and analysis) is largely due to the fact that normative environment of the organisation fails to encompass the various cultural and social-psychological values of its members.

Members of the non-managerial group of Unit-II have shown lower scores for the organisational effort in imparting knowledge and training to them. Moreover, they have expressed greater desire (compared to their managerial group) to acquire new knowledge, training and skills and an overall organisational perspective. Similar trend is exhibited in Unit-I though the scores are relatively higher. Higher scores on individual growth dimensions by non-managerial group of Unit-I corresponds to their higher scores on the index of organisational effort to impart training and knowledge to them. This validates our ninth hypothesis.

Our data do not produce very conclusive evidence of the tenth hypothesis. However, we feel that higher scores by the members of Unit-I (as compared to Unit-II) on the dimension of Unit-HQ Relationship index are reflective of a relationship characterised by somewhat more mutual trust, understanding and co-operation. It will not be inappropriate to remind here that the HQ image of fairness and reasonableness is not shared by the members of Unit-II. The members of Unit-II (which is earning high profits) do not approve of the sharing of their "hard-earned" profits by Unit-I. This lends some support to our hypothesis.

In support of our eleventh hypothesis, we are not able to present any more data. However, the nature of technology at Unit-II is such that majority of tasks are repetitive and routine skills that are required are simple in nature. The employment pattern shows a high percentage of women engaged in such tasks. The average stay of these women workers in the unit is between 3 and 4 years. And they take up this simple job mainly as a stop-gap arrangement between their schooling and marriage. Moreover, they are able to save some money through employment. These women employees are not very much interested in a long-term career plan. This feature has led the top management to adopt *ad hoc* personnel policies without any clear-cut career-plan and promotion policy. This has led to frustration in male employees of the unit. The approach is different in Unit-I where the level of technology is sophisticated and complex skills are required. The employment pattern is correspondingly different (overwhelming majority of male workers) and so are the personnel policies (of course, within the broad framework of the total organisational policies). This lends substantial support to our eleventh hypothesis.

Conclusion

We are now in a position to make a few concluding remarks. The study suffers from a few limitations. One of them is a small sample size restricted by time constraints. Another significant limitation is the static nature of the data. More meaningful analysis can be made by obtaining responses over a period of time to give insight into trends and processes of change.

We have tried to support a few hypothesis by a comparative analysis. We feel that more rigorous analysis can be done for each index, variable and hypothesis. However, under the limited scope of this study, this was not feasible. We feel that further research will provide greater insight and may even modify the hypotheses.

We will end by proposing a few hypothesis which could provide framework for future research:

(1) Overemphasis on accountability in organisations increases the rigidity of the structure leading to lower levels of organisational effectiveness.

(2) Over-conformity in an organisation acts as a hindrance to creativity and innovativeness.

(3) Aspirations and socio-cultural values of members determine the extent of conformity functional for organisational growth.

(4) In a technology based organisation continuous striving for latest tools and techniques can create a technologically normative environment rewarding competence and effective utilisation of knowledge.

(5) Clarity in the normative environment of the organisation leads to greater productivity and fewer conflicts.

(6) Awareness of self and others leads to increased interpersonal competence.

(7) Continuous rethinking on the goal-structure of the organisation can lead to greater effectiveness by incorporating changing aspirations of its members and the external environment.

Administrative Remoteness in Branch Banking

Tushar K Das

The problem of administrative remoteness in a bank with a large number of branches is not merely one of communication difficulties stemming from geographical distance. The existence of a large and growing body of relatively inexperienced managers adds a crucial dimension to this problem. Various organisational strategies have been adopted by banks to attain the desired degree of effectiveness in administering their branches.

This article briefly touches upon some of the traditional approaches, such as dispersed controlling offices established in the heart of particular areas, the concept of link branches, and the system of personal visits of headquarters officials to branches. It then discusses in some detail the institution of the Area Superintendent which has been designed by the State Bank of India with the object of providing the controlling authority with yet another instrument of administration.

Each bank has naturally to judge for itself whether this new organisational position, or rather this new approach to reducing administrative remoteness, is relevant to its own peculiar needs. As there are rarely any standard solutions in organisational matters, a bank has necessarily to work out a strategy appropriate to its requirement.

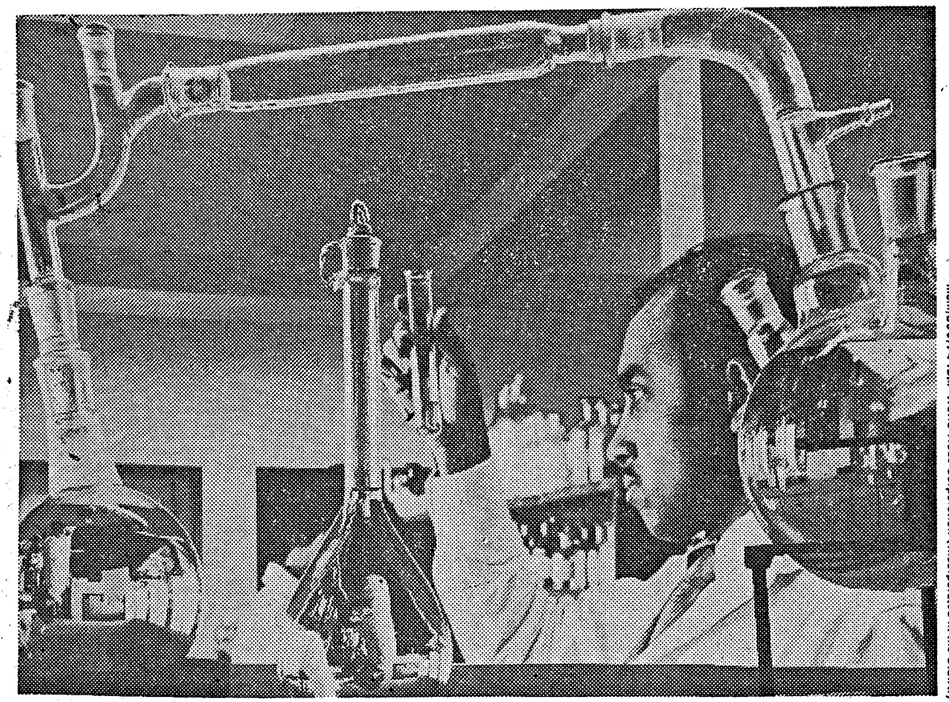
ONE of the characteristics of commercial banks in this country, as in many other countries, is that their branches are dispersed over a wide geographical area. This problem is further accentuated by the continuing policy of ambitious branch expansion (especially after the nationalisation of the 14 largest banks in 1969) with the emphasis on opening offices in hitherto unbanked centres in rural and semi-urban areas. This national policy will remain unaltered for some time to come, and quite rightly so, till we have a reasonably satisfactory network of branches for making basic banking facilities available to all sections of the population, including in the rural areas.

It is in this context that we have to consider one of the crucial problems facing bank managements today — that of efficiently administering branches which are remote from the headquarters. One of the problems of administration of branches which are at a distance, are small in size and are numerous, has been that of inadequacy of communication facilities. Another aspect of administering a large number of outlying branches has to do with the fact that, having regard to the rapid expansion programmes which have been planned, managements have to contend with a large complement of relatively junior and inexperienced branch managers. And since this condition is going to remain with us in the foreseeable future — training facilities being grossly inadequate even today — more and more such junior officers will man the ever-growing number of bank branches. This means that much more than ordinary effort has to be put in by the controlling offices of banks (head offices, regional offices, etc).

Bank managements have been exercised over this problem of administrative remoteness and have devised various strategies to tackle it. We shall, in this paper, briefly touch upon some of the traditional methods of solving the problem and see how they do not quite lead to the degree of administrative effectiveness we desire, either singly or in combination. We shall then go on to a somewhat detailed discussion of a novel organisational position designed and developed by a particular commercial bank to overcome the problem of administrative remoteness.

Dispersed Controlling Offices:

One of the conventional strategies adopted to reduce administrative remoteness is to establish a controlling office for a cluster of branches situated in a compact geographical area and to have this controlling office right in the heart of that area. This affords the controlling office easy access to the branches under its jurisdiction and frequent contact can be maintained with each of the Branch Managers. The quality of administration naturally improves on account of this proximity.



However, having a controlling office for every group of branches situated close to it automatically means that there would be quite a few such controlling offices. The major constraint here is the cost of running these offices. Their number may be large in case the bank has a few hundred branches. The result is a long hierarchy of offices, increasing the distance of each lower office from the central or apex office. There thus arises the fresh problem of co-ordinating and administering these controlling offices spread over a very wide geographical area. From the point of view of effective management this problem of co-ordinating and integrating the activities of a large number of controlling offices is, in many respects, no less onerous than the original problem of administering outlying branches.

Another drawback of this system is that these controlling offices, situated as they are far from the head office (or central office), would not be in a position to contribute significantly to the policy-making function of the bank's management. The head office of the bank, in turn, would not be able to communicate satisfactorily its thinking on various matters to the numerous zonal or regional controlling offices. Uniformity in the interpretation of instructions would, again, be difficult to ensure with too many controlling offices. In other words, by having this arrangement of dispersing the administrative function of the head office from headquarters to a number of far-flung controlling offices, the bank loses some of its capability for high-power administration.

Link Branches and Personal Visits

There is also the concept of the link branch in which a particular branch not only functions as an independent branch but has also to supervise, as a sort of group-in-charge, some aspects (e g, development of business, especially loans) of the work of surrounding branches (which are treated as sub-branches for this purpose). This arrangement is intended to reduce pressure at the controlling office and expedite the disposal of certain types of operational matters. However, the link branch is ordinarily unable to attend to personnel problems and other administrative matters; these continue to be looked after by the controlling office.

It has also been the traditional practice of commercial banks to send

THE
NEW DIMENSIONS
OF RESEARCH

Research holds the key to the nation's technological advancement. A growing number of Indian universities and research institutions are using modern techniques and tools—like computers—to bring the benefits of technology to more and more people.

Agricultural scientists are using computers to evolve high-yield seeds. Structural engineers are applying computer techniques to design economical, safer buildings.

Industrial researchers are developing new processes and import substitutes. And meteorologists can now predict weather conditions with greater precision.

Using modern computers like IBM System/360 and System/370, these institutions are imparting new dimensions to research and development in India.

Data processing machines are not only being used in India but are also being manufactured and exported. IBM's plant in Bombay, which produced India's first commercial computer in 1966, has pioneered the indigenous production of data processing machines.

At the Plant, over 350 Indian scientists, engineers and technicians are engaged in the development and manufacture of these machines. Their efforts are helping develop indigenous skills. And their products are winning foreign markets for sophisticated Indian electronic equipment. The value of exports of India-built IBM data processing machines to date exceeds Rs. 12 crores.

This marks for India a significant contribution to the electronic age—an age in which computers are helping people help people.

IBM

officers from the controlling offices to visit branches to personally investigate problems. These personal visits have usually furnished the controlling authorities with a feel of the local situation and the visiting official uses the opportunity to discuss problems with the branch manager and other concerned persons. The information gathered from discussions with the branch manager and the analysis and solutions suggested by the latter have their utility to the controlling office for taking decisions or chalking out strategies or amending existing policies. These visits are undertaken as and when a problem arose, or an investigation is called for, or a feel of the local situation is required. However, there is usually no co-ordinated approach to sizing up and solving the problems faced by branch managers. In recent years because of the growing number of problems and their increasing complexity, coupled with the general inexperience of the cadre of officers, this system of unorganised, unplanned, almost informal visits has become ineffective in relation to the information needs of the controlling offices.

It is necessary, therefore, to think of other means of solving this problem. It is also becoming increasingly necessary to have more frequent glimpses of branch affairs because of the fast-changing nature of the business environment. Also, regular contact with the branch manager by a person from the controlling office is becoming imperative on account of the relative inexperience of the branch managers in the smaller outlying branches. It is no longer sufficient, as it perhaps was previously, for officials to visit branches when they felt like it or when an emergency arose. It is necessary today to have continuous knowledge of the state of affairs at a branch so that emerging problems can be spotted early enough and preventive measures initiated.

In view of the above considerations, the State Bank of India, which was facing an acute problem of maintaining administrative control over the rapidly increasing number of branches at great geographical distances, decided to adopt a somewhat novel method of tackling the problem.

The Area Superintendent

The problem of administering the growing number of outlying branches had been exercising the minds of the top management of the State Bank of India for the past few years. In an attempt to solve the problem, the management decided to introduce a new position in the Bank's organisational structure (which was, incidentally, thoroughly overhauled during 1971-72).[1] This new position or official is called the Area Superintendent.

The State Bank has a Central Office at Bombay at the apex and nine Local Head Offices at various state capitals, which have jurisdiction over specified parts of the country. These Local Head Offices are thus each the headquarters or controlling offices for specific areas of the country known as Circles. A Circle generally has a full state or more than one state/union territory under its control. A Circle is divided into two or more Regions. Each Region covers a number of contiguous revenue districts, and has around 75 branches in it. A Region is, in turn, subdivided into two or three Areas, with a total of around 25 branches in each Area. The branches are under the direct control of the Regional Manager.

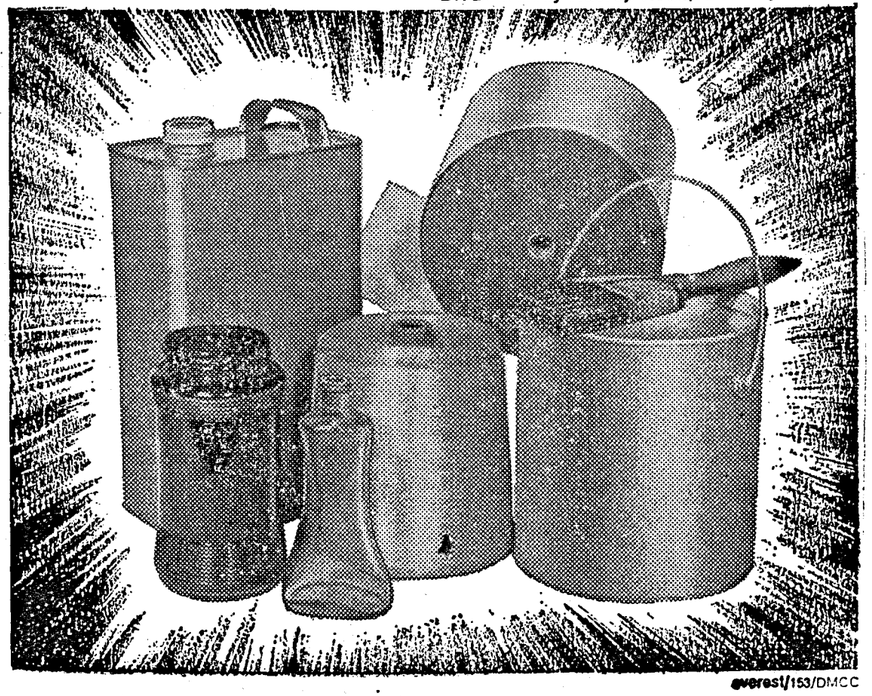
The Area Superintendent does not figure in the chain of command between the Regional Manager and the Branch Managers. He is basically a member of the Regional Manager's Department (which is a part of the Local Head Office) and is a resource to the Regional Manager, who has total operating responsibility for the branches in his Region. The Branch Manager is of course fully responsible for the performance of his branch. The Area Superintendent is thus a special kind of resource to the Regional Manager to be employed in the manner we shall describe presently.

The Area Superintendent is immediately responsible to the Regional Manager under whom he works. The position of the Area Superintendent has been created in order that (a) frequent personal contact can be maintained by the Local Head Office (the Regional Manager) with the Branch Managers, and (b) to help and counsel the Branch Managers in improving the quality of their managerial decisions. The Area Superintendent should thus be able to assist the Branch Managers in gaining a thorough understanding of the Bank's policies and strategies, in developing their ability to interpret and employ operational and environmental data for managerial ends, in improving their capabilities in decision-making, and in acquiring appropriate skills in the supervision of their staff. The Area Superintendent thus has the following duties and responsibilities: scheduling his visits to branches according to their needs; explaining the Bank's policies and procedures to the Branch Managers and providing guidance to facilitate their implementation; reviewing the work of Branch Managers with a view to helping them to improve the quality of their decisions; discussing specific issues relating to performance, as as indicated by the Regional Manager, and generally helping the Branch Managers to obtain such support from the Regional Manager's Department as might be required for achieving the objectives set out for them; satisfying himself generally that the Branch Managers understand and follow the systems and procedures prescribed by the Bank for the security of its business operations; keeping the Regional Manager informed of the operations of the branches assigned to him in order that the Regional Manager is reasonably familiar with various aspects of their operations; and furnishing the different specialist functionaries at headquarters with relevant information about the operations of branches in order to assist them in formulating effective business policies and administrative control mechanisms.

In sum, therefore, the Area Superintendent is basically a counsellor of Branch Managers. However, he is not a manager, in the sense that he has no subordinates (though he does have a boss, the Regional Manager), he has no authority (either financial or administrative), he cannot issue any instructions, and he has no occasion for managerial control.

It would be evident that to be successful, the Area Superintendent should have a strong background in operational banking, be skilled in interpersonal relations, and have rather low power needs. An attempt was therefore made by the Bank to select officials with the requisite professional experience and personal attributes.

The selection was made according to the following broad criteria:



(i) Thorough knowledge of the Bank's policies and procedures.
(ii) Wide operational experience, particularly in the area of personnel, credit, and developmental activities.
(iii) Enthusiasm and aptitude for acquiring knowledge and transferring it to Branch Managers.
(iv) Ability to develop effective relationships with Regional Managers, functional and staff specialists, and Branch Managers.
(v) Minimum concern for power and authority as bases for efficient

working.

(vi) Willingness to travel widely and frequently.

(vii) Keen interest in human beings and their problems.

The kind of work required to be performed by the Area Superintendent had never been done in the Bank. It was considered necessary therefore that the Area Superintendents should be imparted skills necessary to do their job well. Accordingly, all Area Superintendents were covered by a special training programme. The programme had the following broad objectives:

(1) To help the participant develop an attitude of openness and flexibility: this was particularly important if he had to win the confidence of the Branch Managers as well as the Regional Managers.

(2) To make a realistic appraisal of his own need for power and authority.

(3) To expand his awareness of how he affected others and how the behaviour of others affected him.

(4) To develop his ability to foster meaningful inter-personal relations, so that the Branch Managers felt free to discuss their genuine problems with him instead of referring only to trivial matters

(5) To develop helping skills, so that he could provide help to the Branch Managers in a way which was meaningful and was not seen as merely critical.

(6) To develop communication skills necessary for clarifying the Bank's policies to the Branch Managers and providing information about branches to the Regional Managers as well as functional and staff specialists.

(7) To develop diagnostic skills for detecting the problems emerging at the branches, so that these are kept in mind in discussions with the Branch Managers.

(8) To develop empathy skills to understand the problems of others in the proper perspective and interact with the Branch Managers on the basis of equality rather than superiority.

Method of Working

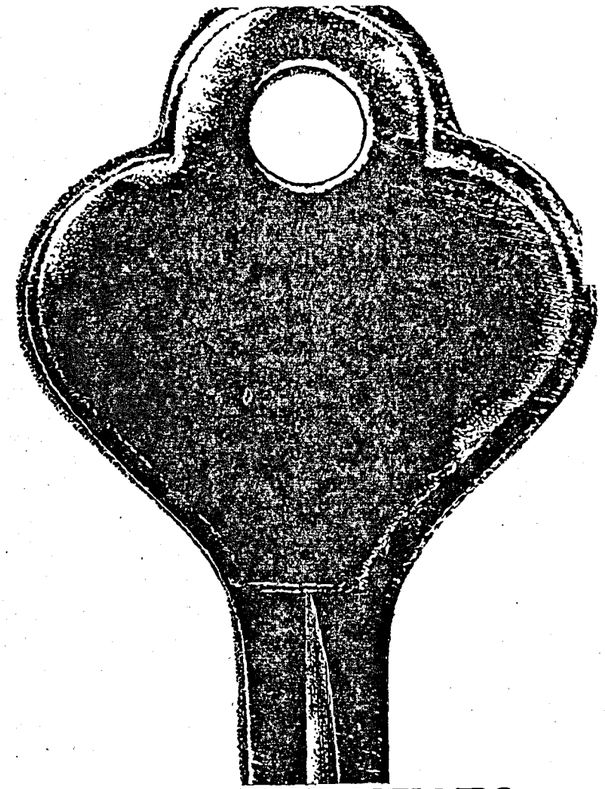
An Area Superintendent has on an average 25 branches in his Area, and is required to visit each branch about once in six weeks. An Area Superintendent may be allotted around 15 branches in case his Area is situated far away from headquarters or when the transport facilities are not fast or efficient enough (hill-tracts, sparsely populated semi-desert territories) and even around 40 branches if the Area comprises branches situated in the immediate vicinity of the Local Head Office.

Before going out on tours the Area Superintendent is briefed in detail by the Regional Manager about important matters to which the former should pay specific attention at particular branches. The Regional Manager also explains to him how to proceed in regard to the more important matters. This detailed briefing is very necessary in order that the Area Superintendent is able to reflect the Regional Manager's mind while talking to Branch Managers; it helps the Area Superintendent to explain to the Branch Manager some of the rationale behind the decisions made by the Regional Manager. This briefing also provides the Area Superintendent with an opportunity to learn from the Regional Manager himself the current position about important matters pending in the Regional Manager's Department so that he can inform the Branch Manager concerned how these matters stand at headquarters.

After the tour schedule is chalked out and agreed upon by the Regional Manager, the dates and timings of visits to the different branches are advised to each of the Branch Managers so that the latter can make arrangements to be present at the time of the visit of the Area Superintendent. Also, the Branch Manager can be prepared with the problems he wishes to discuss with the Area Superintendent.

During his visit to every branch, the Area Superintendent calls into play all his skills in relating with persons, establishing rapport with the Branch Manager, guiding him to come forward with the problems at the branch (and their analyses, discussing the problems and other matters, and, finally, counselling the Branch Manager. However, as the Area Superintendent has ultimately to remember and report back to the Regional Manager the highlights of these discussions, and attend to specific matters, like following up proposals, eliciting particular information at the Local Head Office, conveying certain views and suggestions to particular officials at headquarters, etc, it is necessary for the Area Superintendent to maintain some sort of record or jottings to serve as an *aide memoire* for his activities on returning to headquarters. This applies also to points to be discussed with individual Branch Managers. In many instances, the Area Superintendent has found it convenient to maintain a diary specifically for noting down such matters.

On return from each tour the Area Superintendent reports to his Regional Manager in person about the major problem areas he has discussed or found at the branches and also his analyses and suggestions on all these matters. In these face-to-face discussions the Area Superintendent is able to project in a realistic manner the state of affairs at the branches so that the Regional Manager can form a pretty good idea about the branches which need his special attention and also the kind of guidance and resources that each branch requires. In certain cases where details are involved or where the subject is of substantial importance, the Area Superintendent prepares a short report in writing for permanent record as also to enable the Regional Manager to take necessary follow-up action.



In regard to the question as to which branch called for how much attention on the part of the Area Superintendent, it was observed that there was wide divergence between different categories of branches. In a large number of cases, relating mostly to branches which were quite small in size, very little attention was needed in the sense that the visits of the Area Superintendent were not considered necessary at the usual frequency of about one visit every six weeks. On the other hand, for quite a few branches which were medium size, and also some smaller ones, it was deemed desirable to pay closer attention and arrange visits at frequent intervals; these were not as regularly spaced as in the case of the smallest branches but had to be planned and undertaken according to the changing needs and problems of these branches. At the other extreme were those branches which required very frequent visits and almost constant attention for a certain period because of the existence of numerous problems or an escalating situation.

There are many items of work which usually form part of the discussions between the Regional Manager and his Area Superintendent. While emerging problems no doubt form the major part of the discussions, we may cite here a few of the more frequently occurring areas of work, where consultations have usually been considered necessary between these two officials. These are:

(a) determining tour programmes;

(b) clarifying the decisions taken by the Regional Manager and the advice rendered by the Area Superintendent to Branch Managers;

(c) eliciting more information about matters pending in the Regional

Manager's Department;

(d) bottlenecks in the working of the Regional Manager's Department which affect the branches;

(e) identifying recurring irregularities at branches which have been noticed from control returns and successive audit reports;

(f) determining remedial measures for irregularities reported in audit reports;

(g) problems in personnel management — personnel relations, staff requirements, transfers, etc;

(h) training needs;

(i) premises and furniture;

(j) customer service; and

(k) problems in the budgetary process — settlement, variances, corrective measures.

There are many other areas of business and administration which are discussed by the two officials, but it has been found that by and large the above list of activities demand most of the time and attention of the Regional Manager and the Area Superintendent in their discussions. It is of course true that in accordance with the varying conditions obtaining in an Area, one or more of these listed activities account for a major part of the Area Superintendent's time.

Rapport with Branch Managers

It is one of the fundamental points of the role of the Area Superintendent that he has to function on the basis of a reasonable understanding and rapport with the Branch Manager. It is only when the Area Superintendent is able to win the confidence and trust of the Branch Manager that the latter will come out with his problems, doubts and areas of ignorance. This becomes particularly relevant when we remember that Branch Managers are mostly subject to the normal inhibitions in regard to sharing problems with headquarters officials. There is the understandable fear that a frank expression of one's difficulties may well lead to an impression of one's comparative inepititude. The Area Superintendent thus has the important responsibility of creating conditions for drawing out the Branch Manager. Further, without a friendly and trusting relationship it is not unlikely that the Branch Manager would refuse to accept the advice tendered by the Area Superintendent. If this kind of understanding relationship is missing, the Area Superintendent would most likely be taken as an auditor (albeit in a different guise) or an official who is visiting the branch with the objective of spying on the Branch Manager and his activities on behalf of the Regional Manager.

A large majority of Area Superintendents did not have much difficulty in being accepted by the Branch Managers who were by and large junior to them in rank and service in the Bank. Even with those who were of the same age, service and seniority, there was no great difficulty in establishing proper rapport. However, the Area Superintendent found it a problem to relate on congenial terms in the initial stages with those Branch Managers who were older than he in age or were longer in service, although they were not senior to him in the Bank's hierarchy. These latter Branch Managers, because of their experience in their job, were somewhat reluctant to recognise the usefulness of the role of the Area Superintendent. Their apparent hostility to the Area Superintendent was born out of a feeling that their own long experience was being made light of. In the case of Branch Managers who were senior to the Area Superintendent in rank, the visits were more or less in the nature of courtesy calls and were undertaken mostly when the Regional Manager desired these or when the Branch Managers themselves sought assistance in minor matters. However, irrespective of the nature of the initial reception accorded to the Area Superintendents by the Branch Managers, it was incumbent upon the Area Superintendent to lay the foundation for his future work by establishing a cordial and understanding relationship with all of them. This was mostly accomplished after 2 or 3 visits and, except for one or two cases where the Branch Managers for some reason refused to co-operate or were indifferent in the matter, the Area Superintendent could be successful in this initial objective.

In establishing the necessary rapport, the Area Superintendent faced a variety of obstacles. We give below a selection of incidents which might give an idea of the type of problems encountered by the Area Superintendent in dealing with initially non-co-operative Branch Managers.

(a) the Branch Manager had an extremely negative attitude to business development and was generally not very co-operative with his controlling authority, the Regional Manager, in making the extra effort expected in different organisational situations. The real reasons for this kind of behaviour, not characteristic on the part of the Branch Manager, could not be easily surmised by the Regional Manager. When the Area Superintendent decided to explore this problem, he could identify the cause of the Branch Manager's untypical attitude. It came out that he badly desired the transfer of a recalcitrant employee out of his Branch. When this problem was identified, the Regional Manager could assure the Branch Manager that the problem would certainly be looked into and appropriate measures taken. The attitude of the Branch Manager changed remarkably from that point of time, and he was much more forthcoming in regard to the development of business and responsive to directions from the Regional Manager.

(b) A Branch Manager was very keen on being transferred from his branch situated in a fairly big rural centre to a metropolitan city to which he belonged. Conditions at the branch were not satisfactory, and the Branch Manager was generally unable to carry on well with his subordinate employees. His business, mainly agricultural finance, was suffering. The Area Superintendent, in jointly exploring these problems with the Branch Manager, was able to identify the real problem as the comparative ignorance and inexperience of the Branch Manager about the policies and procedures governing agricultural finance. The Branch Manager was helped to realise that this was the main cause of most of the troubles that he was facing, including loss of confidence of the employees and failure to have the loan proposals approved promptly by the higher authorities. An experienced official, well-versed in the operating procedures of agricultural finance, was accordingly posted at the branch. The Branch Manager was also assisted by the Area Superintendent with suggestions about how to pick up the expertise in agricultural banking on his own within a short period. With increased confidence acquired with the passage of time, the Branch Manager did not find it necessary to press for his transfer to a big city, nor did he encounter any difficulty in get-

ting along with the employees at the branch. Business prospered and the Area Superintendent was often consulted by the Branch Manager — something which he had never done before, except for pleading about his transfer.

(c) Having lost a promotion, a Branch Manager was in a dejected mood when he was transferred to a branch which was in a bad shape, with considerable arrears of work. When the Regional Manager's Department sent communications urging the expeditious reduction of backlog in various areas, the Branch Manager became convinced that his superior had a poor opinion of his work. At this stage, the Area Superintendent stepped into the picture, and put forward to the Branch Manager the point that the latter had been posted at the branch precisely because he was considered capable of restoring it to a proper state of efficiency. The fact that he had been overlooked for promotion had not been because the Regional Manager had a bad impression of him. The Area Superintendent also informed the Regional Manager that hard work was being put in by the Branch Manager to tone up the branch. Whereupon, to reassure the Branch Manager, the Regional Manager spoke to him on the telephone and clarified the situation. The role of the Area Superintendent in this episode was considered very useful by the Branch Manager.

(d) A Branch Manager had, for a variety of reasons, a resentment against the Local Head Office authorities. Most of these antipathies, according to the analysis made by the Area Superintendent, could be ascribed to lack of proper communication between that office and the Branch Manager. The real reason was found to be more often than not the absence of any explanation of the rationale behind many of the decisions taken by the Local Head Office about branch affairs. Most of these decisions, again, concerned rejection of loan proposals put up by the branch. Once this particular cause was identified by the Area Superintendent, he explained the background and the broader considerations why specific decisions had to be taken by the Regional Manager. This approach proved highly beneficial, for it is not always possible for the Regional Manager to put his reasons down in writing. A verbal communication was, as it turned out, highly effective in many instances.

As stated earlier, if the Area Superintendent is to prove himself of any use to the Branch Manager, it is imperative that he first gains his confidence. For this, as the illustrations above show, the one sure method is to satisfy the Branch Manager at the very outset by resolving some of his immediate problems or meeting some of his important needs. It is only after some such satisfaction is afforded to the Branch Manager that an Area Superintendent can hope to play his substantive role of guiding and counselling the Branch Manager on his subsequent visits.

Typical Problems

The problems most often encountered by an Area Superintendent relate to the personnel matters. The principal concern of the typical Branch Manager is how best to solve the multifarious problems in personnel administration, particularly those involving industrial relations. Unless the Area Superintendent could first prove his worth in advising on the personnel problems, the Branch Manager was not particularly interested in being counselled on other matters. The Area Superintendent in many cases was able to render significant assistance in imparting managerial skills involved in developing business, processing proposals for loans, improving branch procedures and systems, etc. Also, the usefulness of the Area Superintendent as an expediter of administrative decisions has been evident in many areas of work, including the sanction of advances, sanction of expenditure, supply of stationery, provision of staff amenities, new telephone connections, etc. But the real test in gaining the confidence of the Branch Manager was the ability of the Area Superintendent to analyse personnel problems and suggest alternative courses of action.

Turning our attention to the situation at headquarters, we may observe here that the Area Superintendent had to wait for some time before the importance of his role was recognised by the personnel in the Regional Manager's Department to which he belongs. While the relationship with the Regional Manager was generally happy, it was only when the Area Superintendent was able to provide valuable feedback over a period of time to the various functionaries in the Regional Manager's Department that his role was clarified and its utility acknowledged. In particular, the Regional Manager felt that the institution of the Area Superintendent definitely resulted in a reduction of references from branches and, consequently, in less paper-work at headquarters.

One of the constant dangers faced by an Area Superintendent is that the Branch Manager may make use of his services to meet his own ends. The Area Superintendent has, therefore, to be careful that in developing an informal relationship with the Branch Managers he does not give the impression that he is an all-purpose man whose services can be employed (at will) for jobs external to his role as a guide and counsellor.

Besides being made use of by Branch Managers, an Area Superintendent on occasion has had to do some extraneous jobs, usually while at headquarters. The occasion for being entrusted with such jobs, which are quite inimical to his organisational role, has usually arisen out of an acute shortage of personnel in the Regional Manager's Department. The types of 'extraneous' work which the Area Superintendent has had to carry out include processing and follow-up of audit reports on branches, replying to customer complaints, reviewing the monthly performance reports of branches, investigation of staff disputes at branches, undertaking deposit mobilisation drives, etc.

It is quite possible that the Regional Manager in these cases did not fully understand the dangers of distorting the role of the Area Superintendent. For the inevitable result of assigning to the Area Superintendent, the kinds of jobs mentioned above is a negation of his counselling role. The rapport that the Area Superintendent is required to develop and maintain with the Branch Manager would become infeasible if he has to carry out tasks which probably belong to a controlling authority or auditor. The Area Superintendent, left to himself, would not ordinarily be inclined to object to undertaking the extra work, for the simple reason that the tasks involved are traditional, tangible, and lead to job satisfaction through visible outputs. The jobs are accordingly not wholly unwelcome to the Area Superintendent, though obviously not sanctioned by organisational analysis. As it happens, however, the jobs in question are not merely extraneous in the sense of being just additional chores, but are intrinsically antithetic and harmful to the effective peformance of his role by the Area Superintendent. This damaging aspect of entrusting extraneous work to the Area Superintendent was perhaps not realised by the Regional Manager in some cases. It could also of course be that the Regional Manager did not quite appreciate, despite all efforts made by the organisation to explain the role of the Area Superintendent, the value of the objectives that are sought to be achieved through this new position. In particular, it is not improbable that the Regional Manager failed to grasp the deleterious repercussions that these extraneous tasks have on the effectiveness of the Area Superintendent.

Performance Appraisal

One of the important questions exercising the minds of the Area Superintendents as well as the Regional Managers is concerned with the way in which the performance of the Area Superintendents would be evaluated. What would be the criteria for judging whether a particular Area Superintendent has done well at his job? This question arose because the Area Superintendent's position was unlike almost all the other jobs existing in the Bank in the past, for which there were certain conventional criteria for performance appraisal. These traditional yardsticks were widely known, even though they may not have been deemed as perfect. In the new role of the Area Superintendent, however, these conventional criteria were not only inapplicable but, also, it was generally felt that it would be very difficult indeed to lay down a satisfactory set of norms for appraising the performance of the Area Superintendents.

The difficulty was no doubt realised even while designing the role, for there was hardly anything tangible which the Area Superintendent could show to his superior as proof of good work. The Regional Manager too had no clear evidence to go by for evaluating the work of his subordinate Area Superintendent. In most of the other jobs one could reasonably have something to show for work done. For an Area Superintendent, however, the most important task is that of counselling the Branch Managers, and the extent of success in performing his job would be difficult to judge through any conventional criteria.

However, the performance of the Area Superintendent, like that of all other functionaries in the Bank, has to be measured in terms of results. Some of the criteria proposed for judging the results are: capacity of the Area Superintendent to understand and sort out problem situations; reduction in the number of procedural lapses and other audit irregularities at the branches; improved efficiency in the disposal of business at the branches; improvement in industrial relations at branches; completeness of business proposals and other matters referred by Branch Managers to the Regional Managers; and a general reduction in the number and types of references to headquarters. While these may not yield quantitative data, they should assist the Regional Manager to a great extent in assessing the performance of an Area Superintendent. One needs also to be conscious that improvements in branch affairs in the areas listed above would not normally be entirely attributable to the efforts of the Area Superintendent or any other individual functionary. The contribution of the Area Superintendent should, in other words, be assessed realistically in the context of all other administrative and operational factors impinging upon branch efficiency, with due consideration for the dominant role of the Branch Manager himself. The appraisal of the performance of the Area Superintendent would thus unavoidably contain a substantial element of subjective judgment on the part of the Regional Manager — perhaps even more, having regard to the special characteristics of the Area Superintendent's role, than one usually associates with evaluating the performance of staff functionaries.

Role Ambiguity

The above discussion brings out the fact that Area Superintendents were likely to experience role ambiguity. There were serious ambiguities about what was required to be done by the Area Superintendents and how they were to proceed to make a success of their work. For instance, it was expected that the Area Superintendents would be reviewing the work of the Branch Managers, an essential step for helping them improve their managerial skills, but nothing was clearly spelt out about what aspects of the activities of a branch were to be reviewed and in what manner. This was important, because while carrying out this review the Area Superintendent has to ensure that he was not seen as an auditor, for otherwise the Branch Managers would not be forthcoming with their problems for discussion and guidance, but rather show that the position at the branch is on the whole satisfactory — something which people usually do when there is an audit. This review becomes a problem for the Area Superintendent because he does not know — and the Bank had not told him at that time — whether he is expected to check or even to call for and scrutinise documents, books and registers at the branch (which may, again, make it seem that he is carrying out an audit).

Similarly, on the issue of counselling — which is one of the main jobs of the Area Superintendent — there was quite a bit of uncertainty about the kind of relationship the Area Superintendent should build up with the Branch Managers. Then, again, the Area Superintendents apprehended that perhaps the Regional Managers would not take them into confidence about many of the important decisions affecting the branches in their respective Areas. There was also the fear that they would not be able to keep up with all the changes in policies and procedures that would be taking place while they were on their frequent tours of branches. Furthermore, it was brought out that the Area Superintendents were afraid that they would be 'neglected' by the officials of the Regional Manager's Department on account of their being away from headquarters most of the time and also because of the fact that they did not have any financial or administrative authority.

These apprehensions were genuine and significant. As the present author has observed elsewhere, these fears were "further compounded by the absence of any previous experience in jobs calling for superior skills in guidance and counselling, and operating with junior Branch Managers on the basis of equality, far removed from the usual pattern of working with legitimised authority. There was an almost unanimous demand from the Area Superintendents for more certainty about the nature of their role, about their specific duties and responsibilities, and about the criteria on which their performance would be appraised."[2] The demand for clarifying their roles was therefore strong at the time the Area Superintendents took up their jobs. This demand for increased role clarity remains an active factor even today. This is not surprising

because the role of the Area Superintendent has by its very nature and design to remain relatively amorphous and ambiguous.

Conclusion

The problem of administrative remoteness in a bank with a large number of branches is not merely one of communication difficulties stemming from geographical distance. The existence of a large and growing body of relatively inexperienced managers adds a crucial dimension to this problem. Unavoidably, more guidance and closer control have become necessary these days in view of these factors, and various organisational strategies are adopted to attain the desired degree of effectiveness in administering the branches. We have briefly touched upon some of the traditional approaches, such as dispersed controlling offices established in the heart of particular areas, the concept of link branches, and the system of personal visits of headquarters officials to branches. There are of course other conventional administrative mechanisms, like control returns, periodical audits, etc, which are simultaneously used to ensure proper supervision and control over branches.

The institution of the Area Superintendent, which we have discussed in some detail here, has been designed with the object of providing the controlling authority with yet another instrument of administration. The position of the Area Superintendent should not be looked upon as a substitute for any part of the traditional organisational machinery: it is best seen as an additional tool in the hands of the bank management for improving administrative effectiveness. Each bank has naturally to judge for itself whether this new organisational position, or rather this new approach to reducing what we have called administrative remoteness, is in some way relevant to its own peculiar needs. As there are rarely any standard solutions in organisational matters, a bank has necessarily to work out a strategy appropriate to its requirement.

Notes

Early Politics of Coal in Eastern India

Ratna Ray
Rajat Ray

At the beginning of the twentieth century there was a striking development of Indian enterprise in the coal industry which led to sharp conflict between European managing agencies involved in coal mining and Indian colliery owners and coal traders. The conflict took the form of a confrontation between the Indian Mining Association, affiliated to the Bengal Chamber of Commerce, which had long represented the collective interests of the bigger European coal companies, and the Indian Mining Federation, newly organised in 1913 to promote unity among Indian colliery owners and affiliated to the Bengal National Chamber of Commerce.

The conflict between European and Indian coal interests, however, gave way to combination against labour agitation and political unrest at the end of the First War. The Indian Mining Federation and the Indian Mining Association were equally worried over the industrial strikes which took place during the mass upsurge of the Non-Co-operation Movement and were determined, if necessary, to meet the demand for increased wages by a complete lock-out.

I

European Managing Agencies and Indian Colliery Owners

AT the beginning of the twentieth century there was a striking development of Indian enterprise in the coal industry which led to sharp conflict between European managing agencies involved in coal mining and Indian colliery owners and coal traders. The conflict took the form of a confrontation between the Indian Mining Association, affiliated to the Bengal Chamber of Commerce, which had long represented the collective interests of the bigger European coal companies, and the Indian Mining Federation, newly organised in 1913 to promote unity among Indian colliery owners and affiliated to the Bengal National Chamber of Commerce.

In the late nineteenth century the European managing agencies had an overpowering presence in the coal fields of Raniganj and Jharia. But the coal mines, which could be run on small capital, were never a complete European monopoly like the jute mills, which required a huge capital outlay. Dwarkanath Tagore, a prince among early Indian entrepreneurs, had been one of the pioneers of the coal industry in Bengal. After the collapse of his business ventures in the crash of 1848, the coal mines acquired by him came to form the nucleus of the huge European-owned Bengal Coal Company. This company, the biggest among all coal companies in India, came under the control of the leading European managing agency of Andrew Yule and Company in 1908.[1] The Bengal Coal Company ruined many Indian colliery and land owners in the Raniganj area. In the late nineteenth century the bigger European corporations were expanding in the coal fields at the expense of the smaller Indian concerns. But Indian interests in coal were never completely crushed, since they subsisted on small local markets to which the managing agencies had no reach. There was no organised body of Indian colliery owners, but resistance was put up to the pressure of the European corporations by an informal leadership consisting of the Malia brothers of Searsole, Rameswar and Dakshineswar Malia.

The Malias, a Punjabi Saraswat Brahman family, owned the coal mine of Searsole and five landed estates. Their collieries were invariably leased out, so that the family had no direct stake in the coal mining and coal marketing business. But the Searsole family and the Bengal Coal Company, which were expanding in the same region around Raniganj, were frequently involved in armed clashes and judicial disputes about the acquirement of proprietary rights in new lands and coal mines. The Jamuria-Raniganj road, along which coal was sent to the Damodar river for transport to Calcutta, went through Searsole, where the Malias systematically held up Bengal Coal Company supplies. In one of the armed clashes two chaprasis of the Malia family were killed. Rameswar Malia changed his tactics after this incident. He became a member of the Indian Mining Association and tried to buy out Bengal Coal Company shares. He was a miserly millionaire with two passions in life — saving money and buying out Bengal Coal Company shares. Before the organisation of an association of Indian colliery owners Rameswar and his brother Dakshineswar acted for more than two decades as the informal representatives of the Indian colliery owners. Dakshineswar Malia was co-opted as the representative of the Indian colliery owners in a committee for mining legislation appointed by the government in 1895.[2]

The intrusion of the European managing agencies in the coal fields fostered a considerable degree of interlocking of jute and coal interests. Control of several jute mills and coal mines by individual managing agencies promoted horizontal concentration in the industries of Eastern India. European domination of the coal fields was partly a result of horizontal concentration. The jute mills in and around Calcutta were the single biggest consumers of coal in the private sector. These mills being controlled by European managing agencies, the orders for coal from the jute mill industry naturally went to European coal companies, which were usually managed by the same managing agencies. The interlocking of jute and coal interests brought another advantage to the European coal companies *vis-a-vis* Indian entrepreneurs. This advantage lay in the vital matter of transport. Railway wagons were in perennial short supply and there was fierce competition for wagons

between European and Indian coal concerns. Wagon supply was supposed to be based on the principle of *pro rata* distribution according to raisings of respective collieries. But collieries supplying coal to the railways and to purposes of public importance were allowed special supply of wagons. The special supply system, which always worked in favour of European coal companies, was a long-standing grievance of the Indian colliery owners. The coal manager of the East Indian Railway argued that the railway authorities had no hand in selecting the collieries to which special supply of wagons should be made. The selection was made entirely by the consumers and the majority of consumers preferred first class coal from the larger collieries. Jute mills, as the biggest private purchasers of coal, were in a position to make wagons available to coal mines of their own choice. Government controls over the coal industry in the matter of transport thus became an instrument of discrimination against Indian entrepreneurs. European domination of the coal fields was ensured by the competitive advantage of European coal companies in transport.[3]

European enterprise in the coal mining industry was mainly an appendage of imperial economic interests. The jute mills, the railways and the Calcutta Port were supplied with coal by the bigger European coal companies. These large consumers of coal were all oriented to the import-export trade of India, in which India's colonial relationship with Britain was most marked. Indian enterprise in the coal mining industry stood on its own — there was no interlocking with other interests. Consequently Indian colliery owners were more aggressive in the defence of the Indian coal industry than the Indian Mining Association. Members of the Indian Mining Association themselves admitted that the Association's obsession with interests other than those of the pure coal industry explained its lukewarm support or absence of support to abolition of all forms of coal control imposed by the government for the benefit of jute and other interests.[4] While European coal enterprise was subservient to imperial needs, Indian coal enterprise catered mainly to the domestic market, that is to say, the needs of the Indian population. The customers of the Indian colliery owners were usually consumers who cooked food with coal, and brick manufacturers who needed coal for burning bricks. The consumer interest and the brick manufacturing interest supported Indian enterprise in coal. Since these consumers were small consumers, Indian coal concerns were smaller than European ones and produced mainly cheap second class coal. They were handicapped by the discrimination by the government against Indians in favour of Europeans in the matter of wagon supply and coal purchase by the railways.[5]

II

Emergence of Indian Mining Federation

It was not until after the death of Rameswar Malia in 1912 that Indian colliery owners learned to stand up collectively to the pressure of the European coal companies. Three self-made Bengali entrepreneurs who rose from lower middle class backgrounds — N C Sircar, A C Banerjee and W C Banerjee — organised the Indian Mining Federation. N C Sircar, the biggest Indian coal producer managing five coal companies through the managing agency of N C Sircar and Sons, began as a Rs 7 a month porter boy in the employ of the Bengal Coal Company. A C Banerjee, who came from a somewhat higher station in life, was a lecturer in mathematics who switched to the coal business in 1902. W C Banerjee, a completely self-made man like N C Sircar, began as a government clerk and then found employment in the East India Railway Company in a branch dealing with transport of coal, thus coming in contact with colliery owners and coal dealers. He became a coal broker and merchant on his own, and after successfully financing several European companies during the coal boom of 1907, amassed enough money to buy half a dozen collieries himself. In association with N C Sircar and A C Banerjee, who became respectively the President and Secretary of the Indian Mining Federation, he guided the infant federation in its early days.[6]

The immediate occasion for the organisation of the Indian Mining Federation in 1913 was a coal boom in 1912 when shortage of wagons became extremely acute and the discrimination of the railway authorities in the supply of wagons particularly blatant. The wagon scramble assumed the character of a bitter conflict between big European coal companies and small Indian collieries, the former getting an unfairly and disproportionately liberal supply of wagons at the expense of the latter. Leading Indian colliery owners and coal merchants, who found their individual efforts futile against the powerful combine of the European companies, convened a meeting to fight for a fair share of wagons in March 1913. Bengali, Marwari and Gujarati owners

came from distant collieries to this meeting and moved that an Indian Mining Federation be formed and affiliated to the Bengal National Chamber of Commerce. The Indian Mining Federation was born as a result.[7] Within a few years almost all Indian collieries entered the Federation. It was an important and representative association, having on its roll 250 members owning 331 collieries in Bengal and Bihar and representing interests which controlled one-third of the whole coal output of the country.[8]

The early activities of the Federation lay mainly in three directions. In the first place, the Federation sent agents wherever wood was consumed in large quantities to replace it with second class coal. Efforts were thus made to expand the Indian consumer market on which the Indian collieries subsisted.[9] Secondly, the Federation also lobbied the government and the railways for using second class coal where it was economic. In public tenders for coal, although rates offered by the Indian colliery owners were lower, higher rates offered for the same quality of coal by European companies were being accepted by the railway authorities. The Federation moved in this matter and as a result Indians got some share in the orders placed by the railways.[10] Thirdly, the Federation agitated against the special wagon supply system. In this vital matter, however, it did not make much headway. The First World War broke out within a year of its birth and the general supply of wagons to the large number of collieries which the Federation represented fell extremely low, causing serious losses. This state of affairs was mainly due to the setting aside of the major portion of the available wagons for special supply. Some parties benefited at the expense of the rest. As the Secretary of the Mining Federation wrote to the EIR Agent, "a colliery which may secure a contract from a Railway, will get by preferential treatment, the full numbers of wagons it may require to meet the contract; secondly, it may get wagons again for special purposes; thirdly, the same colliery may further get rakes; and, lastly, it will again get supplies with the general body of collieries in the *pro rata* distribution of wagons according to raising and stock; whereas some collieries can get wagons only on the last ground".[11] As a result, a considerable number of collieries were unable to despatch enough coal to meet the actual expenses of working the mines.

III

Combination of Coal Interests against Mass Unrest

The conflict between European and Indian coal interests over wagon supply during the war gave way to combination against labour trouble and political unrest after the armistice. The Indian Mining Federation and the Indian Mining Association were equally worried over the industrial strikes which took place during the mass upsurge of the Non-Co-operation movement. During 1921, the Indian Mining Federation noted with alarm, there were no less than 137 strikes in Bengal.[12] Two swamis, Biswanand and Darsanananand, were organising the coal mine labourers. The reaction of the Indian Mining Federation was to gang up with the Indian Mining Association. The two official bodies representing Indian and European collieries agreed that no increase in wages would be considered without a guarantee of increased output. They were determined, if necessary, to meet demands for increased wages by a complete lockout.[13] The Indian Mining Federation took a hostile attitude to the newly-formed All-India Trade Union Congress and the EIR strike of 1922. N C Sircar, one of the founding fathers of the Federation, declared at the annual meeting of April 21, 1922:[14]

> I confess, gentlemen, we who are engaged in industrial pursuit have had not a few occasions when we have found ourselves unable to endorse the views and activities of the political section of our countrymen. In fact, in certain respects, our difference with them is acute and fundamental. We have for instance been charged with lack of sympathy for labour. This is an accusation which was openly hurled at us in connection with our attitude to the recent All-India Trade Union Congress. Gentlemen, let me explain our position. Nothing is further from the truth than to regard that we who represent Indian capital are not interested in the uplift of the Indian masses by which alone the nationalist aspiration may find its realisation. In this movement in its general aspect, we are interested enough but it is to be remembered that the ignorant mass we come in contact with does not represent in our special sphere an underdeveloped citizen but only a human factor in the production of wealth in the widest sense. This is an important difference which seems very often to be lost sight of by the political section. They seem scarcely to realise the tremendous effort we are making for the true regeneration of the country — I mean the economic and material advancement of India. The 'swaraj' that we have been striving for is far too real and difficult an achievement than what seems to be aimed at by a 'purely' political campaign pursued in feverish and what seems to me indeed a break-neck speed. The dream, on the other hand, that we the commercial community are dreaming is different but none the less glorious — it is the vision of India, prosperous and happy, seat of all industries and master of all markets, rolling in plenty and luxuriating in wealth.

The trade union leaders and NCO agitators did not aim their movement at the Indian capitalists, though their activities threw a scare among Indian and European colliery owners alike. Strikes were fomented by them mainly on European collieries. Darsanananand brought about in 1920 strikes at 6 collieries of Andrew Yule, 4 collieries of Equitable Coal Company, and 1 colliery of Bird, involving altogether 5,300 miners. At a meeting in Jamuria he preached the 'Bolshevik principle' of equity between rich and poor. On a second visit to Jamuria, however, he showed his real leanings. He told a gathering of 5,000 labourers that the real object of trade unionism was "to stop the work of European-owned collieries and to strengthen and enrich the collieries belonging to Indians".[15] By 1922 the trade union movement organised in Raniganj had collapsed due to misappropriation of funds by Darsanananda.[16]

Literacy among Scheduled Castes of Maharashtra

Nalini Pandit

Literacy and Educational Enrolment among the Scheduled Castes of Maharashtra by Suma Chitnis; Unit for Research in the Sociology of Education, Tata Institute of Social Sciences, 1974; pp 191.

THIS monograph is part of a national study undertaken by the Indian Council of Social Science Research to probe into the educational problems of the Scheduled Castes and the Scheduled Tribes. It tries to put together some basic demographic data describing these communities in the state, information regarding the facilities available for their education and a brief account of literacy and school and college enrolment among them. The data on literacy is based on the Census of 1961 and that on Scheduled Caste enrolment in schools and colleges is obtained from the State Directorate of Education.

The monograph is useful in that it collects information which, though available, is scattered in offiical, semi-official and other documents and records. As such, like any government directory, it would not call for extensive comment. But it also derives certain conclusions, implies policy recommendations and suggests problems for further research. As this report is to be followed by many other reports in the national study, a discussion of its methodology, it is hoped, would be useful in laying the guidelines for further research into the subject.

Though the monograph purports to provide some basic demographic data describing the Scheduled Castes and Scheduled Tribes, it does not give any information about the absolute population figures. All the 50-odd tables in the main body of the report, whether concerned with literacy or school enrolment, deal only in percentages. One would have thought that population statistics would be more useful for what is part of an all-India study than figures of percentages. The only statistical exercise undertaken is that of comparing, district-wise, the percentage of literates in the Scheduled Caste population with the percentage of literates in the total population. The difference between the two percentages is taken as a measure of relative advance or backwardness.

The whole procedure is questionable. The weightage of Scheduled Castes in the total population varies from district to district. For example, in the district of Kolaba, they form only 1.31 per cent of the total population, while in Bhir their percentage is as high as 13.51. The percentage of literacy in the total population is bound to be lower in the districts with high Scheduled Caste concentrations and the difference between the two percentages will be narrowed thereby. A proper course would have been to compare the Scheduled Caste percentage not with the percentage of literacy in the total population but with that for the non-Scheduled Caste population.

Secondly, the non-Scheduled Caste population is treated as homogeneous. This is surprising since the national study is aimed at understanding the situation of not only the Scheduled Castes but the Scheduled Tribes as well. Many of the districts which show a narrow difference between the Scheduled Castes and the total population in literacy — such as Chanda, Dhulia and Thana — are districts with a high proportion of Scheduled Tribes in the total population. If the same method is followed in other studies, then a report on Scheduled Tribes would show that the Scheduled Tribes have relatively high literacy rates in districts with a high percentage of Scheduled Caste population.

The simple difference in percentages of literacy between the Scheduled Castes and the total population cannot also be taken as a satisfactory measure of the relative advance of the Scheduled Castes. It leads to the conclusion that the disparity between the two increases with every advance of literacy in the total population. This might be true. But even if government measures for assisting the Scheduled Castes lead to a higher than average percentage rate of growth of literacy among the Scheduled Castes, the difference between the percentages of literacy for them and for the total population may actually increase if the initial difference between the two is very large!

It is unfortunate that the report considers the effect of caste on literacy to the exclusion of all other demographic variables. For instance the sex ratios differ from district to district, a district like Greater Bombay having a large excess of males and another like Ratnagiri an excess of females. How far does this difference affect the percentage of literacy among the total population and among the Scheduled Caste population? The report does not also provide any information regarding the actual enrolment of children in schools district-wise or about the proportion of children enrolled in schools to the total number of children in the school-going age. What is compared is the percentage of Scheduled Castes in the total population and Scheduled Caste enrolment as a proportion of total enrolment. It is therefore not clear whether the Scheduled Caste advance in certain areas, particularly in the Nagpur division, is due to the advancement of the Scheduled Castes or the relative backwardness of other groups in the population.

On the basis of these simple comparisons of percentages conclusions are derived and problems for further research are suggested. One of the findings of the survey is that all the five districts in which the Scheduled Castes are 'over-represented' at schools happen to be in the Nagpur division. This is sought to be associated with the fact that Wardha was the centre of Gandhi's movement to improve the status of Harijans and Nagpur happened to be one of the major centres of Ambedkar's movement for mass conversion of Scheduled Castes to Buddhism. A question is posed for further research: In what way did the Wardha ashram and the activities of Gandhi and Ambedkar exercise a favourable influence in Nagpur division? It is suggested, on the other hand, that the relative backwardness of the Scheduled Castes in Degree courses in Poona division may be due to the upper caste supremacy in this area, Poona being known as a stronghold of the Brahmin and upper caste elites of Maharashtra. It does not seem to occur to the author that the incomes or the occupations of parents might have some influence on the educational level of a particular group. Does this mean that economic variables have no place in the so-called sociology of education?

At a more general level also the monograph raises certain issues regarding social justice. The sort of com-

parison which the survey undertakes implies that the recipient of justice in society is a caste and not an individual. This concept might have been justified at a time when all the economic and social criteria of backwardness pointed to the same group. But with the economic change that has been taking place in our country in the last few decades; each caste is getting split into different class groups and the economic and social criteria of backwardness point, many a time, in different directions. The emphasis on statistical averages for whole castes suggests that whenever any particular backward caste shows percentages of literates or of school enrolment which is better than average those for the whole population, it will have to be eliminated from the list of castes getting government protection, it being assumed that the more fortunate individuals in that caste who have benefited from government measures will look after their less fortunate brethren. Even if the government does not follow this policy, such a demand may be expected to be made by other backward castes. The importance given to statistical averages is likely to create jealousies and rancour among different backward castes and might even lead to communal trouble. Social scientists cannot absolve themselves of the responsibility of analysing the implications of such measures of social justice and their effect on society. It is to be hoped that the Department of Sociology of Education of the Tata Institute of Social Sciences and the Indian Council of Social Science Research, which have sponsored the national study, approach this task in a more fundamental and systematic manner so that the reports which are to follow this monograph may be useful in evolving more effective policies for helping the backward sections of the community.

SPECIAL ARTICLES

Environment and Styles of Development

Ignacy Sachs

The merits of growth are today being questioned and, curiously enough, both the Left and the Right are dividing up into the opponents and champions of growth. The over-simplifications of the debate notwithstanding, we should not fail to observe the emerging political practice which has several claims upon our interest.

The long-term future is becoming operational, the notion of organising possible futures and choosing a desired future is gaining acceptance, an approach to planning which is both global and normative at the same time is beginning to take the place of extrapolation, and the systems approach is replacing the sectoral method legitimised by Cartesianism.

The hope of achieving continuous economic and social development hand in hand with rational management of the environment presupposes a redefinition of all objectives and all methods of action. The environment is a dimension of development, and must therefore be internalised at every decision-making level. Problems of resources, energy, environment, population and development cannot, in fact, be correctly understood unless they are examined in relation to one another; and this implies planning within a unified conceptual framework.

AFTER the anti-novel and counter-culture, zero growth. These are three symptoms, though very different from one another, of the re-examination of values by a society in search of new ideological responses to problems which have remained insoluble despite the spectacular progress of material growth, or which have arisen as a result of that progress: the generalised malaise of the young, the persistence of poverty, the aggression against the environment, the frustration of the Third World which today is wondering whether the very concept of development, founded upon efficiency, should not be replaced by that of liberation,[1] centred on social justice and the creation of a new man.

Only a profound sense of uneasiness can explain why the theme of zero growth should have so captured the public imagination and why it should have been taken up by public opinion within so short a time, despite the fact that it represents a complete reversal of the ideological outlook of the last two centuries and, still more, of the past fifty years. The frenzy of the mass media, the abuse of the computer to give credibility to this or that idea by investing it with scientific trappings, explain part of this phenomenon but not all. In a world traumatised by the crisis of the 1930s, the appearance of the socialist camp and the emergence of the Third World, growth was in good standing with capitalists and revolutionaries, profit-makers and lovers of justice alike, and the only differences of opinion related to the methods and uses of growth. Today, however, the merits of growth are being questioned and — curiously enough — both the Left and the Right are dividing up into opponents and champions of growth.

The new awareness of environment problems appears to be both one of the causes and one of the symptoms of this new outlook. True, the degradation of the environment is reaching unpleasant if not dangerous proportions here and there. But would this in itself have been sufficient cause for challenging the very objectives of society? Whatever the courses may be, the debate is now open.

Its over-simplifications, not to say mystifications, tend to be tiresome. Man is presented, now as the arrogant lord of creation and demiurge; now as the prisoner of a machine on a world scale in which production and pollution are conspiring to crush him and in which the only kind of history is natural history, in the sense that the degradation of energy introduces an element of irreversibility. For some, the quality of life is obtained at the price of limiting

material production; for others it is, on the contrary, proportional to the abundance of products.

Beyond these clumsy efforts we should not fail to observe an emerging political practice which has several claims upon our interest: the long-term future is becoming operational, the notion of organising possible futures and choosing a desired future is gaining acceptance, an approach to planning which is both global and normative at the same time is beginning to take the place of extrapolation, and the systems approach is replacing the sectoral method legitimised by Cartesianism. The hope of achieving continuous economic and social development hand in hand with rational management of the environment presupposes a redefinition of all objectives and all methods of action. The environment is a dimension of development, and must therefore be internalised at every decision-making level. Problems of resources, energy, environment, population and development cannot, in fact, be correctly understood unless they are examined in relation to one another; and this implies planning within a unified conceptual framework.

For the poor countries the alternative presents itself more than ever in terms of original projects of civilisation or of non-development, since to follow the path travelled by the industrialised countries appears neither possible nor, indeed, desirable. The rich countries will in future have to limit their wasteful use of resources which are in process of relative exhaustion; price fluctuations will enforce this to some extent, but it would be dangerous to leave such matters to the hazards of the market. The elimination of waste and the confinement, within acceptable limits, of the pollution caused by the production or consumption of certain goods will also raise the problem of limiting the growth of material consumption, and at the same time extending the range of social services in the broadest sense of the word in order to arrive at a form of development which makes less intensive use of resources and is, at the same time, less harmful to the environment. Such restriction of consumption cannot be achieved without institutional changes more radical than is at present realised, starting with the redistribution of incomes and the reduction of social inequalities. In addition, there are a number of international problems: assumption of responsibility for the global environment, development of collective international resources regarded as the common heritage of mankind (e g, the sea-bed), the impact on poor countries of policies initiated by the rich countries, and the creation of an international order capable of helping both to redefine their styles of life.[2]

There is enough here to occupy a whole generation of social scientists. In fact, a new connection will have to be established between the human and the natural sciences in order to achieve a better understanding of the interaction between natural and social processes of which man is both the subject and the object: a subject, let us add, conscious of belonging to nature and of his own gradual growth. Beyond an excessively possibilistic human geography and an excessively deterministic ecology, there is a new synthesis to be made in which the contradictions between anthropology and history will be abolished,[3] and models of energy circulation will be linked with models of the production and circulation of matter and commercial goods. In the meanwhile, the charting of the future must be based on the practice of operational history in the Braudelian sense.[4] In order to learn to define possible futures we must start by dismantling the manifold models of the past, in which population, resources, energy, technology, environment and social institutions are fitted together in a variety of fashions. In this context, *La Terre et l'Evolution Humaine* by Lucien Febvre[5] remains astoundingly topical after the passage of fifty years.

*

How is the new awareness of environment problems affecting the planner's[6] field of vision?

Let us begin with a few necessary distinctions and definitions.

The term "environment" covers, on the one hand, the sum total of identified and identifiable natural resources existing in finite quantities on Earth, and, on the other hand, the quality of the environment or, if one prefers, of the *milieu*, which constitutes an important element of the quality of life and which also determines the available amounts and quality of renewable resources. In fact, the dividing line between the renewable and non-renewable resources is not drawn once and for all. Renewable resources may in the end be destroyed by pollution, and recycling makes possible the repeated use of non-renewable resources. Generally speaking, however, the distinction between these two groups of resources remains valid and useful.

Let us now consider the environment proper. A more ambiguous concept has rarely been known. Of the multitude of proposed definitions, we shall set aside two which are largely complementary.

For the systems approach experts, the environment is made up of everything that does not form part of the purposive system under consideration, though it does affect the performance of that system.[7] As the system endows itself with environment policies, so the environment is less in evidence, and the success of these policies will consequently be measured by the disappearance of the very concept of environment, which will in the end be internalised by the system

Let us now abandon the game of paradoxes, and draw attention to one operational advantage of the above definition. It invites to better identify the ecological and societal impacts of the actions undertaken in order to achieve the explicit objectives of the purposive system constituted by development policies. Such an analysis should lead to a redefinition of development objectives with a view to more effective control of the ecological and social impacts of proposed action.

At a different level, the United Nations Environment Programme (UNEP) speaks of the total habitat of man. This ecological definition of the human environment has the disadvantage of being too comprehensive. But it can be interpreted more restrictively.

Let us distinguish three subsystems within the environment:

—the natural environment
—the man-made technostructures
—the social environment,[8]

and let us endeavour to study the effects of each of these on the living and working conditions of the different social agents[9] and on the operation of enterprises (this corresponds, in an expanded form, to the problem of positive and negative externalities). The quality of the environment will be described by means of "objective" indicators and will, at the same time, be apprehended at the level of its perception by the different social agents. Hence the need for a set of indicators ranging from physical and chemical measurements of the quality of water or air to psycho-sociological surveys and including analyses of the availability and accessibility of collective facilities, housing and social services, which will entail simultaneous recourse to statistics and to the time-budgets of the various agents.

As already stated, the two above definitions are *not* mutually exclusive. The former stimulates the planner's awareness of the inter-relations between natural and social processes. The latter concentrates on a more limited problem which is nevertheless of fundamental importance in the choice of development objectives — *that of the quality* of the environment properly speaking.

Let us now try to establish a relationship between the environment (M) and the population (P), techniques (T), natural resources (R) and the product (Y).

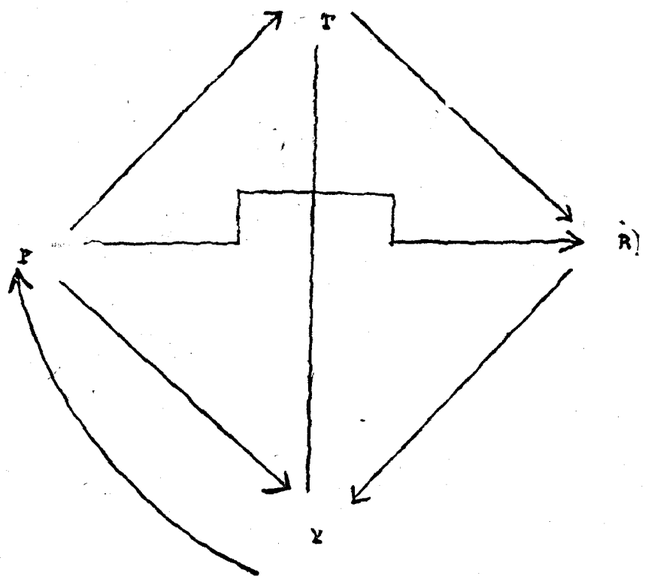
The development economist's traditional field of vision is represented in Figure 1. By means of the available techniques, the population transforms the resources into the appropriate product for purposes of consumption and social reproduction. The dialectic between demographic pressure and resources forms the subject of a large literature dealing with technological and social change. Is it a source of progress or of involution? Put in such general terms, the question cannot be answered. There is no single model to describe the numerous configurations of these variables. On the contrary, systematic efforts on the part of historians and anthropologists are called for to arrive at a typology of situations based on concrete data.

Let us now introduce the environment M. Figure 2 indicates the relevant new relationships:

- R → M and T → M, effects on the environment of methods of utilisation of the resources and of the production techniques employed;
- Y → M, impact on the environment of the methods of consumption of products;
- P → M, impact of human settlements on the environment;
- M → R, degradation of natural resources due to pollutions;
- M → Y, conditioning of production through the quality of the environment;
- M → P, environment as a component of the quality of life.

Figure 2 does not, of course, set out to do anything more than point out the relevant relationships which, over and above the traditional factors used in planning, must be taken into consideration within the framework of a strategy aimed at making development compatible with the management of the environment. At best, the Diagrams presented above have a heuristic value and will have to be modified in every

FIGURE 1



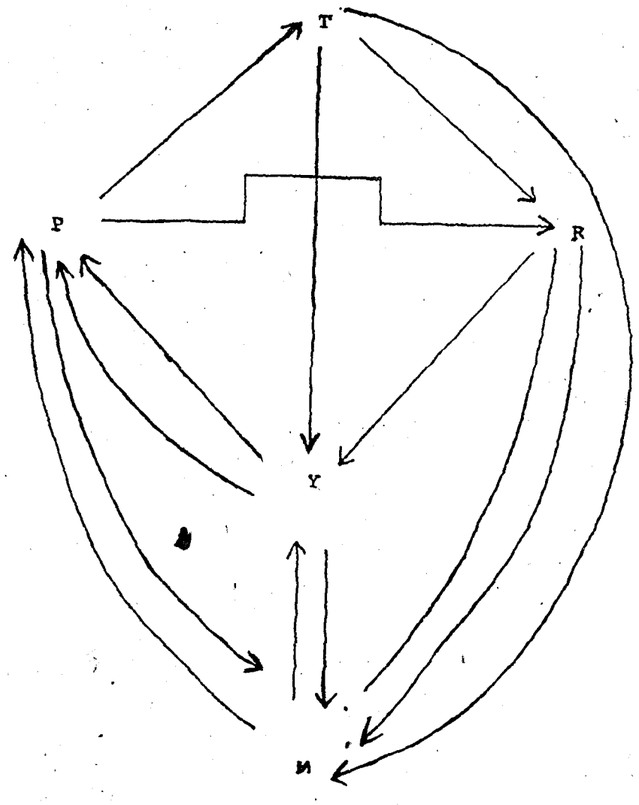


FIGURE 2

concrete case. Likewise it would be impossible to indicate once and for all the operational variables for such a strategy. On the other hand, it is possible to identify the critical levels at which action will take place. We distinguish six such levels, a brief description of which is given below:

(1) The consumption structure, which, in turn, depends on the distribution of incomes and on the totality of values recognised by the society in question;

(2) The socio-political regime and, more particularly, its manner of dealing with social changes; in market economies, the rule is to let enterprises internalise profits and externalise costs, while in socialist or mixed economies, the State may, in theory, change this rule of the game;

(3) The techniques employed, where a distinction has to be drawn between, on the one hand, the adding of antipollution measures to the escalation of production and of the resulting nuisances and, on the other hand, the introduction of techniques which are not destructive of the environment,[10] i e, where the environment factor has been internalised;

(4) The methods of utilisation of natural resources and energy, analysed from the viewpoint of wastage of rare resources, possible recycling of waste products, and even of controlling the obsolescence rates of certain durable goods and equipment with a view to reducing the utilisation of rare resources incorporated in them;[11]

(5) Land occupation systems, since the same types of production and activities lead to very different effects depending on their localisation;

(6) Lastly, the size, rate of growth and distribution of the population, it being understood that population size alone cannot serve as an indicator of its pressure on natural resources; by reason of their high *per capita* consumption, the few hundred million inhabitants of the rich countries exercise much more pressure than the thousands of millions of inhabitants of the Third World.

In view of the complexity of the subject and of the many ways in which the relevant operational variables can be fitted together, there can, of course, be no question of proposing a single development strategy. And so we come back once more to the search for alternative futures.

*

The foregoing general considerations have led to the formulation of the concept of eco-development.[12] This concept aims at defining a style of development particularly suited to the rural regions of the Third World, though this does not mean that it cannot be extended to include towns, as we shall see in the case of New Bombay.

Its main features or guidelines are as follows:

(1) In each eco-region, efforts are made to develop those of its resources which are specifically needed for the satisfaction of the basic needs of the population in regard to food, housing, health and education, these needs being defined realistically and independently so as to avoid the undesirable effects of copying the consumption style of the rich countries.[13]

(2) As man himself is the most valuable resource, eco-development must above all contribute to his fulfilment. Employment, security, the quality of human relations, respect for the diversity of cultures — or, if one prefers, the development of a satisfactory social eco-system — are all part of this concept. A certain symmetry is discernible between the potential contribution of ecology and social anthropology to planning.

(3) The identification, exploitation and management of natural resources[14] is conducted from the standpoint of a forward-looking solidarity with future generations. Depredation is strictly prohibited and the exhaustion of certain non-renewable resources — which is inevitable in the long term — is mitigated by the dual approach of avoiding wastage and making the greatest possible use of renewable resources which, if they are correctly used, should not be exhausted ever.

(4) The negative impact of human activities on the human environment is reduced by resorting to procedures and forms of organising production which make it possible to take advantage of complementarities of all kinds and to use waste for productive purposes.

(5) In tropical and sub-tropical regions in particular, but everywhere else as well, eco-development relies on the natural capacity of the region for photosynthesis in all its forms. Since guideline no 1, as applied to energy, tends to attach great importance to the use of local energy sources and to give preference to means of transport other than the private car, one result should be a reduction in the consumption of energy from commercial sources (and in particular hydrocarbons).

(6) Eco-development implies a particular technical style, since the above guidelines cannot in most cases be applied without the development of appropriate techniques. There are two comments to be made here.

The development of eco-techniques will play a very important place in eco-development strategies for the obvious reason that it is at this level that compatibility can be achieved between various objectives — economic, social and ecological — since technical change would appear to be the principal multi-dimensional variable in planning.

But it would be wrong to assimilate eco-development merely to a technological style. It calls for certain social organisation procedures and a new education system.

(7) The institutional framework for eco-development cannot be defined in the abstract without regard to the specific features of each case, any more than can the new forms of rural institutions proposed by the World Bank for achieving some success at last in the attack on absolute poverty in rural areas and for exploiting the potential of the impoverished masses of the Third World by providing the small peasant with production equipment and techniques suited to his economic and ecological conditions.[15]

We can however state three basic principles.

Eco-development calls for the establishment of a horizontal authority which is capable of looking beyond the interests of particular sectors, is concerned by all the facets of development and is able constantly to control the complementarity of the different activities undertaken.

Such an authority cannot be efficient without the effective participation of the populations concerned in the realisation of eco-development strategies. This participation is essential for the definition and harmonisation of actual needs, for the identification of the productive potential of the eco-system and for the organisation of the collective effort to develop it.

Lastly, it is essential to ensure that the results of eco-development are not impaired by any plundering of the populations concerned, by intermediaries acting as contacts between the local communities and the national or international market.

These principles can be applied without too much difficulty in areas of the Third World where agrarian reform has been undertaken, and also in every case where the community structures have remained in being.

(8) One necessary complement for the

machinery of participatory planning and management is preparatory education. This argument applies *a posteriori* in the case of eco-development, where it is essential also to make people aware of the dimension of the environment and the ecological aspects of development. Lastly, as we have already said, it is essential to internalise this dimension and thus to change the system of values and predominant attitudes to nature or, on the contrary, to preserve and strengthen the respect for nature which is still a characteristic of certain cultures.[16] This result may be obtained either by formal or environmental education. The Chinese experience is very instructive in this connection. The eco-techniques developed in China do not differ appreciably from those which other peasant societies have known and practised; but what is new is the education which proceeds and accompanies their application,[17] and determines their scope.

In brief, eco-development is a style of development which, in each eco-region, calls for specific solutions to the particular problems of the region in the light of cultural as well as ecological data and long-term as well as immediate needs. Accordingly it operates with criteria of progress which are related to each particular case, and adaptation to the environment, as postulated by the anthropologists, plays an important part. Without denying the importance of exchanges — and we shall revert to this matter later — it tries to react against the predominant fashion of allegedly universalist solutions and panacea-type formulas. Instead of placing too much emphasis on external aid, it relies on the capabilities of human societies to identify their problems and devise their own original solutions to them, though drawing on the experience of others. It rejects passive transfers and the spirit of imitation, and gives pride of place to self-reliance.[18] It avoids the pitfalls of extreme ecologism, and suggests on the contrary that a creative effort to benefit from the margin of freedom offered by the environment is always possible, however great the climatic and natural constraints may be. This is amply borne out by the differences between cultures and human achievements in comparable natural environments. But success depends on a knowledge of the environment and on the will to create a lasting balance between man and nature. The setbacks and disasters in which certain societies have foundered offer equally eloquent evidence of the high price which has to be paid for inability to organise the relationships between man and nature.

*

With the assistance of some examples taken from the fields of production, food, housing, energy, industrialisation of renewable natural resources, conservation of resources and organisation of social services, we now propose to illustrate the scope of application of eco-development strategies, with special reference to eco-techniques.

(1) *Food*

The "green revolution", at least in its first phase, is based on a universalist and diffusionist philosophy of development which places too much emphasis on the virtues of transfers of technology and the widespread use of certain "miracle" varieties of wheat and rice. We are unable here to examine the complex and controversial subject of its results, and we shall therefore merely mention that many critical analyses insist that there are limits to its applicability, since it assumes that the problem of irrigation is solved and it also calls for extensive industrial inputs. In addition, it has contributed to an increasing social polarisation and an even more inequitable distribution of income in the countryside. Lastly, it involves ecological risk both because of the reduction of genetic variety and because of the extension of single-crop farming which is more vulnerable to epidemic disease than mixed farming.

Is it necessary to conclude from this that cultural borrowings and "modern" agriculture should be ruled out? Though certain champions of so-called biological agriculture may not agree with us, we reject this conclusion. The mere list of the plants originating from America which are now being cultivated by the rest of the world is enough to demonstrate the absurdity of such an approach, quite apart from the fact that the abandonment of chemical fertilisers and insecticides would lead immediately to a decline in production with very serious consequences. Nevertheless, it is possible to take a stand against the views incorporated in the "green revolution", and to stress the specific potentialities of each eco-region in regard to food production.

This leads us to draw attention, first of all, to the importance of ethnobiological research in order to take advantage — if only as a point of departure — of local people's knowledge of their natural environment, that "practical science" of primitive peoples and peasants whose richness and accuracy are constantly surprising anthropologists and ethnobotanists.[19]

The striking diversity of types of agriculture and cultural habits in the world may be analysed from the standpoint either of their adaptation to natural eco-systems or of the transformation of these systems. A classic study by Clifford Geertz draws a comparison between the irrigated terraces of Java — veritable aquaria fashioned by man for rice cultivation — and nomadic agriculture practised on patches of burnt soil which constitutes an imitation of the tropical forest.[20] These are two extreme cases in many respects — the degree of artificiality, and supportable population densities (that of the rice fields is as much as 2,000 inhabitants per km²); they are also two cases of felicitous adaptation to very different sets of ecological conditions. They reflect two very different orientations for agronomic research, the one relating to highly labour-intensive methods of production involving massive populations living in a small area, the other pointing to the development of mixed farming based on the "chacras" of the Amazonian Indians and the gardens of the indigenous population of Polynesia. In the view of several experts, the apparent disorder of the latter conceals a profound rationality.[21]

In general, we have insufficient knowledge about agriculture in humid tropical areas; and priority should therefore be given to eco-techniques applicable in this area, on which a reasonable development pattern for Amazonia will to a large extent depend. This in itself is a highly controversial theme. Should Amazonia be developed or should it, on the contrary, be kept as a "reserve", as certain people advocate?

In view of the programmes already undertaken and the existence of mineral wealth in this region, this question is rhetorical, particularly since the argument that the Amazonian forest is one of the "lungs of the world" producing oxygen is scientifically unsound. The only real problem is how this development will be effected (and what is to be done with the last of the Indians). Will the development be effected by traditional techniques which involve cutting down the forest[22] in an attempt to transform it into artificial pampas and open fields — which is quite impossible — or, on the contrary, will it be effected by eco-techniques which respect the forest but turn it to greater profit? The results will depend on this basic choice and the ability to create in Amazonia a new "plant life" civilisation. Can it be that the pessimism of Betty Meggers[23] is due perhaps to the fact that she does not believe in the second possibility, while the optimism evident in the last writings of Gourou reflects precisely a genuine act of faith in human creativity in planning.

Whichever be the case, it will of course be necessary, here as everywhere else, to make use of methods which are already known and belong within the range of "classical" solutions, even though they may not have been adequately used hitherto. By way of example, we may mention the use of cassava or stripped sugarcane as fodder. But the bulk of the effort must be based on new approaches, of which we shall mention only a few.

First of all, forest-farming, which the Anglo-Saxons describe as three-dimensional forestry, using the forest as a source of industrial materials and also of animal fodder and human foodstuffs.[24] A glance back to the European Middle Ages will show that forests were long used as "a cattle fodder yard of unequalled quality", in the words of a Burgundy chronicler of the fourteenth century, quite apart from the role which they have long played as a source of energy. For a long time past, Germans have spoken of the *Nahrwald* — the forest as a source of fodder — whose value is calculated in terms of the number of pigs it can feed.[25] The same evidence is provided by the study of certain primitive societies. One example is the astonishing case of the inhabitants of Ukara Island on Lake Victoria in Tanzania, which has a dense population of livestock breeders whose animals are kept in yards and fed on a mixture of leaves from specially planted trees and from aquatic plants.[26] This opens up prospects of research on trees which can produce human foodstuffs, either directly or indirectly through producing fodder. This research is regarded as essential for the future of agriculture in humid tropical areas, since tree cover seems to be the best cover for the soil in these regions.[27] We may note in passing that forest rehabilitation will call for a change in some ideas profoundly rooted in European civilisation, which has grown accustomed to regard forest-clearing as synonymous with economic progress.[28] The rational management of the fauna and the taming of certain species may, in certain conditions, constitute a counterpart and a valuable extension of forest-farming.[29]

Next — aquaculture or the "blue revolution" (as opposed to the "green revolution") in all its aspects: the cultivation of aquatic plants and the breeding of fish and animals in fresh water, lagoons and the sea, instead of a continuous fish-kill. There are abundant examples of this, starting with the familiar case of fish breeding in pools, where a judicious combination of cultivation practices and fertilisation produces very high yields with eco-techniques which require practically no capital investment.[30] Mention may also be made of the possibilities of breeding milk-fish in brackish-water lagoons. From certain lagoons fertilised by sewers in Indonesia it is possible to obtain a yield of 5,000 kg/ha/year. In Taiwan, fish breeding with fertilisers produces yields of 2,000 kg/ha/year; and it has been calculated that in South-East Asia 350,000 km² of water are suitable for breeding milk-fish. If they were put to use, they could produce 70 million tons of fish at the Taiwan productivity rate, or the equivalent of the world fish catch.[31] One more difficult but also promising field is the taming of certain species of aquatic mammals which feed on plants. The most notable example might be the sea-cow, which unfortunately is almost entirely extinct. In tropical regions where the soil is ill-suited for the the creation of meadows, aquatic plants offer great possibilities as fodder for buffaloes and other animals.

Going on a step further, we come to the production of proteins from leaves of various kinds,[32] including weeds.[33] Under certain conditions, the plants infesting certain lakes could likewise become a raw material for the extraction of proteins, and eutrophication could be prevented in this way.[34]

It goes without saying that biological pest control methods, and also genetic research on local species which might be exploited, both naturally come within the framework of an eco-development strategy.

Most of our examples have been taken from the humid tropical zones. The problem is quite different for the arid and semi-arid zones, though it is possible to imagine eco-development strategies for these areas as well. Recent studies have pointed to the possibility of developing plants which are particularly suitable for photo-synthesis in areas where there is a lot of sunshine, high temperatures and little water.[35] It is true that the development of deserts may call for eco-techniques with a high capital-intensiveness, but capital is not lacking in the petroleum producing countries. A Japanese research project which was originally undertaken with a view to desulphuring the petroleum of the Persian Gulf points to the use of asphalt injected beneath the surface of the desert to prepare certain areas for the hydropinic cultivation of plants which are genetically suited to the brackish-waters existing in the region. It is essential to mention also the political importance of studies of this kind, as a possible contribution to solving the Middle East conflict by developing the resources of the desert. The national aspirations of the Palestinians and Israelis could be satisfied more easily if the ecology of the region were changed; and the "Great Petroleum Scare" and the consequent sharp rises in prices have made it possible to envisage a machinery for financing such an enterprise through a small surtax on petroleum, long-term loans advanced by the petroleum producing countries and the conversion of the the military aid provided to the two opposing camps into a desert development fund.

(2) *Housing*

Every year, the housing shortage on the world scale increases by some 4-5 million units in urban areas alone.[36] The situation in the countryside is far from being satisfactory. And yet, paradoxically, this is a field in which over the centuries human societies have created dwellings of varying types according to the locality and culture, and well adapted to the eco-system and the climate,[37] but in which misunderstood modernity has led to such ravages that it has become necessary over recent years to re-invent "eco-dwellings" reflecting a high degree of ingenuity in the choice of materials, the use of solar and wind energy, water recycling, etc.[38] Housing comes within the framework of eco-development under three closely linked aspects:

—the use of building materials of local origin, which are abundant and cheap, ranging from bamboo to mud; this is a problem which has been studied in some detail, but much remains to be done in practice, starting with the rejection of an alien system of values according to which an aluminium roof or a steel and cement house imported at great expense is regarded as a symbol of modernity even in the bush;

—the adaptation of the dwelling itself to ecological conditions; as we have already stated, this is the field par excellence for the cultural creativity of man, in which it is necessary to take a deliberate step backwards to re-

examine traditional housing and possibly draw some inspiration from it. A rigid attitude of a reverence for tradition is, of course, undesirable; but architects should pay more attention to anthropology and move beyond the false universalisation with which their discipline is at present tainted;[39]

—lastly, the integration of ecology and anthropology with urbanistic thinking and with the elaboration of structural plans for towns and all other human settlements; this is by far the most difficult task and the one which has so far been least studied. Hence the importance of the pioneering efforts made by the creators of the New Bombay plan. This city of two million inhabitants is to be built with a minimal allocation of resources for housing proper, since the housing is to be provided by self-construction on very small plots; but a very elaborate plan for the occupation of the ground (which has been made possible by prior purchase of land by the authorities) and rapid collective transport by railway will together provide the inhabitants with living and working conditions which will be very reasonable compared with those in other towns in India.[40]

(3) *Energy*

The debate on the importance of non-classical sources of energy is highly charged and we have no intention here of taking a position on this controversial subject. It is enough merely to state that the recent increase in petroleum prices has already upset many hard-and-fast ideas. We shall not say anything of the possible solutions to the problem of large-scale energy production but, in the context of eco-development strategies, we must refer to the importance which might be attached to the elimination of the energy wastage which occurs so often in the consumption style of the industrialised societies, and to the possible contribution which might be made — in the case of domestic energy uses and small production units — by solar energy (for example for pumps, kitchen stoves and water heaters), wind energy (for the local production of electricity), small dams and even the production of methane from organic sources.[41] These various procedures are justifiable in the conditions of isolation which exist in many rural regions; and they also have the advantage that they can be applied on an even more reduced scale, for example on a single farm. The possibilities of using geothermic energy should, of course, also be carefully assessed where they exist.

(4) *Industrialisation of renewable resources*

One way of combating the possible shortage of certain non-renewable resources might be to restore pride of place to the "plant life civilisations" which are so well described by P Gourou and whose importance is so evident in Far Eastern cultures.[42] We do not advocate a pure and simple return to the past as do the partisans of the so-called intermediary and "soft" techniques, but would rather propose some detailed research on the possible use of plant life as an industrial raw material, both for building materials and for chemical products. The rise in petroleum prices makes this all the more necessary, and it increases the urgency of devising techniques for the rational management and exploitation of tropical forests and water bodies. We believe that a special place should be reserved to "mixed techniques" — i e, transforming the qualities of a product by highly technical processing, as the terminal stage in an otherwise traditional production procedure which offers plenty of employment. All forms of processing and impregnating timber and plant fibres, based on the latest advances in modern chemistry and offering new outlets for certain products of tropical forests and agriculture, provide a good illustration of this concept.

(5) *Conservation of natural resources*

As we have already indicated in regard to the definition of eco-development, the maintenance of natural resources in the name of a forward-looking solidarity with future generations is an integral part of this strategy. It seems that it is also an excellent field for "human investment",[43] since many soil and water conservation activities, reforestation, etc, are suitable for the use of highly labour-intensive techniques. Also, as spare labour is often available, at least outside the season of major agricultural activity, it is possible to envisage natural resources conservation programmes which would not to any large extent diminish the capacity of a country to undertake other development enterprises. This is one opportunity which should not be missed, as the example of China eloquently demonstrates.[44]

(6) *Social services*

If, as has been suggested, the social environment is to be considered as part of the global environment concept, as meaning the total habitat of man, an eco-development strategy must naturally include forms and techniques for providing social, educational and cultural services which are adapted to the specific conditions existing in the rural areas of the Third World and also call for as little capital as possible. Many recent studies and the experience of a number of countries prove that such techniques already exist at the level of para-medicine and rural education. In these conditions, Third World countries should be encouraged to attach much more importance to these activities than they are given in the civilisation projects of the industrialised countries, since the possibilities for developing these services are best at the time when social worker's salaries — like all others — are still low. In other words, the poor countries have a comparative advantage in creating many social services which also offer employment possibilities that are more valuable to society than the traditional tertiary sector (domestic services and small business). Paradoxically, it is the countries of the Third World which have the best chance of creating genuine welfare States.[45]

*

The concept of eco-development is intended to be operational. It constitutes a guideline for action (or, if one prefers, a philosophy of development) whose value can be judged only in the light of practice. Is it merely a return to the illusions of community development? Not necessarily so since, by comparison with the community development schemes for the rural areas of the Third World, it is richer in two aspects: first, there is the critical reflection on the failures of those schemes and accordingly the desire to do better, particularly at the institutional level, and secondly there is the link with natural and social ecology which is revolutionising the habits of thought of the developers.

The application of the concept does, however, require a sustained research effort accompanied by pilot activities subject to critical review, so that permanent feedbacks are established between practice and action-oriented research.

In particular, it is essential to promote the gathering and circulation of information on eco-development experiments as identified and described by anthropologists, historians and human geographers, and also on eco-techniques developed and applied by different indigenous peasant cultures and, to an increasing extent, by certain research laboratories. The purpose of this will be three-fold: to inspire the imagination of research workers and persons responsible for regional planning, to assist in the training of eco-developers and, occasionally, to suggest experiments in adaptation, particularly between similar eco-zones. This will require a vast programme of comparative and inter-disciplinary research and voyages in space and time, undertaken through a network of scientific collaboration in which our colleagues of the Third World will have primary responsibility, since encouragement must be given above all to exchanges within the Third World, on a South-South axis, by insisting on co-operation between eco-regions which are similar but situated in areas geographically distant from one another.

On the basis of these exchanges, supported by specific case studies, it would be possible to define points of interest to serve as foci for the collaboration of biologists, technologists and planners — three professions which have in the past had too little contact with one another. Their exchanges would lead to the formulation of research priorities on eco-techniques and organisational forms of eco-development.

Without waiting for the results of all these exchanges, it is possible even now to undertake certain pilot activities, designed to show that regional or micro-regional development strategies would be improved if they were oriented in the direction of eco-development. The elaboration of eco-development scenarios would make it possible, in a first stage, to take stock of actual knowledge — or gaps in knowledge — on this matter, to test the participatory and unified approach to planning and to train eco-developers. In a second stage, it is conceivable that the eco-development concept will simply be assimilated by the regional planners and will thus be generally used to contribute to the identification of development styles appropriate to each specific case; and, in the long-term, the internalised environment as a permanent dimension in the field of vision of the planner is destined to vanish as a specific field of action.

It would seem that, as a result of the Stockholm Conference, conditions now exist for the above suggestions to be put into effect without delay by the United Nations Environment Programme.

Notes

[This paper was written for the United Nations Environment Programme.]

) Goulet, "The Cruel Choice — . New Concept in the Theory of)evelopment", New York 1973, p XII-XXI.

2 See in this connection the report of the United Nations Symposium on Population, Resources and the Environment (Stockholm, September-October 1973).

3 This social metascience is postulated and practised by M Godelier. See *Horizon*, "Trajets marxistes en anthropologie", Paris 1973, pp 13-82.

4 See in this connection our article "Histoire Globale et Prospective du Tiers Monde", *Diogene*, Number 73.

5 L Febvre, *La Terre et l'Evolution Humaine*, Paris 1972.

6 The present piece of work partly represents our study "Ecodesarollo: un aporte a la defenicion de estilos de desarollo para America Latina" prepared for the ECLA in July 1973.

7 W Churchman, "The Systems Approach", New York 1968.

8 The human environment is also of course made up of men (see T Maldonado, *Environment et ideologie*, Paris 1972, p 15).

9 In this respect F Engels' work on the conditions of the working class in England stands out as a classic of the literature on the environment.

10 The category of non-destructive environmental technologies is broader than that of "soft technologies", defined as inflicting no damage to the environment, as not calling for a great deal of capital or for high qualifications and able moreover to be applied on a small scale. See in this connection: P Harper, "Technologies Douces" and critique of the Western model of development, *Perspectives*, Volume III, Number 2, 1973, and our article published in the same review under the title "Techniques Douces, Civilisation Projects, Development".

11 One cannot over-emphasise, in in this context, the importance of setting up a patrimonial accounting system for nature in order to be in a position to detect the consumption entailed by the irreversible whittling down of the capital of nature or, if one prefers, the rate of exploitation of the environment (for this last concept see R G Wilkinson's fine book, "Poverty and Progress, An Ecological Model of Economic Development", London 1973, and also Dasmann, Milton Freeman, "Ecological Principles for Economic Development", London 1973.

12 Maurice F Strong, Executive Director of the United Nations Programme for the Environment, launched the idea of eco-development at the first meeting of the Administrative Board of this Programme, held in Geneva in June 1973.

13 As the Pakistani economist Mahbub-ul-Haq has rightly written, "the developing countries have no choice but to turn inwards, in much the same way as Communist China did twenty-three years ago, and to adopt a different style of life, seeking a consumption pattern more consistent with their own poverty — pots and pans and bicycles and simple consumption habits — without being seduced by the life style of the rich" ("Crisis in Development Strategies", *World Development*, Volume I, Number 7, 1973, p 29).

14 It should never be forgotten that the very concept of natural resources is tied in with culture; as C O Sauer has said, natural resources are a civilisation's estimates of its environment (quoted by P Gourou, *Pour une geographie humaine*, Paris 1973, p 240).

15 See in this connection the recent address by Robert S McNamara, President of the World Bank (Address to the Board of Governors, Nairobi, September 24, 1973) and the work of the United Nations Committee for the Planning of Development and the United Nations Research Institute for Development on the Unified Approach to Planning.

16 Development as it is traditionally defined always signifies ascribing an unconditional priority to culture over nature. On the other hand, as is stressed by Claude Levi-Strauss, amongst primitive peoples, the relation between culture and nature assumes a certain ambiguity: the latter is at one and the same time pre-culture and sub-culture, but, above all, it contains a super-natural component (*Anthropologie Structurale* II, Paris 1973, p 274).

17 See in particular J B R Whitney, "Ecology and Environmental Control in China's Development Experience", special issue of *The Annals of the American Academy of Political and Social Science*, March 1973, Volume 31, Number 1, pp 95-109.

18 This English term consecrated by Emerson, used again in the context which is of interest to us by Gandhi, and more recently again by Nyerere ("Ujamaa: Essays on Socialism", Dar-es-Salaam, 1968) has connotations which the usual French translation — "developpement autocentre" — renders very imperfectly.

19 See, amongst others, C Levi-Strauss, *La Pensee Sauvage*, Paris 1962, pp 3-47, and J Barrau, "Plantes et comportements des hommes qui les cultivent. L'oeuvre ethnobiologique d'Andre Haudricourt", *La Pensee*, Number 171, October 1973, pp 37-46.

20 C Geertz, "Two Types of Ecosystems", in A P Vayda (ed), "Environment and Cultural Behaviour", New York 1969, pp 3-25.

21 See for instance for the "chacras" of Indians, B J Meggers, "Amazonia: Man and Culture in a Counterfeit Paradise", Chicago 1971, and S Varese, "Au sujet du colonialisme ecologique", *Les Temps Modernes*, April 1973; for the gardens of Polynesia, R A Rapaport, "The

Flow of Energy in an Agricultural Society", *Scientific American*, September 1971.

The International Rice Research Institute has just begun a research programme on "multiple cropping" conceived as a carry-on from the "Green Revolution", keyed to the humble peasant who lacks capital and access to irrigated lands, but could grasp perfectly well a new technique which would depend essentially on his labour and on knowledge of the environment and would afford him a possibility of increasing and diversifying his production. (See G Conway, J Romm, "Ecology and Resource Development in South-East Asia", The Ford Foundation Office for South-East Asia, 1973).

22 Naturalists can be found who justify the cutting down of the forest by pseudo-scientific arguments. Has not Henrique Pimenta Veloso, adviser to the Brazilian Government, just explained that the Amazonian forest is in the process of growing dangerously old and of degenerating beneath the weight of the liana and that 30 per cent of it must be cut down before it is too late? (*O Estado de Sao Paulo*, September 4, 1973). His statements called forth a caustic commentary from the *Journal do Brasil* of September 5: "it would appear that the erudite ecologist has the soul of a lumberjack and of a cattle-breeder".

Why is the Standard Battery like a bestseller?

Because it's a runaway success.

CAR POWER

LINTAS.STB.33-140

23 The book already referred to by Meggers bears the significant subtitle of counterfeit paradise. Gourou, whose assessments of the virtual possibilities of Amazonia have greatly evolved, writes in his last work: "it is more realistic — and more scientific — to think that it is on account of the lack of farming techniques and adequate backing technologies that it has not been possible for a permanent and abundantly productive agriculture to be established in Amazonia. If an ingenious civilisation had risen up in Amazonia, there would be no lack of people to say that it had been favoured by the vast expanse of arable land, by the abundance and regularity of the rains and by an admirable navigable network, unique in the world" (*Pour une geographie humaine*, Paris 1973, p 95).

24 See by way of example the excellent article by James Sholto Douglas, "L'Agrisylviculture pour accroitre la production alimentaire de la nature", *Impact: science et societe*, UNESCO, Volume XXIII, Number 2, 1973.

25 See P Deffontaines, *L'Homme at la foret*, Paris 1969, pp 37 and 44. See also, for examples of the role played by the forest in providing food during the early Middle Ages and the integration of agriculture, stock-raising and sylviculture, Georges Duby, *Guerriers et paysans VIIe — XIIe siecles*, Paris 1973.

26 P Gourou, *Lecons de geographie tropicale*, Paris 1971, pp 160-161.

27 See R Revelle, "Population and National Resources — Land and Water Resources", document prepared for the United Nations Symposium on Population, Resources and Environment (Stockholm, September 26-October 5, 1973).

28 In this connection European culture is in opposition to that of the Moslem East, as has been rightly noted by J Le Goff: "A great mantle of forests and heaths interpersed with cultivated clearings of varying degrees of fertility, such is the face of Christendom — like a negative of the Moslem East, a world of oases in the midst of deserts. Here wood is scarce, there it is plentiful, here trees are civilisation, there they are barbarism. The religion which rose up in the East in the shelter of palm trees, made its appearance in the West at the expense of the trees, the refuge of pagan spirits, which were mercilessly cut down by monks, saints and missionaries. All progress in the medieval West took the form of land clearance, of fighting and vanquishing the brushwood and bushes or, if it was necessary and if technical equipment and courage made it possible, the woods, the 'gaste foret' of Percival, the *selva oscura* of Dante." (*La Civilisation de l'Occident medieval*, Paris, Arthaud, 1967, p 169).

29 The great English biologist Julian Huxley reached a similar conclusion with regard to the African savannahs. See "Riches of Wild Africa" in "Essays of a Humanist", Harmondsworth, 1966, pp 177-201.

30 H Dickenson describes Chinese practices whereby are obtained up to 8000 kilos of fish yearly for each hectare of pond subject to a very sophisticated management, involving the feeding of fish by snails, by the chrysalises of silk worms, the leaves of sweet potatoes, and enriched by pigs' dung ("Rural China", 1972. Report published by the School of Engineering Science, University of Edinburgh, p 133). In Peruvian Amazonia we visited an example of experimental pisciculture where the fish were fed on termites, which opens up possibilities of managing in a new way the trophic chains.

For a very exhaustive wide view of the problems of aquaculture, see J E Bardach, J H Ryther and W O McLarney, "Aquaculture: The Farming and Husbandry of Freshwater and Marine Organisms", New York 1972.

31 P Gourou, *Pour une geographie humaine*, Paris 1973, p 27.

32 See the studies carried out by N W Pirie, a pioneer in the field, and in particular the volume edited by him: "Leaf Protein: Its Agronomy, Preparation, Quality and Use" (Blackwell Scientific Publications for the International Biological Programme), Oxford and Edinburgh, 1971.

33 See S B Gore and R N Joshi, "The Exploitation of Weeds for Leaf Protein Production" in "Tropical Ecology with an Emphasis on Organic Production", Athens (Georgia) 1972, pp 137-146.

34 Thus at the 11th International Great Dam Congress, held at Madrid in June 1973, the Soviet delegation announced the construction in the Ukraine of a factory for the extraction of proteins from the plants which infest the artificial lakes.

35 See O Bjorkman, J Berry, "High-Efficiency Photosynthesis", *Scientific American*, Volume 229, Number 4, October 1973, pp 80-93.

36 "World Housing Survey", prepared by the United Nations (Doc E/C. 6/129), New York 1973.

37 See in this connection Amos Rapaport, *Pour une anthropologie de la maison*, Paris 1972; Pierre Deffontaines, *L'Homme et sa maison*, Geographie Humaine, Paris 1972; and, with regard to the Arabic house, Hassan Fathy's excellent book, *Construire avec le peuple*, Paris 1971; Gilberto Freire has studied the adaptation of the ecosystem to the Brazilian colonial house in *A Casa Brasileria*, Rio de Janeiro, 1971.

38 As one example amongst others mention may be made of the experimental house built at McGill University in Canada: sulphur, a by-product of oil-refining, was used as material, the energy in the wind was harnessed to produce electricity, solar energy was used for cooking and heating water. The creativity of the authors showed itself above all with regard to water husbandry: separating of three qualities of water in terms of use, recycling and purification with the aid of solar energy, collecting of rain-water, condensation of air humidity, choice of simple and judicious methods of sprinking for washing, etc. (A Ortega and collaborators, "The Eco Operation", Montreal 1972).

39 Let us refer once again, by way of example, to Hassan Fathy's fine work.

40 See Charles Correa's excellent study, "Self-Help City, the Internal Organisation of Metropolitan Areas" submitted to the United Nations Symposium on Population, Resources and the Environment (Stockholm, September 26-October 5 1973).

41 Either on the basis of algae, or on the basis of dung, as is already being done in India; in the latter case, this constitutes important economic progress, for cowdung traditionally serves as fuel, wood being scarce; the new process makes it possible to extract fuel to meet the needs of the village, with the aid of a simple device, and also to obtain manure.

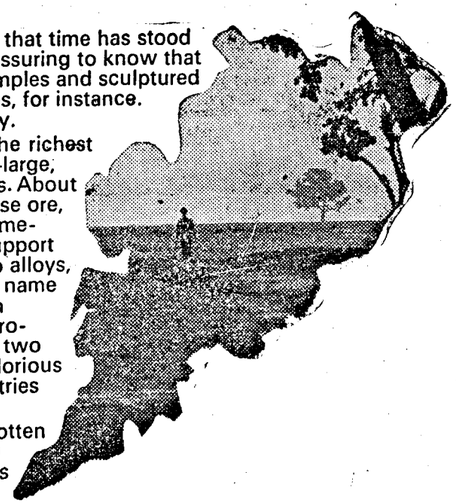
42 See P Gourou, "La Civilisation du vegetal", *Indonesie*, Number 1 (5), 1948; and, by the same author, *La Terre et l'homme en Extreme Orient*, Paris 1972, and in particular pages 26-29.

43 See in this connection E Raynaud's work, *Investissements humains Illusions et realities*, Paris, The Hague, 1969.

44 See in this connection the article already mentioned by J B R Whitney, "Ecology and Environmental Control" and the study made by Chang Kuang-tou, Chen-Chun-Ting, Li Kuei-fen and Liu Ling-Yao "Construction of Dams for Water Conservancy", Peking 1973; and for a general formulation of possibilities with regard to the application of labour intensive methods for the conservation of resources, see our contribution to the Founex Symposium of 1971: "Environmental Quality Management and Development Planning: Some Suggestions for Action", in "Development and Environment", The Hague, Paris, 1972.

45 For further details, see our article: "A Welfare State for Poor Countries", *Economic and Political Weekly*, Volume VI, Numbers 3, 4, 5, January 1971.

Perhaps you think the real wealth of Orissa is displayed in tourist folders.



It's only natural.

It's unforgivable the way some people think that time has stood still in Orissa for the last 600 years. But it's reassuring to know that there's more to this state than just medieval temples and sculptured exotica. Like an abundance of natural resources, for instance. The real wealth of Orissa. The future of industry.

Strangely enough, Orissa offers, perhaps, the richest natural resources for establishing an industry—large, medium or small. The facts speak for themselves. About 30 per cent of the country's iron and manganese ore, besides vast reserves of chrome, nickel, lead, limestone, coal, bauxite, graphite and china clay support varied industrial units—sponge iron, steel, ferro alloys, fertiliser, textile, engineering and chemicals, to name just a few. Plans are afoot for many more. Rich agricultural land underscores the potential of agro-based industries. Valuable forests already feed two large paper mills. A 400 km. coast-line offers glorious opportunities for lucrative marine-based industries that generate vital exports.

It's all there—natural. Under a dreamy, forgotten exterior lies more intrinsic worth than a glossy tourist folder would have you believe. Legacies of the past are admirable. But today plans for the future must predominate.

Orissa—where the scene is set for industrial enterprise

Credit Policy, Interest Rates, Central Banking, and All That

H T Parekh

So long as it cannot be established that there has been speculative inventory build-up in any section of industry, any large increase in bank credit need not cause the kind of alarm it has caused among academicians.

One has only to see the recent increases in foodgrain prices, steel prices, coal prices, transport costs, prices of imported items such as metals and chemicals, and wage costs to realise that the volume of bank credit could not but have reflected these steep increases.

It is idle to say that by an even more stringent credit policy and high interest rate policy we could have hoped to succeed in reversing the price situation.

THE credit policy for the busy season 1973-74, as originally announced in November 1973, and as modified soon after, the actual developments in the credit situation during the busy season and the recent announcement regarding the credit policy for the slack season are all behind us. These developments could perhaps be usefully reviewed now, particularly in this journal in which some contributors have sought to condemn totally the current credit policy (e g, "Interest Rates — Some More Tinkering", April 6, and "Credit Policy — Loss of Credibility", April 27).

I am no advocate or defender of the Government's or the Reserve Bank's policies. I myself hold different views and would like to set them down for public debate. My particular object here is to question the views expressed by your correspondents on credit policy and interest rates. I would even go a step further and say that any attempt to carry out the suggestions made by your correspondents would have disastrous consequences.

Busy Season Experience

Coming to various aspects of credit policy for the last busy season, one can see that the authorities have been under pressure from two opposite directions. On the one hand, the inflationary price situation, the unusual rate of increase in money supply and the high level of deficit financing have forced the hands of the Reserve Bank to take some drastic steps by exercising severe measures of credit restraints, both selective and non-selective. On the other hand, the business community, industry and trade, large-scale industry and small-scale industry, non-priority sectors and priority sectors, such as exports, agriculture, etc, have found it increasingly difficult to meet their credit needs even for genuine purposes, and even from their own bankers, because commercial banks themselves have come under severe pressure in regard to their resources. Commercial banks' credit increased sharply between October 1973 and April 1974, nearly twice the figures estimated by the authorities (from Rs 650 to over Rs 1,000 crores) and yet the demand for credit, even for productive purposes, could not be fully met. Your several correspondents have charged the Reserve Bank in a nonchalant way with failure to restrict credit and call up advances, as if credit can be so easily rolled back. Even the declared credit policy could not be operated effectively because several banks have been unable to adhere to the various liquidity requirements prescribed by the Reserve Bank and have found themselves in the unenviable position of having excess drawings and having to pay to the Reserve Bank penal rates for them.

The credit policy for the busy season was based, firstly, on certain estimates made by the monetary authorities about the likely increase in credit needs in relation to expected increase in bank deposits. In the light of such assessment, revised liquidity requirements were laid down on commercial banks at the beginning of the busy season. Under these requirements, the cash ratio of banks was raised from 3 per cent to 7 per cent and the liquidity ratio of holding of Government securities increased from 30 per cent to 32 per cent. The major consequence of this policy was that the deposits of banks got impounded to the extent of about Rs 500 crores. Much of the trouble in the busy season 1973-74 can perhaps be traced to this impounding of deposits.

This development had a chain effect and far-reaching consequences on the banking situation. During the busy season, the spiralling of prices continued further and it would appear that the estimates made by the authorities of the busy season needs may not have taken adequately into account the impact of rising prices on the demand for bank credit.

However, the authorities had to work under great pressure to meet the legitimate credit needs of production and export and, in order to meet these requirements, they opened a new avenue by encouraging bill discounting with the Reserve Bank which grew phenomenally during the six months. A new window to provide credit was opened which helped considerably to reduce pressure on banks. Commercial banks' borrowing from the Reserve Bank also increased sharply during this period, often at penal rates which meant that banks were unable to maintain the prescribed ratios. The pressure of demand for funds was also reflected in a sharp rise in call money market rates to 20 per cent before they were pegged at 15 per cent indicating a scramble by banks for the available funds. Some funds had even to be injected into the banking system through the call money market to keep interest rates under control.

Even more seriously, individual banks' liquid position got so out of gear that they were driven to refuse credit even to their established clients and even for export purposes. The Reserve Bank rightly held the view that it was not concerned with how each bank operated and that it could not do much if any particular bank found itself over-strained. However, this did not help the overall situation, but further added to the dislocation in banking. As banks declined to provide the required credit, borrowers turned to people with credit balances and to non-banking channels, which in turn had the serious effect of holding down the deposit growth of banks, which further tilted the balance against the banks.

The banking authorities ultimately made available, directly or indirectly, the credit needs of the busy season almost to the full extent which came to about twice the official estimates made at the beginning of the season. In this sense, the credit policy was applied in a flexible manner, though it meant in effect modification of the policy as announced. In this, the authorities acted correctly.

However, in the process, much distortion has taken place in the field of banking operations — both on the deposit front and the credit front. A certain undermining of confidence in banks has resulted for the borrowers as well as depositors. This is an unfortunate development which requires looking into and correction.

The question to ask is : was a restrictive credit policy justified this year? Comparison with the 1972-73 busy season credit expansion is not relevant as, by all accounts, the harvest this season (1973-74) was much larger. Credit policy has to respond to the supply situation, and, as events have shown, even the larger credit expansion that has eventually taken place has proved somewhat restrictive.

Secondly, would not a more gradualist policy have brought about the same results — with less confusion and greater efficiency? Could it not be said that the banking resources impounded were excessive and caused undue strain on the banks? Instead of rushing in with an excessively restrictive credit policy and later beating a hasty retreat from it, perhaps it would have been better to have tightened the credit screw gradually to acheive the required effect.

Interest Rate Policy

Your special correspondent (April 6) has described the current policy as a low interest rate policy and has made sweeping and unworkable suggestions of almost doubling the deposit rates of banks, steep rise in the Bank Rate and a rise of over 50 per cent in term lending rates. I question the very basis of your correspondent's views. The present policy is itself a high interest rate policy, and I would favour some reduction in interest rates. Neither a predetermined personal notion about the interest rate structure, nor any comparsion of interest rates with other countries, particularly the UK, can have any validity in determining the right structure of interest rates for India. Nor would an academic concept of "real cost of capital to a developing country" have any practical application in India, for there is no accepted theoretical basis for working out a rate structure and I am not sure whether economists would agree among themselves about the method of working it out or about the rates of interest so worked out.

On the other hand, the most workable and realistic approach would be to review the country's interest rate structure in a historical perspective, because, as a result of experience extending over generations, people come to regard a certain rate structure as a norm and judge changing rates of interest from time to time in the light of such a norm. I wish our economists and theoreticians would take pains to study the actual pattern of interest rates as it has existed in India for the last 50 years, if not more. During this long period, the country passed through booms and depressions, periods of shortages and surpluses, of war and peace, all under a fairly stable policy of moderate interest rates, with much success. Only in the last 6 to 8 years it seems to have become fashionable to keep raising interest rates in the fond belief that will somehow help in bringing down prices, which has not happened. Ironically, banks operate on a prescribed *minimum* lending rate of 11 per cent, even when credit is in such short supply (warranting if anything, a ceiling rather than a floor). Rates ranging from 12 per cent to 15 per cent are considered normal, and advocates like your correspondents suggest even further steep increases.

Those who are over-critical of the interest rate policy of the authorities on the ground that they are too low, fail to take into account the psychological fact that people in India have traditionally come to regard 6-9 per cent as something of a norm in interest rates. First class business firms who accept deposits are known to pay even today interest rates expressed as 10 annas or 12 annas per month, i e, 7½ per cent to 9 per cent. For generations, Courts when they had to deal with deposits in any law suits, stipulated a rate of interest of 6 per cent, which has since been raised to 9 per cent. Even medium and long-term rates of interest, as expressed in yields on government loans, have varied between 3½ per cent and 6 per cent for over 75 years. The advocates of much higher interest rates take no notice of these historical facts and do not seem to regard them of any relevance in determining an interest rate policy in practice.

It seems to me that a prime interest rate structure for short and long-term, ordinarily moving within the range of 6 per cent to 10 per cent, can be regarded as reasonable and appropriate in India. Any rate in excess of that would be regarded as high and can be justified at best as a temporary measure and for special purposes. The argument that you should make allowance for inflation can be met by pointing out that during the period of World War II of 1939-45 there was much greater inflation than in recent times and yet it was possible for the monetary authorities to keep down interest rates. In my view, the commercial banks' current lending rates ranging from 11 to 15 per cent are excessive and are not serving any anti-inflationary purpose, because of other factors connected with supply and demand in the country. In some measure, they are helping to raise the cost structure in the country.

One vital fact often overlooked is that when we talk of interest rate structure, we talk of it as operating in the organised money and capital market. Alongside, there is also a sizeable non-organised money market which caters primarily to the small-scale industry, agriculture and the small businesses, in urban and in rural areas. Normally the ruling rates in this market are 3 to 5 per cent higher than in the organised market (e g, the Multani Hundi rates). The availability of funds and the rates of interest at which such funds are available in this market depend directly on the supply and rates of interest in the organised money market. The impact of any upward change in the organised sector is quickly and sharply felt by the unorganised sector. Today, when commercial banks lend at from 11 per cent to 15 per cent, the ruling rates of interest for the small borrower in the other market ranges from 20 per cent onwards. The advocates of high rates of interest lose sight of this important aspect. Small businesses operate on a low margin and can ill-afford to borrow money on such onerous terms. In recent years, banks are granting more loans on concessional terms to this sector which is considered a priority sector, but banks will never be able to grant to this sector all the finance it needs and the businesses will continue to have to depend on the non-organised market for a vital part of their needs.

In short, what our economists themselves regarded as usurious ten or twenty years ago, has now become the respectable rate in their eyes. Now, even still higher rates are advocated by them which presumably they do not regard as usurious.

As the columns of this journal amply show, the fashion of the day is to keep pressing for higher and higher rates of interest and to keep beating the Reserve Bank of India for not doing enough in that direction. It may be, that the advocates of high interest rates see something socialistic about high interest rates and therefore find them justifiable. If so, this is rather curious. I would have thought one method of capitalist exploitation is through high or usurious interest rates. It is, therefore, difficult to justify high interest rates even on presumed socialistic leanings.

Future Credit Requirements and Policy

The credit policy announced for the slack season is also based on certain tentative estimates, which may or may not prove correct. However, the authorities have taken the right step of permitting some increase in deposit rates, at the same time discouraging banks from further increase in their lending rates. They have been right in reducing the cash ratio requirements from 7 per cent to 5 per cent. However, they have partially negatived this concession by requiring an additional 1 per cent bank holding of government securities. Thus, liquidity requirements will be reduced from 39 per cent (32 + 7) to 38 per cent (33 + 5).

This poses the question whether the authorities are right in requiring banks to maintain a liquidity of 38 per cent and yet expecting them to meet the real needs of industry for credit in adequate measure. Apart from rising prices, both of controlled and non-controlled goods, and rising wages, requiring a larger volume of credit for sustaining the same activity, it should also be recognised that the past 2-3 years were years of economic stagnation, while the coming years indicate expansion in production, requiring a larger volume of credit.

It would seem, therefore, that the monetary authorities would have to be willing to bring down the liquidity requirements of banks gradually to 30 per cent (25 + 5) over the next 2 to 3 years, to release banking resources for business needs (which includes the growing credit needs of public sector enterprises). While the cash reserve ratio of 5 per cent can be considered reasonable, the present requirement of 33 per cent for government securities would appear to be on the high side and would act as a constraint on banking resources for productive use. This ratio should be constantly reviewed and policy should be to relax the ratio as the economy picks up. The banking sector would be able also to meet adequately the government's need for resources through public borrowing because accretion of new deposits would make available, on the basis of 25 per cent, a sizeable amount for investment in government loans. On an annual addition to bank deposits of Rs 1,500 crores, even at the ratio of 25 per cent, government can depend upon banks for nearly Rs 400 crores in the form of government loans. Economic growth would itself bring about increased demand for government loans from banks and other saving institutions.

However, the policy for the slack season as announced, and the indication given for the full year ahead, recognise the need for expansion of credit. It is based on the expected increase in bank deposits and permits of 35 per cent of such deposits being used for providing credit. At the same time, by the end of the slack season in 1974, the banks are expected to reduce their bill discounting to 40 per cent. Perhaps, the most flexible part of the policy is that provision of refinance will be discretionary and not automatic. In a way, such a policy would be welcome to banks but it also has the weakness of bringing about too much of intervention on the part of the Reserve Bank. The policy for the slack season as announced, however, lacks simplicity and is rather involved. It suffers from the danger that commercial banks would lose much of their operational freedom and would have too often to turn to the Reserve Bank before they are able to take any action. Over-dependence on the Reserve Bank would be good neither for the Reserve Bank nor for the commercial banks.

Central Banking Policy and Inflation

Ultimately, inflation can only be contained by increased production. The current inflation is partly imported, but is largely the result of economic stagnation in India. There are many indications to suggest that government policy is now geared to increasing production, as reflected in the budget and revised industrial licensing and pricing policies. The success of these endeavours also depends upon larger availability of credit and capital. Credit policy necessarily has to be based on expansion of credit, while the critics, if they had their way, would want to deny such credit, because presumably, in their view, a policy of credit restraint by itself would be able to bring down prices.

It seems to me that, as reflected in the writing of your various correspondents and in the memorandum of the over 100 Professors, there is an over-concern about deficit financing and in regard to expansion of bank credit by the commercial banks, and about money supply, as there is inadequate appreciation of the credit needs for production and exports.

What must be borne in mind is that central banking is neither a science nor an art but a craft. The monetary authorities need to gather the various strands and evolve a workable pattern of bank credit appropriate both for the short-term and for the long-term economic needs of the country. This would seem to require closer consultation among industry, banks, economists and government than at present. Ultimately, the policy can only be evolved by trial and error. Perhaps, both the monetary authorities and their critics have tended to take too literally their own tentative estimates of possible credit expansion and then believe in such figures as something sacrosanct. Due to the complexity of conditions in India, all statistical exercises must have built into them large margins for imponderable factors. Increasingly over the years, commercial bank credit is utilised largely for industry. The impact of the busy season is much less today than in the past and during the slack season also return of bank credit does not have the same impact as in the past. This development would seem to warrant an official review of the credit policy every quarter, rather than twice a year, at the beginning of the busy season and of the slack season, as at present. This may help formulate a more appropriate credit policy by the Reserve Bank of India in the light of quarterly revision of estimates.

So long as it cannot be established that there has been any speculative inventory build-up in any sector of industry, any large increase in bank credit need not cause the kind of alarm it has caused among academicians. One has only to see the recent increase in foodgrain prices, steel prices, coal prices, transport costs, prices of imported items such as metals and chemicals, and wage costs to realise that the volume of bank credit could not but have reflected these steep increases. It is idle to say that by an even more stringent credit policy and high interest rate policy we could have hoped to succeed in reversing the price situation.

Chairman's Speech

DUNLOP INDIA IN 1973

Creditable Performance in a Difficult Year

The following is the address by the Chairman, Mr. R. G. S. Nairn, at the 48th Annual General Meeting held on May 17, 1974, at Calcutta.

I have pleasure in welcoming you to the 48th Annual General Meeting of the Company.

As the Directors' Report and Accounts for the year ended 31st December, 1973, have been in your hands for some time, I should like, with your permission, to take them as read.

THE AUTOMOTIVE TYRE INDUSTRY

Industry production in 1973 totalled approximately 50 lakhs automotive tyres, about the same as in 1972. The continued power shortage, difficulties in obtaining raw materials, frequent dislocation in transport facilities and labour problems in some units affected the production of the Automotive Tyre Industry in 1973. As a result, the gap between demand and availability of important product groups such as truck, rear tractor and earthmover tyres has been further widened.

The Fifth Five-Year Plan target is 100 lakhs automotive tyres, which is to be achieved in 1978-79. It has been planned by the Government that the major part of this expansion programme will be achieved by new manufacturing units and letters of intent have been issued to about 15 new units. In this context, it should be remembered that the gestation period for new units can be three to four years, particularly due to extended deliveries for machinery. Consequently, the main burden of meeting the increasing market requirements will continue to rest on the existing manufacturers in the next few years.

Following on the decontrol of selling prices for automotive tyres and tubes, the Industry increased prices with effect from 29th April 1974, in order to cover a part of the cost increases which have taken place since November, 1968, when the prices were last fixed.

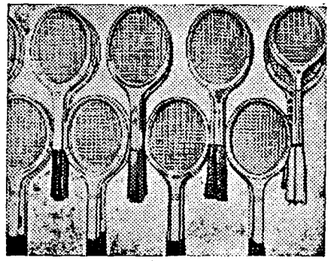
In order to ensure that those tyres which are in short supply are available to genuine consumers at the recommended retail prices, the Industry, with the assistance of the Central and State Governments, is now in the process of implementing a revised distribution system.

THE COMPANY OPERATIONS IN 1973

Sales

Total sales of your Company increased by 6.1% over 1972 to Rs 101.65 crores. This is the first time that our turnover has exceeded Rs 100 crores.

The demand for all our products continued to rise. However, in spite of the increased production, we were not able to meet the demand, particular for truck tyres where a shortage continues due to insufficient capacity. Your Company, therefore, took special steps to try to ensure equitable distribution throughout the country. As in the past, we have maintained priority of supplies to vehicle manufacturers, State Transport undertaking and Defence.



Sales of non-tyre products, particularly industrial rubber products such as conveyor and transmission belting, hoses and vee belts, increased by 11.2% by maximum utilisation of capacity. However, the availability of bicycle rims was badly affected by a shortage of rim strip.

Exports

Dunlop India set up a new record in 1973 by exporting to 87 countries and earning Rs 3.33 crores, the highest achieved by any tyre company in India.

Amongst the products exported were a variety of automotive tyres, including tyres for aeroplanes, cycle tyres and tubes, cycle rims, vee belts, transmission belting and rubber solution. The range of cycle tyres developed exclusively for export continued to perform well in the sophisticated U.S.A. market.

A special feature in 1973 was the development of exports of products

An order for nearly 100,000 tennis rackets was secured from the U.K.

such as sports goods, particularly tennis and squash rackets, produced by small-scale enterprises, as also bicycles, bicycle components and slotted angles. An order for nearly 100,000 tennis rackets was secured from the U.K.

The Company took the initiative of inviting a select number of potential overseas buyers to visit Dunlop factories in India, and, as a result, large export orders were booked.

In recognition of the Company's creditable achievements as an export house, Dunlop India has received a Certificate of Eligibility from the Government of India.

We are fully aware of our responsibility to help the country to increase its foreign exchange earnings. We are, therefore making increasing efforts to expand our exports.

Production

Although there were continuous power cuts throughout the year at the Sahaganj factory, production was higher than in 1972.

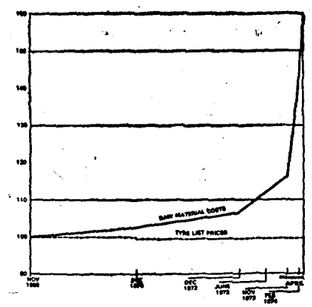
At the Ambattur factory, even though the severe power cuts in Tamil Nadu continued until the middle of July, the additional number of days worked during the year together with the full impact of the factory's expanded capacity partially offset the effect of power shortages during the first half of the year and output was considerably higher than in 1972.

At both factories, special emphasis was given to the production of those types of tyres in short supply, particularly truck and rear tractor tyres.

IN 1973

Personnel

Despite the difficult labour situation in the country, I am happy to report that since the reopening of the Ambattur factory on 29th January, 1973, industrial relations throughout the Company have remained satisfactory. The long-term agreements which govern the terms and conditions of employment of our unionised staff have gone a long way to maintain the stability in industrial relations in your Company.



A tripartite settlement signed on 19th September, 1973, as a supplementary to the long-term agreement of 17th May, 1972, has resolved all outstanding issues at the Ambattur factory and, restored a proper climate for productivity.

I take this opportunity of expressing my appreciation of the commendable efforts made by the Company's employees during a difficult year, and conveying to all of them my sincere thanks.

Profit and Loss Account

Your Company is constantly endeavouring to improve profitability by maximising production and achieving all possible economies. In the case of purchasing, we were able to effect substantial economies by buying critical raw materials before the sharp price increases in the second half of 1973. On the operating side, in spite of rapid inflation, we have been able to contain cost increases to a reasonable level. One example is that, on an increased sales volume, transport and delivery expenses in 1973 were considerably lower than in the previous year. Furthermore, as a result of tighter controls, we were able to reduce our working capital, and interest charges were Rs 42 lakhs lower than in 1972.

It was these measures that contributed to the increase of Rs 2.52 crores in the profit before tax for 1973. However, the total pre-tax profit at 4.9% of turnover was not satisfactory. After maintaining the dividend at the same level of the last four years, we have only been able to transfer Rs 57.78 lakhs to Revenue Reserves, which is, of course, insufficient for continued development and growth of this Company.

Index of raw material costs and tyre prices.

COSTS AND SELLING PRICES

The decontrol of selling prices of automotive tyres and tubes is particularly welcome because, since November, 1968, selling prices have not been increased and, during this period, your Company has had to absorb the ever-increasing costs.

To give you an idea of the magnitude of these cost increases, our raw material costs of automotive tyres and tubes increased by 11.97% between November, 1968 and the end of June, 1973. Between July, 1973 and February, 1974, these costs have increased by a further 29.74%. Between February and the beginning of April, 1974, raw material costs have escalated by a further 17.14%, making a total of 58.85%.

I consider that the pragmatic decision by Government to decontrol automotive tyre and tube prices will provide the incentive for increased production. This decision will also help your Company to operate economically and to generate funds to finance the R & D programmes, to provide for modernisation and growth, and to give shareholders a reasonable return on their investment.

COLLABORATION AGREEMENTS

Two State Industrial Development Corporations, Andhra Pradesh and West Bengal, signed Technical Collaboration Agreements in November, 1973 with Dunlop Limited, U.K., and Dunlop India Limited for setting up automotive tyres and tubes factories in these two States. The Agreements have been approved in principle by the Central Government and we expect to sign detailed Agreements with the two Industrial Development Corporations in the near future.

Documents being exchanged after the signing of the technical collaboration agreement with the West Bengal Industrial Development Corporation Ltd.

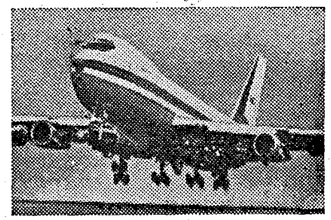
Briefly, the Agreements conceive of Dunlop U.K. preparing and providing project data in the U.K. and continued technical assistance being provided by Dunlop U.K. and Dunlop India for a period of five years after the commencement of production.

A special feature of these Agreements is that part of the fees will be paid locally in Rupees, which will result in foreign exchange savings.

The Industrial Development Corporations are responsible for execution of the projects and both have expressed their desire to appoint Dunlop India as technical consultants in view of the unique expertise we have developed to undertake this work.

Dunlop India is proud to be associated with these projects, which will help to reduce the present tyre shortage, provide employment and give momentum to industrial growth.

We have also offered to supply know-how for scooter and cycle tyres and tubes to two small-scale manufacturers and Government's approval is awaited.



RESEARCH AND DEVELOPMENT

I mentioned last year our intention to establish an R & D unit for cycle tyres and tubes. During the year, we have enlarged our objective and now plan to establish an integrated R & D Centre at Sahaganj, covering our entire product range. Our intention is to consolidate all R & D efforts now spread around the organisation for better co-ordination and control, and thereby improve effectiveness of R & D expenditure. The new Dunlop Research Centre will also assist in providing technical facilities under agreements to other organisations.

The greatest benefit from this new Research Centre will be derived if it has access to the basic know-how already available and being continually developed by our associates, Dunlop U.K. in association with Pirelli, Italy. This know-how, developed at a very high cost, has been provided to us in the past against a nominal technical aid fee. I, however, regret to inform you that our discussions with Government for renewal of our Technical Aid Agreement with Dunlop U.K. have not yet been fruitful. I earnestly hope that it shall be possible to renew this Agreement in the near future in the interest of local technology keeping abreast of fast moving international technological developments.

FUTURE OUTLOOK

As I have mentioned earlier, the decontrol of automotive tyre and tube prices will help us to generate funds for modernisation and expansion. However, the cost increases that we have had to absorb, particularly over the last twelve months, and the production losses due to power shortages, have had a very adverse effect on our our internal cash generation. The credit control measures recently introduced by the Reserve Bank of India have further added to our financing problems. Consequently, this may necessitate a review of the implementation and timing of our expansion and modernisation projects.

A Jumbo jet fitted with Dunlop India tyres. Dunlop is the country's only manufacturer of aircraft tyres.

The Energy Crisis has also created serious problems for us. Many of our major raw materials, such as nylon tyre cord, carbon black, some synthetic rubbers and rubber chemicals, are derived from oil, and apart from the problems created by the increases in the cost of these raw materials, their availability in sufficient quantities is uncertain. We also face continuing power cuts, restricted supplies of furnace oil for the Ambattur factory and and problems in obtaining the required quality and quantity of coal for the Sahaganj factory. In addition, wood pulp for manufacturing rayon tyre cord may be in short supply in the second half of 1974. Nevertheless, I am confident that these problems will be overcome in the long term, and I view the future with optimism.

75 YEARS IN INDIA

In 1973, your Company completed 75 years. This is, therefore, an appropriate occasion to recall the achievements of your Company during these eventful years. The first pneumatic tyres to come to India were imported by Dunlop in 1898 and this event marked the beginning of a revolution in road transport. In 1936, your Company set up India's first automotive tyre factory at Sahaganj, West Bengal and thus enabled the country to take the first step towards self-sufficiency of a vital product.

Over the years, your Company has identified itself with the nation's aspirations, anticipated the country's needs and has very often been the first to manufacture new products such as aircraft tyres for the Indian Air Force, Air-India and Indian Airlines; tyres for Vijayanta tanks and other Defence vehicles; rubber conveyor belting for major projects; tractor tyres and hoses for agriculture; tyres for animal drawn vehicles and special tyres for export. Even today, Dunlop is the country's only manufacturer of aircraft tyres.

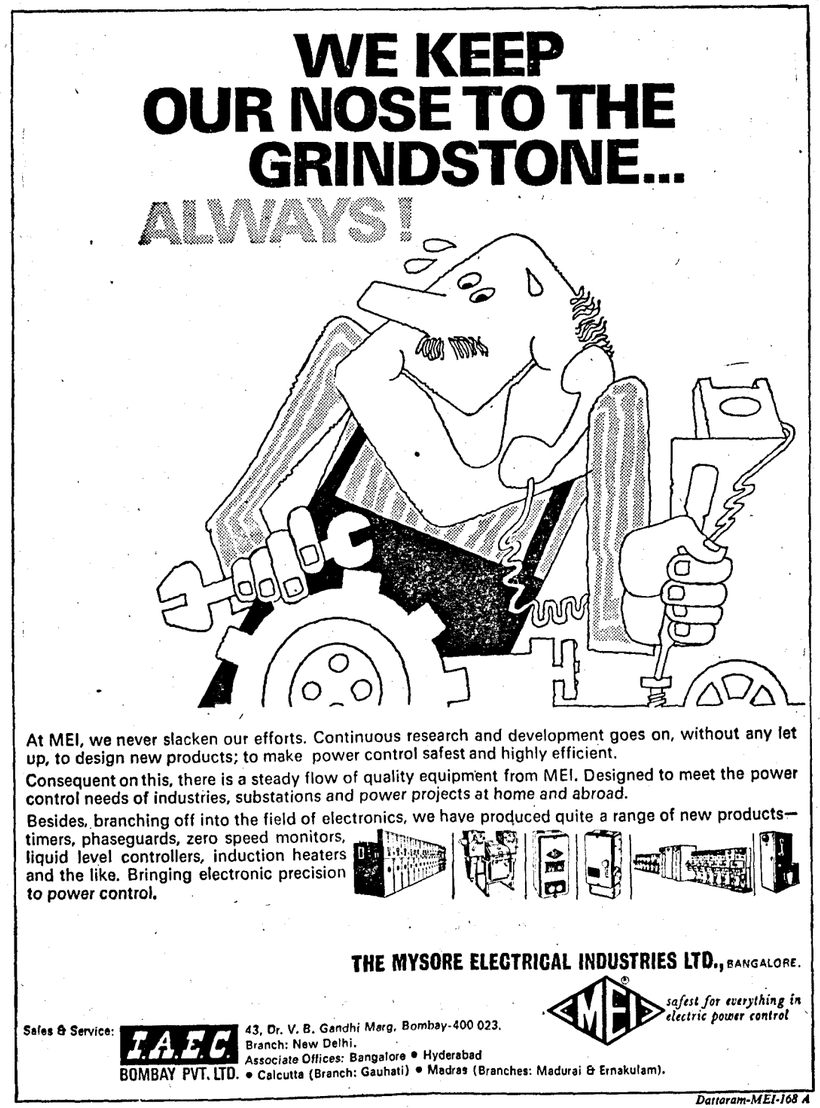
I can claim with pride that Dunlop has developed its manufacturing facilities and skills to meet the needs of the country often at high developmental costs. This policy of your Company has made a major contribution towards achieving the national objective of self-reliance and served the country well in war and peace.

Dunlop India is also at the forefront of the Tyre Industry's drive for exports. Over the last five years (1969-1973) we exported to nearly 100 countries including the U.S.A., the U.K. and the U.S.S.R. and earned Rs. 15.74 crores, which constituted a substantial part of the Industry's exports.

Looking from every point of view, Dunlop India can be proud of its pioneering role over the last 75 years.

On the threshold of the fourth quarter of a century, we look forward to making a still greater contribution towards the nation's transport, industry, agriculture, Defence and exports. At the same time, our own creative ability, strengthened and supported by the latest international technology, will ensure that India does not lag behind world standards.

The long record of Dunlop's service to India and its contribution towards technological development and self-reliance places the Company in a very special position and I hope that the recent restrictive provisions of the Foreign Exchange Regulation Act will not be allowed to affect the Company's operations and future development plans.



It is my sincere belief that in the years ahead Dunlop India will be allowed to play its part fully in meeting the country's increasing needs in many vital areas and thus contribute to national development.

Note: : This does not purport to be a record of the proceedings of the Annual General Meeting.

J Stone

J STONE's new project, for manufacture of marine navigational aids, set up in Bombay last year, is progressing as planned. Manufacture for the large order for 18 major light stations, secured in 1971, is now in full swing and equipment is being delivered. The company executed last year an order from the Marmagoa port trust to supply buoys and lighting for a scheme for Marmagoa harbour. Also, contracts have been received for complete lighting schemes for the harbours at Visakapatnam and Paradeep. The company has obtained a 'letter of intent' for automatic door gear for rail and road vehicles and matters connected with development and manufacture of these items are also progressing satisfactorily. Sales in 1973 included some significant exports of railway equipment to West Germany, Burma and the UK which, it is hoped, will be the basis of a growing export programme in the future. Negotiations are at a fairly advanced stage covering an export contract of electrical equipment to Australia, which would give this programme a further impetus. The company has entered into a licence agreement with Westinghouse Air Brake of the US, under which it is manufacturing air brakes for locomotives and freight wagons. A first important order has been secured from the railways. This product is expected to become increasingly important.

The company has produced good results for 1973, with higher sales and margins. The recommended 15 per cent distribution is covered more than twofold. The comfortable actual and potential order position notwithstanding, the directors are reluctant to make any forecast for the current year owing to "the enormous dislocation to production" caused by the increasingly severe load shedding which is only partly mitigated by a standby generator recently installed. It is also stated that there has been a marked upward swing in prices of almost all raw materials and bought-out components owing to heavy excise and other increases since the last budget.

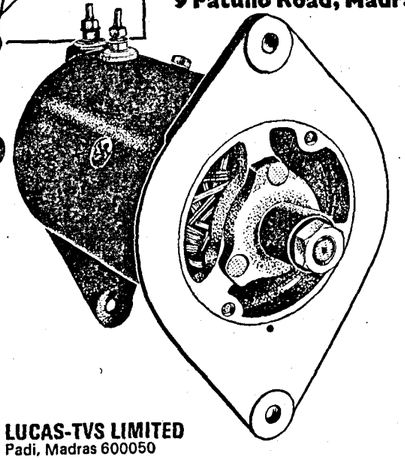
BEFORE YOU PUT YOUR MONEY IN A DYNAMO, SEE HOW FAST YOU CAN GET IT BACK...

The Lucas-TVS dynamo is the highest value for your money. Because each one of its several components is precision-made from top-quality material. Components that should withstand heavy stresses have been designed with extra care. So you get extra life out of them. Proven manufacturing techniques also ensure that breakdowns are minimised.



Which is why over 70% of Lucas-TVS products are used as Original Equipment.

And should one of the many components of a Lucas-TVS dynamo ever need replacement, ensure that you fit only a genuine Lucas-TVS part. Because the Lucas-TVS products you buy are perfectly matched to the needs of every make of vehicle. And each one of them carries a 6-month guarantee against any manufacturing defect!

Compare these advantages of Lucas-TVS dynamo with any other. You'll see there's no comparison.

The Dishonesty of It All

IT was a famous victory. The trade unions representing railway workers surrendered abjectly, without even face-saving concessions from the other side. The government can claim to have not only successfully resisted the railway workers' demands for bonus and for parity in wages with employees of other public sector undertakings but also made an example of railway workers to demonstrate to other public sector employees that it will stand no nonsense from them. Understandably, government spokesmen are gloating over the statistics of railway workers dismissed, suspended or made to suffer a break in service.

For all that, the government must know that this is hardly the end of the story, even in the railways. The subjugation of the railway workers — through the DIR, the MISA and police terror — may yet prove costly in terms of long-term industrial peace in the railways. There have been reports of spontaneous action by railway workers in many places protesting against the mass dismissal and suspension of their colleagues. The government must also know that given the steadily worsening economic situation — with a 30 per cent annual rate of inflation, with prices of the necessities of life going up even faster and with growing unemployment — labour, wherever it is organised enough, is bound to make desperate attempts to stem the erosion of its economic condition. It was railway workers yesterday; it may be bank employees tomorrow. Since it is plainly beyond the government's capabilities to rectify the economic situation, however marginally and slowly, the pattern set in the railway workers' strike of meeting workers' demands with brute repression will have to be extended to all these cases. And having set certain norms for dealing with labour in the public sector, the government will scarcely be in a position to resist the pressure of private sector employers that government quash trade union activity among their workers with equal toughness. After all, once the argument is advanced by the government that a rupee paid to labour is a rupee less for investment and growth, it applies as much to the private sector as to the public sector.

The sudden revival of the government's interest in a national wage policy has to be seen in this context of the prospect of a developing confrontation with industrial labour. The Political Affairs Committee of the Union Cabinet, meeting on Thursday, is reported to have considered the adoption of a resolution on wage policy and the setting up of a national wage board. In ideal circumstances, a wages and incomes policy is a vital component of economic planning. Regulating the relative and absolute growth of incomes is important not only from the standpoint of equity but also from that of raising the levels of saving and determining the pattern of investment and output. What makes the government's current espousal of the cause of a wage policy so totally lacking in credibility is that it comes at a time when the government has virtually abandoned economic planning. Even the pretence of revising the Draft Fifth Plan with a view to preparing a final version of the Plan has been given up.

Indeed the government's dishonesty in talking of a national wage policy could not have been more transparent than it is at the present moment. There is enough circumstantial evidence to suggest that the distribution of incomes has become even more skewed in the last two years or so. What is more, this has not been the doing of some invisible hand but the outcome of the deliberate policies and actions of the government. The richer sections of the population have prospered even as the spiralling inflation has pushed down the real earnings of the workers and the poor.

Successive and large increases in procurement prices of foodgrains have yielded solid gains for the rich farmers. The uncontrolled rise in prices of practically all agricultural commodities have similarly brought undreamt of bonanzas to surplus farmers and traders alike. The opportunities thrown open for stock-building, with credit obligingly provided by the supposedly nationalised commercial banks, and for creating artificial shortages of a wide range of industrial raw materials and finished products — e g, cotton, cement, paper, fertilisers — have enabled manufacturers and traders to make super profits, most of it black and tax-free. Nor has the government neglected the upper reaches of the salary-earning population. The chopping and changing of salary-scales under the pretext of implementing the Pay Commission's recommendations have brought sumptuous dividends to middle-level and senior government bureaucrats and has almost certainly widened income differentials within the bureaucracy. Similarly, the University Grants Commission has recently announced handsome salary increases to teachers in the so-called Central

Universities which, as has been pointed out in these columns, have made the salary structure in the teaching profession decidedly more inequitous. The biggest bounty to the salaried rich has, however, come in the form of the reduction in income-tax rates announced in this year's budget in the name of curbing tax evasion. The tax concessions have meant a straight increase of Rs 50 to over Rs 150 in the monthly post-tax incomes of middle and upper level government officials. The benefit to the higher bureaucracy in the private sector is, of course, much more than even that.

The pampering of the rich by the government has not had even the saving grace claimed for it in conventional economics — that of raising saving and investment in the economy. The ten-year old stagnation of investment levels stubbornly persists. In fact, investment in the public sector has recently suffered a further setback. And little worthwhile private investment has gone into industries like cement, paper and fertilisers. The growth in the incomes of the rich has resulted only in rendering more difficult the task of regulation of the economy because of the proliferation of black money and in further distorting the pattern of investment in favour of articles of upper class consumption.

The current talk of a national wage policy is plainly intended to provide a respectable cover for the government's policies of creating the conditions for the rich to multiply their incomes while cracking down on industrial workers and the like. It was wholly appropriate, therefore, that the report of the Political Affairs Committee's discussions on the need for a national wage policy appeared in the newspapers together with a report that the government had decided to raise the ceiling for government on expenditure on "superior furniture, furnishings and electrical appliances" at the residences of the judges of the Supreme Court. This had been considered necessary, it was stated, because "the judges of the highest court in the land should be provided with amenities commensurate with their status". The government will now spend Rs 38,500 and Rs 30,000 on furnishing and equipping the houses of the Chief Justice and the other judges, respectively, of the Supreme Court — or roughly what the low-paid majority of the supposedly rapacious railway workers earn in a third of their entire working lives!

Police

Growing Power

THE most notable feature of the railway workers' strike was the completely free hand given to the police to break the strike. The way for this was cleared by declaring the strike illegal under the DIR, following which even passive participation in the strike became a crime punishable with arrest and imprisonment. After this, the police had a field day, conducting itself as if it were dealing not with workers on strike but with gangs of hardened criminals. The mass arrests under DIR and MISA as well as the Criminal Procedure Code and the terrorisation of railway workers and their families have been commented on in these columns. There have been reports, especially from the eastern part of the country, of cases of the railway workers' womenfolk being raped by policemen. It is idle to expect that even the gravest of such charges against the police will be looked into and those found guilty punished. First, the government's instructions to the police were plainly to strike terror among the railway workers; after that the government is scarcely likely to make too fine a point of the precise methods employed by the police. Second, even if there are any in the government with enough scruples left in such matters, they will find themselves powerless to act against the police. Such is the power and status that the police, including the numerous paramilitary forces, have acquired today.

Reflecting this power and status is the recent appointment of the just-retired Director-General of the Border Security Force (BSF), K F Rustomji, as Special Secretary in the Ministry of Home Affairs. Rustomji's is the second instance of a police official being raised to the highest post in the bureaucracy — the first being the appointment of the head of that elite intelligence organisation, the Research and Analysis Wing (RAW), as Secretary of the Department of National Security in the Cabinet Secretariat. Though Rustomji will be nominally within the Home Ministry, the real purpose of his appointment is evidently to place all the police and para-military forces under a single command outside the control of the Home Secretary. It may be presumed that as in the case of the head of RAW, Rustomji will in fact report directly to the Prime Minister. Thus the move also marks a further step in the Prime Minister's attempt to bring the intelligence and police services under her direct control.

The growing power and status of the police is to be seen in the proliferation of posts of Commissioners of Police who are outside the control of the civilian authority represented by the District Magistrate. Unlike the situation till even a few years ago most of the larger cities now have Commissioners of Police. The control of the District Magistrates over even the District Superintendents of Police has been substantially eroded. The confidential reports of the DSPs are now no more written by the District Magistrates; this power has passed to the DIGs of police.

It is not generally known that at over 800,000, the total strength of the police and the para-military forces is almost equal to that of the country's regular armed forces. The functions that are performed by many of these forces today bear no relationship to the purposes for which they were originally created. The outstanding case is that of the BSF. As its name suggests, the BSF was conceived of as a cheaper alternative to the army for routine patrolling of the country's borders. Actually the BSF has been increasingly used for so-called maintenance of law and order within the country. Thus the Home Ministry's latest annual report for 1973-74 mentions that during the year the BSF was used for "maintenance of internal security" in as many as 13 states, all the way from Meghalaya to Andhra Pradesh, and two Union Territories. Recognising the fact that such activities have become a part of the permanent avocation of the BSF, the Home Ministry's report discloses that attempts are being made to "broad-base the training of the BSF personnel". Maintenance of internal security is a euphemism, accepted the world over for keeping the ruling party or group in power; in the years to come the BSF may be expected to play an increasingly important role in this area. And towards that end the strength of the BSF is being increased and it has been equipped with sophisticated arms and equipment and even aircraft.

Organised industrial labour is one of the sources from which the government apparently anticipates threats to "internal security". To keep labour in the public sector undertakings on a tight leash the government some years ago created the Central Industrial Security Force which today has a sanctioned strength of over 17,000.

And just this week the West Bengal Chief Minister, Siddhartha Shankar Ray, has announced that a new armed police battalion is to be raised for service in the coal mines of the state. The battalion would be under the control of the West Bengal government with an Inspector-General of Police in command. According to Siddhartha Ray, the Central government has undertaken to meet the cost of raising and maintaining the battalion. It is clear that the Centre, which is seldom so generous when faced with requests for a little more money for primary education or for rural health services has got it priorities right!

Bhutan

External Insurance?

Brahmanand Mishra writes:

BEHIND the extravaganza and ritual of the coronation, Bhutan's royal regime is attempting to widen its contacts beyond India which has for decades been its patron-in-chief. Although Bhutan acquired sovereign status with its entry into the UN on September 21, 1971, its foreign policy has till lately been guided by New Delhi.

Over the past year, however Bhutan and China have been quietly making contacts with each other. In traditional style, a Bhutanese table-tennis team visited Peking some months ago and shook hands with Mao Tse-tung. Soon after, a two-man official delegation also visited China and came back with reports of the friendly Chinese attitude towards the King and people of Bhutan. These visits seem to have caused some raised eyebrows in South Block. Bhutan's foreign Minister, Daba Tsering is reported to have made some general statements like Bhutan and China have always had goodwill for each other" and "common courtesies are observed between the two countries".

The increasing goodwill between Bhutan and China was one of the reasons for Swaran Singh's trip to Thimpu, Bhutan's capital, last February. Daba Tsering humoured India by announcing that the Himalayan kingdom had "no intention to establish diplomatic relations with any country other than India and Bangladesh in the foreseeable future". India, in turn, agreed 'in principle' to cooperate with Bhutan in the construction of the Rs 80 crore Chukkha hydro-electric project and the possibility of a cement factory and a paper plant was also discussed.

But these affirmations of indo-Bhutanese friendship did not wean Thimpu away from widening its external relations. China was invited to send an official representative to the coronation on June 2 despite New Delhi's tacit disapproval. It is quite apparent that the regime in Thimpu does not wish to be dependent solely on New Delhi, particularly in case of any internal troubles directed against it. The political demise of the Chogyal of Sikkim last year was perhaps an eye-opener for the royals in Bhutan.

European Communists

Permanent Exiles from Power

THE Left in France could not make it; it could not pierce the Great Divide. By a minuscle 1.4 per cent plurality Valery Giscard d'Estaing, the candidate of the Right, squeaked past Francois Mitterand, the candidate jointly put up by the Communist and Socialist parties, in the Presidental run-off on May 19. For the Communists, who continue to be the best organised political force in the country, to be denied, this narrowly, the fruits of victory must indeed be galling. Never before in the post-World War II has the Left been able to amass so many popular votes in an election; yet, it failed to clinch it. Ever since Maurice Thorez was hounded out of government in early 1947, the Communists have been excluded from power in France, and the situation is thus likely to remain unaltered. And this despite the fact that they have been more or less on their best behaviour from the day of Nikita Khrushchev's famous speech at the Twentieth Congress.

Various permutations and combinations of political alliances have been tried by the Communists in order to make a breakthrough into bourgeois respectability, and to live down the sneer that they do not belong to the Left, but to the East. Apparently nothing has worked; the suspicion of the basically conservative majority sections of the French electorate about, Communist participation in government stays intact.

As in France, so in Italy. It was a touch and go election in 1948 when de Gasperi and the Christian Democrats barely manage to vanquish Palmiro Togliatti and his Socialist allies. Through the next quarter of a century, the Communists have been able to hold on to their strength, but not once have they been allowed even to approach the threshold of power. Meanwhile, the Socialists have moved out of their understanding with the Communists, split, re-united, joined the Christian Democrats in Government, moved back again into opposition. These turns and twists have passed the Communists by: as far as they are concerned, they have remained — in Italy as much as in France — the permanent exiles from power: they have belonged to their respective nations, but their claim to belong has not been recognised.

And now that the attempt *via* Francois Metterand's candidacy too has failed, notwithstanding the fact that, following Pompidou's death, the Right was in virtual disarray in France, providing the Left with the greatest opportunity it had ever come across. It seems that however hard the Communists try, the prize of being installed in power through democratic elections will always be denied to them. One can only speculate on the reasons. This could be because of revulsion for the modalities of life ushered in by the Communist establishment in East Europe, or because of the increasing embourgeoisement of life and living in the West, or on account of what NATO and all that it implies have done to the psyche of the solid mass of the middle class electorate in countries such as France and Italy. In other seasons, they will quarrel among themselves, their bickerings will keep making the headlines, but the natural majority of the electorate, who are conservatively inclined, will unite the moment the danger lurks of a Communist penetration into the seat of power. When the crunch comes, even were the Left to offer a united battle, as it did in last month's election in France, that crucial segment of the electorate at the margin, whose support would be necessary to put the Left over, would evidently hold back.

A matter of considerable irony, in the same month of May, the Communists have found themselves suddenly installed in power in, of all countries, Portugal, and through the courtesy of a *coup d'etat* engineered by an army general. This has been more in the nature of an arrangement of convenience. General Spinola is desperately anxious for a broad phalanx of support on the home front which could enable him to take bold decisions with respect to the colonies in Africa. His calculations must be two-fold: softening the hostility of the African insurgents by embellishing the image of his Government through the induction of Communists, and leaning upon whatever quantum of popular support the Com-

munists would at the moment be able to drum up, in case he has to take some unpalatable decisions — such as granting effective independence to the people of Angola, Mozambique and Guinea Bissau. Once they have served the purpose, it is indeed possible that, even in Portugal, the Communists would discover that they are overstaying their hospitality in Government and would be unceremoniously booted out, as they were in France 27 years ago.

Could it be that underlying this destiny which stalks the West European Communists is the curse of welfarism, through which a modern state can persuade a crucial segment of the population to keep always on this side of a cataclysm? However assiduously the communists might try, they might therefore find that in a situation where standards of living are continually going up at a comfortable pace, inertia enters the soul and even those who potentially ought to be their comrades deny them the much-needed vote. There is perhaps a lesson in this for those who would like to stick to the straight and narrow parliamentary path. One is however not at all sure that the interpretation of the lesson will be the same for all parties.

The Economy

If 1962 Had Not Happened ...

A Correspondent writes:

THE nuclear test is a great obfuscator; nonetheless certain facts cry out to be put across. The explosion has scarcely been able to assuage the grim economic realities. And as one looks back, it is easy to see how much the economic fortunes of the nation were affected by the events of the last quarter of 1962. In many respects, that year represented a watershed: the watershed between relative political stability and recurrent political tension, between the achievement of a fairly satisfactory rate of growth and economic stagnation, between monetary stability and runaway prices, between a general feeling of self-assurance and pervading defeatism. From 1962, in fact, the pattern has been one of sliding downhill in a monotonic function.

The successful test in Rajasthan notwithstanding, the difficulties, on the economic as much as on the political fronts, are bound to persist. Pressure groups have scented success and they will not let go. The authorities are either sadly mistaken or are deliberately misleading others when they try to give out that hustlers abound only among species such as railway employees. The major pressure groups are elsewhere — among the kulaks concentrated in the wheat-belt in the north-west, among the traders, within the portals of chambers of industry and commerce, among those who, taking the Prime Minister for a ride while the going is good, sell the notion that there could be no economic salvation without massive external assistance. An administration which has lost all confidence in itself is easy to be bullied.

All this however takes us back to 1962 and to the McMahon Line, Ladakh, Nathu La, *et al.* The government, for the first time since Independence, lost its cool on account of the events of 1962. And the events of 1962 could be traced back to the events in Tibet in 1959. If the government of the People's Republic of China did not feel it necessary to close in on the Dalai Lama, and the latter did not consider it prudent to escape along the Brahmaputra route down to India, perhaps 1962 would have been a non-event for India. Therein lies a particular irony of history. The people of this country, it will be told, were emotionally aroused as never before by the atrocities perpetrated on the peace-loving occupants of the Buddhist monasteries in Tibet — it would have been against the tenets of Indian civilisation and Indian values not to lodge a strident protest with the Chinese against these atrocities, or not to accord open asylum to the Dalai Lama and his entourage. But, cannot one ask at this distance, how much did we really know? How much information did we ever have on the alleged torture perpetrated by the communists on the Tibetan people, or on the extent of provocation offered by those who controlled the monasteries? On the other hand, how much first hand, or even secondary, knowledge did we have regarding the kind of exploitation of the poor and the weak which, over the decades had been indulged in by those incarnations of the Buddha? How much were we aware of the excesses and orgies which went on behind the facade of spiritual benediction? Suppose in one corner of India, a set of monks decided to challenge the political authority of New Delhi, how much tolerance would have been shown to them? How much tolerance, for example, was shown, some years ago, to the Mohant of the Goraknath temple at Gorakhpur, or, for that matter, to the determined group of people who captured the decision-making authority of the Golden Temple in Amritsar?

These questions have become relevant once more, since the Central Intelligence Agency of the United States has now come round to confessing implicitly that much of the trouble in Tibet, in 1959 and subsequently, was its doing. It has also been benign enough to admit, again tacitly, that quite a number of the incidents along the China-India border, culminating in the final clash of the two armeis in 1962, were the contribution of *agents provocateurs* planted by it. It would thus indeed seem that the government and the people of India were led up by the Ladakh path as much by a genuinely felt emotion for the suffering masses of Tibet as by the deliberate acts of subversion and subterfuge planned and executed by the CIA. It was neither China's India war, nor India's China war, but the CIA's India-China war. Those who are at present going to town with advertisements about the danger within were then all worked up over the danger from outside: but they had not a clue about the true identity of the external enemy.

If 1962 had not happened, perhaps there would have been no occasion for rudely interrupting the strategy of economic growth initiated way back in 1956. If 1962 had not happened, there would perhaps have been no occasion either to divert each year as much as three per cent of national income additionally for defence, and therefore that much more could have been available for investment in growth. If there were no 1962, perhaps there would have been no occasion for selling out to the American agricultural advisers, which has cost us an irretrievably lost decade, in the course of which the rate of growth of farm output has actually fallen to half of what it was in the previous decade. In case there were no 1962, who knows, perhaps the hucksters who have now taken over the reigns of administration, would have continued to be in the mute background.

But, it may be asked, was not 1962 more than compensated for by the glory of 1971, by that famous victory in Bangladesh? Unfortunately, it was not. A passing phase of euphoria was certainly ushered in, but that Indian summer was altogether too brief. Some would go even further and suggest that perhaps Bangladesh was a tragedy whose dimension was about equal to that of 1962. Bangladesh went to a few people's head, and that was that. The surrender of Generals Niazi and Farman Ali was a low-cost victory; through an odd causation, it was assumed that managing the economy could be made an equally effortless, painless venture. Economic development was accordingly made a function of manipulative politics. It is perhaps largely because, during the past two years, the glory of Bangladesh was considered substantive enough to take care of all the follies committed subsequent to 1962 that we have now arrived where we have: *sans* a code of principles, *sans* policy, *sans* integrity, *sans* even an ordinary roster of decency. What greater irony could then be than the possibility that each of these, once you track it down to its source, is on account of the meanderings of the Central Intelligence Agency? The Agency could not do any harm at all to that erstwhile enemy, China, but certainly succeeded beyond expectations, to turn however unintentionally, the once comfortably placed India into a shabby, amoral, panhandling wretch of a nation.

CAPITAL VIEW

The Bullock-Cart and the Bomb

Romesh Thapar

I AM beginning to realise why India is the natural habitat for the astrologer and the soothsayer. Two years ago, the 'Indira Wave' was sweeping all before it. Two weeks ago, the Congress party and its leader were on the brink of collapse. And now with the rail strike broken and a nuclear device exploded in the most sophisticated manner, the Prime Minister is again in command. There may not be an 'Indira Wave' because empty stomachs cannot generate the necessary energy, but at least the lady at 1 Safdarjang can rightfully claim that she is again in a position to ride the waves, as it were

Of course, these situations were not sparked by the inexorable movement of the planets. They were largely moulded by the stupidities of the Congress party, its political opponents and by natural forces which create surpluses and shortages in food. The current crisis, into which the organised working class has been manoeuvred by an incredibly adventurist and opportunist Left leadership, gives Indira Gandhi and her colleagues the kind of opportunity which seldom comes to discredited politicians. Once again, the initiative has passed decisively to the ruling party.

What will Indira Gandhi do with this opportunity (I will not say, 'the last', because she seems to get more than her fair share)? Will she let the old bullock-cart jog along even as a series of nuclear tests are carried out? Should we expect a surge of chauvinism and a nationalistic euphoria to cover the ascendancy of private capital and multinational corporations? Or do we move to restructure our decision-making system and our society in meaningful, egalitarian ways recognising that nuclear status gives us the international prestige and the national will to experiment boldly with a life style which restores dignity and faith to our people? Yes, what the Chinese have been doing in their very special authoritarian manner.

What a splendidly organised operation this nuclear detonation was, right from the secrecy of the preparations to the low-key pronouncements following the event. The scientists and technicians involved have lived up to the traditions set by Homi Bhabha, traditions which fortunately were not eroded by an unthinking bureaucracy. However, a great deal of follow-up is needed if we are to project an accurate idea of what we intend to do with the power this new technology places in our hands

It was Jawaharlal Nehru's firm conviction that the only way for India to make up the leeway of centuries was to find the short-cuts hidden in the enveloping revolution of science and technology — and to use them creatively in the interests of the people's life and progress. We have certainly produced the cheapest — and cleanest, by the looks of it — nuclear detonation. It remains to be seen whether our thinking is keeping pace with our social objectives. Are we going to utilise these test explosions for economically beneficial ends? Where are the Nehrus and the Bhabhas?

Indira Gandhi has yet to show signs that she has shaken herself out of the lethargy of the last two years. It is not enough to break a trade union attempt to paralyse the productivity of the economy, or to trigger the ultimate weapon which wins big power status. The internal health of the subcontinent could not be worse. We continue to teeter from crisis to crisis. This is not something unique but it is about time the politicians began to discipline this exhausting and nerve-shattering state of affairs, heightened today by runaway inflation. The political, economic and administrative system, at whatever level you look at it, is not working. It has to. Otherwise, all the talk in the world is meaningless.

Will Indira Gandhi apply her mind to the details of this mundane, dull and dreary business? Or will she establish a task force of both experienced and motivated persons to begin the restructuring of the system of decision-making and implementation, step by step, day by day, order by order? The job has to be done before this year is out. It is the key to future achievement. Or we will remain the dung heap we are in comparison to the world, and now, maybe, radioactive? The sooner this effort begins, the better. The cranks are already seeing Bharat as a nuclear power.

The reaction of the white world, even the sophisticated section of it, is true to type. There is horror at the prospect of the naked and the hungry getting at technologies which can topple their many myths of superiority. Significantly, we receive lectures only from those who are overwhelmingly nuclear. Aiding operations are threatened with closure because the falsehood is spread that it is the foreign aid we have misused. Maybe, the Canadians could be confused, but no one else. The howl will last for some weeks, and then it will settle because living with reality is one of the fall-outs of the revolution of science and technology. Let us be patient, and largely silent. Two much petulance at this point would be naive and undignified.

I have been moving around over the past fortnight. It is incredible what a mess the world is in. We need to take a hold of ourselves and work out a hard-headed, hard-knuckled plan for the future. It will not be found in the text-books.

May 27

Calcutta Diary

A M

MEET Kamal Bose, son of late Surendra Nath Bose of 11 Surya Kumar Chatterjee Street, Calcutta; occupation: social service worker at Chittaranjan Cancer Hospital, 37 Syamaprasad Mookerjee Road, Calcutta; drawing a sum of Rs 343 and 55 paise only per month as salary and allowances; a citizen of India, head of household consisting of himself, his wife, and a child of two years.

Till the morning of January 8, 1973, Bose was a run-of-the-mill citizen, never having had any brush with the forces of law and order; no warrant of arrest had ever been lodged against him, nor had he ever been interrogated or interviewed by the police in connection with any case whatever. Things however changed from that fateful morning, Kamal Bose lost his liberty: he was arrested in connection with two criminal cases, Case No T/454/72, dated October 19, 1972, and Case No T5/73, dated January 7, 1973, and both filed by the officer-in-charge of the Bhowanipore Police Station at Calcutta. Bose was duly produced before a magistrate, who granted him bail in both the cases. Bose, however, stayed where he was — namely, in prison — for, even as the bonds for the bail were being posted, the Tollygunge Police Station moved in with two further criminal cases against him: Case No U/C 647, dated October 19, 1972 and Case No U/C 650, dated October 20, 1972. Again, a petition for bail was moved before a magistrate; once more, bail was granted. After the fresh bail bonds were furnished, camaraderie among the police being what it is, it was time for the Narkeldanga Police Station to move in: Bose was taken into custody at the behest of the officer-in-charge of the latter Police Station, under order number PSP (3)-257, dated January 24, 1972.

The assorted calumnies spread by the enemies of democracy notwithstanding, the wheels of justice continue to move inexorably in our country. Since no evidence could be adduced by the hard-working policemen of the three aforementioned Police Stations, that is, Bhowanipore (located in Calcutta's south-central region), Tollygunge (location: city south), and Narkeldanga (location: city north-east), Kamal Bose was discharged in each of the five cases till then registered against him. But Bose could not be released from custody, for the Commissioner of Police, Calcutta, decided to exercise his discretion: by an order number 49(M), dated February 24, 1973, "with a view to preventing him [Bose] from acting in any manner prejudicial to the maintenance of public order", and in exercise of the powers conferred by Sub-section (1) (a) (ii) read with Sub-section (2) of Section 3 and Section 17A of the Maintenance of Internal Security Act, 1971 (Act 26, 1971), the Commissioner directed that Bose remain in detention. In terms of Sub-section (3) of Section 3 of the Act, the Governor of West Bengal approved the Commissioner's order through a subsequent order issued by the State Government's Home Department, Special Section (No 2803 HS, dated March 7, 1973).

A writ of *habeas corpus* under Article 226 of the country's Constitution was moved on Bose's behalf before the Hon'ble Shri Sankar Prasad Mitra, Chief Justice, and His Companion Justices of the Hon'ble High Court at Calcutta, Extraordinary Original Criminal Jurisdiction. While the *habeas corpus* application was pending, on the principle of 'the more the merrier' Calcutta Police produced Bose before the city's Additional Chief Presidency Magistrate and thumped down yet another case against him: No A119, dated March 15, 1972. Kamal Bose was granted bail in this case too; but since he was being detained under the MISA, there was no question of his availing the order of bail issued by the ACPM: he continued to languish in Calcutta's elite prison, the Presidency Jail.

On April 19, 1973, the country's Supreme Court threw a spanner in the works. While delivering judgment in the case of Sambhu Nath Sarkar *vs* the State of West Bengal and others, it struck down Section 17A of the MISA as being violative of Article 22 (7) (a) of the Constitution. On May 18, 1973, the Hon'ble Shri Justices S K Bhattacharyya and S Basu of the High Court at Calcutta, responding to an application from Bose, ordered the Commissioner of Police, Calcutta, the Superintendent, Presidency Jail, Calcutta, the Assistant Secretary, Home (Special) Department, Government of West Bengal and the State of West Bengal through the Secretary, Home Department, to set him at liberty 'forthwith' in view of the Supreme Court's decision. The Hon'ble Justices instructed that their order be communicated to the Superintendent, Presidency Jail that same day by special messenger. The messenger arrived at the jail gate along with the order at 5.10 p m; but Kamal Bose was not to be released: the High Court's order could not be complied with on that day: it was blandly explained that Bose had already been sent to the lock-up for the night.

Dawned May 19, 1973. Bose was taken out of Presidency Jail by the police, thrust into a waiting Black Maria and despatched to the office of the Special Branch at Lord Sinha Road. Bose's counsel tried hard to locate his client's whereabouts; he was ultimately informed by the police about what had transpired. Like the cat, the MISA too had nine lives: Section 17 (a) was struck down by the Supreme Court, but Section 3 remained intact, and Bose had been re-arrested under the latter Section of the Act.

The police wanted to be even more thorough. These were uncertain times, you never know with wayward judges, and Section 3 of MISA was obviously not considered sufficient. So, on this occasion, the Beliaghata Police Station (city east) was pressed into service: an order of arrest was served on Bose by the officer-in-charge of this Station under Case No PI/47, dated March 5, 1972. The Special Branch transferred Bose to the custody of the good and honourable custodians of law and order at Beliaghata. Bose's wife, Dolly, thought it would be rude not to match the police in tenacity: she, therefore, kept trying. She arranged for a bail petition to be moved on behalf of her husband in the Beliaghata case too. Once more, bail was granted, at Rs 1,000, by a magistrate. But, as you must have guessed by now, the moment the bail bond was furnished on July 19, 1973, Kamal Bose was re-arrested in connection with another case. This time, the charge was registered by the Karaya Police Station (city east-centre), Case No Y113, dated June 29, 1972, under Section 148/149/307 of the IPC read with Section 27 of the Arms Act. A move deserved to be answered by a counter-move. On July 21, 1973, Bose was produced at the court of the District and Sessions Judge at Alipore in connection with the case lodged by the Karaya Police Station, and an application for bail was moved for the umpteenth time. To the frustration of the Police, he was again granted bail, once more for the identical sum of Rs 1,000. As Dolly moved about to arrange the bail bonds, she and Bose's lawyers could overhear the minions of the police openly discussing what would be the implications of furnishing the bail bonds. The suggestion was put across in a very friendly, informal manner: what, after all, was the point of elongating the suspense? Didn't Kamal and Dolly and Kamal's lawyers realise that the moment the bail bonds were furnished, he was going to be re-arrested in connection with some other case or cases? Why could not he and they therefore, give up the ghost?

The pursuit of justice in this great land of ours is not only tiring, it is also an expensive process. Dolly saw the futility of it all; she and her lawyers relented, and the police heaved a sigh of relief. Bose went back to Presidency Jail, resigned to the fate of indefinite incarceration. The nation's Constitution, he had learned meanwhile, has many nuances: since what its Articles 19 and 20 give are taken away by Articles 352, 358 and 359, it needs quite an effort to stay at liberty. All Bose was able to achieve through six months' of sustained effort on the part of his wife and lawyers was a continuous shuffling between one Police Station and another and further on to the next one; to be confronted with nearly a dozen criminal cases in succession; to be granted bail in each of these: to be also discharged in each of these; once the police and the government had decided that he must stay in, he must stay in.

There the matter rested — until the introduction of Section 438 in the Code of Criminal Procedure in 1973. Under this Section, it is now possible for a citizen to move a High Court or even a district court for anticipatory bail. Hope springs eternal in human breast. Dolly Bose, on behalf of her husband, therefore arranged to move a petition on May 13, 1974 before the Hon'ble Shri Sankar Prasad Mitra, Chief Justice, and his, Companion Justices at Hon'ble High Court of Calcutta, Criminal Miscellaneous Jurisdiction, in which the State of West Bengal, the Assistant Secretary, Home (Special) Department, Government of West Bengal, the Commissioner of Police, Calcutta, and the Inspector-General of Police, West Bengal were cited as respondents. The facts narrated in the preceding paragraphs were placed before the Court along with the plea that the police were acting in a *malafide* manner and that they appeared to be determined to keep Bose in custody without trial as long as they could. The entire purpose of the police and the other respondents, the petition claimed, was to implicate the petitioner in case after case so as to thwart the orders of the various Courts for bail or for release. The *modus operandi*, it was explained, was to follow the sequential process: to disclose a case and implicate the petitioner in it only *after* bail had been granted in a previous case. He had reasons to believe, Bose maintained, that as soon as he furnished the bail bond in the Karaya Police Station case — till then the last one against him in the very long series —, he would be re-arrested on the accusation of having committed some other offence or offences; in the circumstances, he prayed that the Hon'ble Court might direct that, in the event of such re-arrest, he shall be released on bail.

The petition was heard by Hon'ble Justices N C Talukdar and A N Banerjee. After listening to the saga of arrests and re-arrests and re-re-arrests, the Hon'ble Justices suggested to counsel that maybe Bose should try it out at least once more: since what the justices were saying were within the earshot of the representatives of the police, Bose could perhaps come back to the High Court after giving himself — and the police — another chance.

Kamal Bose and his counsel respectfully heeded the suggestion of the Hon'ble Court. The bail granted by the magistrate in the Karaya Police Station case in July 1973 was availed of on May 14, 1974. Bose walked out of prison, a free man for the first time in sixteen months. The police, perhaps still cogitating over the import of what the Hon'ble Justices had said, let him go.

Thus ends, for the present, the story of the Emancipation of Kamal Bose. But you never know. Life and living have become extremely chancy under this Constitution, which we, the people of India — having solemnly resolved to constitute ourselves into a Sovereign Democratic Republic and to secure to all our citizens Justice, social, economic and political; Liberty of thought, expression, belief, faith and worship; Equality of status and opportunity; and Fraternity assuring the dignity of the individual and the unity of the Nation — adopted, enacted and gave to ourselves in our Constituent Assembly on the twenty-sixth day of November 1949.

As this piece is being written, Kamal Bose is still at liberty, but Dolly remains a much worried woman. In this great Republic of ours, by the time the piece arrives in Bombay for being printed in these columns, her husband may once more be gathered in. Whether the charge this time will be under Section 302 or 304 or 476 of the CPC, she does not know: whether it will be lodged by the officer-in-charge of the Cossipore Police Station or Burrabazar Police Station or the Muchipara Police Station, she does not know. Dolly Bose has never read Franz Kafka, but she and her husband, between them, can now furnish enough material for works that could put Kafka into shade.

Those wanting to stay out of prison in this country should beware. Liberty is not your birthright, nor your constitutional right. It is what your government and the police might occasionally like to bestow upon you.

Government to the Rescue

Hansavivek

HYDERABAD ALLWYN is to be converted into a government company. The directors had stated last year that it had become a government company, but the Company Law Board decided that the value of forfeited shares did not entitle it to be so treated. The government of Andhra Pradesh has agreed to conversion of Rs 40 lakhs out of the Rs 76 lakhs due to it towards sales-tax arrears and loans into preference capital and also agreed to invest the balance payable to it in the preference capital of the company, subject to clearance by the Controller of Capital Issues. The state government has also shown its willingness to acquire, in case of need, some more equity shares.

Due to accumulated losses, the company has been suffering from want of working capital. Last year it paid as much as Rs 57 lakhs by way of interest, which made considerable inroads into the operating surplus.

The company has applied for a licence for expansion of manufacturing capacity of refrigerators to one lakh units a year. Last year the company produced 33,779 refrigerators. The present installed capacity is 60,000, while the licensed capacity on single-shift basis is only 30,000. A new 380 litres capacity model with two doors and double temperature has been introduced and has been well received in the market. Some other models of refrigerators, deep freezers, washing machines and cooking ranges are proposed to be introduced in the near future. The company has entered into a technical collaboratron agreement with Scooters India, a public-sector undertaking, for manufacture of scooters. Transfer of the 'letter of intent' from APIDC, the original recepient, to the company is awaited. Allwyn exported 5,000 refrigerators to Poland and has been approached by importers for supply of another 10,000 to 15,000. If this deal goes through, the company will not only become a major exporters of refrigerators in the country, but will also be able to consolidate its position in the home market by improving its brand image.

The directors say that there is continuing improvement in production and sales in the current year. They have budgeted for a production of the value of Rs 9 crores. Sales of refrigerators have picked up and the company has also sufficient orders for chassis in the bus body division. In the first quarter of the current year, the company is reported to have made a profit of about Rs 10 lakhs. "If all goes as planned, the company hopes to make a very good profit for the current year and wipe out all the accumulated losses", it is claimed.

DUNLOP INDIA has been issued a 'letter of intent' for manufacture of an additional 200,000 truck tyres and tubes per annum at its Ambattur factory. The foreign exchange requirement for this expansion, estimated at about $ 1.5 million, is proposed to be obtained from Eximbank, American Express International and ICICI in the ratio of 45:45:10, respectively. The company is awaiting government approval to this proposal. One of the conditions of the 'letter' is that the company should purchase India Tyre and Rubber Company (India), a wholly-owned subsidiary of India Tyres of the UK, which itself is one of the companies in the Dunlop Group. India Tyres has agreed in principle to sell its holdings in India Tyre and Rubber Company (India) to Dunlop India and the latter's proposals for purchase are being considered by government. The company has signed agreements with the West Bengal Industrial Development Corporation and Andhra Pradesh Industrial Development Corporation, whereby it will provide continuing technical assistance for manufacture of crossply and belted-bias automotive tyres and tubes in their respective manufacturing units which are proposed to be set up in collaboration with Dunlop of UK. The Indian company has also offered to supply knowhow for scooter and cycle tyres and tubes to two small-scale manufacturers and is awaiting government approval in this regard.

Dunlop India set up a new export record last year by exporting to 87 countries and earning Rs 333 lakhs, the highest-ever achieved by any tyre company in the country. A special feature of the export effort in 1973 was the development of exports of products such as sports goods, particularly tennis and squash rackets, produced by small-scale enterprises, as also bicycles, bicycle components and slotted angles. An order for about one lakh tennis rackets was secured from the UK. The company has been recognised as an 'eligible export house'. A large technical and engineering organisation has been developed within the company for research and development, and current expenditure on this account is around a crore of rupees per annum. R G S Nairn, chairman, says that the continuous flow of international knowhow from Dunlop of UK has enabled the Indian company not only to meet the country's requirements for transport, agriculture, industry and defence, but also to develop a number of products exclusively for export. He complains that the company is experiencing difficulty in obtaining government approval for making payment for the cost of providing this knowhow.

The company turned out good results for 1973, with higher production, sales and profits. Production at Sahaganj was higher than in the previous year in spite of continuous power-cuts throughout the year. At Ambattur, the additional number of days worked together with the full benefit of the expanded capacity partially offset the effect of the severe power shortage during the first half of the year, and output was considerably higher than in 1972. Higher sales volume apart, the use of raw materials out of stocks held at the end of 1972 and the "substantial" purchases of critical raw materials made in early part of 1973 at considerably lower prices lifted profit-margins. The ratio of inventories to sales was brought down considerably over the year as were borrowings. The year-end stocks were also lower than in 1972. Capital expenditure in 1973 was lower at Rs 134 lakhs compared with Rs 191 lakhs in the previous year owing to delays in receipt of equipment from suppliers. Commitments for capital expenditure at the end of the year amounted to Rs 93 lakhs.

SWAN MILLS has turned out good results for 1973 in line with the general trend in the industry. With less than 19 per cent rise in sales, gross margins have more than doubled. The ratios of inventories and wages to sales have been reduced. Dividend, stepped up two points to 15 per cent, is covered 1.36 times against a bare 0.31 last year. These results have been achieved in spite of high prices of cotton, particularly imported cotton, increases in other costs, and power-cuts. The company increased exports from Rs 19 lakhs to Rs 73 lakhs. The working in the current year has been affected by a 41-day strike by textile workers in Bombay, coupled with rising costs and load shedding in March and frequent cuts in power supply thereafter. The directors find it difficult to foresee with any degree of certainty the prospects for the current year.

W G FORGE AND ALLIED INDUSTRIES (formerly Wyman-Gordon India) proposes to make a capital issue of 13.80 lakh equity shares of Rs 10 each at a premium of Rs 2.50 per share to raise part of the finance required for the expansion-cum-diversification programme and to reduce the non-resident shareholding to 39.4 per cent. The project, estimated to cost Rs 284 lakhs, is intended to be financed by, apart from the capital issue, additional borrowings and internal cash generation. Out of the present issue, 2.40 lakh shares have been reserved for allotment to the financial institutions and another 3 lakh shares for allotment to Indian directors and employees of the company. The public will be offered the remaining 8.40 lakh shares under a prospectus. Promoted in technical and financial collaboration with Yyman-Gordon of USA, the Indian company manufactures closed-die precision forgings. Its present installed capacity is 11,000 tonnes per annum. It has been issued two 'letters of intent' to expand capacity of forgings by 4,000 tonnes by the 'pour forge' process and to manufacture 12,000 finished crankshafts per annum. An application has already been submitted to seek increase in the crankshaft capacity to 36,000. The crankshaft project is expected to be completed by mid-1975 and the 'pour forge' project by the end of that year.

The company has already built up a good record of sales and earnings and expects to accelerate the growth rate in the future. During the past 5 years ended December last, its sales expanded from Rs 363 lakhs to Rs 914 lakhs, gross profit from Rs 89 lakhs to Rs 202 lakhs and after-tax profit from Rs 49 lakhs to Rs 77 lakhs. Dividend, paid at 10 per cent regularly, was stepped up to 15 per cent for 1973 on the capital raised by the issue of gift shares on a three-for-four basis. Gross block in this period got increased from Rs 278 lakhs to Rs 699 lakhs. Shapur P Rao, managing director, expects output of forgings this year at around 12,000 tonnes. On this basis, he estimates the company's turnover at about Rs 15 crores and gross profit around Rs 284 lakhs. At full capacity operation on implementation of the two programmes, the turnover and gross profit should be about Rs 26 crores and Rs 5.60 crores, respectively. The company should, therefore, find no difficulty in maintaining dividend at the present rate on the increased capital. The book value of the Rs 10 share, even after the proposed capital issue, will be around Rs 15.50. The company hopes to come to the capital market some time in the middle of July this year. One unusual feature of this issue is that the management does not intend to appoint any underwriters — a temptation which some of even the large and well established industrial houses in the country have not been able to resist. The public issue is managed by the Management Consultation Division of FNCB.

OFFSHORE EXPLORATION

No Killings These

(From a Special Correspondent)

THE government has announced the signing of contracts with two foreign oil companies for offshore exploration and production of petroleum in the Bengal and Kutch basins. These two companies, we are told, were picked out of some 40 parties which had shown interest in offshore exploration. One need not contest the government's claim that the two US firms, *viz*, Carlsberg and Reading and Bates Oil and Gas Company, have considerable expertise in onshore as well as offshore exploration and that they are very well suited for the job. But it is worth examining whether the government has got as good terms from these companies as it claims to have.

Terms of Contract

According to the terms of the contracts, the two oil companies are to be leased 28,000 square kilometres in the Kutch and Bengal basins, respectively, for a two-year period, to start with. At the end of the two years, the area of activity of each company will be limited to 5,000 sq km. The oil companies will have the freedom to choose this area out of the larger area initially leased to them. At the end of three years they will have to further scale down their activity to a 2,500 sq km area and at the end of seven years they will have to confine their activity only to the producing areas. It is also stipulated that the oil companies will have to part with all the vital data and information collected by them about the areas which they surrender to the government at the end of the seven-year period. Thus it may appear that the government will be getting, free of cost, a lot of valuable data about the oil-bearing potential of a vast area which it can put to use to augment the country's production of oil. This may be to take too optimistic a view of the matter. When the companies decide to finally settle down to some areas for producing oil, they would obviously like to stick to areas that have the maximum production potential. So the areas surrendered to the government by the oil companies are likely to be commercially the least productive ones. Too much need not, therefore, be made of the condition requiring the companies to surrender a progressively larger proportion of the area initially leased out to them.

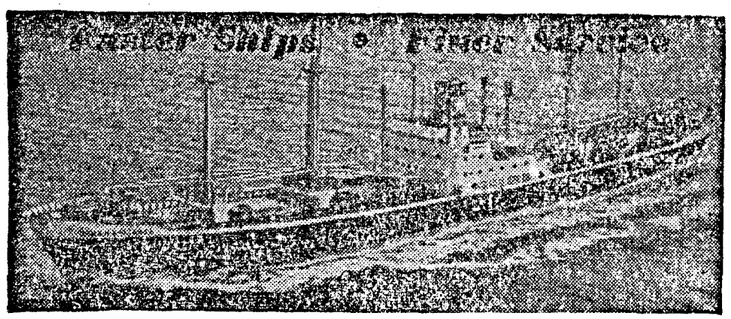
The two companies are required to invest a minimum of $ 13 mn and $ 10.5 mn, respectively, in exploration. These are relatively small sums considering the costs of oil exploration and what the large international oil companies normally spend on exploration in other parts of the world. The total sum involved, *viz*, 23.5 mn, is certainly not so large that the government could not have undertaken the exploration work itself without relying on foreign oil companies.

From the point of view of the companies, the capital risks are quite small considered against the benefits that will accrue to them if oil in commercially extractable quantities is found. First, the oil companies are assured of 40 per cent of the total oil produced to recover their costs plus a large sum in addition. Thus if the oil companies incur capital costs of 100 mn, they can recover a total of $ 300 mn, made up of the actual cost plus a 200 per cent bonus. The remaining 60 per cent of the output until the so-called 'costs' are recovered and the entire 100 per cent of the oil produced afterwards is to be shared between the government and the oil companies in the ratio of 65:35; if the oil production is 12.5 mn tonnes or more, the proportion of 'profit oil' accruing to the oil company will decline to 20 per cent. Thus if the initial production of oil is around 10 mn tonnes annually, the oil company will get 4 mn tonnes as 'cost oil' and slightly over 2 mn tonnes as its share of 'profit oil'. Once the entire 'cost' is recovered by the company, and if by then production rises to 20 mn tonnes, the company will get 4 mn tonnes of oil per annum. At the present level of international oil prices this comes to over $ 300 mn per annum as the company's share of profits. The agreements with the companies are to remain in force for 24 to 27 years. Therefore, if production of oil reaches a level of 20 million tonnes after a period of ten years — by which time the oil companies in any case would have recovered their costs plus 200 per cent and also got their share of the 'profit oil' during the period — they will earn over $ 300 million annually and continue to do so till the expiry of the contracts. It may be recalled that even a couple of years ago the North Sea area of the UK was not regarded as particularly promising, whereas it is now thought to be capable of producing 100-150 mn tonnes of oil by 1980. The companies operating in the North Sea are thus assured of fantastic profits unless the UK government modifies the present agreements with them. Similarly, if the two Indian basins together turn out to be capable of producing 50 mn tonnes of oil after a period of 10 years, the two companies will be earning profits of over $ 750 mn per year at the current international prices. What is more, the oil companies are not expected to pay any royalty or corporate taxes.

Better than Indonesia's Terms?

The government has claimed that the agreements with the oil companies are similar to those that Indonesia had signed and that the terms secured by India are much more favourable than those obtained by Indonesia. Thus it is pointed out that the terms of sharing of the 'profit oil' put India's share at 65 to 80 per cent, against only 60 per cent for Indonesia. According to *Petroleum Economics*, February 1974, most of the foreign oil companies in Indonesia are on production-sharing contracts which provide Indonesia with shares ranging from 65-70 per cent, after recovery of costs by the companies from upto 40 per cent of production. Caltex Pacific and Stanvac are the only ones on contract of work basis which calls for a 60-40 division of profits.

It may thus be true that the Indian agreements are slightly better than those which Indonesia could extract from the oil companies a couple of years ago. But one should not overlook the fact that the Indonesian agreements were concluded at a time when it had appeared that a surplus situation might emerge in the international oil market. The posted prices as well as the market prices of oil were then 1/6th to 1/10th of their current levels. The recent phenomenal spurt in oil prices has brought about a total change in the world of oil and the strength of the Western oil companies



has declined appreciably *vis-a-vis* the governments of the oil producing countries. It is, therefore, difficult to compare the Indian agreements with the Indonesian agreements concluded two years ago. Indonesia is reported to be now bargaining with the oil companies for a greater share in the excessive profits of the oil companies. It has reportedly asked for a 90 per cent share for itself of all sales revenues over $5 a barrel. In January last Indonesia signed a production-sharing contract with Katy Industries which will give it a 70-80 per cent share in the oil produced plus an undisclosed part of the extra profits accruing from high crude prices. In the light of these recent developments can the government still claim that it has got such a good bargain with the oil companies?

Subsidiary Features

There are some other subsidiary features of the agreements for which the government is patting itself on the back. It is claimed that the ONGC would exercise a degree of control over the oil companies' operations through a joint committee of management and, if necessary, by acquiring a 10 per cent financial share in the operations. Actually the Indonesian contracts also allow for control over the operations of the oil companies through the Indonesian state-owned company Pertamina. In practice, however, Pertamina has chosen to exercise very limited control. Secondly, the option open to the ONGC to acquire a 10 per cent financial share in the operations if oil is found in large quantities does not mean much. To exercise the option, ONGC will have to pay proportionate investment costs with retrospective effect. In return it will get a 10 per cent share in the oil companies' share of 'profit oil' which will work out to 2 to 3.5 per cent of the total 'profit oil'. The ONGC is also said to have the option to take over by "mutual agreement" the full production 11 years after the signing of the contract. The phrase "mutual agreement" is sufficient to indicate that if oil is found in large quantities, the government will have to pay an exorbitant sum as compensation to the oil companies to cover the loss of several hundred million dollars of annual income for the oil companies over the unexpired part of the contract.

Well Known Proposition

In view of these long-term financial implications, it might have been better for the government to have borrowed funds abroad even at commercial rates and gone ahead with exploration and production work on its own rather than pass on such a potentially highly profitable operation to foreign oil companies. It is a well known proposition that whenever a sizeable investment is involved in any project, private investors generally discount future gains at a much higher rate than national governments. Given the current levels of oil prices, the cost to the country of oil exploration and production would have been lower had the government undertaken the task on its own instead of involving foreign companies — however favourable the terms of the contracts with these companies may be claimed to be.

MINERALS

Keeping Up Appearances

Magnus

JUDGING by the tone of its Report for 1973-74, the Department of Mines seems to have lost all vitality. Since the reorganisation of the Ministry of Steel and Mines, the Steel section has stolen the show; the Department of Mines has lost control over Bharat Coking Coal, National Mineral Development Corporation and Manganese Ore India. It had lost Pyrites, Phosphates and Chemicals three years ago. The Coal Board and the Coal Controller's organisation under the Department are also likely to be wound up. Coal, of the non-coking variety, is therefore now the principal concern of this Department.

A sign of the creeping lethargy in the Department is its tendency to appoint, or join, more and more committees. To solve the vexed problem of coal transport, for instance, the Department took part in forming a High Level Standing Committee, which held two sittings during the year and whose first set of pedestrian recommendations could have been — and probably was — drawn up by any earnest junior official. The Committee in turn set up a Joint Monitoring Cell, a sub-committee to study coal handling facilities in steel plants, and a Control Room in the Railway Board. A Standing Linkages Committee was then formed to fix colliery linkages for all the power stations and the cement units, though recent experience has shown that the list of 'linked coalfields' is in a state of flux from week to week. The first grand attempt was made by the Fuel Policy Committee set up in October 1970. The Committee submitted Part I of its report in May 1972; its final report is yet to be submitted. Meanwhile, the country has continued without a rational long-term fuel policy.

The Coal Mining Authority, which has charge of all the non-coking coal mines, has to nearly double coal output by 1979. The Report states that towards this end it has to prepare as many as 141 feasibility/project/reorganisation reports. To help along, there is a revamped Central Mine Planning and Design Institute at Ranchi with Polish collaboration. For the Singrauli and Raniganj coalfields, moreover, there will be technical collaboration with the USSR.

The 'progress' recorded in the Report is largely negative. Between 1971 and 1973, the output of as many as 14 out of 20 minerals listed dropped — among them, bauxite, iron ore, limestone, manganese ore, phosphorite, and gold. Major coal washeries are still running at 40 to 45 per cent of their rated capacities while the Polish-designed washery at Gidi, rated at 2.8 million tonnes, has been idle since late 1970. BALCO's Korba plant finally commissioned one alumina stream in April 1973, but was soon shut down. Hindustan Zinc's melting furnace broke down, badly hitting zinc ingot output; after 10 years' efforts, HZL's daily ore production is yet to reach the target of 2,000 tonnes. Hindustan Copper continues to be the pet project; its Dariba project is going to cost Rs 1.1 crore, and produce 100 tonnes daily — a level of output achieved by small mine-owners with next to no investment other than in trucks. The Khetri concentrator, which is reported to be partly commissioned, will starve for lack of ore from the mines, and the company's smelters are starved of concentrates. HCL's Chairman has been shopping all over the world (but not in the Eastern bloc) for copper concentrates. Copper imports cost Rs 41 crores last year. The Khetri project alone has had Rs 110 crores spent on it so far.

One suspects that there is the same lack of direction in many other projects. Neyveli, for instance, 'raised' its annual capacity of 6.3 mn tonnes of lignite, but the same was 'assessed' at 3.6 mn tonnes. As a result, part of the power station and fertiliser plant at Neyveli may have to be converted to oil. Bharat Gold Mines wants to take contracts to make machinery, to provide consultancy and to produce other metals; meanwhile, gold output has halved since 1971.

The craze for foreign consultancy seems to afflict this Department as well. Bharat Aluminium has Hungarian consultants for Korba and Ratnagiri; it has signed an agreement with Tsvetmepromexport of USSR for an export-oriented alumina project in MP. Hindustan Zinc has Centrozap, Poland, as consultants for its new zinc smelter at Visakhapatnam. Hindustan Copper has Russian consultants for the major Malanjkhand project. Bharat Coking Coal is also engaging Polish consultants. The public sector companies (particularly Hindustan Copper) have sent hundreds of persons — from top managers to foremen — for training abroad during the last few years. Have they learnt nothing?

The Indian Bureau of Mines publishes an annual called Mineral Year Book. It has proudly issued the 1969 edition recently, whereas the US Bureau of Mines has already published data on India's mineral activity up to mid-1973. The Indian Bureau, besides, took up consultancy jobs for a total fee of Rs 66,000, which would barely cover its office rent. The Geological Survey of India, now shorn of its responsibilities in groundwater and mineral exploration, appears to have settled down to more purposeful activity.

The Department of Mines' own Technical Cell, which was inadequate to begin with, has never really got off the ground, because its chief soon became Secretary to the Department.

SOUTH

Continuity in Kerala

Mohit Sen

THE ministerial crisis in this state appears to have abated for the time being. There is also a universal impression that the dissensions within the Muslim League which almost led to a split may be reduced to less intractable proportions. And it is now widely believed that, should the legislative Assembly be convened in due course, the government would not find it too difficult to secure a vote of confidence. The continuity in radical change may, therefore, not get upset.

What gives stability to the Ministry and its leadership in the continuous process of radicalisation is the fact that the people in the state feel this is the best Ministry that they have ever had and that there is no prospect of finding a better one. In the general cynicism regarding the corruption of politicians and the entire political process itself,

IOL continues its advance on the technological front

and here are the facts

*A Centre is being set up in Bombay for the production of a range of gases of ultra high purity and special mixtures for the electronic and other industries. Hitherto these were being imported.

*MIG 400, a more sophisticated form of metal inert gas welding set from IOL, will soon be in the market.

*IOL has won the first 1200 cubic metre/hour Oxygen Plant contract for a mini-steel project of the Maharashtra Government. This is the forerunner of a series to be manufactured by IOL in the near future.

*For the first time in India IOL will produce indigenous tubular hard facing electrodes—"Cobalarc"

*Also for the first time in India IOL has established facilities for producing special purpose automatic welding machines.

Meeting national objectives

IOL Indian Oxygen Limited

even the otherwise sceptical Malayalees seem to be confident that the Ministry of their state has an enviably clean record. This is what they feel above all about the Chief Minister.

Nor is it a negative credibility that the Ministry enjoys. To its fairly long list of achievements it has recently added two more. One concerns University reform whereby students get representation not only in larger numbers than before in the Senate but for the first time in the crucial executive organ, the Syndicate. The second is, of course, very much more important: the Agricultural Workers Act. At least in one part of the country the wretched of the earth have themselves enacted this historic turn. By their determined struggle and strong organisation, built up by decades of sacrifice, the agricultural labourers of Kerala have pioneered in this sphere. The leadership of this vital process has come from the Communists of Kerala — both those who are now in the CPI and those who are in the CPM.

What they have done has borne fruit: As a result of the Act, agricultural workers in Kerala are provided work security, an eight-hour day, higher wages, and a provident fund scheme. The benefits of the Act also indicate the new stage which the former agrestic slaves of Kerala have reached. No longer are wages alone the road to liberation in their conception. Now the demands are for safeguards which guarantee a more human condition. What is of tremendous importance for the future development of Kerala is that the agricultural workers have become wage labour in the true sense of the word. This represents an enormous accretion of strength for the Indian working class.

It is because of its credibility and the achievements that the Ministry headed by Achuta Menon has lasted so long, despite its thin majority and the heterogeneous character of the coalition. These achievements underline another important factor too with great potential for India's future, *viz*, the capacity of the Congress in Kerala to go along with the most radical of structural reforms.

Meanwhile, the dissensions that have developed in the Muslim League concern much more than personality clashes. The struggle includes the question of direction and pace of development of the Muslim community; it includes the question of with whom are they going to unite, for what would they unite, and how are they going to gain that identity and protection which would ensure a better life for the coming generations. It is not without significance that the dissidents, by and large, are those who are somewhat disinclined to see the rapid implementation of a programme of radical structural reforms adopted by the government at its very inception.

The CPM, on the other hand, is in a real dilemma in the state. It opposes the convening of the Assembly to test the majority of the government because it knows that the opposition, at any rate, would not be able to secure a majority. It is, therefore, not claiming its right to form an alternative government; it is demanding fresh elections. Despite the directive of the Politbureau that he devote most of his time to the work of the Centre in Calcutta, Namboodiripad spends almost all his time in Kerala. The mass base of the party in Kerala continues to be extensive, and the present accentuation of the crisis of the capitalist path of development has delayed the break-up of this mass base. It is certainly true to say that Left and democratic unity in Kerala would be incomplete unless this mass force is brought into it; but this can be done only by a sharp and sustained struggle against Left opportunism in the state.

It is being suggested that the political basis for the coalition government has been undermined by the fact that the CPI moved a vote of no confidence against the Indira Gandhi government in the recent session of the Lok Sabha. True there has been a tilt to the Right in the crucial sphere of economic policy by the Central Congress government — a menacing feature of the present situation. The CPI struggles to its capacity against this tilt — especially as manifested in the hardening opposition towards the treachery and repression displayed towards the railway workers. Achuta Menon thus wrote to the Prime Minister that the way to settle the strike was through negotiations. But the political basis of the coalition in Kerala is the programme of the United Front and the Congress. The political basis is action to implement this programme. So long as this basis is not thrust aside, the coalition would continue. By the implementation of the programme the Kerala government becomes one of the important levers or bastions from which would be conducted the fight against the Right, against the Centrist tilt to the Right and for a shift to the Left.

NORTH

With and Without Power

THE supercession of the Punjab and Haryana High Court's seniormost judge and the appointment of a judge about five years his junior to the Chief Justiceship was a concerted action on the part of Chief Ministers of Punjab and Haryana through their respective Governors, to serve notice that promotion to the coveted post of the High Court Chief Justice was predicated on their favour and that seniority would no longer be the sole, nor even the principal, criterion. It was noticed that a judge's refusal to oblige, or his too independent action or too liberal interpretation of judicial impartiality, would merely earn denial of even overdue promotion. The judges, thus, have a choice between pathetic subservience and difficult integrity.

The superceded judge had recently declined to oblige a Chief Minister over an incident in which firing had taken place and in which one of the Chief Minister's relatives was involved. The Chief Minister must also have noticed that the judge had blatantly absented himself from a recent dinner hosted by him. The Chief Minister of the other state could not have forgotten that the same judge, acting in another capacity, had once hauled him up for illegitimate political activity. So both Chief Ministers evidently agreed to by-pass him and to recommend, instead, a relatively junior judge on whom they could fully rely.

Since no official reason was given for the supercession, all sorts of rumours were current. High Court lawyers and a section of politicians gave a distinctly communal tinge to the issue. The Bar, what is worse, seemed to want to thrash out the issue through an unedifying brawl. At the meeting summoned on May 14 to consider the supercession issue, pandemonium broke out even as the members' verdict was being sought through secret ballot. A lawyer snatched some ballot papers and tried to swallow them. He was roughed up. Another, equally determined, colleague sat tight on the ballot-box. There was fist-fighting. The Returning

Officer was manhandled. Some advocates rolled up their sleeves for a bout with their known rivals.

Delayed Protests

Within days of this blow to the judiciary came another — to the economy. K C Pant, Union Minister for Irrigation and Power, disclosed in Chandigarh on May 21 that the Rs 244-crore multi-purpose Beas-Sutlej project — which has been under construction in Himachal territory for the last decade or so — would be even longer in being completed. The target dates for completing this project have, in fact, been revised very often, and reports of corruption, waste, work interruptions, and operational inefficiency have been persistent. Not long ago, K L Rao, Union Minister in charge at the time, blamed the lags on the delays in arrival of certain equipment. Last month, his successor, K C Pant, sought to give a technical explanation: "unforeseen geological problems encountered by engineers in tunnelling operations". Bad rock, he said, had slowed down the work. But the fact is that prolonged studies of the terrain, especially of the nature of the rocks, were carried out some years ago and the construction schedules adjusted accordingly. Talk of geological obstacles, moreover, at a time when the project should have been in the final stages of construction lacks credibility. According to the revised schedule now, commissioning of the project's water-carrier system would take place in June-July 1976. The first two units (165 MW each) of the Dehar power house, on the Sutlej river bank, are not likely to generate power before September 1976.

The Beas project is a joint venture of Haryana, Punjab and Rajasthan. Owing to the frequent revisions of the schedule, costs have doubled. The latest estimates of total costs are: Rs 244 crores — Rs 205 crores on irrigation and Rs 39 crores on power. For much of this hike, the government and the engineers are themselves responsible — the former because of their endless dithering and the latter because they fail to work with any sense of urgency. Reports have it that the long delays and revisions have helped vested interests to develop. The unresolved differences between Punjab and Haryana over the sharing of the Ravi-Beas waters too present rich ground for horse-trading.

The Centre's vacillation over important projects which could end this region's seemingly perpetual power famine is evident also in its failure to reach a decision on the Thein Dam over the Ravi river, near Gurdaspur, in Punjab. The project has been under 'active consideration' for several years. A large stretch of land behind the proposed dam lies in Jammu and Kashmir. The prolonged inter-state rivalries, claims, and counter-claims, made a Central takeover of the project desirable. Over a year ago, K L Rao announced that the Centre itself would execute the project. But there followed a long period in which neither the Centre nor any state agency undertook construction work at site. Planning Minister D P Dhar is reported to have assured some time ago that the project would be handed over to Punjab for execution. But now there is widespread fear that the project might be altogether postponed — or even dropped. Meanwhile, much water from the Ravi has been flowing into Pakistan, though since 1970, under the Indus Waters Treaty, this water belongs to India.

There have been repeated delays, too, in the Rs 100-crore, 220 MW thermal plant at Bhatinda (Punjab). The first unit was expected to be commissioned by the end of July 1974; but, on May 22, Punjab's Minister of State for Irrigation and Power announced that there would be further delay — this time, owing to inadequate coal supplies. The plant, he said, could be commissioned only if it builds up a stock of 45,000 tonnes of coal to meet one month's requirements.

Power Cut

The power famine in Punjab therefore continues. There has been a 60 per cent cut in power to the industries. This cut is to continue unless there is timely and adequate melting of the Himalayan snow to feed the Bhakra Dam's catchment areas. Alas, like the monsoon, the sun and the snow too do not always oblige.

WEST BERLIN

Brandt's Graceful Exit

Ramesh Jaura

AMIDST continuing speculation about the real motives behind Willy Brandt's surprise resignation on May 6, West Germany is slowly returning to political normalcy. The former Finance Minister Helmut Schmidt has been elected as the new Federal Chancellor. Erstwhile Foreign Minister Walter Scheel has won, like Schmidt, the required majority votes in the first round of voting, for the office of the Federal President.

Scheel assumes his presidential office in July after its present incumbent Gustav Heinemann retires voluntarily. Chancellor Schmidt has already formed his new coalition government with former Home Minister Hans-Friederichs Genscher as his deputy and Foreign Minister. The five new faces in the Schmidt-Genscher coalition government, all belonging to the Social Democratic Party (SPD), replace an equal number. The two outstanding ministers among those dropped, presumably at their own insistence, are Ehmke and Egon Bahr. Ehmke was involved in West Germany's latest spy scandal, the Guillaume affair. Bahr was a close confidant of Brandt and played a significant role in the previous government's *Ost-Politik*.

Ost-Politik to Continue

The Eastern policy of the Brandt-Scheel coalition, founded in 1969, is to be carried out by the new government in Bonn, as Schmidt stated in a declaration of his government's policy and programme. The policy statement has been in general welcomed in the Soviet Union, Poland and Czechoslovakia. Even East Germany has expressed its readiness to co-operate with the new coalition in Bonn in all measures aimed at the maintenance and furtherance of relations between the two German states.

The pledge to adhere to the *Ost-Politik* has not come as a surprise. It was to be expected that a renewed coalition of Social Democrats and Free Democrats would continue to follow a policy of reconciliation and peace with Moscow, Prague, Warsaw and East Berlin. Nor was it doubted at any stage that the Schmidt-Genscher coalition would derecognise either the Basic Treaty with the GDR or the Four-Power Agreement on West Berlin. In the prevailing circumstances of *detente* between the Soviet Union and the US, even a conservative government of Christian Democrats (CDU) and Christian Socialists (CSU) would not have dared to do otherwise. But as with the CDU and CSU, though not to the same extent, the manner and style of conducting the Eastern policy would in practice be different as far as the new socialist-liberal coalition in Bonn is concerned. Because both the men now at the helm of affairs in West Germany not only come from a background different from that of Brandt and Scheel, but also harbour distinctly different nuances of political conviction and orientation.

This is also reflected in the renewed coalition government's statement of domestic policy. The Brandt-Scheel coalition was characterised for its reforms programme. Much of this programme could not be implemented and led to disenchantment particularly among the youth wing of the SPD, known as the JUSOs. Some observers even explain the defeat of the SPD in the two recent state elections in West Germany to the non-implementation of the reforms programme. It is highly doubtful whether by sacrificing the reforms programme, as the Schmidt-Genscher coalition has done, for other priorities in the financial and economic fields, the growing impatience of the JUSOs can be checked. Equally uncertain is the prospect of retrieving the image of the Social Democrats among the voters.

Brandt who has now been made the Chairman of the SPD has promised to do his best for the party and its electoral campaigns in the forthcoming polls in the states as well as in the 1976 general elections. Some place their hopes in Brandt being able to 'integrate' the JUSOs into the party. Others doubt whether the former Chancellor would really carry much moral weight and conviction either with the JUSOs or the West German electorate. Some observers quote "cool and analytical Social Democrats" as saying that Brandt is in any case irredeemable and predict that latest after one year he might even have to give up the Chairmanship of the SPD. Others like the well known West German historian Golo Mann — son of Thomas Mann — express the hope that Brandt might be able to stage a comeback as Federal President, perhaps in 1979, when Walter Scheel's term expires.

Meanwhile, it is an exceptionally trying time for Brandt and his detractors do not shy away from adding to it. It is known that Brandt is highly sensitive about the smear campaign against him. A similar campaign was launched in the early 1960s when he stood as SPD candidate for chancellorship against Adenauer. That he was an illegitimate child was the core of that campaign. The present smear propaganda centres on Brandt's private life — his love affairs with various ladies.

Brandt said in a nationwide televised statement that "it would be and is grotesque" to believe that an East German spy could bring about the downfall of a West German Chancellor. But in his statement, Brandt also pointed out that he did not feel himself uninhibited enough to carry on contacts with the Warsaw Pact states in view of the top secret information transmitted. To this the editor of the weekly, *Die Zeit*, Theo Sommer, retorted: "A Federal Chancellor should have been able to face the challenge of a spy scandal. But he obviously did not have either the strength or courage to do so".

Brandt's Negligence

Others, particularly on the right, have gone to the extent of deeply implicating Brandt in the espionage affair. A CDU member from West Berlin has in fact applied for a trial of Brandt at the Federal Court in Karlsruhe. He has grounded his case on the thesis that Brandt displayed negligence in regard to the spy case. And, he has based his case on no less than what Brandt stated in his letter of resignation to the Federal President: "I accept the political responsibility for negligence in regard to the espionage affair Guillaume and offer my resignation from the office of Federal Chancellor".

Meanwhile the issue of political responsibility continues to be debated both theoretically and in its current context. Does the political responsibility lie only on the head of government? Were the others in the Brandt government not responsible for the spy case? In this case, reference is made to the erstwhile Home Minister,

Genscher. It was after all the agencies under his ministry which had given a green signal to the appointment of Guillaume as an aide to the Chancellor. Observers point out that the question of Genscher resigning was ruled out from the very beginning since insistence on Genscher's resignation would have endangered the SPD-FDP coalition itself.

Of course, Brandt could have acted in a Machiavellian fashion and rolled ministerial and official heads and at the same time blown up a cold war with the GDR which even the CDU-CSU opposition would have swallowed. For instance, the CDU Chancellor, Adenauer, had resorted to political high-handedness in the wake of the unearthing of a spy case involving Otto John, who presided over the Federal agency entrusted with the protection of the constitution. But then Brandt is not a thick-skinned prince nor does he have the political make-up of Adenauer.

THE FOURTH ESTATE

With a Little Bit of Threat

Nireekshak

EVEN those who pontificate on the sanctity of facts seem to regard news-management by the government as a legitimate — even a 'responsible' — operation in a democracy. Little wonder then that editors of even what are winningly described as national newspapers, and the journalists employed by them, allowed themselves to be used to break the railway strike. They worked with the zeal of a demolition squad, and contributed their mite towards de-fusing the strike.

Thus the two national news agencies, heavily subsidised as they are by the government, were not found wanting when their benefactor required their co-operation.

Honourable Exceptions

The daily Press was in any case ill-disposed towards the railway strike, so it was not anywhere near finnicky about the kind of news it was fed. If, nevertheless, several newspapers felt free to criticise the provocation they saw in the arrest of the labour leaders on May 2 in the midst of negotiations to avert the strike, it was because such comment could still be made without harm to the main news columns in which the papers continued to toe the government line, presenting the facts in the light prescribed by the government. Thus, with a few honourable exceptions, the newspapers fed readers with untruths and half-truths. Even the otherwise pro-government Indian Federation of Working Journalists was moved to speak out in protest, and call upon its members not to be party to the official news-management operation.

Weeks before the strike, the Prime Minister is reported to have told her aides that the proposed strike would pose a bigger challenge than the Sino-Indian war did in 1962. So, dutifully, everything seems to have been organised on a war footing. A couple of advertising agencies were hired to do the copywriting and visuals, and the Directorate of Advertising and Visual Publicity — the Government's own advertisement agency — played the role of post-office for this expensive campaign. The All India Radio and TV were geared for the strike-breaking operation, and no chances were taken with the Press.

Hilarious Briefings

Groups of journalists were invited for brainwashing with a liberal flow of alcoholic beverages. At a session organised for the Sub-Editors' Guild, the Railway Minister, L N Mishra, was himself present. People claiming to speak on behalf of the Prime Minister went round the major cities, meeting news editors to explain the 'other side' of the picture and to enlist their co-operation for the national endeavour to defeat the strike which had already been declared illegal, anti-national, and so on.

The daily briefings by the Railway Board Chairman, M N Bery, hilarious though they were in relation to actual facts, were printed dutifully by the newspapers — and nothwithstanding that statements such as "marginal strike situation continues", "but there are signs of improvement", services are "coming back to trim" and "returning to shape", can be ill put together to make news copy. Questions about the actual number of trains run under the near-secret 'revised schedules' remained unanswered. Asked about the number of territorial army men pressed into service, the Chairman declined to answer, pleading it was in the nature of 'classified' information. In terms of sheer wordage, the Railway Board's version of the news overpowered the papers' own reports on the strike. Yet the blatant inaccuracy and vagueness could not altogether throw mud in the reader's eyes.

There is the classic instance of a leading daily running a front-page story to assure the nation that there were no signs of eviction of the striking railwaymen's families from their officially allotted tenements in New Delhi. On an inside page, however, there was a report of the wife of a railway employee filing a writ petition to stay her eviction. Another leading daily published a tell-tale photograph of the locked door of a tenement from which a family had been thrown out.

Blatant to Subtle

Methods used for managing the news ranged from the blatant to the subtle. For instance, the editor of a daily that attempted to give a depiction of the facts despite its declared opposition to the 'anti-people and anti-worker' stike, was sought to be prevented from publishing the details of George Fernandes's letter from prison to the Prime Minister — it being gently hinted that, since the strike was illegal under the Defence of India Rules, anything in the nature of support to the strike would attract action under the DIR. Alas, the story was already on one of the agency wires while the editor was still discussing the implications of publishing the details of the letter. To play safe, the paper used the agency copy.

It is difficult to measure the degree to which the DIR influenced coverage of the strike. The Rules are so draconian that anything which can be interpreted as supporting the strike could be categorised a 'prejudicial report' and made actionable. While there is no instance yet of action under the DIR against any newspaper in connection with the railway strike, the existence of the DIR and its known employ against the railway employees themselves was enough of a Damocles' Sword to cajole the reporter into behaving. Willingly, rather than reluctantly the Press played its role in breaking up what was the largest strike the country has ever known.

Neither Flashes in the Pan nor Sound of Artillery Fire

John V Ferreira

Society in India; Volume One: **Continuity and Change;** Volume Two: **Change and Continuity** by David G Mandelbaum; University of California Press; pp 700.

FROM the time of its conception to the time of its publication, the making of this two-volume work of 700 pages has taken 33 years. Its author, David G Mandelbaum, has paid several visits to India as a field-worker and in various other capacities. He has done field-work among the Kotas and neighbouring tribes and castes in the Nilgiri Hills; and, judging from the bibliography of 693 books and pages, has an extensive knowledge of the relevant literature. The blurb describes this analysis of Indian society as the most comprehensive study that has been done in recent times. If one adds to that statement the neat inversion of subtitles to volumes one and two, one delves into the pages of this large work with high hopes of being instructed, stimulated and illuminated. Regrettably, however, ploughing through these pages becomes dull work, first, because most of the information communicated is well known stuff; and, second, because the book fails to startle and grip for want of originality of interpretation and to provoke and excite for lack of controversy. Nevertheless, an attempt at a comprehensive study is always a useful exercise from time to time, and, whatever its limitations, serves the valuable purpose of offering an overview. Mandelbaum's volumes are, therefore, useful; and one can even expect that they will acquire a measure of popularity on that account in our colleges and university departments.

Systems Approach

Let us add further that in attempting this 'comprehensive' analysis of Indian society, Mandelbaum adopts the systems approach which has been growing in strength in America, elsewhere in the Western world and also in India to some extent. Such, be it noted, is the power of the long-scorned fact of diffusion. Thomas Kuhn's ideas are no doubt also relevant here. Mandelbaum makes large claims for the systems approach. It eliminates misleading dichotomies; it includes crucial social factors in one model; it views structure and process, concord and conflict in the same general perspective; it enables the examination of stability and change, norm and deviance together; it does not treat social control apart from social conformity because the system is the social control; and the feedback of counter-change is as integral to it as is the expected interchange. Furthermore, the systems approach, says Mandelbaum, permits us to perceive society in Redfield's paradoxical phrase as an 'analysed whole'. It is good to observe that the word paradox is no longer anathema among social scientists. However, it would appear from the enthusiasm of its growing band of advocates and other fashion-loving supporters that in the systems approach social science has finally reached its apogee or highest point of development. The fallacy or self-delusion of the highest point of development has been long with us in the human disciplines treated as sciences in the narrower sense of the word. But note that F E Emery, while registering the notion that the systems approach aims at grasping the *Gestalt* properties which characterise the higher levels of organisation, points out the uncertain state of knowledge in this field. Again, Guy Rocher demonstrates as recently as in 1972 that the validity of systemic analysis is still called into question by several sociologists and that even those who agree about its utility suggest various interpretations of such analyses. Babel is never far away from the social sciences considered narrowly as sciences, no matter how much effort is expended by the stalwarts in trying to reach out for consensus. Finally, note that Mandelbaum, too, after making large claims for the approach, hedges by asserting that the test of the utility of a concept is whether it helps to clarify, explain and assess probabilities and not whether its use surmounts all questions about it and fills all gaps in it. The clarification, explanation and assessment of probabilities, however, can well be regarded as a milk-and-water version of the deterministic certainties sought by scientists of an earlier epoch, as the use of the term 'explanation' would seem to suggest. Indeed, the tracing of word-symbolism in depth would prove a fascinating exercise in unveiling underlying motivations if undertaken with acumen.

Mandelbaum also tells us that his own use of the concept of social system has been influenced by the writings of Homans, Nadel, Redfield and the more recent syntheses made by Walter Buckley. To consider just one, and that the last mentioned, of this array of dazzling luminaries, in his synthetic endeavour to include everything and please everybody, Buckley treacles his pages, especially his initial ones, with sweet reasonableness and disarming all-inclusiveness. Above all, we are informed that the modern systems approach aims at replacing the older, analytic, atomic technique by a more integral orientation to the problem of complex organisation. But when it comes to the crux of the issue, that is to say, the basic concept of man, what does one discover in Buckley's pages? A reduction, of course. Man is reduced to a "highly flexible and efficient information processing servosystem" — in a word, a computer. If this is not reification in the bargain, what is it? To use a phrase from the Catechism, reification is a mortal sin even among social scientists as their charges and counter-charges against one another in their more heated controversies amply indicate. Why, then, do they keep on perpetrating it time and again? First, because they do not seem to have fully realised, as R F Murphy, drawing on the insights and methods of dialectical philosophy, has done that the contradictions between ideology and behaviour are existential to humanity and that the tendency of society is not towards stability but towards movement and imbalance; and, second, because they prefer to avert their eyes from the implications of an authentically integral approach as a consequence of the hubris and *Zeitgeist* of an earlier decade, thereby failing to perceive or refusing to perceive that society is essentially a creative flux directed at the attainment of an almost unimaginable consummation and that man is essentially not an analysable structure but an elusive *Geist* from whom flows spontaneity and creativity. Therefore, the drift of

But in this section which relates to the tribes as well as in his reference to the totemic clan exogamy of the Marathas in volume one, Mandelbaum's use of the available literature is partial and one-sided. However, he ends this part of volume two with the observation that the advance of status can now be carried out in a wider setting than before which includes the region, state and nation, that there is more differentiation, specialisation and carrying capacity than there is within a local jati hierarchy, and that the caste society may accordingly be undergoing systemic change to a new level of organisation. What is this new level of organisation? Mandelbaum offers the suggestion that "systemic change in jati organisation may perhaps be understood as recurrent change toward modern, global organisation, just as systemic change in a tribal society can be seen as recurrent change into caste society". Are we, then, all caught up in a deterministic cage of systemic recurrence? Is not the qualifying word 'perhaps' much too weak to do full justice to the essential freedom and creativity in man? And all this stress on systemic recurrences within systemic recurrences comes to us from America at a time when even outstanding Marxist thinkers of the calibre of Julien Lefebvre are playing down economism and conformism and emphasising the fact that the *raison d'etre* of a social system is the release of the creative powers in all human beings.

ENTROPY

Much more could be said by way of critical discussion about this large work on Indian society, such as, for instance, its almost total neglect of history or any attempt at reconciling the historical with the systems approach. But we shall confine ourselves for the sake of brevity to a final critical statement. Mandelbaum repeats Milton Singer's arguments against Max Weber, K William Kapp and Gunnar Myrdal and points out that adequate empirical evidence has not been tendered in maintaining the Weberian thesis by Weber himself or by those who support his thesis. The crucial evidence, however, has taken some time to make its appearance and gather momentum, as is understandable in connection with so complex a being as man. This evidence is the increase in entropy, as I have already indicated, which is manifest all around us in India today. Thought, creativity and excellence constitute negative entropy; but these vital elements are not conspicuously present in the country today. Instead, there is a kind of intellectual colonialism which is very likely the prime cause of our many woes. If, therefore, one interprets Weber liberally, one will discover that he is not so far out on the wrong side as some American social scientists would have us believe. Gunnar Myrdal's advice to social scientists to make a candid declaration of their values — add partialities and prejudices — could well be taken to heart by the anti-Weberites in the ranks of American social science.

Tata Services

Require

ECONOMISTS AT DIFFERENT LEVELS

At the *SENIOR* level, the job will involve principally: (i) interpreting and forecasting economic trends on a continuous basis and advising top management in a practical manner, (ii) preparing background notes on various topics at short notice, and (iii) assessing and analysing the implications of Government's plans and economic policies in diverse fields.

We are looking for the following attributes: (i) A brilliant academic career in economics, and a supporting qualification in Statistics, Mathematics, Commerce or Technology. (ii) Capacity for hard work and for generating fresh practical ideas. (iii) A high sense of devotion and loyalty. (iv) Proven organisational ability. (v) Experience of work in institutions dealing with applied economic problems or a successful spell at a reputed academic institution. (vi) A number of published works on a variety of different economic problems.

There are not many around with all these attributes, but you can apply if you are convinced that you are reasonably close.

At the *JUNIOR* level, the selected economists, in addition to keeping a thorough grasp of certain aspects of macro-economic developments, will study and specialise in the economics of particular industries allotted to them, in the light of the changing economic environment.

The Junior posts are also open to non-economists who have had wide useful experience. A sound knowledge of a supporting area will be desirable. An alert and constructive mind will be rated highly.

These are long-term appointments and will involve a probation period of one year. Total monthly emoluments for the junior level posts will be upwards of Rs. 1,100; and for the senior level it may be up to Rs. 3,000. The posts carry excellent other benefits such as Provident Fund, House Rent Subsidy, Bonus, etc., according to the rules in force.

Headquarters: Bombay. Possibly one post each at a suitable level may be located at Delhi, Calcutta and Jamshedpur.

Applications in strictest confidence, and giving full particulars, the post applied for, emoluments expected and preference for headquarters, if any, should be made to **Tata Services Limited,** Army & Navy Building, Mahatma Gandhi Road, Bombay 400 023, to reach within 20 days and should be marked 'Economist' on the envelope.

Age at Marriage of Women

Kumudini Dandekar

The average age at marriage of Indian women has risen relatively rapidly in the last two decades and has reached a fairly reasonable level in recent years.

There is nothing desirable or undesirable about the present age at marriage per se. *What is a cause for concern, however, is the fact that the average age at marriage of women in India has been so unresponsive to efforts to raise it.*

Why is this so?

THE marriage pattern in India is examined here in the light of patterns observed elsewhere, especially with a view to determining the difference in the status of the female in India from that in other countries.

The average age at marriage, the minimum age at marriage specified by law, and the distribution of women marrying at various ages in India, Sri Lanka, Pakistan, Thailand, United Kingdom, France, United States and Japan are presented in Table I. The age at marriage in India is much lower than that in other countries except Pakistan. In fact it is observed to be the lowest among most of the countries of the world. Can any explanation be offered for this state of affairs?

As for advanced countries it seems that there is a definite change in the marriage pattern, namely a decline in the age at marriage in the post World War II period after a substantial rise in the early thirties. This gives negative values for older ages (in Table 1) for women who married late in the 1930s, namely the depression days. Poverty combined with education raised the age at marriage at that time. The recent decline in age at marriage is due to relative prosperity in the relavant countries. In India the explanations for low age at marriage that may strike one at the outset, especially while comparing the countries in Table 1, are the low level of industrialisation and acute poverty unaccompained by education. Even the highly advanced countries of today had low ages at marriage in the preindustrial stage. But today people in many countries even at low level of industrialisation do not marry that early. Moreover the Indian age at marriage remained low in spite of deliberate efforts to raise the age till 1960s. From 1890 to 1960 the female age at marriage increased by only four years, i e, from about 12 years to about 16 years. The average ages at marriage in the various decades were as follows:

Census Decade	Age at Marriage (in years)
1901-1911	12.8
1911-1921	13.0
1921-1931	13.5
1931-1941	14.9
1941-1951	15.4
1951-1961	16.3*
"	17 | our
1961-1971	18 | estimates

* Estimate by S P Jain given in the Introduction, page XXXV, to "Patterns of Population Change in India during 1951-61", edited by A Bose. (Allied Publications, Delhi).

The average age at marriage in 1971 is however 20 years in urban areas and 18 years in rural areas. It shows that the age at marriage in India has been increasing at a greater speed during the last two decades and has reached a reasonable level in recent years. There is nothing desirable or undesirable about present age at marriage, *per se*. But the low capacity to raise it when called for by social circumstances is the serious problem. Why is it that Indian conditions are so poorly responsive to efforts to raise the age at marriage? (See Table 2.) The Sarda Act of 1930, subsequently amended in 1949 and 1956, raised the minimum age at marriage from 14 to 15 years and finally to 16 years. The present move is to raise it to 18 to 21 years by legislation. The Sarda Act was obviously meant as a health measure by specifying the minimum age at marriage to rule out forced sex before puberty. A congenial climate for such action was created in those days by recent criticism of Indian child marriages by Miss Mayo and others of her kind. In many countries the minimum age at marriage is specified by law and is very often nearabout the age of puberty. Legislation regarding minimum age at marriage had no substantial effect on the age at marriage in India and 24 per cent of the women married before 14 during 1931-41. Even today a substantial percentage is estimated to marry before the specified minimum. From Table 3, 20 per cent women in 1961 and 12 per cent women in 1971 married during 10 to 14 years of age. The current attempt to raise the minimum age at marriage to about 20 years is aimed at reducing the birth rate. The possible results however are not very encouraging as shown below.

K G Basavarajappa and M I Belvalgidad showed that the decline in birth rate could not be more than 10 per cent by raising the age at marriage to 19 or 20 as indicated in Table 4. Such rise in the age at marriage reduces the proportion of married women among those aged 15-44 years by about 16 per cent or so. But the decline in birth rate happens to be smaller. In short, the two authors indicate that socially it is desirable to raise the age at marriage, but as a measure of fertility control it may not be very effective. The Ministry of Health and Family Planning has in its Mass Mailing Unit recently announced an expected long-term fall of 15 and 19 per cent due to raising the age at marriage to 18 and 20 years, respectively. A number of similar estimates have been offered by a number of demographers. The reduction in fertility estimated by them is set out below:

Author	Percentage Reduction in Birth Rate
S N Agarwala	30 during 25 years.
Zachariah and Talwar	25 immediately; 8.21 in long term
Goyal	30
Mukherji and Venkatachari	23
Chidambaram	15 or less

According to Ansley Coale and Tye[2] with rise in the age at marriage, the length of generation increases which reduces the intrinsic rate of growth per annum even if women produce the same number of children. Though there would be some fall in the birth rate as a result of raising the age at marriage above puberty, there is no possibility of rise in the age through legislation without proper implementation. Im-

Imagine Employment...

...without Petrochemicals

The livelihood of almost one in fifty people employed in the organised sector depends on petrochemicals.

Petrochemicals provide the basic raw materials that sustain many of our essential industries, ranging from antibiotics which preserve health to pesticides which enhance foodgrain production.

A majority of these industries comprise of small scale units, an estimated 5,000 of which employ over 2,00,000 people.

Growth of petrochemicals is of national importance since it will enable a large number of manufacturers to expand and diversify production and thus generate more employment opportunities.

Petrochemicals—essential to many crucial sectors of our economy.

Today Germany is looking back.

Back 25 years.
To when the fathers of the German Constitution signed the Basic Law. May 23, 1949.
Solemnly, the First Article proclaimed:
"The dignity of man shall be inviolable.
To respect and protect it shall be the duty of all State Authority".

25 years back
The Federal Republic of Germany was born
A social, democratic republic.
With a will to work, re-create and live again.
Rising from the ruins and rubble of war.
Seizing the "advantage of the defeated",
Germans rebuilt Germany.
Divided but not disheartened.

25 years.
Challenges. Achievements.
Rising standards of living.
Flourishing industry and commerce.
Social justice and, above all, freedom.

25 years
of cooperation,
dialogue and sharing.
With countries and people.
With India. Fruitful. Encouraging.

25 years.
Looking back, every minute,
every mile has been covered usefully.
And Germany looks forward;
forward to a promising future.
Based on hard work,
friendship and understanding.
And Peace based on justice and co-operation.

Today Germany is looking forward.

Issued by the Federal Republic of Germany on the 25th Constitution Day.

plementation is not without social as well as economic costs and then the question is whether the reduction in birth rate is worth the costs.

It seems to us that further rise in the age at marriage can occur only with high motivation among women for a better life for themselves. This can lead to reduction in fertility. Such a motivation can come with better education, employment or general improvement in the level of living above a certain minimum. There is only one country that has achieved birth reduction by marrying late, at an average age of 29 or above.[4] This is Ireland. But the conditions of living there were better than those in India. This perhaps explains its capacity to raise the age at marriage. In fact in advanced countries people can raise the age at marriage when circumstances call for it. However, a number of observations with regard to India show that only raising the age at marriage to 18 or 20 years, without a change in other socio-economic conditions, is not going to produce the desired change — a decline of 15 per cent to 30 per cent — in the birth rate as envisaged by the demographers referred to above.

To understand the above situation one has only to note that the birth rate is not lower in these states where the age at marriage is higher (see Table 5). For example, the states of Assam, Tamil Nadu and Kerala, though they had the highest age at marriage in 1961 namely, 20+, did not show a birth rate lower to the extent of 15 to 30 per cent as compared to other parts of India. In fact there is no definite relationship between birth rate and age at marriage in various states, as seen from Table 5. Similarly, countries like Thailand or Sri Lanka, have higher age at marriage than 20 but do not show lower birth rates. Comparison with Thailand may not be valid because of cultural differences between India and Thailand. But as far as Sri Lanka is concerned, culturally it is not much different from South India.

In short, just high age at marriage may not produce a lower birth rate. Still, if circumstances demand it can India immediately attain a higher age at marriage as in Sri Lanka or Ireland? Can the Indian female choose her age at marriage, especially when national circumstances call for it?

Leaving a female to choose her time of marriage is a big step in raising her social status. It may also indirectly mean allowing her to choose her marriage partner. All this means a marriage which is based on the sex-urge. Can India afford it for the majority of females? As mentioned earlier, the need for food comes before the need for sex and there is a substantial portion of population in the country which does not get even adequate food. When 40 per cent of the rural and 50 per cent of the urban households live below the subsistence level,[3] the first consideration for such households is to weed out sharers of food whenever possible or to dump the burden of feeding on somebody else. This can be manoeuvred by parents only by disposing of female children who anyway will join their male partners in future if left to themselves. There are a number of advantages for this class if the parents manage the problem early enough. First, the burden of feeding the children is transferred early. Second, if the marriage is arranged by the parents, the girls can be kept in the closed circle of caste and community of the choice of parents. Left to herself the girl may choose her partner from an undesired community (according to the parents). Third, the problem of illegitimate babies may be prevented by marrying the girls early. In short, keeping the 'good' of the girl in mind, parents can discharge their responsibilities properly only if girls are married before they get choosy. Further, left to themselves girls will take time to make their choice of partner, depending upon their sex-urge and maturity which will mean longer dependence on parents. In fact, in many of the countries where girls are left relatively free to choose their age at marriage, marriages take place at late ages for biological reasons of getting the sex-urge late which situation may be further strengthened by education and employment. But in India these supporting institutions being

rare, the young girl is thrown with a boy as a married partner. If there is a clash of interest between the married partners the girl coming from outside the boy's family is thrown on the parents of the boy for further dealings. In the class living below subsistence there is competition for getting food and of other basic amenities and the newly-wed girl is a foreign worm in the household and so does not deserve high priority for such amenities. This determines her status in the family as well as in the society.[4] This class, though living below the subsistence level, still has a set of values so that it cannot tolerate illegitimate children. But the lowest placed in this class cannot afford even such a set of values and the marriage pattern among them may differ slightly from that described above with perhaps more equality between men and women.

As for the class just managing to earn its subsistence or is at a slightly higher level, the problems of marriage do not change qualitatively. Food sharing and competition to get the basic needs may be a problem even here, though to a lesser degree. The higher one goes in the income line, there are problems of settling the children in life and especially girls by providing them education and making them employable. In the subsequent paragraphs the problems of educating females are discussed.

The class under consideration is mostly rural. Half the rural population (which is 80 per cent of the total) lives in villages with populations of one thousand or less. Very often here girls go to school upto about the 12th year because local schools offer facilities for about six years of schooling. With the small size of villages higher standard schools cannot be afforded. So girls have to go to schools in nearby biggish villages two to three miles away through isolated areas. A walk to schools through isolated areas may not always be safe for girls of about 12 years of age. Hence they drop out of schools. On the other hand, boys may continue their education by going to the bigger villages. Such village schools may be joined by local girls only, but boys may come from nearby villages also. This raises the proportion of males in the school and is unfavourable to females. The dearth of female teachers aggravates the situation. The Government of Maharashtra, for instance, had a policy of having one-third female school teachers. But female teachers were available only to the extent of 17 per cent[5] or so and they too were concentrated in small towns and not villages. Hence schools in even big villages do not have the right kind of atmosphere for female students which can be created only by the existence of female teachers. Further, in Maharashtra female teachers were found to go on leave for about 90 days in the year on average.[6] Our guess is that they went on leave for one year after every three years probably because of maternity. Whatever the reason substitution of female teachers was not possible because of shortage of female teachers in villages. This left a substantial proportion of classes without teachers when female teachers went on leave.[7] Such a situation often led the administrators to take an unfavourable view of female teachers. The result on the whole was a smaller number of female teachers and an atmosphere adverse to the promotion of female education above some minimum levels. The low level of female education led to shortage of female teachers and lower employability of females. This vicious circle meant increased dependence of females on agriculture for employment. Agricultural occupations are just not congenial for unmarried female workers in Indian conditions. Hence the age at marriage does not rise fast even in the class living at or slightly above subsistence.

The two classes discussed above cover a major portion of the Indian population. As a result, early marriage achieves a kind of group acceptance in the country.

As for the middle class which can afford to educte their females, considerations bearing on age at marriage differ. A number of reasons that keep the age low among the poorer classes such as problems of caste-ridden marriages or illegitimate reproduction, etc, do hold for this class too. But the main problem here is that of maintaining the girls either in this or the higher income class which is very small in size. In order to settle the girls in the same or higher class, parents may prefer to arrange the marriage of their daughters so that they are not left completely free to choose their partners.

With education and employment females will choose to marry late even in a poor country like India. The relatively poor among women in even the advanced countries do marry late if need be. This will surely happen in India. In fact though the age at marriage rose very slowly during 1890 to 1960, it has risen comparatively rapidly during the two decades 1950 to 1970. But the proportion of educated females being smaller, the Irish experience cannot be expected to be repeated here, despite the abysmal poverty and the fact that the need to raise the age at marriage is more severe than in Ireland.

Source : "Population by Marital Status, Sex, Ages, Urban/Rural Residence", pp 190-276, Demographic Year Book, 1968.

The result of generally low age at marriage is the universality of marriage in India. Here the sex-urge not being the base of marriage, the individual's early or late requirements of sex do not come into play in marriage. Almost all parents uniformly marry off their daughters at puberty or thereabouts. Hence only one half of one per cent women in India never marry in their lives. The percentage is higher for other countries except in Korea (Table 6).

Very often the elders warn that maintenance in old age is difficult if one is unmarried. Living alone speaks for growth of individualism which has limited outlets in Indian conditions. Hence women rarely remain unmarried in India. With low levels of health and vigour one does not expect higher sexual needs among Indian women than those in the other countries mentioned above. If women in other countries are dying unmarried because of no felt-need for marriage, India also could easily have a similar percentage or more of such women. There is one factor which goes against this. In India for a large majority of females even speaking with men of their age is taboo if they are unmarried. Hence if one does not get married one cannot freely mix with half the adult population. Hence even to satisfy slight curiosities about the other sex, one has to marry and even be forced to cohabitate. For Indian women marriage provides security in young age and children provide it in old age if they are widowed.

If one considers the problems of social and economic security for women, it is necessary to discuss the total cycle of female life with its extent of widowhood and the number of sons on whom they can depend in old age if need be. Such data are not available. A sample of 2,380 couples in 60 villages of Uttar Pradesh were observed in 1956 to study the life cycle of the female. It was found that due to high infant mortality 22 per cent of the couples[8] had no son at the end of reproductive period. In following the life-cycle, even the broken couples were followed after their widowhood. It was worthwhile noting this cycle because it gives the combined effect of marriage, widowhood, birth rate and death rate, to estimate the size of family including the parents (see Table 7). It gives the probability of security to women at various ages with husbands or children. In other words one can know how many women lose their married partners at various ages and to what extent they can depend on children or sons if the need arose in old age. The reading of the Table will be illustrated by the following example.

At 10 years after marriage (husband 17.5 years of age and wife 14.5 at marriage) out of 100 couples at the beginning 4 got widowed, i e, out of 200 parents (or married partners) only 192 were living in the sample in Uttar Pradesh. They had altogether 229 children born out of which 158 were living so that the average size of the family including widowed persons became 3.5 at 10 years after marriage. The average size of the family was maximum, i e, 5.39 after 30 years of marriage. The Table shows that in spite of early marriage the size of the family was not very large for the observed sample. Widowhood and orphanhood due to mortality of either or both the parents was pretty large. It is this factor which transferred the burden of dependent persons to close relatives, producing what is called a joint family. One can see why the vast majority of the poorer classes have a low level of motivation for family planning. The life cycle discussed above is probably illus-

Note: Man and woman are assumed to be married at 17.5 and 14.5 years, respectively, starting the family cycle at these ages.

trative of conditions in many parts of India in the year 1956.

The current view in India is in favour of changing the age at marriage to 20 by legislation. However, this is not likely to have the desired effect of reducing the birth rate for various reasons. No piece of social legislation is implemented in this country. This is what the Britishers did because they did not want to displease the people. Nor does the post-Independence administration care to implement these laws. It is costly to try to implement them because of the close supervision necessary for implementation. In fact the initial idea of community development experimented with by Albert Mayer could be usefully developed even to have village communities that watched for illegal early marriages and such other irregularities checking which is so desirable for proper development of society. Otherwise one has to depend on growth of education and employment in the country. If education and employment could be made available for a majority of women and if marriage was not depended upon for sheer subsistence, there will be a society in India that could be called progressive, and it will control the age at marriage as directed by social circumstances.

Before closing one may compare the Indian age at marriage with that in China, the only country in the world which resembles India in size and poverty. It is important to note that the ages at marriages of 30 and 25 years for men and women respectively are considered to be medically right in China. The medical view that the most suitable age for child-birth is if the female is confined between ages 24 and and 28 years is reportedly followed in practice too.

DAMODAR VALLEY CORPORATION

Damodar Valley Corporation

6 PER CENT BONDS, 1986
of Rs. 300 Lakhs

Subscriptions will be received at the office of the State Bank of India at No. 1, Strand Road, Calcutta-1. Prospectus and application forms will be available at the above office and the office of the Chief Accounts Officer, Damodar Valley Corporation, Bhabani Bhawan, Alipore, Calcutta-27.

Issue Price	100 Per cent.
Rate of Interest	6 per cent per annum
Currency	12 years
Brokerage	6 paise per cent to Banks and recognised Brokers on allotments made in respect of applications bearing their stamps
Underwriting Commission	38 paise per Rs. 100 (nominal) to every subscriber who subscribes and is allotted Rs. 25 lakhs or more.

Payment of interest and repayment of the principal are guaranteed by the Government of India.

Bonds will be Trustee Securities under the Indian Trust Act, 1882 and Approved Securities for the purpose of the Insurance Act, 1938 and the Banking Regulations Act, 1949.

Proceeds of the Bonds will be utilised in financing the power expansion programme during 1974-75.

Subscriptions will open on 11th June, 1974 and close on 13th June, 1974 or earlier without notice on being fully subscribed.

Tax Concession as a Remedy for Evasion

A K Das Gupta

The Union Budget for 1974-75 carries a considerable amount of concession in direct taxes.

Not only has the exemption limit been raised, there has been also a reduction in rates at all levels of taxable income.

Obviously this is an extraordinary measure to have been taken by the government in the present state of the economy when the Exchequer is so much in need of funds.

Yet these concessions do not seem to have attracted the attention of the critics of government finance to the extent one would have expected they would.

THE Union Budget for 1974-75 carries a considerable amount of concession in direct taxes. Not only has the exemption limit been raised, there has been also a reduction in rates at all levels of taxable income. The marginal rate of taxation, including surcharge, has been reduced from 97.75 per cent to 77 per cent. Obviously this is an extraordinary measure to have been taken by the government in the present state of the economy when the Exchequer is so much in need of funds. Yet these concessions do not seem to have attracted the attention of the critics of government finance to the extent one would expect they would.

The Finance Minister's plea is that the measure will reduce tax evasion. He said it is in his Budget speech, quoting the views of the Direct Taxes Enquiry Committee. And he repeated it in his reply in Lok Sabha to the general debate on the Finance Bill. The downward revision of the income tax rates, the Finance Minister argued in Lok Sabha, is "an experimental measure to combat the greatest menace facing us today, namely that of tax evasion". We are told that the lowering of the marginal rate of taxation has the support of judicial, administrative and financial experts whom apparently the government has consulted. It is argued that the measure of tax concession is "not to give any benefit to tax evaders"; it is rather "to reduce the incentive for tax evasion". Let us examine the claim.

We take the case of the marginal rate of taxation — the rate which applies to the slab beyond Rs 70,000 per year. The present rate of 97.75 per cent looks very high indeed on the face of it, although one does not know how an individual income of Rs 70,000 per year could be at all tolerated in an economy where the per capita income is not even one hundredth part of it. But let that pass. The proposed marginal rate, including surcharge, is 77 per cent. The Finance Minister and his advisers expect that this concession of 20.75 per cent will reduce the incentive to tax evasion. Which means that, while at 97.75 *per cent no tax is paid on the* marginal slab by the highest income earners, at 77 per cent they will be induced not to conceal their income and at least 77 per cent of it will be in the hands of the government.

Why? What is the psychological or sociological principle on which this is based? Is it that the tax evaders were hitherto having a game with the government, that their refusal to pay was only a kind of bargaining strategy to be withdrawn as soon as the rates would come down to what they would want them to be? Are we to take it that the tax evaders are well-behaved citizens and that their decision not to pay is merely a protest against what they consider to be unfair? If the Finance Minister allows himself to think that this is how the mind of the tax evader works then he must be under a delusion. *Tax evasion is a* propensity born of greed. Like any other propensity it is restrained only insofar as the person having recourse to it *has to pay a price.* A tax evader runs the risk of being detected and punished. This risk is the measure of the price that he pays for the gain that he derives from non-payment of his dues. He would not consider it worthwhile taking the risk if it were higher than the amount that he is called upon to pay. Suppose, as in our present case, our tax payer is charged 97.75 per cent on his marginal slab. *If he evades the tax, it is* because the risk involved in evasion is less than the tax liability, having regard to the probability of his being detected and the penalty to be paid in the event of detection. Now that the marginal rate has been reduced to 77 per cent, he will desist from the malpractice provided he values the risk at more than 77 per cent of the marginal slab of his income, but will not do so if the estimated risk is less. It is difficult to say how our tax evaders will respond to the revised rates. The response is uncertain; for it will all depend upon their individual valuation of the risks of evasion. If these risks are low, as they apparently are in our country, particularly at higher levels, the reduction in tax rates will be of little avail. What is certain is that the revision in rates will reduce the overall income tax receipts of the government. For those who would in any case pay their dues would now pay less.

The Finance Minister's claim that the tax concession is not to benefit the tax evaders is beyond dispute. What one wonders, however, is why the claim should have been announced at all. Who would ever argue that the concession was designed to benefit the tax evaders? Of course one who does not pay at all is not benefited if he is asked to pay less. The concession will benefit, not the tax evaders but the tax payers — those salary earners whose income taxes are deducted at the source. And when it is remembered that top officers in the government and the public sector corporations enjoy salaries ranging from Rs 42,000 and Rs 48,000 per year, or even more, and that incomes ranging between Rs 70,000 and Rs 1,50,000 are not uncommon in the private sector, one can appreciate what these concessions will mean for the Exchequer. To reduce direct taxes and to cover the loss by a larger dose of indirect taxes, as the Finance Minister proposes to do is a retrograde step.

It is arguable that, where evasion prevails, income taxes are discriminatory as against salary earners. Whereas a businessman can conceal his income, a salaried officer cannot. Assuming therefore that the businessman systematically conceals a given percentage of his income, an undesired differential appears between the disposable income of a salaried officer and that of his counterpart in business, and it tends to be larger the *higher* is the rate of income tax. It is conceivable that this precisely is the consideration which, consciously or unconsciously, weighed with the

administrative and financial experts (who after all are salary earners!), from whom the government is supposed to have sought advice on the matter of tax concession. Consider, for example, the relative position of a Secretary to the Government of India *vis-a-vis* a lawyer or a doctor doing private practice. The normal earning of the latter may be the same as the salary of the former. But, insofar as the lawyer or doctor is in a position to conceal a substantial part of his salary, his disposable income has a tendency to be higher than the take-home pay of the Secretary. This certainly is an anomaly which needs a remedy. But is the answer to the anomaly a general reduction in income tax rates? Theft and robbery occur in an imperfect society, such as we are, and they discriminate against owners of moveable property. Yet no government would ever think of giving subsidy to such property owners as protection against so-called discrimination. Thieves and robbers are punished, and measures are taken so that the frequency of their operation is minimised. The alternative to tax concession as a corrective to discrimination is a tighter, tougher and a cleaner Income Tax Administration, supported by a more rigorous system of penalty for the tax evader, whatever his status.

While the proposed tax concessions will reduce one kind of anomaly — that arising from evasion — there is another kind of anomaly to which it will give rise; it will increase the differential between the lower and the higher salary ranges within a particular organisation. Take, for example, the case of government salaries. One of the more important matters that the last Pay Commission had to consider was the permissible limit to differences in the level of Class IV salaries and the level of Class I salaries. In considering the matter the Commission was *naturally* influenced by the prevailing income rates; the differential considered referred to the pay ranges, *net* of income tax. Assume, then, that the vertical relativity fixed by the Commission on the basis of the current tax rates was optimum. Whether or not it was so one does not know — for "optimum" in this context is not amenable to precise definition. Yet, considering the present social mood, and regard being had to the experience in comparable economies, the differential accepted by the Commission was very definitely not on the low side. The differential is now going to be further widened in view of the proposed tax concessions.

Let us face the fact. On the principle that "an old tax is no tax", one might say that the reductions in the income tax rates are a kind of "tax-free bonus" granted to salary earners. And since the concessions relate to an income tax system which is progressive, the bonus happens also to be progressive, yielding proportionately larger benefit to higher levels of income. An analysis of the old and the new income tax schedules will show that the rate of tax concession rises from 0.22 per cent, as it is for an income of Rs 10,000 per year, to 9.1 per cent in respect of an income Rs 1,50,000 yer pear. In absolute terms, for the income range, Rs 10,000-15,000 per year, the amount of concession lies between just Rs 22 and Rs 132 per year, whereas, at the upper end, for the income range, Rs 50,000-1,50,000 per year, the concession goes up inordinately high, ranging from Rs 2,247 to Rs 13,697 per year.

It must be an extraordinarily stout-hearted government which could grant a "net" bonus of this order to the top salary earners in the society, while denying a "gross" bonus of 8½ per cent of the salary, such as is demanded by its own lower-grade employees. The latter's demand, one fears, is not altogether unconnected with what benefits the top employees arrogate to themselves.

Indian Bank

(Wholly Owned by the Government of India)
Head Office: 17, North Beach Road, Madras 600 001

Directors' Report for the Year 1973

THE Board of Directors have pleasure in presenting the audited Balance Sheet and Profit and Loss Account for the year ended 31st December, 1973.

Impact of Monetary Policy

The working of the banking system during the year was conditioned more than ever before by the culmination of a series of credit control measures clamped down by the monetary authorities "with a view to influencing the cost and availability of commercial bank credit". In the wake of deepening stresses and strains in the economy, interest rates on certain classes of deposits were put up — though fractionally — Bank Rate itself was raised from 6 per cent to 7 per cent, a part of the lendable resources of the banking system was mopped up by enhancing the statutory cash reserve ratio from 3 per cent to 7 per cent in three stages accompanied by stepping up the statutory liquidity ratio itself to 32 per cent from 30 per cent. The impact of these ratio revisions was to limit the lending capability of the banking system to about 61 per cent of the deposit resources, as against 67 per cent at end of 1972. Recourse to refinance from the Reserve Bank was curtailed by the imposition of quantitative ceiling apart from raising the cost of borrowing as well. The net liquidity ratio (*NLR*) that governs the rate of interest payable on certain types of borrowings from the Reserve Bank was marked up from 36 per cent to 40 per cent in three stages, and the maximum rate of interest so payable was hoisted back to 15 per cent from 12 per cent prevailing earlier in the year. The cost of bank credit was directly marked up by the imposition, in two stages, of a minimum interest rate of 11 per cent on lendings by the banking system, — except on certain exempted categories of bank credit. The maximum permissible interest rate on export credit was taken upto 8 per cent* (from 7 per cent) and the minimum rate on bills under the New Bill Market Scheme was raised in two stages, from 8 per cent to 9.5 per cent.

* The maximum interest rate on export credit has since been further raised to 9 per cent from 1st April, 1974.

The impact of these successive monetary restraints was a serious depletion of the liquidity position of the banking system, — as indeed the measures were intended to be. But coming on the heels of excess liquidity so temptingly prevailing only some months before, the sudden evaporation of liquidity had an unsettling effect both on the banking system as well as borrowers from the banking system, public and private sector borrowers alike. Despite some possible moderate fluctuations in liquidity in the coming months and years, any return to conditions of excess liquidity seems to be a far cry for quite a time to come. Indeed, the banking system and the borrowers may have to gear themselves to conditions of credit stringency, maybe of increasing rigour, if the banking system is to continue to support fresh investment in the productive segment of the economy. This poses an exciting challenge to the banking system to accelerate the pace of deposit mobilisation by winning over the most marginal of depositors through efficient and inexpensive customer service, rationalisation of internal procedure, and extension of branch network. The banking system should also ensure that the genuine credit requirements of the productive sector are not starved. The borrower has likewise to reckon with paucity of credit and foster financial discipline of the highest order in the management of the business enterprise.

Thanks perhaps to the moderate size of its operations, Indian Bank has sought to bring about a flexible approach by examining the credit requirements of its borrowers in the productive sector on the merits of each case, and has endeavoured to reduce the hardship arising from the overall constraint in its lendable resources. Drawals against sanctioned limits were not frozen by any rule of thumb method. The flow of credit to the priority sectors in particular was allowed unrestrained as presented in greater detail elsewhere in this report.

A Year of Spectacular Growth

Deposits Rise 34.31 Per Cent

For Indian Bank, 1973 was a year of spectacular growth. Total deposits including Colombo and Singapore branches rose smartly from Rs 164.86 crores at end of 1972 to Rs 216.74 crores at end of 1973. Deposits in India (excluding deposits by other banks) increased from Rs 154.25 crores to Rs 207.17 crores, or 34.31 per cent, among the highest growth rates in public sector banks, if not the highest. The deposits of all scheduled commercial banks in India (other than inter-bank deposits) rose however by 22.18 per cent only, between last Friday of December 1972 and 1973. Hereunder the comparative position of the Bank's deposits as at the end of the last five years (see Table below).

Advances Rise 31.26 Per Cent

The growth rate of Indian Bank's advances again surpassed the average for scheduled commercial banks. The Bank's total advances including those at Colombo and Singapore branches rose smartly from Rs 114.96 crores at the end of 1972 to Rs 152.49 crores at the end of 1973. Advances at Indian branches alone rose from Rs 110.94 crores to Rs 145.62 crores, or by 31.26 per cent, against 27.15 per cent for the scheduled commercial banks in India between last Friday, December 1972

Table

End of the Year	Deposits of Indian Bank in India (excluding deposits by other banks) (in crores of rupees)	Per cent increase of Indian Bank's deposits over the previous year	Per cent increase of deposits of scheduled commercial banks in India over the last Friday of the previous year
1969	82.20	13.20	15.00
1970	93.20	13.40	17.00
1971	116.10	24.60	20.80
1972	154.24	32.85	17.43
1973	207.17	34.31	22.18

and 1973. The Bank's credit deposit ratio in India stood at 70.29 per cent as against 68.97 per cent for the scheduled commercial banks on the last Friday, December 1973. There was considerable diversification in the Bank's advances sector-wise and region-wise. The Bank's foreign exchange business also continued to expand.

Priority Sector Credit

A reference was made in the earlier paragraphs to the unrestrained flow of credit to priority sectors despite the credit squeeze. Indeed the growth in the priority sector credit during 1973 was as high as 57.65 per cent, surpassing even the 1972 increase of 41.58 per cent, and as against 31.26 per cent growth in the aggregate advances of the Bank during the year 1973. At the end of 1973 credit to priority sector made 35.58 per cent of our total bank credit in India as against 30.31 per cent at the end of 1972. The thrust in agriculture credit was far more.

Entrepreneur Advisory Service

In the sphere of small-scale industry assistance, the Bank launched during the year a package of free consultancy services to prospective entrepreneurs, particularly unemployed engineers, diploma holders, University graduates and business executives, to set themselves up in self-employment. This scheme known as the Entrepreneur Advisory Service was inaugurated by the Hon'ble Union Minister of Finance Shri Y B Chavan on 3rd October 1973. This is a new dimension in the pre-setting up assistance to technocrats who have the capacity but are not conversant with the innumerable preliminaries to the setting up of a project including:

- identification of project
- market for the product
- location of the project
- sources of machinery and raw material
- power, water, sheds and other infrastructure
- procedural requirements
- raising financial resources

One of the special services under the scheme is to enable the new entrepreneur to meet established industries which may be interested in buying the product proposed to be manufactured and also arrange for special consultancy with business executives of standing in the line of manufacture. The scheme initially operative for unemployed technocrats in and around Madras has made a good progress. Since its inauguration in October 1973, 26 projects have been set up through the Bank's Entrepreneur Advisory Service. 15 units are promoted by engineering graduates, 2 units by diploma holders in engineering, 8 units by University graduates and one unit by a housewife. The range of products manufactured includes magnetos, alternators and ignition coil for automobiles, furnace equipments, foundry die casting items, spiral wound metallic gaskets used in chemical processing industries, sodium bichromate, industrial gloves and educational aids. The 26 units have provided employment opportunities for about 150 people, most of them skilled.

Branch Expansion

Our programme of branch expansion was pressed forward with greater vigour in 1973. 67 new branches were opened, against 43 in 1972. The Bank has opened 208 new branches in the last five years taking the total number of branches in India to 427 at end of 1973. Of the 208 new branches 118 were in rural centres, 38 semi-urban, 17 urban and 35 metropolitan. Again, 113 out of the 208 new branches were opened in the lead districts allocated to Indian Bank. The new branches have been actively developed to become an instrument of credit assistance, particularly rural and semi-urban branches. They have contributed substantially to the growth of advances to priority sectors. They have also helped direct employment opportunity. Of the total 6,221 staff members on the Bank's rolls at end of 1973, 1,348 members are working in the branches opened in the last five years. 654 members are at our newly opened rural and semi-urban branches, the number of staff at the new branches has progressively risen from 102 at end of 1969 to 1,348 at end of 1973.

The Bank has drawn up a more ambitious programme of branch expansion for the year 1974. In consultation with the Reserve Bank of India and the Government of India the Bank has taken up a special programme of branch expansion in the under-banked State of Orissa and the under-banked Telengana area in Andhra Pradesh. The Bank also contemplates opening a chain of branches in important centres in Uttar Pradesh, Madhya Pradesh, Punjab, Haryana, Rajasthan and Gujarat in order that the Bank will be able to handle its growing volume of business.

Staff Training

The Directors have always set great store by staff training as the very basis of the Bank's development. A reference was made in the earlier reports to the special steps taken to attune the vision of managers to the larger purposes of banking, as an instrument of socio-economic change. The range and depth of training was further accelerated during 1973. It was noticed that apart from the attitudinal reorientation, credit officers required lot more technical skill to handle the variety of credit requests from the priority sectors, as also the highly specialised technique of financing the large-scale and petro-chemical industries. A specially designed course, with particular reference to term lending, foreign exchange operations, etc, was therefore initiated during the year. These courses were conducted in Bombay and Delhi also so as to integrate the environmental aspects into the technical skills of credit management. As many as 1,689 staff members of different cadre went through one or other type of training in the college during the year 1973.

Bank's Patrons

The number of deposit accounts in the Bank's books in India rose from 8,97,794 at the end of 1972 to 11,78,416 at end of 1973 and lending accounts from 1,62,252 to 2,40,158. The Board of Directors are grateful to the Bank's patrons in India and abroad for their goodwill and wholehearted support to the Bank.

Staff

The Bank's staff strength in India was considerably augmented to handle the increasing volume of the Bank's business. As many as 1,231 clerical cadre staff were recruited during 1973, as against 393 only in the year 1972. 364 members of the clerical cadre were promoted to the officer cadre as against 197 in the previous year. Promotions from subordinate staff to clerical cadre were 31 against 25 in the previous year. 113 members were directly recruited as officers against 73 in the previous year. 247 members were recruited to the subordinate staff cadre against 175 in the previous year. As at the end of 1973 the Bank has the privilege of being served by 6,221 staff members in India — 1,590 officers, 3,289 clerical cadre staff and 1,342 subordinate cadre staff — against 4,797 at the end of 1972 and 4,288 at the end of 1971. The Board of Directors place on record their deepest appreciation of the team work and dedication to duty of the staff of all cadre of the Bank which accounted for the Bank's spectacular progress in the year 1973. The Directors are confident that the staff will continue to enhance the image of the Indian Bank in the comity of Indian Banking.

For and on behalf of the Board
G LAKSHMINARAYANAN
Chairman and Managing Director

Madras: 17th May, 1974.

Industrial Finance Corporation of India

6 PER CENT BONDS 1986

Payment of Interest and Repayment of Principal Guaranteed by the Government of India

AMOUNT OF ISSUE Rs. 7,25,00,000
ISSUE PRICE *Rs. 100.00 PER CENT*
REDEEMABLE AT PAR ON THE 10TH JUNE 1986

The Bonds are approved securities under the Indian Trusts Act, the Insurance Act and the Banking Regulation Act, and are also eligible for grant of advances to scheduled banks by the Reserve Bank of India. These are on the approved list of securities of the State Bank of India and are also eligible for investment of the accumulations of the Provident Funds, exempted as well as non-exempted.

Subscription will be received in cash/cheque at the Branches of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay, Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi, and Patna from Monday, the 10th June 1974. The list will be closed without notice as soon as the total subscriptions amount to Rs. 7.25 crores, and in any case, not later than the close of business on Friday, the 14th June 1974. The Corporation reserves the right to retain subscriptions received upto 10 per cent in excess of the sum of Rs. 7.25 crores.

The Bonds will have a currency of 12 years, and will be repaid at par on the 10th June 1986. These will bear interest at the rate of 6 per cent per annum from the 10th June 1974. Interest will be payable half yearly on the 10th December and 10th June and will be subject to tax under the Income Tax Act 1961.

Copies of the Prospectus and application forms can be had from the offices of the Reserve Bank of India as also from the Head Office of the Corporation at Bank of Baroda Building, 16 Parliament Street, P. B. No. 363, New Delhi-1, its regional/branch/sub offices at (i) Mehta Mahal (5th Floor), 15, Mathew Road, P. B. No. 3928, Bombay-400004 (ii) 4, Mangoe Lane, (2nd Floor), P. B. No. 2483, Calcutta-700001 (iii) Raji Building (3rd Floor), 147, Mount Road, P. B. No. 1080, Madras-600006 (iv) Jivabhai Chambers, Ashram Road, Ahmedabad-380009 (v) 22, Mahatma Gandhi Road, P. B. No. 5091, Bangalore-560001 (vi) 6-3-631, Zilla Parishad Road, Khairatabad, P. B. No. 11, Hyderabad-500004 (vii) Jeevan Tara Building, First Floor, Gate No. 3, 5 Parliament Street, P. B. No. 182, New Delhi-110001 (viii) E-1/23, Arera Colony, Bhopal (ix) 20, Forest Park Area, Bhubaneswar-751009 (x) Bungalow No. 216, Sector 11-A, Chandigarh-160011 (xi) 'Karuna' (2nd Floor), XXIII/1311-D, Mahatma Gandhi Road, Ernakulam, Cochin-682011 (xii) Kanram Medhi Road, (Ranibari Lane), P. B. No. 30, Panbazar, Gauhati-781001 (xiii) S. B. 38/A, Bhawani Singh Marg, Bapunagar, Jaipur (xiv) Aggarwal Building, Canal Crossing, The Mall, P. B. No. 319, Kanpur-208004 (xv) 43, Pataliputra Colony, Patna-800013.

Arrangements will be made for listing of these Bonds at the Bombay, Calcutta and Madras Stock Exchanges.

Brokerage will be paid at the rate of six paise per Rs. 100/- to recognised banks and brokers on allotments made in respect of applications for the Bonds tendered by them and bearing their stamps.

NEW DELHI
Dated the 15th May 1974.

Kamani Engineering Corporation Limited

Statement by the Chairman, Shri R R Kamani

THE following is the Statement by Shri R R Kamani, Chairman, Kamani Engineering Corporation Limited, delivered at the Twenty-eighth Annual General Meeting of the Company on May 31, 1974:

Gentlemen,

Last year has been a year of extreme economic distress. All round shortages, strikes, disturbances, oil crisis, unprecedented increase in prices, and the low food and industrial production, have dragged down the national income growth to about half a per cent. In my last year's Annual Report, I had anticipated a difficult year, but realities have outstripped the worst fears. The pace at which problems have multiplied has been faster than the ability to cope with them. Our country, as a result, is facing an undeclared economic emergency. In the midst of all these, your Company's performance both in turnover and profit may be considered very satisfactory.

Impact of Budget

The budget has met with mixed reception. I personally think, it is realistic, in spite of the fact that certain handicaps confronting the industrial sectors have yet to be removed. The Finance Minister has been realistic in his approach in accepting some of the Wanchoo Committee recommendations on personal taxation, albeit in a modified form. Although the budget has been aimed at curbing inflation, its impact in this direction has not yet manifested.

Engineering Industry and Exports

Whereas engineering exports had registered a growth rate of 22 per cent in 1972-73, and during the first six months of 1973-74, nearly maintained this growth rate; exports without positive and effective measures to insulate exporters against rising costs, will lead to dwindling exports and diminishing returns on them. This indeed would be most unfortunate, as labour and organised efforts that have gone into building India's image as a reliable exporter of engineering goods will be undone by the serious setback that the engineering exports shall suffer, if urgent steps are not taken to counter the effect of the current situation the country is facing.

Whereas growth of capacity in various industrial sectors is dictated by the targets set out in the Fifth Five-Year Plan and the Plans to come, the pattern of engineering exports should not only be guided by the objective to find markets for surplus capacity, but capacity should be created, augmented and modernised in product lines that offer potential for exports to developed and developing countries. There should, therefore, be a 15-year National Plan for exports, for identifying potential products and areas and for development of export-oriented industries in a planned manner. With this broad framework in operation, one can hope that the country will be able to

meet its growing foreign exchange needs the importance of which has now been thrown into a position of paramountcy by the recent oil crisis and all over increase in the price of imported commodities.

While traditional exports have limitations with regard to growth, engineering exports and particularly construction and turnkey jobs shall enjoy the advantage of everwidening scope and frontiers, and would provide to the world a most effective yard-stick of our industrial development and also of the success of our political and economic systems. Exports impose compulsions for improvement of our management, technology, production methods, selling techniques and above all timely availability of required inputs and set new trends for domestic production and production patterns. Furthermore, engineering exports have already shown a high rate of growth which can be further increased.

The Government should take due note of these factors and also take advantage of India's geography placed as it is between the two largest developing areas in the world, with a vast coastline, extensive resources of manpower and minerals, and a broad based industrial infrastructure.

Engineering exports must enjoy defence priority if this country has to win its war against poverty through accelerated industrial growth and export earnings. Engineering exporters, having successfully weathered the hazards of hitherto unknown markets, against competitors from highly developed countries, in spite of being battered by forces of recession within the country and having put India on the engineering map of the world, deserve to be rewarded by a positive, pragmatic and practical attitude by the Government towards export problems. Assured of such backing, I am sure, engineering exports shall play a dominant role in changing deficit balance of payments into a veritable surplus.

You will be happy to know that the Government have set up a high level Committee for boosting engineering exports during the 5-Year Plan and, for the first time, perhaps, some serious thinking shall go into creating surpluses in products with high export potential, providing adequate inputs, simplifying procedures and ensuring a viable home base.

I would also strongly recommend establishment of a 'Steel Bank' for supply of raw materials at the right time and at prices which would obviate the need for claiming duty drawback and the price differences. Similarly, there should be a warehousing facility where export material can be stored and such materials be treated as having been exported for claiming incentives. The above would help in reducing the working capital requirement and thereby making the exports more competitive. As a significant step towards accelerating the export efforts, the Government must hasten the establishment of an 'Export Bank' which will have a positive impact on our promotional efforts. As one of the largest exporters of engineering goods, having earned about 50 million Dollars of foreign exchange, exports comprising nearly 50 per cent of our annual turnover of over Rs 20 crores, we see in these efforts the beginning of a bright future for engineering exports.

Company's Performance, Problems and Prospects

Your Company has been awarded the highest award for Engineering Exports for 1970-71. Our exports during 1971-72 and 1972-73 are even higher than that of 1970-71 for which Government of India bestowed on us the country's highest recognition. Our share of activity within the country in tower manufacture again is second to none. Our turnover during 1972-73 has been the highest so far and in 1973-74 we are aiming at still higher turnover. This indeed will mean higher earnings of foreign exchange and speedier power developments within the country

Your Company is playing an important role in two critical sectors of India's economy : Power development and Exports. Whereas we have the twin objectives of ensuring return on capital employed and to fulfil national objectives within the framework of our share of responsibilities, results and objectives in prospect and retrospect shall have to be evaluated and framed in the backdrop of the economic distress, shortages, spiralling prices, credit squeeze and oil crisis confronting the country.

If steel, zinc and aluminium had come when needed and as required, payment of dues had been made without delay and genuine claims settled, steel, zinc, copper and oil prices had not assumed run-away trends, and ocean freight had maintained past trends; the results of the efforts of employees, workmen and officers of the Company would have taken your Company to new heights of which all of you and the country would have been proud. In the national context, it would have set forth a trend to reduce inflationary pressure.

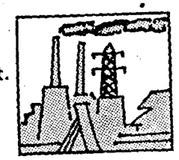
Our success in the export market — Rs 1.81 crores in 1968-69 to Rs 9.64 crores in 1972-73 — and growth in turnover — Rs 8.39 crores in 1968-69 to Rs 21.15 crores in 1972-73 — amidst overwhelming problems, is a measure of the Company's technical and organisational vitality. This today is one of our most valuable assets. Furthermore, there are some welcome features relevant to the operations of your Company that I would like to share with you. The demand for our products both within the country and abroad has shown significant improvement. Meanwhile, the Government has permitted fuller utilisation of our capacity at Kurla and at Jaipur factories to the extent of 90,000 tonnes in place of 60,000 tonnes, from September 1973. Our Road Roller unit at Wadala has been modernised. We have also received a licence for numerically controlled lines for manufacture of sophisticated towers to cater to the market in USA and Canada. A letter of intent has also been received for our Bolts and Nuts Project. Government has displayed an enlightened understanding of the potential this Company has for increasing exports.

Times look propitious and favourable for growth, in spite of the present uncertainties. Although 1973-74 may not show the impact of the change, from the beginning of 1974-75 let us hope that the country, and as a result, your Company, will start going to better and still better times with upward production trends and increasing returns. Considering the present strains and good possibilities of growth of the Company, the management team is being geared up and augmented to tone up and reorganise themselves to meet the challenge of increasing activity on the one hand and on the other to ensure Government's understanding of the peculiarities of our business and extend its support to supplement our own efforts for playing our role in meeting the current economic challenge of the country consistent with profitability that we must ensure on our operations.

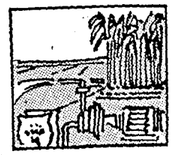
Our experience with various officials and quasi-official agencies like Ministry of Foreign Trade, Ministry of Industry, Office of Iron and Steel Controller, ECGC, EEPC continue to be one of constructive collaboration. With the inflationary pressures, credit squeeze measures and fast changing world situation, we would need greater understanding and timely help from the financial institutions and our bankers and I am sure they would come forward making the venture — theirs and ours — a success to our mutual advantage.

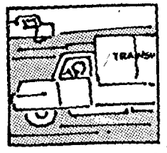
Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

We make your money go a long way



mas/CBL-142





We make your money work. Silently. Your money grows and grows. For your benefit. And in the interest of the nation too.

Your money works in big factories, small industries, trade, agricultural farms, and helps unemployed persons. Your money is never idle; helps increase national productivity; yields good dividend for you too.

Put your money in any of our schemes — Monthly Repayment Plan Account, Monthly Income Deposits, Balanidhi Deposits, Janata Deposits, Fixed Deposits, Cumulative Deposits, Savings Bank Deposits.

Come, drop in for a chat; you'd know how helpful we are.

Over 140 branches in Karnataka, Kerala, Andhra Pradesh, Tamil Nadu, Gujarat, Maharashtra, Bengal, Delhi and Goa.

For your export, import needs, please contact our Foreign Department. We have a network of Correspondents in all major countries of the world.

With effect from 1-4-1974, we pay higher rates of interest on your deposits.

— *Where friendliness is a tradition.*

Requiem for the AHT

EVERY Five-Year Plan, every commission and committee even remotely concerned with the subject and, of course, government spokesmen have been unanimous about the need to make the agricultural sector contribute more to the resources for development. The Fourth Five-Year Plan had this to say: "As a result largely of public investment in the agricultural sector since the inception of planning, agricultural incomes have increased substantially... There is, therefore, need for raising more resources from the agricultural sector for financing its development by imposing an additional burden on the well-to-do farmer." Besides a direct tax on agricultural incomes, the Fourth Plan had suggested improving the rate of return from the state government's commercial irrigation works and electricity undertakings by raising irrigation rates and the electricity tariff. The Draft Fifth Plan is even more emphatic. It says: "The incidence of direct taxes on agriculture is extremely low, being hardly one per cent of the net domestic product from agriculture. Savings mobilised from the rural sector through financial institutions and instruments are also relatively low." The Plan has, therefore, commended the recommendations of the Raj Committee which had suggested an Agricultural Holdings Tax. The latest Economic Survey for 1973-74 is no less explicit: "The inadequate taxation of the agricultural sector remains one of the most serious anomalies of the Indian fiscal structure... In this context taxation of agricultural incomes, increases in irrigation rates and revision of electricity tariff appear as three major areas holding prospects for substantial contributions to the state exchequers." And most recently, the Union Finance Minister himself has specially written to the state governments urging them to raise more revenue, particularly from the agricultural sector. They have been asked to "adopt time-bound programmes to implement the recommendations of the Raj Committee and/or raise a combination of measures like withdrawal of concessions on land revenue, imposition of surcharge on land revenue at graduated rates, greater use of cesses on commercial crops and imposition of a betterment levy and, lastly, revision of irrigation rates and power tariff".

The land revenue collection of all the state governments had touched a peak of Rs 123 crores in 1963-64. Thereafter, it remained consistently below this figure, falling as low as Rs 90 crores in 1966-67, which may be considered to have been an exceptional year. But even in 1972-73 the estimate of land revenue collection was only Rs 99 crores and in 1973-74 also it is unlikely to be more than Rs 115 crores. Revenue from the agricultural income tax has hovered around Rs 10-12 crores during this period. The peak of Rs 14 crores was reached in 1969-70 and the Budget estimate for 1973-74 was Rs 12 crores. The performance in this regard over the Fourth Plan period is summed up by the Economic Survey for 1973-74 thus: "The mobilisation of additional resources from the agricultural sector in the form of land revenue and agricultural income-tax shows a negative figure of Rs 30 crores". In addition there are two Central taxes, the estate duty and the wealth tax, which apply to agricultural property. However, collection of excise duty on agricultural land does not amount to even Rs 1 crore. As for the wealth tax, the Explanatory Memorandum to the Central Budget for 1974-75 has this to say: "In view of the small collections, the Revised Estimate and the next Budget do not include any provision for the payment to the states of grants on account of agricultural wealth tax".

On the other hand, in the decade between 1973 and 1974, the CSO's estimate of national income originating in agriculture (at current prices) rose by Rs 10,000 crores, from Rs 8,473 crores to over Rs 24,500 crores. Of course, national income estimates, based on the value added concept, do not correspond to the tax concept of net income. But even if wages and salaries and interest cost are taken at 60 per cent of the value added, there has been an increase in the annual money income of farmers of nearly Rs 10,000 crores in the past 10 years, while the receipts from agricultural taxes have actually declined. The larger farmers who have appropriated the bulk of the increase in agricultural incomes have also benefited from a series of subsidies and other gains conferred on them in the name of faster growth of agricultural production. The two most important subsidies, as has been repeatedly noted, are given through the supply of irrigation water and electricity at especially low rates. The budgeted loss of the state governments on irrigation works was Rs 173 crores in 1973-74. The total loss during the Fourth Plan period was about Rs 700 crores — on an investment of about Rs 3,500 crores. The loss in the Fifth Plan period will be over Rs 1,000 crores, or an average of around

Rs 200 per year. The Committee on the Working of the State Electricity Boards had recommended as far back as in 1964 that the Boards' rate of return on capital should be raised to 11 per cent. The latest Economic Survey gives the actual rate of return on capital invested in the State Electricity Boards at 4.3 per cent in both 1972-73 and 1973-74. If the norm of an 11 per cent return were realised, the additional resources available during the Fifth Plan period would be of the order of Rs 2,000 crores. Of course, not all of this would come from agriculture. But insofar as electricity is now supplied for agricultural operations at specially low rates, the contribution of the agricultural sector would be substantial.

The budgetary deficits of all the state governments was Rs 267 crores in 1973-74, while their budgets for 1974-75 show a deficit of Rs 175 crores. As many as 13 states have presented deficit budgets for this year. Even of the estimated Rs 101 crores of additional resource mobilisation, only a very part would come from the agricultural sector. The agriculturally prosperous states of Punjab and Haryana have budgeted for deficits of Rs 38 crores and Rs 18 crores, respectively in 1974-75.

The reported decision of most of the state governments against levying the Agricultural Holdings Tax (AHT) has to be seen against this background. The Raj Committee had conservatively estimated that the AHT on holdings with a rateable value of Rs 2,500 and more would fetch a revenue of Rs 200 crores a year. Yet most state governments have tried to make out that the AHT would scarcely be an improvement over their existing arrangements for taxing agriculture. Thus Assam has claimed that it already has an effective enough agricultural income tax, though, as the Raj Committee pointed out, 99 per cent of the revenue from the tax comes from the tea gardens. Rajasthan has argued that it would actually suffer a loss of revenue if it introduced the AHT. This is hardly credible considering that though Rajasthan is one of the states which has experienced a fairly high increase in agricultural production and productivity, the state government's receipts from land revenue have declined from Rs 9 crores to Rs 6 crores in 1972-73 (though a part of the decline may have been because of the drought in the latter year). Tamil Nadu is another state which claims to have an effective land revenue system which it sees no need to replace with the AHT. But the decline in land revenue collections has been perhaps the steepest in this state, from Rs 10 crores in 1967-68 to Rs 2.86 crores in 1973-74, while the receipts from the agricultural income tax have been barely Rs 2 crores a year.

The state governments' reported reasons for rejecting the AHT are thus entirely specious. However, the Centre itself had prepared the ground for this by the manner in which in the 1973-74 Budget the Union Finance Minister had sought to fob off the Raj Committee with the acceptance of one of its secondary recommendations — that for partial integration of agricultural and non-agricultural incomes for purposes of taxation. Nor can the state governments be unaware that the Prime Minister herself is reported to have, at the meeting of the Planning Commission last month, dismissed proposals for taxation of agriculture as impractical and unrealistic. This is a judgment with which the states could not agree more.

In the attempt to check inflation, the government is said to be desperately anxious to curb the rate of growth of money supply. However, given the inability of the monetary authorities to check the expansion of credit to private industry and business on the one hand and the reluctance of the government to raise additional revenues — a major source of which, by any reckoning, is taxation of the agricultural sector — the focus will continue to be on cutting government expenditure which, as long experience has shown, is another expression for cutting public sector investment. Considering the acute shortage of practically everything from railway transport and power to steel, fertiliser, cement and paper this is indeed some way to fight inflation!

Indo-Yugoslav Trade

The Last Wagon

THE tripartite trade and economic cooperation agreement among India, Egypt and Yugoslavia, is now as good as dead though India has shown a lot of keenness recently to revitalise it. Some of the recent trips abroad by the Commerce Minister D P Chattopadhyaya had the rejuvenation of the agreement as an important aim. But as neither India nor the other two partners have ever treated the tripartite agreement as anything more than a publicity gimmick, little could be expected from such last-minute efforts. India's own treatment of the much-publicised massive wagon deal with Yugoslavia is a classic example of mismanagement of bilateral trade.

The wagon deal was given particular importance in the negotiations carried out between the two countries for phasing out the rupee trade arrangement into a new convertible currency arrangement. Yet, right from its inception the wagon deal has run into rough weather several times for reasons emanating mostly from the Indian side.

The wagon deal was negotiated by the Projects and Equipment Corporation (PEC) — a subsidiary of the State Trading Corporation (STC) — at a time when the wagon building industry was in need of orders. The railways had drastically curtailed its orders for wagons, and the PEC hurriedly arranged to supply 3,600 wagons at a contract price of Rs 37.44 crores to Yugoslavia, without having adequate prior consultations with the Indian suppliers — some of them in the private sector. The terms of the contract were so badly negotiated that there was no proper assessment of the net gains to the country in net foreign exchange nor was any attention paid to the details of the contract such as inclusion of a price escalation clause or phasing of the delivery schedule. In fact it could be shown that the net foreign exchange which could be earned was less than one-third of the contracted value (see 'Wagon Deal', November 4, 1972, p 2211). Nevertheless, the PEC offered all sorts of facilities to the other side — such as deferred payment arrangements spread over 12 years at a paltry interest of 5 per cent and sizeable down payments in cash amounting nearly one-third of the contract value to Yugoslav manufacturers for assembling the wagons in that country. Apart from its failure to assess the cost-benefit of the wagon deal to the country, the PEC subsequently failed to arrange for the supply of imported components and components manufactured by the Indian railways to the wagon manufacturers so as to enable them to observe the delivery schedules.

According to the initial terms of the contract, all the wagons should have been delivered to Yugoslavia before the end of 1972 in a semi-knocked-down condition. In fact, only 600 wagons have been exported to-date. A high-powered delegation, headed by the Additional Secretary to the Commerce Ministry, was sent to Yugoslavia to renegotiate the contract and ask for both a minimum price increase of 25 per cent and extended delivery schedules upto almost March 1977. In the discussion the Indian side is reported to have pleaded several difficulties such as the power crisis, labour difficulties, shortage of components and raw materials, and steeply enhanced costs. The Yugoslavs were of course firm that India should complete the contract according to the terms settled at the start. In all this exchange between the Commerce Ministry and the Yugoslav authorities, the PEC appears to have lost all interest and initiative to make amends for its initial mishandling of the contract.

The wagon deal as it will now emerge will probably be one scaled down to less than two-fifths its original size. India would be supplying altogether only, 1,400 wagons, inclusive of the 600 wagons already supplied. Yugoslavia is reported to have refused to pay the additional 25 per cent price in respect of the 600 wagons already supplied. If India has hopes of bilateral trade arrangements shoring up its balance of payments, the much-vaunted wagon deal bodes ill for these expectations.

Bihar

'National' Calculations

THE farce in Bihar continues; New Delhi is determined that it shall continue. The domino theory is at work. If the Abdul Ghafoor regime in Bihar is allowed to collapse, it would then be difficult to hold back the warriors in the Madhya Pradesh Congress Legislature Party who are thirsting for P C Sethi's blood. Such could be the reasoning which underlies the enactment of the farce. And if MP crumbles, it could be Orissa's turn next, or Punjab's, or Assam's...

The cumulative impression that might thereby be created could be that of a crumbling empire. But perhaps by now the Prime Minister has ceased to worry about images and impressions. It is the predicament in the practical sphere, likely to arise in the wake of a wholesale collapse of Congress regimes in the states, with a mounting cacophony of demands for the dissolution of the state Assemblies, that should be bothering her. The Presidential election in August is an irritant, and it must be got out of the way. In order to ensure that no further shadow falls before that event, no repetition of Gujarat must be permitted elsewhere in the country. Irrespective of the Attorney-General's extraordinary suggestions before the bench of the Supreme Court — implying that the Presidential election could take place even without a properly constituted Lok Sabha and without any of the state Assemblies —, independently of the judgment handed down by the Court on the issue, matters would nevertheless look rather awkward if as many as three or four state Assemblies cease to exist when the hour arrived to elect a successor to Giri.

The farce in Bihar must therefore continue. The state chief minister knows that few among his cabinet colleagues have any loyalty towards him. In fact, they may continue to speak derisively of him, flout his orders, behave in the manner of independent warlords. But he is not to be permitted to quit. Inevitably, in this kind of situation, the administration in the state will be non-existent; the bureaucrats at different levels cannot but get to know that this government is a lame duck: it has a lease of life till August. It is a free-for-all: nobody is under anybody's discipline. The forces of inertia are playing their preordained role; and the rest of what is happening is in accordance with the throws of the dice. Whether it is the procurement of grains, or the farm production programme for the ensuing kharif season, or various schemes for the state's rapid industrialisation, or plans for tribal or scheduled caste welfare, there could be no question of any co-ordinated political well being brought to bear. In this milieu, what started it all — viz, corruption at high places — is maintaining its uninhibited run.

Meanwhile, students, the overwhelming majority of whom are disaffected with the system but few of whom are in a position to spell out any clear-cut alternatives, will continue to march, shout slogans, and generally endeavour to bring administrative and economic activities to a standstill. The return of Jayaprakash Narayan to the scene will boost their morale. But since the caste basis of Bihar's political alignments remains as strong as ever, it will not be altogether impossible for the Congress, with the support of the CPI, to set up a counter-movement. Already, several clashes have been reported between rival student factions; these may multiply in the coming weeks. Following the morcha on June 5, Jayaprakash Narayan's devout followers, as well as those determined to oppose him, are both likely to raise their tempo of activities, and the confusion will be worse confounded. Besides, while the Prime Minister's admonitions have placed a moratorium on open fisticuffs, intramural intrigues within the Congress Legislature Party are bound to persist. About everybody in the party who is anybody will keep jockeying for position in anticipation of developments beyond the ides of August.

International Trade

Spectre of Recession

THE impact of the spurt in oil prices has begun to be felt by the developed countries. Most of these countries are seriously worried about the likelihood of a 1930-type world recession if more countries resort to restrictive trade practices to shore up their individual payments positions. Italy's recent decision to require importers to make cash deposits equal to a given proportion of the value of their imports has inspired a move for closer consultations among the developed countries under the umbrella of the OECD. The Italians preferred this step, despite the offer by West Germany to provide financial accommodation to meet Italy's payments gap. The measures introduced by Italy to restrict imports will hurt its trading partners, particularly the other eight members of the enlarged European Economic Community. These measures do not, however, violate any of the EEC's laws; nor do they infringe GATT regulations. But they do offend the spirit of the EEC which aims to foster greater economic integration among the member countries. What is worrying the developed countries is that Italy is not the only country to have recently introduced measures to restrict imports. Denmark and Iceland too have imposed import restrictions which are threatening to become popular with other countries as well.

The estimates put forward by the OECD indicate that the collective deficits of the oil consuming countries would be around $ 40 billion in 1974. The OECD estimates have sprung some surprises about the positions of individual countries. Britain and France, for instance, would be faced with balance of payments deficits during the current year that are worse than these countries' own official estimates. This is likely to lead to a dangerous situation when countries faced with larger-than-anticipated trade deficits are tempted to follow beggar-thy-neighbour policies that may lead to a global recession. At the start of the current year the OECD countries had pledged to co-ordinate their balance of payments objectives by harmonising their overall economic policies, but so far they appear to have done very little in that direction. The OECD Ministerial Council, which met at the end of last month, made a valiant effort to persuade all the 24 member-countries to avoid competitive restrictive trade measures. The member-countries adopted a three-point declaration and pledged that they would not adopt any trade measures that would have an adverse impact on one another's foreign trade flows. The pledge, which would

be respected for the period of one year, bars unilateral steps to curb imports, to stimulate exports artificially or to restrict exports.

While all the 24 countries sincerely share these views, the undertaking would prove to be very fragile unless joint efforts are made to finance the $ 40 billion oil deficit. Only this will assure all the countries that restrictive trade devices are unnecessary to safeguard their individual positions. The Italian budget minister, who was the Chairman of the OECD council meeting, maintained that Italy had been pushed into adopting import restrictive measures due to the absence of a clearly-formulated international plan to finance oil induced deficits. In this context it is interesting to note that a large number of OECD countries are keen to revitalise the Group of Ten, the developed countries' exclusive club, to prepare some concrete plans to finance the oil deficits. It is expected that the Group of Ten would meet in Washington before the concluding meeting of the ineffective Committee of Twenty. The record of the Committee of Twenty in the last two years or so has been so dismal that the developed countries are keen to revive more exclusive groups for tackling their problems.

In the meanwhile, the US has shown renewed interest in strengthening the International Monetary Fund by entrusting it with the responsibility for ensuring that policies internationally agreed upon are not flouted by individual members. Not being sure of the willingness of some of the developed countries to fulfil their obligations—such as those agreed to at the recent OECD Council meeting—, the US is pressing for a new international agreement under which IMF approval would be needed for any trade measures aimed at improving a country's balance of payments. The US is expected to put forth some such suggestion at the forthcoming meeting of the Committee of Twenty so that it can be presented for inclusion in the Articles of Agreement of the IMF at the Fund's next annual meeting in September 1974.

At the moment there is a gap in international law in regard to exercising control over national trade measures which are intended to influence the current accounts of the balance of payments. The GATT cannot object to trade measures intended to improve the balance of payments so long as they are non-discriminatory in character and the IMF cannot object to trade restrictions so long as they do not get directly translated into payments restrictions. The US proposal may find supporters among the developed countries, but the developing countries as a group are likely to oppose any such proposal as it would severely curtail their freedom to take action to protect their trade and payments positions. It is unlikely, therefore, that any agreed rules and laws will be framed to discipline intransigent governments and to bar them from following beggar-thy-neighbour policies.

LETTER TO EDITOR

Contractors' Opera

WE have read with interest the article "Contractors' Opera" by Amrita Rangaswami in your issue of February 2. The article appeared at a time when the deliberations of the Committee set up by the Government of Maharashtra on revising the rates for harvesters and cartmen were practically at the final stage. The Committee has now arrived at a settlement, satisfactory to both the parties, namely, the co-operative sugar factory managements and the labour leaders. The harvesters have been given an 85 per cent rise in their wages while cartmen have been given an increase of about 33 per cent rise in transport rates. Harvesting and carting of sugarcane for a distance of 8 miles will now cost Rs 19 per metric ton, against Rs 12.65 previously — a rise of 50 per cent (see Table). The season of unrest and strikes predicted by the author of the article has thus not materialised. The harvesting and transport workers are more than satisfied. As a result of the increase in the harvesting and transporting rates, the factories have to bear an additional burden of Rs 3.90 crores in 1973-74.

The co-operative sector of the sugar industry began its career in 1950 with the establishment of the Pravara Sahakari Sakhar Karkhana. Since then 60 factories have come up in Maharashtra in less than 25 years. About 38 factories have already gone on stream and they produce 25 per cent of India's sugar output and account for 80 per cent of India's sugar exports. The capital invested in the running of the factories is of the order of Rs 115 crores. More than 50 per cent of the 2 lakh members of the co-operative sugar factories grow just about one acre of sugarcane, 25 per cent grow just two acres and 12 per cent three acres. The growth of the industry is simply without any parallel and has been primarily due to (1) the loyalty of member cane-growers, for whom the sugar factories offer an assured market for their produce; (2) meaningful support from the state government; (3) enlightened leadership; and, (4) special operational features of the system.

The co-operative sugar factory is established by a large number of small sugarcane growers, primarily to ensure a reasonable price for the sugarcane produced by them. In a co-operative society all members get equal treatment. Hence the co-operative sugar factories adopted the system of payment of cane price on ex-field basis so that every member-grower gets the same return for the cane supplied by him, irrespective of the distance of his field from the factory. This required the factories to arrange for harvesting and transport of cane, as the agent of the members. This involved making arrangements to ensure (i) efficient harvesting and quick transport of cane to reduce sucrose losses, and (ii) even supply of cane to the factory.

As a matter of fact, the harvesters and cartmen are themselves farmers cultivating dry lands. They harvest their own kharif crops and shift to sugar factory areas from October to the following April. They may not work for the same factory a second time. They work under some contractor who himself is a harvesting and carting operator. He acts as a link between the sugarcane grower, the labourers and the sugar factory. Unlike factory workers, the harvesting and carting labourers have no fixed hours of work and, again unlike factory workers, are paid wages on piece-rate basis, i e, per metric ton of cane harvested and/or carted.

The labour leaders have claimed, on the basis of a notification issued by the state government, that these harvesting and carting labourers are 'employees' of the sugar factories and are entitled to wage and other service conditions applicable to unskilled workers of factory. They have sought legal redress and the matter has not been finally disposed of by the Supreme Court. The co-operative sugar factories have challenged the labour leaders' contention, mainly on the following grounds:

(1) The labourers are seasonal employees of individual sugarcane growers and are paid wages depending upon the paying capacity of the cane growers.

(2) The nature of the work of these labourers is such that it is beyond factory discipline and control. The first and second Wage Boards for sugar factory workers have not recognised harvesting and carting labourers as factory employees.

(3) The Tariff Commission and the Government of India have also not so far recognised harvesting and carting cost as a legitimate part of the cost of sugar for levy purposes.

(4) The earnings of these labourers do not compare unfavourably with the earnings of the average sugarcane grower.

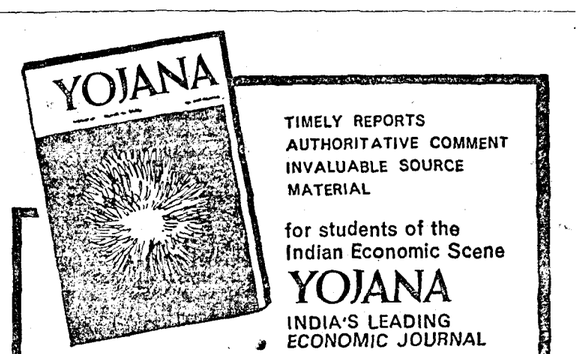
(5) Any extra burden on the sugar industry in one state only — namely, Maharashtra — will impair its competitive position *vis-a-vis* the sugar industry in the other states.

In spite of the above-stated facts, we would like to mention that co-operative sugar factories have always adopted a progressive view towards harvesting and transport labourers. The treatment given to these labourers has been, therefore, always liberal and this can be ascertained by talking to the labourers in the factory areas. There has not been even a single instance of either strike or lock-out in the history of the co-operative sugar industry.

Amrita Rangaswami writes:

The revision of the wage structure proposed does not take into account the deductions made by the sugar factory from the wages of workers on loans for capital expenditure that the workers are forced to incur. How is the worker expected to bear the burden of a seasonal loan of Rs 500 to Rs 1,300 on a wage of Rs 2 to Rs 3 per day?

Further, the increase is on a mileage-tonnage, i e, output basis (haven't the workers moved into the metric age?) which means the wage is shared by a 'koytha', a harvesting and transporting unit of three persons. The wage increase per person works out to approximately Rs 1.53 (Rs 3.55 on harvesting plus 95 paise for carting for the first mile) per person. That in most cases this is the first wage increase since 1965 (the increase now awarded works out to a rate of increase of 17 paise per annum since 1965) bears testimony to the 'progressive' character of the industry.



The Federation has acknowledged that it maintains and services the system through hired intermediaries. Naturally, the payment of the wage has to be channelled through the intermediary. While the factory ensures that the loan is repaid by making deductions from the wages, it does not check whether the contractor acknowledges the repayment to the worker. In a number of cases, at the end of the season the 'loan' remains unpaid. How many farmers have been forced by this system to sell their lands and join the ranks of landless labourers?

The Government of Maharashtra seems to be blind to the implications of this system. In 1965, it had to provide wages on relief works for six lakh people. In 1972 the figure had risen to 50 lakhs, five lakhs coming from Ahmednagar district alone, where the Pravara Sugar Co-operative first began its operations. Has the sugar industry contributed in any small way to this phenomenal growth in the numbers of those rendered destitute?

The co-operative sugar factory has indeed transformed the lives of those who have access to a scarce resource: water. It has failed to grasp that it has the potential to transform the lives of those who are now denied their share of it.

TABLE: RATES FOR HARVESTING AND TRANSPORTING CANE

	Present Rate Rs	Revised Rate Rs	Per Cent Rise
Harvesting rate per tonne	4.20	7.85	87
Transport rate for the first mile	3.20	4.15	30
Transport rate for every additional mile	0.75	1.00	33
Rate for harvesting and transporting cane for eight miles	12.65	19.00	50

Calcutta Diary

A M

THIS could have been predicted. Now that the saints have come marchin' in, and private enterprise has worked its way back into the Government of India, where else to look for guidance and light than Brazil — the Brazil which treats the entire toiling population, whether mulatto, negro, or Indian worker, as so many millions of serfs? This gushing Brazilophilia, so evident from the newspapers, must represent a genre of neo-colonialism. If the American journals and newspapers are full of the Delfim Netti device of 'indexation', and Milton Friedman and the Chicago School have been talking gloatingly about it, why not we?

Inflation, particularly runaway inflation, is in any case manna from heaven for the rich ones in society — the industrialists, the traders, and those who have succeeded in developing agriculture along capitalist lines. While the rich prosper during an inflation, the fixed income groups are squeezed, the subsistence farmer and the landless labourer who hires himself out for daily wages are in great difficulty, the organised working class too can protect its real earnings only after prolonged struggles which ensure that the money wage rate is at least partially adjusted to the rise in prices. Inflation is a conscious act of income redistribution on the part of the powers that be: its purpose is to erode the share in national income of the lower deciles of the population and to transfer a larger part to the rich. The avarice of the luckier sections in all societies is, however, truly extraordinary: the more they have, the more they want to have. This is perhaps the principal reason for revolutions, the successful ones as well as the flops. Those who prosper by exploiting others tend to forget that, as with other things in life, it might be disastrous for them to carry the act of exploitation beyond certain limits of tolerance.

As inflation marches on, and strong-arm methods are used to put down workers, there is a gleam in establishment eyes. The attention of the affluent ones is rivetted on the Brazilian example. Inflation is good, it swells their pockets, it enables them to rob the poor; but inflation, accompanied by the stratagem of 'monetary correction', is even better. Eating the cake is great, but eating the cake and having it too is absolutely heavenly. For this is what the Brazilian artifice of indexation is all about. Because of the runaway inflation, the rate of return enjoyed by the tycoon on his invested capital has perhaps jumped from 8 to 80 per cent in the course of a single year. That obviously is not enough. Over the year, the general price index has moved up, say, by 40 per cent. For tax purposes, therefore, the tycoon's earnings must be recorded after a downward adjustment — 'indexated' inversely to this rise in prices; a rebate must be shown due to him. The exchequer will thus receive as revenue much less than is nominally its due. Similarly, if the tycoon's wife has purchased some fixed interest-bearing Government securities, the yield from these must be subject to 'monetary correction', so that there will be no danger of the holder of these bonds being made the victim of untoward bearish sentiments in the market. And, if the tycoon has some footloose cash which he wants to keep as bank deposits, the interest the banks offer against the deposits must also be adjusted so as to compensate fully for the erosion of the money value of the deposit rate. This, then, is a foolproof system, innovated by the rich for the rich, under which, in an inflation, they will never suffer. They will appropriate the gains from inflation, such as a widening of profit margins, a fantastic increase in the return from speculative activities, and so on. They will also have the completest insurance against the common inconveniences which stem from a spiralling of prices, such as a drop in the real rate of interest. Blessed are the rich, for they shall inherit the earth *via* 'indexation'.

But, even under 'indexation', somewhere a line has to be drawn. Your enthusiasm for the new device must not be permitted to carry you away. There are such things as broader social responsibilities. 'Indexation' is all right for the rich and the privileged, it is not all right for the working class. Most of the present turbulence in the country in the field of industrial relations is on account of the plea of the organised sections of the working class that they must have a hedge against inflation, that their wages must be adjusted against the rise in prices. This, to be precise, is an echo of the demand for 'monetary correction' *a la* Brazil. Yet, as in Brazil, so here, the authorities and their hangers-on will be aghast at the idea of their precious formula being also applied for the earnings of the wretched workers. After all, one must not press the point of symmetry to absurd lengths. So, while for *rentiers* and capitalists there shall be the boon of monetary correction, for the labourers the principle to be followed shall be that of wage adjustments *pari passu* with rise in productivity. Nobody shall be permitted to be officious enough to ask how the productivity of a *rentier* is to be measured, or what is the contribution made to the national output by a speculator. In the case of the rich, questions concerning productivity are *lese majeste;* they become relevant only if the working class is involved. When the crunch comes, the trade unions will be able to trot out statistics which indicate that, in the 20 years since 1953-54, adjustments in money wage rates in this country for a whole range of industries, old and new, have lagged far behind not only the rise in prices, but also behind the advances in productivity. But such awkward facts do not deserve a free airing: the newspapers will be asked to play such facts down, or to have them completely censored.

It is a nasty wind which is currently blowing. What causes greater worry, however, is the slow deadening of even elementary social conscience. The character of a polity is determined by the structure of its classes. One should not, therefore, feign surprise at the asymmetrical attitude of the powers that be towards the relative merits of compensating the rich and the poor against inflation. But, whereas a few years ago there would have been a certain shamefacedness about the way the subject is broached, today, the deference with which proponents of the Brazilian solution are being treated is indeed breathtaking. Formerly, the attitude would have been: yes, the matter is engaging our attention, the share of wages in national incomes has declined, something ought to be done about it, we are trying to curb the excesses of the rich, but, you know, it will take a while, they are politically so powerful. Anyone suggesting that it is the affluent ones who deserve official protection against inflation would have been ignored, and even held up for ridicule; now, such a person will receive a respectable press coverage, official circles will promise to have his point of view 'examined', perhaps even the Prime Minister will give him audience and listen to his prescriptions.

By contrast, anyone foolhardy enough to suggest that the wages of workers must occasionally be adjusted for the rise in prices will be read the Riot Act, he will be apprised of the Defence of India Rules and the Maintenance of the Internal Security Act. The taxpayers' money will be invested in a lavish bid to inform the countrymen that one propagating such dangerous ideas represents 'the enemy within', what our external foes could not do in 1965 or in 1971, this person is currently bent upon doing. All this and more, because the person has asked for 'indexation' — but not of the profits of capitalists or of the interest accruing to *rentiers;* he has asked for indexation of the wages of labour, oh horror, horror, horror, foul, foul, foul.

There it is. The fangs are out when railwaymen strike. But when traders refuse to part with their stocks of grains, the response is a gentlemanly whimper. It is not the Territorial Army and the Border Security Force whose services are commandeered in the face of this emergency, it is the President of the Federation of Indian Chambers of Commerce and Industry who is invited to accompany the minister to the Punjab *mandis* to plead the Government's cause with the traders and hoarders. At such moments, history is made. The only apt parallel could be Al Capone's accompanying the law enforcement officers to the speakeasies and beseeching the bootleggers to behave; Al Capone would have regarded the episode as a huge joke. There is no reason to believe that the FICCI President felt any differently about his weekend motorcade around the *mandis*.

Where do we go from here? It is an unquiet land, almost exclusively because prices have not been kept on leash. Neither the railwaymen, nor any other set of workers — not even those wretched junior employees of the Indian Airlines, who seem to be everybody's whipping boy — are responsible for the unbridled price increase. The inflation cannot even be laid at the door of stagnant output: a record kharif crop, after all, has been accompanied by a record rise in prices during the so-called busy season. Prices, let's face it, have risen because in several cases the Government wanted them to rise; it either connived in the price increase, or benignly created conditions — for instance, through liberalised bank credit — such that price spiralling would become inevitable. The guilty men are in the Government, and on its fringes. The responsibility for undoing the inflation therefore also rests with the Government. In such matters, it is often difficult to sort out the wheat of folly from the chaff of knavery.

Instant solutions to the scourge of inflation are being peddled every day: there is a beeline for meeting the Prime Minister; you can spot in the queue nearly all the well-known quacks and charlatans out to make a fast buck. One can take a little wager: most of the cures currently suggested will only aggravate the malady. The Government, however, appears to be lapping it all up: its love for the charlatans could not be more transparent. As for its hate, that is reserved for the hapless working class.

At this rate, though, very soon, will it not be time to chirp: who deserves greatness deserves your hate?

CAPITAL VIEW

The Politics of the Strike

Romesh Thapar

HAVING succeeded in delivering a terrible blow to the working class, because of the opportunity offered by a thoroughly incompetent trade union leadership, there is a tendency among politicians, and bureaucrats to go to sleep. If this happens, even incompetent leaders will not blunt the spirit of the dispossessed and the discontented.

The government of Indira Gandhi needs to take a good look at the absurdities, the incongruities, and the anomalies built into the country's wage structure over the past 25 years.

Something along these lines is being attempted, but it is clear that the Labour Ministry will have to be revived as a relevant arm of democratic government before anything can be done to remedy the sorry and very sick state of affairs. Too long have we been drugged into the belief that every labour agitation is sparked off by deep economic despair.

Logic of Economism

This is far from the truth in the major sectors of governmental enterprises. Indeed, the mood is motivated by the conviction that if sufficient pressure is mounted and threatening attitudes adopted, demands will be met. Of late, the Labour Ministry under two ministers has deliberately created this kind of panic in the mistaken belief that this is the essence of the battle for egalitarianism.

So dominant was the voice of the so-called 'radicals', and their allies among the working journalists, that wide sections came to regard every strike as economic. When the closure of the railways was threatened by the unions, the general assumption was that there would be the usual compromise on some figure around Rs 200-300 crores. But there is always 'the last straw'. The strike threat on the railways, after the student revolts in Gujarat and Bihar, was apparently seen as precisely that. As information poured in, of plans to paralyse the country and to move to a general strike, the conviction crystallised that the strike was political — intended to topple the government.

From the mess of reports now available, it appears that the new consciousness of the GOI was not adequately reported to sections of the leadership of the railway unions, particularly those belonging to the CPI. The sudden arrest of the critical leadership, the tough measures adopted in the railway colonies, and the determination to live with the strike, soon made it clear that once again the Left had led the working class into a messy situation. Even the face-saving formulae could not be devised fast enough.

The hysteria now being expressed in certain quarters about the measures taken to break the strike, and the tedious emphasis about it being an economic struggle, is empty and false. What was expected? That the GOI move to embrace the leaders of the railway unions and kiss them on both cheeks? That ineffective measures be ordered so that the very life of the GOI be put under a question mark? The critics do not seem to have an iota of understanding about the determined mood now visible at the Prime Minister's level to bring some discipline into the developing chaos.

However, as I said earlier, if the apparatus of government rests content with punishing the railway workers and fails to move against the corrupt who have always wrecked the administration, the market, and the various structures which support our fragile

democracy, the assumption will soon form again that this is a government which needs toppling. Indira Gandhi's ears should be close to the ground these days. There is a lot to be done to make the people feel that she is leading an intelligent, just and meaningful government.

Each day brings evidence of new damage — to economic, political and social effort — by men closest to the Prime Minister, men within the Council of Ministers. The story persists about impending 'sackings', 'purges', 'reshuffles' and 'shuffles'. When will the country see some real structural change in functioning? Even at the level of the Prime Minister's Secretariat, a restructuring is long overdue. We cannot preen ourselves about being nuclear when we function with systems which make us queer specimens in this twentieth century.

If we carry on as before, imagining that a good monsoon will build the bridges to tomorrow, we are in for a terrible shock. The economics of strikes will be transformed by the runaway inflation. And then we will be facing political strikes, not by aged and compromised TU leaders but by young activists of the working class who are so patient and so angry that they can slowly, deliberately, bring government and production to a standstill.

And what use a nuclear device when everything has come to a standstill . . .

June 3

COMPANIES

Curtain-Raiser for Modernisation

Hansavivek

MODERN MILLS is going ahead with its scheme of renovation and modernisation and is seeking a soft loan of Rs 75 lakhs from IFCI. New machinery and conversion material of the value of Rs 24 lakhs was received last year. Out of the 84 ring frames transferred from mill number one, nearly half have been converted to pendulum arm drafting system, and the remaining are expected to be converted during the current year. The back process is also being modernised. The whole scheme is expected to be finally implemented by 1975. The company has received Rs 20 lakhs out of the total consideration of Rs 30 lakhs for sale of the immovable property at Mahalaxmi which was surplus to the company's requirements. In March 1973 the company received about Rs 28 lakhs, being the balance consideration in respect of the sale of immovable property at Parel, from where the entire productive machinery had been already transferred and commissioned at Mahalaxmi. The integration of the machinery at one place has brought in, apart from considerable savings, some additional operational control. The Karnataka State Industrial Investment and Development Corporation has received a 'letter of intent' for manufacture of high wet modulus polynosic viscose staple fibre. The company says it had made joint efforts with KSIIDC in this regard.

The company's 1973 results show a marked improvement in profits even though these figures include a surplus of Rs 50 lakhs realised on sale of fixed assets in the latest year against Rs 18 lakhs in the previous year. After an absence of five years, the company has returned to the dividend list with a 10 per cent distribution. Cloth and yarn export increased from Rs 90 lakhs to Rs 117 lakhs over the year. The 40-year-old company made a beginning in the manufacture of controlled cloth last year, but production was restricted owing to "slow offtake and heavy loss". No provision has been made in respect of the liability for future payment of gratuity estimated at around Rs 74 lakhs. Also, no provision has been made for bonus estimated at Rs 9 lakhs. The management of the sister concerns, Mysore Spinning and Minerva Mills, has been taken over by government from October 1971. The monies due from these two companies are Rs 26 lakhs and Rs 6 lakhs, respectively. These balances have been "suspended". Their realisability depends on the eventual reconstruction of these two companies. Meanwhile, no provision has been made in the accounts for any shortfall in this behalf.

MINERVA MILLS, under an authorised controller, has shown improved results for 1972-73 and has reduced the accumulated loss from Rs 103 lakhs to Rs 82 lakhs. Once again no provision has been made for depreciation, resulting in the piling up of arrears on this account to Rs 65 lakhs. The company's accounts show certain dues to Modern Mills and N Sirur and Company. Provision for interest thereon has not been made, and it is stated that the nature and purpose of these debts are "not quite clear". The company's production has been substantially more than in the previous year even though the mills have had to face considerable idle capacity on account of shortage of power. The company was able to pack 8.16 lakh square metres of controlled cloth, produce 2.63 lakh kgs of yarn for the decentralised sector and achieve exports of Rs 83 lakhs. The company's modernisation scheme, costing over Rs 50 lakhs, has been sanctioned by the government of India and steps have been taken to procure machinery and accessories. It is pointed out that in most cases the supply periods are long and somewhat uncertain. According to an earlier arrangement, the entire modernisation had to be financed by NTC and government of Karnataka in the proportion 51:49. The state government, after releasing a part of its share, has now communicated its inability to further participate in the programme. This, it is stated, will place the mills in a very difficult situation. The liability accruing upto 1972-73 under the company's old scheme of gratuity amounts to about Rs 14 lakhs. A provision of Rs 4 lakhs has been made under the Payment of Gratuity Act, pending assessment on an acturial basis. Accumulated losses upto 1970-71 have been adjusted in the accounts upto 1970-71 against the capital reserve to the tune of Rs 39 lakhs — made up of surplus on revaluation of lands (Rs 32 lakhs) and net capital gains over cost on sales of assets (Rs 6 lakhs). Contingent liabilities not provided for in the accounts include arrears of preferential dividends amounting to Rs 7 lakhs; lay-off compensation payable to workmen aggregating Rs 5 lakhs; and possible penalty arising from non-payments within the stipulated time relating to the pre-takeover period on contribution to provident fund (Rs 1,20,973), employers' special contribution to ESIC (Rs 82,580), income-tax deducted at source on interest (Rs 26,330) and sales tax, central sales tax and purchase tax (Rs 62,765). One of the notes appended to the accounts says that confirmations have been called for from debtors and creditors, but the response has not been satisfactory.

SANDVIK ASIA has written to government on the conditions contained in the 'letter of intent' for substantial expansion, received by it after an application made in 1971. It hopes to receive the industrial licence in the near future. The company has once again turned out good results, with higher sales and improved margins. Dividend, stepped up two points to 20 per cent, on the capital enlarged by a one-for-five basis, is covered more than twice by earnings. However, borrowings had increased substantially, and ratios of both inventories and wages to sales were higher than last year. The company's export sales rose to a new high of Rs 47 lakhs. The chairman, N S Phatarphekar, assures shareholders that the management is making efforts to maintain, if not to improve upon, profitability. He hopes to achieve this despite scarcity, and escalation in the cost of raw materials. He points out that prices of the steel used by the company have gone up by nearly 40 per cent, and the price of tungsten ore has advanced by nearly 90 per cent in recent months. He hopes, however, that conditions will improve in the near future and that the company can achieve better results. The company has a satisfactory order book; also, turnover during the first four months has been higher at Rs 298 lakhs, against Rs 200 lakhs in the corresponding period of 1973.

LAXMI VISHNU TEXTILE showed further improvement in 1973. Its profit margins were widened, as reflected in a 40 per cent rise in gross profit following only a 4 per cent rise in net sales. These results, achieved in a year of comfortable supplies of cotton at reasonable prices and favourable trading conditions, enabled the company to return to the dividend list after several years. The recommended equity distribution is, moreover, covered nearly 6.5 times. The cover, however, is mainly on account of absence of tax liability, because of the unabsorbed development rebate of earlier years. Also, no provision has been made for the gratuity liability, estimated at Rs 66 lakhs. The company is pursuing its reorganisation and renovation programme and has spent Rs 72 lakhs on this account last year. Industrial relations continued to be quite satisfactory throughout last year, and there was no disruption of the mills' working.

ICICI is offering for public subscription from June 11 18,000 debentures of Rs 5,000 each at the issue price of 99.5 per cent (that is, Rs 4,975 per debenture) which would be redeemed at par on June 15, 1986. The rate of interest would be 6.25 per cent per annum, subject to tax, and would be payable half-yearly. The issue is being made to augment the rupee resources of the Corporation to meet the demands of industry. The subscription list will close on June 15 or earlier, but not before June 13. In the event of oversubscription, shareholders of the Corporation who apply for debentures will be given preferential allotment to the extent of as many debentures as they would be entitled to take up if the entire issue had been offered to such

INDUSTRIAL FINANCE CORPORATION OF INDIA is raising Rs 7.25 crores by means of bonds to be issued at par in denominations of Rs 100, Rs 500, Rs 1,000, Rs 5,000, Rs 10,000, Rs 25,000, Rs 50,000 and Rs 1,00,000. These bonds will bear interest at 6 per cent per annum, subject to tax, which will be payable half-yearly. The bonds, which will have a currency of 12 years, will be issued only in the form of promissory notes payable to, or to the order of, a certain person or persons, and will be repaid at par on June 10, 1986. The bonds are being issued to replenish IFCI's resources to meet the demand of industry for financial assistance. The subscription list will open on June 10 and close on June 14 or earlier as soon as it appears that the total subscription approximates Rs 7.25 crores.

SECALS, which made a public issue of capital in July last, has so far been on schedule in regard to the implementation of its project. Subject to availability of furnace oil, for which the company has applied to the government, the plant is expected to be commissioned soon. Owing to procedural delays in obtaining a licence for import of raw materials, however, the start up of manufacture of cast toolings would be delayed by about four months. Production of these precision castings is expected to commence from early September next. In the meantime, it is proposed to establish at the earliest production capacity of 10 tonnes per month made up mainly of heat-resistant steels and stainless steel castings. The total project cost, originally estimated at Rs 50 lakhs, increased to over Rs 56 lakhs due to enhanced customs duty and cost of imported machinery. The additional capital cost will be met by the subsidy being made available from the State Industries Promotion Corporation of Tamil Nadu. The company has been registered with the DGTD for manufacture of 350 tonnes of alloy steel castings per annum, in addition to the industrial licence already held for the manufacture of 144 tonnes cast tools per annum. According to the chairman, R P Aiyer, the company has got sufficient orders for heat-resistant steels and stainless steel castings to keep operations going for the next four months. Orders for cast toolings are also being negotiated.

SYNDICATE BANK's deposits rose from Rs 271.14 crores in 1972 to Rs 343.78 crores in 1973. Net profit improved from Rs 101.26 lakhs to Rs 118.65 lakhs, representing 4.4 per cent of the Bank's total income. The rise in deposits over the previous year amounted to 26.8 per cent in 1973 as compared to a rise of 23.5 per cent in 1972. The number of deposit accounts rose from 26.47 lakhs in 1972 to 33.72 lakhs in 1973, an increase of 7.25 lakhs as against 4.40 lakhs in 1972. Of the accounts, 97.54 per cent had balances of Rs 5,000 and less. Syndicate Bank's advances increased from Rs 179.10 crores in 1972 to Rs 230.41 crores in 1973. The number of borrowing accounts rose from 5.36 lakhs to 6.58 lakhs, an increase of nearly 21.4 per cent. The number of accounts with balances of less than Rs 1,000 represented 71.29 per cent of the total borrowing accounts. As many as 92,000 accounts had balances upto Rs 100 while the number of accounts with balances between Rs 100 and Rs 1,000 was 3.77 lakhs. Advances to priority sectors, including exports, showed a steep increase from Rs 79.52 crores to Rs 106.54 crores in 1973. Advances to priority sectors formed 46.2 per cent of the Bank's total advances. The Bank opened 74 branches in 1973 as against 57 in 1972. Of the 74 branches, 36 were in rural and semi-urban areas, 23 in urban areas and 15 in metropolitan areas. The total number of branches as in December 1973 was 638 of which 68.2 per cent were in rural and semi-urban areas. The bank exceeded its target (½ per cent of the total advances of the previous year) by a handsome margin in implementing the differential interest rates scheme. The Bank's assistance to self-employed persons during 1973 was to the tune of Rs 141.40 lakhs. This effort has generated employment for nearly 3,000 persons.

BATA INDIA achieved a turnover of Rs 57.2 crores in 1973, of which exports accounted for Rs 3.25 crores. Profits before tax for the year were Rs 110 lakhs. After appropriation to the statutory reserve for development rebate (Rs 4.85 lakhs) and provision for taxation (Rs 75 lakhs) the net profit was Rs 34 lakhs. The directors have recommended a dividend of 22.5 per cent for the year. The Company complains that the power supply situation deteriorated sharply in the second half of 1973 resulting in a loss of production of about 5 mn pairs of footwear. The company's exports also suffered due to production constraints and non-availability of shipping space. To overcome the power shortages the company is installing captive power plants at its factories at Faridabad and Batanagar.

SUNDARAM FINANCE achieved a marked growth in business during the latter part of 1973. As a result, advances on hire purchase contracts rose from Rs 513 lakhs in 1972 to Rs 843 lakhs in 1973. The growth in business has continued in the first four months of 1974. Payments on hire purchase contracts during this period amounted to Rs 461 lakhs as against Rs 148 lakhs in the corresponding period of 1973. In view of the growth in business, the company resumed acceptance of deposits with effect from January 1, 1974. The company's operating profit in 1973 was Rs 176 lakhs compared to Rs 191 lakhs in 1972. After deducting interest on borrowings and administrative expenses and making a provision of Rs 43 lakhs for taxation, the balance transferred to reserve was Rs 30 lakhs (Rs 28 lakhs in 1972). The Directors have recommended a final dividend of 10 per cent, subject to tax. Together with the interim dividend of 6 per cent already paid in February, this makes a total dividend of 16 per cent. The dividend amount of Rs 16 lakhs will be paid out of general reserve.

LARSEN AND TOUBRO group achieved a turnover of Rs 68 crores in 1973-74 against Rs 58 crores in 1972-73. Of this, the sales of Larsen and Toubro were Rs 43 crores in 1973-74 as compared to Rs 37 crores in the previous year. Though production in 1973-74 registered a rise of 27 per cent — despite power cuts and raw material shortages —, the order backlog as at March 31, 1974 was Rs 58 crores as compared to Rs 48 crores on March 31, 1973. Production so far in the current year is substantially higher than during the corresponding period of 1973-74. Orders booked and sales during the current year have registered increases of 35 per cent and 20 per cent, respectively, over the corresponding period last year. Four senior employees of the Company have joined the Board as full-time directors. Two Deputy Managing Directors, John Hover and Gunnar Hansen, have resigned their directorships in response to the government's policy of Indianisation.

NEW DELHI

Narrowing Options

AFTER much prevarication, the Food and Agriculture Ministry now claims to have made up its mind to fix the ceiling on the wholesalers' price for wheat at Rs 150 per quintal. An announcement to this effect had been made by Fakhruddin Ali Ahmed at the meeting of the Congress Working Committee last month. It was an impromptu announcement and was made merely to mollify some of the vocal critics in the Working Committee of the manner in which the new wheat policy was working. There was, therefore, no serious intention to implement the decision. However, events have moved rather fast since then and the new wheat policy is now seen even by its advocates to have been a complete failure. The Food and Agriculture Ministry's move to fix a ceiling on the wholesale price by an executive order under the Essential Commodities Act amounts to admission of this failure. The move has been readily cleared by the food ministers of the surplus states, but has still to be discussed at a conference of food ministers of the deficit states.

Not, of course, that the government can seriously expect the ceiling on the wholesalers' sale price to be enforced. It cannot be expected that the wholesalers, who have been buying wheat from the farmers at prices much above the fixed procurement price of Rs. 105 per quintal, will observe this ceiling. They had been making their purchases on the basis that after parting with a part of what they buy to the government at the fixed procurement price, they would be free to sell the rest in the deficit states at prices which would give them handsome profits. It is no wonder, therefore, that there has been a further slowing down of the already poor arrivals and purchases of wheat in the so-called organised markets after the talk of a price ceiling started. The Uttar Pradesh Foodgrain Dealers Association has even gone so far as to formally decide to suspend trading in wheat by its members.

This is not to say that the record of procurement through the agency of private traders under the new wheat trade policy was anywhere near satisfactory, even before the latest developments. The policy envisaged that the wholesalers will give 50 per cent of their purchases in the mandis to the government at the fixed procurement price of Rs 105 per quintal. It was, of course, completely facile for the government to believe that this arrangement could bring to the government as much as 5 mn tonnes of wheat. It could, after all, operate only in the organised markets. The arrivals in these markets, even in the best of times, is never more than 5 mn tonnes. The government's share could not, therefore, have been more than 2.5 mn tonnes at the most. The reason for anxiety, therefore, is not that the target of procurement of 5 mn tonnes for government stocks is nowhere near being fulfilled. It is that the pace of arrivals in the market has been so slow and inadequate that there is no likelihood of the traders handing over even 2.5 mn tonnes to the government. More than half the rabi marketing season is over and till June 1 the total arrival of wheat in the organised markets had been hardly 1.6 mn tonnes. Procurement by the government cannot, therefore, have been more than 0.8 mn tonnes. Last year, under the policy of take-over of wholesale trade by the government, the arrival of wheat in the markets of Punjab alone during the corresponding period was as much as 1.9 mn tonnes, all of which was picked up by public agencies. What is more, the pitifully small procurement this year is in spite of the hefty increase in the procurement price from Rs 76 to Rs 105 per quintal.

The failure of procurement is indeed built into the new wheat trade policy. The wholesalers have no particular incentive to induce the producers to bring their marketable surpluses to the market where they would have to give up half of their purchases to the government. They were bound to prefer to make their purchases outside the markets even if these purchases are made at higher prices. It is not that the farmers have not sold as much as last year; only that a sizeable part of their sales, on a much bigger scale and in a much more organised manner, has taken place outside the organised markets. This has enabled the trader to evade the obligation of sharing his purchases with the government. In addition, this situation has whetted the appetite of the producer for prices far higher than even the government-fixed procurement price. The increase of the procurement price from Rs 76 to 105 per quintal is so impressive that wheat producers would have readily sold their stocks to government agencies at that price. But the bringing back of the wholesalers into the picture and reliance on them as the principal agency for procuring stocks for the government has changed the situation entirely. The producers found that the traders were willing to give them much more than the officially-fixed procurement price and naturally they were not averse to taking advantage of this. The traders found that they were in a position to recover the higher cost of purchases if they were allowed to sell their stocks freely in the deficit areas. This naturally implied a big push to the prices which consumers would have to pay. According to the reports received in the so-called control room of the Food Ministry, the wholesalers' price per quintal of wheat on May 24 ranged between Rs 155 and Rs 255 in Delhi, Rs 175 and Rs 200 in Maharashtra, Rs 130 and Rs 185 in Madhya Pradesh, Rs 120 and Rs 180 in Rajasthan and Rs 115 and Rs 175 in UP. Retail prices were naturally much higher. The new wheat trade policy thus created ideal conditions for collusion between the trader and the bigger farmer producing for the market for mulcting the consumer.

The pitifully small procurement and the soaring prices have shaken up even the most smug in the government. Glib talk of the virtues of free trade has give place to panic and an all-round scramble for foodgrain stocks. The deficit states know that they can no longer rely on the Centre for adequate supplies to keep their public distribution systems going. So they are trying desperately to get wheat from the surplus states by every available means — directly and through agents. The surplus states, on their part, are worried about their own requirements, mainly their urban consumers, and are anxious to build up their own stocks. The UP government, for instance, has made it clear that it has no stocks to send outside the state and has even demanded that the Centre should declare UP a deficit state. Similar is the stand of Madhya Pradesh. What is emerging is a sorry spectacle of pulls and pressure, panicky decisions and working at cross purposes all round.

This is the background against which the Food Minister announced the government's intention to impose a ceiling

on the wholesale price of wheat and the UP Chief Minister launched his much-advertised dehoarding drive under which the limits for the stocks of both the farmers and the traders have been lowered. These measures will certainly mean a vast spurt in unauthorised transactions and a further shrinking of arrivals of wheat in the open markets. The consequences of this are indeed frightening to contemplate. A few demonstrative raids in villages to seize the stocks from farmers will be hardly adequate to meet this situation.

But the government has few options left. The 'firm' policy in industrial relations first used against Indian Airlines employees and subsequently on a bigger and far more ruthless scale against railway workers has underlined the fact that the government has no means left to give even partial satisfaction to organised industrial labour and white collar workers — such as it had attempted to provide during the phase of populist policies beginning in 1969. The prolonged economic stagnation and the failure to mobilise and deploy savings properly over the years have taken the economy to a stage where no surpluses are available with the government to manoeuvre with. Hence the need to stage a confrontation with the working class. The government's options are becoming narrower and narrower.

RAILWAY STRIKE

The Fall-Out

M R

RAILWAYMEN went back to work angry, sullen and embittered even as their leaders were divided and frustrated at the end of the 20-day strike action. When the strike was losing its tempo, a Minister who sought to mediate was told by the Prime Minister that once this one was smashed, there would not be another for 50 years to come.

Yet it might suit parties like the CPI to convince themselves (as S A Dange did while addressing the Press Club of India on May 31) that the strike forced the Congress Working Committee and the Government to think of rationalising the wage system in the country as a whole. But the two most important demands of railwaymen — wage parity with other public sector undertakings and bonus — have not only not been conceded but the Government is firm that they cannot be the subject of negotiations. The assurances to be implemented now relate to the six demands conceded before the strike began.

The consequences of the strike rather than the demands behind the strike will dominate negotiations when they are resumed. The Government has discreetly made it known that it no longer recognises the National Co-ordination Committee for Railwaymen's Struggle, set up on February 27. The Government, by negotiating with it in the pre-strike stage had, however reluctantly, conferred indirect recognition on some of the unrecognised unions which were presented in the Committee. Now the Government is going back to the old position of negotiating only with the two recognised national bodies — the Congress-controlled National Federation of Indian Railwaymen which was not a party to the strike, and the All-India Railwaymen's Federation which does not include communists.

Another fall-out, the more serious one is the dismissal notices on over 15,000 railwaymen, most of them union activists. The 50,000-odd arrests during three weeks covered most of these activists. While others might be freed, these union activists have been covered, in a planned manner, by charges of violence, intimidation, attempted sabotage, destruction of public property, etc. As for the lakhs of strikers (one lakh in the Western and Central Railways even by official admission), they will have to suffer a break in service and are to be taken back on tendering apology for participation in the strike. The bureaucratic answer is that application of rules does not amount to "victimisation".

Whether the railway strike constitutes a big setback to the organised labour movement or not is too early to conjecture but the Government's massive repression of the strike has sinister implications for the working class movement as a whole. It might even be a prelude to a total moratorium on all strikes and lock-outs in the name of evolving a rational wage policy for the country.

The Government prevailed partly because it could force the strike at the time of its choosing. Three months before the strike, it had commissioned the production of a film to discredit any railway strike to come. A big advertisement campaign had been geared up and a secret Home Ministry circular was sent out well before the strike about the need to round up key persons not too early and not too late. In contrast, the strikers were unprepared when the strike was forced on them through two pre-emptive acts — cancellations of trains as from April 27 and the countrywide swoop on their leaders on May 2 when negotiations to avert the strike were still going on.

Besides the psychological warfare against the strikers and the public on the basis of half-true and untrue reports, the Government went out all the way to press in the army and paramilitary forces on a war footing. The Defence of India Rules and the Maintenance of Internal Security Act, meant to protect the country against external threats, came in handy for the Government to solve a domestic problem.

In contrast, how did the strike leaders conduct the strike? While the CPI(M) and the Socialist Party seemed to aim at an eventual "political confrontation" with the Government through the railway strike, the CPI's participation in it was half-hearted and conditional. Within two days of the beginning of the strike, CPI spokesmen were saying that it should not and will not last long. On May 12, Bhupesh Gupta had affixed his signature on a statement by Opposition leaders denouncing the repressive measures but tried frantically the whole evening to withdraw his signature before the statement reached the Press but failed. His explanation was that the CPI wanted to play the role of a mediator and therefore he could not sign the statement though he was against the repressive measures. The CPI thinks that the strike itself was adventurist, though Dange clarified this to say he would not hold the strike adventurist but some of the demands were certainly adventurist.

The strike leaders had perhaps thought of a short and swift struggle. The strike gained tempo around the third day but had crossed the hump on the seventh day and leaders began speaking in many voices. Through selective arrests the Government left only the CPI leaders out to carry on behind the scene negotiations. L N Mishra is still the CPI's hero inside the Government. K D Malaviya, R K Khadilkar and K V Raghunatha Reddy, all its allies, played their role some time or the other but the Prime Minister played everyone of them out.

V V Giri's decision to cancel his stay in Mussoorie on May 10 and return to the Capital embarrassed the Government a great deal. His views on the Government's handling of the strike, aired to Opposition leaders who met him, embarrassed Indira Gandhi further. Eventually, even the President was rebuffed by the Government which was emboldened by the advice of the tough-lining Railway Board. It is now confirmed that the decision to arrest the railway workers' leaders was taken on April 27 before Indira Gandhi left for Teheran while the Government was still feigning earnestness for a negotiated settlement.

In short, the Government was itching for the strike so that it could crush it. A delegation of industrial interests, led by one of the Birlas, called on the Prime Minister to express its anxiety over the effects of the strike on the economy. The delegation was assured that the massive retaliation by the Government would in fact do the industry good in the long run even if the strike meant temporary dislocation. The murmurs from various sections of the industry were silenced in this fashion.

No wonder the private sector and the industrial interests in general are pleased beyond measure at the Government's tough line which has paid quick and rich dividends. The leaders who planned the strike did not see far enough when they decided to serve the strike notice. They gambled on a short struggle and on their own terms little realising the readiness of the government to use ruthless methods which amount to an open war on the working class.

BUILDING TECHNOLOGY

Institutional Resistance to Innovation

(By a Special Correspondent)

THE Government of Kerala had in February 1972 set up an Expert Committee to "examine and assess different methods of lowering the cost of construction of residential houses utilising to the maximum extent possible local materials and labour" and to suggest "means of promoting and encouraging the use of low cost methods of construction of buildings in the state". The Committee, which consisted of an architect, an economist, a structural engineer and a design specialist, submitted a Report which was released by the government in February 1974.

The basic concept behind the Committee's approach was that of "social cost". By using scarce materials such as cement and steel in house-building, where their use was avoidable, these materials were being denied to vital sectors (e g, machine building, dams) where their use was essential. Again, by using technology with a higher capital/labour ratio, employment was being forgone. From the national economic point of view, therefore, it made sense to:

(a) minimise the use of scarce items such as cement and steel in house-building;

(b) maximise the use of locally-available materials; in particular, those items the production of which does not enjoy significant scale economies (so that investment, employment and income can be distributed over as wide an area as possible); and

(c) use technologies with a low capital/labour ratio (so as to promote employment and save on capital).

Among the suggestions made by the committee were:

(i) replacement of cement mortar with lime-surkhi;

(ii) substitution of load-bearing masonry walls for RCC-framed structures in buildings with a storey height below five;

(iii) recognition of the redundancy and maintenance disadvantages of whitewashing and plastering of walls;

(iv) acceptance of the cost advantages of a tile-and-timber or tile filler-slab roof compared to an RCC-slab roof; and

(v) acceptance of the structural adequacy of load-bearing 4½" brick masonry walls for single storey constructions.

The Committee went into considerable detail in its desire to pinpoint areas where costs could be cut. This led it to making even minor suggestions, such as for replacement of windows not needing to be closed with brick jallis and conventional lintels with brick arches. Also frameless doors were to be used wherever possible. The Committee also recommended the replacement of mechanised bricks with country-bricks for buildings not exceeding two storeys and mosaic or cement concrete flooring with clay tile or brickbat floors. The latter could be topped with a 1:2:4.5 lime-surkhi-sand mortar mix in place of cement.

In its report the Committee also included designs for several types of dwellings to which the Low Cost Technology (LCT) could be applied. It also pointed out some of the wasteful features of contemporary 'sophisticated' design, such as the extensive use of RC sunshades and the use of expensively-cantilevered blocks and slabs as part of facade design.

The Committee believed that once the financial and social benefits of the LCT were pointed out, a "revolution from above" in housebuilding would be launched. The higher-income groups would begin the process of adoption, and their example would be emulated by those below. As for the technical community, special training and orientation courses for engineers, administrators and such other 'decision makers', to point out the benefits of the LCT, would result in their adopting it in their planning. The building of demonstration houses in various colonies and efforts towards ensuring strict quality control and wherever possible standardisation of traditional materials would complete the process of persuasion, it was expected.

To begin the process of persuasion required to convince engineers, administrators and other "decision-makers" of the advantages of the LCT, a seminar on the subject was organised in Trivandrum last month. The seminar was held in the campus of the Centre for Development Studies, all of whose buildings have been constructed using the LCT. The seminar was attended by PWD and Housing Board engineers and architects, as well as by administrators and the political heads of Ministries. All four members of the Committee were present to explain their recommendations.

The PWD and the Housing Board technical staff had, from their point of view excellent reasons for not being over-enthusiastic about the Committee's recommendations. There was, first the fact that the Committee had said nothing that was very new. If its report was to be praised, it would indirectly imply that these simple recommendations had not yet occurred to the Department. More importantly, the question of "scarcity" was hardly the Department's problem. It was the government's responsibility to provide the Department with sufficient stocks of steel and cement. As for cost, the financial estimates made naturally took account of the prevailing material costs, and

using this a programme was drawn up to fit the (given) budget. If the programme was inadequate, what it meant was that the budget needed to be revised upwards.

Finally, many generations of engineers and architects had been brought up on conventional technologies, and a switchover to another would create dislocation. Contract work was organised on the basis of conventional methods, and the use of different technology would upset the procedures that had been carefully developed to the mutual satisfaction of the Department and the contractors.

To prevent the threatened rupture in its traditions and methods of work, the Department offered resistance against the Committee's recommendations. In particular, it aimed at convincing the political leadership that the recommendations were not to be taken so seriously as to be considered for implementation.

The opening gambit in this resistance was a philosophical focusing on prevalent social ills. There was, for example, low production. Cement was scarce, but need it be scarce for ever? Cannot ways of increasing cement production be devised? Why not tackle this problem rather than attempt to throw overboard conventional building methods? Then again, the problem of high costs and waste. This was true of so many places. Government departments, for example, were so grossly overstaffed. There should be economies here. And look at the scarce resources flowing into luxury sectors such as airconditioners and refrigerators. This must be put a stop to at once. The implication behind all this was, of course, that the question of cost reduction went much further than mere house-building.

The proponents of the LCT countered this by pointing out that in the process of cost reduction a beginning had to be made somewhere, and housebuilding, considering the financial magnitudes involved, the employment generated and the welfare provided, was an excellent starting point. Also, several people were going in for conventional designs simply because they were not aware of the alternatives. Many of them would gladly switch to the LCT if the choice were given. Finally, the government, through its executive and financial powers, had a crucial say in adapting designs to social needs. In particular, its own housebuilding programmes could be based on the LCT.

A different approach was then adopted by the opponents of LCT. It was argued that, while the Department fully subscribed to the view that it was essential to reduce costs and in fact had done considerable work in this direction, there were 'practical difficulties' in a general acceptance of the Committee's suggestions. These difficulties were basically that:

(1) Government procedures were so rigid that "experiments" were discouraged. If one departed from conventional methods and a mishap occurred, suspension would be immediate. Such procedures needed to be relaxed. Also, so far the Government had shown very little interest in research. Much more emphasis needed to be placed on this.

(2) The Department could not take the "risks" involved in departing from well-tried conventional techniques and adopting what were basically experiments. This would be playing with public safety. Until the techniques suggested by the Committee were shown to be fully safe, and until good quality, standardised traditional building materials were made available, the Department could not undertake to change techniques in the reckless manner suggested by the Committee.

These points were buttressed by numerous attacks on the LCT, which covered a wide area, ranging from allegations that the Committee "had not made any cost analyses" of the structures recommended by it or that the LCT buildings had a short life or that (unnamed Government teams had submitted unfavourable reports on the technology, to claims such as that burglars could enter LCT dwellings more easily or that the roofs of such dwellings had a tendency to collapse.

One of the interested parties in the debate was not present at the seminar. These were the contractors, to whom the change to the LCT could mean a drastic cut in margins. After all, the open market prices of steel and cement were several times the controlled rates, and through overdesign and other methods at least 15 per cent of these materials could be 'saved' for disposal in the black market. This was for original building. For maintenance works, the proportion of material 'saved' could jump to beyond 50 per cent. Unplastered walls would result in the virtual extinction of the maintenance "saving", and the use of brick and lime-surkhi (for which a blackmarket did not exist) would remove most of the 'savings' from original building. The need for "soundness in design" which naturally meant the use of cement and steel, as well as whitewashing and plastering, needed therefore to be stressed.

However, it was clear that the defences of the Expert Committee were strong and that unless stronger attacks were made the political leadership may intervene in favour of speedy adoption of its recommendations. The members of the Committee made short work of the numerous 'technical' arguments against their recommendations, by pointing out that the suggestions they had made were not novel, and had all been in use often over long periods of time. The Committees recommendations had satisfied the National Building Code, and on all points where the NBC was silent, the recommendations were so designed as to satisfy the British Standard Code. It was clear from the interventions of the two political leaders present (the State Chief Minister and the Housing Minister) that they favoured the acceptance of the LCT.

A fresh strategy, therefore, needed to be evolved. The Department now professed itself ready to accept 'all but two' of the recommendations. It was 'fully aware' of the urgent need to reduce costs. It was prepared to introduce such features as brick jallis and brickbat floors. It was even prepared to use lime-surkhi in place of cement, provided, of course, these were "standardised" and of "high quality". All this and much more it was ready to do. However, as a responsible arm of the Government, conscious of its duty to the public, it could not in fairness adopt the "experiment" of the tile filler-slab roof until its safety was established to its satisfaction, and this may take an indefinite length of time. As for maintenance, it must be remembered that public buildings were exposed to 'several hazards' (students on a rampaging were cited as one) and to provide for all this the design must incorporate "protective" features such as plaster.

In all this, the fact that the tile filler-slab was only an adaptation of the ordinary waffle-slab was overlooked, as also the fact that several buildings had been built over the years with tile filler-slab roofs, and that an inspection of these would be enough to demonstrate that the tile filler-slab was structurally safe. Or that unplastered walls reduce rather than increase the maintenance requirement, because it is plaster that continuously needs to be colour-washed and redone, whereas all that a barebrick wall needs is an occasional scraping. But the Department would not budge from its stand. After all, had it not shown itself to be reasonable by accepting all but two of the Committee's suggestions?

In point of fact, by rejecting the use of unplastered walls and the tile filler-slab roof, the Department was rejecting almost the whole of the Committee's recommendations. This was not only because the roof was a major item of cost-saving. Even at present the Department constructed two or even three-storied dwellings using load-bearing masonry and not RC-frame walls; only the roof was RC-slab and, therefore, needed to be replaced. Also, if the light tile filler-slab roof were not introduced in preference to the heavy RC-slab roof some of the other crucial recommendations of the Committee, such as the use of country-burnt bricks and 4-1/2" walls would also go by default. The wall strength and thickness would need to be increased to take account of the heavy roof, and thereby the Committee's entire approach may be washed away.

However, the political leadership's reluctance to give definite directives in the face of what appeared to be a deadlock between two sets of technical experts, and the statistical fact that "all but two" of the Committee's recommendations had been accepted, carried the day for the Department. A committee was set up to examine the roof question and a two-year deadline was given to it — long enough for memories of the LCT to be erased and for other more vital matters such as "increase production" and "stop government waste" to come to the forefront again. The presence of Department engineers in the Committee, and the fact that they could be expected to overawe in technical discussion the lay members from the Planning Board, worked as a further safeguard in this direction.

The Seminar had some interesting lessons to those interested in the study of institutional behaviour. These included:

(a) The dilemma of the lay political leader in the face of conflicting opinions of technical experts. The resistance put up by the Department proved strong enough to neutralise the desire of the political leadership to make a quick start with LCT. The political leaders were not able to independently assess the merits of the technical arguments put forward. They searched for a consensus and when they found that there was none, wavered. They were unwilling to take the course of boldly accepting the LCT and asking the Department to move ahead speedily in its implementation. They therefore settled for what they thought was a half-and-half solution, but which in actuality favoured the *status quo*; give the Department time to "experiment" with techniques that were already in common use!

(b) The inability of those involved to focus on issues not directly involving them. Arguments about the social desirability of the LCT were almost completely removed from the open discussions, except for an occasional ritual mention. The focus of the Department was on the problems it would face in a switchover, and this outweighed in its view the advantages for society as a whole of such a switchover. This constricted focus on one's own interests came out clearly at the Seminar

(c) The capacity to get diverted from facts to metaphysics. Repeated attempts were made to divert the discussions from considerations of technical suitabilities to metaphysical considerations such as "taste". Allegations against the LCT were often so vague that they could not be pinned down and answered. Again and again, words such as 'safety' and 'risk' were used to imply that the LCT was unsafe, without stating clearly the technical reasons for this apprehension.

The Seminar clearly showed that reliance on 'consensus' and 'percolation' is not enough to break down institutional barriers to innovation. Strong drives by a determined political leadership is essential. If this not forthcoming, the old quietly overwhelms the new.

SPACE RESEARCH

Unspelled Objectives

R S Ganapathy

THE annual report of the Department of Space for 1973-74 starts with the statement: "During the year 1973-74, the Department of Space (DOS), continued its activities on space research" — as if to reassure, readers that the Department had not forgotten its *raison d'etre*! The report then describes a series of projects at its various units, in Trivandrum, Ahmedabad, Sriharikota (near Madras) and Bangalore. The linkages among the projects are not, however, very clear

What ought to be the objectives of research into the peaceful uses of outer space in India? There is the clear urge to undertake a moderate programme in order to be a 'somebody' in outer space. Its potential applications in communications, television, meteorology resources survey and remote sensing are also significant. It is also the technology of the future. Granted that India would derive considerable benefits from such applications, what should be our goals? In view of our severe resources constraint we should aim to develop only a communication satellite by the early eighties. The use of a satellite for TV transmission, except as a national hook-up facility, is of limited value to India. Without massive investments and clear social policies, use of satellite TV, as a means for social change and national integration, is doubtful.

For telecommunications, however, a satellite is cheaper and is clearly more advantageous than the conventional microwave links. It can be a powerful aid to supplement existing terrestrial means. But in meteorology, natural resources survey, geodesy, and remote sensing the satellite has limited advantages. It might have been useful to know if one satellite could do all these things, how big it would have to be when it would need to become operational, what strategies are required in other sectors to ensure co-ordinated development, etc. On all such questions the annual report is mum. While nevertheless it is true that the space programme has clearer objectives than say the CSIR, these objectives are not still specific enough. Motivation and results are not possible without such a specific objective statement about our satellite; and such a goal can be set only after detailed examination of other social goals and assessment of the technological means for achieving them.

The major share of the expenditure on space is for developing the launching capability (rockets, fuel, control mechanisms, etc). The first Indian satellite, meant purely for scientific studies, will be launched shortly from a Soviet Cosmodrome by the Soviet Union. And it is planned that future satellites will be launched by India itself. While the benefits of the satellite are clear, the logic of developing our own launching capability is not so evident. It seems feasible that we could continue to get our satellites launched by friendly countries; we would thus cut our space programme expenses considerably. Indigenous launching capability can be justified only on defence grounds; unfortunately, the defence objectives of our space programme have never been spelt out clearly. That they exist cannot be disputed. A clear articulation would help to understand the logic of the current outlays on launchers.

From the list of activities of the Department, it is clear that it wants to play a major role in 'applications'. However, this is undesirable for many reasons. The executive responsibility for the applications must rest with the user agencies, who ought to have the options to choose the appropriate technologies for their missions. Space technology is just one of the alternatives, and development of unit-technology-oriented applications is a dangerous precedent. For example, the Ministry of Communications must be responsible for developing communications and they should be free to decide on the use of space technology. Similarly, the Ministry of Information and Broadcasting, the India Meteorological Depot, the Geological Survey of India, etc, must be responsible for their own programmes. If DOS wants to do some work in these applications, it should get funded by the potential users, rather than by the exchequer directly. Its own programmes should continue to be in space-research technology, rather than in applications.

The programme on space sciences — mostly basic research — is being carried out at Trivandrum and in the Physical Research Laboratory at Ahmedabad. Its objectives are not clear. There is a need to increase the programme content of the basic research.

The capability already built up by DOS over the past few years in different technologies has relevance to many industries. It is not clear from the report how DOS is planning to use this resource for general industrial/economic development of the country. It may be worthwhile to invest further in the exploitation of existing knowhow than in the generation of new knowledge.

Strangely enough the role of educational institutions and industries in sponsored research programmes and in technical collaborations is not elaborated. It is the bane of many Indian scientific organisations that they do everything 'in-house' and this seems characteristic of DOS as well. The use of external institutional resources for the DOS programmes ought to be higher. Similarly, duplication of research facilities needs to be avoided. For example, the Department of Science and Technology is setting up a National Remote Sensing Agency at a time when the Department of Space too is setting up a Remote Sensing Agency with the same objectives.

The phenomenal growth in the outlay on the space programme (from Rs 4 crores in 1969-70 to Rs 19 crores in 1973-74) must have resulted in a number of managerial problems which find no mention in the report. In fact, it is well known that industrial relations are a major problem in Trivandrum but these are not even mentioned. The legal status and public accountability of the Indian Space Research Organisation, which is responsible for the programme and is fully funded by government, are also not clear. The Space Commission, in spite of being the top policy-making body, finds no mention in the entire report.

The annual report is otherwise well produced, though somewhat bureaucratic in style. It has a different format and layout from other annual reports of government departments, and it does give some financial and statistical information about the programme. But the real problems seem to be glossed over, and only the non-controversial and not easily understandable details are presented. Hoarding information is a common practice among government departments — and it is a bureaucratic source of power. The DOS is no exception. Openness, sharing of information, and high public accountability, appear to be alien to this organisation involved in the frontiers of technology.

MALAYSIA-CHINA

Give and Take

Harish Chandola

MALAYSIA'S foreign policy has changed significantly since Tun Abdul Razak took over the Prime Ministership in October 1970. The biggest change in its policy has been its decision to establish diplomatic relations with China. Abdul Razak is visiting Peking (May 28 to June 2) to sign an agreement for the establishment of diplomatic ties.

For 13 years, during the Prime Ministership of Tungku Abdul Rahman, China used to be the daily target of attacks and condemnation, first in Malaya, and then later when it grew into Malaysia in 1963 with the addition of Sarawak and Sabah. It was said then that Malaya's or Malaysia's biggest problem, the armed insurgency of the Malayan Communist Party, was nothing but an activity sponsored by China to establish its hegemony over South-East Asia, a region close to China.

The day it was born (August 30, 1957) as an independent nation, Malaya was greeted by Prime Minister Chou En-lai who sent a message to its first Prime Minister, Abdul Rahman, expressing the hope that "friendly relations between China and Malaya would be daily strengthened and developed". China wished to establish relations with Malaya on the basis of the Five Principles of Peaceful Co-existence as enunciated in the Bandung Declaration. But Abdul Rahman rejected the friendship of China. He did not even reply to the message of greetings sent to him by Chou En-lai. Not only did Abdul Rahman describe China as hostile to the nations of Asia, but he went ahead and established relations with all the anti-China regimes in the continent, like those of Taiwan, South Korea and South Vietnam.

Malaya remained tied to Britain on matters of defence. It signed the Anglo-Malayan Defence Agreement (AMDA) in 1957. This agreement came to an end as a result of the decison of the British government in January 1968 to withdraw most of its troops from Malaysia and Singapore by 1971. The AMDA was then replaced by the Five-Power Defence Arrangement between Britain, Australia, New Zealand, Malaysia and Singapore, which came into force on November 1, 1971.

It was Abdul Razak who on succeeding Abdul Rahman decided to give his country a truly non-aligned foreign policy, by establishing friendly relations with all countries, including China and the East European nations. His first step in this direction was to establish diplomatic relations with various East European countries, including East Germany. (Albania is the only country in that region with whom Malaysia does not have relations yet.) Malaysia had established diplomatic relations with the Soviet Union earlier — in 1968. Last year Malaysia signed agreements to establish diplomatic relations with North Korea and North Vietnam.

In November 1971 Malaysia called a conference of the Foreign Ministers of the five countries which together form the Association of South-East Asian Nations — Thailand, Malaysia, Singapore, Indonesia and the Philippines. The conference adopted the Kuala Lumpur Declaration which stated that South-East Asia should be regarded as "a zone of peace, freedom and neutrality, free from any form or manner of interference by outside powers". Malaysia wanted the support of the major powers for the Declaration. China was not only a very large and close neighbour but also a major power. It was Abdul Razak's desire to establish friendly relations with Peking right from the time he assumed the Prime Ministership, but after the adoption of the Kuala Lumpur Declaration it became a matter of urgency for him to do so.

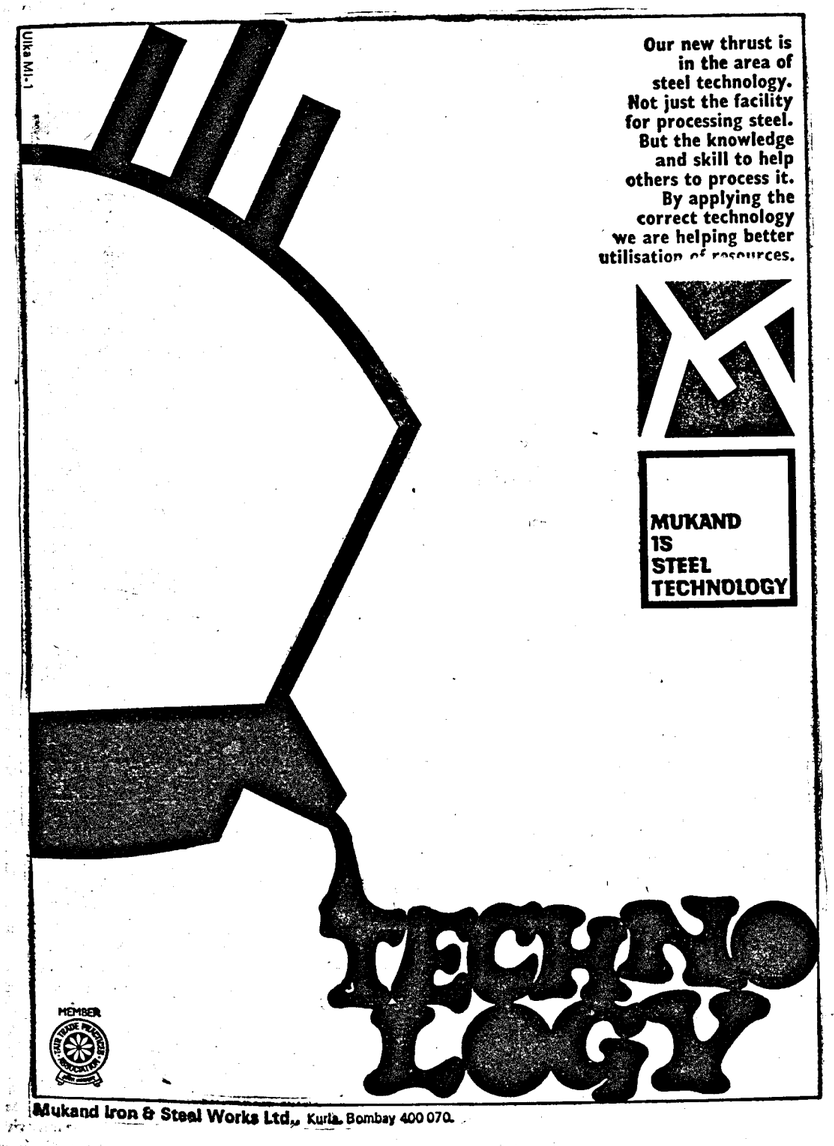
Malaysia then initiated informal contacts with China, first to find out if it was interested in opening talks on the establishment of trade and diplomatic relations. The first informal contacts were made by the then Malaysian High Commissioner to Pakistan, Mohammed Sopiee, with the Chinese Ambassador there. Almost at the same time similar contacts were established by Zakaria Ali, the Malaysian High Commissioner to Canada, who speaks Chinese fluently, with the Chinese Ambassador to that country, Huang Hua. The response was good. It was then decided to open talks on this subject officially. The talks began in New York in June last year. The Malaysian team was led by Zakaria Ali who had then been posted as his country's Permanent Representative to the UN, and the Chinese team by Huang Hua who too had been posted as China's Permanent Representative to the UN.

Initially China wanted to discuss only matters relating to the establishment of diplomatic relations. But Malaysia wanted to bring up and settle other matters also. It sought to know China's attitude towards the Malayan Communist Party, which is still waging an armed struggle from its bases in the jungles along the Malaysia-Thailand border, and towards the 220,000 stateless persons of Chinese origin living in Malaysia. The Malaysians expressed their suspicion that the radio station called the "Voice of Malayan Revolution" — which broadcast commentaries on the Malaysian situation daily in the three languages of Malaysia, Malay, Chinese and Tamil, and called upon the Malaysian people to support and strengthen the armed struggle of the Malayan Communist Party, — was located in the southern part of China.

After a short deadlock, China agreed to talk about these and other issues. It is now reported to have agreed to provide Chinese citizenship to about 151,000 stateless persons of Chinese origin in Malaysia. The question of the remaining stateless persons is to be discussed later. China is reported to have categorically denied that the radio station, the "Voice of Malayan Revolution", was located in China or that China had anything to do with it. It is also reported to have stated that the struggle led by the Malayan Communist Party was an internal affair of Malaysia, with which China had nothing to do.

On the other side, Malaysia will break off its consular relations with Taiwan before establishing diplomatic relations with China. It will close down the Taiwan Consulate-General in Kuala Lumpur and also the offices of Taiwan's Cathay Information Service, an anti-China propaganda organisation. Taiwan wants its Consulate-General in Kuala Lumpur to be turned into its trade and tourist offices, like it has done in Japan after the establishment of China-Japan diplomatic relations. It is not known if Malaysia will permit it to do so. Similarly, Taiwan wants its carrier, China Airlines, to keep flying to Kuala Lumpur and the Malaysian Airlines System to continue calling at Taipeh on its Kuala Lumpur-Tokyo run. Since it is unlikely that China will start an air service to Malaysia in the near future, Taiwan is likely to continue its air links and also perhaps its trade links with Malaysia.

While in Peking, Abdul Razak will certainly seek China's support for the Kuala Lumpur Declaration of November 1971, which wants the major powers to respect South-East Asia as a neutral zone. China has indirectly voiced support for this proposal, but it is to be seen if it is going to endorse it entirely. The US still has its troops stationed in Thailand and it maintains a large naval base at Subic Bay in the Philippines. A war is still going on in Cambodia and the ceasefire in South Vietnam is becoming untenable. In such a situation, will China be prepared to accept South-East Asia as a "zone of peace, freedom and neutrality"? To accept it as such is to accept the *status quo* in this region and indirectly accept regimes like that of Thieu and Lon Nol.



Some observers have commented that since various Western countries have established ties with China, there is nothing new in Malaysia also establishing similar ties with China. But for China, South-East Asia is not like Canada or Italy. It is a region immediately next to it. In it live over 15 million people of Chinese origin who are still very much linked by language, culture and pride to China. In this region China has historically wielded a considerable amount of influence.

Why is Malaysia keen to establish relations with China? Apart from its desire to appear genuinely non-aligned by establishing friendship with all, Malaysia stands to benefit from this relationship. Nearly 44 per cent of Malaysia's population is of Chinese origin. By establishing friendship with China, the Malaysian leaders can create a more favourable place for themselves in the hearts of the Malaysian Chinese, at least for the time being.

But an even bigger benefit for the Malaysian leadership at the moment is that its agreement with China creates a good deal of confusion in the ranks of those who are supporting an armed struggle in Malaysia and who consider China as their staunchest ally. Perhaps this confusion does not occur in the minds of the leadership of the elements conducting the armed struggle, but it does, for the time being, greatly confuse the rank and file. How could China, their staunchest ally, establish friendly relations with a leadership which they regard as their enemy? For whatever period it might last, this confusion is going to be of great benefit to the present Malaysian leadership. After all, the only firm opposition enemy in the country is the Malayan Communist Party, which has been struggling for the past 30 years, which has never given up its struggle and which has an organised, disciplined, ideologically-oriented armed force at its command, however small it might be at the moment. There is no other force in the country which can threaten the present Malaysian leadership.

By establishing this relationship with Malaysia, China perhaps wants to make it abundantly clear that liberation struggles or revolutions in Asia or elsewhere have essentially to depend on their own strength for their success. They cannot succeed on the basis of the strength of China. China has never marched its army in support of a liberation struggle anywhere. Neither is it going to do so in the future. Ideologically it will perhaps continue to support these struggles and perhaps materially also when such support may be of crucial importance to their progress. But China is not going to wait for the success of these movements before establishing relations with various countries.

As a state, in conflict with other states and forces, China perhaps feels

that it must take certain steps to conduct its business in international affairs. For instance, it finds the Soviet Union rapidly establishing relations with Asian governments around China. China therefore, perhaps, feels that it cannot allow itself to be isolated by maintaining no direct contact with governments in its neighbourhood.

There is, however, just one question that some observers in this region are asking at this juncture when Malaysia and China are going to establish relations. They think it is perfectly all right for China to assert that liberation struggles and revolutions are the responsibility of the peoples of the countries where they are taking place. They say, in the past — as now — China used to say that these struggles were the responsibility of the peoples conducting them, but China also used to state that it would always support them because that was its internationalist duty. But now China may not wish to re-iterate the latter proposition.

THE FOURTH ESTATE

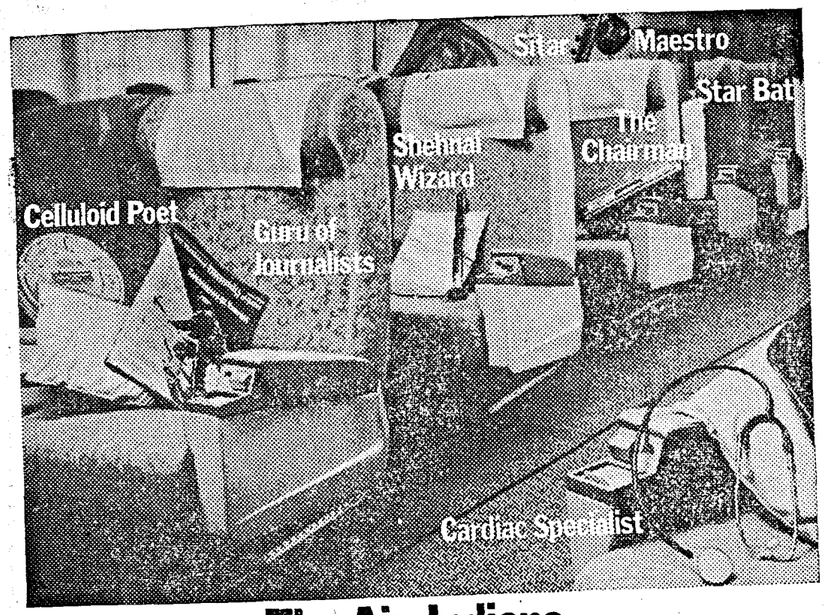
The Image-Builders

Nireekshak

EDITORS from Gauhati to Rajkot and Srinagar to Tirunelveli went to town with the May 18 nuclear blast story. The fall-out of reaction, predictably, ranged from jingoistic rhetoric to sober assessments of the potential of nuclear energy for peaceful uses in India. But it was one kind of conformism or the other with little positive dissent. Almost everyone seemed to regard it unpatriotic to question the timing of the test. It was fairly well known in New Delhi that the blast would come sometime after the crucial Uttar Pradesh elections in February as part of an image-building exercise on behalf of the Prime Minister. However, the Press, in its preoccupation with the railway strike, found that the story stole on it unawares.

The Cabinet had met that morning and an innocuously-worded two paragraph hand-out was all that was distributed to correspondents who made their routine call at the Press Information Bureau. The hand-out would not even disclose the exact location of the experiment. The drama was reserved for the afternoon. The Prime Minister was present to introduce Sethna and Ramanna to the hurriedly-called press conference. Adequate international TV coverage of the event was ensured even if all the Indian correspondents who mattered could not be informed of the conference. The Prime Minister's presence was interpreted as a rare gesture of honour for the two scientists. No one would say that her presence was perhaps aimed at underlining her own role in the achievement. Atomic energy is the only portfolio the Prime Minister holds after Home was handed over to Uma Shankar Dikshit and Inder Gujral was given independent charge of the Information and Broadcasting Ministry.

The Prime Minister's presence at the press conference made history of sorts for the correspondents present because she has of late restricted formal meetings with the Capital's press corps to once a year, either on the last day of the year or on New Year's Day. The complaint often heard is that she talks more to the press when she goes out of New Delhi, though her contention has been that her impromptu encounters with the Press in New Delhi — at the airport or in the corridors of Parliament House or in South Block — are no different from press conferences even if they are brief and are not proper "sit-down" affairs. But one cannot help the feeling that she is not very accessible to the Press while in New Delhi and that she has got used to making the more important statements when she is away from the Capital.



Three days after the nuclear blast, the Prime Minister gave a long interview with a *Newsweek* team of two visiting journalists. The interview was on the basis of subjects for discussion made available to her in advance. The interview, which yielded a 26-page transcript, followed a harsh write-up on India in the journal a few weeks earlier. The transcript was made available to the Indian press by the Prime Minister's aides.

If one remembers right, the Prime Minister has not given such a wide-ranging interview to any Indian journalist in years. Barring pro-CPI journals, the only interview given to an Indian journalist during the last 12 months was to the biographer of her mother and was largely of a non-political nature.

It is far easier for visiting journalists to get an interview with the Prime Minister than it is for foreign journalists based in New Delhi. Since 1966, there have been several grotesquely written-up interviews by visiting foreign journalists, some of them women. Some of the journals and journalists were of doubtful professional standing but the defence put forward, when one such interview appeared, was that is difficult to screen all those who seek interviews with the Prime Minister. On another occasion, when a journalist of the standing of the editor of *Dawn* from Karachi interviewed her, the tape-recorder failed. When the interviewer, who did not feel the need for taking notes because he saw the tape-recorder grinding away, asked for the transcript, the Prime Minister's press aides discovered that the instrument had let them down. The interview was virtually redone, this time by post and the *Dawn* published an explanation of the gap between the editor's return from India and the publication of the interview.

The easy access that visiting foreign journalists have to the Prime Minister is partly due to the anxiety of her press aides to build her image abroad. In the process, communication between the Indian press and the Prime Minister is one of the casualties. And this, ironically, at a time when the Prime Minister has professional Press advisers. Such advisers were unknown in Nehru's days nor did Lal Bahadur Shastri have a press adviser. The upshot is a remarkable increase in communication between the correspondents and the advisers and a near lapse of communication between the Press and the Prime Minister.

In the early years of Independence, one of the jokes going round New Delhi's press world related to the high and mighty political correspondents and the Prime Minister. If one met the Prime Minister's personal assistant, he would tell everyone that he had met the Prime Minister. And if he chanced to meet the Prime Minister himself, he would tell others about how he had advised the Prime Minister on how he should handle this or that problem. But these days, the Capital's five-star correspondents are content to drop the names of the Prime Minister's policy or press advisers. That is the nearest they get to the Prime Minister.

The Air-Indians.

You know them, we fly them.

Who are the Air-Indians?

You know them all. They are Indians who have put their country on the world's industrial map, Indians who have carried the liquid notes of their music to distant lands, Indians whose films have lent a lyrical vision to world cinema, Indians whose feet have transmitted the rhythm of Indian dance across the seas, Indians who are leaders in sport, in science, in technology. Air-Indians are Indians who are proud of their country, proud to fly their country's airline.

When you fly Air-India, you fly with your people, your culture and your flag. In fact, when you fly Air-India, you fly your very own airline.

Be an Air-Indian

Fly Air-India

Women and Economic Development

Sondra A Zeidenstein

Woman's Role in Economic Development by Ester Boserup; London: George Allen and Unwin.

ESTER BOSERUP, a Danish economist, has written a book that should be read by all those involved or interested in the economic and social development of poorer nations. "Woman's Role in Economic Development" is one of the few studies concerned with what happens to women, as socially and economically productive members of society, when a nation begins to modernise its agricultural and urban life. Her analysis indicates that 'development' frequently causes a decline in the productivity and status of women. If this is so — and she is the first to suggest that more basic information and further study are needed to determine the validity of her conclusions — then planners and their advisers must become more conscious of the effects their plans have on women and weigh what is being lost against what is being gained both on the economic and human scale.

Boserup looks at what has been happening to women in developing nations as modernisation takes place in the village and the town and in the process of migration from the one to the other.

At the village level, in the earlier stages of development, families produce and consume their own goods, dividing labour along sex lines which, though they differ from culture to culture, each culture considers "natural". Among the areas she is considering — Asia, Africa, Latin America — Boserup describes two basic kinds of agriculture, differentiated in part by the roles women play. Women do much of the work involved in farming in many parts of Africa (and a few in Asia and Latin America) where the land is sparsely populated and there is shifting cultivation on small plots. Where agriculture is dominated by women, wives command a high bride price; they work hard, often are expected to support themselves, but have freedom of movement and some economic independence from the sale of their products. Male-dominated agriculture, usually in densely populated areas on larger pieces of land, privately owned, is characterised by the use of the plough, work animals and hired labour, which may include poor or low-caste women. The farmers' wives usually live in seclusion, doing work related to harvesting and caring for animals. They are totally dependent on their husbands for support.

While modernisation has had negative effects on both groups of women, it is the former that has been most obviously neglected. Many colonialists, Christian missionaries and American and European advisers have assumed, even where the culture indicated otherwise, that farming is man's work and, by giving opportunities exclusively to men and even, in some cases, undercutting women's traditional rights to own land by their male-oriented land reform policies, have contributed to lowering the status of women who, not allowed to move ahead with the men, are then perceived as "backward". Men have come to monopolise new agricultural methods and use them for cash crops while women, the original farmers, who have not been encouraged to go to school or given the chance for agriculture courses or extension services, continue to use traditional methods for food crops.

Other economic activities of women in developing countries vary from culture to culture, but modernisation seems to have neglected or hurt them all. In the traditional trading sector there are especially wide variations in the participation of women from one country to another. In Ghana, for example, 80 per cent of the labour force in trading is female while in Pakistán the figure was 2 per cent. But the trend in many developing nations, whether traditional trading has been predominantly female or not, is that jobs in the modern trading sector go to men.

In countries where the culture prevents women from doing anything outside the home, they may work in home or cottage industries, an initial step in entering the labour force. Where many women are available for such work and their goods must compete with those of modern industry, the wages of course are quite low. Men, who may have been working with women in home industry, go to factories when they open up and, with an increase in wages and productivity, attain an increase in status. And if factories take over from home industries, women lose their jobs.

In the urban world where factory work is available, women again are relegated to lower status and productivity. In modern industry, Boserup points out, there are only two kinds of jobs, and in developing countries the salary differential between them is high. One is for those who have had some training and will have a chance for promotion; the other is for the unskilled or "helpers" who will not have a chance to move ahead. Though men are hired for both kinds of jobs, women as a rule are hired only for the latter.

The employment situation of educated women in developing countries is new, but still, according to Boserup, a trend is developing. Few women anywhere are in administrative jobs; the percentage is higher where Americans have been influential. The ratio of women in the professions seems to be related to the ratio of women in the student body, but the professions women concentrate in are medicine, teaching and nursing. In Asia and Africa at the stage of development when the demand for women in these professions exceeds supply, few women take clerical jobs. But as educated women begin to have difficulty finding jobs in "appropriate" professions, the pull is toward office jobs. Educated middle-class women seem to be turning to low grade clerical jobs which, as Boserup points out, may improve their status *vis-a-vis* their husbands by giving them some measure of economic independence, but will lower their status in the labour market.

In her concluding chapters Boserup looks at development policies that would benefit both women and society as a whole. She pays special attention to the question of employment of urban women whose economic productivity has often been lost in the process of migration from the village. Most of the work women did as part of subsistence activity in the rural area must be paid for with cash in the city. As much as one-half to two-thirds of the husband's income from his city job is spent on goods and services that were produced at home in the village, at least in part by the women. Now she stays at home and his productivity is offset by the loss of hers. Even women who were employed in the service sec-

tors in towns tend to decline in economic productivity as a result of migration to the city.

Yet many planners, almost as a matter of course (or cultural bias) argue against employment of urban women because of high unemployment among men. Boserup presents some important counter-arguments. First of all, she points out that thinking about unemployment is often confused. Several surveys in developing countries indicate that unemployment among new unskilled migrants is relatively low either because news about the urban job situation is available in the villages or because migrants unable to find jobs return to the villages, where they usually can find at least seasonal work (and where, if the agricultural sector develops as it should, there will be need for their labour). If urban women are more widely hired for jobs, it is possible that fewer unskilled labourers will leave their villages.

Unemployment among educated males in cities is higher. Boserup sees this as a natural phenomenon when the numbers of educated are continually expanding but the literate are not yet ready to take jobs traditionally held by the illiterate. (Among literate populations, of course, all jobs are held by the literate.) These people may be quite noisily against the hiring of women but to yield to them is to postpone, through injustice, an unavoidable step in the process of development. It is an urgent step in the light of the need for literate workers to remain in the village.

In addition, hiring urban women whose husbands are already employed will cut down the amount of costly urban infrastructure required when an urban family produces only one worker.

To prevent further decline in the status and productivity of women with modernisation, Boserup emphasises the need for proper education and training for women. In the beginning, both men and women were economically productive and both sexes were equally illiterate and superstitious. Now as the result of modernisation men are getting formal training and education and using modern techniques while women continue to get educated in old ways by their mothers and, as a result, are preceived as backward. To avoid creating a backward class whose decline in status and productivity are bound to offset socially and economically more visible gains, developers must provide and encourage education and job training for women. Jobs for rural women are a necessity now, to provide an incentive for educated women to stay in the village and to offer some alternative to achieving status besides having babies. Jobs for urban women will become increasingly important because, unlike the situation in the West at this stage of industrialisation, taking care of a family will not be so time-consuming and women will be freer to work outside the home.

Boserup's study, supported by invaluable tables reflecting the pattern of female employment in developing nations, reveals a clear trend. No doubt more data are needed from social scientists in specific areas, especially South and West Asia, but equally important is commitment to women as people. It is possible that many social scientists and planners have class and caltural biases about the role of women in society that keep them from seeing what is happening to women as modernisation takes place. Reading Boserup's book may help remove these biases.

Industrial Finance Corporation of India

6 PER CENT BONDS 1986

Payment of Interest and Repayment of Principal Guaranteed by the Government of India

AMOUNT OF ISSUE Rs. 7,25,00,000
ISSUE PRICE Rs. 100.00 PER CENT
REDEEMABLE AT PAR ON THE 10TH JUNE 1986

The Bonds are approved securities under the Indian Trusts Act, the Insurance Act and the Banking Regulation Act, and are also eligible for grant of advances to scheduled banks by the Reserve Bank of India. These are on the approved list of securities of the State Bank of India and are also eligible for investment of the accumulations of the Provident Funds, exempted as well as non-exempted.

Subscription will be received in cash/cheque at the Branches of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay, Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi, and Patna from Monday, the 10th June 1974. The list will be closed without notice as soon as the total subscriptions amount to Rs. 7.25 crores, and in any case, not later than the close of business on Friday, the 14th June 1974. The Corporation reserves the right to retain subscriptions received upto 10 per cent in excess of the sum of Rs. 7.25 crores.

The Bonds will have a currency of 12 years, and will be repaid at par on the 10th June 1986. These will bear interest at the rate of 6 per cent per annum from the 10th June 1974. Interest will be payable half yearly on the 10th December and 10th June and will be subject to tax under the Income Tax Act 1961.

Copies of the Prospectus and application forms can be had from the offices of the Reserve Bank of India as also from the Head Office of the Corporation at Bank of Baroda Building, 16 Parliament Street, P. B. No. 363, New Delhi-1, its regional/branch/sub offices at (i) Mehta Mahal (5th Floor), 15, Mathew Road, P. B. No. 3928, Bombay-400004 (ii) 4, Mangoe Lane, (2nd Floor), P. B. No. 2483, Calcutta-700001 (iii) Raji Building (3rd Floor), 147, Mount Road, P. B. No. 1080, Madras-600006 (iv) Jivabhai Chambers, Ashram Road, Ahmedabad-380009 (v) 22, Mahatma Gandhi Road, P. B. No. 5091, Bangalore-560001 (vi) 6-3-631, Zilla Parishad Road, Khairatabad, P. B. No. 11, Hyderabad-500004 (vii) Jeevan Tara Building, First Floor, Gate No. 3, 5 Parliament Street, P. B. No. 182, New Delhi-110001 (viii) E-1/23, Arera Colony, Bhopal (ix) 20, Forest Park Area, Bhubaneswar-751009 (x) Bungalow No. 216, Sector 11-A, Chandigarh-160011 (xi) 'Karuna' (2nd Floor), XXIII/1311-D, Mahatma Gandhi Road, Ernakulam, Cochin-682011 (xii) Kanram Medhi Road, (Ranibari Lane), P. B. No. 30, Panbazar, Gauhati-781001 (xiii) S. B. 38/A, Bhawani Singh Marg, Bapunagar, Jaipur (xiv) Aggarwal Building, Canal Crossing, The Mall, P. B. No. 319, Kanpur-208004 (xv) 43, Pataliputra Colony, Patna-800013.

Arrangements will be made for listing of these Bonds at the Bombay, Calcutta and Madras Stock Exchanges.

Brokerage will be paid at the rate of six paise per Rs. 100/- to recognised banks and brokers on allotments made in respect of applications for the Bonds tendered by them and bearing their stamps.

Telengana People's Struggle and Its Lessons by P Sundarayya; Communist Party of India (Marxist), Calcutta, 1973; pp 502; Rs 10.

P SUNDARAYYA'S book on the Telengana uprising is the latest addition to the literature dealing with this momentous event which spans the pre-Independence and the immediate post-Independence periods in the country's history. What makes the book significant is the fact that the writer was an active leader of the struggle and has continued to be an important political figure.

Sundarayya's description of the Telengana struggle is detailed, though most of the facts are by now familiar. The initial success of the movement, as is well known, was due to the initiative of the local leadership of the Andhra Maha Sabha (AMS). In the anti-feudal struggle against the 'Nizam-shahi', the communists within the AMS organised the peasants — poor, middle and rich — as also the urban bourgeoisie. Their military equipment and skills were primitive, but the repressive machinery of the Nizam was hardly more impressive. As a result, the AMS scored considerable successes. Large areas were liberated, land distribution programmes were carried out and the struggle broadened.

The situation, however, changed completely after August 15, 1947. The factors that had helped initially ceased to operate once the Indian army intervened the following year. The middle class which had supported the AMS in the anti-Nizam struggle, began to dither once the struggle came to be directed at the Nehru regime which, to large sections of the middle class, represented their class interests. Second, the communist partisans armed with spears and flintlocks were poor match for the well equipped Indian army. The Telengana partisans had neither the organisation nor the equipment and training to face the new situations. As the author says. "Knowledge of use of firearms, of their manufacture and repair was so dismally poor that even great enthusiasm and sacrifice would not overcome it." Further, on the question of military organisation: "the communists could not combine and develop small-scale guerilla actions for harassing the enemy into sufficiently large-scale operations, to drive out the enemy from their scattered posts and clear the enemy from larger and larger areas".

The mass front that had been built up when the struggle was against the Nizam's regime broke up and there was confusion about who constituted allies and who enemies in the struggle. This was not a unique problem faced by the Telengana movement alone. Bhowani Sen, who led the Tebhaga peasant struggle in the then Bengal at about the same period writes about that movement: "The working class and middle class did not support the sharecropper's struggle in Bengal." The peasantry had also alienated the middle and small jotedars, the local landlords who should have been weaned over to the side of the fighting peasants. Sen admits: "We should have advised the adhiars [sharecroppers] to exempt petty jotedars from the operation of Tebhaga and concentrated against the richest and biggest". In parentheses, it may be mentioned that from this diagnosis, some rather odd prescriptions did follow. Thus in the following year, at the first rumblings of dissatisfaction among the Bengal peasants during harvesting time, the peasantry was promptly warned "not to launch direct action this year as they did last year". They were further advised that "the government must be given an opportunity of fulfilling its promise through legal change."

The crucial question to be answered is whether factors such as the military weaknesses and failings or the failure to forge alliances of the peasantry with the urban proletariat and the middle classes can be taken as the real causes of the failure of Telengana — and, for that matter, of practically all communist-led movements in the post-Independence era — or whether they are the symptoms of more fundamental weaknesses of the Indian communist movement?

The author devotes a great deal of attention to the role of the Comintern in influencing the fortunes of the Telengana struggle. However, instead of going into the details of the polemics on this subject, it would be more fruitful to look within the Indian communist movement itself for the forces that have time and again thwarted the Indian people's genuine desire for change as typified in Telengana and in Tebhaga. Though communists cannot afford to ignore the question of the international political-ideological line, it is a political crime to pursue a line unmindful of the actual internal situation, which is what the CPI leadership did. A reference to what happened in China during its liberation struggle might put this point in perspective. After the abortive 1927 uprising, the Cominform sounded a note of caution and urged the CCP to go slow with the idea of rural bases. The Chinese communists, however, went on to set up a base in a remote area of the country and began work to extend it.

The Indian communist leadership has repeatedly failed to fully grasp the situation within the country. As a result, it has always looked to outsiders for rectification or for enunciation of the political line. At one time, following Cominform advice, it neglected the bourgeoisie, and concentrated on the working class and on straight economic demands. The peasantry was accorded a lower priority in its political framework, though it constitutes the majority of the Indian masses. During most of the post-Independence period, the communists have tried to organise the peasantry through the All-India Kisan Sabha, which is little more than a movement to improve the peasants' economic condition.

It was in a similar state of unpreparedness that the CPI was called upon to take up the leadership of Telengana. This was fully reflected in the manner in which the leadership acted. From innocuous economism it switched to a call for insurrectionary uprisings throughout the country in support of the Telengana peasants. Naturally it was organisationally unequal to the task.

Confessions of such failures are there in this book. But the reasons put forward are hardly credible. The original sin of the Indian communists was their failure to grasp the political situation in British India and to lead the anti-colonial struggle. Misconceived land reform programmes or alienation of the middle classes and similar programmatic defects flow out of this. The author avoids this aspect of the problem. As a result, his account is reduced to an apologia for the writer and the group he belongs to and an accusation of those who chose to disagree with them.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

BOMBAY SUBURBAN ELECTRIC SUPPLY, LIMITED.

(Incorporated on 1st October, 1929 under the Indian Companies Act VII of 1913)

Registered Office: Nagin Mahal (6th Floor), Veer Nariman Road, Bombay - 400 020.

ANNOUNCEMENT REGARDING ISSUE OF 50,000-9.8% Cumulative Redeemable Second Preference Shares of Rs. 100/- each at par and * 1,00,000-8.5% "F" Class Redeemable Convertible Debentures of Rs. 100/- each at par

*** (Declared by the Government of Maharashtra as "Public Securities" under Section 2 (12) (d) of the Bombay Public Trusts Act, 1950**

Persons interested in full details may obtain copies of Prospectus and Application Forms from the Registered Office of the Company, Underwriters, Brokers or Bankers to the ISSUE.

The Subscription List will open at the Commencement of Banking Hours on Thursday, the 20th June, 1974 and will close at the close of Banking Hours on Monday, the 1st July, 1974 or earlier at the discretion of the Board of Directors of the Company but not earlier than the close of Banking Hours on Saturday, the 22nd June, 1974.

HISTORY AND BUSINESS OF THE COMPANY:

The Company was incorporated on 1st October, 1929, as a Public Limited Company under the provisions of Indian Companies Act, VII of 1913, in Bombay with the objects as fully stated in the Memorandum of Association of the Company. The Company since the date of certificate of commencement of business is engaged in the distribution of electricity to consumers within its licensed area of supply, which comprises portions of the Island of Salsette in the south taluka of Bombay Suburban District and North Salsette taluka of Thana District, the overall area is approximately 368 square kilometres. The electricity distributed to consumers is purchased in bulk from Tata Hydro Electric System. Bulk supply is received at several points within the licensed area, and is distributed to consumers through a network of distribution mains and sub-stations. The Company is also engaged in the Business of Contract Work such as installation of various electrical and mechanical machineries through its Contracts Division.

OBJECTS OF THE COMPANY:

This Issue is being made to meet the shortfall on Capital Expenditure required for expansion of electricity distribution facilities and would mainly cover expenditure on laying cables, underground and overhead, installing plant and machinery and constructing building for sub-stations etc.

SHARE CAPITAL:

Authorised :

		Rs.
* 2,50,000	Shares of Rs. 100/- each.	2,50,00,000
5,00,000	Equity Shares of Rs. 100/- each.	5,00,00,000
* 2,50,000	Unclassified Shares of Rs. 100/- each.	2,50,00,000
		10,00,00,000

* Note: 1,75,000 Shares of Rs. 100/- each issued as Equity Shares and, 75,000 Shares of Rs. 100/- each issued as 9.5 per cent Cumulative Redeemable Preference Shares.

Issued, Subscribed and Paid-up (As on 30-11-1973):

			Rs.
1,75,000	Equity Shares of Rs. 100/- each fully paid		1,75,00,000
	Of the above shares, 14,300 shares (including 460 shares out of the 4,990 Bonus Shares referred to hereafter) are allotted as fully paid up pursuant to a contract without payment being received in cash, and 4,990 shares are allotted as fully paid up by way of Bonus Shares by transferring Rs. 1,70,020 from Premium on Shares and Rs. 3,28,980 from General Reserve.		
83,379	Equity Shares of Rs. 100/- each fully paid converted from 7 per cent "B" Class Convertible Debenture Loan.		83,67,900
50,000	Equity Shares of Rs. 100/- each fully paid.	Rs 50,00,000	
	Less: Calls in arrears (from other than Directors).	Rs. 750	49,99,250
51,446	Equity Shares of Rs. 100/- each fully paid.	Rs. 51,44,600	
	Less: Calls in arrears (from other than Directors).	Rs. 775	51,43,825
			3,60,10,975
75,000	9.5 per cent Cumulative Redeemable Preference Shares of Rs. 100/- each fully paid (Redeemable at par on 1st June, 1976).		75,00,000
			4,35,10,975

PRESENT ISSUE:

50,000	9.8 per cent (subject to tax) Cumulative Redeemable Second Preference Shares of Rs. 100/- each at par.	
1,00,000	8.5 per cent (subject to tax) 'F' Class Redeemable Convertible Debentures of Rs. 100/- each at par.	

TERMS OF PAYMENT:

	Preference Shares	*Debentures*
On application:	Rs. 50/- per share	Rs. 100/- per debenture.
On allotment:	Rs. 50/- per share	Nil.

TERMS OF CONVERTIBILITY:

The debenture holders will be entitled at their respective option which they may exercise on one or more occasions during the period from 1st April, 1976 to 31st March, 1978 to convert 20 per cent of nominal value of the debentures held by them respectively into fully paid up equity shares of the face value of Rs. 100/- each at par (i e, out of every five debentures held by them respectively, one fully paid debenture of Rs. 100/- will be allowed to be converted into one fully paid equity share of Rs. 100/-, ignoring fractional entitlements, if any) in the capital of the Company.

Joint Sector and 'Control' of Indian Monopoly

Aurobindo Ghose

The Dutt Committee envisaged the joint sector as "an important means of curbing the increasing of economic power", but the Tatas and FICCI have welcomed the joint sector proposal. This is not surprising if it is recalled that when the 'socialistic pattern' was first announced in 1955, Bombay's stock market witnessed a boom. Since subsequent developments seem to have validated Dalal Street's judgment on the character of the 'socialistic pattern', it is pertinent to ask: Is the joint sector really an instrument of control of Indian monopoly? This paper seeks to answer this question.

In Section I the author examines the meaning and evolution of the joint sector concept. As a background to finding out its real rationals, Section II illustrates the operation of industrial policy in post-1947 India in relation to the declared objective of reducing the concentration of economic power. In the concluding part the author deals with the nature of the recent capitalist crisis and the extent to which the joint sector is designed to meet the new problems of development of Indian monopoly.

THE Dutt Committee[1] envisaged the joint sector as "an important means of curbing the increasing of economic power", but the Tatas[2] and the FICCI[3] have welcomed the joint sector proposal. This is not surprising if it is recalled that when the 'socialistic pattern' was first announced in 1955, Bombay's stock market witnessed a boom.[4] Since subsequent developments seem to have validated Dalal Street's judgment on the character of the 'socialistic pattern', it is pertinent to ask: Is the joint sector really an instrument of control of Indian monopoly? This paper seeks to answer this question.

In Section I we examine the meaning and evolution of the joint sector concept. As a background to finding out its real rationale Section II illustrates the operation of industrial policy in post-1947 India in relation to the declared objective of reducing the concentration of economic power. In the concluding part we deal with the nature of the recent capitalist crisis and the extent to which the joint sector is designed to meet the new problems of development of Indian monopoly.

I
Joint Sector: Meaning and Evolution of Concept

Recent discussion on the joint sector reveals little uniformity and even less agreement on what constitutes the joint sector. Different variants are propagated. Even public sector undertakings such as Madras Refineries, Cochin Refineries and Madras Fertilisers are cited as examples of joint sector enterprises and 'successful' ones at that.[5] It becomes imperative then to start from an identification of the organisational form of the joint sector.

The organisational form of any industrial enterprise is defined with respect to the structure of ownership of its equity. It is then possible to distinguish three broad categories of enterprises in the Indian economy: the pure public enterprise, the pure private enterprise and a middle zone of mixed enterprises. A mixed enterprise[6] is one where there is co-ownership of equity by the government and private elements within a single enterprise. Since the term 'joint sector' connotes some form of joint ownership, the concept would appear to belong to the generic family of mixed enterprises.

Depending on the nature of the mixture, a distinction can be drawn between two kinds of mixed enterprises:

(a) the mixed public enterprise, and

(b) the mixed private enterprise.

The mixed public enterprise is a public sector undertaking characterised by (i) majority equity ownership by the government and its different agencies, (ii) financial supervision and audit control in the hands of the government even when management is with the private collaborator, and (iii) statutory accountability to the government as well as the Parliament.

The mixed public enterprise has emerged in two ways. First, through acquisition of controlling equity by the government in erstwhile private enterprises, as in Indian Oil Corporation, Indo-Burmah Petroleum, Balmer Lawrie, and IISCO.[7] Secondly, through formation of a new company in collaboration with private elements, usually foreign capital in technology-complex industries, as in Madras Refineries, Cochin Refineries, Madras Fertilisers, Lubrizol India and Triveni Structurals. Whichever way it has emerged, the above characteristics are common to all mixed public enterprises.

By contrast, there exists the mixed private enterprise characterised by (i) minority[8] equity participation by the government and its different agencies, (ii) day-to-day management, financial supervision and audit control in the hands of the private promoter, and (iii) its functioning not being statutorily accountable to the government or Parliament.

Examples of such mixed private enterprises are not difficult to find. Subsequent to the formation of the LIC and the emergence of public financial institutions as the principal source of underwriting of new capital issues, there is hardly any public limited company in the Indian private sector which has no government equity participation. In fact in the large-sized and leading companies, government's equity participation is considerable. For example, the government's share is about 53 per cent in Premier Tyres, 44 per cent in CIMMCO, 42 per cent in TISCO — the largest company in the private sector —, 40 per cent in ACC, 32 per cent in Texmaco, 30 per cent in Voltas and Hindustan Motors, 25 per cent in TELCO and 16 per cent in DCM and Century Spinning.

Even considering a large industrial house as a unit of ownership, government equity participation is estimated[9] to be more than half in Martin Burn, about one-third in Tata and ACC, nearly one-fifth to one-fourth in Birla, Sri Ram, Bangur and Killick-Kapadia, etc. Despite such large government equity participation in these companies, management and control are completely with the controlling houses/families.

The distinction between the two types of mixed enterprises then turns around the character of "effective control" of the enterprise. Where effective control is in the hands of the government, it is a mixed public enterprise; where, however, effective control is in the hands of the private promoter, it is a mixed private enterprise.

From this point of view, the joint sector, at least in the form in which it is being implemented by several state governments, can be regarded as a mixed private enterprise.

Such joint sector enterprises have in general the following characteristics:

(i) *Equity Participation*: Certain guidelines laid down by the Central government provide for 26 per cent equity ownership for the state government, 25 per cent for the private promoter and 49 per cent for the investing public, including financial institutions. In cases involving foreign participation, the formula provides for 25 per cent equity for the state government, 20 per cent for the Indian promoter, 20 per cent for the foreign collaborator and 35 per cent for the investing public including financial institutions. Generally, the equity owned by the state government and the public financial institutions put together should be less than 50 per cent of the total equity of the enterprise. Thus even if the government is the single largest shareholder, normally it will be the minority equity participant. This, as we have seen, is no different from the situation in existing mixed private enterprises, e g, TISCO, TELCO, Voltas, CIMMCO, etc.

(ii) *Management and Control*: Representation on the Board of Directors would normally be in proportion to the ownership of equity, with the state government usually having one additional director than the private promoter. The Chairman of the Board of Directors is to be normally the nominee of the state government but, from all accounts, he is a mere figurehead. The Managing Director will be the nominee of the private promoter, subject to government approval. Broad policy-making will be done by the Board of Directors but detailed management and decision-making will be left to the Managing Director. The government promoter's main role will be to "use its good offices" (a) to obtain licences and other necessary government sanctions, (b) to facilitate the availability of government overheads such as transport, communications and electricity, and (c) to negotiate with public financial institutions and foreign collaborators. Financial supervision would be under the private promoter's control. Financial audit would be done by commercial auditors, unlike the normal practice of public audit in purely public or mixed public enterprises. Effective control would thus rest with the private promoter.

(iii) *Public accountability*: The functioning of the enterprise would not be statutorily accountable to the government or the Parliament.

From this brief review it clearly emerges that the organisational form of the joint sector is not much different from that of the mixed private enterprise. It would be incorrect then to identify the joint sector with mixed public enterprises such as Cochin Refineries, Madras Refineries and Madras Fertilisers[10] and further to argue for the joint sector as an instrument of industrial development based on the successful operation of these enterprises.

Despite differences on what constitutes the joint sector, recent discussion on the subject is unanimous regarding the origins of the concept, in the context of Indian industry, in the Dutt Committee Report. This view is at variance with our findings. The concept of the joint sector did not suddenly emerge in 1969; it has evolved over time. It is to an examination of the evolution of this concept that we now turn. We take this opportunity to clarify some vagueness and much confusion that has crept into recent discussion on the *content* of the joint sector.

We confine ourselves here to some basic observations regarding the genesis and evolution of the joint sector.

(a) The concept did not originate in the Dutt Committee Report. It is implicit in the Industrial Policy Resolution of 1956 wherein mixed enterprises were envisaged in each of the three Schedules of industries demarcating the areas of operation of the public and private sectors. But in a concrete form, the concept as well as the term, was first suggested by a study group appointed by the Maharashtra government in September 1960 in connection with preparation of Maharashtra's Draft Third Plan. The study group submitted its report[11] in May 1961. The report was accepted[12] and six joint sector projects[13] were implemented in the Maharashtra state's Third Plan involving a total investment of about Rs 10 crores in the state public sector and the joint sector put together. What is interesting and revealing is that the study group was headed by the then President of the FICCI, R G Saraiya, and included Naval Tata[14] as one of its members. The joint sector is being advocated today as an instrument of control of monopoly. But it is precisely the representatives of Indian monopoly capital

who first suggested the concept in a concrete form.

The Saraiya Committee Report may not be much known to academic economists. But it seems to have been the precursor of ideas on the joint sector preached by the Tata Memorandum on Industrial Growth and as practised by several state governments. There are three essential aspects where the Saraiya Committee's influence can be detected: (i) the necessity of government partnership and promotion in industries and (backward) areas where private capital is not likely to venture on its own, (ii) the equity ownership formula of 26 per cent for the state government, 25 per cent for the private promoter and 49 per cent for the investing public, and (iii) the stipulation that management of the enterprise should essentially remain with the private promoter.

(b) It is equally interesting to find that simultaneously with Saraiya and Naval Tata's advocacy of the joint sector, John P Lewis — an important influence on United States foreign economic policy — was thinking on similar lines, even when he was not using the same terminology. In his "Quiet Crisis in India: Economic Development and American Policy", first published in 1962, John P Lewis observes:

> "The private-sector vs public-sector issue as such has been greatly overplayed. The recent drift of Indian government policy has been markedly toward a rapprochement with major private enterprise, and the private sector's effective opportunity for expansion is secure, at least for the time being. The question of the private sector's long-term share of productive activity is due to become increasingly blurred as private and public enterprises overlap one another in the form of mixed enterprises ... They constitute a broadening middle zone between 'purely private' and 'purely public' enterprise, from which anyone concerned with the practical affairs of the Indian economy can ill afford to stand aloof."[15]

(c) Recent discussion on the joint sector has centred around the Dutt Committee's concept. However, the Committee's approach[16] has not always been correctly represented.

The Dutt Committee observed (i) that the growth of the public sector in India has not occurred to the extent envisaged, especially in industries included in Schedule B of the 1956 Industrial Policy Resolution, due mainly to a lack of funds, and (ii) that, at the same time, the growth of the private sector, especially the monopoly sector, has been predominantly financed by public-sector financial institutions. On the basis of these observations, the Committee recommended the mixed public enterprise as the most suitable form of development of Indian industry without increasing private concentration. Such mixed public enterprises would be regarded as belonging to the public sector.

For the time being, however, the Committee felt that the joint sector should be resorted to. The joint sector would include units in which both public and private investment has taken place and where the State takes an active part in direction and control. How the State would play this active part was left unspecified, except for the possibility of conversion of public loans into equity and the necessity of creation of a cadre of trained full-time Public Directors.

(d) The manner of argumentation in the Dutt Committee brings out sharply the two contending tendencies in government policy: one arguing for a greater and more explicit role of the public sector, and the other arguing for the enlargement of the role of the private sector but of course with public

(b) For 1966-71: Author's computations based on data given in various issues of *Company News and Notes.*

* Upto 1960-63 the data relate to capital offered for subscription to general public which is to be distinguished from the portion actually subscribed to by the public. Capital offered includes the amount ultimately subscribed by underwriting institutions. For 1966-71 the data relate to capital subscribed by the public and by non-Government underwriters.

** The amount subscribed by government financial institutions through underwriting devolvement is not available for the periods 1955-59 and 1960-63 and has been estimated for the period 1966-71 by distributing 80 per cent of capital subscribed by all underwriters to government financial institutions and the remaining 20 per cent being included under 'general public'.

funds and some semblance of public control.

One such proponent of the latter approach is H K Paranjape. Despite having been a member of the Dutt Committee, Paranjape now makes it out[17] as if the Dutt Committee recommended the joint sector as the optimum instrument of development of Indian industry. But the truth, as we have seen, is that the Dutt Committee recommended the joint sector *only* as an intermediate measure, a second-best alternative to the mixed public sector which was in fact advocated as the first-best instrument.

It is true that Paranjape is (i) for the extension of the joint sector concept to existing companies in the large industrial sector through *retrospective* conversion of public loans into equity, *and also (ii)* for professionalisation of their managements through break-up of dysfunctional inter-connections with family groups or controlling houses. But the net effect of all this is: the joint sector is the operational alternative both to the nationalisation of monopoly houses and to the explicit expansion of the public sector. The terminology is indicative: the joint sector should be treated as a "national enterprise". This is the new idiom of the Indian mixed economy. At one stage Paranjape pleads: "There is no reason for public policy to be against the large professionally managed company". But it all depends on what is the object of public policy. To counterpose: Is there any reason why public policy should be against increase in the concentration of private economic power?

Paranjape seems to take up cudgels with the Tata Memorandum regarding its "public funds-private management" approach to the joint sector but himself leaves undefined the nature of management, beyond a point. According to Paranjape: "The management would be largely professional, the State through its financial institutions exercising control to make sure that a good management is appointed and supervising the results achieved." What is good about professional management in an economy hitherto dominated by a few monopoly houses? Or has the Berle-Means 'managerial revolution' arrived? What is the meaning of State supervision? Public audit and Parliamentary accountability are some such forms but Paranjape is for 'autonomy' of joint sector enterprises and against making them 'government companies' in the legal sense of the term.[18] The crux of management in any single enterprise is its monolithic nature: dual management renders an enterprise ineffective.[19] Nowhere does Paranjape specify the mechanism of resolving public-private conflict in decision-making within a joint sector enterprise.

Source: Company News and Notes, various issues.

The real content of Paranjape's arguments comes out sharply when the similarities between him and the Tata Memorandum are identified[20] regarding (i) the scope of the joint sector, (ii) public sector functioning and bureaucratic inefficiencies, and (iii) the possibility of the joint sector replacing the existing public sector.

(i) *Scope of the Joint Sector:*

Tata: The very fact that in any specific case, government favour a joint sector solution must surely indicate that they believe that management by the private sector partner will be better than public sector management.

Paranjape: To set up new public enterprises to take up growth in areas where existing private enterprises can provide an excellent growth nucleus cannot but be wasteful.

(ii) *Alternative to Bureaucratic Inefficiencies:*

Tata: Joint sector enterprises should not be burdened with the cumbersome and time-consuming procedures enforced in public sector enterprises.

Paranjape: The development of the Joint Sector as an important form of business organisation should also help us to get over the major inadequacies of the public sector. The public sector enterprises have many a times been observed to be "public" but not "enterprises". Many of them suffer from the maladies of bureaucratic approaches and procedures.

(iii) *Replacement of Public Sector by Joint Sector:*

Tata: We see no reason why government, with a view to releasing funds for other priority projects, should not think of taking opportunities of divesting themselves of a monetary share of public sector enterprises, which would then become one form of joint sector enterprise.

Paranjape: We may even think of gradually converting existing public sector enterprises into joint sector units. This may be done by selling a part of the equity of these units to private individuals.

(e) The joint sector is no longer just a concept. Starting from Maharashtra during its Third Plan, state governments have been vigorously implementing a large number of joint sector enterprises. A few such enterprises promoted by the Central government are also under implementation. Certain features of the working of the joint sector need to be highlighted.

(i) Most of the projects relate to medium-sized investments of Rs 1 crore to Rs 10 crores in short gestation consumer goods industries such as cotton textiles, battery cells, beer, cigarettes, scooters, etc. Those which are exceptionally large investments relate to long-gestation projects in basic industries listed in Schedule B of the 1956 Industrial Policy Resolution, e g, TISCO's Rs 800 crores proposed steel expansion project and Gujarat State Fertilisers' Rs 50 crores fertilisers project.

(ii) In almost all cases the main private collaborators are those belonging to already well-established industrial houses. However, there is an observed difference regarding the geographical areas of operation of the various industrial houses, depending on whether the joint promoter is a state government or the Central government. In enter-

prises promoted by state governments, it is not the largest industrial houses in India which necessarily dominate but rather houses or companies with regional importance, e g, the predominance of South India-based houses such as API, Muthiah, Murugappa Chettiar, Thiagarajah and Shri Ambica in joint sector enterprises promoted by Tamil Nadu, Andhra and Karnataka governments and the corresponding importance of North-ern India-based houses such as Sri Ram, Raunaq Singh, Oberoi, Anand and Oswal in projects promoted by Punjab, Haryana and Rajasthan governments. The top-most houses like Tata, Birla and Bangur with all-India dispersal in the location of their industries, have been associated in proposed projects to be jointly promoted by the Central government.[21]

(iii) In practice, joint sector enterprises are indistinguishable from other private sector enterprises. For instance, it turns out that Bharat Forge (Kirloskar) and Mahindra Ugine Steel (Mahindra) are joint sector enterprises. In certain cases established joint sector enterprises are taken over fully by the erstwhile private promoters, e g, Kerala Spinning was jointly promoted by the Birlas and Kerala State Industrial Development Corporation (KSIDC) but subsequently the Birlas took over the equity of KSIDC. This case of conversion of the joint sector into the full-fledged private sector is extremely portentious of future trends.

(iv) Some interesting and revealing features of the working of joint sector projects promoted by the Punjab State Industrial Development Corporation have come to light in a recent report.[22] The conclusion drawn in this report is that the concept has been distorted such that it is the already well-established elements within the private sector which are promoted in various ways and derive the main benefit.

From this review of the evolution of the joint sector in India, the conclusion emerges that essentially it is no different from the mixed private enterprise which has proliferated in the Indian private sector since the emergence of public financial institutions as the principal source of finance and underwriting. What is perhaps new about it is that is represents a shift in emphasis away from the public sector as an instrument of economic and social policy. At the same time the joint sector has been proclaimed by the government as an instrument of "reducing the concentration of economic power".

The question thus arises: what is this policy instrument which within the framework of a mixed economy seeks to control monopoly in principle and replace the public sector in practice? To understand this paradox it is necessary to have some idea of the experience of industrial policy in post-1947 India *vis-a-vis* the stated objective of control of monopoly. This we shall attempt to do in the next section.

II

Control of Monopoly in India: Precept and Practice

The nature of industrial policy in post-1947 India *vis-a-vis* the control of monopoly is only illustrated here, rather than discussed exhaustively.

Industrial Policy Resolution of 1956

The basis of industrial policy in India is the Industrial Policy Resolution (IPR) of 1956 and practically all changes or innovations in industrial policy can be traced to it. The IPR had two major stated objectives: namely to achieve a rapid self-sustaining rate of growth of the economy and the reduction of social inequalities. From these policy objectives there seemed to follow certain specific policy prescriptions. For achieving a rapid rate of growth of the economy it was necessary to develop basic and machine-making industries. It was also decided to assign the major role to the public sector and about the nature of private ownership itself, to prevent the growth of monopolies and concentration of economic power. In addition, the respective roles of the public and the private sectors in different industries were defined by classifying industries into three categories.

Strategic or growth-inducing industries were to be the prime responsibility of the public sector. There was, however, the flexibility clause for possible private entry into such industries at any future date. The private sector's main area of operation would be consumer's goods and machinery for consumer's goods industries. Private sector investment in all categories of industries, and especially in the third category, would be facilitated by the State through the provision of transport and power and especially of institutional finance. State participation in private sector's equity capital was stipulated in case of private entry in industries in Schedules A and B and was not ruled out for industries in the third category.

It is possible to look for a consistent logic behind these policy prescriptions based on the credibility of the government's intentions. It would then seem that rapid growth in an underdeveloped economy characterised by stagnant export earnings gives rise to the *technical* necessity of developing a domestic capital goods sector at the outset. Such is the logic of the physical aspect of savings. However, this emphasis has to include within its scope a balanced development of agriculture and industry and balances between different sectors within industry, in keeping with the technological co-efficients of production, and also balances with respect to time lags and foreign exchange.

Such technical possibilities cannot, however, be attained under any *institutional* conditions. The need for emphasis on a genuine public sector and the corresponding control of monopoly arises especially because (a) the private sector is not likely to initiate the development of basic and mother-machinery industries and economic overheads, especially infrastructure, crucial for rapid economic growth, (b) public ownership of such strategic industries is crucial particularly when the private sector is essentially monopolistic and hence in a position to restrict current output as well future capacities with disastrous effects on the attainment of physical balances, and (c) the distribution of the means of production within the private sector and as between the public and private sectors determines the distribution of national income as between wages and profits and this in turn determines the rate of savings and the volume and composition of consumption in the economy. The classification of the respective areas of operation of the private and public sectors broadly follows the above logic: the higher the strategic or growth-inducing importance of any industry the more likely is its inclusion in Schedules A or B.

Such would be one *a priori* interpretation of the internal consistency of the IPR. Its validity of course would depend on the manner of implementation of the totality of the programme rather than fulfilment of its parts. A verification of this ultimately revolves

on the actual results and the extent to which the resulting industrial struture conforms to that envisaged. It would also reflect in terms of the flexibility or rigidity of the approach and the nature of the policy instruments. Already a certain flexibility in favour of the private sector is discernible in the IPR. While it envisages a predominant role for the State sector in order to prevent monopolies and concentration, simultaneouly it allows the private sector to develop and expand "as an agency for planned national development". Similarly, the IPR recognises the necessity to control and regulate the private sector, but it also considers it "desirable to allow such undertakings to develop with as much freedom as possible, consistent with the targets and objectives of the national plan". Further: "The division of industries into separate categories does not imply that they are being placed in water-tight compartments".

The alternative interpretation stemming from such observations would be that the IPR is quite *consistent* regarding the growth and development of monopoly capital. The development of mother-machinery and basic industries and infrastructure, especially power and communications, in the public sector is quite consistent with the initial requirements of growth of the private sector, particularly monopoly. They would be developed under State ownership only to the extent required. When monopoly is capable enough to enter such high-risk industries on its own then public sector development is no longer required so explicitly. That is where the joint sector is presumed to emerge. Similarly, the different policy instruments were so designed as to aid the development of monopoly.

We will first consider briefly the character of the actual industrial structure that has emerged and then examine the nature and operation of industrial licensing and institutional financing as illustrative of instruments of policy.

Let us note in brief the characteristics of the industrial structure that has emerged during the past 15 years.

Physical Aspect: There has been under-fulfilment of both capacity and production targets for the Plans, especially the Third and Fourth Plans, in the case of crucial basic and mother-machinery industries, underfulfilment in the production targets of essential goods, and over-fulfilment of capacity targets for luxury industries and industries producing machinery for consumers goods. The envisaged emphasis on basic and mother-machinery industries has not taken place, particularly in the Third Plan, but the plans for infrastructure and communications have been fulfilled. The emerging industrial structure is being increasingly geared to the production of luxury goods. In addition, the structure is physically disbalanced and distorted with a lack of correspondence as between complementary capacities.

Institutional Aspect: The relative area of operation of the public sector is declining since the beginning of the Fourth Plan. On the other hand, the dominance of the large industrial houses is on the increase (see Table 1). The breakdown of the demarcation of the respective roles of the public and private sectors as envisaged by the IPR[23] is indicative of the distortions emerging in the institutional structure. Of the 17 industries listed in Schedule A of the IPR, at least 11 were opened to private interests, for example arms, heavy-electrical plant, heavy plant and machinery, heavy castings and forgings, mineral oils, electricity generation, ship-building, etc. Of the 12 industries listed in Schedule B, in at least 9, the private sector (and especially the monopoly houses) have played the dominant role contrary to what the IPR envisaged as in aluminium, machine tools, basic chemicals, drugs, synthetic chemicals, etc.

Let us now illustrate the role of policy instruments in the implementation of the IPR with reference to industrial licensing and institutional financing.

Industrial Licensing

An industrial licence is the government's permission to an intending investor in fixed capital above a certain size to set up a new unit or to expand or diversify an existing unit. Industrial licensing has been operating since the Industrial (Development and Regulation) Act of 1951 but it became important in 1956, on the eve of industrialisation, when the IPR was enunciated and the Second Plan launched.

Ideally, industrial licensing should be able to:

(a) determine the volume and pattern of private investment, so as to fulfil that component of Plan targets meant for the private sector;

(b) prevent the growth of monopoly by controlling the investments allocated to monopoly; and

(c) maintain the respective roles of the private and public sectors as defined in the IPR by preventing the entry of the private sector in Schedule A industries and by controlling its entry in Schedule B industries, assigning to it a relatively lesser role than the public sector.

This would be the theoretical rationale of industrial licensing. In practice, however, it has had the following characteristics.

(a) An industrial licence is in the nature of an investment intention only. There is no commitment on the part of the licencee to implement the project or to complete it by an appropriate date. Effective steps (as defined) regarding licence implementation are meant to be taken within time-limits, but in practice liberal extensions have been granted. Unimplemented licences can be revoked but there is no other penalty.

(b) The precise relationship between Plan targets and priorities and licensing as an instrument to implement them was never worked out. Instead of government inviting applications for licensing required capacities, applications were considered as and when they were received. The time-phasing of investment and the corresponding time-phasing of licensing does not appear to have been taken care of.

(c) Applications of licences were considered on a 'first come, first served' basis, i e, licensing was sequential.

(d) The availability of foreign collaboration and finance seems to have been implicitly accepted as a criterion for preferring an application.

Now let us see what these characteristics implied for the working of the industrial licensing system.

(i) Industrial licensing as it worked out could only allocate rather than determine private investment in terms of its volume, composition and timing. Other complementary instruments are required to determine private savings and its transformation into precise types of investment maturing with appropriate time-lags. Industrial licensing by itself has been inadequate for fulfilling the physical balances essential for the Plans to succeed.

(ii) In the absence of clear-cut criteria for using industrial licensing to imple-

ment the Plans, the commodities and the capacities licensed have had little correspondence with Plan targets. Both over-licensing and under-licensing in particular industries has been practised. Over-licensing failed to prevent underfulfilment of Plan targets: on the contrary it may have generated fear of excess competition and deterred implementation of many licences.[24] Licensing could not ensure the creation of targeted capacities in priority industries such as cement and fertilisers, at the same time as it failed to prevent the overfulfilment of Plan targets in less essential industries such as synthetic textiles and vanaspati (sometimes even through unauthorised capacity creation in excess of licensed capacity).

(iii) Sequential licensing and preference for applications with foreign collaboration and finance meant that there was a built-in-bias in the licensing system for large industrial houses. Through multiple and early applications in different lines simultaneously and through vigorous pursuit of these licences up to the stage of approval, large industrial houses were able to corner a disproportionate portion of the licensable capacity only a small fraction of which was implemented. This is the phenomenon popularly described as preemption by monopoly.

According to the Dutt Committee Report, whereas the top 20 industrial houses (consisting of 1,125 companies) accounted for 31 per cent of the paid-up capital in the private sector in 1958, they obtained 41 per cent of the value of investment licensed between 1956 and 1966. The corresponding shares for the 24,560 unaffiliated small and medium companies were 45 per cent and 36 per cent respectively. On the basis of data given in the Dutt Committee Report it has been estimated by the author elsewhere that about half of the capital goods import content of licensed investment was actually applied for by the top 20 large industrial houses at the stage of CG licensing. The conclusion that can be drawn is that monopoly succeeded in licensing *double* the volume of investment it was capable of or intended implementing.

From the viewpoint of Indian monopoly, such significant pre-emption meant that (a) its potential competition was significantly reduced and (b) its capability to adjust and reverse its investment decisions (necessitated by different kinds of uncertainties inherent in the investment process) was correspondingly strengthened. It is also true that such pre-emption flowed from the properties of the licensing system itself, like absence of follow-up measures, easy extension of time-limits and absence of penalty in case of non-implementation. Licensing regulated entry into industry to the advantage of Indian monopoly.

Thus it is clear that the licensing system far from controlling the volume and pattern of monopoly's investment, was in fact instrumental in contributing to monopoly power.[25] It is possible to argue that from the beginning that was the purpose of licensing and changes and modifications in licensing rules can be directly traced to the changed requirements of Indian monopoly.

For example, licensing from the beginning reduced primary and secondary uncertainty for monopoly's investment, but not necessarily that of the rest of the private sector. Since licensing is normally done according to demand projections and inter-industry balances, investment can proceed on the basis of assured demand. Excessive investment by monopoly is curtailed, if not eliminated. But monopoly's advantage is precisely that these effects or results are not symmetric as between monopoly and small business. The capacities licensed for small business are normally ancillary to those licensed for monopoly such that small business suffers from the uncertainties of implementation of monopoly's investments, given a situation of significant preemption.

A large number of industries were delicensed during the recessionary years of 1966-1968. The ostensible purpose behind this policy change was that in the context of a lower inducement to invest on the part of the private sector, delicensing would remove one constraint to investment and reduce the gestation lag of investment. It is clear, however, that this effect would operate in the case of the large industrial houses but not in the case of small business. It is the inducement to invest of small business in particular which is practically eliminated by a recession, whereas the inducement to invest of monopoly is only reduced but not removed. Thus if any investment is actually undertaken during a recession it is likely to be mainly that of monopoly. Thus monopoly's share of fixed capital in the private sector is *encouraged* to increase during a recession through delicensing.

With the ostensible purpose of "facilitating fuller utilisation of installed capacity" government permitted industrial undertakings in January 1972 to expand production upto 100 per cent of the licensed capacity (including the 25 per cent allowed earlier in December 1967). These relaxations were subject to the conditions: (a) no additional capacity was installed except minor balancing equipment, (b) no additional expenditure of foreign exchange was involved, and (c) there was no additional pressure on scarce indigenous raw materials. This amounted to rationalisation of unauthorised capacity in excess of licensed capacity created by a number of large industrial houses, the facts of which had been highlighted by the Dutt Committee Report.

Whereas the Dutt Committee recommended that larger industrial houses be restricted to what it termed the 'core sector', the government's February 1970 policy statement defined a wider area of operation for these houses. They could enter not only 9 core industries but also the 'heavy investment' sector. Whereas the 'core sector' broadly related the basic and mother-machinery industries, the 'heavy investment' sector related not to types of industries but to the size of investment, i e, those worth Rs 5 crores and above. The entry of the larger industrial houses into luxury industries was permitted in this way.

By its redefinition of the larger industrial houses and by its re-demarcation of the sectors of industries open to these houses, the government's industrial policy statement of February 1973[26] made the expansion of these houses easier and covered a wider area relative to the previous February 1970 policy.

Consider finally the change introduced in November 1973 whereby all the approvals for licensing and associated aspects like foreign collaboration, foreign exchange requirements, capital issue consent and CG licence can all be applied for simultaneously and also cleared simultaneously. This would considerably reduce the bureaucratic lags in investment and thereby increase the scope of monopoly's intentional delays even more. This change, it is interesting to note, has been brought about as a result of the demand made by FICCI more than a year prior to the change.[27]

The conclusion emerges that licensing far from being an instrument of control, has been in fact an instrument for the promotion of monopoly.

Institutional Finance

The IPR of 1956 had provided for public financial assistance for purposes of private investment, it seems, as a means to supplement internal accumulation within the private sector. What has actually happened is different. First, apart from foreign sources, public financial assistance has emerged over time as the major source of investment finance for the private sector. Secondly, the most significant part of this public financial assistance has gone to the monopoly sector comprising the various large industrial houses. From an analytical viewpoint, it can be argued that institutional finance has substantially reduced the constraining influence on investment operating from the side of external finance as enunciated by Kalecki's "principle of increasing risk".[28]

We restrict ourselves here to certain significant facts and features.

Table 2 shows the sources of long-term finance for new companies approaching the capital market through prospectuses, over the time-periods 1955-59, 1960-63 and 1966-71. It is clear that next to foreign sources, particularly foreign financial institutions, government sources are significant, especially as a source for share capital. If, in the period 1966-71, banks are included as part of the public sector, then it is observed that the public sector's share in total investment finance increased from around 8 per cent in 1955-59 to about 24 per cent in 1960-63 and then to 35 per cent during 1966-71.

From Table 2 the impression is created that the public sector's share in long-term loans has remained constant, if not reduced, between 1960-63 and 1966-71. The picture is clarified by Table 3. This Table compares the role of underwriting by public financial institutions, in capital raised by new as well as old private sector companies between the Third Plan period (1960-61 to 1965-66) and the next five-year period (1966-67 to 1971-72). The conclusion emerges that public financial assistance is increasingly taking the form of assistance devolving through underwriting rather than in the form of direct long-term loans. It is recognised[29] that assistance devolving through underwriting is a cheaper form of finance than normal loans.

That the major part of public financial assistance went to the monopoly sector is brought out clearly by the Dutt Committee Report.[30] Of the total public financial assistance disbursed in various forms between 1956 and 1966, 42 per cent went to the 73 large industrial houses and 20 per cent to the 20 largest houses. The share of the monopoly sector in specific forms of public financial assistance was even more significant. In assistance devolving through underwriting of shares and debentures, 53 per cent went to the 73 large houses and 36 per cent to the 20 largest houses. In foreign currency loans — which are crucial for fixed capital investment given the fact that the average import intensity of fixed capital investment in Indian industry is around two-thirds — the respective shares of the 73 large houses and the 20 largest houses were 53 per cent and 28 per cent.

The Dutt Committee's data relate to the period upto 1966. The trend has not changed thereafter, as is indicated by a combined picture[31] of the long-term loans disbursed by four public financial institutions (IDBI, IFCI, ICICI and LIC) from their inception upto 31st March, 1972. It is seen that the 73 large houses received 42 per cent of the total loans disbursed by these institutions. The 7 top receiving houses (Mafatlal, Birla, Tata, Bangur, ACC, ICI and Parry) obtained 18 per cent.

Here it is relevant to mention the practice of pre-emption of institutional finance by certain large industrial houses, as revealed during the recent public hearings of the Sarkar Commission.[32] Such pre-emption takes the form of reservation of institutional finance (at the time of its sanction irrespective of its disbursement) by a large industrial house without any commitment to actually making the investment for which the finance has been sanctioned. The effect of such pre-emption — analogous to the effect of pre-emption of industrial licences — has been to reduce the availability of institutional finance for other licencees and also to increase the capability of the individual monopolist to adjust and move, when required, from one investment plan to another. In sum, both forms of pre-emption have contributed to the growth of the power of the large industrial houses.

The conclusion emerges that the operation of public financial institutions has contributed to the growth of Indian monopoly. It may be argued, however, that earlier public financial institutions were never meant to control monopoly. But ever since government's industrial policy statement of February 1970 wherein the principle of conversion of public loans into equity was enunciated — so the argument goes — the large-scale private sector has been wary of growing on the basis of predominent institutional financing. The contention is that "fearing nationalisation through the backdoor" the private sector has been expeditious in the repayment of public loans. The *RBI Bulletin's* study[33] on the finances of joint stock companies is cited as evidence. There we find that between 1965-66 and 1970-71 the debt of these companies to the public financial institutions as a proportion of their total assets has been falling and sharply falling between 1969-70 and 1970-71.

The observation is correct but the interpretation is not. Ever since the recessionary years of 1965-66 to 1967-68, there has been a slow-down of actual fixed capital investment in the Indian private sector. Thus *new* loans from the public financial institutions were considerably reduced both in number as well as total quantum. Thus net debt — which is the resultant of repayment of old loans and the obtaining of new loans — to the public financial institutions was declining, in relative terms if not absolutely.

It is not fear of conversion of public loans into equity which was operative. Rather new investment was not occurring much. New investment slowed down because of the slow down in investment decisions during the recessionary period, allowing for the observed lag between investment decisions and actual investment in Indian industry. There was a recovery in the volume of investment decisions since 1969-70 — as indicated by the volume of licence applications, foreign collaboration approvals, capital issue consents, CG licences and sanctions of public financial institutions. Because of the gestation lag, actual investment was yet to pick up. This process has started from about 1970-71 as indicated by disbursements of public financial institutions, the raising of capital and imports of machinery.[34] Despite the continuance of the *principle* of conversion of public loans into equity, an increasing proportion of private investment in Indian industry is being financed by the public financial institutions, as we have seen earlier.

The operation of industrial policy *vis-a-vis* the stated objective of control of monopoly can also be illustrated with respect to other policy instruments such as foreign exchange control, price fixation and tax policy. The abolition of the managing agency system,[35] the nationalisation of banks and the establishment of the Monopolies Commission can also be considered. The conclusion will not be altered thereby: that industrial policy in post-1947 India has differed as between its precept and its practice. Industrial policy even when it was stated to be an instrument of control of monopoly, has not succeeded in doing so and sometimes, in fact, it

has been an instrument for the development of monopoly.

The question that now arises is: what is the rationale of the joint sector as a new instrument of industrial policy? Even if the experience of industrial policy in India make us suspect that it is an instrument for the growth and consolidation of Indian monopoly capital, the question still remains: what is the need for a new policy? We shall seek to answer these questions in Section III in relation to the problems of development of Indian monopoly subsequent to the recent recessionary period, the period of capitalist crisis.

III

Timing and Rationality of the Joint Sector

It has been observed that the joint sector was first suggested in a concrete form in 1961 by the Saraiya Committee Report in order to facilitate private investment in Maharashtra State, particularly investment by industrial houses such as Kirloskar, Mahindra and Khandelwal. The concept was thereafter revived in 1969 by the Dutt Committee Report and accepted by the government in its industrial policy statement of February 1970. The Tatas and the FICCI in their 1972 memoranda to the government accepted the proposal in principle and specified their approach to the joint sector. The question arises: what explains the timing of the revival of the joint sector concept? Is it possible to relate this revival to happenings within the private sector, especially the monopoly sector, in the immediately preceding period?

It is possible to identify the 4-year period, 1964-65 to 1967-1968, as a period of crisis for the Indian private sector including the monopoly sector, with recovery starting from the latter part of 1968-69. Without trying to look into the *causes* of this crisis, it is possible to have some indication of the *nature* of the crisis. We restrict ourselves here to the following indicators.

(i) The share of profits in national income declined (see Table 4) between 1963-64 and 1967-68 for the private sector as a whole (RBI's sample) as well as for leading industrial houses such as Tata, Birla and Mafatlal[36]

(ii) The profit margin as well as the profit rate declined (see Tables 5 and 6)° between 1963-64 and 1968-69 for the private corporate sector as a whole and between 1963-64 and 1967-78 for monopoly houses like Tata, Birla and Mafatlal.

(iii) The rate of growth of sales declined between 1963-64 and 1968-69 and capacity utilisation also declined substantially in a large number of industries.

TABLE 4: SHARE OF PROFITS IN NATIONAL INCOME (GROSS PROFIT BEFORE TAX AS PERCENTAGE OF NATIONAL INCOME)

Category	1963-64	1964-65	1965-66	1966-67	1967-68	1968-69	1969-70
(1) RBI Sample*	4.74	4.30	4.25	3.69	2.89	2.95	3.28
(2) Tata	0.28	0.25	0.26	0.20	0.16	0.18	0.19
(3) Birla	0.25	0.22	0.26	0.23	0.18	0.21	0.24
(4) Mafatlal	0.035	0.028	0.033	0.027	0.016	0.042	0.058

* The RBI series is neither uniform nor continuous. It pertains to two different samples of companies, one pertaining to the period 1960-61 to 1965-66 and the other to 1965-66 upto 1970-71.

TABLE 5: GROSS PROFIT MARGIN (I E, GROSS PROFIT AS PER CENT OF SALES)

Category	1963-64	1964-65	1965-66	1966-67	1967-68	1968-69	1969-70
(1) RBI Sample*	10.2	9.9	9.7	9.5	8.3	7.9	8.6
(2) Tata	13.4	12.6	11.6	9.6	7.9	8.3	8.7
(3) Birla	14.9	13.6	14.2	11.8	10.6	11.6	11.9
(4) Mafatlal	12.1	10.4	14.1	5.7	2.9	10.1	18.8

° The definitions of gross profit margin are somewhat different as between the RBI sample and our sample relating to Tata, Birla and Mafatlal.

TABLE 6: GROSS PROFIT RATE (I E, GROSS PROFIT AS PER CENT. OF NET WORTH)

Category	1963-64	1964-65	1965-66	1966-67	1967-68	1968-69	1969-70
(1) RBI Sample*	9.5	9.3	8.8	9.0	7.1	6.8	9.3
(2) Tata	11.2	10.8	11.3	10.0	8.9	9.2	9.4
(3) Birla	15.6	14.3	14.9	14.4	12.2	12.4	12.4
(4) Mafatlal	10.9	9.6	10.7	14.4	8.2	17.9	20.2

° Definitions of gross profit rate differ as between the RBI sample and our sample for Tata, Birla and Mafatlal.

(iv) The indivisibility of investment — both technically and financially — has been rising rapidly.[37]

(v) The volume of new investment intentions started declining from 1963-64 and this trend continued upto 1969-70 when there was a recovery. This is indicated by data on new licences issued, foreign collaboration approvals, and capital issue consents.

(vi) The rate of growth of actual fixed capital investment was high during 1966-67 but thereafter there was a decline which continued upto 1970-71.[38]

The discrepancy between trends in investment decisions and actual investment in Indian industry is explained by the considerable time lag between initial investment intentions and actual investment. The size of this time lag — 4 to 5 years on the average — is explained not only by *frictional* delays arising from technological and bureaucratic factors but mainly by *intentional* delays arising from monopoly's significant capacity to pre-empt industrial licences, foreign collaboration approvals, institutional finance, etc. Thus it is seen that whereas current corporate performance — relating to profitability, share of profits in national income, rate of internal accumulation — does influence current investment intentions, it does not determine current actual investment.

(vi) The Indian private sector's, especially Indian monopoly's, bargaining power *vis-a-vis* foreign monopoly capital has reduced substantially since the period of capitalist crisis. This is indicated by the sharply rising proportion of foreign equity in new consents for equity issue. It is also noticed that when an investment project gets delayed in the process of its finalisation, its foreign exchange cost rises. This occasion is used by the foreign collaborator to increase its equity participation in the new enterprise, both absolutely and relatively. This is indicated by frequent changes in capital issue consent[39] relating to certain Birla companies: Bihar Alloy Steel, High Quality Steel, Indo-Newall Machine Tools and Universal Tyres. In all these projects, the foreign collaborator succeeded in raising its relative equity participation over time, but ultimately the Birlas did not implement any of these projects.

From an analytical viewpoint, although the "principle of increasing risk" does not operate in Indian industry so far as institutional finance is concerned, it is likely to be valid in relation to foreign equity participation. An increase in the proportion of foreign equity increases the share of profits to be foregone by the Indian monopolist — this reduces the expected profits from any investment project and hence reduces its attractiveness.

If the characteristics of the joint sector are examined, then it follows that they are designed to meet the above problems thrown up by the recent capitalist crisis.

First, increasing indivisibility of investment increases monopoly's need for institutional finance. For example, TISCO expanded its steel capacity in 1959 by 1 million tons which was worth Rs 100 crores. The current TISCO expansion scheme relates to 2.5 million tonnes with total investment worth almost Rs 800 crores.[40] Even though the Tata house's total investible surplus is considerably more in 1974 than in 1959, the project is beyond the Tatas, on their own. A 15 per cent minimum promoter's contribution in any new investment — as laid down by the Indian Companies Act — would require Tatas to invest Rs 120 crores at the least. If, however, the project is in the joint sector then the Tatas need to invest only Rs 60 crores and still have management and control in their hands. The total assets of the Tata house now is about Rs 800 crores so that an investment of Rs 60 crores in the steel expansion project would double Tata's assets.

Let us examine this logic more closely. The debt: equity ratio in any large investment project is normally 2: 1 (two parts debt and one part equity). Numerically, in a Rs 100 crores project, Rs 66 crores is financed by loans, debentures and preference shares, whereas Rs 33 crores comes from equity. In order to satisfy the requirement of Company Law regarding minimum promoter's stake and also to retain majority control, earlier an Indian monopolist like Birla used to invest about Rs 17 crores in terms of equity. The rest of the funds used to come from public financial institutions, the foreign collaborator and the general public. In the joint sector, however, there is joint promotion by the government and the private promoter. Now it is possible for Birla to start a new Rs 100 crores investment project in the joint sector with an investment of about Rs 8 crores corresponding to its 25 per cent equity participation. The government and the public financial institutions now invest about 8 per cent more of required finance, than earlier.

The joint sector thus halves the private promoter's investment in any new project.[41] With a given amount of investible surplus, in the joint sector it becomes possible for a large industrial house to *double the number* of its projects than possible earlier. Thus not only the area of investment is enlargened, risks are also spread out over a larger number of projects and industries. Monopoly's inducement to invest is raised.

Secondly, joint promotion by the government and the "use of its good offices" to expedite the project in different ways reduces the bureaucratic element in the investment lag. Thus the monopolist's own capacity to adjust and reverse his investment decisions is correspondingly increased.

Thirdly, in relation to foreign monopoly capital, the joint sector's bargaining power is enhanced. In any case, foreign equity participation is restricted to 20 per cent.

Fourthly, the joint sector is a means to expand the areas and spheres of operation of Indian monopoly relative to the public sector without a corresponding reduction in the volume of public investment. Having consolidated itself in traditional consumer's goods industries and machinery for consumer's goods industries, Indian monopoly would now seek to enter and dominate the mother-machinery industries and basic industries, but they cannot do so on their own. These are also the industries mainly listed in Schedule A or B of the 1956 Industrial Policy Resolution. The joint sector would make entry of Indian monopoly into such industries possible through greater financial assistance and other means of promotion, without modification of the IPR of 1956.

Finally, the joint sector would become an alternative to the nationalisation of monopoly houses. Such nationalisation of monopoly houses is both institutionally necessary and technically possible. It is institutionally necessary because the elimination of the monopoly houses would remove a number of constraining factors to the rapid growth of Indian industry. It is technically possible because the amount of compensation required will not be forbidding. This is so both because of the existing large government equity in monopoly houses and also because of the holding-company-structure characteristic of Indian monopoly houses. For example, in TISCO, government's equity participation is 42 per cent whereas the Tata's controlling interest of a little more than 8 per cent is held by Tata Sons Pvt Ltd, the holding company of the Tata house. Nationalisation of Tata Sons would result in the virtual nationalisation of the Tata house, or at least its principal companies.

But the propagation of the joint sector as an envisaged instrument of control of monopoly would lessen the force of the nationalisation argument. Thus the conclusion is inescapable that the joint sector is an ingenious instrument of protection and promotion of Indian monopoly capital in its crisis phase.

Appendix

FICCI's INTERNAL ASSESSMENT OF THE JOINT SECTOR

The following extracts are taken from "Note on the Concept of Joint Sector" prepared by the Standing Advisory Committee of FICCI, sometime during 1972. It was prepared on the basis of replies to FICCI Secretary's enquiry addressed to Naval H Tata, R P Goenka, K K Birla, M V Arunachalam, D C Kothari, Charat Ram, K N Modi, Raunaq Singh, H P Nanda, Bharat Ram and H S Singhania.

(i) State governments seem to have accepted the principle of leaving the day-to-day administration of joint enterprises to the managing director nominated by the private sector participants, the state nominees on the Board confining themselves to policy matters. This pattern of joint management has certain advantages in the sense that it obviates difficulties of obtaining licences and raising capital. At the same time, professional management can be made to play its useful role. It is important that this pattern of joint management is maintained in future.

(ii) A private entrepreneur is able to participate in a joint sector project with a lower amount of nucleus capital — 8 to 9 per cent of capital employed — as compared to what would be needed for setting up his own industrial undertakings — 15 per cent.

(iii) Respective powers of Chairman and Managing Director need to be defined. Otherwise it may lead to state government's interference through the state-appointed Chairman in the day-to-day management of the Companies.

(iv) The provision that state government should approve the appointment of managing director at the time of renewal of the agreement can lead to difficulties for the company since the acceptance will be subject to the predilections and prejudices of the ruling party in the state government.

Notes

[The author is grateful to S Ganguli for his guidance and also to S S Sivakumar, Shoji Ito and Jayabrata Bhattacharjee for their comments and suggestions. The author alone is, however, responsible for any errors that remain.]

1 Report of the Industrial Licensing Policy Inquiry Committee (Chairman: S Dutt), Government of India, 1969, p 187.

2 "We have obviously no bias against this [joint sector] concept and are, on the contrary, very receptive to the principle of co-operation between the public and the private sector which we believe to offer special advantages in some cases." So states the Tata Memorandum on Industrial Growth (dated May 17, 1972), printed in *Mainstream*, August 19, 1972, p 13.

3 "Joint Sector as a form of industrial organisation has considerable potentialities." See "Planning for Results", FICCI, September 27, 1972, p 40. Also FICCI's (internal) assessment of the joint sector extracts from which are reproduced in Appendix 'A' of this paper.

4 "Dalal Street Wants More of This Socialism", reported the *Economic Weekly*'s stock exchange correspondent from Bombay, commenting on the post-Avadi budget. See *Economic Weekly*, March 5, 1955, p 325, as cited in M Kidron, "Foreign Investments in India", Oxford, 1965, p 139.

5 See Samuel Paul, S K Bhattacharya and S C Kuchhal, "Joint Sector: Guidelines for Policy", *Economic and Political Weekly*, December 9, 1972, p 2416.

6 To be distinguished from a "mixed enterprise system" which refers to the nature of the economic system as a whole and not an individual company or enterprise. For a fascinating analysis of the nature of government intervention and public sector in a "mixed-enterprise system", see Meir Merhav, "Technological Dependence, Monopoly and Growth", Pergamon Press, 1969, Ch 4.

7 Although the government owns about 52 per cent of IISCO's equity, only its management was nationalised in July 1972 for a period of 3 years.

8 This is not so in every case though, e g, IISCO before the takeover or Premier Tyres where the government owns more than 50 per cent of the equity.

9 These are rough estimates based on evidence given in Dutt Committee Report, Appendices, Volume IV; *Economic Times*, October 4, 1970; "Joint Sector: Adapted to Private Ends", *Economic and Political Weekly*, July 15, 1972, p 1351; and also Shoji Ito, "Studies in Indian Zaibatsu: Roles of Inter-Corporate Investment", (Mimeo), Institute of Economic Growth, 1974.

10 In reply to the author's query, representatives of Madras Refineries, Madras Fertilisers, Lubrizol India and Triveni Structurals have categorically stated that their companies are not in the joint sector.

31 "Government Loans to Big Business", *Mainstream*, September 30, 1972, pp 10-12.

32 For details see the author's (unsigned) reports on the Sarkar Commission in *Economic and Political Weekly*: 'Public Money for Private Empires', January 12, 1974, pp 15-16 and 'Pre-emption of Institutional Finance: Procedural Red Herrings', February 2, 1974.

33 "Finances of Medium and Large Public-Limited Companies, 1970-71" *RBI Bulletin*, September 1972.

34 It can be said that the old managing agency system is being replaced by a new managing agency': the joint sector.

35 See "Economic Survey: 1973-74", Government of India, pp 15-16.

36 The data on Tata, Birla and Mafatlal provided here relate to all the first-tier companies of these houses (as defined by the Dutt Committee) which are included in the Bombay Stock Exchange Directory. The sample is hence quite representative.

37 See R K Hazari, "Industrial Planning and Licensing Policy", Final Report, Government of India, 1967, Volume 1, Text, pp 3 and 39; and also "Project Costs Skyrocket", *Economic Times*, January 19, 1973, p 1.

38 See "Finances of Large Public Limited Companies 1970-71", *RBI Bulletin*, February 1972.

39 As observed from various issues of *Quarterly Statistics of the Working of Capital Issues Control*, Ministry of Finance, Government of India.

40 If it were a 3 million tonnes expansion, then the investment would be worth Rs 1,600 crores, according to the latest project report. "TISCO Expansion Requirements", *Economic Times*, April 10, 1974, p 6.

41 This is what is being pointed out in FICCI's "Note on the Concept of Joint Sector" (see the Appendix) when it is stated: "A private entrepreneur is able to participate in a joint sector project with a lower amount of nucleus capital — 8 to 9 per cent of capital employed — as compared to what would be needed for setting up his own industrial undertakings."

Reflections of an Indian Scholar

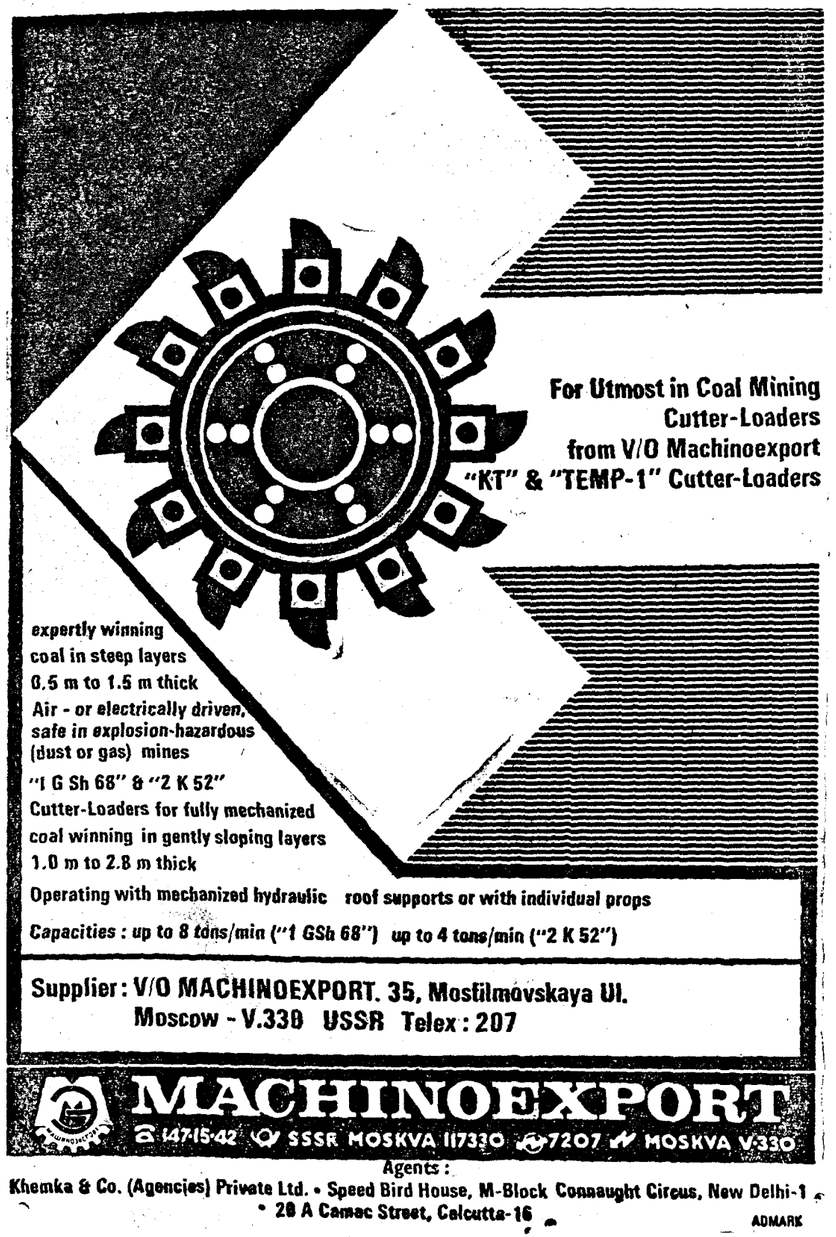
Susanne Hoeber Rudolph

In India, the author suggests, there is today a wave of what may be called cosmological nationalism, an impetus toward repossessing one's intellectual categories even as one has repossessed one's political fate and one's cultural climate.

When there is talk of an Indian sociology and an Indian political science, sometimes what is at stake is a protest against the ill fit of Western social science; sometimes a hope of uncontaminated or less contaminated indigenous categories by which to grasp reality; sometimes a wish that the social scientists and other intellectuals (Indian and foreign) shape up, do relevant social science, and support official visions of the Indian future.

Of these only the first two are relevant here. Cosmological nationalism may be, at its narrowest, merely a game for home consumption. At its best, it may be a step toward Indian participation in the reconstruction of a universal social science. The foreign area scholars who work on India and the Indian social scientists have both some unique perspective to bring to that reconstruction.

WE were a very small tribe, we American political scientists who took an interest in India in the early fifties. We could be counted on the fingers of one and a half hands: three at Berkeley, two at Harvard, one at Penn, one at Princeton, one at Wisconsin. We were off-beat in the discipline: everyone knew, and went out of their way to advise us, that professional futures lay in the politics of England and France or the US, "real" countries, with "real" political systems. An eminent constitutional lawman at Harvard advised my husband that it was OK for Susanne to take an interest in India; girls could afford to pursue whimsical interests; but serious scholars had to recognise that solid men did not throw themselves away on marginal problems. It took another ten years before the comparative study of new nations became a a strong vogue. Rupert Emerson seemed almost alone in the profession of political science at that time in lending some respectability to non-Europe.



The surrounding intellectual landscape, including the categories of the profession, was equally inhospitable to our enterprise. We were equipped with institutional and legal tools that proved uncommonly brittle as we tried them on our Indian data. We had read Ivor Jennings on cabinet government in England; Clinton Rossiter on the American presidency; David Truman on the political process; and reflected with Dwight Waldo on whether policy and administration could be fruitfully separated. Carl Friedrich taught us constitutional democracy.

We were trained, in short, in macro-institutional, historical, and legal studies, at a time when the great behavioural wave was yet to rise. Sociological and anthropological data were relatively suspect. Talcott Parsons was only just beginning to infiltrate political science with European macro-sociological concepts. Survey research was a new thing; aggregate data analysis was something economists did; cross-cultural comparisons were essentially confined to anthropology.

All of this macro-institutional training suddenly appeared very formalistic when we arrived in the field. We found it hard to believe that the countless English analyses of Morley-Minto and Montague-Chelmsford, of the Simon Commission, the constitution of 1935 and of the stillborn federal scheme were a reliable guide to political reality. Most of us ignored all this, and headed instead for state capitals and district offices and village panchayats. We did so partly with a sense that independence had rendered legal and constitutional structures less important by promising bold new socialist and nationalist departures. Economics and politics, not fundamental law, was the name of the game. (We were wrong, of course; the legacies of those sixty years, reworked and re-interpreted as they have been, are absolutely crucial to the enduring framework of the post-Independence Indian government.) We ignored it partly because, like all American political scientists, even those with training in constitutional law, we were populist enough to believe that the real action had to be somewhere else than at headquarters; anyone living in the hurly-burly of Boston or Chicago politics always developed some experiential scepticism about parliaments and courts. And we ignored the constitutional and legal picture partly because it was in any case familiar, and had been accounted for. We believed that that which made the Indian experience different, that which might make a new contribution to learning, could not be found at Delhi.

I have been hearing a good bit, in the last two years, from Indian colleagues and Indian officials about how we've all been bought into Indian studies. As I devised some exercises in historical and psychological data retrieval, I did come across that original Ford grant that sent me and my husband to India in 1956 — no doubt the necessary condition for our going. But by itself, how insufficient a condition. How can I, sixteen years later, convey that mixture of utter zestfulness, of brimming curiosity, of commitment to fluid intellectual categories, of confident belief that we would bring back new data and understanding which would enliven the intellectual enterprise. And that heubrisful frame of mind without which no fresh-minted young scholar will ever make a contribution, that gave us the conviction that we would break open the staid categories of our discipline, and de-parochialise our unadventuresome colleagues who couldn't even pronounce 'Uttar Pradesh', and who thought the vote was the last rather than first act of political education.

Whatever else the American political scientists did, then, when they went to India, they did not transplant the American political science in which they had been trained. There are virtually no institutional studies of the classical, legal, administrative, legislative, or executive variety by American scholars; Granville Austin's study of the constituent assembly is almost the lone exception. Nor did we, though we have often been accused of it, export the functionalist comparativism that became a vogue in the late fifties. It went to India, but mainly via other channels. It travelled *via* its direct impact on Indian scholars who responded to American professional books and journals. It also travelled *via* cross-national survey teams that were organised by scholars who had no special area base, but who believed the categories of political culture were universal

rather than differentiated and indigenous. Very little came via the kit bag of American political scientists working on India, most of whom quickly became queasy about the disparity between functionalist theory and what they found on the ground.

We did transplant one Western political science much in vogue in the fifties and which bridged earlier historical-institutional interests and the new behavioural dispensation. That area was party, ground well hoed in different ways by Duverger and McKenzie and V O Key. The first wave of American political science produced a large spate of party studies, from Congress through Swatantra through Jan Sangh to Communist. But for the rest, scholars tended to focus on what seemed different and fresh, and took their cues from the Indian situation: village decision-making; caste and politics; distinctive themes of consensus; ambivalence about and opposition to power; problems and prospects of the secular state; the law of progressive discrimination.

What happened to us is what happened to comparative scholars who went to Africa, or South-East Asia, or the Middle East, or Japan. All of us had a common experience: Western institutional structures transplanted from imperial motherlands either did not perform at all, or performed differently in their new contexts. We were driven out of the conventional institutional studies, or forced to evaluate the cultural contexts that produced such different consequences.

We needed to understand these contexts, and there was nothing for it but to soak ourselves in them. We grasped for disciplines which could lend pattern to the immersion; we all became instant anthropologists, not because we were among primitive tribes, but because that discipline legitimised participant observation as a research tool, and we all felt some need for it. The anthropologists have most thoroughly systematised paths toward inside understanding and grasping indigenous categories and meanings.

What then did the American students of Indian political science teach Americans or Indians or themselves? We can answer that in part by examining what they said; but as social scientists, we observe that emitting a message is not the same as assuring its reception. In terms of reception, I'm impressed with the fact that American secondary or higher education, let alone mass public opinion, remain largely untouched by our collective efforts. There is a strong assertion, in a recent white paper out of the Indian Ministry of External Affairs, that we haven't succeeded, after twenty years of Indian studies, in conveying a correct image of India, notably with respect to India's capacity to sustain her unity. I'm sure they are right. I suspect that it will be a long time before India is justly perceived in the US. *Ad hoc* TV accounts that focus on crisis spectacles get higher ratings than do the midnight interviews on educational TV where we India scholars perform our non-prime time acts.

While I'm sure the white paper was right in its pessimistic assessment of our impact, it was wrong with respect to its summary of the messages. Most of us spent the first ten years of our careers, after 1955 or so, confronting two durable stereotypes of India. The first was the stereotype that India was a country of a hundred tongues, which could not remain united on that account. The Balkans and the Tower of Babel usually served about equal time as comparative analogies. In the case of Balkan fragmentation, no one ever seemed to ask what part of the variance could be accounted for by Hapsburg mismanagement and political insensitivity. The second image focused on that indelible figure, the poor, illiterate, hungry, Indian villager, usually female with baby, who obviously was not available for anything except the politics of paternalism and authority.

The first image invited us to reiterate endlessly that India was not about to fall apart. For our pains, we suffered the supreme dishonour in American political science, the charge of Pollyannaism. In America, it has always been better to be hardnosed than dewy-eyed; among the political scientists it was and remains true that if you err in prediction, you should always err on the side of pessimism. Our assertions were suspect in part because the Indian instance systematically contradicted the predictions of much new comparative and modernisation theory. That theory emphasised the necessities created by underlying — and implicitly determinative — social forces. It did not give much credit to political skill. If underlying forces seemed to be unfavourable to unity, no one thought political skill could, as it did in India, channel those forces to unity. Among our most vigorous opponents in this debate, between 1958 and 1968, were Indian political scientists, journalists, and public commissions appointed to consider the effects of caste and language on emotional integration. They almost uniformly, from Shriman Narayan through M N Srinivas, embraced aspects of an Indian fragmentation theory, although, as Rajni Kothari, who is not of that persuasion, remarked somewhere, they should have known better. Between them and Selig Harrison, the talented journalist whose excellent if wrong-headed book systematised the fragmentation theory for Americans, the American political scientists of India had rather an uphill task.

When we weren't spending our time saying, "India won't fall apart", we were saying, "There really is someone down there." The Indian villager and mofussil merchant or artisan do in fact act; they have interests, opinions, demands; and they are capable of articulating them. The American stereotype of the illiterate, passive, Indian villager, ensconced itself in American comparative theory via the concept of the elite mass gap. Many of us persistently pressed the notions that ordinary Indians are among the most actively mobilised political peoples; that mobilisation reaches well below the literacy line and out beyond the cities where mobilisation was said to take place; that literacy and urbanisation are, perhaps, weak indicators of political articulation in societies that democratise in the twentieth century.

Since the issue has been raised, often polemically, I have tried to ask myself to what extent American scholars of India represented dominant trends in American social science. I have already suggested that few of the first wave adhered to the legal and institutional perspectives in which they had been trained, and that the scholars of India were relatively impervious to functionalist comparativism. They did bring to the study of Indian data a pluralist perspective. But here we must make a distinction. The pluralist perspective is both a way of viewing empirical reality and a normative position. As an empirical perspective, pluralism emphasises and looks for the voluntary or ascriptive groupings into which social forces organise themselves when they bring political pressures to bear; empirically, it often captures more of reality than does a perspective which stresses individual political actors or one that stresses social classes. I do not claim these are entirely matters of objective fact; at the moment, similarly competent political scientists looking at India seem to be seeing different quantities of pluralistic vote banks and non-pluralistic classes. But we used pluralistic perspectives in India not so much because we were American political scientists, but because so much of Indian reality seemed to invite it. I am not sure that data ever spontaneously organises itself, but at the very least, from an empirical point of view, plural-

ism seemed to be an indigenous category, and many would argue it still is.

As a normative perspective, pluralism represents the view that somewhere behind the clash of interest groups there moves an invisible hand that will draw rational and representative results out of the myriad interactions of contentious and demanding groups. This normative perspective was not usually embraced in studies of India. Many American scholars believed that the criticism levelled against normative pluralism in America applied all the more to India, that those who have the means better to organise themselves, who already have resources, are in a stronger position to move the invisible hand in their favour. Some of us, and I think I would include myself among these, found ourselves offering a more benign interpretation of the consequences of interest group pressures in India than we were prepared to offer in America. We took this stance in dissent from some Indian intellectuals who, when they wrote about their own system in the mid-fifties or early sixties, were often unsympathetic with the messiness of democratic participation. We perceived their lack of sympathy as elitist, and opposed it with a certain populist fervour.

Meanwhile, back home, a new class of practitioners of comparative politics was arising, quite unlike the old British and French comparativists. The French and British comparativists had been, like us, area scholars living at Paris or London, and absorbing the thought and culture of their locations before they began to compare. Unlike them, the new comparativists were distinguished by being relatively liberated from specific data pertaining to any particular area. Innocence of area data was thought to conduce to more universal theorising. We listened to them with a certain cheerful and programmatic obtuseness as they upbraided us with our excessive zeal for cultural immersion, and called us to the higher, dryer ground of comparative theory. It was a protective obtuseness, which saved many of us from the fruitless and ethnocentric concepts of premature theorising.

On the other hand, our colleagues were right when they said we needed more than context and immersion. We needed concepts and theory to grasp the social facts we observed. The question was, who would be ready, when, to formulate such theory? What in fact ensued was an extraordinarily pernicious division of labour. Professional comparativists in the late fifties and early sixties began to formulate questions and concepts for dealing with the reality of new nations. Relatively unrefreshed as they were by the revolution in perception that was overwhelming the area scholars, they relied heavily on older constructs, notably Weber, sometimes Marx, or Person's mediation of Weber. Meanwhile area scholars, between 1960 and 1970 began to produce the data base, but also the new frameworks of meaning, which would render these formulations increasingly doubtful. As fast as comparativists built new theory, area scholars began to dismantle, sometimes by offering counterconstructs, more usually by what might be called paradigm nibbling. It gradually began to dawn on us that much more was at stake than the interpretation of India or of some other new nation. What was at stake was no less serious game than the disestablishment of prevailing views of world history and civilisation. These provided the implicit and often unrecognised underpinning of Western social science. This was no small game; it was big game, involving great theoretical daring and boldness. And most of us had aimed, after all, for something less than Spenglerian or Toynbee-esque vocations.

Let me elaborate, for a moment, on what is likely to be disestablished.

Behind the social and modernisation theory the comparativists developed lies a theory of history which was perhaps best articulated by the greatest comparativist of them all, although not, perhaps, in his best moment. Max Weber so opens "The Protestant Ethic and the Spirit of Capitalism":

> A product of modern European civilisation, studying any problem of universal history, is bound to ask himself to what combination of circumstances the fact should be attributed that in Western civilisation, and in Western civilisation only, cultural phenomena have appeared which (as we like to think) lie in a line of development having *universal* significance and value.

It is not the sort of statement to which any modern social scientist schooled in the hazards of cultural hubris would commit himself. Yet its assumptions govern much modernisation theory, both that stream which flows from Marx and that which flows from Weber. It is a theory which postulates multiple historical pasts, differently experienced in different parts of the world; it postulates, for all these pasts, but a single future (that which lies in the line of "universal value", and of which Western experience has given us a glimpse). The crux of the theory is — and here Karl Deutsch, Seymore Martin Lipset, Daniel Lerner, Marx, and Weber can safely be subsumed to a common rubric — that certain events of the last two hundred years are so powerful that before them all previous heterogeneities must give way, transforming themselves into a single, homogeneous future.

This is not to say that everyone will reach that future. In this particular teleological scheme, Indian or South-East Asian or Chinese acorns are essentially promised the equally questionable options of either growing or not growing into Anglo-American oak trees. To Weber it seemed unlikely that countries dominated by Asian religions, lacking the critical cultural ingredients that the Judaeo-Calvinist ethic represented, would reach the universal future. Marx would have been similarly pessimistic, but he believed in the progressive effects of imperialism, which exported bourgeois productive relations to eastern immobilism, and thus set India too on the way to the "universal" — i e, our — future.

The future promised to all new nations was a syndrome of elements that looked (as has now often been remarked) uncommonly like a description of selected countries in the West circa 1950: urbanisation, literacy, increased communications, political participation, industrialism, centralisation, egalitarianism, decline of corporate groups, individuation, de-mythification, rationalisation —, I shall not go on. Specific elements in the syndrome varied by authors, but they had certain features in common. In each case, the elements were seen as associated with each other by logical necessity, bound together by some form of constraint or functional interdependence, by some assumption of reciprocal causality. And the causality was seen to lie essentially in those two hundred extraordinary years of history, in which the march of a new technology impressed itself on all social reality, shaping it to its overweening requirements.

Yet the association of these elements is in fact neither logical nor necessary. The future is not one syndrome, it is many. The particular syndrome which is the present and future of the West is historical, specific, experiential. It arises out of the interaction of one factor which may be universal, 19th and 20th century technology, with unique features, the normative and structural givens of earlier European history. The outcome of this encounter, our society, values, and social structure, are culture specific. The belief that they are logical and necessary arises from the subjective psychological states of Americans and Europeans, prone to believe that their history is universal history, not merely a temporary, possibly deviant set of events on the shores of the north Atlantic. The syndromes of future history, which called themselves a set of hypotheses about social change, in fact functioned as a belief system that gave meaning to the Anglo-Americans in the 20th century.

What has become increasingly apparent is that while the technological breakthrough of the last two hundred years has indeed exercised a powerful effect, its homogenising consequences have been much exaggerated. As diverse cultural and historical legacies interact with the common experience of the industrial revolution, they create heterogeneous outcomes. Indeed, the effects of the industrial revolution are themselves increasingly various as new forms of technology and industrial organisation diverge from the original. And even where culture and previous history may not dictate outcomes different from those of the West, often political policy does or can, by choiceful and purposive action.

The social sciences in the West, in sum, have gotten stuck with a series of propositions concerning the nature of social change which are based on our understanding of our own history, but elevated to the level of universal postulates. They have constrained us in our visions of our own future alternatives as much as they have constrained non-Western countries in their vision of theirs. Re-formulating Western social science, and the image of world history that lies behind it, is a task which will re-locate us in our own cosmology, as well as in that common cosmology which other nations may or may not share with us.

Who will participate in these reconstructions? I take seriously the precepts of the Mannheimian sociology of knowledge, which would assert that our very vision, the categories by which we perceive reality are created and constrained by our social and cultural context. Pursued somewhat simple-mindedly, this notion would lead to the conclusion that the social science constructed by Westerners must be Western social science; and by contrast, when Indians begin to construct theirs, it will be Indian social science. By that measure, the hope for a universal, or at least a more universal, social science is a will-o'-the-wisp. But I would remind us that we have had a good bit of public education in the sociology of knowledge in America in the last ten years, and the lessons are not so glum. The new American ambassador to India was told some years ago that his sociology of the black family was white Irish male sociology. Women fancy they see "ideology" in male sociology of sex differences, "ideology" in the double Mannheimian sense, first of social science vision which serves as rationalisation of *status quo* arrangements, and second, as a social science vision that cannot transcend itself because it is anchored in the categories of male culture and personality. But out of these critiques has come, not a despair which laments that there can never be more than sociologies, black, female, white, male, fragmented and mutually irrelevant. Rather, there has come a cautious optimism that participation, in which we Americans like to see the cure of so many things, may prove meliorative here as well. Participation in theory construction by previously excluded classes will have similar effects on theory as it does on political power: it will change the balance of power, the terms of trade, the tilt of values. But beyond that, or before that, it may enlarge the categories, expand the visions, and broaden the comprehensiveness of theory. The notion of participatory theory construction has too populist a ring perhaps to be acceptable in intellectual circles. But that is the only direction in which we can hope for more comprehensive theory, theory which can move further toward the universalism to which the best social theory has always aspired.

In India today there is a wave of what I'm tempted to call cosmological nationalism, an impetus toward repossessing one's intellectual categories even as one has repossessed one's political fate and one's cultural climate. When there is talk of an Indian sociology and an Indian political science, sometimes what is at stake is a protest against the ill fit of Western social science; sometimes a hope for uncontaminated or less contaminated indigenous categories by which to grasp reality; sometimes a wish that the social scientists and other intellectuals (Indian and foreign) shape up, do relevant social science, and support official visions of the Indian future. Of these only the first two are relevant here; the last is a problem for Indians to worry about. The first of these, the protest against the fit of Western social science and the search for indigenous categories, is a valid and fruitful part of cosmological nationalism. Its efforts can have small or large gains, depending on the breadth of vision of the cosmological nationalist. Some may find it useful to follow Louis Dumont's search for an Indian sociology, a search which finds "real" Indian categories in the homo-hierarchicus of Brahmanic subculture. That strategy will, among other things, expel most of the critical Indian social scientists from Indian social science: Andre Beteille, Dharma Kumar, Tapan Raychaudhuri, Romila Thapar, Satish Chandra are all Marxian influenced conflict theorists who don't fit well with Manu. But certainly searches for theory and categories have in India, in both religious and secular traditions, so much to work on that modelling from indigenous categories — indigenous in both normative and empirical senses — offers numerous possibilities.

Cosmological nationalism may be, at its narrowest, merely a game for home consumption. At its best, it may be a step toward Indian participation in the reconstruction of a universal social science. I like to think that we and they, the area scholars who work on India, and the Indian social scientists, have some unique perspective to bring to that reconstruction. (I don't mean to imply, in my use of the collective first person, that I expect American and Indian scholars of India to have their hands clasped to the same pen. Some intellectual separatism may, in fact, be benign at this moment in history.) We are both alienated — I use the word now in that philosophical sense which makes otherness and alienation a requisite for fresh vision — in ways that make it more likely that we can transcend the constraints which our respective national, cultural, and historical locations impose. Many of the American social scientists of India have spent up to a quarter of their grown lives in India, in ways that make India much more than the field. Many live there, intellectually, as much as they do at home. I may be a sport, but I can always tell you last Wednesday's news from the *Times of India* more reliably than this week's news in the *New York Times*. Unlike colonised peoples, we have been benignly infiltrated by the values and styles of another culture, benignly, with the grain, and with our wishes, rather than against them. The Indian scholars of India are alienated from their own in similar ways, by foreign styles and values, which were imposed by procedures that are today perceived as working against the grain rather than with it. The main point is, we both have double vision, operate within more than one set of norms and categories, and work with mixed and ambivalent motives. Because I assume that it is intellectual incongruities, mutually incompatible theoretical constructs, and uncomfortable fits, which are the spur to intellectual inventiveness, I believe our double visions and our ambivalences will be the fruitful ground of new theory construction.

FROM THE CHAIR

The Andhra Bank Limited

Regd. Office: Andhra Bank Buildings, Sultan Bazar Hyderabad 500 001.

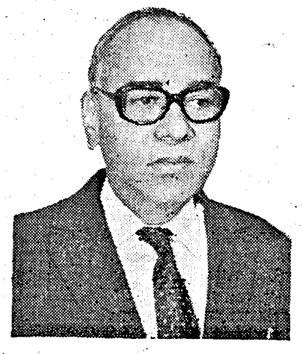
Speech of the Chairman, Mr K K Narayan

THE following is the Speech of Mr K K Narayan, Chairman, The Andhra Bank Limited at the Fiftieth Annual General Meeting of the Share Holders held at Hyderabad, on June 7, 1974:

GENTLEMEN,

I have great pleasure in welcoming you all to this 50th Annual General Meeting of the Bank. The Directors' Report and audited Balance Sheet and Profit and Loss Account for the year 1973 have been in your hands for some time and I am sure you would have studied them with some interest.

GOLDEN JUBILEE



This Annual General Meeting is of special significance because it marks the completion of 50 years of useful public service by your bank to the people of this country, more particularly to the people of Andhra Pradesh. It is a matter of pride that this Bank which was started in a small way by the great patriot and illustrious Andhra Dr Pattabhi Seetharamayya, should have weathered all the vicissitudes of fortune and grown into the largest bank in the private sector today. This record of public service, of which any institution will be proud of, was celebrated by your Bank in a befitting manner on 25th December, 1973 at Hyderabad. The occasion was graced by the President of India, Sri V V Giri. On my part, I have been singularly fortunate in having been associated with the Bank on the eve of its Golden Jubilee.

ECONOMIC SCENE

The year 1973 was an exceptionally difficult year on the economic and political front. The problems faced by the country were stupendous. The drought during 1972 in several parts of the country and consequent set-back in agricultural production continued to have an impact on many fronts even during 1973. The political sagacity of the governments, both at the Central and State levels, has enabled the country to cross the big hump on its journey to economic freedom. One point that is driven home to us is how susceptible we are to just a year's drought even after two decades of economic planning and development.

There was a runaway rise of 18.6% in prices with its adverse impact on the economy, especially on the fixed income groups. This inevitably resulted in demand for higher wages by the organised labour. To the extent enhanced wages were conceded it was an addition to the inflationary pressure.

The all round rise in price level affected the industrial front as well. But there are signs of improvements despite the raw material shortages, power cuts and transport bottlenecks. It is hoped that the return of popular governments in many States, like Andhra Pradesh, will give a fillip to industrial activity.

Mr K K Narayan

Luckily the 1973 monsoon has been satisfactory. But the impact of higher farm production is yet to be felt by the economy. The foodgrains distribution pipelines which were drained by the middle of last year are gradually filling-in with the new crops flowing in from the fields. The situation however still appears to be difficult since one good monsoon is not able to undo the ill-effects of the earlier two successive bad agricultural years.

On the international front also, the situation has been equally unhelpful. The crisis in the international currency market and the sharp hike in petroleum crude price have thrown the world economy into disarray. The threat of a world-wide recession is still looming. The increased cost of crude oil and its irregular supplies is bound to deplete our holdings of foreign exchange reserves and affect our industrial production, particularly, in the core sector.

The Government has rightly decided to embark on a large sized Fifth Plan which will strengthen the industrial and agricultural sectors and thus impart a measure of self-reliance to the economy. I am sure that with the new industrial and fiscal policies now being reshaped and formulated, our economy will reach new heights in the coming years and the Fifth Plan implemented successfully.

CREDIT SQUEEZE

In the wake of the highly inflationary pressures operating in the economy, the Reserve Bank of India initiated a series of measures to restrain the rapidly increasing Bank credit. These measures include raising of bank rate, statutory liquidity ratio, net liquidity ratio and curtailment of concessional refinance facilities and fixing of minimum lending rate on bank advances. The Reserve Bank also tightened selective credit controls on advances against sensitive commodities and adopted, for the first time, a new technique, *viz*, the prescription of quantitative aggregate ceiling on the expansion of bank credit. The accent of the Reserve Bank policy has been to bring about an increase in the cost and availability of credit thus making the commercial banks step-up their deposits and depend on their own internal resources for credit expansion without resorting to borrowing from the Reserve Bank beyond certain specified ceilings. However, following the aggravation of balance of payments problems as a result of energy crisis, the Reserve Bank of India has exempted the export sector from the ceiling requirements. But the success of these monetary measures depends mostly on the borrowing constituents who should co-operate with commercial banks by restraining the use of credit. Your Bank, on its part, has been readjusting its lending policies in line with the changes in the monetary policies of the Reserve Bank of India.

REVIEW OF THE YEAR

The year 1973 has been a good year on the whole, despite the general economic climate in the country. The deposits and advances of the Bank at the end of the year stood at Rs 113.82 crores and Rs 81.51 crores respectively. The somewhat inadequate rate of growth of deposits of the Bank is partially due to disturbed political conditions in Andhra Pradesh in the early part of the year and withdrawal of deposits consequent on the credit squeeze imposed by the Reserve Bank of India in the last quarter of the year. I am happy to say that the Bhagyalakshmi Scheme, a savings scheme tailor-made for the small depositor, was taken up in right earnest and implemented vigorously and that there is good response, particularly in the metropolitan and urban areas. Kiddy Bank scheme, another of our novel schemes, continues to be popular.

PRIORITY SECTOR

On the Bank's total advances, advances to priority sectors including exports stood at Rs 27.45 crores forming 33.67% of the total. As in previous years, your Bank has been taking sustained interest in the welfare of small farmers, educated unemployed, small traders and other socially and economically backward sections of the community.

Advances to Small Scale Industries increased from Rs 8.98 crores to Rs 9.80 crores during the year, covering about 100 additional units. Emphasis is being laid on providing assistance to the self-employed people for setting up small scale units. Thus, our assistance to the professional and self-employed has increased by 76% over that of the previous year.

Your Bank has taken up the challenge of financing agricultural sector in right earnest and has built up the technical manpower required at various levels. As a result, advances to this sector stood at Rs 14.72 crores at the end of the year. Of this, direct finance to agriculturists was Rs 12.60 crores spread over nearly 1,20,000 accounts. Thus the average amount per account was about Rs 1,500/-.

Though operating in the private sector, your Bank has associated itself voluntarily with various schemes sponsored by the Government. It has been financing Primary Agricultural Co-operative Credit Societies, Small Farmers under SFDA, marginal farmers under MFAL and Girijans under Girijan Development Programme. It is presently financing the Andhra Pradesh Agricultural Credit Project (IDA) for Minor irrigation schemes under the guidance of the Agricultural Refinance Corporation (ARC) and is proposing to finance this scheme in Nandyal and Dhone taluks of Kurnool District also. It has also financed 2 Lift Irrigation schemes on the Lal Bahadur Canal of the Nagarjunasagar Project. These two schemes are expected to benefit about 600 farmers and provide irrigation for about 3,000 acres. Similarly your Bank has financed crop loans to the members of the Sri Dattatreya Co-operative Lift Irrigation Society Ltd in Gadwal taluk. With the organisational structure and lending techniques streamlined and simplified based on earlier experiences, your Bank may be expected to enlarge the financing of agriculture on area approach basis more and more during the coming years.

LEAD BANK

The banking industry has adopted the area approach concept of the Lead Bank scheme to enable the commercial banks play their due role in the process of economic development. The merit of the scheme is that it defines the area of responsibility clearly, at any rate geographically. This would enable us to determine the priorities on our resources.

Under this scheme, your Bank was allotted six districts — five in Andhra Pradesh and one in Orissa State, of these in two districts we are Lead Bank jointly with the Indian Bank. The initial quick techno-economic surveys of the Lead districts have been completed and this has helped us in identifying the centres where bank branches need to be established. Meetings of banks operating in these lead districts were convened and these centres were allotted to various banks on a mutually agreed basis. Subsequently, Consultative Committees have been formed in all the Lead Districts.

As the next logical step, your Bank will be taking up in depth studies in select predetermined, manageable units of area for stuying the scope and potential for investments as well as filling up the infrastructure gaps. This will help us in drawing up action plans, both short and long term, for the economic and banking developments in our lead districts. Your Bank is also proposing to take up the second round of survey for identification of growth centres for chalking out the long range programme of branch expansion.

BRANCH EXPANSION

During the year under review the Bank opened 28 branches as against 42 in the year 1972. The political disturbances in Andhra Pradesh and the inevitable period of consolidation after preceding five years of rapid branch expansion were responsible for the decrease in the number of new branches opened in 1973. I may mention here that we have plans to open about 50 branches at metropolitan, urban and rural centres during 1974.

The number of branches at the end of 1973 stood at 307. Your Bank continued its thrust into the rural scene during the year 1973. I am glad to mention that of the total number of 307 branches at the end of the year, you have as many as 268 branches in the rural and urban areas. I can boldly assert that your Bank has now a wide range of branches from extension counters to rural credit branches to suit the local conditions and the individual need and style of the people belonging to different walks of life.

MAN-POWER AND STAFF MATTERS

The Bank has evolved scientific methods of man-power, planning and development. It has become necessary to assess the requirements of staff in numerical as well as qualitative terms and also work out projections of future requirements, taking into account the plans for expansion, normal growth environmental factors and other developmental activities, such as lead bank responsibilities.

In terms of the man-power planning carried out recently, taking into consideration the number of branches, the deposit figures and advances at the end of the year 1973 and the anticipated growth of branches and deposits in 1974, the additional manpower required for 1974 is around 160 officers and 240 clerks.

The new promotion policy agreement entered into with the award staff union in late 1973 has given scope for the promotion of altogether 97 talented young men in the Bank from clerical to Grade III Officer cadre. Some more promotions are in the offing.

The Staff Training College has been organising several training programmes for officers at different levels, keeping in view their aptitudes and the needs of the organisation. The services of specialists from different organisations are also availed of for the purpose. The new recruits to clerical cadre are being given induction at the Staff Training Centre.

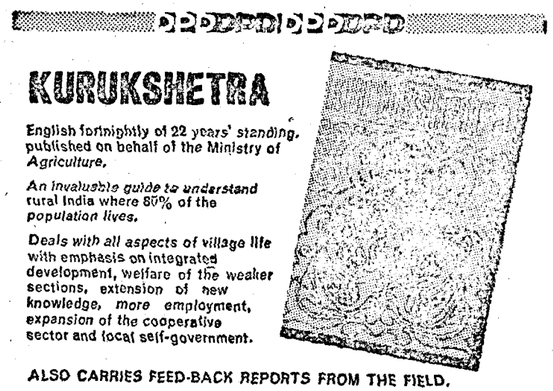
FORMER CHAIRMAN

I deem it my duty and I am also sure all of you too would like to place

on record our deep sense of appreciation for the very significant contribution made by my predecessor in office, Sri K Gopal Rao for the growth of the Bank. It has indeed a befitting recognition of his services that the President of India has conferred on him "Padma Sri". The Andhra Bank can take legitimate pride in this honour conferred on a professional Banker for the first time.

INDUSTRIAL RELATIONS

The policy of the Bank is to establish good rapport and have fair dealings with the Officers' Association well as the Award Staff Unions in line with the terms and conditions laid down under the Code of Discipline and it is hoped that they would play a constructive role in increasing productivity and maintaining proper discipline in the Bank.



ACKNOWLEDGEMENT

I would like to make particular mention of the continued co-operation, advice and guidance I have received from all the officials of the Reserve Bank of India. My grateful thanks are also due to the Hon. Chief Minister of Andhra Pradesh, his council of Ministers and officials of the State on whose support and patronage the Bank depends greatly.

In conclusion I would like to express my grateful thanks to my colleagues on the Board who have spared their time and experience ungrudgingly in the discharge of my duties. I also wish to thank Mr M V Subba Rao, our General Manager, all the officers and all members of the Staff at the Head Office and branches for their devoted service.

Thank you.

Note: This does not purport to be a report of the proceedings of Annual General Meeting.

Alembic Glass Industries Limited, Baroda

Speech of the Chairman, Shri R B Amin

High Indirect Taxes Harm Economy
Plea to Replace Excise by Value-Added Tax

THE following is the Speech of Shri R B Amin, Chairman, Board of Directors, Alembic Glass Industries Limited, Baroda, at the Twenty-ninth Annual General Meeting held on June 6, 1974:

LADIES AND GENTLEMEN,

I have pleasure in welcoming you all to the 29th Annual General Meeting of the Company. The Accounts for the year ending 31st December, 1973 have been circulated to you in advance and, with your permission, I shall take them as read.

I have to report, with deep sorrow, the death of our Director Dr Mangaldas J Shah in October, 1973. He was a Director of your Company for the last 23 years. I am sure you would all like to place on record our appreciation of his services as a member of the Board.

You will recall that in my Address to you last year, it was noted that indications were not at all good for the operations and results of your Company, in view of the rising costs all round and the unsatisfactory supply of power at Whitefield. These unfavourable factors have had their adverse effects on the working of your Company and have led to lower profits for 1973 in comparison with those in 1972.

To counteract the ill-effects of erratic power supplies at Whitefield, we made one of the two furnaces mixed melter so that it could be operated both on oil and by electricity. Nevertheless, there was significant lowering of output and sales from Bangalore in 1973. Thus, 1973 was the second successive year in which the overall production of your Company declined, from 50,262 metric tons in 1971 to 46,125 tons in 1972 and therefrom to 45,278 in 1973. Matters began to improve with the beginning of 1974 with the mixed melter furnace coming into production and with somewhat better power supply. This advance, however, was abruptly interrupted and checked by labour trouble at Whitefield. The unfortunate and uncalled for strike continued for fifty-seven days and has adversely effected our production and sales during the first half of 1974. We should now all work together to reach maximum output so that the operating results for 1974 could be more satisfactory.

Sales were maintained and marginally increased from Rs 6.61 crores in 1972 to Rs 6.93 crores in 1973. Further, the finished goods in stock were brought down from Rs 94 lakhs to Rs 53 lakhs, thereby taking up some of the slack caused by the lower production. Your Company also achieved significantly higher export earnings at Rs 21.92 lakhs in comparison with about Rs 3 lakhs in 1972. There are some problems in meeting both the requirements of internal demand and the growing needs of our export trade. Your Company will give due priority to the development of the export of its products and try to allot sufficient quantities for this purpose.

The Budget this year imposed an additional 5 per cent excise duty on glassware, taking it up to 25 per cent *ad valorem*. Government have found an easy way to augment their revenue by imposing excise duties. Nothing is left out, whether they are raw materials, intermediate goods or finished articles or whether they are necessities or so-called luxuries. While levying these taxes, the perverse precept that is followed is that nothing succeeds like excess. We have to carefully consider our economic objectives, adjust fiscal instruments and to introduce modalities and themes of growth in the Budget. The objective of tax policy has to be promotion of economic growth and the well-being of our people. In view of this, it is time to call a halt to this excessively revenue-oriented approach in our Budgets.

As of now, we load almost every consumer and industrial article with taxes at each stage of production. Fuel required for all production is taxed. Steel required in all fabrication is taxed. This in only the beginning of the cost increase multiplier. In the manufacture of glass containers, soda ash, a major raw material, bears a duty of 10 per cent *ad valorem*. Your Company pays out almost Rs 5 lakhs each year on account of this duty alone. On its finished goods, this duty came to nearly Rs 90 lakhs in 1973. Materials for packing glass containers like paper, paper board, fibre board and gummed tapes have all gone up in price through excise. The net result is that the product becomes artificially and unnecessarily expensive to the user. This user may be the housewife or the storekeeper who buys our Yeraware. Or it could be another industry which takes our products as containers for their output of pharmaceuticals, beverages, cosmetics or preserved food. Their products, in turn, bear further excise — 10 per cent *ad valorem* on prepared or preserved food, 20 per cent on aerated waters, 30 per cent on cosmetics and so on. All this means an overloading of the tax element on tax in costs of production and an unpleasant rise in the final price of goods for the consumer. Imposition of excise on excise is the way to ensure that the consumer feels frustrated because he is deliberately denied the good things of life by government by making them artificially and excessively expensive. It is also the way to cripple the manufacturers of such goods, to induce stagnation in industry and to aggravate unemployment.

It would be much better if the burden of excessive excise is taken off the back of our economy and replaced by something in the nature of a value added tax. Thus, the basis of taxation has to be value added and not gross value. If this is done production will increase and attain momentum, employment will go up, costs will decrease, goods will be cheaper and consumers will be happier. On a lower rate of duty, the increased turnover will more than take care of the revenue angle as well.

Any excise duty in the excess of ten per cent is counter productive and regressive. Excise higher than ten per cent acts as a curb on production and productive employment. In a situation of grave unemployment, underemployment and shortage of goods, high excise is undesirable and harmful to our economy and society.

Many goods are being very heavily taxed because they are termed luxury articles. Luxury is a very variable and subjective idea; solution of unemployment is a far more urgent and concrete objective than an arbitrary curb on luxuries. If we lighten the burden of excise we can undertake larger production and consumption of these goods in our own country. On this basis, quality will improve and reach international standards

so that we can go in a big way for exports to other countries, where labour costs are very high or where such production facilities do not exist. Therefore, we have to discard the approach of high excise on so called luxury goods.

Government should do re-thinking on excise duty, retrace its steps from the past erroneous approach and adopt a policy which favours growth, higher employment, greater availability of goods, a perceptible reduction of miseries and a better life for the people. What is wanted is an immediate and substantial relief. What matters is what we do now. A future utopia is irrelevant to people who are suffering here and now.

Before concluding, let me place on record my appreciation of the co-operation and assistance I have received from my colleagues on the Board as well as the officers and employees of the Company. We can be confident that with continued co-operation, hard work and understanding, the challenging problems posed by the grave economic situation and by the need to sustain the growth of your Company will be faced boldly and effectively in the years to come.

I now commend the Annual Accounts and the Directors' Report for your consideration.

Note: This does not purport to be a report of the Annual General Meeting.

Indian Overseas Bank, Madras

Directors' Report 1973

1. 1973 was a year of stresses and strains for the banking system. Starting from a comfortable resources position, the banking system passed through a phase of acute stringency for funds, as the year came to a close, in spite of a record accretion in deposits. The change in the complexion of the banking environment was brought about by an unprecedented expansion in demand for bank credit which the monetary authorities had necessarily to contain, having regard to the prevailing inflationary situation.

2. For IOB, 1973 was a year of all-round gains. Deposits and other accounts in India and abroad crossed the Rs 200 crore mark to exceed Rs 209 crores — an increase of Rs 50 crores or 31 per cent. In India, aggregate deposits went up by Rs 42.3 crores or 30 per cent, a growth rate higher than that of the banking system (18.8 per cent). The number of deposit accounts (in India) was up from 7.5 lakhs in 1972 to 8.9 lakhs in 1973. Lendings in India rose sharply by Rs 45 crores or 59 per cent against only Rs 10.4 crores or 15 per cent in 1972. The pace of growth in IOB's advances was, thus, much faster than the 23 per cent increase recorded by the banking system. With credit expansion outstripping deposit growth, there was a spurt in the credit-deposit ratio for IOB in India from 55 per cent in 1972 to 67 per cent in 1973.

3. It has been the Bank's policy to ensure that funds mobilised in rural areas are, as far as possible, invested for the benefit of rural population. Thus, the credit-deposit ratio for rural branches at the end of 1973 stood at 71 per cent as against the ratio of 67 per cent for the Bank as a whole in India.

4. Profits after tax (but before providing for bonus to staff) registered a smart rise of Rs 29 lakhs to Rs 66 lakhs. This is in contrast to a decline of Rs 2.3 lakhs in the preceding year.

5. The Bank's advances to the priority sectors continued to register progress. Total lendings to priority categories rose by Rs 7.3 crores, or 27 per cent, as compared to an increase of Rs 2.9 crores or 12 per cent in 1972. An additional 13,000 lending accounts covering the priority sectors were brought into the books of the bank, raising the total under this head to 83,000.

6. Finance to agriculture (both direct and indirect) rose by Rs 154 lakhs or 15.5 per cent, an improvement over 1972 (Rs 93 lakhs or 10.4 per cent). The number of lending accounts in agriculture went up by 7,000 to 67,000. The Bank participated in a host of schemes to promote farm lendings. In collaboration with Tamil Nadu Dairy Development Corporation and through tie-up arrangements with various milk supply unions, finance was extended to individual dairy farmers as well as to milk co-operative societies. Other schemes financed by the Bank include tobacco cultivation and construction of barns in Karnataka, development of wool in Gujarat, purchase of power threshers in Nagpur, tractors and accessories under IDA scheme in Punjab and Karnataka and purchase of shares by sugarcane growers in a co-operative sugar factory in Andhra Pradesh. The 'area approach' to farm finance was pursued vigorously.

7. Advances to small scale industries continued to grow including lendings to engineers under the technocrat scheme. Total lendings to small scale units rose by Rs 200 lakhs or 15.2 per cent against Rs 71 lakhs or 5.7 per cent in the previous year.

8. An impressive rise of Rs 147 lakhs was witnessed in lendings to transport operators. Total advances to this sector touched the Rs 2.5 crore mark. Number of lending accounts rose two-fold to 1,200.

9. Notable progress was also registered in extending credit to retail traders and the professionals and self-employed. Advances to this group as a whole rose by Rs 227 lakhs or 71 per cent against only Rs 58 lakhs or 22 per cent in 1972. The number of lending accounts doubled to reach 11,100. Almost all the branches improved their advances to this category of borrowers.

10. A scheme was launched last year to induce young doctors to set up practice in rural and semi-urban areas. Need-based finance is provided to such doctors for setting up a clinic, buying surgical, laboratory and other equipments and furniture. A special feature of the scheme is that a doctor's living expenses for the first three months are taken care of. Repayment will be in convenient instalments spread over a maximum period of 40 months.

11. A 'Small Business Aid Agency' has been set up initially at Madras, to exclusively handle small business relating to the priority and hitherto neglected sectors. The Agency is well equipped with field staff to handle pre-sanction inspection, follow up and recovery.

12. Lendings under the Differential Interest Rate Scheme picked up in the course of the year. Amount outstanding as of end 1973 was Rs 5.1 lakhs. Since then it has improved to Rs 7 lakhs. We are intensifying our efforts to increase advances under this scheme.

13. The Bank continued to lay emphasis on financing the export sector. During 1973, nearly one-eighth of incremental lendings was diverted to this sector raising it from Rs 7½ crores to

Rs 13 crores. It has picked up further momentum during the first quarter of 1974. Cashew, tobacco, sea-foods, coir and coir goods, tea, spices, textiles (including handloom goods), engineering items and leather and leather goods are among the wide list of export products financed by the Bank.

14. The Bank opened 54 new branches during 1973, the highest so far for any year. Twenty-nine of these are in rural and semi-urban centres, 14 in urban and 11 in metropolitan locations. State-wise, 9 are in Tamil Nadu, 7 in Andhra Pradesh, 6 each in Gujarat, Kerala and Uttar Pradesh, 5 in Punjab, 3 each in Maharashtra and Karnataka and 2 each in Delhi, Rajasthan and Haryana and one each in West Bengal, Madhya Pradesh and Bihar. In the last two States IOB extended its operations for the first time. Six branches were opened in lead districts raising the number of branches in the lead districts to 98 or 26 per cent of the Bank's branch network. Besides the new branches, extension counters were opened in six institutions. At the end of the year, the Bank had 384 branches and 15 extension counters in India covering 14 States and 4 Union Territories. It is significant to note that out of 189 branches opened since nationalisation 91 are located in unbanked centres.

15. In discharging its responsibilities under the lead bank scheme IOB turned its attention last year to the major task of identifying credit gaps and formulating specific programmes to bridge such gaps. The Co-ordination and Consultative Committees which have been set up in all the lead districts are functioning actively.

16. Inadequate manpower of requisite experience and training is a major constraint to business growth in its diverse and newer manifestations. IOB has continued to take special interest to quicken the process of recruitment, to accelerate promotions and to re-design and enlarge training programmes which have started yielding results.

17. A determined effort was made last year to reduce significantly the backlog in training. The expansion of training facilities is reflected in the number of courses conducted at the Bank's College and regional training centres — 19 courses covered 360 officers and 36 courses took care of 738 clerks against only 14 courses for 215 officers and 19 courses for 548 clerks in 1972. For the first time programmes were specially designed and conducted for rural Branch Managers. The duration of induction programmes was reduced to cope with the fast pace of recruitment. Besides the Bank's College at Madras, training programmes were conducted at Coimbatore, Madurai, Bangalore, Calcutta, Ahmedabad, Bombay and New Delhi.

18. To supplement the internal training programmes, the Bank sponsored 85 officers for various courses/seminars conducted by specialised institutions.

19. Last year we took a major step to reorganise the Bank's administrative and organisational structure by creating seven regions. The new system is working satisfactorily. Another important step taken was the introduction of business planning which covers all aspects of performance: deposits, advances, earnings, expenditure control, profits, manpower and other inputs.

20. To facilitate the use of Hindi in correspondence, forms, documents, literature, etc, a Hindi Cell has been created at the Central office. A similar Cell will be set up shortly at the Delhi Regional Office to cover the Hindi States including Uttar Pradesh, Haryana, Madhya Pradesh, etc.

21. The Bank's overseas branches registered good progress both in business and profits.

22. The United Asian Bank Berhad, promoted jointly by three nationalised banks, including IOB, to take over their branches in Malaysia, commenced functioning at Kuala Lumpur on May 26, 1973.

23. To conform to the banking law in Thailand, IOB's Bangkok branch was handed over on January 1, 1974 to the Bharat Overseas Bank Limited, a scheduled bank established in the joint sector at Madras on October 26, 1973 We have a 30 per cent interest in the capital of the new bank, the balance of 70 per cent contributed by six private sector banks.

24. On October 1, 1973, Shri A M Kadhiresan took over as Chairman and Managing Director of the Bank upon the retirement of Shri R N Chettur. The Board wishes to place on record its deep appreciation of the services rendered by Shri R N Chettur during his tenure. Shri S V Sundaram has been elevated to the position of General Manager.

25. In pursuance of clause 3 sub-clauses (c) to (f) of the Nationalised Banks (Management and Miscellaneous Provisions) Scheme, 1970, the terms of six directors of the Bank were extended for a further period commencing from February 7, 1974 and ending on December 10, 1975. Shri M G Balasubramanian, Director, representing the Department of Banking, resigned from the Board with effect from July 6, 1973. The Board wishes to place on record its deep appreciation of his wise counsel and valuable guidance as director. Shri K P Geethakrishnan of the Department of Banking joined the Board in his place.

26. Finally, we would like to thank the members of the staff, at all levels, for the enthusiastic role played by them in making possible the creditable overall performance of the Bank.

For and on behalf of the Board of Directors.

water from waste in water-scarce Bombay

When Union Carbide India established the country's first petro-chemicals complex in Bombay, its water needs shot up. But the Municipal Corporation was unable to quench this thirst.

Local talent and expertise of Union Carbide India came up with a solution. Sewage. Pilot studies successfully proved that clear water can be reclaimed from sewage. Efficiently, dependably.

Today the plant at Bombay reclaims 5 million litres of clear water everyday. With provision to double the capacity.

Union Carbide India's pioneering effort in reclaiming water in Bombay has solved another civic problem in the bargain: disposal of sewage. Usefully, without adding to pollution.

With scientific expertise acquired over the years through continued research and development, Union Carbide India is today contributing in the many areas of the country's growth.

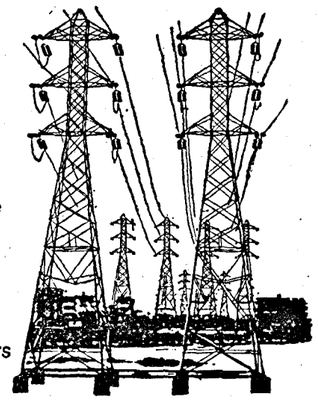
HAGGLING OVER PRICE OF GOLD

NEW USES OF A COLONIAL LAW

Orissa can offer just what so many industrialists eagerly want.



A lot more power.

Orissa has the ideal infrastructure to nurture a new or expanding industry. Not the least is an abundance of electric power which is supplied at concessional rates for as long as five years after the commissioning of a plant.

Today the potential investor in an industrial project in Orissa is offered ready-to-occupy industrial estates and developed land on easy lease terms; water at no-profit rates; financial incentives and services coupled with a price preference on Government purchases.

Moreover, Orissa offers the advantages of Paradip, the port with the deepest draft in the country. An outlet that is crucial to the economical export of ores and finished industrial products. In this port lies the future of much of India's foreign trade.

So if it's an industry that you wish to set up, Orissa offers a lot more than you'd get elsewhere. A sound foundation that provides the ideal climate for healthy enterprise.

Money Delusion

AFTER fiddling for more than two years, the government is apparently awakening to the need to do something about the inflation. However, all semblance of an overall economic policy having disappeared in the meantime, the partial measures now being contemplated are likely to further aggravate the distortions in the economy. The gross inequity of a wage freeze when non-wage incomes have not only not been curbed but have been deliberately promoted by government policy has been commented on in these columns ("The Dishonesty of It All", June 1). The government's other hang-up is apparently money supply; the attempt seems to be to keep down the rate of expansion of money supply to some arbitrary figure, no matter how this is achieved.

The total absence of any continuity in the government's economic thinking is brought out by the sharp contrast between the current preoccupation with checking the growth of money supply and the actual trend in money supply in just the last few months. In the first two months of the current financial year, upto the end of May, money supply expanded by as much as Rs 524 crores or nearly 5 per cent against an expansion of Rs 367 crores or less than 4 per cent in the comparable period of 1973-74. The composition of this expansion is equally significant. Net bank credit to the government increased by Rs 355 crores against an increase of Rs 547 crores during April-May 1973. On the other hand, there has been a phenomenal growth of as much as Rs 424 crores in total bank credit to the commercial sector which is in sharp contrast with the increase of only Rs 91 crores in April-May 1973. What is more, this runaway credit creation for the benefit of the commercial sector has been largely financed by the Reserve Bank. The commercial banks' outstanding borrowings from the Reserve Bank total Rs 407 crores, bills discounted Rs 268 crores and the shortfall in the banks' statutory minimum balances with the Reserve Bank Rs 207 crores — all together making a continued contribution of Rs 882 crores by the Reserve Bank to credit extended to the commercial sector. True, these are outstanding balances and not additions during the current financial year; but the Reserve Bank had aimed to restrict credit expansion in the current slack season to one-third the growth in banks' deposits whereas so far the increase in credit works out to nearly twice the rise in deposits.

In the meanwhile, the price situation continues to get worse. The index number of wholesale prices (base: 1961-62 = 100) had touched 298.5 on May 25, showing a rise of nearly 16 points or 5.5 per cent over the end-March level. The index for food articles has over the same period shown a rise of 24 points or 7.4 per cent. The All-India Consumer Price Index (base: 1960 = 100) had risen to 344 in April 1974 from 316 in December 1973. The index has risen by 45 per cent in the last two years and by 28 per cent in the last one year.

There are two aspects of the current economic situation which have to be kept in mind while assessing the preoccupation with curbing the growth of money supply — first, the failure of public distribution of essential commodities, particularly foodgrains; and, second, the stagnation and even decline of public investment. Despite increase in the output of foodgrains, procurement for public distribution has been tapering off. Out of the rabi output of 1973, the government could procure only 5 mn tonnes against the original target of 8 mn tonnes. In the current rabi season, procurement of wheat so far is reported to be only about 1 mn tonnes against the government's expectation of 5.5 mn tonnes and against the procurement of 3.3 mn tonnes during the corresponding period last year. Procurement of wheat this year cannot possibly exceed one-half of the target. In the last kharif season, again, procurement of rice was only 3.8 mn tonnes against the target of 5 mn tonnes and of coarse grains 0.4 mn tonnes against the target of 1.65 mn tonnes. As a result, despite the Russian wheat loan of 2 mn tonnes, the stock of wheat with the government has declined to less than a million tonnes compared to a stock of a little over 2 mn tonnes at about the same time last year. Even on the basis of an offtake of just 7 lakh tonnes a month — the average for 1973 — the public distribution system will need about 7 mn tonnes of wheat till next March. The government is reported to be negotiating for the import of as much as 5 mn tonnes of wheat at a total cost of Rs 784 crores. This order of expenditure of foreign exchange represents the cost of the government's failure to enforce an effective procurement policy. State trading in foodgrains has if anything operated in a manner inimical to the objective of price stability. The so-called procurement prices have in effect served as high

and continuously rising support prices for the benefit of the rich farmers and traders.

The impact of the stagnation of investment for almost a decade is seen in the worsening shortages of a series of industrial commodities like coal, steel, non-ferrous metals, basic and intermediate chemicals, dyes, cement, commercial vehicles and paper and paper products as well as rail transport and power. Particularly, the dismal performance of the four key sectors of the economy — railways, power, coal and steel — is the result of low investment. The public sector Plan outlays had reached Rs 2,291 crores in 1965-66 and are placed at Rs 4,844 crores in 1974-75, showing a rise of 111 per cent; during the same period, however, the wholesale price index would have risen by over 130 per cent, from 132 to 308. Even if, instead of the index of wholesale prices, some more appropriate index of investment cost is considered, the position would not turn out to be very different. Besides, the proposed level of the Plan outlay in 1974-75 is unlikely to materialise. There are already reports that the government is cutting Plan outlay this year by about Rs 150 to 200 crores. The stagnation of public sector investment in real terms has occurred despite the mobilisation of very large additional resources by the government. In other words, the proportion of total government expenditure going for developmental or physical assets creation purposes has been continuously shrinking. The share of development expenditure in the total expenditure of the Central government has dwindled from 59.4 per cent in 1964-65 to 46 per cent in 1973-74. Capital formation expenditure of the Central government has similarly declined from around 48 per cent of total expenditure in 1964-65 to 33 per cent in 1973-74.

Even for financing the reduced level of investment, government has not only mobilised substantial additional resources but also indulged in a large amount of deficit spending. In terms of net bank credit to the government, deficit spending had amounted to Rs 108 crores in 1969-70, but rose to Rs 515 crores in 1970-71, Rs 1,147 crores in 1971-72 and Rs 1,307 crores in 1972-73; in 1973-74 it was Rs 966 crores. Had the government deployed the additional funds thus raised for investment according to planned programmes, the production potential in different sectors of the economy would have been much larger than it is today. Thus it is not deficit financing *per se* that has been responsible for the inflation, but rather the squandering away of the additional resources on current consumption. Backed by public distribution arrangements for key wage goods, the government could have used the higher level of budgetary operations sustained by expansion of money supply for expanding employment and the production potential of the economy. The same could be said of expansion of credit to the commercial sector. It is not that the level of such credit has been in itself high, but that it has been misused for unproductive purposes, particularly for financing larger inventory holdings by the bigger borrowers. Excessive inventory holdings are found profitable because of the still relatively low interest rates charged on bank loans.

Such being the origins of the current economic crisis, tampering with money supply would hardly work and, if it leads to a further cut in developmental outlays, could make the situation palpably worse. It is worth recalling how, faced with the drought of 1966-67, the government had cut the public sector annual Plan outlay from Rs 2,291 crores in 1965-66 to Rs 2,165 crores in 1966-67 and further to Rs 2,085 crores in 1967-68. In real terms, the annual Plan outlay has never recovered since then, except perhaps temporarily in 1972-73. The current ills of the economy are very largely attributable to the government's decision to cut back investment in those years. The story would be quite different if the expansion of money supply could be achieved through larger savings in the Central and state budgets. Of course, this has been seldom, if ever, possible. For instance, the Central budget for 1973-74 had placed the net savings of the Central government and its departmental undertakings at Rs 846 crores; however, the revised estimates place them at Rs 424 crores, or just one-half of the original estimate. To put it differently, if the Central and state governments make a 10 per cent cut in their non-Plan expenditure there would be a net saving of as much as Rs 800 crores.

An effective policy to check inflation will therefore have to be very much more complex than one which aims at no more than restricting the expansion of money supply in the current year to some arbitrary rate such as, say, 5 per cent. It will have to encompass a cut in the non-developmental expenditure of the government together with mobilisation of additional resources; raising of the level of investment, particularly public sector investment, and allocation of investment according to a more rigorous scheme of priorities than has been attempted for many years now; higher interest rates on bank loans to the commercial sector together with denial of bank funds for stock-building; and, finally, expansion of the scale of public distribution of essential wage goods, especially foodgrains.

DIR

Perks in Danger

THE Defence of India Rules have been in force almost continuously for the last decade and a half. During most of this period they have been used not so much for the defence of the country against external foes as for the defence of the government against internal political opposition to it. It used to be the government's pretence at one time that the DIR — as well as the Preventive Detention Act and its successor, the Maintenance of Internal Security Act — were used only against political elements which explicitly rejected the parliamentary system and worked for the violent overthrow of the government and the existing political and economic order. Of course, this left enough room for misuse of the virtually unlimited police powers conferred on the government by the DIR and preventive detention laws. All that was required was to label an individual or a group as extremist or 'Naxalite' to justify arrest, indefinite imprisonment, torture and even physical liquidation. The ruthlessness with which the government has used its powers can be seen from the number of persons killed supposedly in 'encounters' with the police and of political prisoners who have been rotting in jails for the last last many years.

Now even the pretence that the DIR and the preventive detention laws are used only against those who do not abide by the rules of parliamentary politics is becoming difficult to maintain. They are being increasingly used to suppress activities which are accepted as a legitimate part of the type of political system that we are supposed to have in this country. They have been used to put down trade union activity of the most unexceptionable variety and to smother popular protest of the kind on which so-called

democracies the world over pride themselves. Last month's railway strike saw the use of the DIR and the MISA on a hitherto unprecedented scale to crush what was a perfectly legitimate trade union action by a section of government employees. In Bihar, to take another kind of example, Socialist party leaders, George Fernandes and Raj Narain, have been served with externment orders under the DIR which forbid them from entering the state. The government apparently feared that their presence would have strengthened the mass movement against the Congress ministry in the state. The irony is that virtually all the charges levelled against the Gafoor Ministry by the opposition parties who are part of this movement used to be voiced till the other day by members of the Congress party itself. Only weeks ago the most insistent demands for the removal of the Chief Minister came from within the ranks of ruling party MLAs. In any case, neither George Fernandes nor Raj Narain can be accused of working for violent overthrow of the political system; and as for Jayaprakash Narayan, his contribution to the agitation will in the end be seen to have only blunted the edge of mass dissatisfaction with the government and the ruling party.

The manner in which the government has recently used its powers under the DIR and the MISA shows that increasingly *all* opposition is becoming intolerable to it. This has been the experience also in many other countries where too government which started with elaborate democratic facades eventually showed their true authoritarian faces. Distinguishing between legitimate opposition and opposition of the illegitimate kind is a luxury indulged in only so long as opposition of the former variety is seen to pose no threat to the regime. Once the regime is seriously threatened by mass discontent, all opposition is tarred with the same brush. The opposition parties in India which have come to regard the perks of the parliamentary system as immutable will do well to remember this.

Vanaspati

Writing on the Wall

THE agitation within the government over the price of vanaspati would not call for any comment if it did not bring out so well how the government has reduced itself to a position of irrelevance in matters relating to the economy. The question of the price of vanaspati was considered for weeks on end at the highest levels in the government — including the Food and Agriculture Ministry and the Economic Affairs and Political Affairs Committees of the Cabinet — before the decision, announced on Friday, to raise the controlled price was taken. However, for all the effect that this is going to have on the actual price and availability of vanaspati in the market, the government might well have saved itself the trouble.

The vanaspati industry's case for a higher price was a simple one. The price of vanaspati had to be high enough to cover the cost of the industry's raw materials — that is, edible oils, mainly groundnut oil — and processing costs and to provide a reasonable margin of profit. In any case, a situation — such as had come to prevail recently — in which the controlled price of vanaspati was lower than the price of groundnut oil was an obviously untenable one. In the past such a situation could be sustained because vanaspati manufacture used to be subsidised through the supply of low-priced imported oils. Since this source of subsidy has been now closed, the price of vanaspati had to be more in step with that of edible oils. To press home the point the vanaspati industry — including, significantly, a few units taken over by the government — pretended to stop production.

Faced with this situation the government had a choice between removing the price control on vanaspati and allowing a pretty whopping increase in the controlled price. It has opted for the latter, the price increase allowed ranging from Rs 180 to Rs 220 per quintal for the different zones. Given the steep rise in the prices of edible oils recently, this may seem altogether reasonable. The catch, however, is that the vanaspati manufacturers exercise no small influence over the price of edible oils. Quite apart from the fact that they are a major consumer of edible oils, they are individually and collectively major 'operators' in the market for these oils. Indeed, even the Tariff Commission has acknowledged that profits in the vanaspati industry came essentially from these 'operations' in edible oils. With the edible oils-vanaspati price link now officially accepted, vanaspati manufacturers have every incentive to continuously bid up the price of oils. The writing on the wall for consumers of edible oils as well as of vanaspati is thus clear.

It has been claimed in all innocence on behalf of the vanaspati industry that the industry currently has no more than 15 days' stocks of oils. This is presumably to make out a case that should the price of oils rise further, even the revised controlled prices of vanaspati will become uneconomical. However, their physical stocks of oils hardly reflect the vanaspati manufacturers' command over oil supplies which consist as much of stocks bought and held by various nominees on their behalf as well as of forward positions acquired by them. The prevalent prices of oil at any point of time, especially with the progress of the oil season, may bear little relationship to the actual cost of oils to the vanaspati manufacturers, especially the larger ones with enough resources of their own and sufficient access to bank funds to 'play' the oils market.

Fertiliser Prices

Sauce for Industry, Sauce for the Farmer

COMPARED to the total value of farm output in the country, the turnover of the fertiliser industry, even at the higher prices announced earlier this month, is a minuscule percentage. Other things remaining the same, the rise in fertiliser prices should not therefore have much adverse impact on agricultural activity. In any case, the overwhelming majority of farmers lack the resources to apply chemical fertilisers to their land. Perhaps not more than 5 per cent of the country's farming community, and certainly not more than 20 per cent of the total arable land, are currently drawn into the orbit of the New Technology. For these farmers and for such lands, the rise in fertiliser prices will, of course, have a somewhat greater consequence; but even here, it is easy to exaggerate the effects of the price rise. Data on the dosage of fertilisers, recommended or actually applied, indicate that crop for crop the unit cost of production on account of fertilisers could hardly exceed 5 per cent of the total. The increase in fertiliser prices should not exactly smother further agricultural development.

Anything which reduces the element of subsidy, whether hidden or overt, to the affluent farmers is welcome. Two caveats, however, have to be entered. First, because of the

sweeping nature of the price rise, a fairly large number of fertiliser producing units will now enjoy a widening of profit margins. The oil crisis has already been made the general alibi for raising the prices of fertilisers across-the-board, though it would be difficult to establish a precise quantitative relationship between, for example, the increase in price of such intermediate petro-chemical products as naphtha and the announced rise in fertilisers. As in all such cases, the price increase for each of the specified fertilisers has evidently been dictated by the cost structure of the least efficient unit. This is, in fact, one of the worst aspects of the 'cost plus' principle. The administrative decision to allow the general price increase, without even the face-saving device of referring the issue to either the Tariff Commission or the Bureau of Industrial Costs and Prices, will make life that much more cushy for a large number of units, both private and government, which in the past, too, have seldom bothered to take the minimum measures for efficient plant management.

The other implication of the decision to raise fertiliser prices is still more ominous. In normal course the increase in fertiliser prices should not lead to any rise in price of farm products: the bulk of farmers in any event do not use chemical fertilisers and even for those who use them, the impact of the price rise on their costs need be only marginal. Moreover, when one compares the trend in the open market prices and the procurement prices of agricultural products with the trend in fertiliser prices, it is seen that, over the past five years, the rise in agricultural prices has been much sharper. But such arguments hardly count. Given the immense power currently enjoyed by the entrenched farm lobby, the increase in fertiliser prices will now be made the ground for demanding a further rise in all farm prices across the board. The demand is likely to be pressed for even the 1973-74 harvest which is already gathered — as if the increase in fertiliser prices could have retrospectively affected the cost of cultivation of the harvested crop. And as for the coming kharif and rabi crops, the rise in fertiliser prices will provide an excellent alibi to the farm lobby for maintaining the pressure to raise prices. Procurement prices for foodgrains may hence be expected to climb even further.

An economic culture would seem to be firmly established. For every little difficulty, whether in a government undertaking or in a private unit, the instinctive response will be to press for a rise in product prices and thus pass the incidence of rising costs on to the consumers or users of the products. The adoption of such a line of least resistance will inevitably lead to a worsening of the inflation in the country. The rise in fertiliser prices could not have come at a more opportune moment as far as the farm lobby is concerned. It has got a made-to-order explanation for its failure to fulfil its commitment to supply wheat to the government; it can now refurbish its arguments in favour of a sustained, continuous rise in farm prices. Its bluff could have been called, but it knows that none in government would ever dare get positioned in any antagonistic contradiction with it.

Opposition Parties

Slowly Paralysed

A Correspondent writes:

THE Supreme Court has stuck to a literal interpretation of Article 71(4) of the Constitution. It was not expected to bother, and it has not bothered, over such issues as whether the spirit of the Constitution will survive if — following the logic of its judgment — neither the Lok Sabha nor the majority of the state Assemblies were to be there and yet the administration of the day went ahead with the ritual of a Presidential election by the rump of an electorate. All that the Supreme Court has said is that the election of the next President must be completed before the term of the present incumbent is over. It is little use to feel exasperated over the Court's decision. Within the limits of the Constitution, the Court has given its judgment by a strict interpretation of the law.

Clearly, the matter belongs more to the political arena than to the legal and constitutional one. If there are flaws in the system of legality and the Constitution, these can be redressed only *via* the political process. The country is facing the prospect of a breakdown of the legislative and parliamentary modalities. Given the crushing majority of the Congress party in Parliament and in most of the state Assemblies, just anything can now be turned into law. Even if fresh elections were to take place here and there, the vast resources commanded by the ruling party, combined with the free use of corrupt practices, might still ensure a comfortable majority for it; and this, despite large-scale mass discontent. In case the party has strong ground for apprehending that the majority might elude it and even corrupt manoeuvres would not help, it could simply decide not to hold any elections or as in Gujarat to postpone them indefinitely. In view of the Supreme Court's stand, the opposition will be left completely stranded, legally as well as constitutionally, when confronted with such tactics. And an impasse will be reached. The present frustration of the opposition stems from the realisation that there is hardly any way out of this predicament immediately. Distress may be widespread in the country; people may be aghast at the near-authoritarian traits displayed by the ruling party; allegations may be made, and openly, about corrupt practices to which recourse is supposedly taken by it; food may be scarce; prices may be spiralling; and yet, there may not be any legal or constitutional device through which the opposition could seek to retrieve the situation. Where this or that opposition group stands a chance to win the elections, these may not be held.

What Jayaprakash Narayan is attempting in Bihar is in the nature of a desperate groping for a way out of this claustrophobic milieu: an attempt to go off the beaten track of the parliamentary system and see whether, through more or less peaceful means, it is possible to force the government to temporise its authoritarianism. This, however, seems to be a *cul de sac;* what the young insurgents in Gujarat were able to achieve, their counterparts in Bihar plainly have not succeeded in repeating. In the other states, the possibility of success is even more remote. In Bihar, one has witnessed the bizarre spectacle of the opposition parties themselves splintering the moment the demand for resignation of their members from the state legislature has been pressed. With the experience of Gujarat behind it, the government too is equally determined not to allow any re-enactment of the drama. The military, para-military, and police forces will therefore ensure that the so-called mass agitation in Bihar does not get out of hand, irrespective of the magnitude of discontent pervading the length and breadth of the state.

In case Jayaprakash Narayan's ambition to extend the Gujarat pattern is

still-born, an alternative strategy could be an initiative from the Left. This could take two forms. The first would be to foment a Naxalite type of mass insurgence. But, as should have been amply demonstrated by now, in view of the heterogeneity of the Indian polity, a Naxalbari kind of violent uprising can have only a limited run; any chance of its catching on is at the moment as good as negligible. A more modest variant could be a season of strikes and agitations paralysing the administration. As the experience of the railway strike bears out, even here the government will be in a position to worst the opposition parties, particularly since the latter are not quite united among themselves and the economic wherewithal for laying a long siege against the authorities does not exist. As long as the Leftists are divided in umpteen groups, the government will also find it possible to play some groups against others and get away with it: this would be so even were the CPI not around.

If the government is incompetent and corrupt and mass discontent is pervasive, at the other end the opposition too has proved itself to be thoroughly incapable of taking advantage of the situation. This failure can be accounted for by the fact that, apart from the objective circumstances, certain subjective factors are at work. In almost each of the parties on the Left, dynamism is a thing of the past. The leadership is old and tired and reluctant to think along new lines. Inevitably, the emphasis is on shuffling and reshuffling a set of strategies evolved a long time ago. Precisely because these strategies are by now shop-worn, the government feels hardly stretched while combating the onslaughts launched by the opposition parties. The leaders of these parties have lost their credibility; but they are reluctant to step down and allow younger elements to take over. The consequence is a certain corrosive dissidence and futile revolt. Witness the convulsions currently overwhelming the CPM and the open polemics among different factions of the Socialist Party, the SSP, and similar other groups. A demoralised opposition can scarcely be a bulwark against the emerging authoritarianism in the system.

National Rayon

Behind the Proxy War

WHEN the Unit Trust of India (UTI) went in for National Rayon shares, it could not have known what it was taking on. Its role as a large shareholder acquired public significance when the LIC, another major institutional holder, sold a large block of preference shares to the Kapadias, who had made a speculative thrust into National Rayon. Whatever the LIC's consideration for selling the preference shares, which have voting rights on par with ordinary shares, the consequences of the deal continue to affect the affairs of the company. Some idea of the UTI's problem can be had from the following assessment of Kapadias by the Company Law Board: "It would be a grave risk to allow a company of the importance of National Rayon to pass into their [Kapadias] hands." The Company Law Board expressed this view after noting that the performance of Kapadia managements in other companies did not inspire confidence.

National Rayon's eleven-member board has five Kapadia directors. There are two directors representing the government and one each on behalf of the UTI and the LIC. Rasiklal Chinai, whom the Kapadias tried to oust from National Rayon, is a minority director. Naval Tata is the non-partisan chairman of the board. The Kapadias agreed to this composition of the board at the instance of T A Pai, the then chairman of the LIC, who sought to mitigate the damage done by his predecessor in the LIC, through an arrangement that kept the Kapadias in a minority.

Clearly, the arrangement could not be expected to last forever. Sure enough, last year the Kapadias sought to expand the board by bringing in seven of their nominees. The move was blocked by the Company Law Board. However, the Kapadias still have a number of options. First, they could strike a deal with Rasik Chinai. If he vacates his seat on the board in favour of the Kapadias, the majority would be theirs. Second, they could try to secure withdrawal of the government directors from the board. And third, they could try to worst the UTI in a proxy war. The options are not mutually exclusive and are apparently being pursued with zeal. With the proximity of the annual general meeting of the company on June 29, the emphasis just now is on bagging proxies. No effort in being spared, for what is at stake is control over a segment of the prized synthetic fibre industry whose products command a premium that runs into a couple of crores of rupees annually.

The new element in the situation is that Rasiklal Chinai has of late been in two minds about the usefulness of his continuing on the board. This opens the way for the Kapadias to exercise option number one. Nor, despite the views of the Company Law Board, can option number two be altogether disregarded, given the Kapadias' relationship with the most influential entrepreneur in the automobile industry. The relationship is said to be currently under some strain, but the strain can be eased. And once that happens everything is possible.

The UTI's decision to put up its nominees against the two retiring Kapadia directors and Rasiklal Chinai should be seen against this background. When the Kapadias sought to induct seven additional members into the board last year, the UTI had secured 1,75,000 votes (including 30,000 preference votes) and the Kapadias 2,10,000 votes (including 92,000 preference votes). Equity votes polled by the UTI thus outnumbered those polled by the Kapadias by 1,45,000 to 1,17,500. The total votes cast numbered around 3,85,000 out of the total of 5,74,000, including 1,74,000 preference shares. In other words, nearly 2,00,000 shares did not participate in the poll last year. If, of these, holders of, say, 1,00,000 shares are not interested one way or the other, the Kapadias and the Unit Trust will in effect be wooing the holders of the remaining 1,00,000 shares.

Like the UTI, the Kapadias too have been in the market for National Rayon shares. The shares have climbed a high and marketmen, knowing that their price will slip after June 29, are turning bears. Right now National Rayon has attracted backwardation charges, reflecting short sales. This does not mean that there is no scope for collection of proxies. The UTI is stated to be confident of polling at least one-third of the total voting strength, largely through equity shares. Nor are the Kapadias, and their agents, resting on their laurels. A premium for proxies is being paid outside the market, over and above the carry forward charge.

There remains the small shareholer who is baffled by all this proxy game. It is this fragmented body of shareholders who can tilt the balance; but, alas, they know not their strength and appear to be resigned to the fact that, the Company Law Board notwithstanding, the fate of National Rayon depends on the rapport speculators establish with fixers in the government and the Congress party.

A Shifting Focus

Romesh Thapar

THE post-parliamentary session holiday-season is ending, although not a few are trying to extend their pleasures by pretending they are on work. Both politician and bureaucrat are, however, anxious to keep in touch with the power centre that is Delhi — if only because there is confusion about policies, and strong rumours concerning purges in the ruling party and shake-ups in its leadership. This is usual for this lazy time of the year, and especially so in 1974 with the Presidential election due in August.

Probably the Prime Minister will hold her hand until the Presidential nominations are out of the way. The Supreme Court opinion on the legality of the election in the absence of certain State Assemblies was commonsensical. Any other way, given the politicians of today, we would never have an intact electoral college. Now, the thorny question of who stands as the candidate of the ruling party is to the fore.

Time to Consolidate

We should remember that the election is taking place at a rather critical moment. Politically and economically, the Prime Minister needs to consolidate her position for the general elections which are not so far away. The rupture with the Left, following the crack-down on the striking railway workers, is very much a fact of political life, despite the attempts to paper it over. So, too, the new honeymoon with private enterprise since political interference and Leftist trade union activity have wrecked the public sector. The choice of presidential candidate is dependent on many solid considerations; or so we hope.

The doubt arises because of two parallel developments. Political lobbyists, working for various groups of ministers, seem to have been slowly 'gheraoed' to support, believe it or not, the frail and crumbling figure of Fakhruddin Ali Ahmed. Presumably, this selection is intended to satiate the ambitions (sic!) of the Muslims, and, of East India. Dubious as the choice is, the South in expected to acquiesce on the promise of the Vice-Presidentship. The second layer of speculation is the intense activity, covered and not-so-covered, of the present occupant of Rashtrapati Bhavan. Giri sees no reason why he cannot carry on. And the entire Opposition, in its present state of disarray, might agree. Then what? Another term?

Perhaps, it is too early to say that 'a situation' is developing around the Presidential election. Apart from candidatures, the first criticisms of the Supreme Court's opinion about the continuity of the electoral college suggest that, attempts will be made to dissolve some more Assemblies by August so as to create the basis for challenging the election. Bihar? Madhya Pradesh? Kerala? Assam? Between now and September is a period of serious and grave shortages. The Opposition needs to restore its 'initiatives'.

Too Much Sophistry

Meanwhile, we have developed a great deal of energy over Bhutto's refusal to meet with us following the nuclear test in Rajasthan. The exchange of letters amuses. So much argumentation, but the basic point is missed. After all, India's unilateral cease-fire following Pakistan's military disaster in Bangladesh proved that we did not seek the destruction of our neighbour — and what's more, public opinion supported the Prime Minister. The dismantling of the visible military confrontation between the two countries needs stressing. If the Arabs and Israel can begin this process, why not us? Bhutto needs more blunt treatment. Too much sophistry only blocks communication to the peoples of Pakistan.

As part of the game, the normalisation proceeds in Kashmir. Sheikh Abdullah is very much a part of India now, even down to the operators and fixers who surround him, never leaving his shadow, to the despair of genuine supporters. The arrangement with Abdullah on the delegation of power will have to be disciplined by the realities of the Indian federal polity; it cannot be something exclusive, only applicable to the Valley. In other words, the dialogue now joined with Abdullah cannot but have wider repercussions. And this is understood where understanding is needed.

Of course, all these carefully laid plans may well get out of hand if the food position and the supply of essentials continue to deteriorate. Bhutto may well be banking on some such complications for India. He has had a taste of the Qadiani riots in his own country. The trouble is that we are seldom masters in our own home. Too many influences are at play. And, alas, in India too many tasks are performed by too few people. A mistake here, and a mistake there, and we are in for the high jump.

When will the focus shift from political manipulation to this critical area?

June 10

LETTER TO EDITOR

Punjab Government and the Press

NIREEKSHAK, often well-informed and always bold, has been rather stingy in appreciating the generosity of the Punjab government to some correspondents based in Delhi ("Fourth Estate", April 27, p 673). He writes that "a few hand-picked correspondents have been allotted living accommodation in the estate at *nominal rent*" (emphasis added). This is not true. As the Punjab Minister of State for Public Works recently disclosed in the state assembly in reply to a question by S P Dang, CPI, these correspondents have been allotted accommodation at *government cost*. The beneficiaries of the Punjab government's munificence, named by the Minister, are the Special Correspondents of *Daily Tribune, Statesman, National Herald* and *Assam Tribune*, the Staff Correspondent of the UNI, the Staff Reporter of the PTI and the Editors of *Daily Ajit* and *Quami Ekta*. According to the Minister "no specific basis/grounds have been determined to allot residential accommodation to the journalists. Allotment is being done on the basis of the available accommodation in the Nabha Plot".

It may be added here that the buildings housing the offices of the *Times of India, National Herald, Patriot* and numerous other newspapers in Chandigarh are subsidised to the extent of about 50 per cent by the Punjab government here. The managements of these newspapers have closed their eyes to this fact because thereby they save a few hundred rupees per month.

NEWSMAN

Chandigarh

Despite Raw Material Shortages

Hansavivek

MOTOR INDUSTRIES COMPANY has completed construction of the first phase of its factory building at Nasik and is shifting machinery there from the rented premises in which it had been carrying on operations hitherto. Complete production of nozzles and nozzle holders at its own factory at Nasik is expected to start by the end of this year. The first lot of imported machinery was received and installed last year and substantial shipments are expected during 1974. The company allotted 375,000 bonus shares on a one-for-one basis in June 1973. A 'rights' issue of 95,588 shares at a premium of Rs 75 per share was made in the second half of 1973 to reduce the holding of Robert Bosch. Out of these, 48,000 shares were allotted to the five financial institutions on conversion of a part of the loan taken from them for financing the company's fifth expansion. The remaining 47,588 shares were issued to the existing Indian shareholders. The company has obtained a long-term loan of Rs 3 crores from ICICI, IDBI, IFCI, LIC and UTI through privately placed debentures. Irregular supplies of raw materials notwithstanding, MICO turned out good results for 1973. Net sales advanced by 21 per cent and profit-margins too edged up a little, although the wage bill in relation to sales was considerably higher. The ratio of inventories/sales was also higher compared to the previous year. Dividend, lowered from 17.5 per cent to 12 per cent, payable on the enlarged capital, required more but the earnings-cover was maintained at the last year's level. Exports more than doubled to Rs 363 lakhs (Rs 172 lakhs).

AHMEDABAD ADVANCE is commissioning its special alloy steels project in a phased manner and expects to complete it before the end of this year. The imported Sendzimir mill and some other indigenous equipment are either under installation or are undergoing trials, but there has been delay in the supply of 2 Hi/4 Hi rolling mill equipment from Metallurgical and Engineering Consultants (India) and Bharat Heavy Electricals. Meanwhile, the company's metals division has developed some new products which to some extent have helped in import substitution. The company has executed substantial orders for high carbon steel strips used for manufacture of various types of industrial blades such as hacksaws and bandsaws. The metals division has also developed cold rolled steel strips for the manufacture of razor blades. What is affecting the operations, however, is the shortage of raw materials. Chronic shortage of steel has been further accentuated by shortages of power, coal and non-availability of railway wagons for transport. Naval H Tata, chairman, envisages a bright future for both the metals division and the special alloys steel project, provided they are fed with adequate feedstock of hot rolled material. With bigger contribution from both the textiles and metals divisions, AA showed better results with higher sales and profit-margins. Net profit was lower than last year's because of tax liability. Cover for the unchanged 12 per cent distribution is therefore lower. The company fulfilled its export obligation and exports rose from Rs 15 lakhs to Rs 24 lakhs. Plant and machinery worth Rs 15 lakhs were installed last year.

TATA MILLS has been granted a licence for installation of 9,240 spindles for balancing purposes and is implementing the project, but its application for an industrial licence for 200 additional automatic looms is still under consideration by the government. Meanwhile, the Bondtex non-woven products of the company have made a new breakthrough in lapping material for printing machines. The inroads into applications in industrial filters has also continued, and the company has developed special filters for ultra-jet dust catchers and air filters for locomotives as import substitution. The sale of Bondtex material for use as fusible and non-fusible interlining has also increased. The company is developing new products to cater to the special needs of defence. With the favourable trading conditions and change in the product-mix, the company lifted its margins spectacularly as reflected in a seven-fold jump in gross profit following a less than 6 per cent rise in sales. Dividend, stepped up 6 points to 16 per cent, is covered over three times. It is proposed to make a 'rights' issue on a one-for-four basis at par to augment cash resources to the extent of about Rs 24 lakhs. A public issue of 8 per cent debentures (1983-85) of the nominal values of Rs 40 lakhs was made last year. Plant and machinery worth about Rs 53 lakhs was installed.

SVADESHI MILLS, which has completed 88 years of existence, is continuing the process of replacing old and worn out machinery. Plant and equipment of the approximate value of Rs 25 lakhs, including a 1,500 KVA transformer, was installed last year. Availability of cotton at reasonable prices and improved trading conditions enabled the company to lift its gross profit from a mere Rs 22 lakhs to Rs 127 lakhs last year, although net sales were only marginally higher. With a larger cash generation, the total debt of the company could be reduced by Rs 120 lakhs to Rs 279 lakhs over the year. Although taxation drained away Rs 55 lakhs against nil in the previous year, net profit amounted to Rs 41 lakhs against a loss of Rs 8 lakhs, and the dividend stepped up 5 points to 20 per cent is adequately covered. The company performed well on the export front too and the value of exports reached a new high of Rs 133 lakhs as compared to Rs 71 lakhs for the previous year.

NALANDA CERAMICS AND INDUSTRIES is establishing a project at Getalsud, near Ranchi in Bihar, for production of decorated porcelain tableware with a capacity of 3,000 tonnes per annum. It has undertaken to export 30 per cent of the production. Technical collaboration agreements have been entered into with two Japanese firms and with India Potteries of Calcutta. IP will take over from the foreign collaborators when they leave after the initial period. The project, estimated to cost Rs 255 lakhs, is proposed to be financed by share capital (Rs 100 lakhs) and long-term loans from IDBI, IFCI, SBI and BSFC (Rs 155 lakhs). The subscription list for 4,37,500 equity shares of Rs 10 each and 18,000 9.5 per cent redeemable cumulative preference shares of Rs 100 each will open on June 17 and close on June 27 or earlier, but not earlier than June 19. The rate of dividend on preference shares is proposed to be increased to 9.8 per cent after obtaining approval of the shareholders and consent of the Controller of Capital Issues. D L Mazumdar is the chairman and S K

Ghosh, a ceramic technologist, is the managing director. The company has been promoted by a group of small-scale industrialists from Bihar and West Bengal. The management expects the company to start trial runs at the plant from November and go into commercial production from January 1975.

GOGTE STEELS will enter the capital market in July 1974 with a public issue of Rs 96.25 lakhs to finance its special and low alloy steels project. This will comprise 612,500 equity shares of Rs 10 each and 35,000 9.8 per cent cumulative redeemable preference shares of Rs 100 each. The company is being promoted by Gogte Minerals and Special Steels, The State Industrial Investment Corporation of Maharashtra is taking 26 per cent of the equity share capital. The total cost of the project is estimated at Rs 3.90 crores. This is proposed to be met by share capital (Rs 1.60 crores) and term loans from financial institutions (Rs 2.30 crores). The loan arrangements have been finalised. Technical consultants for the project are M N Dastur and Company who have prepared the project report and are responsible for the engineering and supervision of the project. Two 15-tonne electric arc furnaces and a continuous casting machine with an annual capacity of 42,000 tonnes are being installed. The plant will mainly produce medium carbon, high carbon, spring steel and other special quality steel billets. The addition of a wire rod mill to the above complex has been planned and the company has already received a letter of intent in this regard from the government. This therefore will be a complete steel works complex with steel making plant, continuous casting machine and rolling mill. Production of billets is expected to commence by the last quarter of this year. The project is situated at the MIDC Industrial Estate at Tarapur. Thus it is close to Bombay and Ahmedabad, the two main scrap collection centres in the country. Power, water and other infrastructural facilities are available at the Tarapur Industrial Estate.

STRAW PRODUCTS has produced encouraging working results for the year ended December 1973. Production, sales and profits have all moved up and the Directors have recommended a higher dividend of 12 per cent on equity shares against 10 per cent in the previous year. Production of paper, paper board and straw board was 40,741 tonnes as compared to 36,549 tonnes during the previous year, showing an increase of about 11 per cent. Sales have moved up by 34 per cent to Rs 12.61 crores from Rs 9.37 crores in the previous year. Profit before depreciation is Rs 1.83 crores against Rs 1.59 crores. After providing depreciation of Rs 1.24 crores against Rs 1.07 crores, profit amounts to Rs 59 lakhs against Rs 52 lakhs. Writing back Income Tax of Rs 1.7 lakhs and Development Rebate Reserve of Rs 4 lakhs, the disposable profit is Rs 65 lakhs against Rs 52 lakhs, showing a rise of about 24 per cent. A sum of Rs 17.48 lakhs has been provided for Gratuity for earlier years against nil last year; Rs 2.46 lakhs has been transferred to General Reserve against Rs 5.24 lakhs; and a sum of Rs 44.32 lakhs has been set aside for proposed dividends against

Rs 35.76 lakhs last year. The company claims that its results would have been considerably better but for substantial loss of production at the paper mill because of a power cut of 40 per cent imposed for about 2½ months and shortages of lime and coal caused by transport bottlenecks and all round increase in costs. Expansion of paper-making capacity by 3,000 tonnes per annum was completed during the year. The project for establishment of a coating plant at JK Paper Mills with an installed capacity of 4,500 tonnes per annum of coated paper and board is in progress. Production is expected to commence during 1974.

SKOL BREWERIES' project, which was behind schedule owing to difficulty in obtaining cement and steel for construction purposes coupled with delays in manufacture of certain items of equipment manufactured for the first time in the country and in supply of refrigeration equipment on account of shortage of electricity in Haryana, was completed in early February last. Initial production commenced soon thereafter. The company has obtained sufficient quantities of brewer's barley, produced for the first time in India in the 1973 harvest. The current year's crop is expected to be higher. The management complains, however, that bottle prices have increased by about 60 per cent during the past six months and that prices of other packaging materials, which constitute a substantial part of the ex-brewery price, have increased by almost 50 per cent. It is further stated that there is no sign of this trend slowing down.

ASHOK LEYLAND achieved an all-time record production in the year ending March 1974. The record production was achieved despite a 75 per cent power cut in Tamil Nadu for almost four months in the first half of the year. Output of the popular 7½-ton Comet chassis was 105 per cent of licensed capacity. Production of industrial engines, together with the recently developed, highly popular, marine version, was also above capacity levels. The Company is taking steps to increase output further with the government's approval. There is, however, a shortage of spare parts, production of which has not kept pace with demand. The Company has been trying to raise the production of spares and during the past two years output of spares has been increased by almost 20 per cent. Licensing formalities and government approval for the Company to double production of the Comet range of vehicles are now complete. The Company has taken steps to implement the project in the shortest time possible. This will go a long way to meet the unsatisfied demand and considerable backlog of orders for the Company's vehicles. The Company claims that neither the present economic conditions in the country nor the inflationary trends have had any adverse effect on the market demand and potential for these vehicles.

Calcutta Diary

A M

MINISTERS and their cronies call each other thieves and worse. A commission of enquiry is to find out which set of allegations has greater verisimilitude. What on earth for? To discover which minister is the greater thief, is a peripheral issue. In any case, one must not be carried away by the day's rhetoric. Certainly not all ministers are crooks. Certainly some of them are. But, given the context, the distinction between the two species is hardly relevant. Even those whose personal integrity is not to be questioned are constituents of the whole. When the very basis of the government is amorality, formal clearance of this or that minister — or his formal commitment for that matter — by a commission of enquiry is neither here or there. Since the political arrangement is structured on corruption, its working will stay corrupt. Even ministers whose personal integrity is not in question will have to acquiesce in immoral, and possibly illegal, acts for the sake of the arrangement.

For, remind yourself of the grand strategy that was. Around 1970, West Bengal was being considered touch and go. Between the Scylla of the Marxists and the Charybdis of the Naxalites, the state was given only a marginal chance of survival as a tranquil member of the feudal-bourgeois feudal polity. Any day, or so it was being thought, the final bell would toll. Something had to be done, and desperately hurriedly. For the first time in nearly three decades, around the middle sixties, a rich crop of brilliant young people had again been drawn to the political movement in the state. Most often, perhaps, you would not have agreed with their views and attitudes; nevertheless, they charmed you, bowled you over by their grit, their courage, their willingness to suffer for the cause. They had intellectual capability, they had organising skill, many of them had that undefinable, unquantifiable thing in plenty — namely, charisma. Even as these brave, bold youngsters were radicalising the arena, the working class movement too was gaining rapidly in strength; it attained, for the first time, a certain depth as well as a certain cohesiveness. Almost simultaneously, the landless labourers and the smaller peasants, encouraged by the experiment of the United Front, had begun to grab land and harvest that part of the crop which, legitimately if not legally, belonged to them. All of these dovetailed into one another, and the background was provided by an environment reeking with distrust of the Centre. Many of the grievances against the Centre had solid objective bases; a few were the products of emotive causality. But, in that milieu, that mixture of grouses was having a lethal effect.

Private industry which, under B C Roy's protective tutelage, had merrily gone on with their 'Ballygunge Plates' and whiskey sours and vintage car rallies, was badly scared. The feudal elements in the countryside — or whatever their remnants — which had just started to blossom into a new identity, i e, that of the quasi-capitalist group specialising in Mexican wheat, IR-8 paddy, and potato seeds, panicked about equally. And, of course, the Centre — which by then had recovered from its own identity crisis — was flabbergasted by the display of red flags fluttering across Calcutta's smog-smothered sky. Touch and go, said private industry. Touch and go, said the share-market operator. Touch and go, said the *faria* and the *kutcha adatiya*. Touch and go, said the many branches of the police, whose minions, by convention, have always shared the booty with the wagon-breaker and the levy-evader. Aye aye, conceded the Centre, it was touch and go.

West Bengal could not be allowed to go over. A grand strategy was worked out. It took months to mount it, there were hitches and flaws in the initial stages, but, by early 1971, a reasonably viable operational plan could be set in

motion. The ideologically fanatic young men were picked up in their hundreds. Several of the more determined ones amongst them were summarily liquidated. They were shot point blank, without trial, without even the mildest warning, some of them within a couple of hours of their being arrested, some of them right in front of their near relatives. Nobody talks about these young people any more, nobody seemingly knows their names: they were there, they are no longer there. The rest of the world, including the intellectuals who congregate in the groves of academia to discuss Mallarme and Bergman and My Lai, were not disturbed by the occasional rumblings of reports about these organised deaths. And those who were not shot were tortured: there was this shock of recognition, the modalities one has read in connection with the practice of torture in authoritarian regimes were faithfully deployed: many of these are too lurid to be described, and might hurt this or that reader's bourgeois susceptibilities.

The strategy marched forward, inexorably. The Central Reserve Police and battalions of the army were commissioned to activise a scheme of encirclement and annihilation. In order to make the scheme foolproof, the army and the police however had to have reliable allies and collaborators. The forces of law and order discovered the social scum. The habitual wagon-breaker, the knifewielder, the area ruffian, the *mohulla* rogue, the snatcher, the ragamuffin, they were all mobilised. Sometimes their services were purchased on daily wage, sometimes threats of arrest and persecution were held out to persuade them to fall in, sometimes they were promised a millenium once the communists were got rid of. Every now and then, these rich specimens of society were made to don the mantle of membership of the ruling party's youth or student body, so that the cover could look almost respectable: the hand that wielded the knife also waved the banner flaunting the Prime Minister's smiling, socialistically-inclined countenance. All the good men were thus brought together for the sake of the cause. It could be morning or afternoon or the dead of night, the units of the army or the CRP would cordon off an area, and the hired thugs, ably assisted by the police, would then begin to comb each individual house. Terror would strike the neighbourhood. It was violence perpetrated by, and at the order of, the authorities. Young men caught in the dragnet would become members in so much bragging statistics by the end of the day: in area A, the total catch from Operation Dragnet was three hundred and eighty-two; in area B, it was perhaps two hundred and ninety-seven. As in Vietnam, a neat credit system was set up: in our area, we have, in the course of barely one hour, caught twenty, liquidated three, bashed up eleven; what is your count? We have won, we have won.

Meanwhile, other ploys were also set to work. The Left parties, which took their own oral eroticism as the real thing — the Revolution — were busy pretending that their clumsy attempts at enlarging their own sphere of influence at the cost of the others was akin to seizure of power. Most of them could not see beyond their nose, and blind egotism was the credo of the day. In this confusion, the social scum could be liberally infiltrated by the police here, there and everywhere, so that, side by side with the government-organised terror, mutual knifings too took their toll of the cadres of the Left. This is a technique which the ideologues had read is their books, a technique which fascists and social reactionaries are wont to apply for creating a chink in the armour of working class solidarity. But, to the ideologues, such things happened elsewhere, in remote lands; few amongst them realised that the class war, unknown to them, had already come to their own shores.

From this, it was but a short hop for the hoodlums — by now totally identified with the government and the ruling party — to capture the polling booths and ordain the results of the 1972 poll. At least thirty thousand men and women locked away without trial for political reasons; the capture of power through *force majeure;* individual localities, including factory belts, cleansed of the turbulent Left elements with the help of hired goons; who can doubt that West Bengal has been made safe for democracy, and for private industrial and feudal elements? This state is no longer touch and go.

It is unreasonable to assume that, having served the cause, the social scum will now make themselves scarce. The police and the army by themselves would never have been able to achieve the spectacular success which West Bengal has been. It is the logistic support extended by the underworld, whose doughty champions often masquerade as a youth or student leader, which made the difference. If, today, the social scum withdraw from the scene, the Left will again take over Calcutta, and West Bengal. This is market reality. The underworld consists of people who are in a hurry: they want to be paid off, here, now, today, for the services rendered by them. They are represented in the state government, directly or otherwise. At the same time, the underworld, like West Bengal's Left, are also terribly suspicious of each other. The government they have helped to set up must by definition be a government which will dispense spoils. The current brawl in the state Congress is over which set of the anti-social elements will get how much of what spoils. Since all groups had participated in the jolly game of bashing up the communists, why must only one amongst them walk away with all the fruits of victory?

A commission of enquiry, even assuming that its *bona fides* are beyond dispute, can only do a gentle probing of the facade. The issue, however, concerns the entire rationale of the political arrangement. Morality is impossible of compartmentalisation. Having participated, alongside with the regimens of the army and the police, in much greater crimes while putting down the Left, the social scum will be hardly inhibited by a commission of inquiry. To eliminate the threat of the communist take-over, the authorities once considered it worth their while to befriend the sleaziest specimens of humanity. It is the code of ethics of the latter which will now prevail. Jobbery and nepotism may be in conflict with the goals of production and distribution, but past accounts must be settled. The social scum now hold the government to ransom. But it is their government, why should not they? You complain of the intellectual shortcomings of the government, you complain of its lack of achievements? These are again unfair charges to lodge. Nobody was looking for competence, honesty, integrity, *et al* when the *putsch* was arranged; the overriding criterion for decision-making was usefulness for suppressing communist influence. Those who helped you bump off communist cadres were promised the princess and half a kingdom; they will now claim their booty, and quarrel amongst themselves in case they suspect they are being short-changed. A government set up by thieves will naturally be expected to be a government run for the benefit of the thieves. Why cavil at it?

NEW DELHI

The Big Stick for Workers

B M

GOVERNMENT spokesmen from the Prime Minister down have been talking nineteen to the dozen about major 'wage reforms' in the offing. The various Cabinet committees are also said to have been discussing the subject. To take all this to indicate the beginning of an earnest effort to end iniquitous wage differentials and distortions would be to allow oneself to be misled by official propaganda.

What is, in fact, under way is a determined effort by the government to impose a freeze on wage and salary earnings. In the past also there have often been apprehensions about and agitations against a wage freeze, but of a different kind. The main issue then used to be the speed with which — and the extent to which — neutralisation of the rise in the cost of living could be secured from employers whether in the private or the public sector. An outright freeze on wages, regardless of the price rise and the consequent erosion of real incomes, was never seriously conceived.

It is this conception that has crystallised now. After the government's success in crushing the railwaymen's strike, the Prime Minister evidently feels confident about the feasibility of an unqualified wage freeze and seems even to believe that this is called for.

It was in fact the prospect of a general strike by over a million railwaymen that had underlined the need for wage reform. The Prime Minister had assured 'earnest' consideration of it by the government — though she had been careful to qualify the commitment by saying that big changes of this kind could not be effected 'overnight', and by putting the rider which had gone almost unnoticed at the time that wage reform should not dislocate the existing order of things. It was thus clear that, apart from overtly recognising the problem, government did not intend to attempt any significant reform in the field.

Talk of an integrated incomes and wages policy has been going on for as long as one can remember. In fact, however, wage differentials have widened and become less rational. Wages and salaries have been even less related to the imperatives of social labour, skills or productivity. Now that the resources position of the government is far worse, it could conceive of little else than taking an indiscriminate stand on wages. Hence the blinkered move, brazen and without evasion or equivocation, for a total freeze on earned incomes to the point where DA neutralisation too is to be denied to its present beneficiaries — particularly Government and public sector employees. Even before the railway strike, the Finance Ministry, as part of its so-called economy measures, had directed public sector undertakings not to raise allowances and other benefits to their workers without its own prior approval. This had already caused tensions among workers and unrest among officer cadres in the public sector undertakings.

In the steel plants, for example, there is considerable unrest among the officer cadres, earning Rs 550-775 with a DA of hardly Rs 70 per month — just half of what workers drawing almost the same emoluments receive. But the Finance Ministry has consistently refused relief. A similar situation prevails in the nationalised coal mines.

The main impetus to refuse DA neutralisation arises over the application of the Third Pay Commission's DA formula for government employees including employees of departmental undertakings, such as the railways, P and T, and defence production. According to the Third Pay Commission's recommendation, when the twelve-monthly average of the price index advances to 272 points, the government must decide whether to continue to give DA at the rates recommended by the Commission or to revise the pay-scales of the employees. Thus, during 1973-74, the government had to give five DA instalments under the Commission's formula. The sixth instalment was due in April. At the present rate of inflation, the level when pay revision must take place under the Pay Commission's formula may be reached in another two months. The immediate question, therefore, is whether the Government should continue to honour the Pay Commission's recommendations on this issue.

There is a strong section in the government which feels — arguing from the need to curb deficit financing and control inflation — that there should be no more DA payment on the scale of the last year or two. This opinion is a major ingredient in the so-called integrated wages and incomes policy.

Implementation of the policy will, of course, require an extremely harsh industrial relations policy. The manner in which the railway strike has been crushed and the treatment meted out by the government after the strike to the striking workers and their organisations foreshadows accurately what is to come in the future. The government has made it plain that there will be no discussion with the organisations which had led the strike and that there is no question of leniency towards workers who had participated in the strike. A proposal, now under consideration, is most revealing of the present mood of the ruling leadership.

While the principle of no pay for the period of the strike has always been acknowledged, its application in the past has been quite flexible. Generally speaking, workers have been paid for the duration of the strike, either

SUBSCRIPTION RATES

1 year	Rs 35
2 years	Rs 60
3 years	Rs 80

Concessional rates are not applicable to students and teachers outside India

as an advance to be adjusted against future earnings or as payment in lieu of their earned leave. The practice helped enormously to restore normalcy after a strike. The new proposal is that such adjustments should not be allowed if workers are to be 'disciplined' and strikes are to be effectively prohibited. On the contrary, more stringent procedures are to be laid down for managing industrial disputes. Already, the concept of the 'essential services' in which strikes may be prohibited has been freely applied by the government. It is now proposed that this provision should be used more liberally in the blanket concept of the 'core' sector.

But this is not all. The logic of populism turning towards authoritarianism has been relentlessly unfolding on a wide and ever-expanding front. If workers are being treated with toughness, there appears at the same time to be a corresponding soft corner in the official heart for the industrialists and the businessmen. In any case, industry and its leading lights are feeling greatly heartened by the turn of events. The new implicit industrial policy — of allowing expansion of foreign-owned companies against a token dilution of foreign equity holdings and of licensing expansion of the big business houses — which has been under way for nearly two years, is now gathering more obvious momentum. The policy is rationalised on the ground that the cost of such expansions being very small compared to what will be required to set up new ventures, they offer the most economical way of increasing production and ensuring use of available private and corporate funds for investment. Further, the outright clearances recently given by the Monopolies Commission and the government for the expansion schemes of big business houses and foreign companies have greatly helped to bring about a 'spurt in industrial activity' — though the qualitative significance of this on the pattern of investment is not yet, and may never be, fully appreciated. It is pointed out that it is not quite easy to quantify this either. However, the capital outlay itself on these schemes may easily exceed Rs 500 crores. Among the noteworthy schemes in this category are the STPP plant of Hindustan Lever in West Bengal. Others engaged in similar ventures are Philips, Indian Aluminium and German Remedies, which have already diluted their foreign equity and have started implementing their expansion schemes. Other giants in the race are Indian Oxygen, Union Carbide, and many others. Among the big Indian business houses, Birlas take the cake : three units in the Birla group alone, it is pointed out, will implement an additional cement manufacturing capacity of 2.5 million tonnes in the next three years, involving a capital outlay of Rs 50 crores.

POLITICAL PRISONERS

New Uses of a Colonial Law

M R

THE Indian Penal Code, with its obnoxious 'conspiracy' provisions, was promulgated by the British in 1860 to stabilise and perpetuate their colonial rule. But not only has the IPC survived a quarter of a century and more of Indian Independence but the country's new rulers have found a new relevance for it. In addition, of course, we have known preventive detention laws of one kind or the other during most of the post-Independence period. In 1970 amidst the split in the Congress which deprived Indira Gandhi of her majority in the Lok Sabha, the Preventive Detention Act lapsed. Rather than risk a vote on the issue, she let the states enact their own preventive detention laws to fill the vacuum. Came the massive mandate in 1971 and about the first thing that Indira Gandhi did was to enact a new preventive detention law. It was called the Maintenance of Internal Security Act. Later in the year, the Defence of India Rules were clamped down. The State of Emergency still continues, though Swaran Singh proclaimed after the tripartite meeting of India, Pakistan and Bangladesh in New Delhi on April 9 that the subcontinent was on the "threshold of reconciliation".

In 1970, the Andhra Pradesh government had armed itself with a law more draconian than the PDA that it was supposed to replace. However, to its dismay, the state government has found itself repeatedly stymied by the High Court over its use of preventive detention laws against left movements in the state. It has, therefore, resorted to using the penal provisions of the IPC. A couple of weeks ago, the government launched yet another 'conspiracy' case under the IPC. Known as the State *versus* K G Satyamurthi and others case (or the Secunderabad Conspiracy Case) it implicates 46 functionaries of the Communist Party of India (Marxist-Leninist). Among the accused are six prominent writers and poets belonging to the Andhra Pradesh Revolutionary Writers' Association: T Madhusudana Rao, secretary of the Association, K V Ramana Reddy, Varava Rao, Cherabanda Raju, M T Khan and M V Ranganatham. Among the other accused are some leaders who are already in prison and are implicated in similar cases. Thus K G Satyamurthi, for instance, is one of the accused in the Parvathipuram Conspiracy Case, which is perhaps the biggest trial of communists in India since the Meerut and Cawnpore Conspiracy trials of the 1930s. According to the First Information Report, the 46 accused in the Secunderabad Conspiracy Case — some of them still underground —are supposed to have conspired, along with K G Satyamurthi and underground leader Kondapalli Seetharamiah and others to overthrow the government by violent means.

The Andhra Pradesh government has used Meerut and Cawnpore-type cases against revolutionary communists since 1969 when it swooped down on a secret conclave of CPI(M-L) leaders and, after a trial which lasted two years, secured the conviction of 28 persons to 4 years' rigorous imprisonment. These accused are now held on short-leash in the form of conditional bails — under which normally they are not allowed to move out of their home towns without permission — pending disposal of their appeals. The Parvathipuram Conspiracy Case, registered a little later, took years to come up before the Sessions Court and what with over 1,000 witnesses and mountains of paper evidence to be examined, will last for years. In the meantime, many of the accused have been in prison for five years already. The charges relate to pre-1969 events in the Srikakulam district of Andhra Pradesh. Most of the 60-odd accused standing trial in this case are also implicated in several other cases of dacoity, murder, etc.

Most of the revolutionary communist leaders had already been covered under the Nagi Reddy Conspiracy Case and the Parvathipuram Conspiracy Case. The new case just registered is, therefore, in the nature of a 'mopping up' operation. Among its objectives is to smash the Andhra Pradesh Revolutionary Writers' Association which has grown in strength and has become a powerful literary-political movement. By arresting the revolutionary writers under the IPC on non-bailable offences, the Andhra Pradesh government apparently feels secure against habaes corpus petitions and the like. The interlocking of the Parvathipuram and the incipient Secunderabad Conspiracy Cases has sinister implications for the accused who are common to both the cases. Even if they are acquitted in the first case, they can be held in continued custody in connection with the second.

INTERNATIONAL MONETARY REFORM

Haggling over the Price of Gold

(From a Special Correspondent)

THE persistent efforts of certain EEC countries to jack up the official price of gold have once again come to a dead-end. The nine member-countries of the EEC decided last week to drop their plans to press for an upward revision of the gold price at this week's final meeting of the IMF's Committee of Twenty on international monetary reform. They will, however, continue to work on their tentative proposal to allow central banks to trade in gold among themselves at market-related prices.

Some six weeks ago, it may be recalled, the nine EEC countries had, after prolonged discussions, finally approved this proposal. They were then ready to implement it after securing the concurrence of the United States. It is interesting that even those EEC countries which are very vocal about the EEC countries asserting their total independence from the US so far as intra-EEC economic matters are concerned, were willing to go along with the other member-countries who maintained that they could not possibly think of introducing such a measure without obtaining US approval for it.

The EEC's argument for raising the official price of gold for inter-central bank dealings runs along familiar lines. Since the present official price of gold is ridiculously low in relation to its free market price, all monetary stocks of gold are virtually frozen as no central bank is willing to part with its gold at the official price. According to IMF rules, no central bank can buy gold at the market price, though it can sell gold at that price if it chooses to. This one-way option, however, deters central banks from selling gold as they cannot repurchase it later so long as the market price remains higher than the official price. Moreover, the majority of the more important central banks are reluctant to deal in gold in the free market since the market has been in the grip of speculators for quite some time. Thus the only option left is to permit dealings in gold among central banks at some agreed price.

France and Italy, which hold large stocks of gold, are currently facing unusual balance of payments difficulties. They are, therefore, keen that the price at which gold is traded among central banks should be as high as possible. Hence their anxiety to persuade other countries to agree to the proposal that dealings in gold among central banks should be at market-related prices.

A major flaw in this arrangement, however, is the possibility of central banks trying to manipulate the market so as to influence the market price of gold in their favour. It is now well known that despite IMF rules against official deals in gold at prices other than the official price, some central banks have surreptitiously purchased gold from the market so as to rig up its market price. The main reason for these deals was that these countries wanted to convince as large a number of countries as possible that the official price of gold was highly unrealistic and that, therefore, it needed to be raised several-fold.

The US, however, remains unconvinced by this argument and is bent upon reducing the monetary role of gold to the point of eventually eliminating it from the international monetary system. In the immediate post-war period the US had the largest stocks of gold and, as a result of its policy of maintaining the gold convertability of the dollar till August 1971, it lost almost 60 per cent of its gold stocks, largely to such countries as France, Italy and West Germany. The US is, therefore, understandably hostile to proposals for raising the official price of gold which would confer windfall gains on some of the European countries which had built up their gold stocks at the expense of the US at the-then prevailing low official prices.

The EEC countries are aware that without the concurrence of the US they will not be able to introduce a step of far-reaching importance such as raising the official price of gold. They also know that most of the developing countries are not in favour of raising the official price of gold as it would benefit only the developed countries which hold most of the world stocks of gold. In view of this allround indifference, even hostility, to their proposals for raising the price of gold, the EEC countries did make some desperate efforts to win the support of the US. They had taken the unusual step of sending a high-powered emissary, the Dutch Finance Minister, to Washington to sound the US Administration on the EEC's proposal on gold. The US, however, side-stepped the issue by politely reiterating its oft-repeated position that the monetary role of gold should be gradually reduced and eventually eliminated. The new US Treasury Secretary later offered a tempting bait to the EEC countries by stating that there was need to work out new rules for gold which would both assist nations in responding constructively to changes in their balance of payments positions and facilitate steps towards the agreed objective of a diminishing the monetary role of gold. He, however, cautioned that he was not implying acceptance by the US of a high price of gold but only suggesting that something needed to be done about gold.

The US attempt appears to be to bargain with the EEC countries in making the SDRs the numeraire of the reformed international monetary system by delinking the value of the SDRs from that of gold, so that gold would not have any official price. This would leave the EEC countries free to deal in gold among themselves at any price they like. It was reported that, as part of this package, the US wanted that the volume of monetary gold should be brought down by official sales of gold on the free market, while the ban on purchases of gold from the market by central banks was continued. As a first step, the IMF should be made to sell gold out of its stocks which are valued over at $5 billion at the present official price of $ 42.22 per ounce. This would improve the liquidity position of the IMF and would enable it to lend in a bigger way to countries which are badly hit by the oil crisis. Official sales of gold would have the other beneficial effect of reducing the ludi-

crously high price of gold in the market which is being manipulated by speculators. After the speculators' back was broken and the free market price of gold was brought to sensible levels through official gold sales, dealings in gold among central banks at market-related prices could be a sensible proposition.

On the eve of the meeting of the Committee of Twenty there were some hasty discussions among the Group of Ten, which is the rich countries' club concerned with international monetary affairs. At these discussions, the US appears to have agreed to a compromise proposal. According to this proposal, gold could be used as collateral for international borrowing by any country. The value of the gold used as collateral for such borrowing could be determined by the lender, depending on his assessment of the worth of the collateral being offered as security. Thus while gold will not be valued at market-related prices, the proposal takes the wind out of the sails of the European countries' complaint that they are unable to make use of their large gold stocks to finance their payments deficits. It may be expected that in return for this small concession, the US will insist on reciprocal compromises by the Europeans on the other important issues invoved in international monetary reform.

NORTH

Taxing the Rich without Hurting Them

HOWEVER persistently the Central Government and the Planning Commission might press for speedy implementation of the Raj Committee's recommendations, the Punjab Government is unlikely to budge very much. The farm lobby is so strong in this region that any such proposals — including 'time-bound programmes' to mop up surplus funds from the rural rich — are summarily shelved. In fact the present rates of land revenue and other taxes in Punjab are believed to be the lowest in the country, even though the state is about the most prosperous. Every Punjab ministry, whether Congress or Akali, relies on the goodwill of the rural rich for political survival. Consequently, even the Vice-Chancellor of the Punjab Agricultural University, which has become an influential forum for protecting landowners' interests, was able to publicly warn on May 30 that imposition of an income-tax on agricultural incomes would be 'ruinous' to the state's agriculture. He suggested that, instead of levying any fresh tax which would be strongly resented, the rates of traditional imports — such as land revenue and water rates — could be enhanced.

And this is what the state government is now contemplating in answer to the mounting Central pressures for tapping agricultural incomes for state revenues. Thus, Revenue Minister Umrao Singh stated on May 31 that, while there was no question of imposing an income-tax on the farm sector the Government would consolidate several taxes (including land revenue and the special surcharges) into one levy, the rate of which might be later on progressively increased. The new consolidated levy is estimated to yield another Rs 2 to 3 crores.

Indeed, with landlords predominating the state cabinet and the state legislature, any major levy on agriculturists, or any effective land reform, is ruled out. The land ceilings law, for instance, exists only on paper, the bigger owners having already obtained the requisite adjustments in the revenue records and through numerous fictitious transfers. In any case, the entire attempt at land reform has been thrown out of gear following the High Court's order declaring some provisions of the Act as *ultra vires*. Any hope of reviving it appears remote as most of the Congress and Akali legislators are happy that the state's land ownerhsip pattern remains unchanged. The only group strongly advocating land reform is the CPI, and it has lately started an aggressive campaign despite its earlier understanding with the Congress.

Meanwhile, the Punjab Government has announced another Rs 10-crore economy drive. All non-productive expenditure is to be heavily curtailed; the non-plan programmes are to be pruned to save at least 5 per cent in the current year; travelling allowances and contingencies are to be cut by 5 to 10 per cent; and no new posts are to be created except under the Special Employment Programme.

While the Government's move to consolidate and ostensibly increase the agricultural tax has not caused excitement, the sharp rise in fertiliser prices has greatly upset Punjab farmers, big and small. Whatever the case for raising the fertiliser price to the farmer, the 90 per cent price hike is considered wholly unjustified. The small and marginal farmers would be the hardest hit. Many of them might refrain from buying fertilisers in the requisite quantities. Punjab's vocal landlords argue that the prohibitive fertiliser prices make nonsense of the Government's repeated calls to the farmers to raise production. According to some peasants, with reduced consumption of fertilisers, production of foodgrains and other agricultural commodities would fall by 15 to 20 per cent. Taking Rs 200 worth of fertilisers as the normal input per acre for each major crop, the 90 per cent price increase represents a tax burden of Rs 180 per acre per crop, or about Rs 360 per acre for the whole year. Power tariffs for tubewells are higher too. With the sharp rise in the cost of farm inputs, the farmer will, no doubt, demand another spurt in prices. And, of course, the burden will be passed on to the consumer.

While farmers in Punjab and Haryana are agitated over the fertiliser price hike, two lakh small landowners of the newly-merged areas of Himachal Pradesh are facing a crisis of a quite different sort. As part of its all-out bid to protect the tenants' interests and ensure land to the tiller, the Himachal Pradesh government sponsored the Land Reforms and Tenancy Bill. The Bill was passed in December 1972, but the Union President gave conditional approval to it early this year. Acting on the suggestions made by the Union Government, the state government issued an ordinance making the ejection of tenants even more difficult and conferring proprietary rights on them. Resumption of land even by small owners of between one to five acres has become virtually impossible. Since February, the Laghu (small) Zamindar Sabha has been conducting an agitation in the affected areas of Kangra valley. The agitation has at times taken violent turns, and there have been several landowner-tenant clashes. A few weeks ago, a Minister's car was burnt, though the Zamindar Sabha denied having any hand in the incident. The Jan Sangh has been backing the landowners, and the CPI pleading the tenants' cause. Since this is not a case of ending repression or acquiring surplus land, the state government finds itself on the horns of a dilemma. There is strong resentment against the denial of the petty landowners' right of resumption even up to five acres; so, to relieve the tension and to claim credit for the outcome, the ruling Congress has formed a rival organisation of small landowners.

The thousands of ex-servicemen, hailing from this area which has for decades been an important recruiting ground for the armed forces, also stand to suffer under the new land law. Army personnel are allowed to resume land upto five acres after retirement; now, ex-soldiers who are not cultivating their land are denied this right.

The measure is also discriminatory in the exemption granted to orchards. The logic behind the favourable treatment accorded to orchard owners, most of whom are far more prosperous than are the petty landowners, is hard to understand. Under the new Tenancy law, an orchard owner may employ as many tenants as he likes for any length of time, without losing his proprietary rights; but the small landowner who gets his land cultivated by tenants for foodgrains stands to lose the land.

CHINA AND SOUTH-EAST ASIA

Discarding Alien Curtains

G P Deshpande

TUN ABDUL RAZAK concluded a six-day official visit to Peking recently. He came back after a formal announcement that China and Malaysia would be establishing diplomatic relations. All this was not unexpected. Nevertheless the importance of this event should not be overlooked. Razak has set a new trend in South-East Asia's international relations which his other ASEAN partners like Thailand and the Philippines will have to consider very seriously and, perhaps, sharpen.

South-East Asian politics was so far characterised by an alliance system aimed primarily against China. The Western promoters of this system had moved out of this position quite some time ago. When the smaller partners of the several varieties of 'alliance for progress' that were tried in South-East Asia would follow suit was only a question of time. Malaysia has taken the big leap forward. China will now have a second embassy in non-communist South-East Asia. With the exception of Sihanouk's Cambodia, Indonesia before 1965, and Burma, the members of the South-East Asian 'free' world were never on talking terms with China. They held China responsible for the insurgencies that almost each one of them faced. There was the red menace, so the argument ran, and it owed its existence to the communist government in Peking. Consequently the first step to meet the threat was the building of barriers around themselves. Any number of walls were created in an area where historically and culturally none had existed. The 'free' world had built around itself one curtain after another. First SEATO, then ASEAN, and so on.

The Chinese kept repeating ever since Bandung that on their side there never was a Bamboo Curtain. But the barricades built by the South-East Asians and their alien partners had to be cleared in order to take a look at each other. SEATO and the other barricades have not, of course, disappeared, but some paths have been opened through them.

The dominoes of yesterday have become independent actors of some importance. They always were, in a sense. The philosophers of collective security have a tendency to treat smaller and weaker states as helpless and in need of protection. Sooner or later the domino myth — of which South-East Asia has been a victim — had to go. At one time it almost appeared that South-East Asian statesmen took their appointed role of dominoes very seriously. The myth began to break with the Americans talking to the Chinese; with the Japanese establishing an embassy in Peking the myth finally lost all its appeal.

Insurgencies Are Internal

It is not as though the insurgency in Malaysia has ceased. Nor is it true to say that Razak takes any kinder a view of the Malayan Communist Party guerillas than his predecessor Rahman did. The change has occurred with a rather vague realisation that the insurgencies probably have very little to do with Peking and, in any case, a 'send me no flowers' approach does not help in meeting these threats. It is possible that Razak may have, in fact, come to believe exactly the opposite. A friendly relationship with a communist state is the best way of neutralising the local communists. There have been many in Asia who have tried this therapy. Some have actually succeeded. Whether the MCP will, like some other fraternal parties elsewhere in Asia, oblige Razak, one does not know. That he certainly thinks so is brought out by the joint communique at the end of the Razak-Chou talks. The communique states that "the two governments consider all foreign aggression, interference, control and subversion to be impermissible". In short Chou En-lai and Razak have restated what international politics is all about. Its scope has always been limited to relations between states. To believe that it can and should extend to domestic politics is an error. The South-East Asians and their alliance systems perpetuated the error. The 'if you have an insurgency blame it on Peking' approach was the result of that terror. Razak's trip to Peking seems to be the first faltering step towards recognition of this rather simple truth.

In terms of international politics there are two issues which have been uppermost in Chou En-lai's mind for the last quarter of a century. The first relates to the status of Taiwan. The Chinese have insisted on the recognition of their claim that Taiwan is an inalienable part of China as a prior condition for the establishment of diplomatic relations. Malaysia has now withdrawn its consulate from Taipei and accepted that Taiwan is a part of China (which Malaysia, incidentally, had never questioned), thus ruling out Malaysian support to any future move for an independent Taiwan.

The other issue has been the doctrine of collective security being beamed at Asia from outside. Therefore, in supporting ASEAN plans for the neutralisation of South-East Asia, Chou En-lai has insisted that China's support is subject to the dismantling of foreign bases in the area. It is worthwhile to remember that the only foreign bases in the area are American bases. Chou En-lai has asserted in no uncertain terms that neutralisation within the existing alliance system is unthinkable. In short, American bases will have to go.

Another, slightly more respectable, collective security thesis propounded for Asia is the Brezhnev Doctrine. Razak tried to steer clear of the problem by saying that no details were in fact available. In any case, ASEAN ideas on the subject of security consisted of small associations of small states.

With Best Compliments

of

BRAKES INDIA LIMITED

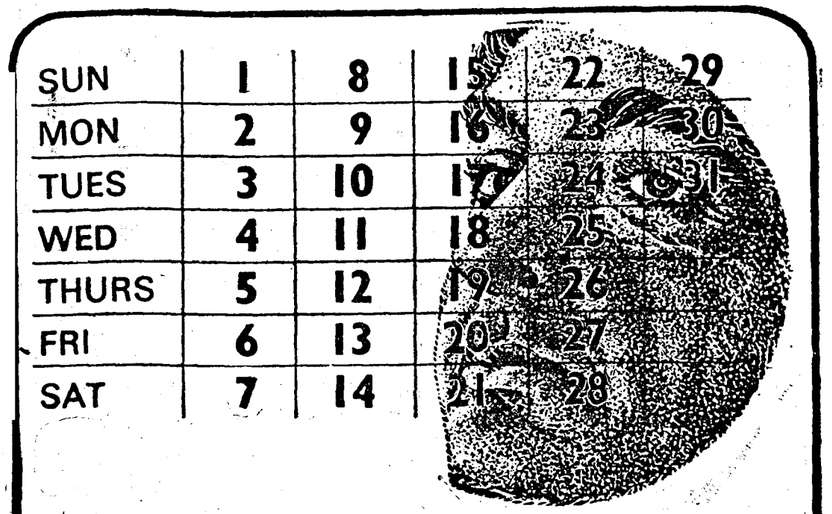
Padi, Madras 50

The Razak talks in Peking have thus covered a wide field. They have, however, left a few questions unanswered. Malaysia has the largest number of overseas Chinese. Apparently some 220,000 stateless Chinese reside in Malaysia. The principle of dual nationality was rejected as obsolete and no clear guidelines have emerged on how the citizenship problems of these people are to be solved. The problem is likely to be trickier than expected. An earlier attempt at resolving the citizenship problem of the overseas Chinese in Indonesia in the early sixties did not yield very smooth results.

The most interesting feature of the Chou-Razak talks has been the subject of the Malacca Straits. We have no clear indication in the communique on what the discussion on the subject was like. Malaysian officials have claimed that Chou En-lai supported the Malaysian-Indonesian claim that the Straits were their territorial waters. The full implication of this would be clear the moment we look at the map of South-East Asia. What is at stake here is not just the ownership of the Malacca Straits. Gradually, the South China Sea is developing into a lake to be shared by the littoral states including China. All major approaches to that Sea will, if this trend persists, be controlled by the littoral states. At least theoretically, the Sea would then be freed of any external penetration and thereby of control. We can see here the gradual emergence of China's naval doctrine. It consists of extension of the sovereignty over and control of the seas by smaller and weaker states and not just periodic demands that great powers should quit the seas. The super powers have so far been used to behaving as pirates on the seas. The transformation of the South-China Sea into a lake is therefore going to be a development of tremendous importance. Razak's trip to Peking probably indicates that the littoral states want to live peacefully with each other. This is the first condition of eventual Asian control of Asian waters. It is to be seen whether the new leaderships in Asia will actually abide by this condition. Razak's talks with Mao and Chou may thus be a trend-setter in a more meaningful manner than what the cautious communique would indicate.

MAHARASHTRA

Beedi Workers of Sinnar



SINNAR town and some 15 adjoining villages in Sinnar taluka of Nasik district are a major beedi manufacturing centre in Maharashtra. Bhandara, Gondia and Nasik are other important beedi centres. Sinnar town has been known as a beedi manufacturing centre for more than 50 years. Today in Sinnar town and the 15 adjoining villages, six manufacturers, known as 'beedi kings', control this cottage industry.

Sinnar has a population of around 20,000, of whom over 5,000 are beedi workers, employed by the six 'beedi kings.' There are another 5,000 beedi workers in the villages adjoining Sinnar. Of the 10,000 beedi workers, over 65 per cent are women. While the male workers work in the so-called 'karkhanas', which are in fact no more than improvised, temporary sheds, the women workers generally work in their homes.

In the beedi industry, the age-old practice is for the employers to supply tobacco, beedi leaves and thread to the workers who are paid piece wages. The minimum rate of wage fixed by the Maharashtra government is Rs 4 for 40 bundles of 25 beedis each, or for 1,000 beedis in all. In 1948, the then Government of Bombay, appointed the Bakhle Committee to fix the minimum wages for beedi workers. The Committee fixed the minimum wage for rolling 1,000 beedis at Rs 2.50. In 1965 the state government appointed the Vazkar Committee which fixed the minimum wage at Rs 3.50 1,000 beedis. The rate was raised by 50 paise to Rs 4 in December last year. This, it may appear, is not an unsatisfactory wage, at any rate when compared with the wages paid to agricultural workers and workers employed on road works or in cottage industries. However, even a casual acquaintance with the terms of employment and actual working conditions of the beedi workers will show that reality is very different from appearance.

Though the beedi worker in Sinnar is statutorily assured of a wage of Rs 4 for rolling 1,000 beedis, in fact his daily earnings range on average between Rs 3 and Rs 3.50 and his monthly earnings come to only Rs 60 to Rs 75, depending on the number of days in a month he is able to work. Because of the unhealthy working conditions — continuous inhaling of tobacco fumes, cramped work sheds — and the fatigue, a beedi worker is able to work 20 to 22 days in a month on average. A beedi worker is able to roll about 800 to 1,000 beedis a day. The total labour time required for rolling 1,000 beedis ranges from 12 to 16 hours. Four to six hours are needed for cutting the beedi leaves and eight to 10 hours for rolling the beedis. The workers cut the leaves at night and roll the beedis the next day. As mentioned above, employers supply tobacco, beedi leaves and thread, but they do not take back bad leaves and exchange them for good ones. If a large number of leaves in the bundles supplied to a worker turn out to be bad, the worker has to make up for the shortfall by buying leaves from the market. On average, a worker has to spend Rs 8 to Rs 10 per month on buying beedi leaves to sustain his monthly earnings. Sometimes, beedi workers have to buy thread as well. Another malpractice indulged in by employers is the rejection of beedis rolled by the workers. On average, out of a day's labour a worker loses about 50 to 100 beedis rejected as defective by the employers' supervisors. These rejected beedis, for which the workers are paid nothing, are sold by the employers as seconds in the market. In addition, the beedi worker has to supply 50 beedis free for every 1,000 beedis paid for by the employer. Thus if a worker rolls 1,000 beedis a day, he is not paid for about 100 beedis. The gain for the employer on this account out of a day's output of one crore beedis in Sinnar and the adjoining villages is therefore very substantial. This reporter was also told that workers employed in the 'karkhanas' in the villages are even required to pay rent for the space where they sit for rolling beedis.

The Beedi and Cigarette Workers (Conditions of Employment) Act 1966, passed by the Centre, was challenged by the beedi manufacturers. The Supreme Court, however, upheld the Act in a judgment delivered on January 31, 1974. The Act stipulates, inter alia, that workers shall not be made to work more than nine hours a day or 48 hours a week; that workers shall be entitled to, in addition to a paid weekly holiday, annual leave at the rate of one day for every 20 days worked during the preceding calendar year; that the

DARKNESS AT NOON

For many of us in the fixed income group, the month begins with a bang. A spending spree or just that wee bit extra pressure on purse follows..... And the days start limping to that far-away destination—the next pay-day. But we cannot avoid spending on festive occasions, guests, social obligations and what have you. They are no respecter of the state of our purse either.

Here's the UBI way out of the impasse. Open an account with UBI Deposit your pay-packet right at the beginning of the month; withdraw money when you need it. This practice will gradually lead to some savings. Sure enough, you will be able to meet any unforeseen expenses on your own and without worry.

Keep your money secure with UBI. Cash at home has the peculiar tendency to evaporate quickly even under normal circumstances !

UNITED BANK OF INDIA

(A Government of India Undertaking)

UBF-1-72

worker shall be paid wages for the leave period at a rate equal to his average daily wages during the month immediately preceding his leave; that for the weekly holiday, the worker shall be paid at a rate equal to his average daily wage for the days immediately preceding the weekly holiday. However, the Beedi and Cigarette Workers Act remains a dead letter at Sinnar and the adjoining villages. This writer was told by representatives of beedi workers that workers get neither a paid weekly holiday nor paid annual leave. Women workers do not get any maternity leave, though the Act stipulates three months' maternity leave. Most women workers return to work within a fortnight of delivery. If they do not go to work in the 'karkhanas', they work at home. Women workers continue to work in the most unhealthy conditions throughout their pre-natal period, inhaling injurious tobacco fumes. They work in these conditions often with infants on their laps and huddled together with male workers.

The state government's Labour Officer is the supervising and enforcing authority for the Beedi and Cigarette Workers Act as also for ensuring payment of the statutory minimum wages to the workers. According to a trade union leader, visits by the Labour Officer to the 'karkhanas' in Sinnar and the adjoining villages are rare. This trade union leader, who had himself worked as a beedi worker for 25 years, told this writer that more than 50 per cent of workers eventually die of TB or asthma. Despite the unhealthy conditions in which they work, the beedi workers do not get any sick leave or any medical benefits. Even more important, the beedi workers in Sinnar and the adjoining villages do not get any lay-off compensation if the employers decide to cut the production of beedis. This leaves the employer free to suspend or curtail production on various specious pleas. Finally, despite the Act, there is no job security for the beedi workers.

The beedi workers of Sinnar have launched many struggles for improving their wages and working conditions, but without much success. The reason for this is their extremely poor holding capacity and their total dependence on the day's earnings. In their struggles they get no help from the legislation enacted by the Centre. The state government has been made responsible for the implementation of the legislation. According to the trade union leader mentioned above, the money power of the 'beedi kings' and their influence over the state government, which extends right up to the Cabinet, are enough to ensure that the beedi workers do not get any of the benefits assured to them by statute.

UTTAR PRADESH

Some More Feudal Rivalries

Anees Chishti

The death of Muslim Majlis leader, A J Faridi, has left his organisation leaderless. He did not nominate anyone to take his place and even though all his companions knew for some time that he was ailing, there was no move to plan for a successor. This was typical of Faridi's style of functioning. Although he wielded tremendous influence in UP's Muslim politics for a decade and a half, he never took politics as a serious full-time commitment; to him it was just an interesting diversion that gave him considerable popularity.

Faridi's rise in UP politics can be traced to his personal vendetta with C B Gupta who is said to have passed some uncomplimentary remarks against
ı. Consequently, in the true tradi-
ı of feudal rivals they fought for
ir glory in the city of Lucknow.

Few perhaps know that Faridi drew his inspiration from Maulana Abul Hasan Ali Nadvi (Ali Mian) who is known to the large number of his devout followers for his profound religious 'wisdom' and Arabic scholarship and whose command is like the proverbial inscription in stone. Interestingly, while Faridi adopted postures of "enlightened communalism" and shades of Western modernism, the fact is that he could hardly think of operating outside the political matrix of conservatism laid out for him by Ali Mian.

The Muslim Majlis-e-Mushawarat was formed in 1964 as a consultative committee of Muslims mainly to give vent to the community's feeling of horror and disgust following the killing of Muslims at Jabalpur and Rourkela. The Congress government was, however, successful in seeing one of its leading lights, Syed Mahmood, elected as president of this body which was supposed to be a "purely non-political organisation." Apart from Syed Mahmood, the most important Muslim leader who gave a call for the coming together of Muslims of all shades of opinion was Ali Mian. Some fire-eating young Muslims drew satisfaction from Ali Mian's close association with this body. It is, however, interesting that some informed sources have always maintained that Ali Mian, too, enjoyed the full confidence of the Central government. Nevertheless, the Majlis-e-Mushawarat continued to be regarded as the representative body of disgruntled, anti-establishment Muslims.

The split which took place in the Majlis-e-Mushawarat between pro-Congress and anti-Congress elements preceding the 1967 general elections was inevitable. While the anti-Congress faction, led by Faridi, wanted the Majlis not to support any Congressman, the official pro-Congress faction led by Syed Mahmood, chose to support some "good" Congress candidates. The battle was carried on to the bitterest end and led to the defeat of the Congress in the UP assembly and depletion in the party's strength at the Centre. Mahmood retired from politics in disgust and left the field open for Faridi.

In an effort to broaden the character of the Majlis' campaigns, Faridi's mentor, Ali Mian, advised him to involve the top Muslim League leaders of south India more actively. It was thought that by doing so, the Majlis-e-Mushawarat might fill the gap caused by the apathy towards it shown by leaders of the Jamaat-e-Islami because of certain ideological differences. The south Indian leaders on their part found in Faridi's outfit a wonderful opportunity for extension of their own influence in the thus far unexplored north. This aggressive opportunism of the Muslim League and the mutual north-south suspicions gave rise to yet another split in the organisation when Faridi created an active political front of the Majlis-e-Mushawarat — the Muslim Majlis. The Muslim League in UP then enrolled some dropouts from the Majlis-e-Mushawarat and started operating as an active rival party in UP and other parts of north India.

Prior to the 1971 Lok Sabha poll, Faridi had gained considerable bargaining power. Indira Gandhi ob-

viously realised this and made peace with Ali Mian and Faridi with the help of her own representatives of orthodox Muslims. Partly due to this, Muslims in north India gave the Congress an almost total mandate.

But the same could not be achieved during the recent elections to the UP assembly. Sheikh Abdullah was launched in Lucknow a few months before the elections. He operated on a more or less common wavelength with Faridi in some of his campaigns but as expected the understanding could not last long. While Ali Mian and Faridi were hell-bent to oppose the Congress as they nursed the grievance of neglect even after doing an excellent job for the Prime Minister in 1971, the Sheikh seemed to have other motivations. Ali Mian found a serious challenge to his own leadership and in an interview, his first in any English daily, he condemned the Sheikh's activities in Lucknow and elsewhere in the severest terms. Consequently, Faridi asked the Kashmiri leader to wind up even though they had earlier agreed to share the Majlis-e-Mushawarat platform according to an elaborate programme. Faridi's subsequent understanding with Charan Singh was a clever move. So was his refusal to merge with the famous seven parties. Throughout his life Faridi clamoured for a separate identity for himself and his group and he was hardly expected to dissolve his political substance into a rather alien solution.

But now that Faridi is gone, Ali Mian will have to look for another political disciple who could be used as a new messiah. Presently, he has no one cut out for such a role. Those under him who carry his command to various other sectors of thought and activity are made of different stuff and have no talent for the required dynamic role. In these changed circumstances, a realignment with the Muslim League cannot be ruled out. Ibrahim Suleiman Sait, himself an outsider to Kerala, might be willing to pick up the threads in UP. He might also not be unprepared to treat Ali Mian as a father figure much as he had earlier considered Abdur Rahman Baffaki Thangal of Kerala. His interest in the north is further reflected in the fact that he has got himself elected president of the UP Muslim League unit.

Moreover, there are no ideological contradictions between the leaders and cadres of the Muslim League and the Muslim Majlis. The earlier parting of ways was due primarily to certain personal motivations. After Faridi's demise the League volunteers in UP may find a new opportunity for recognition. Ali Mian is likely to favour Suleiman Sait and not anyone from the Jamaat-e-Islami (the other likely alternative) because the Maulana himself is a Jamaat deserter and does not see eye-to-eye with its top leadership. He is soft on the Tablighee Jamaat, but this group is not interested in playing politics.

It will not be too long before the first moves are made in preparation for the 1976 elections.

ISRAEL

Some Perplexing Questions

Surendra Bhutani

GOLDA Meir's resignation as Prime Minister, though long expected, did not come in the manner she would have wished for herself, for her Mapai (Labour) party or even for Israel. Though originally chosen as a stopgap Premier in June 1969 in order to prevent a split in the Mapai party and to stem the rivalry between Moshe Dayan and Yigal Allon, she continued unchallenged till the October War of 1973. With the October War there began a new process in Israeli politics. A whole generation of Israelis who had previously been politically disinterested and apathetic were awakened to political conciousness for a wide spectrum of reasons, ranging from poverty to careerism and from the generation gap to an election system that leaves a minimum of choice to the individual.

Some features of the new process became apparent after the results of the December 1973 election. The election campaign witnessed much wrangling between the coalition partners and within the parties themselves, and a search within the military establishment "as to who was responsible for what". Golda Meir returned to power but with a thin majority. Many voted for the Mapai party simply because they were not prepared to support the unwillingness of the Likud (the right wing group) to make concessions on territorial issues, if any sort of accommodation was to be reached with the Arabs.

As long as most reservists were at the front, the misgivings about the military establishment and the political leadership were voiced generally in parliament. The moment most of the reservists were released, these misgivings resulted in the emergence of a number of protest groups. The wave was set in motion by a lone reserve officer, Motti Ashkenazi, who launched a campaign for the removal of Moshe Dayan as the Defence Minister. Singlehandedly, Ashkenazi addressed several largely attended rallies. Hitherto political rallies had been the joint monopoly of the New Communist List (Moscow-oriented) and the Israeli Black Panthers. Now there are at least eight to ten sizeable protest groups and all of them seek to reform the country's proportional representation electoral system. One of the roots of the present malaise is the fact that the individual voter has nobody to turn to as he is forced to vote for a party, never an individual. The major parties, all of them dominated by people in office for decades, and in their 60s or 70s, simply put up lists of candidates and the ordinary voter has no idea whatsoever as to who represents him.

Nor is the military set-up devoid of recriminations. The lack of information available to the public over the case of General Tal, Deputy Chief of Staff, is just one instance. Tal resigned without stating his reasons. Rumours persist about how he was 'elbowed out'. Hardly had the Tal affair subsided when the Agranat Commission's findings about Israeli unpreparedness for the October War shocked the entire country. Questions were asked as to why the Commission applied different yardsticks to Defence Minister Moshe Dayan and to former Chief of Staff David Elazar. With the dismissal of Elazar and other officers, armed forces morale is depressingly low, particularly because no action was taken against equally culpable politicians.

Although the Labour party has chosen Yitzhak Rabin as its new leader, uncertainty about the viability of his coalition government still remains. Labour's erstwhile partner in the coalition, the National Religious party, wants to solve the 'who is a Jew' problem and wants a national government of all parties, including Likud. And for how long the Rafi wing led by Shimon Peres, after its defeat in the Labour party, will continue to give its support to Rabin, is another perplexing question.

HYV: Missing Dimensions

N S Jodha

Science and Agricultural Production by Ingrid Palmer; United Nations Research Institute for Social Development, (Report No 72.8); Geneva, 1972; pp vi + 100; $ 2.
Food and New Agricultural Technology by Ingrid Palmer; United Nations Research Institute for Social Development (Report No 72.9); Geneva, 1972; pp vii + 85; $ 2.

A NUMBER of global research projects, to understand the implications of the green revolution, were initiated by various UN agencies. One such, the United Nations Research Institute for Social Development, brought out a series of studies on different aspects of the green revolution. The two monographs by Ingrid Palmer, reviewed here, are part of that series. The first deals with the science and the physical production aspects of HYVs, while the second is devoted to the problems in the nutritional field, resulting from large-scale introduction of HYVs.

What distinguishes the first book from several studies on the green revolution is its very approach, looking into HYV-based crop farming as a physical production activity determined by a host of soil-plant-water relationships. Variables as far-ranging as climatology to micro-biology have been considered in order to explain the scientific basis, the potential, and the problems of HYVs. Through a discussion of the physical and biological aspects of the HYV-based farm technology, the author proceeds to bring out the social, economic and ecological implications of it. This immensely enhances the value of the book. For, agro-economists — particularly those coming from 'social sciences stream' — often reduce the complex farm activity to the framework of a model while too often betraying gross ignorance of the real ingredients in agriculture that may completely invalidate their model.

A summary view of the global performance of HYVs and the role of fertilisers in that performance, is followed by a brief description of the physiological basis of HYVs — spanning problems of identification and isolation of plant characteristics that activate nutrient-uptake and ensure higher grain-bearing capacity in the plants. The subsequent discussion is devoted largely to analyse how, the very factors which helped evolve the miracle seed for one location (environment-type) cannot be expected *ipso facto* to repeat their performance in every location.

On the basis of scientific results and other evidence from various parts of the world, the author in simple, non-technical language explains the specific role of climate, soil, solar radiation, moisture, pests, diseases and, of course, cultural practices, on crop production in general and HYVs in particular. In fact, while Indian farm scientists have been basing their recommendations too on such facts — showing the efficacy of some of these factors, through integrated national demonstrations conducted in farmers' fields in various parts of the country — they have often ignored that, in view of the micro-heterogeneity characterising agriculture, any recommendations outside of these plots, to be most effective have to be highly area/plot specific. To ensure this, there has to be a competent technical-support base at the grassroots level. The creation of such infrastructure, is probably more difficult and more costly than evolution of a miracle seed, and is simply beyond the financial and technical competence of most of the LDCs — pilot projects, mainly through outside assistance, such as the Pueblo project in Mexico, being the exception. In practice, while sophisticated technology may call for plot-specific details, the farmer has to remain contented with the broad district-level recommendations that are available and use the crucial inputs if and when they are available. Thus, it is clearly the lack of means and mechanisms, rather than lack of knowledge or desire, which stand in the way of scientific farming.

The book conveys two distinct warnings. First, if today's science operates, as did yesterday's, by placing its limited resources where natural environment is more sympathetic or where commercial profits are greatest, we may in time be faced with a populous fourth world within the third world of today, and the international hard core of poverty would be worse than ever (p 5).

Secondly, unless the long-term safeguards are ensured, a rush for exploiting the new technology in HYV-areas may accentuate the resource depletion process, and the green revolution may indeed prove an ecological misadventure.

The two tendencies apprehended by the author represent, respectively, the likely spatial and temporal dimensions of the green revolution's backlash.

The first danger may arise because of the not so fully recognised environment-specific character of the HYV. Besides preventing an automatic transfer of the new technology to different regions, this tends to inject an unconscious bias against the less well-endowed regions in the allocation of national and international research and production resources for agriculture. A cursory look at the whole process of institutionalised plant-breeding programme and the noticeable concentration of development assistance and effort in the habitats of the newly-evolved seeds, are enough to convince one about the real possibility of regional imbalances being accentuated by the green revolution. The implied process of 'geographical polarisation of agricultural activity' is initiated right at the stage of the selection of initially high-yielding plants — products sympathetic environments — as against the poor yielding plants — an outcome of harsher and erratic environments — for breeding programme. Thus, the gap between regions, initially created by nature, gets re-inforced by vigorous organised scientific effort of man and is supported equally strongly by the market mechanism at several stages.

The second message or danger, relating to the likely consequences of unplanned spreads of new technology within the HYV areas, makes only brief references to the oft-repeated problems of inter-farm differences, proletarisation of small farmers, etc. In keeping with the central theme of the book, the consequences of physical and biological nature are highlighted.

Precisely because of its potential for quick and higher returns, the HYV-technology carries strong temptation for planners to overdo the same and ignore its long-term consequences. This amounts to unscientific use of science in agriculture. To take a few examples.

The concentration on a few selected crop varieties (called 'eco-types') tended to reduce the world's genetic diversity of food crops; the narrow genetic base of HYVs, on the other hand, also makes them more vulnerable to disease and failure; genetic erosion of cereals poses a serious long-term problem too

as the plant breeder is deprived of his basic 'building block' (p 83).

Imbalanced and improper use of fertilisers, besides causing a declining trend in yields, has created problems of toxicity and has proved conducive to the spread of diseases (p 65). Fertiliser responsive HYV crops, both due to their thicker foliage and their early maturing character permitting multiple cropping, have ensured increased and perennial supply of feeding stuff and have thereby contributed to the increased incidence of insect population (p 74). More use of chemicals in these crops has interfered with the biological and cultural control measures against pests and diseases (p 71).

The rush of irrigation schemes — considered necessary for success of the HYVs — may ignore the experience from the faulty designs of colonial irrigation systems. By disturbing the hydrological balance and causing soil degradation through water logging, salinity, and alkalinity, it may thus deplete the production potential of the land resources.

These, and some more likely dangers including the cultural and psychological shock, caused to the HYV-farmer due to changed activity schedule of the green revolution, are indicated — although, perhaps for want of adequate data, no quantitative data have been provided to support the views in many cases. While highlighting these potential dangers, however, the author suggests the remedial measures. The root cause of the potentially harmful consequences of the green revolution is traced by the author to the institutional forces — national and international — which determine the actual resource allocation in agriculture.

Thus, unlike several studies on the subject which attribute the failure of the green revolution to touch the 'small farmer' to micro-level institutional factors — such as tenancy, factor market imperfections, etc* — and highlight the neutral character of the new technology, this study sees seeds of discrimination against less well-endowed regions (and people) in the new technology itself (due to its environment-specific character) and blames the higher-level decision-making institutions for the indiscriminate germination and multiplication of the seeds.

The remedial measures proposed by the author then consist of suggestions for changes in the attitude and priorities (to be favourable to poor and neglected areas, crops and people) of the decision-makers, including local governments, aid-givers, international agencies and the national and international private agencies engaged in the agro-business.

The second volume by Ingrid Palmer deals with the nutritional implications of the spread of HYV. The latter being rich in carbohydrates, it is pointed out that their spread may not fit well with the United Nations Second Development Decade's protein-centred strategy against malnutrition. The author questions the misplaced over-emphasis on protein in such a stand and makes a strong case for putting calorie promotion above protein promotion for the poor countries. Despite the loud cries about the protein crisis and its role in the early stages of development particularly of the brain, medical investigation does not conclusively establish that it is protein deficiency as such that inhibits cell division (pp 19-26). Either calorific or protein deprivation can inhibit the vital cell proliferation or DNA synthesis. The relation between calorie and protein utilisation shows that when there is deficiency of both protein and calorie, protein can act as a calorie substitute but not vice versa. In fact, as the first need of the body is for energy, rather than for building of new cells, the calorie deficiency eats into protein intake for energy purposes and thereby adds to net protein deficiency (p 24). Hence any measure which increases the total calorie consumption may indirectly reduce the protein undernutrition. The HYVs can help in this respect — provided increased cereal production is accompanied by both more even distribution and increased per capita consumption.

Further, in view of the scope for breeding higher protein content into the HYVs, raising non-photosensitive cereals during the period of seasonal malnutrition in areas like parts of Africa, facilitating output growth of protein-rich pulses (even without productivity improvements in those crops) due to land saving and time saving resulting from the early maturing of the HYV crops, the HYVs have a much larger protein-promoting potential.

Nevertheless, the author cautions that, in particular circumstances, the potential advantage of HYVs for mass nutrition may not materialise — instead, "the final divorce of agriculture and nutrition through the agency of green revolution may take place (Chapter V). This may happen in the poor countries as with the introduction of HYVs there is accelerated accumulation of capital (and land), restricting access of workers on the land to the means of production and encouraging economic inequalities. As agriculture gets commercialised in these circumstances people as consumers also do not have the same access to the food.

The tendency is amply evident from the growth of acreage under HYVs, at the cost of other food crops particularly pulses, in India, Indonesia, etc. Thus far from being land savers the HYVs have proved land consumers. Not only land but overall factor allocations — owing to market forces and government blessings — have shifted in favour of HYVs. The second tendency, viz, increasing rural inequalities adversely affecting mass nutrition through a lowering of the real incomes of the poor is again very evident. Changes in production relations — i e, weakening of the informal employer-employee ties, substitution of cash for kind wage, etc, resulting as by-products from green revolution further adversely affect foodgrains consumption of some categories of the poor. With commerce getting precedence over nutrition, the gap between production and mass consumption may further widen, as illustrated by Mexico — the first country which entered the so-called green revolution in the late 1940s. During 1948-52 Mexico was a net importer of 33,360 tons (annual average) of wheat. By 1965 (despite increase in population) the country's large-scale, irrigated, tractorised wheat industry was exporting 685,000 tons a year, while 60 per cent of Mexicans, 25 years after the initiation of the green revolution, still ate maize as their staple food (p 79).

The important policy implication of the discussion is that distribution of the productivity gains of the HYVs is as important as the growth of yields, because the "problem of nutrition is not of production, but of distribution"; free market forces cannot be expected to bridge the gap between agricultural production and mass nutrition. Nutritional planning is thus seen as an integral part of economic planning for higher production and equitable distribution.

Efficacy of Tax Incentives

'Tax Expenditure Analysis' and Its Relevance for India

Amaresh Bagchi

Nowhere, it seems, is faith in the potency of tax incentives to achieve a variety of objectives more deep-rooted than in India. The Indian Income-Tax Act bears eloquent testimony to this abiding faith.

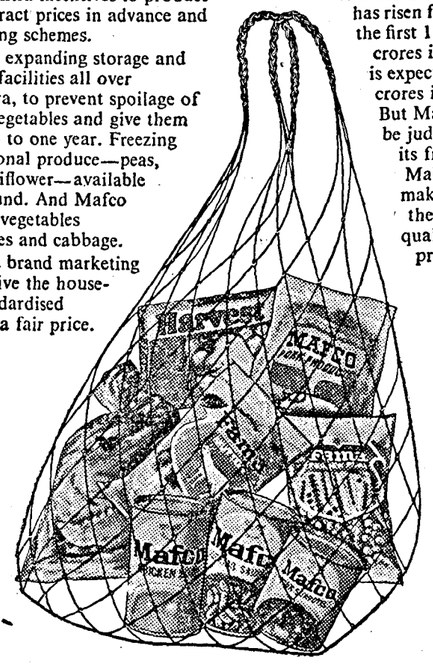
From book publishing to family planning, not to mention fostering of investment, export promotion, agricultural development, refugee rehabilitation and scientific research, there is hardly any item on the national agenda that does not find some support somewhere in the tax statute. Almost invariably the first act of an individual or a collective body entrusted with or engaging itself in anything with a 'public' pretension is to ask for tax exemption for itself and its donors. Seldom does a committee or study group conclude its report without putting down a plea for some tax incentive among its recommendations.

What the saddling of the tax laws with the responsibility for promoting every conceivable worthy cause means to the tax administration and the tax system as a whole does not seem to be anybody's concern. No one bothers to inquire what the cost of a tax incentive is to the community, whether the incentive actually begets the intended benefit and whether allowing a tax concession is always the best method of extending state support for a particular activity.

TAXATION is widely acknowledged as a powerful instrument of state policy and every country in the world makes use of it in varying degrees to further its national objectives. Nowhere, however, is the faith in the potency of tax incentives to stimulate activity more deep-rooted than perhaps in India. The Indian Income-tax Act bears eloquent testimony to this abiding faith. From book publishing to family planning, not to mention fostering of growth, export promotion, agricultural development, refugee rehabilitation and scientific research, there is hardly any item on the national agenda that does not find some support somewhere in the tax statute.[1] Almost invariably, the first act of an individual or a collective body entrusted with or engaging themselves in looking after anything with a 'public' pretension is to ask for tax exemption for themselves and their donors. Seldom does a committee or study group required to look into specific problems of public policy conclude its report without putting down a plea for a tax incentive among its recommendations.[2] What all this — that is, saddling the tax laws with the task of promoting every conceivable worthy cause — means to the tax administration and the tax system as a whole does not seem to be anybody's concern. No one even bothers to inquire what the cost of a tax incentive is to the community, whether the incentive truly begets any benefit to the country or whether allowing a tax concession is the best method of extending state support for a particular activity.

Extensive use of tax incentive as a policy lever is certainly not peculiar to India — though some of the incentives (e g, weighted deduction for certain expenses)[3] can perhaps claim uniqueness in form as well as scale. The Internal Revenue Code of the United States is also notorious for its special provisions affording shelter to taxpayers for engaging in particular activities or using their income for certain purposes. But getting a provision for a new tax preference enacted by the US Congress is no longer as easy as it was in the past. The credit for this change of public attitude in the US to special provisions in the tax laws goes largely to public finance theorists and experts like Pechman, Musgrave and Surrey who, following the footsteps of Haig and Simons, have waged for over two decades a relentless battle against the erosion of the income tax base through the special provisions by quantifying their consequences and focusing attention on the damage they do to the entire tax structure.

During the fifties in several papers presented to Congressional committees sharp criticism was voiced against the tax incentive method of providing state aid for private activity. In one such paper, the case against 'tax subsidies' was summed up thus:



> Subsidies in this form vary directly in amount with the tax brackets of the recipients; they are invariably hidden in technicalities of the tax law; they do not show up in the budget; their cost frequently is difficult to assess. Partly for these very reasons they are likely to become fixtures which are not easily removed.[4]

In a paper published in 1957, Pechman made some estimates of the extent of erosion of the Federal individual income tax caused by the exclusions, deductions and exemptions which are not essential for effective income taxation.[5] The main finding of that study was that "the eroding features of the 1954 tax law reduced the yield of the individual income tax by one-third and that a comprehensive income tax could yield the same revenue with rates that were on the average one-third lower than the rates then in effect". Similar studies were carried out by others. Mounting pressure of public opinion impelled the authorities to move for reforms culminating in the Tax Reform Act of 1969. That Act did not go far. A recent study carried out by Pechman jointly with Okner shows that the position revealed by the 1957 study is not very different now.[6] But the labours of the experts have not gone entirely in vain. Apart from helping the public and the policy-makers to evaluate the special provisions in the Revenue Code from a new angle and thereby create a climate for reform — to which several popular level writings also contributed ably[7] — the findings of the academicians and others working in the field led the authorities to curb the tax privileges by levying a minimum tax on exempt incomes which was replaced in 1973 by a scheme of 'minimum taxable income'. More important, the pressure of public opinion to which experts

FOOD SHORTAGE

and what's Mafco doing about it?

- Mafco is buying heavily in the flush season to make more food available in the lean season.
- Mafco is developing a network of food procurement centres, and offering farmers in Maharashtra incentives to produce more: contract prices in advance and profit-sharing schemes.
- Mafco is expanding storage and processing facilities all over Maharashtra, to prevent spoilage of meat and vegetables and give them a life of up to one year. Freezing makes seasonal produce—peas, maize, cauliflower—available all year round. And Mafco cold stores vegetables like potatoes and cabbage.
- Mafco is brand marketing foods, to give the housewife a standardised product at a fair price.

So Bombay broilers are cheaper than Delhi's, in spite of higher feed prices in Maharashtra.

- Mafco has entered a field where no private or public sector unit has dared to tread. Our turnover has risen from Rs. 53 lakhs in the first 15 months to Rs.1.32 crores in the next year, and is expected to increase to Rs.3 crores in the coming year.

But Mafco's real success is to be judged with the growth of its frozen food markets in Maharashtra. Because that makes new markets for the farmer, and provides quality foods at a reasonable price to the housewife.

MAFCO
Mafco brings thought to food marketing.

MAFCO.10-140

like Surrey, former Assistant Secretary of the US Treasury, lent support, compelled the US Treasury Department to undertake a detailed study of the Federal Government's expenditure implicit in the system of tax incentives. The study first published[8] in 1968, "described and quantified the special provisions of the federal income tax system which represent Government expenditures — tax expenditures — made through that system to achieve various social and economic objectives".[9] Subsequently, the Joint Economic Committee through its Subcommittee on Economy in Government recommended the inclusion of such an analysis in the Federal budget to make it more comprehensive.[10]

Some of the facts brought out by the US Treasury's Tax Expenditure Analysis (TEA for short) were found to be quite startling. It showed for the first time that for some activities the tax expenditures, that is, the subsidies implicit in the tax concessions, exceeded or were close to expenditures openly budgeted for through the departments concerned with those activities (Community Development and Housing, 204 per cent; Commerce and Transportation, 114 per cent; Natural Resources, 90 per cent; Health and Welfare, 37 per cent).[11] Barring National Defence and Veterans, for none of the categories listed was the 'tax expenditure' less than 10 per cent of what was budgeted for explicitly.

What lends significance to the TEA, however, is not simply the magnitude of the expenditures concealed in the tax incentives, but the way it shows of appraising the special provisions in the tax statute. When presented in terms of direct expenditures, many of the incentive provisions show up "as either inequitable, often to the point of being so grossly unfair as to be ludicrous or ineffective".[12] In the US context it revealed for example that the five-year amortisation allowed through the 1969 Reform Act for expenditure on rehabilitating low-income housing meant loaning money for rehabilitation purposes at 3 per cent interest to wealthy persons but at 7-8 per cent to poor people.

Though inadequate as a measure of the social costs involved, this, as Surrey comments, is often sufficient to highlight the inadequacy of the tax route. The merit of the approach lies in underscoring the point that "whatever are the cost-benefit analysis, other analytic techniques available for examining direct expenditure proposals those techniques are equally pertinent to tax expenditure proposals".

II

The Indian Scene

No one familiar with the Indian tax scene would fail to perceive how urgently the Indian income tax needs the TEA approach to appraise its special provisions, quite a few of which in effect benefit only narrow interests, in order to weed them out and to put a step to the ever-increasing demand for more. Despite a plethora of such provisions in its direct taxes laws there is little evidence in India of any awareness of the cost that such provisions entail to the community in terms of government revenue lost, not to speak of the indirect burdens. Barring one or two stray instances — like Gulati's attempt to estimate the revenue cost of retaining the Hindu undivided family as a tax unit,[13] Krishnan's study of what a less exemption-ridden wealth-tax in India could yield and Jhaveri's estimates of the "tax saving" resulting from incentives for personal saving[14] — there is hardly any systematic attempt to quantify the effects of the special provisions. What one comes across in the Press and in public discussions is grossly one-sided, *viz*, how oppressive the tax structure is and how obstructive the direct taxes are of growth. Even in most of the expert writings, stylised models are set up to show how the tax rates depress the yield to make it unremunerative to work, save or invest, with little regard to the presence of the sumptuous exemptions and deductions that are available to taxpayers of most categories. Proposals for any extension of the area of tax benefits are therefore regarded as welcome by everybody whoever be the real beneficiary and whatever be their actual influence on the activity they are supposed to sponsor. Small surprise that such proposals always go through virtually unopposed. By stressing the cost aspect the TEA technique would compel attention on the provisions of the tax laws which emasculate the system in ways that do not come to public notice.

In the Indian context, the TEA, if it is to afford a proper cost-benefit perspective, has to be based on a broader concept of cost than has apparently guided the US Treasury's estimates of tax expenditure. The US estimates furnish the 'first order' effects by way of the tax benefit received by the taxpayer. Going beyond first level changes of course involves practical as well as conceptual problems. But the first order effects would be incomplete or inadequate for the purpose on hand unless two things are taken into account: first, the possibility of spurious claims being put forward under cover of the incentive provision in question; in other words, the extent to which the provision facilitates avoidance and evasion; and, secondly, the additional burden of compliance and enforcement attributable to the operation of the special provision in the law. With a streamline administration like the USA's, overlooking these elements in estimating costs may not be of much consequence. But in a country like India, where tax morality is ever so low and administrative streamlining remains a distant goal, these elements of cost can make a lot of difference. A little examination of the way some of the deduction provisions of the Income-tax Act, 1961 are operating in practice would show how serious the impact of these factors can be on the cost to the community.

III

Take, for instance, Section 80 MM of the Act. This section was put into the Income-tax Act through the Finance Act 1969 to provide for a deduction of 40 per cent of the Income received by an Indian company by way of royalty, commission, fees or any other payment (not being chargeable under the head "capital gain") from any person carrying on a business in India in consideration for,

> "(i) the provision of technical knowhow which is likely to assist in the manufacture or processing of goods or materials, or in the installation or erection of machinery or plant for such manufacture or processing, or in the working of a mine, oil well or other source of mineral deposits or in the search for, or discovery or testing of, mineral deposits or the winning of access to them, or in carrying out any operation relating to agriculture, animal husbandry, dairy or poultry farming, forestry or fishing, or
> (ii) rendering services in connection with the provision of such technical knowhow"

under an agreement approved by the Central Board of Direct Taxes within a specified time.

The aim underlying this provision was stated to be "to minimise the repetitive import of technical knowhow from abroad and also encourage In-

dian companies to develop their technical knowhow."[15]

Development and dissemination of technical knowhow is no doubt essential for economic growth. But is a tax incentive like this the most efficient way to secure that objective? To look at the costs first, it does not take long to see that even with the best of efforts the benefit of the deduction cannot be kept confined only to those for whom it was intended. For what, after all, is "technical knowhow" and what does its "provision" mean? The operative part of the section shows that it applies to anything that assists in manufacturing, processing or exploration over a wide field. By way of clarification, a sub-section spells out what "provision of technical knowhow" means. But that helps little to delimit the area of its operation. For it is stated that not only the transfer of any right in respect of a "patent, invention, model, design secret formula or process a similar property" or the permission to use such patent design, etc, but the transmission of any information pertaining to the patent, invention, etc, will constitute supply of knowhow.[16] The "imparting of any information concerning industrial, commercial or scientific knowledge, experience or skill" also answers to the description of "provision of the technical knowhow". Now "information" concerning the working of or the use of a patent, design or concerning industrial, commercial or scientific knowledge, etc, is wide enough to include even a set of routine instructions regarding the use of a machine or a process. Anyone selling anything that helps even remotely to produce something can therefore claim to have provided technical knowhow and ask for the deduction if only he takes care to hand out an elaborate formula even though that divulges no secret or even if it contains nothing that is not already common knowledge. What, for instance, prevents the manufacturers of ordinary electric motors from asking for the deduction in respect of their sale of motors to farmers using them for irrigation. Execution of ordinary contracts for supply and erection of machinery can also pass for sale of technical knowhow. It would not be wild to imagine that spurious "consultancy" concerns which perform no real function except siphoning off the profits of big companies would be reaping a windfall along with many others. There is of course the stipulation that the provision of the knowhow must take place under a contract duly approved by the Board of Direct Taxes. But that Board has to act within the terms of the section and, the ambit of knowhow as set out in the Act being wide, disputes are bound to arise over its application in individual cases. In fact some companies have already moved the courts in writ petitions challenging the legality of the government's refusal to approve contracts that would entitle them to claim the benefit of this section.[17]

Whatever be the view the courts finally take in particular cases, it is clear that a large section of taxpayers will profit from this provision without doing anything to help the cause contemplated. Another segment of taxpayers for whom the benefit would be a windfall are those who would have sold their knowhow anyway. And, as is inevitable with such provisions, access to this benefit which was originally restricted only to Indian companies was enlarged to permit any person resident in India to go in for the concession. Failure to take full advantage of the section on the part of the ignorant or the innocent will only compound the costs *via* damage to the equity of the system. Presumably, sensing the possibility of misuse, the authorities have once again sought to limit the scope of the deduction only to Indian companies.[18]

That is not all. For a complete picture of the costs one has also to consider the burden of compliance and enforcement. Taxpayers transacting their business in the ordinary course will now seek the services of tax advisers to explore ways of availing this benefit. Voluminous agreements will now be drawn up to document the transfer of "knowhow" where none was needed before. Air trips will be made to Delhi by assessees and their advisers to plead their cases before the concerned authorities and their cost, being all in the course of business, will be deductible from their taxable income. Even if they happen to be "capital" in nature claims will certainly be made for their deduction as revenue expenditure. On the government side, scrutiny of contracts and looking after court cases would require the attention of adequate staff. Moreover, officers in the field have to familiarise themselves with the implications of the provision to be in a position to administer it. To throw light on how it will be applied the CBDT has issued an elaborate circular on the subject running into several pages.[19] All officers of the tax department have to study and note its contents carefully as any slip-up carries the risk of strictures from audit and punishment from above. The result is at least some aggravation, however slight, of the already serious tension to which the tax collectors are unavoidably exposed. The cost of a straw on the camel's back may not always be quantifiable but failure to take it into account may be fatal.

So much for the costs. What about the benefits? To judge the efficacy of the measure in achieving its objective it is necessary first to investigate the causes inhibiting the diffusion of technical knowhow in the country. That raises complex issues beyond the scope of this paper touching on the dual (or multiple?) character of our economy with a small organised sector and a large unorganised sector and weak links between the two.[20] It may however be safely asserted that a major inhibiting factor is the oligopolistic market structure of the economy. When there are monopoly profits to reap one who is in exclusive possession of a knowhow is not likely to sell it to others instead of using it himself. In principle, a tax concession by altering the relative profitability of the alternative uses of knowhow may provide an inducement for its sale by those who happen to possess it. But with strong influences working against the growth of competition such as the imperfections of the capital market a tax incentive like this is unlikely to be of much avail. Where competition is restricted, few would like to lose their market whatever be the immediate gain. Moreover, where production of luxury consumption goods fetches large profits and indigenous innovations tend to concentrate in this sector, an unselective price incentive for spread of technology might serve to encourage production of these commodities more than that of others, which may not be in accordance with the desired growth pattern. Technology of fancy furniture-making, for instance, may spread. But would that be conducive to growth? Even though prior approval of the contracts is stipulated as a condition, tax authorities are neither empowered nor can they be in a position to discriminate between the claims for concession on such grounds. In any event, what constitutes the core of a knowhow and whether in a given case a real transfer of knowhow is taking place are matters best left to experts to decide rather than to tax administrators. Even with the best of care spurious claims are bound

to get through. If the incentive is to go only to the deserving, it has to be administered through direct subsidies supervised by experts. The costs of providing it through the tax system are likely to be much too high to be justified by the benefits.

IV

Another instance where a tax incentive results merely in conferring a windfall on some taxpayers, enlarging avoidance possibilities and adding to costs of enforcement can be found in Section 35 B of the Act. This section permits a deduction from taxable profits on account of expenses on export market development to the extent of 1-1/3 times the actual expenses.

Development of exports is undoubtedly one of our urgent tasks and publicity can play an important part in this task though what perhaps matters more in this field is the level of production costs as compared to their international level and restraint on internal demand for goods that have a market abroad. Anything that has the effect of compromising the progressiveness of the direct taxes serves in a way to harm exports by strengthening the consuming power of the rich. That apart the weighted deduction in question is so wide in its scope that it almost constitutes an ideal avenue for avoidance. The expense items qualifying for the deduction as listed in the section include not only advertisement or publicity outside India in respect of the goods, services or facilities which the assessee dealing in it provides "in the course of business", cost of maintenance of a sales office or agency abroad and travelling outside India for sales promotion, but the expenditure on almost any activity ancillary to the export of goods and services. Payments made to foreign agents on account of commission on export sales also seem to come within the scope of weighted deduction though according to the Audit such payments are not covered by the said provisions.[21] The expenditure need not always be incurred directly by the taxpayer himself. A claim can be made for weighted deduction for expenditure on such activities even if these are incurred in association with others.

A clarificatory circular has been issued indicating the conditions under which claims for the allowance in respect of expenditure incurred by a taxpayer through some other person or organisation would be entertained. "To facilitate verification", it is stated, "it is necessary that proper accounts are maintained in respect of expenditure incurred by an association or body with reference to which the allowance under Section 35B (or 35C) is claimed."[22] But how do the authorities make sure that the expenditure undertaken abroad, for which the section is invoked in a given case, was incurred genuinely for exports especially when only a remote connection with supply of goods abroad suffices for eligibility? Where verification is so difficult, it would seem wiser to go by results as the best index of effort put in. The quality of publicity is best judged by the volume of exports. Handsome rewards are available for exports in other direct forms. Why not raise the scale of such rewards if they appear inadequate? Tax incentives for exports were tried in the recent past and these were withdrawn on the devaluation of the rupee. Presumably the export market development allowance was intended to encourage search for new markets. But, as we have seen, the tax route seems too costly to be justifiable for the purpose. Currently, the weight of this allowance is proposed to be raised from 1-1/3 to 1½ times the expenditure.[23] Those who can avail of this deduction will then get nearly the whole of their expenditure incurred outside India for purposes other than material purchase substantially reimbursed by the government if the expenditure can be linked somehow to exports. For every Rs 100 spent under this head an exporting company would earn a tax saving of more than Rs 80. Even a 100 per cent direct subsidy would be cheaper in the long run being less amenable to misuse. That would also save the tax department from the additional bother of impossible policing.

V

Some of the deduction provisions favour relatively small groups of taxpayers. One such provision is section 80R which permits deduction of 50 per cent in respect of remuneration of certain foreign sources (like a short assignment in a foreign university) in the case of Indian professors, teachers and research workers. It is difficult to see the rationale of this provision from any point of view. Invitation from foreign universities is an honour few in this country at any rate like to turn down and the urge for going abroad in the case of professors hardly needs a tax incentive. In many cases, they are paid handsome amounts in the form of daily allowances that cannot be touched by the income tax collector being part of the "cost of earning". Referring to the origin of such narrow preferential tax provisions in the US Internal Revenue Code, one author comments: "A single taxpayer or a small group of taxpayers may convince Congress to enact a tax provision specially tailored to fit the taxpayer's own needs."[24] As was to be expected, the benefit contemplated under Section 80R for visiting teachers and researchers was partly extended two years later to authors, and artistes too.[25] The cost of such privileges may not be much in money terms but, as the commentator mentioned above put it, "preferences afforded to small groups or individuals are especially likely to upset taxpayer expectations that the tax laws expand and contract according to neutral principles unrelated to the identity of those advantaged and disadvantaged".

Even when the rationale is not in doubt, many of the provisions require reappraisal in the light of the experience gained in their working, as for example, section 80J which provides what is called a 'tax holiday' for new industrial undertakings. Dating from 1949, this provision is designed to apply only to new units of industrial undertakings and the benefit is available in the shape of a deduction from taxable income for the first five years to the extent of six per cent of the capital employed. Through successive amendments the scope of the section has been widened to include not only new industrial undertakings but ships, certain types of hotels and also cold storages. At first the provision benefited only those who earned adequate profits in their early years — for which there was obviously some point in that inefficient firms were automatically debarred from the reward. This merit was lost in 1967 when carry-forward of the deduction permitted in this section was allowed for a specified period, if unabsorbed in the initial years.

Since investments carry many external economies[26] there is a case for government support for private investment. The capital allowances and tax benefits for expenditure on scientific research derive their rationale primarily from this consideration. The stress on newness of the industrial undertaking would seem to indicate that the objective of this section was not only promotion of industrial growth but diversification through development of new lines of activity. Pursuit of these twin objectives with one instrument like this provision has however proved difficult and in fact has resulted in inequity apart from causing

constant headache to the administration.

Conditions of eligibility prescribed for this benefit require, *inter alia*, that (i) the undertaking should not be formed by splitting up or reconstructing an existing one and (ii) it should not be formed by transfer of building, plant or machinery previously used except as a specified fraction of the aggregate fixed assets of the undertaking. Whether a given undertaking is new or merely a reconstructed one being a crucial test has been a potent source of dispute and despite several decisions on the point no satisfactory general principle has emerged, much depending on the facts of each case. Thus, when a company manufacturing boilers, machinery parts and wagons sets up a steel foundry division and jute mill division to manufacture machinery-plants required for its original business, one High Court held that the profits of the foundry and jute mill division were not entitled to tax holidays as their creation amounted to "reconstruction"[27] whereas, the same Court held in a subsequent case where the taxpayer, a manufacturer of aluminium ingots at four centres, opened a new centre and also extended its factories at some of the existing centres, that the expansions constituted a "new industrial undertaking".[28] One of the reasons advanced by the Court for distinguishing the case of the aluminium company from that of the machinery manufacturer was that by setting up the foundry the latter had merely sought to make the parts required for its main business which was already existing. Similarly, when a sugar manufacturing company overhauled its old unit to set up a new, expanded one, another High Court held that there was no reconstruction and a new industrial unit had come into being.[29] But when a book publishing concern which used to get its books printed elsewhere, set up its own printing press, the same High Court had held that no part of the profits was entitled to the benefit of tax holiday as the printing business was not 'new'.[30] If the test had been simply whether the taxpayer's activity had developed along a new line, that is whether diversification, had taken place, clearly the machinery manufacturing company and the publishing concern should have got the concession and the others denied it whereas the very opposite took place. The tests applied by the court are evidently based on considerations irrelevant to the objectives and has frustrated the intended purpose, if it is assumed that diversification was the aim. If, however, the intention was to encourage fresh investment, irrespective of whether any new product is manufactured then all the four taxpayers should have received the benefit.

What constitutes 'capital employed' has also led to many disputes. Do all reserves form part of capital or only some of them? If only some, which ones? An elaborate formula for computation of capital for this purpose has been laid down in the rules. But together with the main section, this rule is one of the most confounding spots of the Indian income tax law. Distinguishing between a new or additional unit set up by an industrial undertaking and extension of its existing units has proved extremely difficult and not surprisingly there are sharp differences of opinion between tax authorities and assessees and also between tax authorities and the Audit. An illuminating example of the hazards of administering this provision is provided in a recent report of the Public Accounts Committee. Even the circular issued by the CBDT on the subject was commented upon by the Committee as not in conformity with the law![31] The Working Group of the ARC on Direct Taxes also had commented, "that the application of this elaborate procedure has not been understood properly by the officials of the Income Tax Department is clear from the number of mistakes committed which has come to the notice of the Public Accounts Committee".[32]

To simplify the procedure and ensure uniformity, the said Working Group suggested that the profits eligible for deduction should be computed at the specified rate with reference to paid up capital instead of "capital employed". But that would not remove the difficulties created by the insistence on newness of the undertaking. Perhaps a better method would be to tie the tax holiday to net investment in fixed assets financed by the taxpayer's own capital. But that would in effect be equivalent to a capital allowance like the development rebate. In the context of growing unemployment, need is felt increasingly for incentives to promote employment-generating investments. The incentives allowed so far have tended to encourage investment in capital intensive methods and even generate excess capacity. It thus needs to be considered whether it would not be preferable to reorient the tax holiday provisions to support investment with the maximum potential for employment. Consideration of the alternatives in this regard would take us too far afield. The point to note is that all such alternatives carry a cost, and in judging which one is the most paying in terms of benefit to the community all the elements of cost should be kept in mind. The tax holiday should preferably seek to achieve one basic objective instead of many at a time. Thus if employment creation is taken to be the prime objective, no attempt should be made to aim at diversification as well through the same provision. For, as experience shows, when too many things are sought to be achieved through one provision, none of the aims is served well. On the contrary, positive harm — such as inequity — results. By focusing attention on costs the TEA compels continuous reappraisal of the incentive provisions and spurs the search for better alternatives or improvement of the existing ones.

VI

For some of the deductions the cost burden has grown over time beyond what was originally anticipated as a result of changes made in the relevant sections and their interpretation based on considerations unrelated to their basic purpose. Whether the economic (or social) merit of the provisions is still worth their cost needs to be considered afresh through an explicit recognition of the enhancement that has occurred in the cost through this process. This is the case with section 80M which permits deduction of a specified fraction of intercorporate dividends. Designed to alleviate the element of 'double taxation' in taxing the dividend income received by companies on their investments in other companies, this provision was brought into the statute book in 1967 (wef 1.4.1968) to replace the system of taxing intercorporate dividends at concessional rates by a provision for straight deduction from taxable income.' This was among the simplification measures taken on the recommendation of the Bhoothalingam Committee. The decision to simplify, it might be presumed, did not signify any desire to enlarge the benefits except marginally where unavoidable. Yet this is what has occurred at least in the case of intercorporate dividends.

Take, for instance, a domestic company with a dividend income of Rs 3 lakhs in a year from its shares in other companies. Suppose, the company incurred a loss in business of Rs 2 lakhs so that after setting off the loss its next taxable income works out to Rs 1 lakh. Before simplification such a company was required to pay around Rs 23,000 as tax, (i e, at a concessional rate on Rs 1 lakh, being the intercorporate dividend net of other losses), whereas, after the simplification, it does not have to pay any tax at all. This is because, as per current interpretation, the deduction of 60 per cent allowed on intercorporate dividend is to be calculated with reference to the gross amount of the dividend and not the net amount which falls to be taxed after setting off losses, etc.[34] There may of course be a good case for further liberalising the tax treatment of intercorporate dividend but that requires a substantive decision by the legislature. If the process of simplification results inadvertently in enlarging a concession, the TEA would serve to bring that out though only partially for as in the case of intercorporate dividend, even that would not shed any light on the avoidance opportunities opened up in the process (e g, by manipulating the timing of loss realisation as between investment companies).

VII

An annual TEA would also have the wholesome effect of pointing to the urgency of organising a better data base so that the provisions long on the statute book can be subjected to meaningful study. Two such provisions are (1) deduction for saving in specified media like life insurance and provident fund;[35] and (2) deduction for contribution to charities.[36] Though, as stated, the provisions have long been in operation and account for sizeable diminution of the tax base we have no precise idea of what their revenue cost is. Sometime ago there was a debate on the probable dimensions of the cost of savings incentives in income tax but there was a sharp divergence of opinion.[37] The figure shown in the All-Income Revenue Statistics under this head does not provide any clue as it does not cover all salary earners liable to pay income tax. Many of them do not submit any return and are not formally assessed, their tax being deducted at source, and thus do not come up for inclusion in the tax statistics even though they may be paying income tax and enjoying the concession for saving in specified media.

The inequity and inefficiency of this system of providing incentives for saving can be seen easily. A taxpayer earning over Rs 1 lakh gets a tax benefit of as much as Rs 920 if he puts into his insurance a paltry amount of Rs 1,000 which he can save without any hardship.[38] Moreover, most of the savings of the taxpayers in the lower brackets being in contractual form, e g, provident fund contribution and life insurance premiums are either made on compulsion or on considerations other than the return on the savings. Their responsiveness to such incentives is thus unlikely to be high. Worse still, the existing relief scheme contains no check to ensure that the saving for which tax reduction is allowed is not frittered away through loans taken against such accumulations (borrowing from provident fund, etc). Similar questions might be raised about donations to charity particularly those for places of public worship.[39]

If subjected to scrutiny in the light of their cost and benefit, many of the provisions in our income tax law would probably be found wanting. A quick survey suggests that the whole of Chapter VIA consisting of section 80A to 80U deserves to be scrapped except perhaps three or four like those granting deduction for savings, long-term capital gains and income of the handicapped. Even the provisions which appear to stand the test call for modification to serve better their underlying objectives.

The TEA has its limitations. It is open to criticism on conceptual grounds since it presents only first order effects and takes no notice of behavioural changes of the taxpayers as a result of the incentives.[40] Besides, it raises tricky definitional problems. Which provisions of the tax laws are special provisions and which are integral to the tax statute? If departures from an ideal base are sought to be mapped in this way, the ideal needs to be selected first and that opens up room for sharp differences of opinion. For all its shortcomings, however, the TEA furnishes a useful tool of looking at provisions in the tax law that cater only to the interest of special sections or groups of taxpayers. The operational significance of the TEA — and, as one author, observes, that is the principal lesson to be derived from this approach[41] — lies in indicating that tax concessions are inferior devices for implementing purely non-tax objectives, the most important of which is to curb private demand in order to provide resources for public use.

It is not denied that tax incentives can be useful for certain purposes but they should be used sparingly for the costs of such incentives are usually likely to be higher than under alternative methods. The idea that the tax route may be simpler is often erroneous. Had there been adequate cost-consciousness, the cumberous provisions of Tax Credit in Chapter XXIIA and XXIIB of the Act most of which were suspended within a short period would not have found their way into the statute. The cost of these experiments in terms of revenue loss may not have been significant as probably few were aware of the existence of the incentives but the damage caused to the simplicity of the system was not negligible. Caution against indiscriminate use of tax incentives was sounded in this country by Bhoothalingam,[42] and the ARC too.[43] Their recommendations helped to arrest the expansion of the tax shelter, but only to a limited extent. There is however need for subjecting the existing provisions and any new proposal to a more exacting cost-benefit analysis. It is heartening to note that a directive to subject to such an analysis many of the provisions of Chapter VIA was given by the Public Accounts Committee in one of their recent reports.[44]

In sum, the case against tax expenditure rests not so much on the fact that they are not always effective — efficacy of selective incentives cannot be doubled — but on the strong probability that the losses often outweigh the gains, and worse still, this method affords no clear picture of the extent of loss and gain. In developing countries, anything that adds to the strain of the tax administration involves a social cost. Friedman said some time ago the loss to revenue arising from the tax concessions does not always represent a corresponding gain to any taxpayer group. They may be just 'deadweight losses'.[45] To show that for a given objective the tax incentive method is superior, to quote Surrey again, "as a generalisation the burden of proof should rest heavily on those proposing the use of the tax incentive method".[46] The case against the tax expenditure method is best put forward in the following observations of Surrey :

> "I think it unlikely that clear advantages in the tax incentive method will be found. Moreover, I stress strongly that the advantages must be clear and compelling to overcome the losses that accompany the use of the tax incentive. The problems of achieving a well-structured incentive are in themselves formidable. Even assuming that such problems as unfairness and windfalls are overcome, there are still the losses and drawbacks we have described; confusion and divided authority in the legislative and administrative processes; difficulties in maintaining budgetary control, confusion in perceiving and setting national priorities and dangers to the tax structure itself." (p 47)

Escorts

ESCORTS' sales rose to over Rs 50 crores in 1973 from Rs 40 crores in the previous year. The Directors of the Company have recommended a dividend of 14 per cent this year on equity shares against 12 per cent in 1972. The Directors have also recommended, subject to approval of shareholders, Controller of Capital Issues and Industrial Finance Corporation of India, the issue of bonus shares in the ratio of one share for every two shares held.

In spite of higher costs of industrial inputs and increase in wages, the Company's profit before tax in 1973 shot up to Rs 295 lakhs as against Rs 171 lakhs in the previous year after providing for depreciation and interest. Profit after tax was Rs 128 lakhs against Rs 74 lakhs in the previous year. It is expected that a part of the dividend will be free of tax under section 80 of the Income Tax Act.

The Company sold 7,500 tractors in 1973 as against 6,000 in the previous year. The sales performance of the Yellowline range of industrial equipment was also a considerable improvement over that of last year — Rs 233 lakhs against Rs 146 lakhs in 1972. Production of motorcycles and scooters during the year, however, remained almost the same as in 1972, largely because of a six-week strike by workers. The International Division's exports rose by more than 50 per cent over the previous year — Rs 50 lakhs in 1973 against Rs 30 lakhs in 1972.

The Company feels that it can achieve far better results in 1974 if the 50 to 60 per cent power cut in Punjab and Haryana is withdrawn. The Company has on the cards a big expansion programme in tractors, motorcycles and automotive and railway ancillaries during the period 1974 to 1976.

Only Ashok Leyland Make

GIANTS FOR GIGANTIC JOBS

The Ashok HIPPO has a GVW of 28 tonnes; the Ashok BEAVER, 19 tonnes!

These two giants — HIPPO and BEAVER — are already in service as Tractor-Trailer combinations and Dumpers, handling extra-heavy payloads, on or off the highways in many major industries, utilities, harbours, mines, quarries, multi-purpose projects etc. HIPPO and BEAVER are exclusively built for strenuous jobs by Ashok Leyland, backed by the technical knowhow of British Leyland. Over the years, these extra-heavy-duty vehicles have proved their ruggedness, reliability and economic operating costs.

Here are only a few of the *many satisfied users:*

Hindustan Steel • HEC • Hindustan Construction • ESSO • IOC • Madras Atomic Power Project • Electricity Boards and *Agriculture Departments* of various States • ONGC • ACC • DGS & D • Bolani Ores

Imagine Agriculture...

...without Petrochemicals

Agriculture is a vital sector of our economy and its growth is linked with the greater use of hybrid and high-yielding seeds. These varieties, being susceptible to pests and diseases, require increasing quantities of pesticides.

Every rupee invested in pesticides results in a manifold increase in food and cash crops. By the end of the Fifth Plan, 80,000 tonnes of technical grade pesticides will be required to achieve agricultural targets. Pesticide production is dependent on solvents and intermediates supplied by the petrochemical industry.

Growth of the petrochemical industry would not only help increase agricultural production, but would also help many other key sectors of our economy.

Petrochemicals—essential to many crucial sectors of our economy.

The Twice-Blessed

A GROUP of economists had submitted a 'Memorandum on a Policy to Contain Inflation' to the Prime Minister in February 1974. The Memorandum had proposed a package of measures "in the realms of monetary, fiscal and trade policy and industrial relations". Though the Memorandum did refer to "a structured demand management strategy", to regulation of stocks and expansion of production and capacity and to the need to "introduce a freeze on salaries and wages, profits and dividends", its primary preoccupation was with the level of money supply and its growth. The key measures which it proposed were immobilisation of 30 per cent of the existing money supply and a ceiling of 5 per cent on the annual growth rate of money supply. The emphasis on controlling money supply in recent discussions within the government has apparently encouraged the group of economists to now come out with specific proposals — designated, American-style, by a tongue-twister of an acronym, 'Semibombla' — for immobilising a part of money supply.

For this purpose the purchasing power of the community is broken down in the proposals into three categories: (i) currency notes of denominations of Rs 100 and above; (ii) currency notes of lower denominations; and (iii) bank deposits. The face value of the first category of high denomination currency notes is to be reduced by 30 per cent. Holders of these notes will have to get them stamped with their new face values within a specified period. Against the 30 per cent by which the value of the currency notes is reduced, the holders can claim special government saving certificates, with a maturity period of 10 years, protected against price rise through indexation by a factor equivalent to the increase in the index number of wholesale prices, and carrying a redemption value based on 10 per cent compound rate of interest per annum. Holders of high denomination currency notes upto Rs 10,000 will get their saving certificates without any scrutiny or question as to the source of income. For those with currency holdings in excess of Rs 10,000 in high denomination notes, the certificates will be issued only if a satisfactory explanation is forthcoming as to the source of income. This may be taken to be an anti-black money measure built into the proposals. Holders of small denomination notes will have the option to get them exchanged for what have been called Special Bond Medallions, which will also have a maturity period of 10 years, indexation, and a 10 per cent compound rate of interest. Bank deposits will likewise be immobilised to the extent of 30 per cent of current deposits, 25 per cent of savings deposits and 20 per cent of fixed deposits. The immobilised part of the deposits will be transferred into a separate account known as Blocked Deposit Account. The holders of Blocked Deposit Accounts will also get special saving certificates — again with a maturity period of 10 years, indexation, and a 10 per cent compound rate of interest. These measures are expected to reduce money supply by about 22-25 per cent. Thus about Rs 2,500-Rs 2,850 crores out of the current money supply of Rs 11,500 crores would be immobilised. The authors of the scheme are confident that "the reduction in money supply will lead to a drop in the level of prices by a similar proportion".

A not-so-incidental point may be raised about the enormous addition to money supply that would result on the expiry of the 10 year period for the duration of which purchasing power is proposed to be immobilised. For, the Rs 2,800 crores of money supply 'immobilised' through special savings certificates and Bond Medallions would, at a compound interest of 10 per cent per annum, have a maturity value of Rs 7,280 crores, under the assumption of constant prices. And, if prices rise by even 5 per cent a year, the maturity value will work out to no less than Rs 10,910 crores. What would be the implications of a monetary explosion of this order? This implication of the scheme has not been even mentioned by the authors.

This also exposes the gross inequity of the scheme. The benefits of indexation and the high rate of interest will accrue to those with large surplus liquidity. If the scheme is successfully implemented, the holding power over commodities of this section may get affected temporarily to some extent, but it would be able to quickly overcome these effects. The pattern of income distribution and wealth accumulation remaining unchanged, this section would be able to rapidly recoup its loss of liquidity. Further, even in the first instance, the loss of liquidity will be very limited. While 30 per cent of the value of the high denomination notes will be immobilised, there is no obligation to exchange the smaller denomination notes for the so-called Bond Medallions. Ten rupee notes, together with other smaller denomination notes, account for about 44 per cent of total currency in circulation or about Rs

3,000 crores. If even one-half of this is held by the richer section, it is obvious that a significant part of the monetary resources of this section would be left untouched by the scheme. And once they recoup their lost liquidity, the rich will have gained on the swings as well as on the roundabouts — from commodity trading and speculation as well as from indexation of their impounded currency holdings and bank deposits. The cash balances of wage-earners and low and middle level salary-earners are, on the other hand, just enough to meet their minimum transaction requirements. After contractual savings in the form of provident funds and insurance, they are likely to have hardly any savings left with them to take advantage of the Bond Medallions scheme.

If the objective is to cut at the use of money balances to hold commodity stocks, it can be very effectively achieved by a straight demonetisation aimed at unearthing and liquidating 'black' money. If instead of this, an elaborate scheme is required, such as that proposed by the group of economists — which will over a period of years have the effect of making the rich enormously richer — the only reason is that for political reasons the present government cannot be expected to effectively carry out a measure like demonetisation. To put the matter bluntly: since the rich are politically too powerful to be made to relinquish their illegal, tax-evaded money, they have to be persuaded with offers of incentives to temporarily give up a small part of it. And the incentives that they are to be offered for this relatively painless act of self-abnegation on their part are to include complete protection against rise in prices — protection which will not, of course, be available to the incomes of the poor — as well as the assurance that for every Re 1 surrendered today Rs 2.60 will be returned to them 10 years hence. In other words, the rich can now weigh the relative advantage to be gained from investing in commodity trading and speculation and from investing, so to say, in the economists' scheme and decide how much of their money to put in the one and how much in the other. Choice, as every one knows, is the essence of maximisation. By widening the choice available to the rich, the group of economists may be said to have made their contribution to more efficient profit-maximisation. It may be pointed out that there is a provision in the scheme for scrutiny of source of income where the money holding is in excess of Rs 10,000. But should not the effectiveness of this provision be written off for the same reasons that the economists themselves write off the prospects of a straight demonetisation?

And even after presenting the rich with such bounties, the impact of the scheme on prices is problematic, even in the very short run. There is no basis for the assertion that the aggregate price level will decline in proportion to the cut in money supply. And the impact on prices of particular commodity groups will be even more uncertain. An expansion of the scale of public procurement and distribution of foodgrains, for instance, will have a more profound impact on the prices and availability of foodgrains to the sections of the population that really matter than any across-the-board cut in money supply.

The fundamental error — shared by the government and the group of economists — is that of seeing the current economic crisis, of which the the inflation is the most visible symptom, as an essentially monetary phenomenon. As has been repeatedly pointed out in these columns, this view is not only erroneous but also highly dangerous. An obsession with keeping down the rate of growth of money supply and curbing government expenditure to contain the budgetary deficit will in the end have the effect of further reducing investment. And this when it is the almost decade-long stagnation in investment which is responsible for the worsening shortages of a series of industrial commodities like coal, steel, non-ferrous metals, basic and intermediate chemicals, dyes, cement, commercial vehicles and paper and paper products as well as rail transport and power. Despite this experience, the government apparently believes that planning and growth can be postponed till so-called stability is restored to the economy. It was the same calculation which had dictated the three-year holiday from planning after the Third Plan and later rendered the Fourth Plan a non-starter. The fate of the Fifth Plan, it is evident, is to be no different. That the government should want to slur over this is understandable. But most economists be a party to the deception?

State Finances

Case of the Missing Tax

THE budget presented last week by the Uttar Pradesh Finance Minister is significant for only one reason: of the nearly Rs 30 crores of additional resources proposed to be raised, neither agricultural income-tax nor land revenue will contribute any. Yet, 70 per cent of the state's income originates from primary activities and this is a state where many of the country's surplus producing farmers are concentrated. Beyond a point, it will be impossible then to keep loading the other sectors of the economy. The impact of the taxes and duties proposed last week will be felt largely by the urban middle and working classes, the sections which have also been among most severely affected by the inflation. The malaise, resulting from discontent and frustration which disparately distributed fiscal burdens bring in their wake, cannot be prevented from spreading. As the incidence of commodity taxation rises, prices too will rise. Since money earnings will not be permitted to be adjusted *pari passu*, real income will continue to be steadily eroded, straightaway affecting the incentive to work or creating the incentive to earn in the black.

But the fiscal malady afflicting Uttar Pradesh is not specific to that state alone. It is generic. In the present structure of politics, befriending the rich farmers and traders offers the highest pay-off to those in control of State power. Proposals for direct levies on agriculture will therefore continue to be carefully deleted from the agenda of activities. In the current year, the government is also on the defensive because of the increases allowed in the administered prices of fertilisers. Until the Lok Sabha elections in 1976 and the spate of state Assembly elections in 1977 are safely over, no further provocations are likely to be offered which could raise the ire of the emerging capitalist farmers. The limit of what could be dared has been reached for the present.

Plenty of other indications of the wileful defeatism have been made available. The Union Minister of Agriculture regards it a great achievement that the procurement of wheat in the present season has reached 1 million tonnes, or barely 3 per cent of the estimated output. Just two years ago, as much as a quarter of the total wheat crop had been procured, and at a price substantially lower than today's. It is the wretched poor — in government terminology, the vulnerable sections — who will have to bear the consequences of this abject capitulation to the big farmers and traders. In the past, public distribution of foodgrains in the lean period of the year used to exceed 1 million tonnes per month: there have been years when during June to September it was as much as 1.3 or 1.4 million tonnes per month. In the current year, the distribution of foodgrains through the ration and fair price shops is proposed to be cut down to as little as 400,000 tonnes in these months. The poor will be left largely to fend for themselves, starve, and, in a number of instances, die.

But currying favour with the rural oligarchs is by now hardly confined to the Congress party. In 1967, the Dravida Munnethra Kazhagam came to power in Tamil Nadu by promising to supply rice at a rupee a measure. At the time, the slogan yielded rich dividends, and the DMK could enlist the solid support of the rural and urban poor as well as the middle class whose eyes were agleam at the prospect of receiving rice through the ration and fair price shops at one rupee a measure (roughly one and a half kilogrammes). But 1974 is not 1967. In the intervening years, the DMK has extensively enjoyed the fruits of power, and has been diligently wooed by the affluent peasantry and the merchant capitalists. In 1967, Tamil Nadu's rice procurement was the highest in the country. About ten days ago the DMK government issued a notification abandoning, one and for all, the procurement of rice and paddy. As elsewhere, the poor in the state will henceforth have to learn to fend for themselves, and the surplus farmers and traders, no longer hemmed in by the irritant of procurement, will be able to give their undivided attention to optimising their returns from smuggling rice across the border to Kerala.

Maharashtra

The Uprooted in Manikghad

Our Maharashtra Correspondent writes:

MANIKGHAD and some 17 adjoining villages in the Rajura Assembly constituency of Chandrapur district, on Maharashtra's border with Andhra Pradesh, has been the scene of forcible eviction of agriculturists from so-called forest land. Here more than 1,500 families sought to be deprived of land which they have cultivated for over a decade are mostly Mangs, a scheduled caste, and Banjaras and Khumbars which are classified as backward classes. There is also a sprinkling of Marathas and even some Muslims among them. These families have been living in Manikghad and the adjoining villages for the last 12 to 15 years and have been growing cotton and jowar over some 25,000 acres.

One morning, some three months ago, they were served with eviction notices by the state government's Forest and Revenue Department. In these notices they were described as 'encroachers and outsiders' and were called upon to vacate the lands they had been cultivating as well as the villages in which they had been living and to go back to their 'places of origin'. The state government has backed up the eviction notices with the use of police, including the SRP. In some villages, the police are alleged to have burnt down houses and forcibly removed the belongings and personal effects of the farmers in trucks. Some 500 persons have been arrested, including 40 women.

How the 1,500 families came to settle in Manikghad is an interesting story. For decades Manikghad had been a sort of place of pilgrimage; people from far-off places used to come to offer prayers to a goddess called Gramadevata in the Manikghad forest. Every year a fair is held at the shrine of Gramadevata. In 1960 some groups of pilgrims were returning to their homes in Osmanabad and Nanded districts after offering prayers to Gramadevata. They were accosted by forest contractors and asked whether they were interested in employment in the forests as wood-cutters. The pilgrims replied that they were not trained in woodcutting but knew agriculture well. The forest contractors and some local leaders then told them that they would be welcome to develop the lands in Manikghad and the adjoining villages and settle down there permanently. As the pilgrims were mostly landless agricultural labourers in their own villages, the offer of land in Manikghad was very tempting. The forest contractors and the local leaders had no authority to offer land to anyone; yet they took large sums of money for allowing these people to settle on the land. The new settlers soon built improvised houses and began to develop the lands. They sincerely believed that through the payments they had made to the forest contractors and the local leaders, they had acquired legal right to cultivate the lands.

And so the once-uninhabited Manikghad area began to hum with activity. Soon a number of villages came to be established and the government set up gram panchayats in these villages. The leaders of the settlers became members of the panchayats and some among them were elected sarpanches. Came the 1962 elections to Parliament and the state Assembly and the settlers were registered as voters. In the elections in 1971 and 1972, the people of Manikghad and the adjoining villages elected two Congress candidates to the Lok Sabha and the state assembly, respectively. Meanwhile, the state government opened schools and introduced the other paraphernalia of administration. Big markets came to be established at Chandrur and Kirimeri.

Then came the blow in 1973 when the state Forest Minister, M D Chaudhuri, who also holds the Finance portfolio, decided to order his Forest Department to evict the 'outsiders' who had encroached on forest and revenue lands in Manikghad. Following this, 15,000 eviction notices were issued to agriculturists. The Forest Minister claimed that the land developed by the settlers would be distributed among the local adivasis. However, the Chief Minister intervened at this stage to assure the settlers that they would be allowed to continue to cultivate their lands. He further assured them that the lands they had been cultivating for more than a decade would be deemed to belong to them. As recently as on May 18 he called a meeting of legislators from Chandrapur district along with M D Chaudhuri and announced that lands which had been occupied before 1970 would not be treated as having been encroached upon and that their occupation would be regularised.

To his great embarrassment, however, the Chief Minister found that M D Chaudhuri, who is a member of Naik's inner Cabinet and is usually a staunch supporter of his within the Cabinet and in the state Congress party, was determined to uproot the agriculturists of Manikghad. Chaudhuri brought the matter before the Cabinet and got the Chief Minister's decision reversed. He got the Cabinet's approval for the eviction of the 'encroachers' in Manikghad and the adjoining villages. Chaudhuri reportedly argued before the Cabinet that if the government did not remove the 'encroachers' in Manikghad, the state would soon lose all its forests which, he alleged, were already getting eroded because of regularisation of encroachments. The argument apparently convinced the Cabinet. The Congress MLAs and MP from the area as well as the Minister of State for Agriculture and Irrigation and Power, R J Deotale, were prevailed upon to keep quiet on the issue.

Finding that the Congress members they had elected to the Lok Sabha and the state Assembly were not coming to their rescue, the agriculturists turned to the Socialist Party for help. Madhu Dandavate, Socialist MP, and Pannalal Surana, General Secretary of the party, have recently visited Manikghad and the adjoining areas. The Socialist Party, however, has no cadres to organise the

peasants of Manikghad for a struggle against their eviction. As things are, nobody knows — least of all they themselves — where the 10,000 to 12,000 uprooted agriculturists will go. The government certainly has no scheme to rehabilitate them.

Export Earnings

Bloated Image

SUDDENLY, there is a levelling off in the pitch. Claims, thunderingly broadcast by the Ministry of Commerce regarding the country's unprecedented export performance, have been markedly toned down. Much was being made till a few weeks ago of the news that export earnings were up by more than 25 per cent during 1973-74. Now that it has become known that total world exports had expanded by as much as 37 per cent in the same year, this country's achievement has lost some of its intended lustre. Taking the bare facts as they are, India's share in world exports appears to have actually declined in the course of the year. In any case, on such matters, it is clearly hazardous to express any categorical opinion unless the bases of the computations are first laid bare. In these days of fluctuating exchange rates, the measurement of a country's export performance over a specified period may to a large extent depend upon whether the export earnings are being measured in domestic or foreign currency. The reported rise in exports by roughly a quarter in 1973-74 has been arrived at for India after computing the value of exports in rupees. The picture might look altogether different if the gain is re-computed in terms of a standard foreign currency, for example, dollars: for, a large part of India's extra rupee earnings from exports might then be seen to be the result of the rupee having been considerably depreciated *vis-a-vis* a number of important foreign currencies in the course of the year. From time to time, suggestions have been made that the Ministry of Commerce should publish each year the detailed data of additional earnings of foreign exchange from exports: these could be presented, in tabular form, indicating the earnings in different currencies in 1972-73 and the corresponding earnings in 1973-74. Till now, there has been no response to such suggestions, giving rise to the suspicion that all that glitters need not be gold.

Certain other facts have meanwhile started to trickle in. Engineering exports were in any case faring badly in 1973-74, reflecting the phenomenon of uncertain production conditions. Cotton textile exports too have started to decline steeply since the beginning of the current calendar year. There is, of course, the general fact that with a more or less stagnant level of output, it is difficult either to sustain or to force up exports, particularly in a milieu marked by strong consumer demand in the domestic market. A number of other factors, too, must have contributed their influence. The expansion in India's cotton textile exports since 1971 was largely a consequence of the cost explosion in Japan. But, with the prices of raw cotton moving up here by nearly 50 per cent during the past one year, our temporary advantage is now almost completely lost. Sooner or later, a 30 per cent annual rate of domestic inflation could not but cast its shadow on exports. In the face of such spiralling prices survival in the international markets would be largely a function of whether or not international prices are rising at a faster pace. Apart from a few Latin American countries, the order of price increase which the Indian authorities appear to acquiesce in, or even to connive at, is unlikely to be tolerated in any other markets of the world.

At the same time, reports have been loud and frequent about the frivolous manner in which export incentive schemes, including import entitlements, have been administered. Here is an obvious case for a rigorous cost-benefit analysis. If, at the margin, pushing up the rupee value of exports by Rs 500 crores could be shown to have involved an extra fiscal outlay of, say, Rs 250 crores, the validity of the venture would have to be questioned. One would want to know the additional accretion of foreign exchange corresponding to the Rs 500 crores of extra earnings in rupee terms. There is another aspect of the export incentive schemes which also merit cost-benefit analysis — *viz*, the income redistributive effect of the individual export subsidies. A nominal increase in foreign exchange earnings, if it is at the cost of a substantial transfer of resources from the nation's poor to a select group of traders and industrialists, might be something which the nation could do without, whatever the shadow rates of exchange applied.

Oil Prices

Bonanza for the Companies

THE steep rise in oil prices is now an accepted fact. Oil prices have been steadily going up since October 1970 when the newly installed Chaddafi government in Libya single-handedly wrung out large additional revenues from the Western oil companies. This was to be just the beginning. Last year's October War in West Asia was the dramatic occasion needed to spur the major oil exporting countries to increase their revenues — for the first time to levels approximating those hitherto appropriated by the governments of the consumer nations. Previously the major ingredient in the price of oil was the high taxes levied by consumer governments. To this have now been added the high taxes levied by the producer governments.

The Financial Times of June 6 gives a breakdown of the cost of an average barrel of oil in Western Europe which is the world's major importer of oil. The cost breakdown compares the figures of July 1973, i e, before the October War, with those of January 1974, by when all the major price increases by the producer governments had been effected. While the producer governments' revenues (including 25 per cent participation in the fortunes of the oil companies) amounted to only $ 2.3 per barrel in July 1973, the consumer governments appropriated taxes amounting to $ 7.45 from a barrel of oil. By January 1974, the producer governments had begun to take $ 8.48 while the consumer governments had slightly increased their share to $ 7.7

Other costs like distribution and refining remained almost constant. What is even more significant is that while the production cost of the average barrel of oil went down slightly from $ 0.19 to $ 0.18, the oil companies' profits went up from $ 0.58 to $ 0.88, a striking increase of 52 per cent within a period of only six months. The Western oil companies while crying wolf about the extortions of the producer countries have by no means curbed their own traditional predatory instincts.

COST BREAKDOWN OF THE AVERAGE BARREL OF OIL IN WESTERN EUROPE (in US dollars)

	July 1973	January 1974
Average price in the market	14.25	21.49
Production	0.19	0.18
Refining	0.53	0.55
Transport	1.00	1.50
Distribution	2.20	2.20
Oil company profits	0.58	0.88
Consumer government's take	7.45	7.70
Producer government's take	2.30	8.48

Hurt by Power-Cut

Hansavivek

SOUTH INDIA VISCOSE completed the expansion of its staple fibre plant in December last and attained the rated capacity of 20 tonnes per day in the same month. The project involved a capital outlay of about Rs 7 crores and was financed entirely out of internal resources. The company now proposes to set up a polynosic staple fibre plant with the same capacity and has entered into agreements with Italian collaborators for the supply of technical knowhow and machinery for the plant. Orders will be placed with foreign suppliers for import of machinery on obtaining clearance from the government. Meanwhile, the company has also received a 'letter of intent' to double production of woodpulp to 120 tonnes per day. During 1973, SIV produced 2,388 tonnes of rayon yarn, 2,438 tonnes of staple fibre, and 24,124 tonnes of pulp. Production of rayon yarn and staple fibre was affected by a power-cut of 75 per cent in force from February to July 1973. The staple fibre plant had to be shut down for about 5 months, while the rayon unit worked at reduced capacity during February to July 1973. The wood pulp plant was shut down for more than 25 days due to water scarcity. Profit margins were depressed, as reflected in a 12 per cent fall in gross profit following a 6 per cent decline in net sales. Net profit was about 36 per cent down compared to the previous year. Even so, dividend has been stepped up from 20 per cent to 25 per cent. Nearly a quarter of the distribution is short-earned. Both inventories and wages in relation to sales were much higher compared to the previous year. STC has filed a suit against the company in the Bombay High Court for over Rs 28 lakhs, being alleged excess reimbursement of loss under export promotion scheme. No provision has been made in the accounts, as the company says that it has not acknowledged this claim. There is also a liability for about Rs 3 lakhs towards sales tax, which too has not been acknowledged by the company. The Tamil Nadu government has increased, with retrospective effective from 1969, the lease rates for bluegum and wattle areas allotted to the company. From April 1973, the lease rate has been raised further for a period of 3 years. The liability in respect of increased price for pulp wood demanded by the state government has been provided for in the accounts. The company's appeal against the levy of textile committee fees was decided in its favour by the Madras High Court, but the textile committee has filed a petition for grant of a certificate for leave to appeal to the Supreme Court against the judgment.

FOOD SPECIALITIES' application for issue of bonus shares, as approved by the members in July 1972, has not been considered by government because a contingent tax liability stood in the way. Appeals are pending against claims by the tax authorities, which amounted to Rs 20 lakhs in 1972 and was increased to Rs 37 lakhs in 1973. The company's results in 1973 were affected by a 20 per cent reduction of fresh milk supplies to its factory, coupled with fast rising cost of raw and packaging materials. The milk supplies were lower because of poor calving and a larger domestic consumption of milk by farmers owing to high prices of edible oils. Manufacture of milk products, therefore, had to be curtailed. Even so, net sales realisation was marginally higher, but margins deteriorated sharply and gross profit fell by about 21 per cent. Dividend has been lowered by 5 points to 20 per cent and is just covered as before. No provision has been made for gratuity liability upto the end of 1972, actuarially determined at over Rs 6 lakhs. The company has received government permission to increase licensed capacity of milk powder and baby food. The MAGGI cube factory was completed at the end of 1973.

UP ASBESTOS, a joint-sector enterprise in which UP State Cement Corporation has a 26 per cent interest and Arvinda Consultants 25 per cent, is setting up a project at Mohan Ganj

in Lucknow for annual manufacture of 36,000 tonnes of asbestos cement products. Technical knowhow will also be provided by the latter partner. Capital outlay on the project is estimated at around Rs 168 lakhs and is proposed to be financed by equity capital of Rs 50 lakhs, term loans of Rs 60 lakhs and the balance by borrowings from banks and deposits and cash accruals. The basic raw material is cement, which will be drawn from UPSCC. The company has been issued a release order of the value of Rs 34 lakhs for import of asbestos fibre. The public is being offered 2,44,993 equity shares of Rs 10 each at par to meet part of the finance required for the project. According to B Kejriwal, managing director, the plant will go into production by August next. He expects the company to pay a maiden dividend of 12 per cent out of the earnings of the very first year of production and to raise it to 15 per cent from the second year. As the only plant to manufacture asbestos products in UP, the management expects that the entire production will be consumed in that state. The subscription list for the public issue is to open on July 3. It will close on July 13 or earlier, but not earlier than July 6. The public issue is managed by FICOM.

CAPITAL VIEW

Descent on the Corrupt Sector?

Romesh Thapar

THE other day, in Delhi, a number of well-co-ordinated raids were conducted on the godowns and bank-lockers of certain iron and steel merchants. The haul was extensive. The price of steel fell steeply. And, now, it looks as if the vanaspati agents are being given the once over. Are these moves the first of a series of steps against those who have been wrecking the price mechanism of the market? Is Delhi setting the tone? We do not know. We will have to wait and see.

It is well known that government, both at the Central and the state levels, have a fairly comprehensive record of the leading market manipulators and the details of their operations. This highly inflammable knowledge has been with the government for several years. It needs only a gentle signal to put into action an investigation which can bring the crooked to justice. Why then are we so lazy about taking the long overdue steps? Too many fingers in the pie?

Part of the System

Our brand of politics, with its built-in system of over-spending in the sprawling constituencies, spurred the massive growth in black money dealings. The dealings were designed to re-imburse those who had been feeding funds to our politicians. An economy of shortages gave sustenance to the black money operations. And then, during the past two years, the inflation and the resultant impetus to corruption have created what is tantamount to a parallel unofficial economy —, with its own deposit, credit and interest system.

When the decision was taken to crack down on the adventurous railway unions seeking to paralyse economic activity in the country, it was assumed in political circles that the government of Indira Gandhi would hit out at a number of corrupt points, if only to stress its own impartiality. Of course, the government's credibility has been declining so rapidly that there are a fair number of informed persons who just refuse to believe that Delhi is interested in being fair-minded.

It is necessary to take note of the nuances of the situation. Only a large-scale and sustained assault, cutting across state boundaries and embracing well known personalities involved in the buccaneering, can restore credibility to the government of Indira Gandhi. The kind of hesitant, reluctant, half-hearted, and even defensive, actions taken in the past against the corrupt have only served to heighten the contempt in which government and its proliferating institutions are held. And the Prime Minister should stop accusing the Opposition of exploiting ministerial corruption for political ends. What did she expect the Opposition to do?

To Retain the Initiative

The correction, as in the matter of the railway strike, must be clear-cut, determined and ruthless. Then, perhaps, we may see a sense of balance restored. Indeed, in several Left quarters, particularly the embarrassed CPI, the demand is arising for some such organised *expose*. Rumour has it that prominent persons associated with the Prime Minister will have to face concentrated charges.

It would be most unfortunate if the Prime Minister permits this attack and counter-attack situation to develop between government and opposition. In a matter such as this, government needs to set an example and retain the initiative. The past is past. Let the present and the future, at least, be salvaged by a frank recognition of errors.

Direct action by government against the notoriously corrupt has more to recommend it than the legalisms inherent in the decision of the Chief Minister of Bengal for probing the probity of his ministers. Inquiries by Supreme Court judges, with all the paraphernalia of charges and evidence, are designed to save the necks of the really organised operators. Only fools find themselves in trouble with these inquiries. It is strange that the Chief Minister doesn't sack those whom he considers corrupt, faction fights within the ruling party notwithstanding. Passing the buck, particularly to retired judges, only infuriates. The sooner this is realised, the better.

Backdrop of Presidential Election

The descent on the corrupt sector, which spills over into many areas, should keep the CGI and its obedient satraps busy for some time. But speed is essential. Political developments around the presidential election could diffuse attention. Indira Gandhi will probably see the connection between the present probe and the presidential manipulations sooner than the incompetent politicians who crowd the platforms all over India.

Somehow, if the Congress party has to survive the present crises, it has to be freed from the grip of the black-marketeers, the smugglers, and the tycoons who control the black market economy. Indira Gandhi is not guilty of giving these elements their first toehold in the ruling party; that was done by others. But she has permitted them to entrench themselves, despite warnings about the consequences. Now, the embarrassment is extreme.

Maybe, the tactics of the traders in food will provide the occasion for action which will hurt those who build empires on corruption and dishonest dealing.

June 17

Calcutta Diary

A M

NEVER say die. The Economic Policy Committee of the Union Cabinet hesitated when presented with a demand that vanaspati prices be raised by something like 20 per cent at one go. So what. Within a bare two days, the Political Affairs Committee took charge of the matter, and allowed the asked-for price increase. Thereby, an important point was rubbed in, a point which pedantic professors of economics often miss out: Economic policy has no suzerainty of its own, it is a derivative of political affairs.

A few other points also emerged from the episode. One must not look for symmetry in official decision-making: symmetry is not the way of a class-biased government. Vanaspati prices have to be raised because cost of production has supposedly gone up as a consequence of the spiralling prices of oilseeds. The government's purchase prices for wheat and other foodgrains are increased from time to time because, again, cost of production is supposedly moving up and up. The model breaks down, however, in the case of labour. The rise in the cost of production of labour receives no official recognition.

The cost on account of labour is the cost of the subsistence packet. With the steep rise in the prices of foodgrains and other essential commodities and services, the cost of this subsistence packet has increased by at least 60 to 70 per cent in the course of the past two years. The perfunctory adjustment in dearness allowances is patently incapable of compensating the labourers for this rise in their subsistence expenses. Which is why the workers seek certain other additional reliefs, for example, through an award of bonus. The Political Affairs Committee of the Cabinet will lean over backwards to take into account the rise in the cost of production while fixing the administered prices of commodities. Commodities, after all, are inert entities, any compensation for the increase in their cost will flow to those who control their production, viz, the big farmers and the industrial capitalists. With labour, it is different. Labour, in the first place, is not inert. In the second place, the additional funds which might be paid out to the workers by way of compensation for the rise in their cost of living will not flow to the rich farmers or the capitalist producers; because the workers are not inert, anything extra you pay to them they will want to spend on their own welfare; it cannot always be appropriated by their employers. This is scandalous, and cannot be allowed. Labour must be shown its place.

What is worse, labourers will be lectured to. How dare they ask for extra wages when there are people much, much poorer, in cities and towns as well as in the countryside — the millions of unemployed, the half or one-quarter employed small farmers and landless labourers? Do not the organised working class have a modicum of social conscience? Are they not ashamed to raise fresh demands every day for higher wages, when so many in the country are below the subsistence level, some of whom are literally starving day after day? Do not they possess even an iota of patriotism? Are they incapable of realising the enormity of the crisis the nation is going through? In case they are, they must be taught the lessons. Treason is not to be put up with. The Defence of India Rules and the MISA will be invoked. Crack units of the Army, the Border Security Force, the Central Reserve Police, the Industrial Security Force, *et al*, will be out in force. This is not a ha'penny worth of a nation. India — the land of Lord Krishna, Buddha, Sankaracharya, Mahatma Gandhi and Rabindranath Tagore — has survived through the centuries because, despite the many vicissitudes, it has an inner core of strength: it has taught its citizens the art of holding the head high and elevating the heart to a state of fearlessness when confronted by even the direst misfortunes. The secret of that strength is to be found in abstinence and self-abnegation. The demeanour of the organised working class is a slur on this noble tradition of the nation. They must be given no quarter at all.

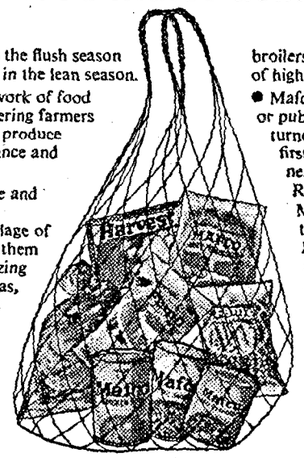
The Old By-Now Non-Curiosity Shop! These lecture notes are somehow misplaced in moments when sectional demands are being pressed instead by the well-heeled categories — such as the rich farmers, the traders and the manufacturers. At the mildest of pressure, the wholesale trade in grains is returned to private operators, procurement prices are raised straightaway by 40 per cent, inter-district cordoning is abandoned. The big farmers are not admonished: they are not informed that they ought to be ashamed of themselves in asking for such hefty increases in prices; they are not asked to consider the plight of their unfortunate neighbours — the small-holders and the landless cultivators — and forgo the demand for higher prices. No, the incentives of the farmers cannot be allowed to be adversly affected; they must be ensured a fair margin above their cost of production; the invocation of patriotism and reading the Riot Act are definitely out even though the surplus-raising farmers are a thoroughly recalcitrant lot. If, despite the staggering increase in procurement prices, farmers and traders do not bring the wheat to the market, then ... ah, yes, there are some local difficulties which need to be sorted out, but, meanwhile, don't you know, we have done very well with the procurement of rice. The rich by definition are incapable of committing treason; it is only the poor who can be, and are, unpatriotic. If vanaspati disappears from the market, it has to be because traders and manufacturers cannot maintain supplies since, at the given price, production is no longer economic. If workers however fail to turn up for duty on the plea that, at the existing wage rates, the supply of their services has become uneconomic, the only no-nonsense answer is the Defence of India Rules and the midnight knock.

This asymmetry percolates into every sphere. The All-India Radio and the docile, complaisant Press play up a non-event at the Kharagpur workshop; practically nothing however gets written about the thousand other things that occurred during and in the aftermath of the rail strike. Organised brutality, spearheaded by the minions of law and order; the vicious bayonet thrust at the bodies of the striking railwaymen waylaid by the police; the bundling into prison of thousands who refused to act as blacklegs; the terrorisation in employees' quarters; the deployment of hired goons to beat up workers and their families; the harassment of women and children; the brusque ejectments; the summary dismissals. These do not get broadcast or written about, for they do not serve the cause: the cause of making the country safe for the privileged ones.

The Press writes, and the All-India Radio's hired pundits pontificate, about the ignominy of a strike called off despite the fact that not one of the major demands was conceded by the authorities. They do not write or speak of the many heroisms which constituted the strike, the courage of the workers, the fortitude shown by their wives and offspring. The Press does not write about some of the other dimensions of the strike either: More than one hundred unions and their members, flung across the length and breadth of the country, came together and decid-

ed to challenge the prowess of the government. For twenty long days, they held out, although they had very little wherewithal. By and large, they stayed away from violence: in any event, they did not have the weaponry to indulge in violence. The violence, almost in its entirety, was on the government's account.

It is as if certain of the things one had read about fascism in Italy or the *putsch* of the National Socialists in Germany had suddenly stepped out of the pages of the history books and had become part of our own living reality. During that strike which the All-India Radio was unable to discover, the State became the leading organiser of illegitimate activities. The workers — and their families — did not flinch; they faced the menace, with dignity. Of course they failed to achieve what they had set out to achieve. The majesty of the endeavour is not reduced thereby. The outcome of the strike merely established the point, which perhaps did not need any establishing, that in a modern State — provided the government is backed by the combined resources of the defence forces, the police, the intelligence and the paramilitary units, the opposition is divided into a hundred fissures, and the level of general political awareness amongst the masses is abysmally low — in any confrontation with the workers, the authorities will get away with strong-arm methods and succeed in bullying them back to work.



The asymmetry, of course, remains. The government will not be seen to deploy the same strong-arm tactics to bring to book the wayward trader, the obstreperous big farmer, or the blackmailing manufacturer. The official solicitude to keep the wheels of production and exchange moving will stand suspended in case they stop at the initiative of the rich ones in the system. The government, in other words, is class-biased. If your susceptibilities are hurt by the use of such expressions borrowed from the gutter of ideology, the government, let it be said, is one-eyed.

A minor point, wearyingly repeated over and over? If the face of reality however does not change, the narration of that reality cannot escape being repetitive. Even more relevant, the asymmetry referred to provides perhaps the major clue to the present economic crisis. This country's economy is much too big and complex and the problems confronting it are much too heterogeneous, to be left to the care of a rarefied decile of the population.

Through its fiscal and monetary policies, its licensing and other administrative procedures, its *modus operandi* concerning the setting of prices and wages, its views on information and broadcasting, the government is bent upon enforcing a particular pattern of income redistribution — *viz*, the transferring of income and resources from the many poor to the few rich, from the millions of the multitude to the handful of the elite. Taking any random period in the post-1947 phase, none can claim that the rise in money wage rates has kept pace with the rise in prices. On the other hand particularly in more recent years, the authorities themselves have taken the lead in raising the prices of so many different commodities, thus widening the profit margins of the traders and producers, that one has almost lost track. But the elite by themselves cannot accelerate the process of growth; according to a number of well-founded economic propositions, the elite are not even interested in growth — their interests lie in short-run profits, and where the latter can be improved upon by restricting growth, by all means growth will be restricted. Besides, only in a highly technologically advanced, fully automated milieu, can the rich ones still hope to carry on more or less in the manner of the scions of nineteenth-century British conservatives; in the present clime in India they cannot hope to do so. If set upon, the sullen middle class condemned to inflation and fixed incomes, the sullen working class, the sullen peasantry, will each go through the motions of participating in the process of production? It will, however, be production as in an occupied territory: the moment the authorities look the other way, things will grind to a halt. In case you are not convinced, just wait till the railway accounts for the fiscal year 1974-75 are ready.

FOOD SHORTAGE

and what's Mafco doing about it?

- Mafco is buying heavily in the flush season to make more food available in the lean season.
- Mafco is developing a network of food procurement centres, and offering farmers in Maharashtra incentives to produce more: contract prices in advance and profit-sharing schemes.
- Mafco is expanding storage and processing facilities all over Maharashtra, to prevent spoilage of meat and vegetables and give them a life of up to one year. Freezing makes seasonal produce—peas, maize, cauliflower—available all year round. And Mafco cold stores vegetables like potatoes and cabbage.
- Mafco is brand marketing foods, to give the housewife a standardised product at a fair price. So Bombay broilers are cheaper than Delhi's, in spite of higher feed prices in Maharashtra.
- Mafco has entered a field where no private or public sector unit has dared to tread. Our turnover has risen from Rs. 53 lakhs in the first 15 months to Rs. 1.32 crores in the next year, and is expected to increase to Rs. 3 crores in the coming year. But Mafco's real success is to be judged with the growth of its frozen food markets in Maharashtra. Because that makes new markets for the farmer, and provides quality foods at a reasonable price to the housewife.

MAFCO

Mafco brings thought to food marketing.

LINTAS-MAFCO. 10-139

WORLD MONETARY REFORM

Floating All Round

(From a Special Correspondent)

THE deliberations of the IMF's Committee of Twenty on international monetary reform ended abruptly last week without producing the expected package of reforms to replace the Bretton Woods system which had determined international monetary arrangements till May 1971. That the Committee would not be successful in achieving the ambitious objectives set for it by the governing board of the IMF had become evident well over a year ago. What was not expected was that the Committee would produce a package of mini-reforms blatantly partisan in favour of the developed countries. On most of the important subjects like the exchange rate regime, the role of gold and the SDRs, and convertibility of national currency holdings, the Committee has either proposed half-hearted solutions or altogether evaded the central issue.

Successful Propagation

The reason for this appears to be the successful propagation of the idea by the Committee's subordinate body, the Deputies of the Committee of Twenty, that basic solutions to international monetary problems have to emerge out of an evolutionary process spread over a long time. If this were so, how was it that the Bretton Woods arrangements, which sustained the international monetary system for over two decades, could be framed after much shorter deliberations? In any case, why did the Committee take such a long time to realise that monetary reform discussions could not be expected to yield results in just two years.

With none of its developed country members interested, each one for a different reason, in a return to the so-called fixed but adjustable parities, the Committee has been forced to accept the inevitability of living with a floating exchange rate system. It has, therefore, proposed to minimise the evils of such a system by stressing the need for establishing "guidelines for the management of floating exchange rates". The word 'guidelines' suggests that the IMF will release a long list of 'rules of the road to be observed by countries floating their currencies so that their 'dirty' floats do not jeopardise the interests of other countries. The proposed new Super Board of the IMF would do the job of policing erring members. But such policing is beset with innumerable practical difficulties and it would be difficult to prove that any member has violated the guidelines. Moreover, since what is proposed to be done is to prepare only a set of guidelines and not rules, the guidelines will lack the force of clearly-formulated rules whose violation will be met by appropriate sanctions.

The floating regime was forced on the world in the first instance by the US with the intention of depreciating the exchange parity of the dollar *vis-a-vis* other currencies in order to gain a trade advantage. Subsequently it became popular with other countries as they saw no other way of coping with their balance of payment problems, made unmanageable by massive speculative transactions in different currencies at the slightest sign of their weakening. It is an irony of the situation that the French, who were and still profess to be most ardent supporters of the par value system, have relied heavily on the floating exchange rates regime to solve their largely oil-induced balance of payments deficits.

Real or Apparent Advantages

Whatever the real or apparent advantages of a floating regime, the Committee of Twenty should have pondered over the possibility of a world recession largely due to floating exchange rates. Faced with the serious implications of the oil crisis, many countries are likely to be tempted to flout the rules of the road in managing floating rates and pursuing beggar-thy-neighbour policies. Countries vie with each other in making statements about the necessity of international co-operation in monetary and trade matters so long as the going is reasonably good or at least is not particularly difficult. But once more and more national governments face difficult external payments situations and are forced to resign, as has happened in Italy, the law of the jungle will tend to prevail — as shown by the experience of the inter-war period. The progress made by economic theory since the 1930s and the many seemingly powerful tools which economists have added to their kit are not good enough reasons to be complacent about the current international economic situation.

It has been generally accepted that it would be unwise to solve the problem of massive oil-induced deficits through exchange rate and trade policies aimed at curbing imports or stimulating exports. Such policies pursued by one country only create difficult situations for other countries without solving the basic problem. Since the oil exporting countries cannot possibly use even a small part of the additional funds accruing to them as a result of the increase in oil prices for stepping up their imports, the oil-induced global trade deficit would remain unchanged whatever the rest of the world does about it. Given this fact, no single country can hope to improve its payments position by recourse to floating exchange rates. It may, therefore, be preferable to return to a regime of par values which would make the international policing job a more manageable and meaningful proposition for the IMF.

Much Energy to No Purpose

On the ill-fated SDR-aid link, the developing countries have so far expended much energy to no purpose. So long as the floating rates regime continues, the world community need not bother about augmenting global liquidity through the creation and allocation of SDR, as the markets take care of themselves without any need for official intervention. Moreover, the scale of official intervention required to smoothen out undue fluctuations in rates would not demand command over reserves much larger than those that are at present at the disposal of the national authorities. Thus since no additional SDRs are going to be created as long as the floating regime continues, it is meaningless to harp on the so-called SDR-aid link.

The developing countries, and India particularly, which have wasted so much energy on this issue, adopted a wrong strategy in not opposing floating rates which are at the very root of the matter. Another blunder committed by some of the developing countries was

to insist that the aid-linked SDRs, instead of being channelled through international development financing agencies like the World Bank and the IDA, should be allocated to the developing countries in relation to their quotas in the IMF. In other words, these countries were in effect asking for additional allocations of SDRs that would not be necessarily used for developmental purposes. A number of developing countries, including India, have shown a penchant for wasting resources for non-developmental purposes. What is the assurance that the additional SDRs would not be similarly wasted unless their utilisation is tied to justifiable purposes by routing them through one of the international development financing bodies?

All the same, just to assuage the

Institute for Social and Economic Change

BANGALORE

Applications are invited for following posts :

1 **Senior Fellows** (3) (Two in Economics, and one in Demographic and Communication Action Research Unit).

2 **Fellows** (7) (one each in Economics, International Trade, Development Administration, Education, DCAR, and *two* in Agricultural Development and Rural Transformation Unit).

3 **Research Associates** (4) (one in ADRT, one in DCAR and two in Malaprabha-Ghataprabha Project Unit).

4 **Research Analysts** (2) (one each in Public Enterprises and ADRT).

5 **Technical Assistants** (5)

6 **Field Investigators** (2)

Senior Fellow is equivalent to University Professors, Fellow to University Reader, and Research Associate to University Lecturer.

Pay Scales :

Senior Fellows : Rs 1,100-50-1,300-60-1,600

Fellows : Rs 700-50-1,250

Research Associate : Rs 400-40-800-50-950

Research Analysts : Rs 325-15-475-20-575

Technical Assistants : Rs 210-10-290-15-320-EB-15-425

Field Investigators : Rs 175-10-275-15-350-EB-20-450

Allowances as admissible in Bangalore University.

Qualifications for respective Posts :

1 Ph D in Economics with 10 years teaching/research experience.

2 Ph D (or equivalent published work) in subject concerned with five years teaching/research experience. For Fellow's post in DCAR, experience in communication work desirable.

3 Ph D, or M A, I or II class, (or post-graduate training in case of DCAR post) in subject concerned with 3 years teaching/research experience. For one or two posts, persons with I or II class B Sc (Ag) and M Sc (Agl. Econ) with experience in farm management and agro-economic analysis, and who can speak and write Kannada preferred.

4 M A, I or II class in subject concerned with one or two years research experience.

5 M A (Econ.) or M Sc (Stat.), I or II class with experience in collection of data and processing. For two or three posts, those who can speak and write Kannada preferred.

6 M A, II class in Econ./Sociology/Stat. with field work experience. Lady candidates who can speak and write Kannada preferred.

Age Limit : Not more than 30 years for posts 5 and 6.

Selection Committee may relax qualifications in exceptional circumstances and can also consider suitable candidates from outside the list of applicants. Persons with I class M A with recognised published work and teaching/research experience would also be considered for posts of Senior Fellows and Fellows. A higher start may be given to those who are exceptionally qualified.

CANDIDATES FROM SCHEDULED CASTES AND TRIBES ARE REQUESTED TO MENTION THE FACT IN THEIR APPLICATIONS.

Applications with details of age, qualifications, publications, and two academic references, should reach Registrar, **Institute for Social and Economic Change**, Post Box 5120, Carlton House, Palace Road, Bangalore 560 001 not later than July 15, 1974.

M R Koneri Rau
Registrar

strong feelings of some of the developing countries both the US and West Germany, which are strongly opposed to any SDR-aid link, agreed to a compromise solution of referring the issue to a new joint IMF-IBRD Committee. However, since the US and West Germany are unlikely to revise their basic position of opposition to any SDR-aid link, the issue may be considered as good as lost.

On the question of gold, the Group of Ten decided that gold could be used as collateral by countries for their international borrowings. That this small group of developed countries arrived at this important decision just a day before the meeting of the Committee of Twenty shows that the developed countries will increasingly try to settle their differences within their own small group and arrive at solutions to international monetary problems by bypassing the newly constituted IMF Super Board. The more noise the developing countries make in the discussions on monetary reform, the more inclined will the developed countries be to settle issues related to monetary reform outside the IMF — as they used to do until the ill-fated Committee of Twenty was appointed. The US, which had taken the initiative in favour of inclusion of developing countries in the reform discussions as a counterweight to the European countries, has shown sufficient irritation with them and has developed its own techniques of dealing with its difficult European colleagues without help from the developing countries.

From the viewpoint of the developing countries the most damaging development is the raising of the interest rate on SDRs to 5 per cent from its present level of 1½ per cent. Along with this the IMF charges on borrowing by member countries will also go up sharply. The IMF is no longer a source of soft loans to be used for meeting temporary balance of payment difficulties. Since most of the developed countries have access to sizeable central bank swap facilities, they are indifferent to the terms at which IMF finance is to be made available to the vulnerable oil-importing developing countries.

It is small consolation to the developing countries that a new IMF facility is to be created, under which funds will be made available upto even 8-10 years. Further, even if additional SDRs are eventually allocated to the developing countries under some variant of the aid-link scheme, use of these SDRs for developmental purposes would cease to be an attractive proposition so long as the interest rate on SDRs continues to be much higher than that which the developing countries now pay on IDA borrowings or on other concessional loans on a government-to-government basis.

In the bargain the developing countries have also lost on another count as they have not been successful in their effort to secure fresh creation and allocation of SDRs after the first three years. The present world holdings of SDRs are insignificant in relation to total global reserve holdings, composed of reserve currencies, gold, reserve positions in the IMF and SDRs. Hence the SDRs will not qualify to become the basic reserve asset as gold was until the middle of 1971. Till such time as SDRs are created regularly and their supply increased sufficiently, the SDR will not become the basic reserve asset of the world monetary system and would continue to be only an accounting unit without being used for the purposes of convertibility which, after all, is what qualifies as asset to be the basic reserve asset.

Valuation of the SDRs in terms of a basket of 16 prominent currencies of the world is only a minor aspect of monetary reform as it merely defines a unit of account of the new system. The only positive feature of the delinking of the SDRs from gold is that it would increase the medium of exchange role of the SDRs whereas its link with gold had made SDRs as immobile as gold because of the wide difference between the official and the market price of gold. Now the value of SDRs will float with that of the 16 currencies that will determine the value of the SDR on a day-to-day basis. With the SDR also now floating along with all the currencies and the gold's collateral value floating along with its fluctuating market price, the world monetary system is fully ushered into a floating regime all round. And what little evidence is available indicates that a floating regime does not augur well for the wellbeing of the international monetary system.

NEW DELHI.

Sell-Out on Aid

B M

THE Economic Affairs Secretary in the Finance Ministry looked very pleased with himself on the results of his visit to Paris from where he returned with the promise of $ 1,400 mn of gross foreign aid from the Consortium of Western aid-givers. This is in fact the largest ever sum of aid offered to us in our long history of dependence on foreign aid. Indeed our dependence on aid will be significantly stepped up in the very first year of the Fifth Plan which aims at the goal of net zero aid at the end of the five-year period. And it is a further comment on the politics of our planning that pointing to this blatant contradiction is treated as sheer impertinence. On the contrary, the Paris meeting is treated as a great triumph for our skill in aid diplomacy, a triumph over all sceptics who had thought that the recent nuclear explosion would result in an aid squeeze.

For all this self-congratulation, the government is still clearly unsure that the promised aid will rescue the country from its economic plight and that the tight balance of payments position will be made any the more manageable. Calculations show that a substantial gap would remain between foreign exchange earnings and the cost of imports after all aid, including that from the socialist bloc and the oil exporting countries, has been taken into account. The way things are going, the bill for maintenance imports, apart from food imports, would be around Rs 3,000 crores. Of this, crude oil and petroleum products would account for Rs 1,150 crores, fertilisers and raw materials for fertiliser manufacture Rs 550 crores and other imports Rs 1,300 crores. Though government circles are very reticent about their intentions on foodgrains imports, on the basis of the very low procurement total imports will very likely be well above 4 mn tonnes — despite the considerable dismantling of the public distribution network. This would involve an outlay of another Rs 600 crores. Export earnings, on the other hand, are expected to be about Rs 2,750 crores. The trade gap of about Rs 850 crores also does not take into account imports required for specific projects.

Of the total gross aid pledged by the Consortium, $ 800 million will be for financing maintenance imports and

debt relief. Since the repayment liability for the current year is about $ 675 mn, net non-project aid during the current year will be only $ 125 mn. The socialist countries do not usually extend non-project aid. Oil credits secured so far aggregate about $ 200 mn. There thus remains a trade gap of about $ 700 mn — assuming that imports will remain pegged at levels presently envisaged and that further deterioration in the terms of trade can be effectively checked. About one-half of this gap will be covered by drawals from the IMF and other sources will have to be tapped to cover the remaining gap. The 'generous' offer by the Consortium does not, therefore, warrant a let-up in the search for more aid, especially since IDA aid forms a major portion of the gross aid pledged by the Consortium and replenishment of the IDA's funds remains somewhat uncertain. Further drawals from the IMF, although these would involve questioning and supervision of our economic management by the IMF, eager anticipation of the visit by US Secretary of State Henry Kissinger which might yield something more than the paltry $ 75 mn so far offered by the US and further drilling for credits from the oil-exporting countries — these are therefore courses 'under active consideration' of the government.

We are back to the situation of the mid-sixties, despite the strong revulsion to the rupee devaluation that had had to be carried through then under pressure from the aid-givers. If in the meantime, the government had for some time envisaged dispensing with foreign aid altogether (except for claiming its right to the transfer of resources under the auspices of the international institutions on suitable terms and conditions), it was because net aid had considerably shrunk anyway. But the failures on the domestic front, particularly in the food and energy sectors, have dragged us back to the easier option of depending on more and more foreign aid. Nor is this dependence counter-balanced by any attempt to save on oil or food imports. Within days of receiving the assurance about the Consortium bounty, the Finance Ministry allocated an additional Rs 150 crores for oil and oil products imports, supposedly to avoid shortages in their supply. Following from this step, efforts to save on their consumption and to switch over to other forms of fuel, particularly coal, will now receive even lower priority.

The current stress on non-project imports as the means for keeping the economy afloat, and the relative neglect of project aid, moreover indicate a fundamental feature of the official approach to the economic situation. With rampant inflation and shrinking resources for development, the projects included in the Plan have lost all significance and interest. Thus the most important decision taken by a full meeting of the Planning Commission early this week was to explore for heads of expenditure that could be axed for controlling the mounting budgetary deficit. A further cut, even in financial terms, in the Plan outlays is now casually accepted as necessary. The axe — protestations about safeguarding the core sector of the Plan notwithstanding — will fall as much on the crucial investment goods sector as on the non-core sector. Since, in any case, not much preparatory work has been done on any excepting a few projects, shortfalls in their execution can hardly be avoided. The project aid of $ 600 million is therefore regarded as so much extra in the kitty. Only a small part of the project and, from the Western Consortium as well as from the socialist countries, is expected to be utilised during the year. No doubt, the Finance Ministry will seek ways of using a part of the project aid to finance non-project imports.

The thrust of economic policy that emerges is one of no growth in the name of containing inflation. A concomitant consequence will be a recession in production and developmental activity which will further strengthen 'the case' for a 'firm' policy towards wages and DA relief. The burdens of the crisis in the economic system is thus sought to be passed on to the shoulders of the working class.

SCIENCE AND TECHNOLOGY

A Department in Search of a Role

R S Ganapathy

THE Department of Science and Technology (DST) has completed three years of existence. Its latest annual report describes its activities during the last fiscal year. In it, there is a reiteration of the Department's role in the planning, organisation, management and co-ordination of science and technology in the various sectors. This all encompassing concept of its role, while it looks elegant on paper, has no basis in reality. The DST's activities do, of course, have to span all these functions to some extent. But the fact is that the other major scientific organisations, such as the Department of Atomic Energy, the Department of Space, and the Defence Research and Development organisations, are all independent of the DST. They derive their budgets directly from Parliament, and it is the Ministry of Finance and the Planning Commission which largely decide on the resource allocation among the various ministries.

The DST has little share in decisions on resource allocation even among the scientific departments. It is, therefore, not possible for it to play the more complex role assigned to it — of planning, co-ordinating and monitoring developments in Science and Technology — without the executive powers that must precede it. At best, it can be an agency where information is collected and disseminated for analysis and which tries to identify the broad long-term research needs and to avoid duplication of projects. It could thus perform a useful staff function for the Cabinet. The Canadian Ministry of Science and Technology, which has an analytical and service role rather than executive responsibility, performs such a function.

But even to play such a service role effectively, the question of whether we can plan for science and technology has to be satisfactorily resolved. True, science and technology are instruments of development, but the magnitude and mode of deployment of these instruments in the various sectors such as agriculture, industry, etc, would depend upon the sectoral goals identified in the socio-economic plan. Once these are identified, the science and technology programmes can be made to fit the sectoral programme. A cross-impact matrix analysis would reveal the nature of the sectoral science and technology programmes, which would then suggest ways of co-ordination, of sharing information, etc. Apart from this, there is no need to prepare an overall Science and Technology Plan. Nowhere else in the world is a national Science and Technology Plan prepared.

Nor has anybody found it necessary or feasible to create an executive agency for it.

Little wonder, then, that the National Committee on Science and Technology (NCST), a unit of DST, after preparing the 'Plan' feels somewhat at a loss as to what to do about it next. Its plan is, at best, only an exercise. It is merely an aggregation of a series of R and D proposals, unconnected to any clear socio-economic goals of production and distribution of goods or income. Moreover, as it is only an R and D plan, it fails to look into problems of investment or of the other forward links of an innovation chain. The user agencies such as the states and the regional bodies are either not associated with, or are indifferent to, the Plan. In any case, they are not funding the projects. The institutional locations of many of the projects are the existing R and D laboratories, which fact will, no doubt, maintain the distance between the R and D scientist and the user — already a prime inhibiting factor in technology transfer. To take just one example, the development of 500 MW power systems ought to be the responsibility of the Ministry of Irrigation and Power, the Ministry of Heavy Industry, Bharat Heavy Electricals, etc. Yet, whereas these agencies have their own separate programmes, DST is funding a 500 MW power project with a minimum of collaboration from the user agencies such as the Electricity Boards. It should not be surprising, therefore, if the investment in this project fails to yield the desired results. Again, employment of nearly 12,000 scientists and engineers is made out to be an objective. But such an objective could be well served by projects undertaken by user agencies and executive ministries.

The Plan is silent on the utilisation of the existing science and technology resources that have been built up over the last 25 years. It elaborates on only the new projects. The Plan is similarly weak in developing programmes for the improvement of rural life — though ostensibly this is a primary goal of our socio-economic planning. A few ideas, like gobar gas plants, are being mentioned; but no integrated schemes as such are in the pipeline. The supply of scientific manpower depends mainly on our universities and technical institutions; yet due to local pressures, these are being expanded rapidly and arbitrarily. The resultant unplanned increase in manpower and the deterioration in the relevant skills will affect the Science and Technology Plan but the DST is helpless to even conceive a co-ordinated plan of action for this problem.

That the benefits of the investments under the Science and Technology Plan will accrue only in the Sixth Five-Year Plan and beyond, is glossed over in the annual report of the DST. Moreover, the anticipated benefits may not relate to the social needs of the future. The DST's Committee on futurology is mapping out only the technological future, not the social future. This seems to be a plan of scientists, by scientists, and for scientists. Others are expected to accept it without raising any serious doubts.

In spite of all these defects, the Plan is a pioneering attempt to forge some links between the social objectives and particular R and D projects. However, in view of the above problems, can NCST monitor the plan? How must it see its future role? The annual report gives no clue to any thinking on these basic problems. Compared with the NCST, the National Committee on Environmental Planning and Co-ordination (NCEPC) has clearly defined roles in research, promotion of environmental quality and regulation. It is evidently examining the environmental impact of major projects. But environment is not a matter of science and technology alone; there is need for a Ministry of Environment responsible for regulatory and promotional functions.

There are a few assorted organisations under the executive control of DST. Among these are Survey of India, National Atlas Organisation and some institutes. Why they have been placed under DST is not clear. They look like related appendages and distract from the main task of the Department.

The National Research Development Corporation too has been given a new lease of life under DST. This organisation for technology-transfer would be more effective under the Ministry of Industrial Development. A number of new organisations like Cryogenic Corporation, Instruments and Machinery Development Corporation, Electronics Components Unit, etc, are assigned to the Fifth Plan. While these public sector companies contribute to the empire-building of the DST, they could be more rationally placed under the Ministry of Industrial Development. Similarly, new agencies for the ocean sciences, technology transfer, information systems, etc, are to be created. In these areas, the following agencies are already operating: National Institute of Oceanography, NRDC, and National Scientific Documentation Centre. What will the new agencies be doing? Similarly the role of the Monitoring and Evaluation Organisation is not described in sufficient detail. The failure of the Monitoring Divisions of the Planning Commission and the Bureau of Public Enterprises should serve as an eye-opener to the DST. It should know that without executive funding power and accountability, "monitoring and evaluation" mean nothing.

The massive increases in DST's budget anticipated in the Fifth Plan appear too ambitious. The organisation simply does not have the capability to grow so fast. What will follow inevitably is the surrender of budgetary provisions. The following figures are revealing:

(Rs in lakhs)

	Budget Estimates 1973-74 (made in January 1973)	Revised Estimates 1973-74 (made in September 1973)
DST Secretariat	32.35	21.49
NCST	27.92	19.96
NRDC	22.00	1.77
NCEPC	13.96	7.95
Survey of India	965.00	803.00

Such massive reduction in the mid-year estimates (actuals at the end of the year are likely to be even lower than the Revised Estimates) can only indicate the slow growth potential of the organisation. At the present rate of inflation, it would mean that in physical or real terms, the outlay and progress would be considerably lower.

What DST can do is to aim at a role similar to that of its Canadian counterpart. It ought to make no pretensions to executive powers, but ought to concentrate on developing user funding of research, on identifying basic and strategic research programmes, promoting the needed managerial and organisational changes, encouraging higher public accountability, and operating an information system in science and technology. At any rate a high-level body on science and technology should stop trying to delude itself and others by frequent use of terms like "maximum extent", "best", "utmost effort", "sustained endeavour", etc, in its annual report. A less pretentious definition of objectives and roles will result in a more meaningful programme for the DST.

GUJARAT

Landed and Landless in Surat District

Virtual Class War

(From a Special Correspondent)

AGRARIAN relations are to be understood for the purposes of this article as the relations between landowners and agricultural labourers. But since there are also owner-labourers or labourer-owners, how are we justified in dividing the population between owners and labourers? It may well be argued that as there are differences of attitude, value, life-style, aspiration, etc, between the 'pure' labourers and the owner-labourers, they cannot be included in the same class.

This objection is valid in many areas of the country but it does not apply in south Gujarat where the landowners and the agricultural labourers are distinctly separate entities. A sort of laboratory situation exists in south Gujarat. But as tribal-non-tribal relations are a complicating factor in south Gujarat, the observations here are confined to the plains so excluding the hill and jungle tribal areas. Of the three administrative districts of south Gujarat, Surat, Bharuch and Valsad, we will concentrate on Surat, particularly during the period of severe political agitation between November 1973 and April 1974. The landless agricultural labourers of Surat district are known as Halpatis. They were formerly known as Dublas. (A good account of their position and relations with the landowners is given by Jan Breman, "Mobilisation of Landless Labourers: Halpatis of South Gujarat", *Economic and Political Weekly*, March 23, 1974, pp 489-96.) Through customary practice supported by the British administration the Halpati was a serf. After Independence the serf legally became a free man. But the old attitudes of the landowners persist. Their expectations of the Halpati continue to be as of old times. The administration also generally looks upon the landowners more favourably than upon the labourers.

Before we deal with the relations between the two classes it is necessary to emphasise that there has been a general change in the character of agriculture in the district since Independence. Agricultural production is no longer mainly for local consumption. It is now market-oriented. The crop pattern has changed. Agriculture in the area has also become more intensive largely due to canal irrigation. These changes have added the elements of industry and commerce to agriculture. Agriculture has also become more capital intensive and less labour intensive, thereby reducing the employment opportunities of unskilled manual labourers such as the Halpatis.

These changes have hit the agricultural labourer directly and harshly. In the absence of alternative employment he has become more open to exploitation in spite of the time and wage fixations by the government. The legislation regarding agricultural labour recognises the change in the nature of the relationship between landowners and labourers but is of no use to the latter as it has never been enforced. Some of the labourers feel that the old system of payment in foodgrains at least provided them with enough to eat; the meagre wages do not do even that.

But generally the change in the nature of agriculture has made the agricultural labourers realise their position as sellers of labour power to the landowning class. Occasionally, however, this employer-employee relationship is side-tracked by caste consciousness which is still an important element in south Gujarat and elsewhere.

Meanwhile, the landowning class has changed its values and has become much more calculating. The general bemoaning of the decline of sincerity and warmth in behaviour between relatives and between castemen and in the hospitality and generosity of the rural rich is evidence of the change in the attitudes of the landowning class. Butter milk is no longer consumed only at home but is sold in the villages and the farmers are no longer generous with their sugarcane, jowar, wheat, bananas and mangoes. They want to earn every paisa from their crops and they grudge inviting even their own relatives to enjoy the first batch of each seasonal crop. It was customary to invite relatives and friends in the *kolu* season (season for making *gur*), in the jowar season for enjoying the *ponk* (a green tender jowar preparation) and in the mango season. Now the complaint is that this is not done or is done grudgingly. But this is not because the landowners have become misers but because they have become more calculating.

In fact, the landowners have become conspicuous consumers. They spend more on others than in the past. But the 'others' have changed and also the occasions. The others are now those who are likely to be useful in buying and selling (businessmen and industrialists), in procuring fertiliser and credit (government officers and other influentials) and in aiding their illegal and illegitimate activities (lawyers, tax experts and other such 'useful' persons). In addition to these useful people there are yet others, connections with whom are supposed to be prestigious, such as professors, writers, journalists, etc. For instance, the landowners might keep a medical general practitioner as a retainer, but they will go to the consultant in the city even for minor ailments. It is more prestigious to do that. It should be noted that all these others are urban dwellers and outside the landowners' immediate environment. All these people also realise the usefulness of the landowners to them.

As for the agricultural labourer, the landowner expects from him the efficiency of the capitalist system but continues to behave towards him in a feudal manner. The landlord expects from him the same servitude and submissiveness as of a serf. These dual expectations — capitalist and feudal — are demanded of each group below one's own in the hierarchy. In this doubly oppressive situation, the lowest groups in the traditional hierarchy suffer the most. The Halpatis as a caste are in that position and so are the other Scheduled Castes and the tribals. Trouble arises when these oppressed groups in their turn begin to expect the relatively egalitarian modes of social behaviour of the capitalist society from the groups which are economically better off. Such tension leads to caste or class conflict, depending on how you perceive the confrontation. The Halpatis or Dublas are in a particularly exposed position as, at the moment, they have no caste or class allies to mitigate their oppression or to help them fight against it. The Halpati-landowner relationship is a pure case of the landless agricultural labourers' relations with the landowning group or an employee-employer relationship.

This relationship has gradually developed into a class struggle since 1947. And in the period, November 1973-April 1974, this struggle erupted in virtual sporadic class warfare. The landowners have been organising themselves for several decades. The token tenancy legislation of 1937 and the lip sympathy paid by the Congress to the Halpatis and other landless labourers were among the factors which convinced the landowners of Gujarat of the need for political and economic organisation to protect and fight for their interests. In 1952 Bhailalbhai Patel organised the Khedut Sangh to oppose land reform legislation. In 1960 he organised the Swatantra party. In 1968 the kheduts (farmers) organised the Khedut Mandal. In 1973 the Khedut Samaj came into existence. A history of these organisations would be a very illuminating study. But for our present purpose it is enough to note that while supporting Congress in general the landowners felt the need for their own separate organisation.

The kheduts have always opposed all land ceiling legislation. When the Congress government in Gujarat introduced a bill in 1973 to reduce the land ceiling, the kheduts of Surat district took the lead in organising the agitation against it. They marched from Bardoli to Gandhinagar, Gujarat's capital, carrying on propaganda against the ceiling bill all the way from Bardoli to Gandhinagar. They also sent their children to Delhi who went in procession to the Prime Minister to submit a memorandum against the bill. The farmers of Surat district, led by those from Bardoli, also organised gheraoes of Congress legislators from the district. They went in their hundreds in tractors, trucks and cars to the houses of the MLAs and sang bhajans for days and nights to persuade them to resign. None of the MLAs resigned.

The bill was ultimately passed and only recently it received the consent of the President and is now an Act. After the bill was passed the farmers took a pledge that no land will be surrendered under the Land Ceiling Act. One leader of the Khedut Samaj was, however, more to the point when he said at a public meeting that the Act would not be implemented "as Congress governments do exactly the opposite of what they profess".

In the meanwhile, the Khedut Samaj has organised 'patrol squads' in 200 villages in Surat district to face any eventuality. Surat's landowners have also organised a Sardar Sena for crop protection. Many licences for firearms have been issued. It is reported that many landowners also possess illegal arms. As reported in the landowners' *Patrika* (Bulletin), these arms are being sold at Vapi at prices ranging from Rs 250 to Rs 1,750. Vapi is the railway station for Daman, the Centrally administered territory from where the arms are smuggled in from abroad.

Another agitation was launched in December 1973 against the government levy on paddy. The levy was not a new measure and previous Congress governments had also been collecting the levy. Why then the agitation this time? Was the measure unjust or unfair and the economic burden on the farmers too heavy?

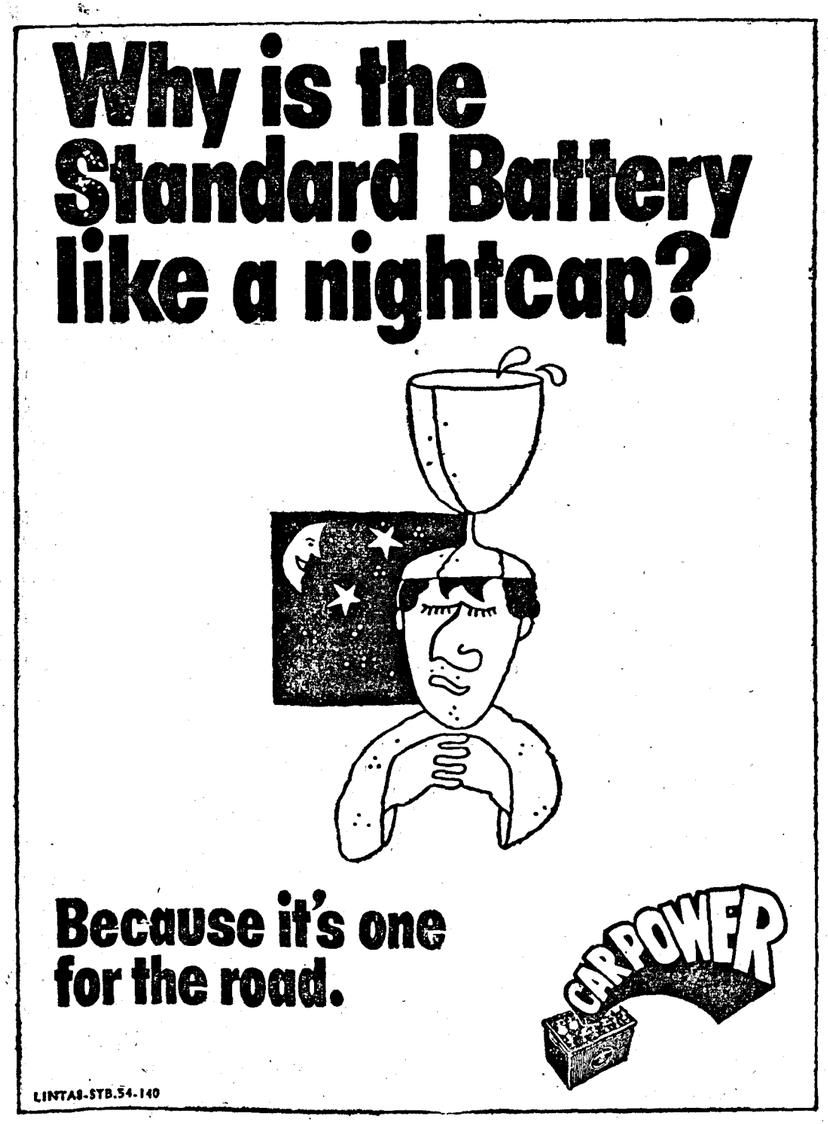
Previous governments had a flat rate of levy. In 1973 the Chimanbhai Patel government graded the levy according to the type of irrigation, the agency of irrigation (private or government) and the size of the holding. In addition, concessions were given for damage or failure of crop. In 1973 a concession of 25 per cent was given to all farmers because of crop damage due to pests. Leaving aside these concessions, how much would the farmers have to give according to the graded levy fixed by the government?

There are 13 talukas in Surat district and about 70,000 farmers grow paddy. Out of these, all those who own less than 0.35 hectares were exempted from the levy. Thus, only 27,000 farmers out of 70,000 were liable for the levy. Of these 27,000, the smaller farmers would have to give less than the bigger ones. Very roughly, the farmer owning 0.35 hectares would have to give up about eight kgs out of his estimated average production of about 260 kgs. The bigger farmers would be levied at a higher rate, though the average rate of levy would still be very low — around 2.5 per cent. So it can be seen that the paddy levy was by no means unjustly heavy.

It should be noted that in only three talukas — Bardoli, Kamrej and Palsana — did the kheduts start and continue the levy satyagraha. The satyagraha was not resorted to in the adjoining Valsad district which produces a larger quantity of paddy than Surat district. How many in the three talukas were affected by the levy? Of the 13,000 farmers growing paddy in the three talukas, only 6,400, i e, about 50 per cent, were liable for the levy. They were the ones who agitated and offered satyagraha. These farmers were also the ones who had benefited the most from irrigation, being under the direct command area of the Ukai canal which came into operation at the beginning of 1973. It is clear that these rich farmers were not willing to give up any of their gains.

They created a fund to keep the smaller farmers on their side and also used social pressures. If these blandishments and pressures were not heeded, the smaller farmers were threatened with violence if they thought of giving the levy. All this was, of course, done in the name of a non-violent satyagraha.

The levy satyagraha was a major show of strength by the dominant class. It was meant to demonstrate to the government once again that the interests of the rural rich could not be lightly crossed. The satyagraha was withdrawn when it became clear that the government was not serious about implementing the levy on paddy. At the reception given to the satyagrahis released from jail, the President of the All-Gujarat Khedut Samaj said that the most important gain of the satyagraha was that the government had been made to negotiate with the Samaj and recognise it as the representative body of the farmers of Gujarat. At the same meeting, the leader of the Bardoli Taluka Samaj said that they would soon launch a programme of non-payment of taxes.



All this is evidence of the rich agricultural interests coming out as a distinct and powerful political force. So far these interests had backed the Congress and been completely loyal to it. But with the introduction of even such token measures as the land ceilings and tenancy bills and the bill for minimum wages for agricultural labour, the Congress could no longer be fully relied upon. So the emergence of a distinct farmers' organisation.

All the three major political parties in Gujarat, the Congress, the Congress-(O) and the Jan Sangh, want to please the kheduts and have no intention of coming to grips with them. This means that party politics in rural Gujarat operates within the ambit of the landed interests. Manoeuvring within and between the political parties, the skill and efficiency of party organisation, the electioneering skills, etc, all work within the shell of the landed interests. All the three major parties and the factions within them want to derive strength from the same source.

None of these three parties nor any other parties, for that matter, have bothered about the agricultural labourer or Halpati. Gandhian or Sarvodaya workers were the only ones involved with the Halpatis. Efforts to prepare the Dubla or Halpati for the 'new society' were started by the Gandhians as early as the 1920s. The Gandhians made a very innocent beginning. They

started a night school in a village to make the Dublas literate. The local landowners opposed even this limited step and the Gandhians had to give up their literacy work in 1927 when Sardar Patel took the position that the alien government must be removed before taking up such issues as literacy among the Dublas. It might or might not have come to the ears of the Sardar, but one of the Dubla leaders is reported to have stated then: "Our *Angrej* (Englishmen) are the Parsis and the Banias". He was referring to the landowners and the moneylenders. The literacy work among the Dublas was given up so that there would be no cause for conflict with the landowners and moneylenders.

But forced ignorance was not enough. Repression followed. During the first Congress ministry there was a police firing on the Dublas. At about the same time the Congress government appointed a committee to inquire into the conditions of the Dublas. Its report was never published. It was only after 1947 that some Sarvodaya workers established the Halpati Seva Sangh. It was only in the 1960s, after several strikes by the agricultural labourers and prolonged pleading by Sarvodaya workers, that a minimum wage of three rupees for an eight-hour day was legislated.

There is, however, no machinery for *enforcing this* law and the landowners often pay less than the three-rupee wage which was fixed in the 1960s. Another method of harassing the Halpatis of Surat is to bring in labourers from Khandesh. The crop pattern has also been changed to items like bananas and sugarcane so that less labour is required. Thus, along with his status of a free wage labourer, the Halpati has also acquired the freedom to be unemployed and the freedom to starve.

Some Halpatis have resorted to minor theft of crops, often to ward off starvation. The kheduts have responded by employing Rakhas or crop protection men. These Rakhas not only protect the crops but also rape unprotected Halpati women. After all this is part of tradition. The high caste landlord has never worried about the modesty of the low caste woman. In any case, what modesty does she have!

The Sarvodaya leadership of the Halpati Seva Sangh has reacted to this oppression in expected style. It has suggested to the government that the latter should create employment for the starving Halpatis. And it has advised the Halpatis not to be impatient with their starvation and to adhere to the Gandhian path.

Despite the Gandhian pleadings of the Halpati Seva Sangh, the first person to be attacked by the kheduts, when the leaders of the Khedut Samaj were arrested on January 3, 1974 for agitating against the levy, was Arvind Desai, the Secretary of the Halpati Seva Sangh at Bardoli. They dragged him out of his house, stripped him and beat him. They pulled out all the belongings from his house and burnt them. All in the name of non-violence! Clearly, in spite of its Gandhian ideology, the Halpati Seva Sangh is considered to be a troublesome obstacle by the kheduts in their efforts to destroy the solidarity of the Halpatis.

The news of the attack on Arvind Desai spread among the Halpatis and they retaliated. They damaged and destroyed the crops, tractors, scooters and bullock-carts of the kheduts and beat up some of the khedut leaders. The fiercest face-to-face encounter between the Halpatis and the kheduts was in the village of Malekpor in Palsana taluka. The Halpatis had axes and other such weapons while the kheduts had guns. In the encounter, khedut bullets injured three Halpatis. But they did not disperse. They fought back and killed one khedut on the spot.

Other such encounters between the kheduts and the Halpatis continue to take place. In the first week of April near a village in Kamrej taluka a Halpati boy was beaten by a Rakha for stealing sugarcane from a field. The boy was brought to the village and he was beaten again by the owner of the field. The Halpatis collected immediately and beat up a number of kheduts and damaged their property. The Halpatis from the surrounding villages also came up and surrounded the village. Nobody was allowed to go out of the village or enter it till 1.30 at night when a police party arrived and cleared the blockade.

Virtual class war is the reality in the district. And the conflict is becoming sharper as the agrarian structure gets transformed and the Halpatis and kheduts see each other quite clearly as opponents. This state of class war has not been created by the communists because none exist in the district.

KUALA LUMPUR

China Confuses Communists

Harish Chandola

SOME serious incidents took place in Malaysia on the eve of the visit of the Prime Minister, Abdul Razak, to China and immediately following his return, which political observers interpret as pointed reminders by the insurgent forces that political activity or struggle in Malaysia can never be controlled or guided by China. Because Razak has initiated peaceful, normal relations with China, it does not follow that the forces conducting an armed struggle for "the national liberation of Malaya" during the past 30 years, will now lay down their arms and change the nature of their struggle by seeking power through elections. Though the Malayan Communist Party is still banned, Razak on his return here from Shanghai on June 2 announced at a public rally that those fighting with arms would be permitted to participate in politics if they laid down their arms.

Of the two major incidents which occurred recently, in the first on May 23, 68 pieces of road-building machinery, including 18 big bulldozers valued at Malaysian $ 15 million (about Rs 45 million), spread over 40 miles of Malaysia's northern border where an east-west highway is being built, were blown up in one single operation by Communist forces. Then on June 7, the Inspector-General of Police of Malaysia, Abdul Rahman, who for nearly 30 years had worked in the Special Branch which deals with the activities of Communists and other left-wing organisations, was gunned down in broad daylight in one of the busiest parts of Kuala Lumpur while going to his office by two men who escaped.

Though the internal affairs of Malaysia can at very best be only slightly influenced by the establishment of ties with China, left-wing forces in Malaysia are suffering great discomfiture at the moment with China disregarding their opinion. And since these forces are fighting against Malaysia's ruling elements, this discomfiture is of advantage to the rulers. The left-wing forces are not entirely composed of highly politically educated and experienced persons who might not be affected by this discomfiture. Like in other movements, there are in the Malaysian left-wing movement, besides its hardcore political leadership, fringe groups in the process of receiving education. These fringe groups have come into the movement for various reasons, one of which has been the support for their movement by China, the first Asian country to lead a successful revolution. These elements are certainly going to be confused by the new attitude of China towards Malaysia. It will not be surprising to find them feeling less interested, less active and even disheartened to a point where they may even cease to stand at the periphery of the left movement where they are now. And their attitude can affect others. Consequently the left movement may experience a temporary setback. Any confusion in the ranks of this movement and any setback to it is of great advantage to Razak and other ruling leaders.

The Malayan Communist Party and its supporters have seen Razak being received in China in a manner in which very few other visiting dignitaries have been received. There were 10,000 people at Peking airport to welcome him and 100,000 at Shanghai. The streets were lined with people to greet him. The Chairman of the Communist Party of China, Mao Tse-tung, invited him for talks and talked with him for 90 minutes; the aging Prime Minister, Chou En-lai, who now feels easily tired and who on his Party's orders is cutting down his activities, not only came out to hold two rounds of talks with Razak and to sign the agreement

on the establishment of diplomatic relations, but also attended the banquet for the Malaysian leader. China received Razak with great warmth and treated him with the highest courtesy. And back home all these years the Communists in Malaysia have been calling Razak a reactionary, a follower of Western powers and the enemy of the people. Some of the Communists must now be wondering if they were right. If they were, then certainly China would not have displayed such friendship for him!

THE FOURTH ESTATE

Decorative Press Council

Nireekshak

EVER since its inception the Press Council has never had the legitimacy and, therefore, the moral sanction needed to function as a regulatory body or as an organisation charged with safeguarding the freedom of the Press. The tenure of the present Council — the second since the inception of the body — ended in September 1973 but was extended until June 30, 1974 and is likely to be further extended until early 1975. The impasse leading to the extension of the life of the present Council began when some members of the Nominating Committee — comprising the Chief Justice of India, the Chairman of the Rajya Sabha and the Speaker of the Lok Sabha — resigned shortly after the constitution of the Council in 1970, following serious criticism of the manner in which the personnel for the Council had been chosen. The government seems to have been hopeful that those who had resigned could be persuaded to relent. But when it was time to reconstitute the Council, there was no Nominating Committee. The tenure of the present Council was extended and an advisory committee of MPs was asked to report to the government about the machinery for nomination of the chairman and members of the new Council. The Press Council Act of 1965 would have to be amended to implement the committee's recommendations.

The Press Council was a non-starter because working journalists were never represented on it in adequate number and the nominations were the subject of controversy. The first Council was constituted on the basis of nominations by the Chief Justice of India, the chairman nominated by him and a nominee of the President of India. It provided representation to organisations of newspaper proprietors, editors, working journalists and Parliament, besides other people of standing. The only organisation of working journalists then, the Indian Federation of Working Journalists, resented the weightage in favour of a proprietors' organisation like the Indian and Eastern Newspaper Society and a near-defunct organisation of dummy editors like the All-India Newspaper Editors' Conference. Worse, proprietor-editors were nominated to represent working journalists. The IFWJ directed its representatives in the Council to resign even before the first meeting of the Council was called. The vacancies remained unfilled and the truncated Council jogged along listlessly until a member representing Parliament resigned to highlight the alleged high-handedness of the chairman, R S Mudholkar, a former Supreme Court Judge. Following criticism of the Council's functioning in Parliament and in the Press, the chairman resigned and thus ended the inglorious existence of the first Council.

The government felt obliged to amend the Press Council Act on the basis of advice from Parliament. After a short vacuum, the Council was reconstituted in 1970. But the representation of the Council left much to be desired. The IFWJ's panel for consideration by the Nominating Committee did not reach it in time and therefore the IFWJ did not find representation at all. The organisation styling itself the Press Association of India but representing only Delhi-based special correspondents — and better known for its real estate activities than for its concern for the profession — was treated on par with the IFWJ for purposes of representation in the Council. Since the IFWJ's panel did not reach the Nominating Committee in time, the entire working journalists representation went to the Press Association. In the result, for the second time in succession, the IFWJ went unrepresented in the Council. The second Council again had representatives of bodies like the IENS and AINEC besides the Indian Language Newspapers' Association.

The balance sheet of the Council for the years of its functioning is far from impressive. True, it has in a few cases held the denial of advertisements to some newspapers by state governments *mala fide* and underscored the principle that there should be no political or other discrimination in the matter of distribution of advertisements. It has pulled up a few editors for professional misdemeanour. But there is nothing to ensure that the state governments do not defy the Council. The Information and Broadcasting Minister, Inder Gujral, has ruled out the proposal to give some teeth to the Press Council because that might create problems!

The Press Commission, some 20 years ago, wanted the Indian Press Council to be patterned on the lines of the one in Britain. The initiative in Britain had come from the Press, but in India the Council has been sponsored and financed by the government. It cannot therefore be deemed an independent body despite a few rulings critical of the government. The Council has no moral sanction because it is not primarily a body of journalists. So far, its secretaries have been government officials or former government officials and it is likely that the next one too will be a retired or serving government official. The two chairmen so far have been retired judges of the Supreme Court.

The types of complaints made to the Press Council suggests that the state governments have scant regard for the freedom of the Press and that harassment of papers and individual journalists is all too common at the state level. Much of such harassment goes unreported to the Council because those who might like to make the complaints do not consider the body a legitimate one. The Press Council will lack legitimacy as well as credibility as long as it is a government-sponsored body without powers to compel state governments to abide by its rulings. For instance, the Council has observed that advertising matter should be distinguishable from editorial matter and that papers should declare, along with advertisements from embassies, the the amount they get paid for them. This observation was on a reference to it by the Information and Broadcasting Ministry. The marathon advertisements of a certain diplomatic mission are now formally described as advertisements but the amounts paid remain a mystery. Legislative action might be needed to enforce this requirement because newspapers do not recognise the right of the Press Council to insist on such things.

Revised Estimates of National Product, Saving and Capital Formation

Estimates of National Product, Saving and Capital Formation, 1960-61 — 1971-72; Central Statistical Organisation, Department of Statistics, Ministry of Planning, Government of India, November 1973; pp 32.

TWO and a half years after the publication of the *Estimates of National Product, 1960-61 — 1969-70* (May 1971), the Central Statistical Organisation (CSO) has released the latest estimates in its publication entitled Estimates of National Product, Saving and Capital Formation, 1960-61 — 1971-72 (November 1973). 'Quick' estimates of NNP for the year 1972-73 have also been released alongside in a cyclostyled sheet. The provisional estimates for 1970-71, which are now made available along with those for 1971-72, should have been released at least a year and a half earlier. Furthermore, figures of national product at factor cost by industry of origin for the years 1966-67 to 1969-70, which were provisional in the May 1971 White Paper, continue to be so even after two and a half years, which is indeed a matter for despair. We are also warned that due to various reasons, the present estimates of national product for 1970-71 and 1971-72 are not strictly comparable with the estimates published for the earlier years in the May 1971 White Paper. Revision of methodology in the estimates of 'Construction' and use of revised data for 'Other Services' are stated to be the main reasons for this incomparability. The continuity of the series is thus broken; but we are told that it is proposed to undertake revisions for the entire series and publish a comparable series in the next White Paper in "early 1974".

A notable feature of the latest estimates is the publication of the series on saving at current prices and gross and net capital formation at current and constant prices for the years 1960-61 to 1970-71, with the last three years' figures being provisional. So far, a table on Capital Finance giving on one side figures of capital expenditures and on the other side figures of sources of finance was being published. But now details of net domestic saving by three main sectors, *viz*, household, private corporate and public sector, as well as of gross and net capital formation by public and private sectors and by type (i e, construction, machinery, inventory build-up) are available in addition to the consolidated accounts on capital finance for the first time in an official White Paper on national income. This improvement is welcome. But it is not clear how the saving and capital formation figures are final for 1966-67 and 1967-68 when the national product figures for these years are still provisional.

We shall focus attention on some effects of changes in methodology, classification, etc, rather than analyse the national income figures. There is some reason to believe that the revised figures lead to higher estimates of total value of 'construction', which in turn lead to upward revisions in the figures of capital formation, saving and contribution to national product. The upward revisions come at a time when we are in need of higher levels of incomes, capital formation and savings and the state of economy does not help in the matter. It is, therefore, necessary to study the impact of the revisions in the figures and examine, if possible, whether the changes in methodology, etc, which make for upward revisions can be justified.

It is relevant to observe that the share of the construction sector in the net domestic product (NDP) ranged from 4.4 per cent to 4.7 per cent between 1960-61 to 1969-70 but has now jumped to 5.4 per cent for the years 1970-71 and 1971-72. Lest someone argues that this could be possible because of lower NDP from other sectors, we must also note that the contribution to NDP from construction jumped by Rs 381 crores from Rs 1,485 crores in 1969-70 to Rs 1,811 crores in 1970-71. The increase of Rs 210 crores at constant price for 1970-71 over a year is also the highest so far. The increase was never so high in the 1960s, and the largest increase was about Rs 200 crores at current prices and Rs 72 crores at constant prices. The increase from 1970-71 to 1971-72 is also only Rs 136 crores at current prices and Rs 10 crores at constant prices. The contribution to GDP by construction also similarly goes up. It is, therefore, safe to presume that change in methodology, etc, has contributed substantially to the large increase of Rs 381 crores in 1970-71. How much exactly this contribution is, it is difficult to say. One would have been wiser in this matter had the provisional figures of NDP and GDP for 1970-71 been worked out on both the original and the revised methodologies, sources, etc, not only for construction but for all sectors. This would have enabled one to measure the total impact of methodological changes. If the upward revision in the contribution of the construction sector to the NDP or GDP were only to the extent of about one percentage point, one would not have much reason to critically examine these revisions; for its total impact on NDP or GDP would still be small. However, the real impact of the revisions in the figures of value of construction is on the estimates of capital formation and saving, which we may now discuss.

Figures of gross domestic capital formation (GDCF) in construction based on earlier methods, sources, etc, and broken down according to various categories are available in the CSO brochure on Estimates of Capital Formation in India, 1960-61 to 1965-66. Similar figures worked out on the earlier methodology for years subsequent to 1965-66 are not available. Figures given in Table 11 of the November 1973 White Paper and based on the revised methodology and using more recent sources of data can therefore be compared with earlier figures for the period 1960-61 to 1965-66 only. Available data on net basis are reproduced in Table 1.

It can be seen that the revised figures are somewhat higher except for 1962-63 in respect of the totals. The figures for public sector are lower and consequently the figures for the private sector are much higher for the revised series than the corresponding figures for the earlier series. For 1965-66, the figures for private sector is Rs 1,006 crores as against Rs 811 crores for the earlier series, which means an upward revision by almost 24 per cent. This aspect of the upward revision in the figures of GDCF in private sector and, more particularly, in construction has another implication which we shall see while discussing household savings figures. Figures for 1966-67 and 1967-

68 in respect of the private sector also show increases of about 53 and 36 per cent, respectively, over the preceding years when public sector construction shows declines. The revisions in the figures for public sector would have been done on the basis of government expenditure as reflected in the budgets or in the Economic Classification of government expenditure. There is not much scope for using ingenuity in revising these figures. But in regard to the total value of construction, there is scope for manipulation.

It is a pity that similar comparisons for the years 1966-67 to 1970-71 cannot be made for want of figures of GDCF in construction based on the earlier methodology, sources, etc. For it is for these years that the more recent data and the revised methods must have been more fully employed. The total GDCF can be compared as shown in Table 2 for the period 1960-61 to 1967-68 on the basis of three sources: (1) CSO's brochure on capital formation, (2) CSO White Paper of May 1971, and (3) CSO White Paper of November 1973.

Private sector capital formation from construction contributes about 40 per cent to the total capital formation, and the dominance of the household sector in the private sector capital formation is quite well known. Physical asset formation in the household sector is also an important component of the household saving. We thus see that upward revisions in the figures of capital formation in the private sector will have their impact on household saving also. Table 3 shows that the household net domestic capital formation (NDCF) generally formed anywhere from about 50 to 80 per cent of the private sector NDCF according to the earlier series, but according to the revised series the dominance of the household sector has substantially increased in recent years. In 1968-69, the household sector figure is even higher than the figure for the private sector! Not that this is impossible. But it looks odd that it should be so. If, for instance, the private corporate sector, which is another component of the private sector had negative net capital formation, households could have a figure higher than the total for the private sector. If changes in stock are high and positive for the household sector and also high but negative for the private corporate sector so that on balance the figures for the private sector comes to Rs —37 crores, as

Note: Closeness of the estimates upto 1964-65 and the marked upward revisions from 1965-66 in the latest series deserve to be noted.

shown, then also the household sector's net physical asset formation can exceed that of the private sector as a whole. But we do not have these figures separately to be able to examine how exactly this happens. It is important that these details are given, particularly when the data needed are not fully revealed and crude methods are employed. One must at least know how figures are used and what the factors causing such apparent anomalies are.

The point, however, is that upward revisions for capital formation in the private sector and greater dominance of the household sector in recent years gives an upward push to household savings. For the years 1960-61 to 1965-66 for which figures for the household sector saving are available for both the sets (i e, earlier and revised) one can see the differences, as detailed in Table 4.

Thus, except in 1965-66, the revised figures of financial assets are somewhat smaller for the revised series, whereas in the case of physical assets formation, differences are positive except for one year, and it is these latter differences which largely explain the overall differences between the two sets of figures. An exception to this statement is 1965-66 which has a large difference in financial assets also, because of an upward revision of Rs 155 crores in 'investment in shares and debentures' and a downward adjustment of Rs 55 crores in currency plus net claims on government sector. But even here, upward revision in household physical asset formation is as high as Rs 157 crores. Insofar as household construction accounts for a large percentage of the total household physical asset formation (the exact figure cannot be worked out from data) and the former also constitutes a very large proportion of the capital formation through private construction, the upward revision in this last mentioned component affects in the same direction the important component of household saving in the form of physical asset formation.

It is also to be noted that household net saving in the form of net physical asset formation is over 60 per cent of the total household net saving; and the latter component again accounts for about 60 per cent of the total net domestic saving. This means that household net physical asset formation accounts for about 36 per cent of the net domestic saving. Indeed, in the recent years 1966-67 to 1968-70, affected by changes in methodology, etc, more fully than the earlier years, the percentage share is around 45-50

Physical assets formation	133	—29	41	21	51	+157
Total difference	132	—31	37	13	30	257

per cent. With this dominance, sizeable upward revision in the household physical asset formation also pushes up the figures of net domestic saving. For instance, an increase of Rs 157 crores in 1965-66 in the household net physical asset formation just because of revisions would mean, other figures remaining the same as in the revised estimates, an increase of over 6 per cent in the total net domestic saving. This should indeed be welcome when we are in search of resources.

In examining how the higher percentage shares (as also the large absolute increment) for the contribution of the construction sector to NDP or GDP in the years 1970-71 has been brought about, we need to comment on the earlier and revised methodology and other changes. To state it briefly, the method is a combination of the commodity flow and labour evaluation methods. The former method is applied to the organised part of the economy where materials are bought and paid labour is generally employed, and where allocation of different building materials like iron and steel structurals, cement, bricks, and tiles, etc, to different uses are made. The labour evaluation method is used where own labour and free materials (like grass, leaves, seeds, mud, etc) are used in construction as in large parts of rural areas and to some extent in urban areas as well. A very substantial proportion of the total value of construction is accounted for by the commodity flow method. A very basic characteristic of this method is that it involves assuming proportions of allocations to different uses and mark-ups for transport and distribution charges.

One's heart would sink on reading the relevant chapters on the methodology in the Brochure on 'Estimates of Capital Formation in India, 1960-61 to 1965-66'. One has to work out how much iron and steel is used for machinery, construction, etc; how much of that going to construction is used in different uses — new construction, major repairs, minor repairs, alterations and so on. So also for cement, bricks and tiles, etc, CSO has somehow worked on these allocation ratios. Then come mark-ups for trade, transport and other charges. Adhering to these figures of ratios, mark-ups, etc, may be a virtue on the part of CSO but certainly it is no proof of accuracy. There are no independent cross-checks of these ratios and mark-ups.

It is not clear at all how year-to-year variations in these allocative ratios and distributive mark-ups are worked out and how precise these are. This needs to be spelled out. If no changes are made so much the worse, since shifts of materials used among construction, machineries, inventories, etc, and of trade and transport mark-ups are not then reflected in annual calculations. To these costs, a certain percentage is added — roughly 33 per cent — to arrive at the value of construction through the commodity flow method. The labour evaluation component is also worked out on various assumptions, outdated surveys, etc. From the combined value of construction, the value of repairs and maintenance is deducted to arrive at gross capital formation from construction. All these allocations, mark-ups, deduction percentages, etc, are no doubt based on heroic assumptions and guesses. The value added component in respect of the commodity flow component plus the labour evaluation in the second component give the estimate of total value added or national product from construction.

Comparing the figures of gross capital formation from construction (earlier series) for 1960-61 to 1965-66 and gross national product from this sector for corresponding years, one finds that the latter figure was 48.3 per cent for 1960-61; it was around 46.5 for the next 4 years and then declined to 44.2 per cent in 1965-66. It is over 49.7 per cent for 1970-71 where the change in methodology is applied to national product estimates also. We may add that it is not possible to work out GDP from construction as percentage of total value of construction which would be a more appropriate ratio. If the ratio of GDP from construction to total value of construction also moves in the same way, then it can be said that upward revisions in the total value of construction activity plus a somewhat higher proportion of this total value assigned to gross product from this sector has resulted in a handsome increase in the contribution of contruction activity to national product. This would explain how its proportion to total NDP or GDP, as the case may be, is now 5.4 per cent as against around 4.5-4.7 per cent in the years 1960-61 to 1969-70 and how, in absolute terms, the increase in 1970-71 is of over Rs 381 crores.

In the Foreword to the November 1973 White Paper, it is mentioned that "the present estimates of national product for 1970-71 and 1971-72 are not strictly comparable with the estimates published earlier (May 1971). This is mainly because of methodological changes in the estimates of construction and use of revised data for 'other services'." When we turn to Notes (page 29 of November 1973 White Paper), all that is said is: "Methodology adopted for obtaining current price estimates of total value of construction has been *slightly* changed, leading to a revision of estimates of product from construction as well. The total value of construction accounted for in the commodity flow approach has now been revised to take into account the movement in prices of 'other construction materials' and 'wages' as well besides the adjustments for changes in prices of the five basic construction materials." Additionally, revised data becoming available for 1965-66 and subsequent years have been made use of. How small or big is this *slight* change is not mentioned; what changes or revisions are in fact effected is not stated in quantitative terms; what effect the new data has on the estimates cannot be made out and exactly how ratios, mark-ups, etc, have changed are things not yet known. It is, therefore, difficult to determine how exactly the revised estimates have received an upward push. We have to await more details with the promised revision of the current series of GNP and NNP. We have already seen that the series of capital formation from construction and household saving in physical assets formation has also been affected through these revisions.

For constant price series, it seems that a more detailed procedure has been followed to obtain the total value of construction at 1960-61 prices; the proportion of gross product to the total value of construction in the base year (i e, 1960-61) has then been applied to the constant price total value of construction. The little details that appear in the 'Notes' suggest use of allocative ratios, mark-ups, etc, to five parts into which construction is divided. This in fact appears to add to the arbitrariness of the entire calculations rather than make for better accuracy. It is also doubtful if constancy of the proportion of gross product to total value of construction can be considered as a methodological improvement. Such a constant proportion would not reflect structural changes. There is no reason for this proportion to remain constant.

Even if one gives the benefit of doubt that the upward revisions are really due to changes in methods and additional data becoming available, etc, and not the result of a deliberate attempt to push up the levels of product, capital formation and household saving in the form of physical asset formation, it will be seen that as long as these estimates are based wholly on allocative ratios and mark-ups, it would be a misnomer to call estimates based on the revised methodology better estimates. To the extent that more recent data become available, figures could be revised, but any changes in the ratios, etc, are bound to be as arbitrary as before because neither the earlier nor the revised set of ratios and mark-ups have that strong base necessary to inspire faith in them. What is needed is a cross-check at least at some points of time if not every year; and any effort directed at developing such cross-checks would pay richer dividends than re-working arbitrary ratios, mark-ups, etc. This is particularly true in respect of private sector construction, and more specifically for household construction, inasmuch as figures of value of construction, value added, etc, could be independently determined with some measure of accuracy in regard to public sector and private corporate sector. It is to be hoped that CSO will concentrate on developing these cross-checks.

The change in the methodology, etc, for the construction sector is a major one and its impact we have discussed. Another important change refers to the calculation of change in stock. In the earlier capital formation series, this component comprised inventory changes calculated for different sectors on certain assumptions and a balancing item termed as 'errors and omissions'. But both were combined. In the revised series, these two components are separated and in the computation of inventory changes some methodological changes have been introduced. 'Error and omission' represents an overall adjusment factor between saving on the one hand and capital formation on the other after necessary adjustment for net lending abroad, etc, as can be seen in Table 13 of the latest White Paper (November 1973). The figures of change in stock in the earlier series differ considerably from the sum total of the two components in the revised series. This shows that calculations have been thoroughly revised and are not a mere split of the figures of 'change of stock' in the earlier series. However, what value can be attached to these figures of inventory changes for economic analysis is open to doubt. Several items are computed on the assumption of constant proportion of stock to production (and that also at manufacturing level only) and these methods would introduce spurious relationships, leading to conclusions which may be different from real facts. It has already been seen that one of the possible reasons why net household physical asset formation exceeds net physical asset formation of the private sector as a whole (in 1968-69) is that a large positive figure of inventory change can be assigned to household sector and a compensating negative figure to the private corporate sector, although on the balance inventory change figure is a small negative figure for the entire private sector. This sort of computation may boost the saving figure, but in the capital finance account of the nation, a corresponding large 'error and omission' might result. The 'error and omission' component is also sizeable for recent years: Rs 628 crores (or over 9 per cent of gross accumulation) in 1970-71; Rs 197 crores and Rs 170 crores in 1967-68 and 1968-69, respectively. Detailed data are not available to examine whether this has not in fact happened. For, if it has, it would be a sorry commentary on the compilers of national income accounts. In the earlier series inventory change for household sector was being separately calculated, presumably because the change in stock estimate for the entire economy came out more or less as a residual in the capital finance account. Now that an 'errors and omissions' component is the balancing item, it is not quite clear whether household sector inventory changes are still being separately worked out or are derived as a residual when total change of stock and that for the corporate sector are independently available.

Among other changes of some consequence, some classificatory shifts may be mentioned. The 'storage' sub-sector has been now taken to the transport and communication sector; earlier, it was with the trade and hotels and restaurants sector. Similarly, the 'business services' component has been separated from 'other services' and added to 'real estate and ownership of dwellings' sector. In each of these changes, the contribution to national product of the components shifted around is not separately known. If the CSO were to give the figures for such components separately when changes occur in classifications, one could make the sectoral series comparable with previous figures to the extent one can by readjusting the 1970-71 and 1971-72 figures. At least for 1970-71 to 1972-73 separate figures should have been therefore given. Obviously, when the whole sector like mining and quarrying is shifted to the primary sectors for subtotal purposes, nothing is lost because, even for earlier figures, one can follow the same procedure. But when component items are shifted and their individual contributions are not known, it becomes impossible to make adjustments.

One can only hope that the CSO will release figures of the revised series of national product and details of methodological changes, new sources of data used, etc, soon. In particular, it would be important for the CSO to discuss in great detail how private sector GDCF in construction, change in stock and specifically household physical asset formation are computed and what are the premises on which figures of allocative ratios, transport and distribution mark-ups are arrived at. One may also hope that steps will be taken at the earliest to develop other, more reliable methods of estimating value of construction, its value added component, capital formation in private sector and particularly in the household sector; if not, at least that reasonable cross-checks will be developed without much delay.

SPECIAL ARTICLE

India: An Arrangement at Stake

Arun Shourie

The country is today in the throes of a crisis much worse than any that has plagued it since Independence. The economy has ceased to progress. Per capita income is probably lower than it was a decade ago. Prices are rising by about 30 per cent a year.

The government's food procurement and distribution policies are in disarray. The public distribution system for essential commodities is now completely at the mercy of those very traders whom the government had sought to drive out of the wheat trade last year and whom it has often accused of profiteering and anti-social behaviour.

The much-advertised Fifth Five-Year Plan has been buried amidst ignominious bickering even before its official commencement. The document itself has not been finalised.

The current crisis is the inevitable consequence of the economic and political system that the Indian elite has engineered for its own benefit. Its inner contradictions have paralysed this self-serving system.

As the difficulties have become more acute during the past year, economists of all hues have rushed in with their quaint suggestions about money supply, distribution of public outlays among the different sectors, about this control or that licensing procedure. They seem to have proceeded on the assumption that government functionaries do not know what needs to be done. They have not realised that the matters they have talked about — money supply, budgetary deficits and the rest — are just symptoms of a deeper malaise. Our difficulty is not that we have run out of ideas but that our polity has been gravely abused — abused by the very leaders to whom the economists have been peddling their aphrodisiacs.

This political arrangement is now straining at the tether. Ideas — old or new, orthodox or unorthodox — will not work till the polity is set right.

I DO NOT know of any country that has as much unexploited — and immediately exploitable — potential for advancement as India. Nor do I know of any country in which the masses live in as much deprivation and squalor, in which they suffer as much, and in which they do this to as little purpose as in India.

Today, the country is in the throes of a crisis much worse than any that has plagued it since Independence. The economy has ceased to progress. Per capita income is probably lower than it was a decade ago. Prices are rising by about 30 per cent a year. The economy does not have the resources to import the oil it needs and we are unable to move the coal we have in abundance to its potential users. Engineers and workers in power plants have begun to sabotage the plants and the transmission network. Just as the economy was recovering from a massive strike by power engineers and by workers in jute and textile industries, employees of the Central government, railwaymen, and others once again were to bring the productive apparatus to a near-halt. The government's food procurement and distribution policies are in disarray. The public distribution system for essential commodities is now completely at the mercy of those very traders whom the government had driven out of the wheat trade last year and whom it has often accused of profiteering and anti-social behaviour. The much-advertised Fifth Five-Year Plan has been buried amidst ignominious bickering even before its official commencement. The document itself has not been finalised. Violence, arson, police firings have become a daily occurrence and are fuelling each other.

The government has watched this mounting crisis as a paralytic would view a rising flood. Its principal lead-

ers are now betraying signs of hysteria. Everyone within reach is being maligned as a 'fascist', a 'Right reactionary', a 'Left adventurer', a 'foreign agent'. The hysteria has not spared even the tallest Indian in the land — Jayaprakash Narayan. The Indian government would have us believe that the crisis is primarily a conspiracy of these *agents provocateur* and in part a result of 'world-wide phenomena' (like rising prices of oil, wheat, fertiliser, steel and the like), bad harvests, and the two-and-a-half-year-old influx of refugees from Bangladesh.

Each of these pseudo-explanations is just an alibi. I shall argue that the current crisis is the inevitable consequence of the economic and political system that the Indian elite has engineered for its own benefits. I shall argue that its inner contradictions will paralyse this self-serving system, that the crisis will intensify in the near future, and that the issue will soon be joined. I shall also argue that the issue will be resolved in favour of India's impoverished masses and that it will be resolved at their initiative. The most hopeful feature of the current crisis is that the ordinary people of the country are beginning to stir. They are beginning to realise that governments, legislatures, secretariats will not be agents of the sort of change that will help them. They are regaining the self-confidence that Mahatma Gandhi preached, and they are now beginning to work for their own deliverance.

The clinical tone of the article should not lead the reader to believe that I am charging some amorphous and unnamed bunch of characters. The responsibility for the current crisis rests with India's well-to-do; in particular, with the country's dominant political party — the Congress — which represents the well-to-do; and, even more specifically, those handful of leaders who have controlled this party in an increasingly authoritarian manner in the last decade — leaders in whom the Indian people had reposed trust and hope.

I

The basic facts about India are well known. The country's population is increasing by about 13 million a year — a figure that equals the total population of Australia. Since the country became Independent in 1947, its population has increased by a number that equals the total population of the United States. Even official documents acknowledge that about 225 million of the country's citizens are so poor that they cannot afford even a diet sufficient in calories. Some studies suggest that the lot of the poorest sections is worsening. Millions — among them hundreds of thousands of educated young men and women — are without a job, without any means of earning a livelihood. As if this were not enough, the labour force is slated to increase by 70 to 80 million in the next 10 years.

Instead of devising an economic and political system that would contain these enormous pressures, a system in which property relations and the values by which people live would be drastically altered — a system, in brief, that would serve the masses — the Indian elite has devised an elaborate ruse. The elite has devised a ruse to serve the rich while fooling the poor into the belief that everything possible is being done for their welfare. The ruse has been conjured out of three elements: a system of property relations and economic policies that looks after the well-to-do; soporifics that fool the masses and rationalisations that 'provide succour to the elite. The ruse is best epitomised by the Congress party, which has held power at the Centre and in most of the states since India became Independent. This party serves the rich. But, with the aid of some progressive slogans and a lot of illicit money, it has been consistently able to fool 30 to 40 per cent of the electorate into believing that it has the people's interests at heart.

Successive Indian governments have fabricated extensive mechanisms to protect the interests of the rich peasantry and the industrial class. These include a completely protected market, restrictions on entry and expansion that virtually eliminate competition among domestic producers, 'price controls' that enable producers and middlemen to rake in illicit earnings without ensuring consumers even the slightest protection, a tax-collection machinery that is notoriously ineffective, an enforcement machinery that can only be described as evanescent, a pattern of investment and taxation of agriculture that benefits the better-off, and so on.[1] These policies have also ensured that patronage and discretion are securely in the hands of the politician and the administrator. The patronage, in turn, has enabled politicians and administrators to milk the principal beneficiaries for all kinds of hospitality.

Having devised a system to look after its interests, the Indian elite has been anxious to ensure its continuance at the least possible cost. For this, it has adopted the easy — and peculiarly Hindu — way of containing pressures. The way is to leave the existing configurations of power undisturbed (in fact, where this is possible, to re-inforce the configurations), and, while ignoring the ordinary members of these configurations, to expend all efforts at cajoling and buying-off the ring-leaders.

A consideration that is often in the minds of party caucuses when they are selecting candidates for an election illustrates this point. In viewing a constituency, most parties pay considerable attention to its caste composition. Each will select a member of the dominant caste and the dominant economic group (literally the 'dominant' and not necessarily the more numerous) as its candidate. After the elections, the successful candidate is ensured all sorts of privileges and positions. Official patronage — in the form of appointments, jobs, development outlays — is channelled through him. What is more, he is vested with considerable power for embarrassing, harming, transferring, and rewarding administrators, police officials, and others, who can affect the lives of his constituents. In this way, members of the group are continually reminded about their dependence on the leader, and the leader having been thus looked after bends all his efforts to perpetuating the existing arrangements.

This stratagem — of co-opting ring-leaders — has been used in its most blatant and cynical form for keeping three groups in line: the Muslims, the scheduled castes, and the organised labourers. Ring-leaders among Muslims and scheduled castes have been given ornamental posts. They, in turn, have ensured that their followers — always neglected and often mauled by the rulers — continue to vote for the ruling party in election after election. This arrangement has been of the greatest value to the ruling party: The members of these two groups have constituted one-half to two-thirds of the hard core Congress vote in successive elections. Similarly, leaders of many a trade union — fattened as palace slaves — have discharged their debt by sabotaging many a workers' struggle.

As long as it works, that is an easy, low-cost, solution. If the elite were to go about cajoling entire groups by ensuring each of their members a decent living, it would have to whittle down its power and its standard of living substantially. By reinforcing the existing configurations of power it buys

peace even though it has provided for only the leaders of the groups.

In the meanwhile it has lulled the masses with soporifics. 'Socialism', parliamentary constitutionalism, the right to cast a vote every five years, and some freedoms — the freedom to write and speak freely, for instance —, are the most prominent among these. A few words on each will clarify the role of each in the scheme of things.

Indian political parties (and factions within each party) are perpetually engaged in an orgy of 'competitive radicalism' — to borrow the phrase of a perceptive participant. Over the years, party manifestos and, indeed, the laws themselves, have become more and more radical. But — true to Hindu practice — we have steadfastly refused to define the precise contours of our 'socialism' and — true this time to the spirit of most religions — we have not allowed the strident sloganeering to inhibit our acquisitive practices.[2]

The impoverished masses have been fed the illusion that they are the fount of power, that, through quinquennial elections, they have a say in what matters. The country has had five general elections. The number of parties and candidates in each election, and the rapid turnover of legislators, are said to show how great a choice the system offers to the voter. For instance, in the recent elections to the legislature of Uttar Pradesh — a state of about 90 million people — about 4,000 candidates competed for 425 seats. But these and similar magnitudes give only a superficial view of things. Elections have not assured that leaders will keep their electoral promises. They have not assured efficient — or even honest — governments. Similarly, there is less to the waxing and waning of individual parties and to the rapid turnover of legislators than an observer might be led to believe. Each political party in India represents the same elite. And, whenever they have had the opportunity, the members of each party have behaved as rapaciously as those of others. The hapless voter has run from one party to another or from one candidate to another. In the recent UP elections I mentioned earlier, the hapless voter defeated two-thirds of the sitting legislators who stood for re-election, but to little avail.[3]

Freedoms — of Press, for instance — have continued their fragile existence. They have meant little to the impoverished masses. The leaders have often used them as an alibi — asserting that these freedoms preclude resolute action and, thereby, more rapid advancement. The freedoms have, of course, meant a great deal to the intellectuals. They are indeed free to write and speak. But their writings and speeches have little effect. Even specific disclosures about wrong-doing do not produce a ripple. As a consequence, the intellectuals are disillusioned and bitter. Even they are beginning to look askance at the argument that these freedom mark out the Indian experiment as a unique one. What good, they ask, is it to be free to shout into a desert? What use are the freedoms if, by deploying them, one cannot change the system or even stem the rot?

Gandhiji's doctrine, that "means are as important as ends" — the last soporific which I will list here — and its contemporary incarnation — 'constitutionalism' — have been perverted to hoodwink the poor. Much play has been made of the doctrine whenever the task has been to implement land reforms, to put down private armies of the rural strongmen, to catch smugglers, hoarders and adulterators, to weed out corrupt ministers and officials, or to alleviate the miseries and violence that are heaped upon the landless. The people have been fed much sophistry about the Constitution, about the due process of law, about the evils of taking the law into one's hands. Means have been touted as ends. But, when elections have had to be won, laws about electoral expenses and about misuse of official machinery have been thrown to the winds; when exceptions have had to be made to accommodate industrial houses or traders, laws and policies have not presented any difficulties.

The elite, while peddling soporifics for the masses, has conjured up many a rationalisation for itself. It has refused to define its egalitarian slogans precisely, on the pretext that it would not like to imprison the country in resolutions that may soon become obsolete. Time and again it has postponed resolute action, on the pretext that it is searching for the optimum solution. It has perfected the device of public cerebration — convening seminars, setting up committees to enquire into matters, then setting up committees to examine the recommendations of these committees — as a subterfuge. By acquiring the very special faculty of detecting merit on each side of every argument, it has consistently refused to push its perceptions to their logical conclusions — for instance, about the difficulties that an exclusive reliance on monetary incentives can cause in a poor country. It has taken to formalism in a big way. Whenever a lacuna has been pointed out, it has worked itself into a verbal fever. But once some formal measures have been taken to deal with the matter — once a committee has been set up, a law passed, a department reorganised — it has quickly relapsed into somnolence. Rationalisations such as these have provided much succour for India's short-sighted and rapacious elite — an elite epitomised by the businessman who bribes so that he, rather than another, may obtain a licence and who shuts his eyes to the long-run consequences of his act.[4]

The single institution that best portrays the system I have been describing — a system serving the rich, buying peace by co-opting ring-leaders, doling soporifics to the masses and conjuring rationalisations for the elite — is the Congress party.

A *status-quo* party, it has clutched on to the slogans of change as its own. On behalf of the elite it has been engaged in a massive deception: an attempt to convince the impoverished masses that it is an agent of change.

Its true class character is revealed not by the slogans it shouts but by the sources of its finances, by the structural changes it attempts, and by the consequences of such attempts. For its finances the Congress relies exclusively on the rich industrialists, the rich traders and, one understands, the richest smugglers. And it relies in equal measure on the traditional — one is almost tempted to say, feudal — leaders for political muscle: the caste leaders and the dominant landowners. These groups dole out money to this party and they support it because they know that it is *their* party, that it ensures *them* a protected market, that it blocks land reforms on *their* behalf, that its radical slogans fool the people on *their* behalf. Is it any wonder then that, while Congress governments are perpetually short of resources and support for their developmental programmes, the Congress party is never short of resources and support for its electoral forays?

Similarly, various attempts at structural reforms illustrate the party's class character. The pathetic story of land reforms is an oft-told tale. The take-over of wholesale trade in wheat in December 1972 provides a fresh and dramatic illustration of the close bonds between traders, large landowners, smugglers, and Congress party mem-

bers. The collusion between these groups was one of the principal factors that prevented the government from acquiring the amounts it needed for the public distribution system, that disrupted the movement of grains to urban centres, that made it impossible for the government to check smuggling, hoarding and adulteration of grain, and that ultimately compelled the government to abandon its policy in the most humiliating manner.

Engaged as it has been in furthering the interests of a rapacious elite, the Congress has buried Mahatma Gandhi. He introduced the mass line into Indian politics. Congress governments have cast it aside. How could they mobilise tenants to ensure that the hold of the landlords is weakened when the landlords were the basis of their power in the rural areas? How could they organise office and factory workers to expose malpractices — adulteration, tax-evasion and the like — when the industrialists and the traders were the principal sources of their funds? Gandhi spent his life trying to alter the acquisitive and imitative values of the elite. Congress governments have fabricated an economic and political system which gives full licence to precisely these values. Gandhi insisted that his associates measure up to the highest ethical standards in public life. Congress governments, representing as they do an elite that is firmly wedded to double standards, have been satisfied with appearances: its ministers wear home-spun cloth, and refrain from drinking in public. Far from insisting on ethical standards, they have shielded the corrupt and even brought back ministers who were forced out of office after judicial enquiries had accused them of wrong-doing. Gandhi won over the masses by working with them. Congress governments have been cajoling them with illicit money and fraudulent slogans.

These choices, made very soon after Independence, have now culminated in a very special pattern of politics — the politics of parlours, sloganeering, and illicit money. The proximate cause for India's present difficulties is to be found in this pattern of politics. I shall now deal with its consequences and with the inner contradictions that are paralysing governments at the Centre and in the states. After that I will sketch the inner contradictions of the larger theme — that of selective co-option — of which this pattern of politics forms a part.

II

India is now led by parlour politicians. Our leaders are not organisers, leaders who — like Stalin or Sardar Patel, to cite two disparate examples — have the perseverance to perfect a party machine and then to use it purposefully. They are not ones to mobilise the masses, not ones who — like Gandhi or Mao, to cite another set of two disparate examples — will mobilise peasants and agricultural workers into a fury that does away with particular inequities in the countryside. Their *forte* is tactical manoeuvre, and their great skill is in judging and manipulating other tacticians.

Unfortunately for these leaders, the very measures that they must take — and indeed, have taken — to strengthen themselves *vis-a-vis* rival tacticians weaken their ability to deal with the objective situation. In order to survive, the chief tactician cannot permit those who have an independent and strong political base to remain afloat, even if they are his colleagues and allies. If one of his colleagues has a base — in a region, a trade union or a particular caste — then he must continually strive to undercut it. He can rest only when all within reach have no strength except that which they derive from the leader's commendation.

For a while, it has seemed that the top leadership has indeed secured itself sufficiently in this manner. Recent events, and the rapidly deteriorating situation, have drawn attention to the other side of this coin: Once they have been weakened sufficiently to no longer be a threat to the chief tactician, the colleagues and associates are also too weak to help him bring about political and economic transformation. None of them can today help ensure that the leader's policies are implemented in the field, that trade unions respect his wishes, or that state legislators do his bidding.[5]

The leader's progressive ascendancy has also affected people's perceptions. The greater has been the chieftain's success in the states and at the Centre in weakening his associates and the more insecure he has made them feel, the more they have left things to him. Thus, the populace has formed the impression that power is indeed centralised, that it is all up to the chieftain. Since, in spite of this, the chieftains have been unable to deliver the goods, people are increasingly focusing their wrath on this handful. The people today allege that this small group has had the power and yet has not used it to good purpose.

These predatory instincts of the tacticians have not had only individuals as objects. They have also distrusted — in fact, feared — mass organisations. Their apprehension has been that such organisations may become autonomous strongholds. For this reason, the organisations have been systematically disrupted — even the organisation of their own party. Today, the Congress party is a helpless and hollow body. Its organisation has been torn up during the past few years and nothing has been allowed to take its place. Consequently at the national level, today, it is just a cult of one person and, in the states, just a set of sub-cults of local subalterns. Having been hollowed up in this fashion, the party cannot now help the leaders implement land reforms in half-a-million villages, it cannot help 115 million city dwellers improve urban sanitation, it cannot help the government unearth illicit stocks of food, it cannot catch tax-evaders and smugglers, it cannot help improve the living conditions and social status of lower castes. Indeed, it cannot help implement any political, social, or economic reform whatsoever.

Thus, the principal consequence of the tacticians' *modus operandi* has been to dilute their power for bringing about substantive changes.

The top leadership has not had the time to intervene in every factional squabble and, in any case, it cannot afford to soil its hands by undermining colleagues and allies openly. It has relied on henchmen. And the henchmen, while they have been at their job, have busied themselves with a lot more than the leaders' bidding. Since the henchmen have been serving the top leadership, since to all appearances they have been ensuring its longevity, no one has had the temerity to deny them a little private business on the side.

But even as they have done their leader's bidding, even as they have filled the party's coffers, these henchmen have soiled their party's image. They have brought disrepute to their leader and they have drained the people's faith in democratic institutions. People have begun to feel that there is a lot wrong with institutions that have allowed these brigands to assume power. Discarding a henchman after the public clamour against him has become oppressive has not helped the top leadership. As it has not altered its basic character, as it has not abandoned parlour politics, as it has not adopted the mass-line, as it has not begun to deliver the goods, one henchman has had to be replaced by another. We see this

dramatically when we recall that bosses — who later came to be known collectively as 'the Syndicate' — originally acquired power within the Congress because the principal leaders wanted money for the party but did not want to handle the money themselves. In 1969, the present-day leaders split the Congress — ostensibly to free it from the bosses. But, as nothing was done to alter the character of politics, the old bosses have been replaced by new ones.

Parlour politics has had disastrous consequences for the management of the country's affairs. Those who have risen to the top in this set-up have done so because they have outdone others in low-level cunning and in petty intrigue, and not because they have proven that they can handle the myriad issues that arise in a large and complex country. The immediate cause for the state of affairs in India today — for the vacillations and the duplicity of economic policies, and for the inability of parliamentarians and state legislators to bring the Central and state governments to book — is the simple fact that the 'successful' politicians in India have little understanding of and little interest in economic and administrative matters. Their preoccupations with trivia, the facility with which they violate norms, the levels to which they stoop for trifling pecuniary gains, and the cynicism with which they view the people, suggest that they are not bothered by any notions about the national interest, about the type of society we are creating — or even about the dignity of our country and its people.

India's successful politicians suspect competence and are jealous of expertise. Unfortunately for the country, their jealousy and their suspicions can overpower. They are able to stall the induction of specialist cadres into economic and technical ministries; they are free to transfer and harass honest and bold officials; they are able to surround themselves with suave salesmen, with individuals who are not so competent as to circumscribe their *ad hoc*isms, with individuals, in short, who are committed to them and not to any public objectives.

Nor is their debilitating influence restricted to their own incompetence or to the selection of key personnel. Administration has been — as it inevitably must be — affected as much by the *ambience* in which policies have been formulated and administered as by the calibre of those who have had to formulate and execute these policies.

The pattern of politics has completely perverted the norms by which colleagues weigh one another and by which they judge their own performance. Success has not meant efficient handling of one's assignments. It has meant rumoured proximity to the leader. Therefore, ministers in Delhi and in the state capitals, spend their time jockeying, lobbying, protesting their loyalty, paying homage to the leader, ingratiating themselves with his henchmen, circulating rumours about their colleagues, squelching rumours about themselves, fighting proxy wars in tabloids — but not in running their ministries efficiently.

Moreover, the accusatory and conspiratorial atmosphere has made ministers and officials nervous and insecure. Each of them has been busy protecting his flanks rather than in doing his job. Today, each of them prevaricates, each of them obfuscates, each tries to push decisions higher and higher up, each tries to rope in as many others as possible into every decision he takes. Discussion — even in the highest counsels of the land — has ceased to be free or frank.

Economic issues differ from political ones in two respects and, unfortunately for the tacticians and for the country at large, each of these makes the former less tractable to the skills of a political tactician.

The first difference is that time itself is the best balm for many a political crisis. Often, the best course of action is to let matters drift, to let events take their course and narrow the options, to let time cool passions. One of the most vital skills of a political tactician — a skill that many an Indian politician possesses in ample measure — is the ability to wait it out, to stall. A good example of this skill at work is the manner in which the agitation for the bifurcation of the state that engulfed Andhra in 1973 successfully defused. But time worsens most economic problems. The ability to stall matters and the patience to let matters drift become fatal handicaps in the economic arena. Secondly, in the economic arena no victories are final. In manipulative politics, success is decisive and its glow serves for a long time. One can outsmart a rival once and be certain that he will not present a threat for years and years. In contrast to this, one has to toil away against economic problems day-in and day-out, for years and years, with the patience of a Sisyphus. India's tacticians — skilled as they have been at swift and decisive thrusts — have not had much aptitude for these protracted labours. Thus, while tacticians have moved from one manoeuvre to another and from one thrust to another parry, the objective situation has continued to worsen.

The country has also learnt to its great cost that for the spirited tactician the advantage of the moment is everything. The long haul and the patient labours that are needed for nurturing institutions do not interest him. India's present-day leaders have not acted until their personal position has been threatened. When that has been threatened, they have stopped at nothing, they have deployed every instrument they could muster; they have not let notions of propriety, constitutionality or fair-play come in their way. "War", they have insisted, "is war" — a Leninist aphorism which, as we noted earlier, has never crossed their minds when the question has been one of bringing hoarders and adulterators to book or of implementing land reforms.

Today, one institution after another is crumbling away in India. The things that are said in the legislatures do not matter. The judiciary is rapidly becoming a mere *alibi*. Politicians in power push through legislation riddled with loopholes. The judges hold that the rich have as much of a right to take advantage of these loopholes as do the poor. The politicians clutch at this as a convenient alibi — proclaiming, as they do, that but for those renegades in the courts they would have brought about a glorious social transformation. Administrators are being demoralised by half-baked accusations about their 'lack of commitments' — accusations that are hurled on every occasion but are never accompanied by any attempt to define the kind of commitment that is expected of them, or to weed out the uncommitted, or a programme to politicise them. Most observers recognise that the wailing is just another alibi — even so, it demoralises an entire institution. The Cabinet, the National Development Council, and other forums, are now stamping machines which will stamp one thing today and its opposite tomorrow. Norms like honesty in public life, civility in debate, propriety in combat, have been discarded as if they were just adolescent inhibitions.

A serious development such as this cannot do the country any good. Nor can it ensure for the tacticians any more than a moment's advantage. For, as the objective situation worsens, their

party — even in its decimated form — and their associates will turn upon them and offer them in sacrifice hoping thereby to assuage an angry citizenry. As the strength of institutions and the authority of norms would have been eroded by then, the tacticians' party, their would-be successors, and their detractors, too, will act without restraints of any sort. The fate of Chimanbhai Patel — the 'strong' and resourceful Chief Minister of Gujarat who was recently forced out by a popular movement — provides a ready illustration of the way tacticians out-manoeuvre themselves.

The foregoing is only a partial list. Among the many other factors that can be listed one deserves brief mention as it recurs again and again: it is the stain of sharp-practices. Sooner or later relatives or friends of the chief tactician start entering into questionable deals. The first — probably hesitant — steps in this direction are taken when the chief tactician is at the zenith of his power, when he is truly unassailable within the parlour and when the deal seems a triviality, just something to keep the relative or friend occupied — something so small and trivial that no one can believe that it could ever hurt the reputation of the leader. A first morsel inevitably whets the appetite of the relative and the fact that no one challenges him in the first few instances makes him more audacious. However, as the objective situation worsens, as the tactician begins to lose his hold, these indiscretions become a focus of public indignation. The later years of Ayub in Pakistan, of Pratap Singh Kairon in Punjab, of Bakshi Ghulam Mohammed in Kashmir, illustrate the sequence of events.

In these and other ways, India's parlour politicians have harmed the country and, just as systematically, they have sawed-off the branch on which they sit. Sloganeering and illicit money — the crutches on which they have leaned more and more as their substantive contact with the masses has diminished — are also helping to close the circle. It is to these that I shall now turn.

III

Strident slogans have had a dynamic of their own. So as to attract the masses, a *status-quo* party — the Congress — began shouting radical slogans. Other political parties — even when they represented more reactionary elements than did the Congress — followed suit. Upon assuming office, the Congress did little to implement its slogans and so in the next round it could not put forward its performance as its commendation. All it could do was to cover up its record and to distract people by even more radical slogans. Other parties have kept pace. In this fashion, years have rolled by. But such Left-wingery has exacted an enormous price.

First, when after a point slogans have reached a hysterical and feverish pitch, the contrast between them and the facts has become obvious even to the innocent masses. Credibility, that essential of effective government, has evaporated. People have lost faith in political parties, in governments, in the value of free debate, and in parliamentary institutions. Second, just to keep up appearances, just to prove that they haven't abandoned their slogans completely, governments have felt compelled into theatrics — theatrics of 'nationalisation', for instance. As the power base and values of the political party have not been altered, as politicised and specialist cadres have not been built up, such nationalisations have often slowed down the pace of advance. Thirdly, these slogans have restricted the manoeuvrability of the governments to such an extent as to keep them from attempting even those things that come naturally to them. The vacillations and the long delays that have characterised India's industrial policies and the consequent losses in output, are a case in point. Swings from one verbal pole to another (the Leftward swing that marked the government's policies since 1969 is now being replaced by slogans about 'pragmatism') have created uncertainty in the minds of officials, investors, and others. At each round-about most of what was set up in the preceding swing has been hastily dismantled. Today, governments — having proclaimed their commitment to the poor in such strident tones — hesitate to raise the salaries of their senior civil servants. Yet, having allowed the rising consumption standards of the trading and industrial classes, such hesitation has in fact amounted to permitting ministers and officials to accept illicit payments and favours. Finally, the most destructive consequence of the half-baked populist slogans has been legitimised indiscipline.

Apart from the slogans they have shouted, Indian governments have had to deploy enormous amounts of money to persuading the people of their *bona fides*. Corruption has spread so rapidly throughout the Indian political and economic system, that it is best to consider it at some length.

Ostensibly, each member of the Lok Sabha — the dominant wing of India's parliament — gets elected on the premise that he has not spent more than Rs 35,000 on his election. Similarly, the law debars each state legislator from spending more than Rs 10,000 to 13,000. The *cognescenti*, however, aver that an average parliamentary election costs a candidate of the Congress party Rs 200,000 to Rs 300,000 and that an average election to a state legislature about Rs 100,000. When one adds expenditure on other elections — those to district bodies, co-operatives and so on — I would not be surprised if the Congress alone has to muster Rs 60-70 crores every five years. Many observers suggest that even this is a gross underestimate. If the opposition parties deploy even one-third of this, the total would be Rs 80-90 crores every five years. As contributions to political parties are prohibited by law, all collections are *illicit*.

As political parties solicit and receive illicit money they fabricate and maintain an economic system that enables industrialists, traders, and smugglers to earn and enjoy it. Is it any wonder, then, that governments daily decree exceptions to announced economic policies, that producers and traders are allowed to create artificial scarcities, that governments never get around to strengthening the apparatus for collecting taxes and to enforcing regulations about foreign exchange and other matters?

The deleterious effects of corruption are not limited to particular decisions taken in favour of individual contributors. Precedent plays a very important role in Indian economic administration. What is conceded to one cannot be denied to others — *a fortiori*, as India is still an open society and decisions cannot be hidden away in almirahs for long. When an Indian party collects funds from an individual it places itself in debt not just to that individual but to the entire class of which that individual is a part. In analysing the implementation of specific policies, one does not therefore find just one or two exceptions to a declared policy; one finds that the policies themselves have been completely riddled by caveats, loopholes, provisos, and after-thoughts.

The exchange of illicit funds for licences, permits, caveats, has involved the participants in a compact. As politicians and governments are entangled with the unscrupulous in these webs of mutual complicity, they cannot now move against them. Nor are they able to move against subordinates — administrators, police officials, and the like — when the latter set up businesses of their own. T K Mahadevan, the Gandhian scholar, has characterised the situation by recalling a Zulu proverb: a dog with a bone in his mouth can't bark. Indeed, corruption at the top has emboldened and tempted the entire populace. As the Sanskrit adage has it :

yatha raja tatha praja.

I have devoted what may seem inordinate space to corruption, because of my belief that, more than anything else it is eating into the Indian polity. Corruption is cancer, both in the sense that it spreads through the body politic at the astronomical rate of cancer cells and in the sense that its eventual consequences shall be fatal.

It has already corroded our conscience. Today, Indians make subtle distinctions between those who "rake it in for the party" and those who "rake it in for themselves" — forgetting that the one who "rakes it in for the party" damages the political system as much, because he places his party and his government in the debt of the unscrupulous. Corruption has greatly impaired the government's ability to govern. Today, it softens every reform, every law, every executive order that is intended to hit out at unscrupulous elements or at the rich. Corruption has demoralised honest officials. They see their dishonest colleagues and their dishonest political masters prosper — both financially and in their careers — while they languish.[6]

More than any other factor, corruption — and rumours about corruption — have destroyed the moral authority of the leadership and, hence, greatly undermined its ability to govern. When India became independent, its leaders refused to frighten people by police methods into serving national objectives, as they felt that such tactics would have resulted in a totalitarian set-up. They also said that they would not indoctrinate the people with an ideology, that they would not politicise them, as that sounded too much like the system communist states had gone in for. Nor, they maintained, would they try to channel the natural acquisitive instincts of the people into serving national objectives as they did not feel that capitalist methods had resulted in an ideal state of affairs. A leadership that forswore police methods, ideological motivation, as well as harnessing of people's acquisitive instincts could have governed only by its moral authority. And India's experience during its struggle for independence had suggested that, indeed, a people could be governed by example, by moral authority : people had obeyed and followed Gandhi, even though the entire state apparatus was arrayed against him, because of his moral authority. It is precisely this moral authority that corruption has now destroyed.

More and more frequently, these days, we hear the highest in the land proclaim that they cannot move against their corrupt colleagues till people bring forward evidence of specific wrong-doing. The less important fact in this context is that, when specific charges have been levelled at the leaders — such as the charges that four of the cabinet colleagues of Gujarat's ex-Chief Minister have made against him — the Central leadership has not ordered investigation. The more important fact is that the moral standing of a government cannot be preserved by legal niceties. The total inability of India's political leaders to inspire the people to harder work and better conduct, clearly shows that, when the people at large believe that there is wrong-doing in high places, the fact that they cannot document their belief by written records of transactions is small comfort.

In fact, the last decade shows that the difficulties in adducing legal evidence — difficulties which help an individual minister or official — are, in fact, a great handicap to the political system. The difficulties make ministers and officials complacent. They become more audacious and lift corrupt practices to the next plateau. Moreover, on account of these difficulties, a long time passes before public opinion about the corrupt solidifies into legally acceptable evidence. Till that happens, rumours have a field day. As evidence is hard to come by, the stories that reach the people's ears are much worse than the facts. And rumours — Indian governments are now realising to their sorrow — are just as effective in destroying the moral authority of a leadership as are the misdeeds themselves. Written records or no written records, convictions or no convictions, people ultimately lose faith in the leaders, they lose faith in the political and judicial system that keeps these men in office; they, therefore, refuse to abide by its rules. This state of affairs has now come to pass in India.

IV

The internal contradictions of the system have become increasingly apparent during the past decade.

As neither the distribution of income and property nor the values by which the people — in particular, the elite — live have been altered, growth has been retarded and perverted. In large parts of the country, feudal and semi-feudal institutions have hampered the growth of even capitalist agriculture.[7] Similarly, in large parts of the industrial and trading sectors, earnings of the propertied and the well-connected have had little do with production. They have been dependent on acquiring quotas and licences and on creating artificial scarcities of products. Growth has been biased towards the goods, to purchase which the well-to-do have had resources, rather than towards goods which the masses have needed. As employment opportunities have lagged woefully, as the wages they receive for such work as they find have remained stagnant, the poor have often not been able to acquire such goods as have been produced.

As population and the labour force have continued to increase, as the people have become more aware of the inequities in their society and of developments in other parts of the world, the contradictions have become a focus of public indignation. More and more people have become desperate and have begun to agitate and disrupt production. This, in turn, has intensified scarcities. Competition — even among the relatively well-off — has become more intense and clamourous: witness the increasingly strident and resolute defiance by India's professionals — nurses, doctors, teachers, engineers and others. As there has been less and less to go around, governments and other bodies representing the elite (e g, employers' organisations) have delayed concessions as long as they could. They have conceded only when disruption of production or violence has reached an absolutely unbearable point. Each round of this kind has convinced the agitators that governments and other organisations listen only to violence and massive disruptions. Hence, each successive round of protest has been more militant and better organised. This sequence of events is not a passing aberration. It is an unavoidable consequence of the economic and political

FROM THE CHAIR

Bayer

BAYER

Bayer (India) Limited

Speech of the Chairman, Mr B M Ghia

THE following is the Speech delivered by Mr B M Ghia, Chairman, Bayer (India) Ltd, at the Sixteenth Annual General Meeting of the Shareholders on 19th June, 1974:

FRIENDS!

I have great pleasure in welcoming you to the 16th Annual General Meeting of the Company.

The Annual Report of your Company for the year 1973 is already in your hands and with your permission, I shall take the same as read.

TROUBLED WATERS

You are fully aware that the nation's economy has been passing through troubled waters for some time. The year 1973 witnessed the after effect of severe drought conditions that prevailed in major parts of the country during 1972. The scarcity of power, all-round shortages of raw materials coupled with the international fuel crisis have hit hard the nation's economy. This, no doubt, had an adverse effect on most industries in India. On this background, I am confident that the progress made by your Company during the year 1973 must have been well received by you. The sales aggregated to Rs 15.78 crores (Rs 13.20 crores during the previous year), *i e*, 20 per cent up against 1972. The pre-tax profit for the year improved by 34 per cent, i e, Rs 3.09 crores against Rs 2.32 crores made during the previous year. A sum of Rs 64.00 lakhs has been provided for Depreciation (against Rs 54.04 lakhs). The provision for Development Rebate Reserve amounts to Rs 6.80 lakhs (against Rs 65,000). You are aware that the Company's profits now attract Income-tax and as such, a sum of Rs 1.98 crores has been provided for Income-tax and Sur-tax. After careful consideration, the Board of Directors of your Company have recommended to maintain the Dividend at 20 per cent (Rs 20/- per Equity Share) for the year ended 31-12-1973. The Dividend for the year will be paid from the General Reserve. I am glad to announce that 90 per cent of the Dividend will be free of Income-tax in the hands of the Shareholders.

ACHIEVEMENTS

The achievements in the working results of your Company were shared by all the Divisions and I hope that barring unforeseen circumstances and with assumption that the position of both imported and indigenous raw materials supply eases, the Company would maintain the tempo of its progress during the forthcoming years.

Mr B M Ghia

Sales of the PESTICIDES DIVISION registered a further improvement over the previous year. Being fully conscious of the country's long-term need of quality Pesticides, we are determined to embark upon the expansion of our Pesticides Project. We have already received the Industrial Licence for substantial expansion of the capacities. Negotiations for the foreign exchange required for import of plant and machinery are practically concluded and we are confident of obtaining the Capital Goods Licence in the very near future.

Sales of the RUBBER CHEMICALS DIVISION increased further in spite of power shortages in many states and strikes in some of the tyre manufacturing units which consume the bulk of our Rubber Chemicals. In fact, our sales increased more than the level of growth of the Rubber Industry in India in 1973. We managed to maintain export sales of our Rubber Chemicals at last year's level of Rs 13.0 lakhs, in spite of all adverse aspects.

We are fully prepared to take in hand the expansion project of our Rubber Chemicals plant any time hereafter and we intend to proceed to implement the same expeditiously. Necessary arrangements for foreign exchange required for the import of plant and machinery have already been made and we hope to have in hand both the Capital Goods Licence as well as the Industrial Licence in a short time.

The PHARMACEUTICAL DIVISION of the Company worked under substantial strain considering the enormous increase in the cost prices of various inputs, while the selling prices remained unchanged.

On the export front, the Pharmaceutical Division made a major breakthrough. The exports increased from Rs 7.50 lakhs in 1972 to Rs 17.10 lakhs in 1973. We exported Formulations as well as Basic Drugs to Indonesia, Thailand, Singapore, Malaysia, Turkey and Sri Lanka. We expect that this encouraging trend of exports achieved will continue in 1974.

EXPANSION

The Government has granted expansion in the licensed capacity of Chloroquine Phosphate from 4 to 12 tons per annum. The work is under progress for going one step more basic and we expect to start production of 4-hydroxy-7-chloroquinoline indigenously by September/October 1974. This item has so far been imported by us.

We could not succeed in obtaining extension for our continuing to do the indent business beyond 31st July, 1973.

Your Company's continued progress is the outcome of the joint efforts of the management and employees of the Company at all levels and I take this opportunity to express my gratitude to all of them.

Thank you.

REVIEW OF AGRICULTURE

The world had nothing before it got zero

India introduced the concept. The Sanskrit name for the figure was Sūnya meaning void. India was the first to use it in the modern form. The earliest inscription dates back to 800 A.D. But there is evidence in Indian scriptures that the zero was used centuries before.

In this and other spheres Indian talents have enriched the world. We at L&T try to continue the tradition by enriching life through industrial development. We design, manufacture and instal plant and equipment for every vital industry—steel, cement, fertilizer, paper and pulp, nuclear. Leading companies like Toyo Engineering, Snam Progetti, Humphreys and Glasgow, Usine De Melle, Power Gas have called on us for complete engineering, manufacturing and construction services in and outside India. You can call on us for more. We have a vast pool of computer programming man power especially on tap for you.

Who are we? A major industrial complex strategically located to serve the developing world. The success of our service lies in the individual talents of over 10,000 people in our network of offices all over India.

Limits of Indicative Planning

THE Ministry of Industrial Development has released its 'Guidelines for Industries for 1974-75'. In his introductory remarks the Minister of Industrial Development and Science and Technology observes that the 'Guidelines' takes note of the targets for various industries envisaged in the Draft Fifth Plan. As a source of information the latest 'Guidelines' is perhaps an improvement over last year's version. The number of industries for which information is provided 'on the present status and future prospects' has gone up from 110 to 172. Separate sections have been added on 'small-scale industries' and the relevant provisions of the Foreign Exchange Regulation Act, 1973.

The latest 'Guidelines' has also avoided some of the more obvious loopholes noticed last year. For instance, the emphasis on fuller utilisation of capacity through diversification left room for building up unlicensed capacity and getting it regularised later. The illegal creation of capacity and its subsequent regularisation would, it was feared, become a regular feature of the licensing system. The latest 'Guidelines' has dropped the relevant reference to diversification except in respect of industrial machinery where there is flexibility to produce different types of machinery based primarily on the same fabricating facilities.

Last year's 'Guidelines' had been criticised also for its total obliviousness of any scheme of industrial priorities related to the objectives and targets of the Fifth Plan. Two conspicuous examples were those of air-conditioners and domestic refrigerators, for which very large growth in capacity had been visualised. In the latest 'Guidelines', though the list of industries covered has been lengthened, air-conditioners have been altogether dropped and for domestic refrigerators it is stated that "the existing capacity (1,75,800 nos) is ... more or less adequate for the present".

These instances cannot, however, be taken to suggest a general tightening up of priorities. Passenger cars are a case in point. The 'Guidelines' estimates the demand for passenger cars to be of the order of 160,000 by 1978-79 — though the possibility of some slight reduction in this figure due to the hike in petrol prices is conceded — compared to the present installed capacity of 47,400 and output of 44,000 in 1973-74. The Draft Fifth Plan has prescribed a production target of 60,000 passenger cars; and yet the government has issued as many as eleven letters of intent for a total capacity of 2,06,500. The 'Guidelines' fail to indicate how this blatant contradiction between the objectives of the Fifth Plan — "the pattern of production must be moved decisively against sectors which contribute little or nothing to the consumption basket of a representative citizen of the country or do not help directly or indirectly to relieve pressure on our foreign exchange resources" — and the working of the licensing authorities is to be resolved.

A closer reading of the 'Guidelines' strongly suggests an infatuation with so-called indicative planning. For every one of the 172 industries covered, the 'Guidelines' gives existing production and capacity, additional licences issued, some estimate of demand, the possible gap and the permissibility of foreign collaboration. The question of setting up units and creating additional capacity has been left entirely to the whims and fancies of entrepreneurs. If the 'Guidelines' had recognised the industrial priorities flowing from the Fifth Plan together with the resources constraint, it would have specified the concrete areas where immediate establishment of capacity is called for. The Ministry of Industrial Development has apparently yet to realise what serious distortions could arise in fulfilling the objectives of the Fifth Plan, if the gaps indicated in the 'Guidelines' in these industries are not filled. What use is the detailed 66-sector consistency type input-output model for the end-year of the Fifth Plan if the results of its use are not to be translated into the reality?

The two classic instances here are those of paper and cement. For paper the present installed capacity is only 9.54 lakh tonnes; another 15 lakh tonnes of additional capacity has been approved according to the Fifth Plan's requirements. But, laments the 'Guidelines', "the progress of implementation of most of the new schemes is not satisfactory, and it is not possible to indicate how much of the approved capacity will materialise by 1978-79. Having regard to the import of capital goods, however, an additional capacity of about 200,000 tonnes is expected to materialise in the next two years". Paper is a highly capital intensive industry with a gestation period of 4 to 5 years. If the Ministry does not show the required sense of urgency and public sector units continue to lag behind, the scarcity of paper would continue and even worsen. This industry cannot put the blame on price

controls either. In cement 55 projects (20 in the public sector) with an additional capacity of 169.11 lakh tonnes have been approved. However, "on the basis of placement of firm orders for plant and machinery, a capacity of 25.4 lakh tonnes, covered by nine schemes, is presently under implementation".

Despite the relatively better availability of agriculture-based industrial raw materials, the Fourth Plan period saw an average rate of industrial growth of just 4.1 per cent against the target of 8 to 10 per cent which, incidentally, was not reached in even a single year of the Plan. In 1969-70, the industrial growth rate was 6.8 per cent, in 1970-71 it declined to 3.3 per cent, in the subsequent two years it was 4.5 per cent and 5 per cent, respectively, and in 1973-74 "there has been little or no growth at all". Interestingly, in the last year of the Plan the decline in industrial output extended to cotton and jute textiles and vanaspati, for all of which availability of raw materials was relatively comfortable. Likewise, based on the quantum of sugarcane available, the output of sugar should have risen much more. In the case of cement, non-availability of railway wagons has been cited as one of the reasons for the decline in output. In a period of acute scarcity of cement even if railway wagons are not available for transportation, the production could be temporarily held in stock, especially given the easy availability of bank funds. The point is that, in the absence of any attempt by the government to actively expand capacity in a number of industries, many of those who control the production units in these industries have converted themselves into traders thriving on the huge margins available on scarce commodities.

The Emergency

A Point of Grammar

THE remark was almost off-the-cuff. In response to a query by a foreign correspondent, the Prime Minister affirmed that the Emergency in the country is to continue. But, she went on to explain, it is no longer a war emergency; it is an economic emergency. The Proclamation cannot be revoked because of the economic factors.

Let Article 352(1) of the Constitution be read once more. If the President is satisfied that a grave emergency exists, whereby the security of the entire country or any part thereof is threatened by war or external aggression or internal disturbance, he may, by Proclamation, make a declaration to that effect — namely, that a situation of emergency has come about. Since the President so wished, a declaration under this Article was made on December 3, 1971, and the emergency was on. However, that evening, when the Proclamation was issued and the Emergency was declared, the explicit reason stated was territorial aggression committed by Pakistan as heralded by the surprise air attacks. It is that proclamation which has yet not been revoked.

Now, according to the Prime Minister herself, the state of the reality has altered since the evening of December 3, 1971. It is no longer a war emergency. Therefore, the reasons which satisfied the President on that date can hardly constitute the reason for the sustenance of the Emergency now. On the Prime Minister's own admission, then, the proclamation which ushered in the Emergency in 1971 has run its course. Sticklers for constitutional niceties might even suggest that, under the Constitution, there is no provision for the declaration of an 'economic Emergency'. Article 352(1) is quite unambiguous: the President must be satisfied that the Emergency is causally related to a threat to the security of India, or any part of the territory thereof, arising from war, external aggression or internal disturbance. It would perhaps be difficult to establish that the economic tribulations the country is undergoing have led to, or is going to lead to, either war or external aggression or internal disturbance. In terms of what the Prime Minister herself has stated, there is at present no threat of war or external aggression. She might still maintain that she is satisfied — and, therefore, the President is satisfied — that the security of India is being threatened by internal disturbances caused by economic difficulties.

But this was not the reason mentioned in the proclamation of December 3, 1971 — the proclamation which provides the franchise for the current emergency. There is, however, a provision under Article 360 of the Constitution for the declaration of a financial emergency in case the President is satisfied that a situation has arisen whereby the financial stability and credit of India or any part thereof is threatened. Maybe at the current moment the financial stability and credit of India or parts thereof is gravely threatened because of the mess created by the Union and the state governments. But, in case the government is satisfied that such is the state of affairs, it must make a declaration to that effect. In other words, if the emergency is a financial one, it is only proper that the President makes a fresh declaration under Article 360(1) — and not rest on the laurels of Article 352(1). The other question of course remains, namely, whether an economic emergency as referred to by the Prime Minister is the same thing as a financial emergency. If it is not, then obviously Article 360 too cannot serve the Prime Minister's cause and she has to fall back on Article 352 — but not without recourse to a fresh proclamation.

There are two separate issues involved here. First, since it is admitted that the nature of the emergency is today qualitatively different from what it was on December 3, 1971, whether the proclamation issued on that date could still be considered as operative. Purists would argue that if the nature of the factors underlying the declaration of the emergency has changed, the old proclamation has lost its franchise, and a new one ought to be forthcoming in case it is the intention of the authorities to continue with the suspension of fundamental rights. The second issue centres round the question whether it is at all possible to relate causally economic difficulties as such with an emerging threat of internal disturbances.

But, of course, it is a matter of the President's pleasure, no questions can be raised in regard to the degree of reasonableness in any stated assumptions. All that is needed under Article 352(3) is for the President to be satisfied that there is an imminent danger of disturbances taking place, and the President would be satisfied once the Central Cabinet is satisfied.

Those who have long given up faith in the Constitution and the constitutional process will, of course, ridicule such attempts at discovering legalistic chinks in the official armour. Authoritarianism, they will say, is already around; how does it matter if the government is caught napping on this or that point of grammar? For those others who take at face value the allegedly democratic virtues of the Indian Constitution, the Prime Minister's attempt to retool the nature of the Emergency can be acutely embarrassing. Such species are a diminishing number, though.

Bhutan

A Growing Minority

A Correspondent writes:

THE recently enthroned King of Bhutan must be watching developments in neighbouring Sikkim with growing trepidation. The present crisis in Sikkim is a spillover from last year and basically reflects the attempt by that country's Nepali population to asset itself against the dominant Bhotia-Lepcha minority. Nepalis constitute 78 per cent of Sikkim's population. It is very much on the cards that sooner or later a similar train of events may be triggered off in the Dragon Kingdom of Bhutan.

Officially, Bhutan's resident Nepali population is put at under 15 per cent. The 18-year-old King estimates that another 25,000 to 30,000 Nepalis have come in as migrant workers. This would still put the Nepali population at less than 20 per cent out of a total of 1.1 million people. Privately, however, it is guardedly admitted that the Nepalis form at least 40 per cent and that soon they may even comprise the majority!

The Nepalis have come into Bhutan to work on the hydro-electric and other Indian-aided projects. Despite the attractive daily wages, very few Bhutanese are prepared to do this work, mainly because they are tied down to their subsistence farming. Most of the Nepalis have settled in the South. The older residents have been allowed to buy plots of farm land but the newcomers are not, which is a major grievance. The immigrants have not as yet become too conscious of their political rights. Even so, the Royal Bhutanese Government saw fit to ban their political party, the Bhutan Congress, ten years ago; leaders of the party are cooling their heels in Siliguri.

Bhutan's royalty — which, incidentally, is closely related to Sikkim's — has been carefully isolating the Nepali minority. There is token representation in the government: the Secretary for Trade and Industry, Om Pradhan, and a member of the Royal Advisory Council, Jung Bahadur Chhetri, are both of Nepali origin but speak *dzongkha* and prefer to think of themselves as "southern Bhutanese". (A token gesture too was the sprinkling of Nepali traditional dances among the famed Bhutanese dragon dances during the coronation celebrations.) Talk of integration sounds hollow; the south has received far less government funds than the rest of the country. Indeed, there can hardly be any better indication of the "separateness" of the Nepali citizens in the eyes of the rulers of Bhutan than the fact that when King Jigme Singhye Wangchuk distributed alms (at Rs 15 per head) to citizens on two days following his enthronement, the first day was reserved exclusively for Bhotia-Lepchas and the second for Nepalis.

Industry

Labour: The Scapegoat

THESE are bad times for the working class. To curb inflation, a wage freeze has been threatened to be forced down the throats of workers. If production in a wide range of industries is far below what it should be, considering the installed capacity, it is again labour which takes the rap. The impression is sought to be created that it is the workers who have disrupted production with their strikes, go-slows and what have you.

In the public sector no one has been working harder at making a scapegoat of workers than the Minister for Steel and Mines, K D Malaviya. During the debate in Parliament on his Ministry's demand for grants, he had laid the blame for the dismal performance of the steel and coal industries under his charge squarely on the trade unions and on the political influences allegedly operating on the workers. Since then he has carried on in the same strain. Speaking to journalists in Srinagar recenty he once again aired his favourite theme. "I am convinced" he is reported to have said "that if our workers do not accelerate work at the [steel] mills, the future of our steel industry may be dark."

Given the 30 per cent annual rate of inflation and the even steeper rise in the prices of the necessities of life, the wonder is that industrial disputes and strikes have not been more widespread than they have been. One can run through the list of major industries without being able to identify a single one in which actions by workers — and not shortages of power, transport and raw materials and, of course, the efforts of those who control these industries to make super profits by deliberately restricting output — has been the decisive factor in keeping down production. The fact that the working class, even the small organised segment of it, has given in so meekly to the sharp decline in its real earnings as a result of the rise in prices bears testimony to, first, the relative ineffectiveness of their trade union organisations and, second, to the determined use of the police and legal apparatus by the government to crush agitations by workers, whether in the public or the private sector. After all, a government which is convinced that it is the workers who are responsible for its economic problems by preventing larger output and faster growth is unlikely to be concerned about the finer points of propriety while dealing with labour disputes.

Even those who will grant the above propositions for the industrial sector as a whole have been led to believe by official propaganda that steel is one instance of an industry where labour has indeed been the villain. After all, if a Congress socialist of such impeccable credentials as the present Steel Minister says so, there must be some truth in it. In any case, who has not heard of Durgapur's perpetual labour problems and bloody inter-union brawls? But does one have anything more definite than official propaganda and popular impressions to go on in such matters?

The annual report of the Department of Steel for 1973-74 fears that production of steel may have been actually lower in 1973-74 than in 1972-73. It is, however, quite categoric about the major cause of this shortfall; it is "principally due to the shortage of power which has directly affected all the plants except Bhilai, and to the inadequate availability of coal, again largely due to power shortage, which has effected all the plants". It is possible to estimate very roughly that about 80 per cent of the decline in production over 1972-73 was on account of the above-mentioned factors. In respect of the much maligned Durgapur plant, the evidence contained in the report is even more conclusive and more contrary to the current official propaganda. At Durgapur, the report says, industrial relations "showed a perceptible improvement over the situation in 1972-73". Yet output data for the first three quarters of the year show that production in 1973-74 was running roughly 25 per cent below that in the previous year. Surely industrial relations — which showed "perceptible improvement" during the year — could not be blamed for this?

West Bengal

No Easy Arrangement

THE current infighting among the various Congress factions in West Bengal should not be allowed to divert attention from the reality of the state's nearly total industrial stagnation and swelling of the numbers of unemployed. Evidently, all attempts at inducing economic revival have failed. For the past two years, the state government has often flaunted data on fresh investment proposals. The exercise soon got to be known as 'the joke of the Rs 500 crores', since the 'investment proposals' aggregated to somewhere around that figure. But most of these proposals have been little more than enquiries. Between the enquiry and the placing of a formal application for a letter of intent, between a letter of intent and the actual issue of an industrial licence, between an industrial licence and actual investment — at each stage, there has been, and continues to be, a yawning gap. In most of these enquiries, the investment proposal is conditional. The condition is that substantial facilities and funds, should be available, as loan or as subsidy, from the government sector: either from the government's own sources or through lobbying with the public financial institutions. In a large number of cases, the original proposer is agreeable to proffer not even five per cent of the total capital needed.

Therefore, it is only partly true that investment activity has suffered in West Bengal because the Union Government has been niggardly with the letters of intent and industrial licences. Making the state 'politically safe', too, has had little impact on the deployment of private 'risk' capital. And this at least partly reflects the hard-headed judgment of big business that the liquidation of communists has not contributed much toward the creation of a more secure industrial climate.

The public financial institutions, it is true, have tended to discriminate against West Bengal during the past two decades. Here a certain inertia is at work. In the late forties or early fifties, going by per capita income levels, in which West Bengal came way on top, the banks, the Life Insurance Corporation, the Industrial Finance Corporation of India, the ICICI, the Industrial Development Bank, *et al*, considered it unnecessary to try to expand the capital base in the states. But developments changed the face of West Bengal. The influx of refugees in several waves, the stagnation in agriculture, the increasingly unfavourable land-man ratio, the gradual silting of the port at Calcutta, the impact of the industrial recession in the country on the heavy engineering plants located in the state, and, finally, the political turmoil — all contributed toward a steep decline in the rate of growth in state income. A number of other states pushed ahead, while West Bengal stagnated. Today, in terms of per capita income, the state is well below not only Maharashtra, Punjab and Haryana, but also Andhra Pradesh, Gujarat and Tamil Nadu.

Certainly, the public financial institutions ought to catch up with this new reality. Were a larger flow available from the financial institutions, the private units might exhibit a somewhat greater enthusiasm, since West Bengal still retains a differential advantage in wage rates in the organised industrial sector. It is the state government that would have to do the campaigning with the public financial institutions over this issue.

But even if the public financial institutions offer finances to private parties willing to expand activities in the state, it is still uncertain that it will herald the start of a new era in the state. For, in the ultimate analysis, it is the total milieu that counts. That milieu has little to do with which political party is in power or how much finance is available.

Technically, the Prime Minister's party has an overwhelming majority in the state Assembly and the Left is very much on the defensive. Since 1970, public funds have also been made available in somewhat more generous terms for various developmental projects: most of these have not even been used up fully. The fact is that other things count as much. Efficiency in administration is as good as non-existent. The quality of the civil service has declined steeply in recent years. Very few in the secretariat are willing to do an honest day's work. This is true as much of the top bureaucrats as of the clerks, who in any case would claim to have lost their *elan* because of spiralling prices. Both groups — the clerks and the senior bureaucrats — take their cue after all from the from the political leadership. It is a remarkably inept leadership, reflecting the quality of men who, for various reasons, have felt drawn toward the Congress party in the course of the past few years.

Once they were re-stalled in power in early 1972, several of the Congress leaders, scarcely realising how the arithmetic matches between resources and returns, fell for the notion that economic success was a unique function of public relations. That phase of innocence is now over, the early shouting and hollering have died down, but there is yet no hard, solid work. One of the main accusations hurled against the constituents of the United Front was the deployment of the apparatus of the State for purposes of the party. Yet, compared to the Congress party's performance in this area during the past two years, the parties of the United Front seem examples of moderation. Since March 1972, the distinction between the public and the private domains has been altogether obliterated: the machinery of the State and its various facilities have been single-mindedly put to work for sectarian causes. Even that might not have been so disastrous in the long run if there was some competence in economic administration. There has been none. For example, more than Rs 150 crores have reportedly been spent on the Calcutta Metropolitan Development Agency Projects, mostly for drainage, sanitation, and road-building. But there is hardly any visible, concrete evidence of where the money has gone.

This is a milieu which negates all expectations of higher production and productivity. And even the political stability, supposedly ushered in with much effort, could prove illusive as is already being demonstrated. Clearly, a government whose administrative and economic achievements are negligible cannot aspire to be in control for long. Sooner or later, people, not getting anything out of the system, will break out in protest: the nature of the protest is not predictable, and it would be suppressed, but the discontent would continue to simmer. Private entrepreneurs are aware of such prospects.

Daniel Thorner

DANIEL Thorner, research professor at the Ecole Pratique des Hautes Etudes of the University of Sorbonne, died of cancer in Paris on June 18. He was 59. With his death, India has lost a dear friend and the world an eminent scholar.

Starting with his celebrated work on the development of Indian Railways, Daniel Thorner's principal preoccupation remained the Indian subcontinent. After a brief spell as a member of the US Lend-Lease Mission in India after the War, Thorner returned to teach at the University of Pennsylvania in 1947. Along with Simon Kuznets and others, he helped to set up in the University a South Asia Study Programme, which continues even now. Later, around 1952, he came to India for a study of agricultural development and agrarian change. What started as a short visit turned into a long stay in India, as a refugee from McCarthyism in the US.

During those years, from 1952 to 1960, Daniel and Alice Thorner illuminated many areas of Indian agriculture and agrarian society. Much of this research was based on extensive field work, and was set in the perspective of historical and dialectical processes. For Daniel Thorner, particularly, there were no economic events or processes as such; they were all a consequence of political forces and social conflicts, made more oppressive by privilege, custom, and religious bigotry.

On moving to Paris in 1960, Thorner continued his research on problems of economic development in the Indian subcontinent at the Ecole Pratique des Hautes Etudes. Side by side, he undertook the laborious task of editing and publishing the classical work of Chayanov on Russian agriculture. To India he returned again and again, refurbishing his knowledge and verifying his hypotheses. His visit in 1971 coincided with the ravaging of East Bengal by Pakistan and the birth of Bangladesh. Appropriately, Thorner's final visit in 1972 was to Bangladesh, to several of whose leaders he had offered succour in their days of dire need.

Daniel Thorner strove for the betterment of those in the lowest echelons of Indian society, the sharecroppers, and the landless labourers, by exposing, with a wealth of data gleaned from first-hand observation, the selfishness, hypocrisy and exploitation that invest Indian agrarian society. For him India was both a source of inspiration and despair.

LETTERS TO EDITOR

Interest Rates

THERE is much more to the socialistic argument in favour of higher interest rates than H T Parekh ("Credit Policy, Interest Rates, Central Banking and All That", May 25) is willing to concede.

The influence of the prevailing interest rates on the choice of technology cannot be ignored. Any entrepreneur has a choice of at least two alternative technologies each representing a different combination of labour and capital inputs. In comparing the costs of these two inputs, the Indian capitalist considers not only the monetary costs but also the psychological costs involved. If only monetary costs were considered, India would have perhaps developed a far more labour-intensive industrial structure than it has today, and a lot more people would have been pulled above the poverty line.

The Indian capitalist wishes to minimise his labour "headaches". He does so by choosing a technology which gives him the minimum requirement of labour. He is able to do this because he has the blessings of the suppliers of technology in America and Europe, and the governments of the countries which provide long-term credits at comfortable rates. If the interest rates were pushed up to "uncomfortable" levels, the demand for the technology as well as the credits would soon dry up. One can therefore see why H T Parekh comes down so heavily on the advocates of high interest rates.

Seen in this light, Parekh's advocacy of the "historical approach" to interest rates is a straightforward defence of feudalism in Indian industry. It is the defence of a class that has not learnt the art of managing labour and is not interested in going through the painful process either. A higher cost of capital would greatly upset the feudal relationship between the entrepreneur and labour to the advantage of the latter. This seems to worry Parekh.

The possibility that progressive economists will not agree on the computation of the appropriate rate for India is no argument at all against the need to make rates truly reflective of the scarcity value of capital. There is nothing particularly socialistic about this. What is scarce should be made expensive and what is abundant should, in comparison, be cheaper. Since there is in our society a psychological aversion to using more of what is abundant, we must compensate for this by a more powerful economic deterrent against the overuse of what is scarce. How else can a country develop a mix of factors that gives its products the maximum international competitiveness?

In this process, some vested interests will be hurt. But this consequence is no reason, nor a good argument, in favour of the present state of affairs.

Bharat Gold Mines

PLEASE refer to the article "Keeping Up Appearances" by Magnus in the issue of June 1, 1974. The statement "Bharat Gold Mines wants to take contracts to make machinery, to provide consultancy and to produce other metals; meanwhile, gold output has halved since 1971" is incorrect. The actual gold production figures for the years 1969-70 to 1973-74 are given below from which it will be seen that production has fallen only this year by 10 per cent:

	(Grammes)
1969-70	19,78,788
1970-71	21,78,197
1971-72	22,46,487
1972-73	20,00,249
1973-74	18,01,877

Larger Margins Despite Higher Costs

Hansavivek

POLYOLEFINS INDUSTRIES, engaged in manufacture of high density polyethylene and processing of polyethylene products, is seeking an industrial licence for setting up a project in MP for annual production of 70,000 tonnes of calcium carbide. Estimated to involve a capital outlay of Rs 20 to 25 crores, the project is likely to be financed partly by a 'rights' issue of capital. Of the total production, some 40,000 tonnes will be sold to NOCIL (National Organic Chemical Industries) and the remaining quantity to Hoechst Dyes and Chemicals, which has plans to establish a plant in MP for production of vinyl acetate monomer. Meanwhile, PIL's scheme for stepping up capacity for high density polyethylene from 20,000 tonnes to 30,000 tonnes per annum is in the final stage of implementation. A plant for the production of n-Butene-1 with a capacity of 600 tonnes is also being installed. During 1973, PIL's output of high density polyethylene increased from 19,046 tonnes to 22,997 tonnes and of processed polyethylene products from 1,398 tonnes to 1,827 tonnes.

On a turnover nearly 10 per cent higher at Rs 10.88 crores, gross profit advanced by over 24 per cent to Rs 4.35 crores, although the cost of naphtha rose sharply. With the 10-year-old company still out of the income-tax net, net profit was substantial. Although dividend is maintained at 12 per cent, the whole of which is exempt from tax the board has also recommended issue of gift shares to the shareholders on a one-for-three basis and indicated repetition of distribution at the same rate on the enlarged capital.

The company's income-tax assessments are complete upto 1970. The directors have created development rebate reserve of Rs 235 lakhs in respect of plant and machinery out of the latest year's profits. Of this, only Rs 1,36,000 relates to 1973 and the balance to earlier years. They had created development rebate reserve of Rs 135 lakhs out of the profits of 1971 and of Rs 145 lakhs out of those of 1972. It is now felt that in view of past losses and unabsorbed depreciation, no deduction for development rebate will be allowed under the Income-tax Act for the accounting year 1971. Accordingly, Rs 125 lakhs out of the development rebate reserve created in 1971 have been transferred to the general reserve after retaining Rs 10 lakhs in respect of plant and machinery installed during 1971. Total development rebate reserve at the end of 1973 thus stood at Rs 390 lakhs. On a writ petition by the company, the Bombay High Court, quashed the order of the Income-tax officer withdrawing the development rebate of Rs 316 lakhs granted for 1968 and allowed to be carried forward and set off against future profits, but the company understands that the department is taking up the matter in further appeal before the Supreme Court.

NATIONAL ORGANIC CHEMICAL INDUSTRIES is seeking an industrial licence for annual manufacture of 1,500 tonnes of technical organo phosphates as also derived formulations, based on technical knowhow to be supplied by the Royal Dutch/Shell Group. The project is estimated to cost over Rs 10 crores. The raw materials, which are not naphtha-based, willl be available mainly from indigenous sources. If the proposals are sanctioned shortly, the management hopes to be able to commission the plant by the end of 1976. Since the company's existing trading activities include the marketing of similar technical and formulated pesticides, the existing distribution facilities in India can be advantageously utilised for the products of the proposed plant. Meanwhile, the new naphtha pipeline from Burmah-Shell Refineries, across the Thana Creek bridge to the plant site is expected to be soon commissioned for use. Total production volume in 1973 was higher than in the previous year, despite frequent interruptions due to power failure. With demand for all the company's products increasing steadily, net sales increased by about 19 per cent to 34.13 crores. Sharply rising cost of naphtha notwithstanding, gross profit at Rs 12.37 crores showed a gain of over 41 per cent over the previous year's level. Equity dividend is raised from 10 per cent to 12 per cent. The statutory development rebate to be availed of as at the end of 1973 in respect of plant and machinery is estimated to be Rs 12.57 crores. The company has created a reserve of Rs 7.50 crores, including Rs 50 lakhs relating to expenditure on plant and machinery installed in 1973.

BRITISH PAINTS (INDIA), a member of Berger, Johnson and Nicholson group of UK, operating in India for the last 50 years, has now decided to reduce the foreign shareholding to 45 per cent by issuing 2,62,282 equity shares of Rs 10 each at a premium of Rs 4 per share to Indian nationals only. The board's decision has followed a condition stipuated by government while sanctioning the company's bonus issue last year. According to the proposal submitted to the Controller of Capital Issues, 97,395 shares are proposed to be offered to existing members as 'rights' on a one-for-five basis, 26,000 shares are to be reserved for subscription by directors and employees of the company, and 1,38,887 shares are to be made available for subscription to the public. The company has produced very good results for 1973, although the directors complain that it was a year of shortages and high prices of important raw materials and when unscheduled load shedding interrupted production. The accounts show, however, that on an increase of 12 per cent in sales by volume, net sales realisation advanced by 31 per cent and gross profit jumped ahead at twice that rate. Equity dividend, maintained at 12.5 per cent on the enlarged capital, is fully covered, whereas last year's payment was a third short earned. Foreign exchange earnings by way of exports amounted to Rs 14 lakhs, while value of imports of raw materials exceeded Rs 16 lakhs and foreign remittance of dividends came to Rs 4 lakhs.

NATIONAL RAYON's nylon-6 tyre cord project, which has been lagging behind because of economic conditions and delay in finalising the required additional finance, is now likely to go into stream either at the end of this year or in the first quarter of next, according to the chairman Naval H Tata. The original cost estimates will have to be revised owing to revaluation of some foreign currencies and mounting prices of Indian equipment. The company has yet to receive the revision of its import licence on account of revaluation of foreign currencies and also licences for crucial equipment like cording and twisting machinery and machinery for conversion of yarn into fabric. NRC has also received a 'letter of intent' for manufacture of additional 100 tonnes of caustic soda per day, but the directors are having second thoughts on it and are going into the economics of the projected cost of production of the main product as well as the allied products. The company's performance in 1973 has been better on the whole than in 1972. Although realisation on the textile yarn was high, the company did not do so well on the cord side owing mainly to power-cuts, strikes and lock-outs in the tyre industry affecting some of its important customers. Equity dividend, raised from 28 per cent to 30 per cent, has a better cover than in the previous year. The chairman anticipates a very high demand this year both for textile and tyre yarns.

WELLMAN INCANDESCENT INDIA's capacity for industrial furnaces and allied equipment has been allowed to be stepped up, in terms of value, from Rs one crore to Rs 3 crores per annum — subject to the execution of a technical collaboration agreement with Wellman Engineering of UK to the satisfaction of the Government of India. One of the terms of this agreement, stipulated by government, is that the foreign equity holding in the Indian company should be lowered to 40 per cent. The company is, therefore, offering 68,000 new equity shares, of Rs 10 each at par, as 'rights' on a 6-for-11 basis to Indian shareholders. Looking to the order book and the outlook for the company's business in the future, the management feels that the company should be able to fully exploit the enhanced licensed capacity. During the year ended March last, the company's factory had a lock-out for 6 months; it also had to experience frequent interruptions in power supply during the remaining period. Even so, completed sales increased by 12.5 per cent to Rs 144 lakhs. Since margins came under pressure, however, gross profit fell from Rs 18 lakhs to Rs 11 lakhs. The board has recommended a 10 per cent dividend.

COROMANDEL FERTILISERS is going ahead with its expansion project and expects to be ready for major linkage before the end of this year and for test runs in early next year. This project has also given the company an opportunity to set right some of the weaknesses noticed in the existing process units. With the implementation of the programme, the company will have an increased volume of product for sale which will strengthen its position. Production in 1973 approximated 1,83,000 tonnes, a decline of 30 per cent compared to 1972. The shortfall was due chiefly to power-cuts, disturbances and, in some measure, operating problems arising from mechanical breakdowns. The chairman, Bharat Ram, pleads that the fertiliser industry be exempted and insulated from power-cuts. The company's proposal for setting up a 5 MW power unit as a standby has been disallowed by government, because it was based on oil usage. Bharat Ram appreciates the state government's gesture of not imposing any cut in the power supplied to the company this year. Referring to the sharp rises in prices of rock phosphate and sulphur, he says that a short supply situation has developed in exporting countries and that if the freight rate trends continue the price of sulphur may go up still further.

Calcutta Diary

A M

THIS is an inexorable process; the shortage of paper claims victims in the remotest quarters. The little magazines are in danger of extinction: the ones with pretensions of monthly appearance have converted themselves into quarterlies; the quarterlies have turned into biannuals; the biannuals have ceased to be so, they have become so much chancy statistic. And all of them have thinned down.

Thereby, a certain richness of life is being rubbed out. Call it a transmutation of the libido, call it the burning of not-altogether-sparable calories, the little magazines represented an archetypal heritage of the Bengali middle class. There is this continuous tussle between mind and matter; the little magazines were the mind challenging the matter. Take any cross-section of clerks, school and college teachers, the unemployed. At any given moment, they are without funds; the sum of these moments is their collective existence. Nevertheless, at any given moment, a fair number among them were wont to indulge in the luxury of a little magazine. The range of themes such magazines would cover boggled conventional imagination: flaming prose; flaming poetry; poetry, as much of the revolution as of the cloister; Jean Genet and the theatre of the absurd; alienation and young Marx; personalised essays, some harping on the nostalgia of life in Presidency College circa 1949, some dilating on the epic heroism of an obscure woman partisan in Vietnam, another one perhaps analysing the agony of a cricket enthusiast on the eve of a test match; a number exclusively given to short stories; Utpal Dutt and the crisis of Bengali drama; Baudelaire and the concept of hell; nineteenth-century Calcutta tapestries; a discourse on whether Titu Mir was a revolutionary or a charlatan; neo-fascism, fundamental rights, and the elections of 1972; translations of three, or six, or eight French slapsticks; annotated commentaries on Antonio Gramsci's prison notes; a heavily footnoted dissertation on the Central Intelligence Agency's roster of alleged activities in South Asia since 1946; the McMahon Line and Neville Maxwell's "India's China War"; is Rilke relevant in the post-EEC European context; a pistachio of an issue running down, evenhandedly, the CPI(M) Satyajit Ray and the up-and-coming Davis Cup player. And the magazines would come in all sizes and shapes. The pages would be replete with naive snobbery; occasionally, there would be name-dropping aplenty; gushes of lyricism would follow pages spouting revolutionary fire; crass dishonesty would co-exist with all too obvious integrity. The writers would run one another down; the adversaries would be called the vilest of names; opportunism would snugly creep up and make a niche for itself next to fearless outpourings of invective against well known establishment figures.

Good, bad, often indifferent, together they still constitute a climate. A mirror to Bengali middle class life, you could say. Insufferable egotism, matinee-kind sentimentalism, wide-eyed sensitiveness, incorrigible nihilism, malice stemming from close and claustrophobic existence, imagination full of audacity, courage to dream impossible dreams, courage to compose incredibly sensuous lines, total indifference to the even bare rudiments of economics and finance, dangerous survival from day to day. Some of the contents might have appeared as prize specimens of elongated adolescence, some others could have seemed atrocious beyond words; but suddenly, in the melee, one would come across a piece, short or long, describing, with meticulous care, the sociological foundations of nineteenth-century French cuisine, or a profoundly moving, strikingly original, tract on Albert Camus and the notion of decadence.

Take it or leave it, these little magazines were a composite whole, an assertion of the left-over life of the Bengali middle class now fast a-dying. Economic opportunities have long passed them by. A combination of follies and circumstances has ensured that, in money matters, they will remain inept for ever. Sometimes the Centre will be blamed, with or without reason, for all that has happened or has not happened. Now and then, perhaps, a more perspicuous piece would appear in one of these magazines, drawing attention to the native deficiencies of the Bengalis themselves: it would be hard-hitting, mercilessy objective, not mincing a word. But while hard words do not break bones, they do not alter the face of reality either. Some of Bengal's young people have thus sought revolutionary death, some have disappeared behind prison bars; some others have taken to Bonnie-and-Clyde quasi-adventures, but with little of pure romanticism percolating in these. All of that, however, still leaves out a considerable number. The latter do not know quite which way to turn. This is an admission which they would hate to make even to themselves. The Bengali ego remains the Bengali ego. Woefully lacking in funds, deficient in calories, the Bengali youth — parochial, impossible — would still like to imagine the rest of the world to be lying at their feet. They might be without food, the only nourishment since morning till late afternoon might be a few tepid cups of tea or coffee, the animation would still not quite go out of their constitution. At this time, and at all times, every one of them is nonetheless a hero unto himself. The hero would launch a little magazine.

Perhaps nothing would ever be set on fire. Perhaps the course of a little magazine was always pre-determined, predictable, as predictable as the volatility of Bengal's youth. Perhaps to an outsider, idly leafing through the pages of such magazines at a street-corner stall, the contents were excruciatingly tiresome: perhaps when you got to know a couple of them, you had known them all. Even so, it would be no move towards Pareto Optimality if these shut down — as might soon be the case with most of them should the cost of paper become increasingly prohibitive and the all-round inflation raise other costs alongside. For it would then be a world without catharsis. As Aristotle sayth, it not gnosis, but praxis must be the fruit. To grant each his own gnosis is not enough. The ego must have its outlet. The decrepit Bengali youth, bereft of co-ordinates, cannot prosper in business. They will flounder in industry; if nothing else, the land-man ratio will keep them away from agriculture; by now they have neither the inclination nor the aptitude to join the various administrative services in their hordes. Binomial causations are at work, and these youngsters, even if they wanted to, will no longer be able to catch up with the remorseless turns of history.

Economic opportunities are a function of asset-holdings. It is altogether futile to speculate whether the distribution of asset-holdings, as it has come about, has a built-in bias against these young people, or whether nemesis has been brought about solely by the Bengali's passion for iconoclasm and vacuous romanticism. Maybe the latter proposition has an element of truth in it. But any attempt to rid the Bengali of his core of cynicism-alternating-with-romanticism would hardly do much good. Take away their little magazines, and several of these youngsters would be deprived of the privilege of the only praxis they know of. The closure of the magazines would not automatically lead them into the ante-rooms of money-minting companies, nor into the cosy parlour of the government. For the issue of asset-structure is not a mere matter of psychological obsession: it is a concrete entity, and cannot be demolished at short notice just because some alleged idlers have their fiddling instruments confiscated. Those who are in with the assets would resist those who are out; the would-be gate-crashers, the overwhelming majority of them, would return empty-handed. What would they do then, without their little magazines?

Only a thin line separates the hilarious from the tragic. A world without little magazines could, according to some, appear to be a world with so much less trash. In case you happen to be a cost-benefit megalomaniac from the ravines of economics, the disappearance of the little magazines might even seem a crucially significant development, bottling up a 'non-priority' activity, with so much saving of precious paper. Nobody seemingly is bothered about the opportunity cost involved: quantifying that would require venturing beyond one's nose, always an inconvenient chore. By shutting down the little magazines, you would be killing many loves, quashing many dreams. But, what should be more relevant, you would be shutting off a modality of expression: the emotions which belong to a dangerous span of years would henceforth keep simmering, but would not be able to simmer over. A complex of urges would grope about in search of an outlet. If there is not going to be any letting out of words, who knows, there might be a whole lot of extra letting of blood.

CAPITAL VIEW

The Presidency

Romesh Thapar

WE are about to plunge into the politics of the presidential election. Apparently, just before the Prime Minister left the Capital for her tour of forward posts in Ladakh, she dropped the name of Fakhruddin Ali Ahmed as a suitable candidate. Of course, this doesn't mean that he is the candidate. He is the first 'kite', as it were, and reactions will be studied — particularly the reactions of the Giri family in Rashtrapati Bhavan. One has to speak about 'the family' because there is some confusion about who in the clan will take the decision about fighting for another term.

Opinion is divided about 80-year-old Giri's ambitions. Until a few months ago, he was not giving any indication of being interested in another term. Then, reports began to circulate about how fit he was, 'like a young man', even though photographs showing him being propped up by ADCs belied the reports. Soon, we were being fed on 'Giri's opinions' which were critical of the Prime Minister. Clearly, he was 'in the running'.

We are now assured that Giri will stand, not as the nominee of a party, but as the 'people's candidate'. This familiar gambit developed soon after the crisis surrounding the railway strike, during which the President of India spoke like an 'impartial' observer of the scene. And, now, a more significant opening shot has been fired — an article in the CPI's central organ urging that Giri be a 'consensus' candidate, whatever that might mean.

Not Worth the Tension

In Giri's rather talkative entourage, where family members mercilessly exploit protocol and privilege at every opportunity, there is no sign that the good days are coming to an end. Plans are even being projected for ceremonial tours next year. After all, hasn't the Lord Shiva so decreed!

As for the toughies who observe the sick scene in Delhi, the feeling is all prevalent that if Giri digs his uncertain toes into the ground, and is persuaded by his wife and the other leading members of his entourage to turn a deaf ear to the Prime Minister's plea that he retire, then the political embarrassment will be such that probably Giri will get his second term — as a so-called 'national' candidate. Clearly, the way the Prime Minister views the Presidency, it is not desirable to build up unnecessary tensions at this problem-encrusted moment.

If one goes deeper into the situation, it is easy to understand why patchwork solutions usually dominate. The ruling party's candidate for the Presidency is no longer a man chosen for the respect he enjoys nationally. He is, usually, a defunct politician who will reflect a certain regional or communal balance, and who will not make trouble. Such men — or women, for that matter — cannot make the candidature of the Giris of this world look ridiculous. This is the essence of the present presidential speculation.

What is the feeling in the country? Neither this nor that. The President is too remote a character. In the towns, particularly the cities, the demand is crystallising that Indira Gandhi give the presidency not only a new dignity, but a new discipline. Everything that pertains to the Rashtrapati and his activities has become lax. And reform is doubtful unless associated with someone who understands the need for setting the correct precedents. Our institutions are living on borrowed time. This requires urgent understanding.

It is extraordinary how the national Press evades this whole issue on the false assumption that Presidency should not be discussed in public. Those who trot out this excuse forget that no one in a democracy is above comment. As for the presidential institution, it needs thorough definition, restructuring, and disciplining. The gossip that surrounds Rashtrapati Bhavan and its inmates is unhealthy, but it will continue so long as there is refusal to face responsibilities.

Well, where does one begin? Naturally, in the selection of a candidate. Who? An easterner? A southerner? Where are the national figures? Have they all perished or are they all eighty-year-olds? Maybe, we have some tame candidates who will pass muster. What a motley bunch? Where does one turn? To a woman? Not really. Then what? And so it goes on, this sad, sad speculation. There is no one to give a fresh lead — and the so-called radicals are about the most dead in the head.

FROM OUR CORRESPONDENTS

India's Nuclear Explosion: Its Effect upon Environment

David Gosling

AS the political repercussions of India's "peaceful" nuclear explosion continue to reverberate to and fro across the Atlantic, it is pertinent to consider the environmental issues raised by underground nuclear explosions. Worldwide press and public reaction to the recent explosion reflected a mixture of ignorance about the extent to which India's nuclear potential over the past two decades has progressed, coupled with dismay that scientific progress should appear to be used by a developing nation for something other than economic development. These attitudes were typified to a large extent by Canada's uncertainty as to whether or not the plutonium used in the explosion had been obtained from the Canadian-designed CIRUS reactor at Trombay or by indigenously built Indian reactors, and by the Canadian government's later threat to suspend certain types of economic aid to India. Insofar as Canada has always been in the forefront of countries which have provided assistance to India on fairly generous terms, the reaction was understandable enough. But the Indian reply, namely that nuclear explosions really *can* be used for peaceful economic purposes needs both to be examined carefully, and also to be set against the background of the Indian government's overall nuclear programme.

Planning for Some Time

Firstly, it needs to be stressed that although the timing of the explosion was apparently arbitrary, India has been planning an underground nuclear explosion for some time. A year ago it was discussed in *Nuclear India*, a technical Atomic Energy Commission publication, and Rajasthan was mentioned as the most probable site. Last December K C Pant, Minister of State for Home Affairs, told Lok Sabha that experiments of this nature were unlikely for some time, but added, darkly, that it was not "in the interest of the House to know about the date". Pre-test hydrological and ecological surveys still needed to be conducted, and the cost was likely to be very high.

There is no scientific reason to doubt the legitimacy of using small nuclear explosions to unearth mineral and other deposits. Both the Russians and the Americans have been exploding underground devices for many years — much to the annoyance of countries such as Sweden which have been urging the superpowers to honour the 1963 partial test ban agreement. But the Russians have argued persistently and persuasively that in addition to underground explosions designed to test nuclear "deterrents", they have also used nuclear techniques to loosen vast mineral deposits. Not surprisingly India has denied any kind of political link with Russia over their recent explosions; however at a purely technological level Russian and Indian scientists have pooled their knowledge about ways of exploiting mineral deposits at a number of scientific conferences. A recent issue of *Nuclear India* mentions the effect of plutonium pollution on marine life and states that plutonium concentrations in the ocean "will probably be increased as a result of fast breeder reactors . . . situated near the coast". But India's oil deposits are also situated near the coastlines, and it seems more than likely that nuclear explosions may be used to locate them and to intensify their concentrations.

Another Device

If and when India decides to explode another "device", it is likely to be either in a coastal region where oil has been located, or in an area where uranium deposits similar to the ones which were recently found in the United Provinces are thought to exist. These deposits are not particularly dense, but they extend in a large arc from a point where a line bisecting India from north to south touches the lower limit of the Himalayas in a north-westerly direction. The Rajasthan explosion occurred well south of this area, but the choice of the site was probably determined by safety considerations. If India did decide to explode a nuclear device in the region of her uranium deposits, then she would almost certainly incur the wrath of either Pakistan or China, depending on which section of the deposits she chose to exploit.

Before discussing the problems raised by nuclear explosions for the safety of the environment, it will be convenient to review briefly the stages by which India has been able to produce plutonium indigenously. Indian research on plutonium technology began in earnest in July 1958 when the Atomic Energy Commission decided to construct a pilot Plutonium Separation Plant at Trombay. Its capacity was designed to be large enough to treat about 50 tons of used fuel elements from conventional uranium reactors per year, and work on the plant started in early 1959. By 1964 most of the construction work was complete, and chemical tests on the properties of plutonium had also been carried out at a Radiochemistry Laboratory.

Very Tenuous Indeed

Active fuel from a reactor was first introduced into the plant on June 1, 1964, and plutonium has been steadily accumulated since then. The entire Plutonium Plant was built without any foreign technical assistance whatever; admittedly spent fuel from the joint Canadian-Indian reactor, CIRUS, was initially fed into it, but more recently the Plant's plutonium supplies have been obtained from the Tarapur Power Units. Thus the link between the underground explosion and Canadian aid is very tenuous indeed.

It is important to see the significance of Plutonium technology against the wider background of India's overall nuclear Plan. It has been known for three quarters of a century that in the beach sands of Kerala and Tamil Nadu "there are the largest deposits of a substance known as monazite in the world. Other deposits are located on the Ranchi plateau in southern Bihar, and these contain nine or ten per cent of the element thorium. In all, some 500,000 tons of thorium are contained in these monazite deposits. This massive natural asset sets the pattern for India's long range nuclear planning and the crucial role played by plutonium.

Thorium is a harmless enough element as it occurs naturally, but it can be incorporated in a nuclear transformation cycle to give uranium-233, which has a similar nuclear configuration to thorium, but which is radioactive. Uranium 233 can be used together with plutonium in a fast reactor to produce atomic energy. But not only does this particular fuel cycle give large quantities of energy, but is "breeds" extra plutonium. This additional plutonium is so pure that it does not even need to be processed in a Separation Plant.

India could conceivably have leapfrogged the construction of a Plutonium Separation Plant, imported small quantities of plutonium to feed her fast reactors, and then stockpiled the plutonium bred by them. But it is very likely that whoever gave the initial supplies of plutonium would have insisted on an all-time embargo on the use to which it was put, and if recent Press reactions are anything to judge by, peaceful nuclear explosions would have been precluded from the start.

Limitations of Plutonium

India's choice of plutonium technology has therefore been determined by economic and practical reasons. Nonetheless, plutonium has its limitations, and these must be briefly reviewed.

First of all, plutonium is highly radioactive. The dangers of radioactive contamination can be very serious as anyone who has seen the the photographs of radiation burns caused to Japanese fishermen by radiation will know. Within the context of a peaceful atomic energy programme the danger of radiation burns lies largely in the fact that they are incurred without immediate pain. The radiation enters the body tissues in such a way that the damage is apparent only several days later, by which time it may be too late to take effective remedies. It is not so long ago that a research scientist in the UK contracted leukaemia by standing beside a nuclear generator which he thought was switched off.

Plutonium is just about the most lethal of all radioactive substances, and as little as 0.6 millionths of a gramme taken into the body can cause death. Such a small quantity may float around as a minute dust particle, and its presence can only be detected with a Geiger counter or on a radiation badge. All scientists working near nuclear radiations wear special badges which tell them when they have been in contact with radioactivity. However although the use of such badges will indicate when the maximum safe dose of radiation has been reached, they will not be of any help if it is suddenly exceeded, and there is little chance of recovery from the effects of large doses of radiation. Scientists in laboratories all over the world work with plutonium and other toxic substances, but nuclear explosions, even the most peaceful ones, are not conducted in scientific laboratories.

According to H N Sethna radioactive fall-out from the Rajasthan explosion was negligible. In July scientists will study the radioactive contamination of rain water as it collects on the site during the monsoon. But it will take years for them to decide whether or not nuclear explosions will ever facilitate the storing of water in desert regions, and radioactive contamination will make any water undrinkable for a long, long time.

The time taken for plutonium radioactivity to subside is very long, and this is a second reason why plutonium may be less than ideal. The half-life of plutonium, that is, the length of time taken for one gramme of plutonium to decay by alpha particle radiation to half a gramme is 24,360 years! By the end of this period, earthquakes, subterranean rivers, or even normal surface erosion may have moved any radioactive materials a long way from their original location and brought underground nuclear waste to the surface.

Excellent Record

It can be stated with some justification that India has an excellent record for nuclear safety, and that there are genuine scientific and non-military benefits to be gained from underground nuclear tests. No attempt will be made to review the spate of arguments which have already been given in the press in defence of the claim that the recent explosion was for completely peaceful purposes, but a few significant points are worth making.

With regard to nuclear safety, the general tone of the AEC's attitude may be gleaned from the following directive which appeared in *Nuclear India*:

> Radioactive materials and sources of radiation should be handled in a manner which not only ensures that no harm can come to workers or anyone else, but also in an exemplary manner so as to set a standard which other organisations in the country may be asked to emulate.

So far, so good, but no one can reasonably expect individuals other than the more educated members of the public to take heed of such strictures. What precautions, for example, can be taken to prevent, say, a villager from killing and eating an animal or a bird which has been in the vicinity of a contaminated area? And, even more important, if nuclear explosions are to be used to shake up oil fields and release natural gas in coastal areas, what precautions will be taken with respect to contaminated fish?

This latter issue is discussed briefly in the March 1974 issue of *Nuclear India*, and it is clear that plutonium contamination in off-shore areas is a real possibility. Fishermen on the Kerala coast are already exposed to a higher-than-average level of atomic radiation on account of natural-uranium deposits, and the prospect of exposing them to even the smallest amount of plutonium radiation as well is not to be relished.

Not Suited for Peaceful Uses

Nuclear explosions can be produced with any of three fissile materials, uranium 233, uranium 235, and plutonium. Uranium 233 is obtained from thorium which is currently mined in Bihar, and will ultimately be made use of in fast breeder reactors. Its properties have not been studied as carefully as those of the other two materials, and no one has ever seriously proposed manufacturing a uranium 233 bomb. Uranium 235 was used on Hiroshima but is not easy to separate from the non-fissile (i e, non-explosive) isotope of uranium, uranium 238. China has been able to make uranium 235 nuclear weapons only by going to enormous expense separating the uranium isotopes.

Plutonium can easily be made into a bomb, and the Nagasaki explosion was produced with it. But all forms of plutonium technology involve greater health risks to personnel than uranium-based chain reactions, and it is unfortunate that the most dangerous fissile material also happens to be the easiest to prepare. Once India's fast reactors are in operation, then weapons-grade plutonium will be even more readily available than at present.

The prospect of more underground nuclear explosions has caused considerable concern outside India, and several commentators have seen this move as the thin end of a wedge which will open the door to a full-scale nuclear weapons programme. Ever since India refused to sign the Non-Proliferation Treaty many people have been convinced that atomic bombs are just around the corner for use against either Pakistan or China or both.

But the economic arguments in support of peaceful nuclear explosions as a means of mining crude minerals are sound enough, and if the Indian government really does intend ultimately to produce a viable nuclear deterrent, then it must be congratulated on having justified a large amount of the necessary groundwork for manufacturing one in terms of purely peaceful economic motives!

India is not alone in her decision to use underground nuclear devices, and it is important for Indian scientists to share the problems raised by contamination at an international level. The Russians have used small nuclear explosions to excavate canals and release natural gas. It is also probable that such explosions will unearth valuable minerals and intensify oil deposits. But plutonium may not be the best explosive for this purpose. And if it is not, then the countries which possess substantial amounts of fissile uranium-235 gain nothing in the long run by withholding it from India on the grounds that she may explode it — as they have done, and continue to do themselves.

NORTH

Hard Headed on Money and Power

VINDICTIVE action by Chief Ministers against colleagues and unobliging officials is by no means uncommon in this country, but Haryana's Chief Minister, Bansi Lal, practises this tradition with outstanding verve. On one pretext or another, he has gradually eliminated most of his political opponents. The state Assembly Congress party has been reduced to a pliable and subservient entity. Bansi Lal reigns supreme in the state. The Central leadership has been extending unstinted support to him. The state Governor has endorsed Bansi Lal's acts of commission and omission — even when their propriety has been blatantly dubious.

Thus, after the supersession of the Punjab and Haryana High Court's seniormost judge in the oppointment of the Chief Justice on May 10 with no legitimate justification given, there has followed the sudden dismissal on June 14 of Chandravati, Haryana's Minister of State for Revenue. Bansi Lal alleged that she was becoming "an embarrassment to the party and the government, as her activities went against the official policies". The real reasons, however, were quite different. State Congress Committee chief, Nihal Singh, stated on June 20, after a joint meeting of the PCC and the Legislature Congress Party that there had in fact been no complaint with the state Congress about any anti-party or anti-government activity by the dismissed Minister. Nevertheless, the party upheld the Chief Minister's action against her by an overwhelming majority; further, it went out of its way to reiterate full confidence in him and to assure him unstinted co-operation, thus underlining Bansi Lal's autocratic hold over the party machinery.

Chandravati's dismissal is, in fact, an aftermath of the scandalous incident that took place three months ago in Bhiwani district. It is alleged that the police harassed the mother and maternal uncle of a youth who had defeated the candidate who had been backed by Bansi Lal's son. Reports have it that the mother and her brother were stripped naked and subjected to other indignities at the police station. Their grandmother's house in Riwasa village, nearby, was reported to have been set on fire; the old woman died of burns. The police version was that she had committed suicide under pressure of anxiety caused by the Bhiwani incident.

Wave of Indignation

A wave of indignation swept the entire area. When Chandravati visited her constituency which is adjacent to the disturbed village in Bansi Lal's stronghold, people related the atrocities to her. She expressed sympathy with the sufferers, and is believed to have suggested to the CPI(M) leaders that they launch an agitation to protest against the police repression.

Bansi Lal evidently took serious notice of her action, and asked her to resign. When she refused, he simply persuaded the Governor to dismiss her. On June 19, he got Sharda Rani, another Minister of State, to give the official version: The Riwasa controversy was 'politically motivated'; the opposition parties were 'exploiting' the incident to mount a smear campaign against Bansi Lal; the police had committed no excesses.

On the economic front, the issue of control or decontrol of some essential commodities has been the subject of much debate in the northern region. Following the acute shortage of vanaspati, the Punjab government has renewed its request to the Centre for powers to take over the state's half a dozen private vanaspati mills which were not fully utilising their 300-tonnes per-day capacity. The government has offered to supply about 100 tonnes of vanaspati to the neighbouring areas after meeting the state's own requirements of 150 tonnes a day — provided control was lifted when production reached a satisfactory level.

The state government has also demanded that there should be no price control on 50 per cent of the stocks of cement earmarked for free sale. Under the existing arrangement, middle men pocket the higher real margin while consumers buy cement at Rs 30 to Rs 35 a bag in the black market — which is more than twice the controlled price.

Both Punjab and Haryana are now hammering away for 'a strategy' to enhance food production in the kharif season. Two measures have been predictably demanded as prerequisites: first, early announcement and stepping up of prices, especially for rice, so as to provide the requisite incentives, and second, adequate supply of fertilisers, preferably at subsidised rates. The UP example, of linking the supply of fertilisers and other incentives with the procurement drive, is being quoted in support. The fertiliser price hike, it is claimed, has nullified the recent incentives. It is maintained that, unless all the constraints are removed, there will be a fall in food production.

Punjab has adopted the line of persuading. the Centre to insist that every state put 50 per cent or more of its cultivable area under foodgrains for at least a couple of years to solve the food problem — and relieve the strain on Punjab and the Central reserves. The Punjab Food and Supplies Minister has underscored that many other states have been concentrating on profitable cash crop cultivation, and depending on states such as Punjab for their food supplies. Chief Minister Zail Singh has suggested that the entire power and irrigation needs of the farmers be met on a regional basis and a regular supply of inputs be ensured. Clearly, the ground is being cleared for horse-trading with the Centre for higher foodgrains prices and subsidised inputs, in exchange for the grain surpluses from this region.

WEST BENGAL

Undeveloping Politics

THE constitution of the Wanchoo Commission to look into allegations of ministerial corruption, and the 'silent burial' of the cold corpse of the Progressive Democratic Alliance (PDA) have led to a considerable thickening of the plot in the state. But they do not signify the imminence of a *denouement* in the state's politics. However much the Congress factions may in-fight, they cannot afford to fall apart — lest the CPI(M) regains its lost pre-eminence in the state's politics. Similarly, whatever the CPI's present position in the circle of its love-hate relationship with the Congress, it cannot break with the Congress without establishing a new equation with the CPI(M). Like the dead Ceasar, then, the decimated CPI (M) continues to be a powerful factor in the 'organised' sector of West Bengal's politics, which encompasses the smaller, but articulate, section of the population as distinct from the vastly more numerous but relatively less articulate masses.

Nevertheless, the recent moves and countermoves — of the various factions within the Congress and of the party's erstwhile PDA partner, the CPI — are quite significant, because they dramatically demonstrate the unbearable strains and stresses generated within the present framework by a fundamental stalemate comprehending two levels: (i) the level of the triangular relations between the Congress, the CPI, and the CPI(M), and (ii) the level of the static difference between the politically articulate the politically not-so-articulate masses. The two levels are, of course, interconnected as only a major shift at the second level can provide the impulse for a shift at the first level.

Viewed in this way, the responsibility for the apparent immobility in the state's politics must lie with the CPI(M). The CPI(M) has to take the lead in breaking the stalemate in the interest of its own recovery, by drawing fresh, popular forces into the arena.

Contrary to this demand of the situation, all that has happened so far is a gradual consolidation of the more diehard forces in the power-complex within the Congress party and in the administration. Siddhartha Shankar Ray had made his entry into the post UF politics in West Bengal as an ally of the younger elements headed by Priya Ranjan Das Munsi, MP and President of the All-India Youth Congress, and Subrata Mukherjee, Minister of State; both of them were, and still are, closer to ex-communist, pro-CPI personalities such as D P Chattopadhyay, Union Commerce Minister, and Arun Moitra, WBPCC President. However, in the past year or so, Ray has moved closer to old-style operators like the two cousins from the Ghosh family (owners of the *Amrita Bazar Patrika, Jugantar*, etc), Commerce and Industry Minister Tarun Kanti, and the Food Minister Prafulla Kanti — who in turn are tied up with the most cynical and pronouncedly anti-communist faction of the Congress youth; this faction has not only gathered a large base among the youth and the students but has also carved out a sizeable empire in the trade union sphere.

At the same time, Ray has achieved and displayed a certain independence of the party because of the sustenance drawn by him from the administrative machinery — particularly the police, which is headed, in the person of the Inspector-General, by a friend of his from college days. As a *quid pro quo*, he has also had to concede, as the Das Munsi faction persistently complain, a measure of independence to the higher echelons of the administration. This independence conceded has amounted to giving longer leash to hoarders, profiteers, blackmarketeers, and generally allowing greater play for corruption, repression, and callousness. There is no longer even ostensible effort to confront these with checks of any kind.

Slighted by the power-conscious bureaucracy and disgraced by Subrata Mukherjee's demotion from the Home (Police) portfolio to the Municipal Affairs portfolio, the losing faction of the Congress youth has been smarting for some time and getting increasingly agitated over the steady encroachments of its mass bases by the rival youth faction which is now backed by other powerful operators.

Influenced by these reactions and the growing popular disaffection, the Das Munsi-Mukherjee faction has been prompted to take an increasingly critical posture in regard to the Siddhartha Ray leadership. After having threatened its own party's government several times in the past with mass struggles against it, the Das Munsi-Mukherjee faction has launched its attack by publicly levelling charges of corruption and inefficiency against five of the Ministers belonging to the rival faction; the latter have retaliated in the same coin by putting four of the ministers of the first faction in the dock.

Faced with this escalation of inner-party confrontation, the Chief Minister, in consultation with New Delhi, devised the instrument of the Wanchoo Commission, along with the amazing innovation of the proposal for punishment for levelling unproved charges. Simultaneously, moves have been afoot for resumption of dialogues between the rival group leaders, which were originally initiated by the AICC general secretary, Chandrajit Yadav, for defusing the situation. Whether the threats

GUJARAT UNIVERSITY

Applications accompanied with a fee of Re. 1/- are invited in the prescribed form available from the Registrar, Gujarat University, Ahmedabad-9 so as to reach him on or before 31-7-1974 for the post of READER in Economics in the University School of Social Sciences in the University in the pay scale of Rs. 700-50-1250. The post carries unmerged dearness allowance and other allowances and benefits of Provident Fund and Gratuity as per rules of the University in force from time to time. A copy of the rules governing minimum qualifications can be obtained on request. The selected candidates will be required to learn Gujarati language during the period of probation.

Weighted consideration may be given to candidates specialised in Mathematical Economics, Econometrics and Agricultural Economics.

K. C. PARIKH
University Registrar

of punishment will deter the would-be accusers, or whether the dialogues will finally lead to a *modus vivendi* is too early to say. But Siddhartha Ray and New Delhi are both banking on the ultimate deterrent — *viz*, the spectre of the CPI(M) which still stands in the wings; they hope, this cannot but cramp the styles of their own feuding chieftains.

It would be an exaggeration to suggest that the CPI's final decision about the party's formal breakaway from the PDA was arrived at secret conclaves with its Congress friends. The success of the Congress in managing the 1972 Assembly elections had destined the PDA to remain a signboard. Ray's cavalier conduct towards the CPI's contingent in the Assembly, together with the increasingly negative impact of the Congress regime on the population of the state, strengthened those in the state CPI who wanted a formal dissolution of the CPI's ties with the Congress. The recent 'tilts' in the national policy of the CPI towards 'struggle' also made it inevitable that so tenuous an entity as the PDA would not last. There are still no signs, however, that the CPI is inclined to revise its relationship with the CPI(M) fundamentally — at the national or the West Bengal levels — or to revise its overall collaborationist politics.

In the final analysis, then, a major shift in the state's politics cannot come about before the CPI(M) acquires more dynamism and depth, of which there are no hopeful signs so far. It still has considerable bases, but it mobilises them for stereotype motions which stop short of a real movement of the masses. And even this capacity to move may suffer if the party's inner dissensions over trivial matters are not ended soon.

SOUTH

Karunanidhi's Dangerous Diversion

Mohit Sen

THE DMK is clearly on its last legs and pretty rickety legs at that. This was clear enough following the Pondicherry election and the Coimbatore Lok Sabha by-election a few months ago. But worse was to follow for the theatrical Chief Minister. Whatever remnants of credibility his party might have retained among some sections of Tamil Nadu's poor were swept away with the resignation of the one Harijan leader who still had rapport with her following and who was one of Annadurai's closest associates. Now it was not a matter of corruption alone but betrayal of the downtrodden or discriminated in a direct and irrefutable manner.

Once it had become evident that the vast legislature majority literally counted for nothing, Karunanidhi decided to go in for extra-parliamentary methods. Here he was fully in line with the drive of the Right in other parts of the country. After all have not Charan Singh and Biju Patnaik, no less vociferously than Atal Bihari Vajpayee and Jayaprakash Narayan, publicly declared that the issue of power would have to be settled on the streets and with all the violence that may be needed?

Even the form of Right rebellion that he is trying differs hardly at all from the tactics adopted in Orissa, UP or Punjab. In the first place there is the resurrection of the cry of 'autonomy'. It is not autonomy in the sense that the states should have more powers to implement more expeditiously and equitably national plans of development. It is actually a thinly masked programme for the total destruction of Indian unity. The Central government is to be composed of representatives of the states and not of the majority in parliament. And this peculiar kind of regency has, in any event, the most limited of powers — diplomatic relations, currency and armed forces. The states are to be free to negotiate directly with foreign companies and governments on all other matters including those relating to economic affairs. What remains of India after this and of what use is the remnant? Biju Patnaik had called for the same kind of arrangement and promised to make Utkal prosperous with foreign help. The Akalis are scarcely lagging behind while Charan Singh projects his vision of a Jat state which would take in its embrace a major chunk of north-west India. The Andhra separatists had propagated the same approach drawing attention to the long coastline of their region.

It would be quite wrong, therefore, to brush aside Karunanidhi's project as just a gimmick of a desperate politician. It is that, of course. But it is not only that. It is an integrated part of the ferocious neo-colonialist offensive that is now on against our country. It is no secret that the office of the US Consulate-General in Madras is working overtime to contact anybody considered influential not only in Tamil Nadu but throughout the south. And the message, often enough put forward in the guise of questions by 'researchers', is always the same — the disutility of the continuation of the Indian Union from the point of view of the identity and interest of Tamil Nadu or Andhra or Kerala or Karnataka.

But this is not the only attack that the dying DMK has started against the democratic forces and their unity in the state. The other is the working up of physical assaults upon the Malayalees, both residents and travellers. The outrageous aspect of this pernicious gambit is that it is so transparently aimed at the Anna-DMK leader, M G Ramachandran, whose Malayalee origin most people in the state do not even know of much less recall. It should, after all, be remembered that the DMK had given birth to itself not on the basis of Tamilism but on that of the so-called separate stock and destiny of the Dravidians — covering all the states of the so-called south. It is quite clear that the attacks on the Malayalees are only the prelude to organised hoodlum violence against all who rally behind a Malayalee leader, i e, against the emerging democratic alternative to the dying DMK. Again, it is a testimony to the utter incapacity of the DMK to organise anything resembling a mass movement and to the inherent democratic good sense of the Tamilian masses that this vicious campaign has not gained anything like the momentum that its sponsors had hoped for.

It is, of course, essential that the democratic forces in Tamil Nadu should be vigilant against and unite to oppose the manoeuvres of Karunanidhi which are aimed, in the first place, against them but which have grave implications for the entire country. But it is far from enough, apart from being tactically unsound, to confine oneself to defensive action. The whole point now is for the democratic forces in Tamil Nadu to come forward as the democratic alternative. It is necessary to review and to remove any of the hindering weaknesses which prevent such an essential emergence.

The ADMK has done and is continuing to do a most important job in shifting the major part of the DMK mass base to the Left. It just will not do in the Indian context, much less in the specific configuration of the consciousness of the masses in Tamil Nadu, to overlook the specifics of the transition mechanism as far as the movement of the masses is concerned. It is no use wishing that the masses would move in the 'normal' manner. As a matter of fact, the move from DMK to ADMK positions is precisely what is normal in Tamil Nadu. The skill required is that of understanding this normalcy and forging a link with it so as to make it a part of the more general and overriding trend of the democratic transition. This requires a complete understanding of both the potential as well as the limitations of the entire ADMK movement, particularly its leadership. This requires an approach that unites with, but by no means merges into the ADMK swing. Only if such an understanding is implemented, it is possible to make a dent in the Kamaraj mass base and to cut short the detour that the Congress leadership has imposed upon its organisation in the state.

And this requires, even more importantly, the maximum stress to be placed on expediting and organising the independent articulation of the working class and the toiling peasantry of Tamil Nadu. Nothing can substitute for this historic work. The railway strike and the support that it received from the entire working class in Tamil Nadu demonstrates the immense possibilities of the situation. This, too, not only in Tamil Nadu. What happened in the historic first three weeks of May was the arrival of the working class as the pioneering and vanguard element of the democratic transition in India. Not that the working class has as yet achieved that status. Far from it. But the working class is on the way and the way is the way of united mass actions combined with the building of even more firm democratic alliances. A splendid chance has presented itself in Tamil Nadu for the achievement of this result so much needed for its advance and that of India.

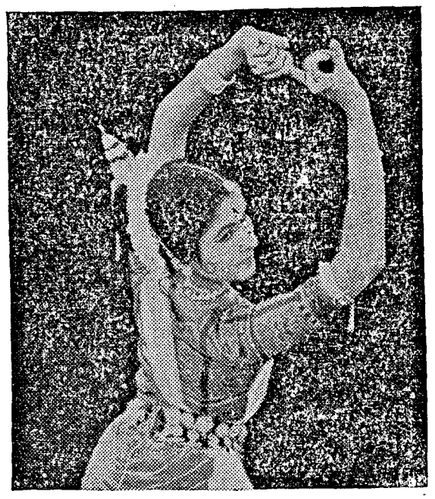
LONDON

The Asian Underclass Revolts

Farrukh Dhondy

ACTION has a way of destroying myths. Ever since they came here two years ago, the Ugandan Asians have been seen by the British working class and even by some Asian organisations, as a wave of 'sponger' immigrants. The prevalent myths, woolly and based as always on prejudiced notions and a vulgar tendency to generalise from surface phenomena, had it that the Ugandans were a new capitalist class, the NCOs of empire, the enemies of the unity of Asian workers, petit bourgeois elements who had filtered into the country under the patronage of a Conservative government and were fast setting up shops and businesses and buying up property. Nine hundred workers in the Imperial Typewriter factories of Leicester, have taken the sort of action during the past month which has made them collectively a national focus and, being Ugandans, have put paid to some of these myths.

In hard times they have assumed a unique position of militant determination within the working class, a very sweeping claim, but nonetheless true. At a time when the unionised workers of the country are by and large honouring the 'social contract' that their leaders have made with the minority Labour government and are watching for the inevitable let down that the history of the Labour party leads them to expect, the Asians have taken a stand. Their strike, now in its fourth week, has been one of those instances of determination which are in themselves a success.



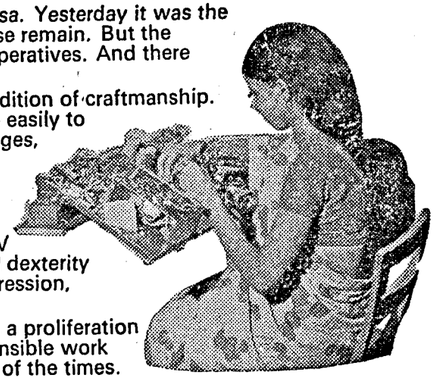
The one issue that faces Asian and Caribbean labour in Britain, the single issue that is defined by their function in the economy of this country, the issue that all other issues can be wrapped in, is the one the Ugandans have chosen to fight on. Their strike is not merely about wages, nor merely about promotions, it is about the relation of a section of the working class to production. Briefly told, the story of the strike makes the issue clear and hopefully will act as an inspiration and rallying point for the other black workers who are in the same economic compact and to whom the same possibilities of action are available.

Imperial Typewriters is part of the Litton Group, an international complex which employs 113,000 people. Beginning in 1908, the company has grown to produce office, defence, marine and digital data processing equipment. Litton bought over Imperial in 1966, paying £ 1.9 million for the lot, when the property itself was worth £ 1.7 million. With the purchase, the policy of management changed and positive encouragement to the easily available immigrant labour became apparent in the patterns of employment. The two plants in Leicester are situated in Highfields, one of the 'little Indias' of the Midlands.

Imperial does not pay wages comparable with those in similar industry. The plants in Leicester make typewriters of two varieties, the Model 80, which is a manual, and an electrical model. The machines are partly manufactured and partly assembled in Leicester. Consequently the plants have piece-work shops and assembly lines. The two factories and their offices employ about 1,700 people, 1,100 of them East African Asians. Five years ago, 90 per cent of the work force was white, but as industry expanded in the Midlands and multi-national monopolies began buying out indigenous British firms, the whites drifted away from the lower paid jobs which are also the most uncertain and the most tedious. The influx of Asians was consolidated by those firms which found them to be an alternative to paying more wages and altering machinery and processes. They recruited from those sections of the working class to whom society gives few options — blacks and women. Two years ago the labour shortage was combated by introducing an 'introduction system', which gives a bounty of £ 25 to workers who introduce others to the personnel manager. It is ironic that this very system of employment encouraged a network of East African Asians to form in the factory, the same network of feeling and community interdependence which is so powerful a force in the class struggle in the factory.

The strike started on May Day. It was the end of a very long series of grumbles, a sequence of dissatisfaction and months of robbery and deceit by the management. The dissatisfactions originate in many things. The factory runs a system of production incentives which is unfairly operated. The pay is calculated by a computer which seems to use a very free and fluid programme which management seem to understand but which leaves the workers with mysteriously less money than they claim to have earned. The workers almost all belong to the Transport and General Workers Union (TGWU) and

Demonstrate the fluid movement of the Odissi today. Assemble a TV set tomorrow.



The people make a fine art of it.

Skill is a characteristic of the people of Orissa. Yesterday it was the Odissi, woodcraft and silver filigree work. These remain. But the development of industry has unfolded new imperatives. And there are new skills to be learnt.

The people, however, have an honoured tradition of craftmanship. And the technical disciplines of industry come easily to them. These are learnt in the engineering colleges, technical schools and industrial training institutes of the state.

But the application of these contemporary crafts is possible only in the varied industrial projects set up in Orissa. Tomorrow when a TV manufacturing unit is established, a proverbial dexterity of hand will find a more relevant mode of expression, assembling the intricate circuitry of a TV set.

Yet this is only a beginning. What is vital is a proliferation of industries to absorb such a large and responsible work force. Manpower that is geared to the rhythm of the times.

Issued by

INDUSTRIAL PROMOTION AND INVESTMENT CORPORATION OF ORISSA LTD.

35 Satyanagar, Bhubaneswar.

Orissa—where the scene is set for industrial enterprise

are represented by shop stewards of the Union who are all white, hand-picked by the convenor of the works, Reg Beaver, who claims that there is no need for a dispute with management and that the Asians have been excited into action by "outside forces".

The production incentive system, in particular, has led to repeated stoppages on the shop floor. The workers are promised a bonus above their basic weekly rate of £ 18 for women and £ 23 for men if they produce above a given target. The problem is that the target is not arranged by the workers but by the supervisors who raise it once a worker becomes efficient, so cutting down the bonus. The calculations have been based on a figure of 115 per cent for bonus payment per hour after the union had secured an undertaking from management to pay at the rate of 125 per cent. The workers now demand a backdating of this swindled percentage from 1973 while the management which admits the robbery wants to pay from 1974. To a reader in India this may seem like a marginal heckle over a marginal amount of money. In Britain today the high cost of living and the galloping inflation make these margins the most powerful trigger of working class action. The males at Imperial earn £ 14 less than the national male average and the women earn £ 6 less than the average for women.

The strike in one part of a factory on May 1 spread throughout the two plants as other workers heard about it reacted to their long standing grievances. Within the first 48 hours, 900 workers walked out and began generating those forms of action which the British Left calls "spontaneous". The strikers immediately put out a bulletin, widely paraphrased in the national press, which claimed that the supervisors on the floor operated a subtle form of racism which insulted the workers and deprived them of money. A gathering of female workers said that in their shop production and payment are dependent on white male supervisors who set the machines which they operate. The supervisors inevitably set the machines of the white women before those of the Asians and consequently deprive the Asian women of upto £ 6 a week (the cost of keeping their babies at private nurseries while they go to work). They complained about the behaviour of white supervisors who followed them to the toilets to ensure that they did not take too much time off. They forbade them to speak in Gujarati and generally played sergeant-major around the shop.

The white workers have not supported the strike. The key to their withheld support they say is the allegation of racism made against the supervisors. Yet the wage claim and the demand for the end to racism are inseperable in the case of Imperial. The differentials in wages, treatment and skills are often set out in Britain along racial lines. Consequently the industrial actions of Asian workers are distinctive in that they rarely produce a division between the men and the women on the shop floor. Asian men and women always support each other's demands and in the case of Imperial have jointly demanded equal pay and equal job opportunities for women.

The strike is at present deadlocked. The strikers are also demanding the election of shop stewards for their branch of the Union as a prerequisite to going back to work. They are using the support of the other Asians in Leicester who belong to the same union to force a change. They have won the active support of four factories in Leicester whose workers are helping the strike committee with funds and a promise of a walkout when a show of strength is necessary.

If the strike does nothing else, at least it will set up a wave of pressure on the organised unions to take up the fight of the lower paid workers in the country and could start the process of proving these unions inadequate. But the action threatens, of course, to do much more. Following so closely after the struggle at Mansfield Hosieries in Loughborough and being part of the general awakening of Asian labour and of Asian women workers, the strike takes on a very specific significance. It is part of the self-organisation of the most underprivileged sections of the working class.

Government of India

5 PER CENT LOAN 1979 TO BE ISSUED AT RS. 99.50 PER CENT AND REPAYABLE AT PAR ON 16TH OF JULY 1979.
5½ PER CENT LOAN 1985 TO BE ISSUED AT RS. 99.75 PER CENT AND REPAYABLE AT PAR ON 16TH OF JULY 1985.
6 PER CENT LOAN 1998 TO BE ISSUED AT RS. 99.50 PER CENT AND REPAYABLE AT PAR ON 16TH OF JULY 1998.

Subscriptions to the above loans will be received simultaneously and will be limited to a total of Rs. 400 crores (approximately). Subscriptions may be in the form of (i) cash/cheque or (ii) Securities of the 3% per cent. Loan 1974 which will be accepted for conversion at par. Government reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

(2) If the total subscriptions received for the loans exceed the notified figure plus the amount of ten per cent retainable as aforesaid, partial allotment will be made in respect of the cash subscriptions received and the balance refunded in cash as soon as possible. Interest on the securities of 3% per cent Loan 1974 will be paid at the rate of 3% per cent per annum upto and inclusive of 15th July 1974 at the time of issue of the new securities.

(3) Interest on the loans will be paid half-yearly on 16th January and 16th July. Interest on all the loans now issued together with interest on other previous Government securities and income from other approved investments will be exempt from income-tax subject to a limit of Rs. 3,000 per annum and subject to other provisions of Section 80L of the Income-tax Act, 1961. The value of the investments in the loans now issued together with the value of other previous investments in Government securities and the other investments specified in Section 5 of the Wealth Tax Act will also be exempt from the Wealth Tax upto Rs. 1,50,000/-.

(4) Subscription lists will open on the 16th of July 1974 and close on 18th of July 1974 or earlier without notice.

Applications for the loans will be received at :-

(a) Offices of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna;

(b) branches of the subsidiary banks of the State Bank of India conducting Government treasury work except at Hyderabad; and

(c) branches of the State Bank of India at other places in India.

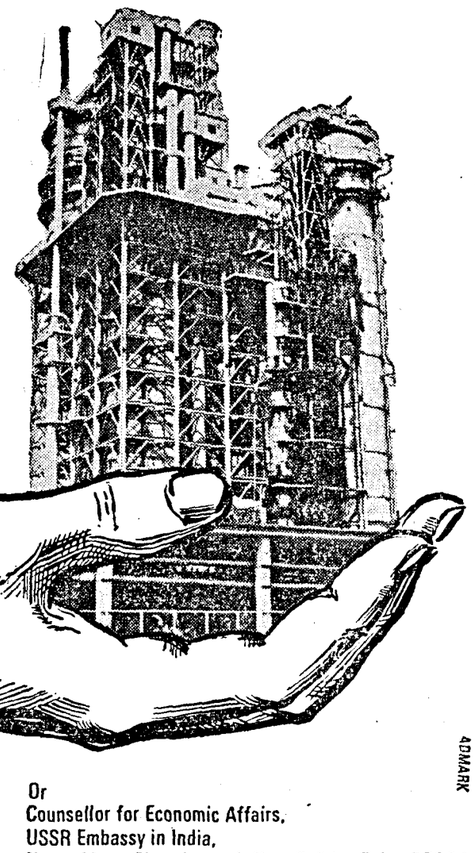
For full particulars please apply to any of these offices or branches

Share the expertise of V/O NEFTECHIMPROMEXPORT in Oil, Petrochemical & Chemical Industries

V/O NEFTECHIMPROMEXPORT designs and assists in construction of highly productive plants for oil-processing, petrochemical and chemical industries, as well as for pulp-and-paper industry. The design and engineering work is performed by highly specialized leading institutions of the USSR

V/O NEFTECHIMPROMEXPORT supplies materials, equipment & spares

V/O NEFTECHIMPROMEXPORT sends specialists to render expert assistance in construction of the plants; supervises the construction works; executes construction, erection and adjustment work; commissions the constructed plants



V/O NEFTECHIMPROMEXPORT arranges training of customer's personnel at similar plants operating in the USSR and in customer's own country

V/O NEFTECHIMPROMEXPORT supplies production equipment for oil refineries & petrochemical plants :

- preparation of crude oil for processing
- atmospheric & atmospheric-vacuum oil processing
- catalytic refining of oil & production of high-octane gasoline
- catalytic production of aromatic hydrocarbons
- gas-fractioning
- production of sulphur and bitumen
- production of industrial oils and lubricants
- production of paraffin, fatty acids & other products and derivatives of oil processing

Chemical plants for manufacturing :

- products of organic synthesis
- nitrogen and phosphorus-containing fertilizers
- sulphuric, nitric and phosphoric acids
- calcinated and electrocaustic soda
- synthetic rubber
- pulp, paper, cardboard

The Foreign Connection

Nireekshak

IT certainly would not add to the joy of any politician or journalist to tell himself that foreign money, both overtly and covertly, has been subverting our parliamentary institutions, political associations, academic and other organisations and the press. Following charges of foreign money intervention in the 1967 elections, the Centre asked its Intelligence Bureau to make a report. The details of the findings were not disclosed but it is fairly well known that foreign money has been and is very much a part of the red light district of electoral politics. The general conclusion of the report, which the government shared with parliament, confirmed this belief. Action was promised to check the flow of foreign money into vital areas of national life.

Apprehensions Justified

The disclosures of CIA activities, at about the same time, highlighted the vulnerability of India's academic and educational institutions to foreign money. Soon there was a great deal of talk of foreign money's role in the Indian press. At the instance of the Information and Broadcasting Ministry, an inquiry was made but the findings were not disclosed though it is again well known that the apprehensions were more than justified by the inquiry findings.

Last December, at long last, the government introduced the promised bill to regulate the flow of foreign money to individuals and organisations. The Foreign Contribution (Regulation) Bill was introduced in the Rajya Sabha and is now before a joint select committee of parliament. It seeks to regulate the acceptance and utilisation of foreign contributions or hospitality with a view to ensuring that individuals and organisations in vital areas of national life may function in a manner consistent with 'the values of a sovereign democratic republic'. The Bill also seeks to distinguish between foreign contributions and foreign hospitality both of which along with "foreign source" have been clearly defined.

Advertisement subsidies, bulk buying of copies which often were never printed and providing additional income to the newspaper staff are some of the known methods of subsidising newspapers used by foreign powers, Eastern and Western, as also by Indian 'subsidisers'. Following a reference by the Information and Broadcasting Ministry, the Press Council ruled that embassy advertisements often published in a form likely to be mistaken for editorial matter should be clearly described as advertisements. Besides, the Council wanted the papers receiving advertisements from embassies to declare (along with the advertisement) the amounts received for them so that there could be no fudging of accounts and so that the payments received were reasonable and justified and not in the nature of subsidies.

But even such restrictions were not of much help because there are cleverer ways of getting foreign subsidies in rupee (or PL-480) form. For instance, an embassy may tell the firms and organisations engaged in rupee trade with that country to give advertisements to certain newspapers. The embassy does not directly come into the picture at all because the advertisements come from export houses and the like. Embassy patronage of this nature gives the foreign power in question a certain lien on the paper's policy and functioning. One wonders how the government proposes to check this because the Bill under discussion regulates only the receipt of direct foreign contributions and not the indirect flow of funds in rupee form.

Individual journalists have been beneficiaries in several ways from their foreign connections. Patronage can take the form of journalistic assignments for embassy publications or even for ordinary journals and newspapers abroad. Indians representing foreign newspapers might come under the influence of the embassy of the country of publication. Embassies of some of the Western countries are particular that Indians representing papers from their country should be 'reliable' from their point of view. The remuneration that comes in might be out of proportion to the quality and quantity of work done. Or maybe the payment is not repatriated to India at all and might be finding a niche in some foreign bank.

In relation to foreign money, individual journalists are sometimes found to be more powerful than the Indian papers they represent. They can fix invitations for their proprietor-editors to go abroad, arrange import of printing machinery, wangle scholarships for the children of proprietor-editors, etc. Regular delivery of crates of duty free liquor round the year, lavish hospitality during junkets, remuneration for planted stories and articles, planted questions asked at press conferences and situation reports made available to embassies — it is a sordid picture. The government cannot and will not check it fully because the government requires the services of the same journalists.

Moreover, as long as the government is unable to check the flow of foreign money into the political processes in the country, it cannot treat the press in isolation and seek to insulate it from foreign money. As it is there are some regulations to check such a flow. For instance, a foreign government cannot extend hospitality to an Indian journalist without the clearance of the government. But this is being got round by getting the invitations issued by some voluntary or semi-official organisation though the government of the host country might be behind it. As long as politicians are also known to benefit from such hospitality, the government cannot deal very firmly with circumventions.

Power to Discriminate

At best, the new rules to be framed when the Bill is enacted will give the government the power to discriminate — to let foreign funds and hospitality flow to those it favours and choke them off from others. As for foreign money held in the form of rupees, regulation will be near impossible and its subversion potential cannot be eliminated even if the government tries to do so.

In 1968, what were claimed to be the details of the Intelligence Bureau's findings were published in a New York daily. Every important party in the parliamentary spectrum, barring the CPI(M), found itself embarrassed by the report and everyone was trying to look holier than the other and stern measures to root out foreign money from Indian politics. The ruling party was not spared by the report and one heard a great many homilies on the need to wipe out foreign money from our public life. The fact that the government took seven years to introduce this Bill speaks for the complexities involved.

Round the Mulberry Bush

IN the current much-publicised discussions within the government on curbing the inflation, a conspicuous omission is that of measures calculated to restrain the rise in prices of foodgrains. The wholesale prices of foodgrains, according to the official price index, have gone up by around 65 per cent in the last two years. Steep as this rise is, it still does not adequately reflect the actual rise in the prices of food articles to consumers in large parts of the country. What this order of rise in prices of foodgrains means for the struggle for survival of the majority of the population — below the poverty line in the best of times — can be more fully appreciated if it is borne in mind that this has also been a period of stagnant investment and slow employment growth, of large-scale lay-offs and loss of employment on account of factors such as raw material and power shortages and of cuts in government expenditure on the so-called 'social services' which are supposed to directly benefit the poor.

If the government were able to exercise reasonable control over the prices and supplies of wage goods, among whom foodgrains are of course the most important, then the inflation can be most effectively taken care of by stepping up investment in the economy to expand output and capacity in the more important sectors. On the other hand, so long as the prices of wage goods continue to rise unchecked, as they have been doing, the stagnation in investment will continue, adding fuel to the fire of inflation. In fact, however, the government's preoccupation has been either with aggregative factors like the overall level of money supply and the increase in it or with the prices of commodities some of which, such as vanaspati, are at best only peripherally relevant while others, such as passenger cars, are totally irrelevant.

The alleged failure of the take-over of wholesale trade in wheat last season was made the ground for the reversal of that policy. The government has been anxious now to avoid attracting attention to the fate of the undertakings given by private foodgrain traders only a few weeks ago when the wheat trade was handed back to them: the traders had then promised to hand over to the government upwards of 5.5 mn tonnes of wheat out of their purchases from the farmers and to keep the 'open' market price of the rest to Rs 150 per quintal. So anxious was the government to accommodate private trade that public procurement agencies were instructed not to compete with private traders in buying wheat from the farmers. The fruits of this touching faith in the good intentions of the traders have not been long in coming: procurement of wheat in the current marketing season, now approaching its end, will be well below 2 mn tonnes or less than one-half of what was achieved last year under the government take-over of wheat trade, which has been roundly condemned as having been a failure. And yet the Prime Minister, who had personally negotiated the return of wheat trade to private traders, has not thought it necessary to call the traders to account. In any case, the traders have readymade alibis in the maze of restrictions on the movement of grains imposed by state governments — more for the opportunities for corruption they offer than to serve any economic purpose. In the circumstances, the Union Agriculture Ministry pretends to accept that, for some unaccountable reasons, of the normal marketed surplus of wheat only some one-third has come to the markets this year and that the remaining two-thirds — some 6 mn tonnes at that — has more or less vanished into the thin air.

The government has now been left with nothing to fall back upon but imports to keep the public distribution system propped up. However, while the country may finally end up by importing 4 to 5 mn tonnes of foodgrains this year at a cost of over Rs 600 crores in foreign exchange, it seems that the planning and phasing of these imports — by design or out of incompetence — will be such that they will have minimum impact in terms of really sustaining the public distribution system or bringing down the 'open' market prices of foodgrains.

The other plank of the government's approach to meeting the food crisis is even more incredible: government is apparently thinking in terms of another crash programme for raising foodgrain production. The government had, it will be recalled, spent over Rs 250 crores on the rabi crash programme in 1972-73, the impact of which on production has been even officially admitted to have been doubtful. According to statistics presented to Parliament, the production of rabi wheat in 1972-73 showed a fall of 1.5 mn tonnes over 1971-72, of summer rice of 0.4 mn tonnes, of rabi jowar of 0.9 mn tonnes and of rabi pulses of 0.6 mn tonnes. The principal effect of the expenditure on the so-called crash programme was to add to the larger farmers' power to hold back their surplus production from the market. The government, however, has apparently learnt nothing from that experience.

Notes of a Rural Area Development Tourist

John P Lewis

A number of lines of public debate and analytical interest in India—involving, among other things, agricultural activities in the countryside, schemes for 'integrated' development, ideas for more direct attacks on mass poverty and unemployment, efforts to identify and promote rural growth centres, and moves toward multi-level (state and district) planning—all seem more or less to be intersecting in a zone of policy concern called 'rural area development'.

In July 1973 the author spent between three and four weeks—mostly in Ahmedabad, Anand, Pantnagar, Bombay, Bangalore, Madras and Trivandrum—trying to gather some fresh notions of what is going on in the rural area development field. Necessarily, such tourist impressions are hastily and selectively based and it is left to the reader to supply a more integrated organisation of these notes. The points made by the author fit most readily under the following sequence of headings:

(1) the definition of 'regions' and 'areas' for nalytical and policy-administrative purposes;
(2) politico-administrative decentralisation of decision-making;
(3) delegating sideways;
(4) decentralisation and equity;
(5) decentralisation and finance;
(6) decentralised planning—the theory and practices emerging at state and district levels;
(7) settlements policy; and,
(8) articulating the network—operationally and in terms of research infrastructure.

A NUMBER of lines of public debate and analytical interest in India — involving, among other things, agriculture, relations between agricultural and non-agricultural activities in the countryside, schemes for "integrated" development, ideas for more direct attacks on mass poverty and unemployment, efforts to identify and promote rural growth centres, and moves toward multi-level (state and district) planning — all seem more or less to be intersecting in a zone of policy concern called "rural area development".

In July 1973 I spent between three and four weeks — mostly outside Delhi, in Ahmedabad, Anand, Pantnagar, Bombay, Bangalore, Madras, and Trivandrum — trying *via* talk with a variety of politicians, officials, quasi-officials, and non-officials to gather some fresh notions of what is going on in the rural area development field. Necessarily, such tourist impressions are hastily and selectively based; they are extremely fallible. Yet this latest junketing followed brief trips partly devoted to the same subjects in each of the three preceding years and a rather long period of sustained exposure theretofore. Thus my current impressions may be of some interest.

I leave it to the reader to supply a more integrated organisation of these notes. As a matter of convenience, such pattern as there is emphasises the centralisation-decentralisation theme, but the latter intrinsically is no more important than other issues, e g, that of equity and social justice, that cross-hatch the discussion. However, the points I want to make seem to fit most readily under the following sequence of headings:

(1) The definition of "regions" and "areas" for analytical and policy-administrative purposes;
(2) politico-administrative decentralisation of decision-making;
(3) delegating sideways;
(4) decentralisation and equity;
(5) decentralisation and finance;
(6) decentralised planning — the theory and practices emerging at state and district levels;
(7) settlements policy;
(8) articulating the network — operationally and in terms of research infrastructure.

'Regions' and 'Areas'

Innovators, especially social scientists, always are trying to remake the political/administrative map, and often with good reason. The political map seldom fits the divisions into which agro-climatic scientists, hydrologists, physical geographers, economists, anthropologists and other specialists would have the territory of a country carved for their particular purposes. Moreover, in their essential meanings, the words "region" and "areas" are inherently unspecified as to size (except that a region must be a sub-division of something larger). So there is endless debate — in India and elsewhere — about what, for development purposes, the scale of "regions" and "areas" ought to be, and where their boundaries should be drawn.

Blessedly, on this trip, I have found this debate somewhat damped down. The issue, of course, is whether developers of one kind or another should try to work with and within the existing politico-administrative jurisdictions. If one were only interested in research without looking beyond data gathering and analysis to the formulation of programmes for implementation, one might redraw the map rather freely — although even here if the data gathering requires much administration, and particularly if it is to be repetitive, there is advantage in conforming to the existing official geography. In fact, however, developmental analysis typically does look toward eventual implementation. Furthermore, development activities in fact are almost always multipurposed, and each single-purposed charting of an area will produce a different result. Thus the most scientific *composite* redrawings of the map cannot avoid blurred, overlapping, dissatisfying edges.

The emerging consensus therefore seems to be, first, that one should try to make do with the existing politico-administrative sub-divisions. Second, if one of the development functions or purposes in question is dominant (as in a catchment basin or major-irrigation command area) and has contours that clearly do not conform to existing jurisdictions, the *ad hoc* jurisdiction contrived should, for easier administrative articulation, be built out of multiples or components of existing jurisdictions. Third, additional layering of the Indian politico-administrative structure should be undertaken with caution (since it injects additional relay points, which also become delay points, into

the vertical communications and clearances chain). But where such extra layering is thought important (as in the case of splitting districts for development purposes in Tamil Nadu or reactivating the divisional commissioner level in Karnataka) the new levels should also be clean multiples or components of existing jurisdictions.

If this indeed is the consensus, I applaud it on practical grounds. There is, it should be noted, a contrary suspicion in some quarters, namely, that some of the existing jurisdictions, rather than offering serviceable machinery to developers, are so inherently anti-developmental in their political structuring and habits of mind that it may be necessary to bypass them and construct new development-administration venues on that count alone. I am one who has seen precisely this argument as one (but only one) of the reasons for not regarding the Indian village as the pivotal development unit. But I doubt that the same position need apply to the politico-administrative structure generally.

Finally, in chiming in with the trend against scientifically challenging rechartings of the map, it behooves any American observer, especially, to remind his Indian colleagues of how good, for development purposes, their existing jurisdictions already are. Compared with the 50 states of the United States, for example, the Indian states fall into a clustered, fairly narrow size distribution, whether of population or territorial size — even though one and perhaps more could be usefully divided. They all have a measure of homogeneity (particularly as to language). Almost without exception their largest towns are their capitals. Moreover, the capitals, whether or not geographically centred, are effective centres of statewide communications; and, aside from Delhi itself, there are virtually no instances of the problem that makes the political and economic geographies of the whole eastern portion of the United States so incompatible — namely, metropolitan areas that spill across the intersections of two or more states.

Much the same claims can be made for Indian districts. They also, by and large, are a very sensible set of jurisdictions for development purposes. On the whole, as they now seem disposed to do, Indian developers should find it quite feasible to work within the existing politico-administrative geographical frame.

Decentralisation of Decision

The transfer of large measures of discretion to the lower levels of the politico-administrative hierarchy appears to be a practical necessity in all massive national systems. In different forms the same lesson has been drawn in the United States, the Soviet Union, and China that now is being drawn in India.

My impression this year, compared with a year or two ago, is that the general advantages of delegating authority downward — selectively and appropriately, not indiscriminately — are still widely recognised in India. But there is not as much movement in this regard as one might have predicted a couple of years ago. The subject divides into two parts — Centre to state delegations and delegations downward within states.

As to the first, a year or two ago one saw the prospect of a greater devolution of developmental decision-making on the states as a function of the greater gathering of political power that had occurred at the Centre. In many ways power is delegated downward more easily and gracefully from a position of political strength than of weakness. During the past year or so the piled-up power in Delhi appears to have eroded. The Prime Minister has found it more difficult to orchestrate state ministries than one imagines she expected.

Moreover, some of the intellectual impetus toward shifting decision-making power to the states has slowed down at the official or quasi-official level. This seems to be evident, for example, in the change of temper from the Gadgil to the D P Dhar Planning Commissions. Partly the reason is one of principle: as elaborated below, there is fear that, contrary to the superficial assumption, decentralisation may be anti-egalitarian. Thus the pro-egalitarian minimum needs programme would pointedly *not* be discretionary; it would be passed down through the states to local jurisdictions on a strict categorical-grants basis.

Partly the check on Centre-to-state delegation reflects the feeling of the central planners (correct in my judgment) that certain functions and sectors, e g, electric power, already have been over-decentralised. Partly it reflects the circumstance (a characteristic also of other pre-five-year-plan years) that the dialogue between Centre and states about the inter-level resource sharing that will apply in the Fifth Five-Year Plan has been slow in getting underway. In part the slowdown that one senses in Centre-to-state delegation may simply reflect the fact that some of the key personalities, by disposition or professional background, are more centrist than their predecessors.

At any rate, although Centre-to-state delegation remains an "in" idea, it does not appear to be as probably "on" in the short run as seemed to be the case only recently. Such further delegations as occur may be more bargained away from Delhi than benignly bestowed by it. And there are new and important reservations about the theory of delegating downward. Yet my own assumption would be that, in the longer and broader sweep, the logic of decentralisation will prove so compelling in a system of India's size and complexity that the trend's apparent slowdown will prove to be, at most, a pause, not a reversal.

The other part of the delegating downward issue — that within states — always has seemed to me the more difficult and problemmatical. It is within the several states that the centralism which has characterised the whole Indian politico-administrative system at least from the time of the British has been strongest and most stubborn.

On this matter my own hypotheses at the start of the seventies would have been (a) that state secretariats would tend rather systematically to resist delegations of consequential discretion to the districts or other local levels (except in time of localised, e g, drought, emergency); (b) that states' political leadership also would resist such delegations, since the power and patronage of state politicians — often, even, of back benchers — are greater when they do not have to be shared with local politicians or administrators; and (c) that, therefore, major downward delegation within a state was likely to occur only if it were aggressively sought by the Centre's political leadership — to the point of the latter's being prepared to strong-arm recalcitrant state ministries on this account and make genuine delegations of discretion from state to district administrations a condition for receipt of substantial Central grants.

I had a further hypothesis, namely, (d) that in a self-consciously democratic system, major delegations of developmental discretion downward that flow simply to administrative functionaries such as the district collector near the bottom of the administrative chain could not long survive unless such officials came to be surrounded, conditioned, supported and indeed directed

by genuine local self-government. Nothing in my recent travels disturbed this last hypothesis; on the contrary, the on-going Maharashtra and Gujarat experiences seem to support it — even though, in some states, one does observe that some secretariat and ministerial personnel feel easier about delegations to one of their own unencumbered bright young men than to one who must submit to all the dissonance and log rolling of an activated local politics.

But as to the other three hypotheses, my recent touring did not support them very well. First, hypothesis (c) — strong arming by the Centre — is broadly perceived not to be feasible at present. Second, as to (b), there is a mixed picture. In some states — it is interesting that two of them, Tamil Nadu and Kerala, have non-Congress governments and vigorous multi-party politics at the local level — state ministries do indeed appear to share the suspicion of downward delegations that I anticipated. Yet in some other states this apparently is not the case; it is interesting that in one of them, Maharashtra, not only is there a particularly strong chief minister who is personally deeply committed to decentralisation, but there is an apparently secure Congress(R) majority statewide.

Referring back to hypothesis (a), the secretariats also are not of one mind. To be sure, many of the state officials with whom I talked quite fulfilled one's expectations of resistance to delegations of substantial discretion to the local level. Lest that statement sound patronising, let it be emphasised that these include some of the most dynamic, effective, development-bent officials of my acquaintance. Their reluctance is rationally, not emotionally based. It includes the same pro-egalitarian fear of unsupervised rural local self-government that one finds in the Centre's Planning Commission. For the time being at least, the reluctance may be quite warranted.

But warranted or not, in many secretariat people the reluctance is there. On the other hand, in others it is not — at least by their own testimony, especially where the official posture of the state government is strongly pro-decentralisation, as in Maharashtra and Gujarat. At the same time, those civilians, e g, in planning and rural development departments, who have become devoted to downward delegation offer no assurance that all of their colleagues in other departments of the same governments have fallen into line. Even in the pro-decentralisation states one senses that agriculture, education, health, and other functional officials still are loath to pass down to the locals broad authority to make choices even within their respective programmes, let alone between them.

All in all, therefore, intrastate delegation is likely for a long time to move slowly and erratically. It will vary greatly from state to state. There are apt to be differential experiments within particular states. But those further downward delegations that do occur are more likely to be state than Central initiatives. Their scope and shape will depend, for one thing, upon the apparent readiness of the local government structure for receiving more responsibility (in Tamil Nadu, for example, the absence of district-level development organisation is inhibiting; it is difficult for state officials to maintain a view of what is going on in some 360 taluka panchayats). But, more generally, what happens, state by state, will reflect the texture and the temper of state politics.

Delegating Sideways

A logical companion theme to decentralisation is that of pluralism. Just as decentralisation involves delegation downward within the politico-administrative structure, so, with respect to certain other issues over which the Central political authority can and/or could exercise ultimate decision, pluralism involves their delegation sideways to agencies which are outside of, or, at least are at some arms-length from, the official hierarchy.

In a mixed economy one may think first of such sideways delegations going to private enterprises. But they can be made also to all manner of other institutions — public-sector firms, co-operatives, labour-management negotiations, development corporations, institutes, public associations and societies. Indeed, thorough-going socialism can be highly pluralistic. The requirement simply is that matters for which the official hierarchy has ultimate responsibility be left to non-official agencies with a considerable measure of autonomy.

Sideways delegations seek to lodge subjects with agencies that have particular expertise on those subjects. Non-official or only quasi-official bodies may have greater capacities for experimenting, innovating, and risk taking than does general government. Their organisational forms and procedures can be more streamlined. And giving them their head vastly diminishes bureaucratic busy work.

As with decentralisation, the problem with collateral dispersions of decision is to assure sufficient coherence and sufficient faithfulness to common purposes. In a nation embarked on pluralism much of the art of government consists in refining systems of social control (the public-policy-conditioned market mechanism is one such, indicative planning is another) that, while preserving scope for dispersed incentives and initiatives, adequately conform fragmentary, self-interested decisions to social purposes.

In my decentralisation-oriented junketing this summer I made no attempt to take a considered view of what is happening just now to Indian pluralism. However, I would be sceptical of the impression of some observers that the nationalisation of the wholesale wheat trade together with a greater alleged affinity for Soviet economic models in the past couple of years indicates a retraction rather than expansion of sideways delegation.

Nationalisation of the wholesale wheat trade appears to have been a desperate measure forced by the government's public-supply dilemma (whose dimensions owed a good deal to the government's own previous miscalculations); in retrospect it is apt to look more like an aberration than a harbinger of things to come. At the national policy level a better harbinger may well turn out to be the work that, in parallel with wheat trade nationalisation, was quietly going on once again to prune some of the accumulated excesses, bric-a-brac, and irrationality out of the industrial control system.

But in any event (it was my cursory impression at midsummer) it was hard to locate harbingers of any kind at the national policy level just now. National economic policy seemed to be at an unprecedented standstill. But meanwhile in the rural area development scene the process of sideways delegation was being widely implemented or proposed — to new community development corporations, to command-area development authorities or associations, to commercial banks, to co-operatives (thriving, rejuvenating, or new), to private firms being drawn to new operations and/or locations, and to various new or newly engaged institutes, centres, and other units of the non-official research and analytical infrastructure.

As we pursue the downward decentralisation theme, therefore, it is necessary to remember that India, especially in the countryside, is indeed a pluralistic system and becoming more so. Probably this too is the trend of all very large systems. In them, more than in smaller collectives, up and down the official hierarchy there is need to share power and decision collaterally out of sheer bureaucratic self-defense. And in some respects, at least, a very large national system has greater scope for such sideways delegation: some of its collateral, non-official self-adjusting control mechanisms tend to be superior; this is notably the case, for example, with the market mechanism, where a larger common market, articulating the interactions of larger numbers of sellers and buyers, is an inherently better, socially more efficient market.

But in any event, the sideways proliferation is there — now more than ever and in prospect more than now. The issue, at local as well as higher levels, of how to co-ordinate the great variety of quasi-official and non-official actors with the official actors is obvious to many of the people I encountered this summer, and I shall return to it at the end of these notes.

Decentralisation and Equity

The idea that there may be an inherent conflict between two of the developing world's currently most prominent reform themes — one, the need to decentralise, "engage the locals", and promote grass-roots democracy, the other, the need to do better on the equity front, to attack mass poverty and unemployment — still is a comparatively novel proposition in international development circles outside India. Kuznets, Adelman and others have cited economic reasons why (absent effective countervailing policies) income distribution tends to worsen for a time as economies develop.[1] But it has been less widely recognised that this dip in the income-distribution path also can be accentuated by political factors — if, simultaneously, political power is being shifted downward to local self-government. For it is in local jurisdictions, at least in the countryside, that traditional, grossly unequal, status structures are likely to be least disturbed and, therefore, most callous in their treatment of the low-end poor.

India is far advanced in its perception of this problem. This was one of the firmer conclusions from my summer travels. Far from being the esoteric insight of a few social scientists, the probable conflict between decentralisation and equity is emphatically recognised by most of the state officials, planning board members, and politicians with whom I talked. They think it applies in most Indian states presently — with the probable exception of Kerala, where apparently there has been enough cumulative incidence of localised radical politics to leave the power of most rural elites permanently disrupted and diminished.

The question is what to do about the conflict. As between decentralisation and equity, most of my conversationalists assign the higher priority in equity. Therefore for some — particularly, as indicated, for some of the best, most-equity-minded state officials — the answer is straightforward: go slow on decentralisation. Others (among them, one or two of the most interesting state politicians I met) are less willing to hold back on the decentralisation front. They are convinced that the Indian countryside never can attain the development dynamic it requires without a much more reliable, sustained engagement of local energies; or they sense the necessity to escape the bureaucratic cumbersomeness of centrism (including state-by-state centrism); or they have an abiding philosophical preference for government by the people — from the bottom up. For some combination of these reasons, they are urgently groping, therefore, for reconciling solutions to the equity-decentralisation problem. There appear to be several possibilities.

First, as already noted, there is the Planning Commission's minimum-needs approach. Actually the latter would be one prong of what I would see, so far as centralisation-decentralisation arrangements are concerned, as a deliberately bifurcated anti-poverty (pro-equity) effort. On the one hand, programmes to generate labour-intensive employment would be consigned to as decentralised a regime as that for which political consent can be mustered — and therefore, while gaining the advantages of decentralisation, would be exposed to the risk of elitist dominance in many unreconstructed local polities. On the one hand, certain basic components of the welfare of the poorest and weakest sections of the population — a few discrete components such as drinking water, primary schooling, and access to minimal health services that are at once important, items of public rather than private consumption, and within the present financial capabilities of government — would be guaranteed by a regime of highly centralised categorical grants upon whose administration little local discretion would be allowed to intrude.

As far as it goes, this is an attractive response to the anti-egalitarian dangers of decentralisation. But it does not go very far. There are practical constraints on how many categories of minimum need can be met *via* public consumption, and there are fiscal constraints on how much public consumption the Centre can support. Some of the activities selected for (centralised) minimum-needs treatment would, save for the danger of elitist distortion, be particularly well adapted to local (i e, decentralised) decision and implementation. Moreover some states, of which Tamil Nadu and Kerala are two, find that the particular nationwide minimum-needs norms the Centre is projecting for the Fifth Five-Year Plan offer their poorest groups little or no anti-egalitarian insurance at all. For in their cases those particular educational, health, electrification, and other minimum standards already have been almost universally achieved. Yet the low-end poor in these states are still disadvantaged and will in no sense be content to mark time during the years next ahead while the rest of the country catches up.

A second answer that one encounters to the decentralisation-equity conflict holds out the hope that minimum-needs-type offsets to the conflict should not be required for more than an interim period. This second is what I would call, simply, the "tough-it-out" solution: Whatever their histories, rural status structures and elites (it is argued) are not inviolate. Not only is it true that they do change and are displaced from time to time; the constitutional machinery for their widespread displacement is fully in place. The disadvantaged groups and the poor are enfranchised. They have the legal capacity to participate in local self-governing processes, and the reason they have participated so little to date is not only a matter of traditional inhibitions and constraints; in large part it is because the powers, resources, and discretion of local self-government have been so limited. The stakes have been too small to induce the poor to pay the costs of rivalling effectively for a role in local politics. It has been easier to leave such things to those worthies who always have handled them.

The only real answer (this argument continues) is to put a greater burden on the system: Pass major power to the local level; let it be subject to

Shriram Chemicals' equation for national progress...

100% capacity utilisation =
1,000,000 tonnes of Urea produced = $100,000,000 saved!

- Total Urea output todate : over 1,000,000 tonnes.
- Increased foodgrain production todate : over 4,000,000 tonnes.
- Total foreign exchange saving todate : over $100,000,000.

SHRIRAM CHEMICALS

some elitist abuse; but let the non-participating poor thereby observe that their local ballots have become valuable — and begin to bestir and organise themselves accordingly.

For any true constitutional democrat this has to be the ultimate answer to the decentralisation-equity dilemma. But for the near term, absent more indication of the probable reaction time of the system to the proposed challenge and, therefore, of the bredth of the wilderness through which this strategy would force the poor to pass, the strategy sounds disagreeably austere — if not downright elitist.

My summer conversations suggest that reliable and generalisable information about the politics of Indian rural poverty remains highly elusive. What are the indications, if any, that disadvantaged groups — harijans, tribals, landless labourers — are developing greater political self-consciousness, voice, and muscle? What data of some representativeness and cogency could be marshalled to test for greater independence and assertiveness in personal behaviour? What time dimensions can be placed on whatever trends may be evident? Is there evidence, other than anecdotal, of grass-roots responses to *garibi hatao*? In particular (bearing more directly on the challenge-and-response hypothesis) in the two states, Maharashtra and Gujarat, where *panchayati raj* has been endowed with greater power and responsibility, are there signs that the low-end poor are beginning to compete more actively for local political participation than they do elsewhere or than they did formerly in those states?

These are questions that Indian political and behavioural scientists and survey-research specialists should be urgently and systematically investigating, it seems to me. At the moment, if my few conversations are any measure of the matter, some of the better political scientists and many state officials are highly sceptical of the empirical assumptions underlying the "tough-it-out" solution, while some politicians are staunchly faithful to it. For his part, the foreign tourist, while reluctant to abandon the classical constitutional-democratic answer, finds reason to look around for other answers that, like the Planning Commission's minimum-needs scheme, can supplement and reinforce it.

One such supplemental possibility (I was somehow more forcefully reminded on this summer's visit to the Kaira District Dairy Co-operative at Anand than on several earlier visits to that place) is for the poor to mobilise into economic ventures of sufficient scale and success so that they not only raise the economic well-being of their constituents but become a wedge (albeit a surrogate wedge) for injecting the interests of the latter into local, state, and even national politics. The Amul Dairy operation is owned by some 280,000 mostly very small people, many of them women, one-quarter of the total being landless labourers. Probably an organisational analyst would not find many of the initiatives in the enterprise flowing from the bottom up; on the contrary, Amul's secret has been very strong — and strong-minded — leadership. But that leadership identifies with the Co-operative's majority of small members and they with it; indeed they have vehemently resisted experimental ploys that elitists of the region have attempted now and then to move in on the management of the enterprise. And the fact is that a couple of lakhs of little people in the Anand area now have themselves one of the 30 largest corporations of India. It is commercially aggressive and successful, throws its weight around shrewdly and to their general benefit, and undoubtedly (even though it eschews formal political involvements) has altered the political power balance in the region.

As is so often the case with promising organisational innovations in India, it is not at all clear to what extent the Anand model is reproducible — although it has been copied elsewhere in Gujarat and although, under "Operation Flood", Anand's chief, V Kurien, is engaged in propagating the model in other metropolitan milk markets right now. To serve the political purpose suggested, such ventures not only must have memberships restricted to or dominated by the poor; they must have a product that is capable of competitive production by individual units of very small scale. They must have economically effective access to markets large enough to support a sufficiently large collective enterprise to develop some political weight as well as profitability. And — maybe most elusive, although about this I would not be too pessimistic — they must have managements not only exceptionally venturesome and skilful but ready to devote themselves to the service of the poor for financially non-competitive rewards.

The formula, at any rate, is worth more widespread promotion — as, indeed, the Government of India, in its Small Farmers and Marginal Farmers programmes, would appear to be doing, if one imputes a fairly subtle political, and not just a welfare, strategy to those programmes. But if the latter in fact are meant to serve as one answer to the anti-egalitarian political backlash of decentralisation, it not only will be necessary to hold candidate ventures up to bolder, higher standards of prospective economic performance than I gather has been the practice thus far; it will be necessary much more reliably to establish their autonomy from government itself.

This last point — about the length of the arm at which economic ventures of the poor must be held from the official hierarchy if such ventures are to serve as an effective counterpoise for the poor in the local political power balance — is one about which Kurien himself is correctly adamant. The tragic thing is that over so much of India the most obvious and appropriate organisational format for such ventures, namely, that of the producers co-operative, has become so discredited. Somehow, if this strategy for reconciling decentralisation with equity is to be exploited adequately, the proposition that producers co-operatives do not need to become vehicles for genteel rural corruption and elitist self-service must be rehabilitated.

In some of my conversations in South India the point was made that another form of response to the decentralisation-versus-equity dilemma may be represented by the aggressive mass tactics of the landless labourers of Tanjore District and the already-mentioned radicalised local politics of Kerala. Whereas the Anand model organises the poor economically and thereby develops a counterweight that offsets their lingering political importance in local councils, the radical Southern (and, I suppose one should add, Bengali) formula is to organise the economically disadvantaged for direct political action. Indeed it may be argued that such ventures represent nothing but the leading edge of what I have called the classical democratic solution to the dilemma: If what is needed is for the poor to "tough-it-out", then burning their exploiters alive should be tough enough.

The issue, of course, it one of means. The whole equity-decentralisation dilemma arises under assumptions of generally constitutional, orderly, lawful procedures. Egregious resorts to violence overstep those boundaries, and to almost all of my summer discussants

are unacceptable. But there is this point to be gleaned from the Southern radical cases: policy makers who are genuinely concerned about equity and who, at the same time, accept the necessity of decentralisation must also be prepared to accept a high measure of turbulence and bitterness in local politics. Most of the rural elites are not going to give up their traditional privileges easily. The question is whether, under constitutional procedures, they can be shaken loose at all. If things go well a good deal of shaking is inevitable — and to be welcomed.

Finally, as to the reconciliation of equity with decentralisation, the summer further persuaded me that a good part of the answer must involve improvements in the incomes of the rural poor that are engineered from the top down, that do not wait for the poor to achieve effective local political participation but instead serve to strengthen the economic base from which greater political assertiveness will subsequently emerge.

It is in this context that the relationship between decentralisation and public works arises, for as many writers, I among them, have argued elsewhere, substantial additive public construction activity must constitute a very large part of any promising attack that a country like India makes on rural poverty.[2] Along lines indicated, there is a strong case for committing such additive, labour-intensive public works to as decentralised a regime as promises to be workable and politically feasible.

This would mean that the local (say, the district) level should exercise responsibility for choosing, designing, implementing (and, I would add, partially funding) most or all of those public construction projects for which it is equipped with adequate expertise, for which there is strong local desire, which have acceptable benefit-cost characteristics, for which local labour is available, and which are manageable on a relatively small local scale. The last consideration, for example, probably would rule out residual employment schemes on which workers may work any day they happen to turn up. On a localised scale this injects so much unpredictability into the operation as to make the achievement of community-satisfying results extremely difficult. Such programmes, as well as those (e g, national highway maintenance and building) whose scope clearly extends beyond the local jurisdiction, should be initiated and administered at higher levels.

But a great part of the additive construction activity would be highly localised and, therefore, in its decision making, subject to the elitist skewing of existing rural politics. However, it nevertheless normally would be the case (and this could be reinforced by Central or state standards requiring that minimum fractions of project costs be devoted to unskilled wages) that the employment and direct income benefits of the activity would flow disproportionately to the poor. For it is they, except under drought-relief circumstances, who would have most of the time for and interest in such work.

Moreover, there is this crucial point: If, as various studies and some recent public-works experience seem to suggest, the surpluses of labour freely and willingly available for such work are fairly thin in many parts of India — if, therefore, rural unskilled labour supplies are fairly inelastic — much of the benefit that such additive activity will deliver to the poor is the substantial upward pressure that it will generate on agricultural and other unskilled wages in the regional labour markets where the additional construction occurs.

In terms of the decentralisation-equity issue, therefore, a decentralised works programme would, in its first round, leave the disadvantaged groups short on participation in project choice but long on economic benefits, directly and indirectly provided. And the latter, in turn, should strengthen their capacities for an expanding role in an increasingly egalitarian local polity.

Decentralisation and Finance

The summer left me only further persuaded that the strongest direct constraint on new rural area development initiatives, as on development efforts in general, remains that of resources.[3] The relationship between finance and decentralisation cuts two ways.

On the one hand, there is a strong persuasion among Indian rural-development students and practitioners that genuine decentralisation cannot occur unless the lower jurisdictions also assume responsibility for raising more of their own resources. The point is made most commonly with respect to decentralised planning, the topic to which we shall turn next. As long as local jurisdictions are so financially dependent on grants and loans from above, so-called district or block-level planning, it is argued, simply becomes a matter of writing shopping lists. Local authorities itemise their wishes for state and/or Central funding without making any of the hard allocative choices of which real planning inherently consists.

Logically, this argument proves too much. Organisations *can* be funded from outside and still plan or budget responsibly. Government financed universities are one set of examples. What is required is that the total available funding be limited and that limit be known to the grantee, which is then left free to make its choices within that constraint. However, the gist of the present Indian persuasion that decentralisation of decision and further decentralisation of financial responsibility are necessary concomitants probably is right — for two reasons. First, if the locals are to have more of the decision-making action, it will indeed improve the quality and reliability of their choices, and of their management, if they are required to raise and risk significant quantities of their own resources. Second, the total quantum of resources needed for rural development is almost sure to fall short unless more funds are raised from the countryside itself; and the best chance of doing this probably is *via* local authorities and institutions that are challenged to dig up more of the funding for their own discretionary purposes.

The latter is the sense in which the relationship between decentralisation and finance cuts two ways. On the one hand, decentralised financing is viewed as a necessary condition for healthy politico-administration decentralisation. But on the other hand, it may be that nothing but fairly radical politico-administrative decentralisation can create the incentives for the incremental resource raising upon which expanded rural development and anti-poverty efforts depend.

In the summer of 1973 it was hard to take other than a bleak view of the financial prospects. Last year's Committee on Agricultural Income and Wealth Taxation, aside from its now already-implemented proposal that agricultural and non-agricultural incomes be bracketed for purposes of assessing the Centre's non-agricultural income tax, had offered only one recommendation — for an agricultural holding tax. This would require state-by-state implementation; at most it would promise very modest yields; and among all the states, I was told, only Himachal Pradesh showed signs of adopting it. The Centre seemed to be out of fresh ideas for raising additional resources from successful cultivators. One state government I visited was preparing to ask the Planning Commission for nearly double the Fifth-Plan allocation that the Commission had tentatively indicated could be provided. The state's secretaries, eloquent in defending their need for all they were asking, were equally eloquent in explaining why, if their claim failed, the state could not make up the difference: it already, for example, had raised farmers' electricity and water rates to uncomfortably high levels *vis-a-vis* its neighbours.

India, it is only fair to note, has quite an admirable record of domestic resource mobilisation. Relative to its income level it has done better than most developing countries. But if it would pursue its present rural development initiatives and make inroads on mass poverty and unemployment, it must do better still on the resource mobilisation front — especially with regard to the more prosperous farmers. As an only quasi-informed outsider, I am still not convinced that something more radical in this regard is not possible at the Central level (for example, a substantial in-kind production levy on foodgrains producers that would be coupled with generous support prices, would meet the supply requirements of the government's subsidised food-distribution programme, would be legally and constitutionally analogous to the present production levy on sugar growers, would, however, be graduated in the manner of the Raj Committee's proposed agricultural holdings tax, but would contribute several times the budgetary resources envisaged for the latter). Nor, certainly, is there much doubt that most state governments, if they can muster the political will and courage, are capable of collecting more direct taxes and user charges from agriculture.

But, as has been suggested, the decisive increment of resources probably must come from local resources and *via* local institutions that gather them for their own disposition. In this regard there are some stirrings. Financial institutions reaching into countryside — notably, the nationalised commercial banks — are rapidly expanding their collection of private savings; these can be channelled increasingly into local investments. Among wholly localised self-financing initiatives, one of the most ingenious and promising is the Land Labour Co-operative Development Bank recently experimentally launched in Ernakulum District of Kerala.[4]

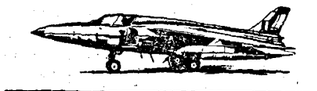
However, such undertakings represent only an important first step in an adequate programme of decentralised development finance. They extend only to self-liquidating projects, i e, ones whose private benefits are expected to make them profitable and where, therefore, their private or entrepreneurial beneficiaries can be made to bear the costs. A full regime of local financing must also extend to uses of resources whose *social* benefit-cost characteristics are attractive but which are not, in the former sense, self-liquidating. A full regime, in short, must also provide expanded local taxation. Here, it would appear, the stirrings still are meagre indeed.

The conceptual formula, most of my summer conversationalists agreed, presumably should be that of Centre and/or state matching grants whereunder local self-governing units not only would be pressed and (*via* bestowal of broader taxing powers) authorised to gather more revenue; they would be rewarded for so doing. Moreover, if one were to judge solely by the relative responses that *panchayati raj* units have made to such inducements in states like Maharashtra and Tamil Nadu, where they have been authorised to and rewarded for levying surcharges atop their land revenue, one would be very optimistic about the matching-grants elasticity of local tax effort.

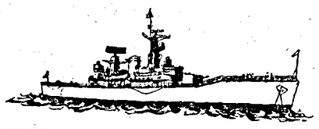
However, the whole quantitative scale of land revenue — indeed, the scale of all present local rural taxation — is too trivial to support any predictions. The fact is that no one knows what, under conditions of politico-administrative decentralisation, local taxing propensities will be. It is time the nation began seriously to find out.

Decentralised Planning

Perhaps I owe the reader an apology for only now reaching the topic that was supposed, more than any other, to be the focus of these comments. But for an Indian audience the subject of planning usually deserves a long preface. There is too much tendency to treat it as an end in itself. People speak often of "planning and development" as if, somehow, they were co-ordinate functions. This, of course, they are not. Governments plan *for* development. Planning is instrumental. It is only one, albeit a fairly strategic one, of a variety of inputs to the development process. So with decentralised planning. It has meaning only in whatever more generalised context of decentralised decision making the system is evolving.



Much of what currently passes for decentralised planning is bogus. Indeed, to narrow the subject down to genuine decentralised planning, I would pare away three misplaced uses of the term.



In the first place — and this point is largely semantic — in a governmental context, it makes good sense to restrict "planning" as a differentiated organisational concept to activity performed by specialised personnel. In other words, "planning" implies planners. Advocacy of this narrow usage will get you a quick argument: District collectors, block development officers, even VLWs and village panchayats, it is insisted, all have to "plan," whether or not they have any specialised planning staffs. Of course they do, but in that sense, so do I when I order my breakfast the night before. Generically, planning is nothing but forehanded decision-making; everyone plans much of the time. But if the term "planning" is to describe a specialised and institutionalised function of government, it had better be restricted to thinking ahead that is assisted by personnel specialised to that purpose. It is in this sense only — not because I think villages or development blocks should not make plans, only because I cannot imagine specialised planning expertise being lodged any time soon in all or, even, a very large fraction of the 5,000 blocks of India — that I doubt that planning can be decentralised below the district level.

Second, as has been noted already, much so-called decentralised planning is bogus in the shopping-list sense. It involves simply the assembly, for districts, blocks, or other local jurisdictions, of arrays of desired projects without regard to resource constraints. Genuine planning always involves the recommendation of choices.

The third kind of bogus decentralised planning in one respect is a counterpart of the second, for if district planners, for example, must recommend choices, it is equally true that the district decision-makers whom they advise must have the discretion to *make* choices. Under the third kind of bogus decentralised planning they do not. Planning *for* the district is not done *by* the district; it is done from above at the state and/or Central levels, where the decision-making discretion is retained. Plainly there is nothing wrong with a Central plan being broken down

INDIANOIL SERVICE TO SERVICES

India's Defence Services, no doubt are our valued customers. But we do not look at it that way. As a leading public enterprise, we deem it our prime responsibility and our duty to rally round the Services and help keep round-the-clock vigil across the national frontiers.

Army, Navy or Air Force—Indianoil is there to meet all the requirements of petroleum products conforming to correct specifications wherever they are needed.

The recent Indo-Pakistan hostilities posed a challenge to provide the logistic support. Indianoilmen accepted the challenge and met it squarely, irrespective of the odds, risks and costs, thus earning the nation's gratitude for their efforts in war and no less in times of peace.

into geographic detail by states (just as for other purposes it is broken down into industrial sectors) or with a state plan being detailed by districts. But these exercises should not be confused with what deserves to be called state planning, in the first case, or district planning, in the second.

In sequence, during their respective memberships on the Planning Commission,[5] Professors Gadgil and Chakravarty have developed the theory of decentralised planning around the propositions that different functions and/or kinds of problems have different appropriate levels of decision and that issues should be decided at the lowest appropriate level. I shall not expand here on the problem of allotting subjects to their proper levels. Nearly all of the relevant considerations are captured in the economist's concept of "externalities." The Gadgil-Chakravarty rule would be that activities should be planned in the smallest jurisdiction at which there are no substantial spillover effects (good or bad, either direct or indirect) on territory and population outside the jurisdiction.

One requirement for decentralised planning obviously is to get the allotment of functions by levels straight. On average, if the proponents of decentralisation are correct, there is scope and need in India to shift the allotment downward. But there also are contrary cases, of which (I have mentioned in passing once already) electric power generation and transmission seems to be an outstanding example, where the present pattern of planning and decision-making needs some centralising.

What increasingly intrigued me in my conversations this summer, however, are the interlevel relationships that would prevail even if and when these interlevel assignments of functions have all been straightened out. The key point is a very simple one. Centre-level, state-level, and district-level activities all would intermingle in the same districts — because, of course, the only territory, other than municipalities, in which any-level activities can occur is that of the districts. As someone or other has written or said already, the economic tableau of a district will resemble a marbled cake, containing a number of things which are district-planned but many which are not.

All the research institutions, analysts, and outside agencies undertaking rural area development studies or consultancies are one group who will do well to keep this local intermingling of both local and non-local activities pointedly in mind. For not only are different decision-making levels involved; different, sometimes conflicting, objectives are at stake. A group at the G B Pant Agricultural University, for example, is undertaking a project to study the possibilities and processes of integrated area development in a section of the Ramganga Catchment Basin. But with whom, as action-oriented researchers, should the professors identify — with the hills people with whom they are working, or with the people of the UP and India downstream from the Ramganga Dam? Should one try to build up goat herds to augment scanty local incomes or diminish them in behalf of soil conservation and anti-silting? Rural area researchers need to know their clients.

The intermingling of Centre, state, and district subjects has even plainer implications for those who would be expected actually to do lower-level planning on an on-going basis. The lower-level planner by no means can be impervious to the impact that higher-level or larger-orbit activity will be having in his territory. He will want to find out all he can about intrusions from above and will welcome the assistance of planning colleagues in higher jurisdictions in this regard. Insofar as local government chooses (or is politically forced) to take a comprehensive interest in the welfare of its constituents, the local planner and his local principals may also seek assurance of certain "higher-level" supplies (e g, electric power, fertiliser); and the locals may seek to induce larger-orbit activities (e g, Central-government enterprises in the case of states, state institutions and/or state and private industries in the case of districts) to locate in their jurisdictions for the sake of the local employment, income, taxation, and other benefits. But if one is speaking of *action* plans, the lower the level of planning, the less complete — the more partial — the planning necessarily will be.

There is another — economic — way of making much the same point that has clearer methodological implications. The economy that is planned at the national level is something approaching a closed system. Imports and exports together constitute a relatively modest exception to this hypothesis. Most inputs are outputs from somewhere else in the country itself and therefore are subject to planning influence if not control. Moreover, to the extent that it is even physically and/or politically feasible to resort to extra imports to correct errors or oversights in domestic planning (as it generally is not, for example, in the cases of internal transport, electrical generation, and skilled manpower) this can be quickly and gravely disruptive on the foreign-exchange front.

At the national level, therefore, there is a maximum case for comprehensive planning that reckons and articulates the linkages that close the system — all of the interindustry and intersectoral interdependencies. At the state level the case for this *type* of planning is a good deal weaker, and at the district level it is far weaker still. A methodology that treats India almost as an island is useful; employing the same techniques for Tamil Nadu badly stretches reality; to do so for Ludhiana would be downright silly. At the district level most of the linkages simply are not very important, because the system is so much more open; imports into and exports from the district are far higher relative to district output and income; and the chances that the market will bridge planning errors and oversights benignly are many times better than they are for India collectively. While I have by no means figured out all of the specifics that this view of things implies for decentralised planning methodology and data needs, I am sure that requirements become more modest as one descends the hierarchy — and that, as a limiting case, district input-output tables would be as futile as they would be difficult to contrive.

There was some indication in my rounds this summer that, in state planning circles, thinking has begun to shape along the lines just sketched. It did not start out that way when, in response to the Planning Commission's encouragement, the new push for state and (more hypothetically) for district planning began in 1972. Partly because of the source of the initiative, there was an initial tendency to think that what was being called for was the establishment, first at the state level, and then subsequently at the district level, of agencies that in miniaturised fashion would do the same things in the same kinds of way the Planning Commission does at the national level. The image was of what might be called mini-macro planning.

However, at the state level second thoughts have begun to accrue. Having projected a full array of national-style plan models for their state, the professionally sophisticated members

of the Tamil Nadu state planning board now have begun thoughtfully to differentiate their function and priorities from those of the national Planning Commission. Like the government of Karnataka (which is particularly adamant on the point) they now emphasise the importance, for state planning purposes, of concentrating on a few key sectors. In Gujarat, the Sardar Patel Institute of Economic and Social Research, clearly one of the strongest concentrations of quantitative applied economics analytical talent in the country, is with praiseworthy candour now in a sense challenging its own stock in trade: It is reporting that its studies show that the intradistrict and intrastate economic linkages upon which much of its closed-system hypothetical planning techniques had been premised are much weaker than had been expected — and it is shifting some of its energies to simpler, more serviceable techniques and to other regional planning issues. The new Centre for Development Studies in Trivandrum, with ready access to Kerala state planning, explicitly eschews the mini-macro format. It intends to concentrate for some time on micro studies of a variety of phenomena within the state, then gradually to experiment with new methodologies and models built on a fresh empirical base.

Fortunately from a methodological viewpoint, the projection of mini-macro planning to the district level is still almost entirely talk — unimplemented. For, as far as I could gather, very little of what is defined above as "genuine" district planning (by specialised district personnel) has yet begun. Karnataka has experimented with one quick round of planning by three-man district teams for which its new Institute for Social and Economic Change provided interesting training. But by and large serious district-level planning lies in the future.

As has been emphasised above, the first requirement for making real district planning operative is the biggest: It must be preceded by or coupled with genuine intrastate decentralisation of decision; otherwise localised planning will remain play acting. Part and parcel with this delegation downward, it must be decided which subjects and functions — selected, for example, from such possibilities as primary education, health, nutrition, rural roads, minor irrigation, aspects of the district's spatial or settlement or Centre-building policy, local public works — can appropriately be left to district-level determination.

With this much settled, one could begin to imagine the texture of the district planning function. The choice of subjects would largely define the the kinds of expertise district planning cells would require. Methodologically, I would make two guesses. First, the single most valuable and generally useful skill for district planners (and one that would afford them professional rapport up the hierarchy, with their counterparts as at the state and Central levels) would be that of close analytical project evaluation. Second, beyond this, however, a rather ironic guess from an economist's viewpoint: When the word "planning" is used professionally there always is the potentiality for confusion about whether the reference is to what economists do, most typically at the national level, or to what town and country planners do, most familiarly at the local urban level. When and if professionalised Indian (rural) district planning finally shakes down, it is likely to draw rather more on the latter than the former.

I would add just two final words on decentralised planning *circa* summer 1973. In the first place, while decentralised planning is not going anywhere in a hurry, this is not because subject is intellectually or even institutionally inert. Cogen, insightful thinking about it is going on in state governments, in their planning boards and commissions, and in a variety of regional research, analysis, and training institutions, which, I shall be noting later, have important network-making roles to play in the rural area development scene. In several states, at least, the decentralised planning function stands ready to evolve as fast as the politicians and bureaucrats decide they are serious about decentralisation *per se*. But planning cannot leapfrog that decision.

In the second place and related to the first point: The probable thing and, under present political circumstances, the healthy thing will be for state planning and for district planning within the several states to grow in various patterns and at various paces. Of necessity, the Centre will be concerned to deal even-handedly with the states, and it may contrive inducements to laggards to move in desired directions. But it would be a great pity if in this field the Centre became a devotee of uniformity for uniformity's sake and attempted — somewhat in the manner of Community Development's propagation in the fifties — to mandate a single decentralised planning model in accordance with a single set of Central guidelines. The political realities are otherwise, and, that being so, there is much that can be learned from a variety of experiments.

Settlements Policy

There is much that could be said, of course, including some that I have said elsewhere myself, about the spatial dimensions of rural area development.[6] But the following will be limited to selected comments on rural growth centres.

During the past decade in India the need to develop growth centres in the countryside has been more and more widely accepted. Almost everyone has abandoned the idea that modernising agriculture, let alone rural industrial, commercial and other activities, can remain village-centred. Moreover, with respect to the rest of the hierarchy of settlements or central places, stretching from the village up to the metropolis, particular interest has formed in building foci of growth that, while larger than villages, are close to them and smaller than district towns. To the defensive purpose of staunching the flow of migrants to the cities has been added the positive purpose of providing conducive and symbiotic supporting structure for progressive agriculture. Social scientists have been researching the characteristics of promising rural growth points. Since 1969 the Centre and state governments have been collaborating in an empirically and methodologically sophisticated Growth Centres Project with 20 field locations. Virtually any new Central or state irrigation or other project with a specific area scope is now inclined to factor some kind of settlements strategy into its project design. And many organisations and enterprises newly reaching out into the countryside — notably the commercial banks with their proliferation of branches — are systematically looking for, or are concerned to help establish, activities clusters with high growth potential.

This new conventional wisdom is almost all to the good. But (in this latest travelling I found further reason to think) it does not yet add up to a clear settlements policy, either in concept or implementation.

For one thing there is a confusing overlap between two distinguishable brands of growth-centre thinking. Both start from the agreed, and readily demonstrable, premise that the country, compared with its needs, has a large deficit of properly appointed and developed market towns — i e, of central places in the size ranges between villages and district towns. But then, following the lead of the geographers' central-place theory, Brand No 1 is concerned to identify the whole stratified

array of settlement sizes that ought to be aimed for and to establish, for each level in the central-places hierarchy, the profile of social services, facilities, amenities, etc, that a proper centre of that scale ought to have. Its policy recommendation seems to be, simply, that governments, as quickly as they can, ought to take steps to fill in all the existing gaps under these profiles.

According to Brand No 2 thinking, such policy is not only unrealistic; it undermines the possibility of using growth-centre building as an engine, and not just an aspect, of development. In the aggregate, the present facilities and services deficits in the lower orders of central places are so massive that, under any realistic view of public budgets, it will take many decades to fill them all. Moreover, if the limited resources available for growth-centre building are sprayed around indiscriminately (or equitably) and, therefore thinly, the opportunity to build up critical masses at a relatively few places and let them start generating self-augmenting externalities will be missed. Further still, the natural *political* tendency (even if the natural economic tendency is toward an early clustering of new commercial and industrial locations) is precisely toward the kind of dispersion of facilities that should be avoided. ('You back the location of this new area-wide public facility in my village and I'll support the location of that other one in yours.')

According to this second brand of growth-centre thinking, therefore, the essence of rural settlements strategy should be to discriminate — deliberately for some time to concentrate at a relatively few places all new locations of government-influenced facilities which are to be made in the countryside and whose siting is discretionary. Finally, because the gap of missing growth centres between the district towns and the villages is so large, it probably also, I think, is the implication of this first-things-first approach that the gap more or less should be filled from the top down. That is, in the typical district the next question should be. What two or three or half-a-dozen other places beside the district town should next serve as preferred locations? — this rather than what should be the several favoured growth points within each of the district's 15 development blocks?

Although I make no pretense of being a neutral witness on this subject, it seemed to me that, once the issue was defined, a high proportion of those in and around state governments with whom I discussed it this summer favoured the second of the foregoing approaches. Moreover, as to the question of how one identifies the growth centres that should receive favourable discrimination, there was much sympathy for a rather agnostic diagnosis that can be summarised as follows: First, if one can strip away the parochial prejudices of the sub-jurisdictions, usually there is no great mystery about which two or three or five places should next be brought up in a given area. In other words, scientifically sophisticated investigations of this issue seldom are likely to (and in the case of those on-going, seldom do) come up with findings that would surprise intelligent laymen or officials of the area. Second, in any event, initial errors in this case (other than egregious, initially obvious errors) are not likely to be very critical or lasting from a social policy viewpoint. This is because, if the strategy of selective, concentrated growth-centre promotion works, whatever slight starting disadvantage site A may have compared with site B are likely to be swamped, if site A is selected, by the cumulating advantages, the self-reinforcing externalities, that site A gains as the strategy proceeds. Finally, the whole question of growth-centre choice cannot ultimately be settled by scientific means anyway; the question always is so inherently and nakedly political that it must somehow be resolved through the political process.

This summary would be grossly unfair both to the on-going and to future social-science inputs to this issue, however, if two amendments were not added. In the first place, while much of the current research on growth centring may appear to be focused on the question of centre identification, it is producing a great deal of data — and, more important, a great deal of experience as to the accessibility and importance of different kinds of data — that may contribute vitally to "genuine" district planning if and when the latter starts. One of the pivotal problems facing that activity will be what is the *minimum* bill of data (minimum both in terms of collection and processing) that can serve continuing local planning. Thanks to its very data-collecting and -processing ambitiousness, some of the on-going research, notably of the Growth Centres Project, may, if it focuses intently on the problem of culling the few key and accessible variables, greatly illuminate this issue.

In the second place, even though discriminatory growth-centre choice will remain an inherently political determination, continuing scientific effort may be necessary to catalyse it. For my own part, the summer travels served finally to disabuse me of an hypothesis I have been carrying around for at least half-a-dozen years. Convinced by the argument summarised two paragraphs back, I had been inclined to think that, under a regime of genuine decentralised decision-making, the need to choose a specified small number of places in a district that for a specified number of years would be favoured for discretionary locations (say two to five places other than the district town itself) should, as a local, inherently political issue, be pitched straight at the district council or *zilla parishad*. And a variety of grants and/or other favourable actions by state and Centre should be made contingent upon the council's making this choice. Several telling witnesses this summer persuaded me that, so confronted, the members of a *zilla parishad* would be likely still to be debating when their terms ran out. Because of its very local political sensitivity, in other words, the discriminatory choice of a district's preferred centres probably, after consultation with the locals, will have to come from the state as a *fait accompli*. But even the state bureaucrats, let alone state-level politicians, are unlikely to be able to stand the heat of this choice, or to get the locals to forbear from further debate, without being able to appeal to the findings of dispassionate experts.

Hence the need for access to specialists giving continuing scientific attention to the issue of growth-centre selection.

Articulating the Network

The present complexity of the Indian rural area development scene is mind-boggling. The scene is populated by interpenetrating levels of official activity, by great varieties of public and private enterprises, by many familiar quasi-government, near-government and voluntary-agency institutions, by (as noted with respect to "sideways delegaion") some new kinds of non-official ventures, by various research-cum-action explorers making forays into the countryside, and by a variety of genuinely indigenous local experiments.

Often this summer in struggling to comprehend only fractions of the scene I was reminded of the injunction of a near neighbour of India's once: 'Let 100 flowers bloom.' Rural area development comprises several hundred flowers — or is it a weed patch? What about the ordering problem?

The first thing to be said is that order is not the name of the game.

Mobilising fresh energies, resources, and initiatives is more important than organisational tidiness. Providing more income, employment, and political leverage to the low-end poor is more critical at the margin than maximising the efficiency of resource allocation. Yet the country does have scant room for wasting resources in the aggregate, and it must seek, not only through vertical hierarches but via horizontal decision-making networks, to reconcile dispersed and/or local initiatives with national priorities. So it is appropriate to ask what ordering mechanisms are likely to save rural area development from chaos. In addition to the politico-administrative command structure itself, at least four are in various stages of readiness.

First, there is the market, and this for all of its imperfections and unfashionability with some Indian progressives, is an enormously important machine for effectuating social purpose. Indeed the principle here can be broadened: the chances for constructive cohesion of the rural development scene will be improved to the extent that as many of the actors as possible are both motivated and analytically and informationally equipped to make socially optimising decision. This is precisely why the practice of sound project-evaluation technique is so important not only for district-level planners but for all of the other private, quasi-public, and government agencies involved.

Second, although this may not raise cheers from either economists or state officials: genuine, participatory local government at the district level, with broad responsibilities and in which the area's interest groups are broadly represented, can be an important integrative, conflict resolving force. The integration often will be heated and contentious, and it can be real.

Third, the kinds of fiscal responsibilities and discipline touched upon earlier can have an ordering, clarifying effect. Lower levels of government, by being held to fixed contracts of support from above, can be required to thrash out their own requirements-resources balances. By being left to allocate within these totals and being required to augment them with locally raised resources, they will have their allocative choices sharpened — without, if the subjects delegated to them have been rightly chosen, yielding results inconsistent with national or state purposes. And in the pluralistic local economy, the need of local governments to raise funds from local sources will make for much closer, albeit sometimes adversary, linkages with the other occupants of the local terrain.

Fourth, an aggressive settlement policy, I am convinced, can be a great orderer. By overcoming the present political disposition toward scatteration of official and officially sponsored facilities, it can greatly strengthen the complementarities and positive externalities that knit the local system together and affect its composite pace.

For all of these reasons, therefore, I find no reason to despair that rural area development in India, if the decentralised, pluralistic directions in which it appears to be headed are encouraged further to mature, need become a weed patch. But there is one small, instrumental reform that could be extremely helpful: the provision by someone of a good and all-embracing information clearing house. The actors not only are so numerous, they belong to so many different semi-insulated cultures — official, entrepreneurial, academic, professional-practitioner, voluntary-agency — that it is almost impossible for any one set to keep track of what is going on elsewhere in the field. This assures gaps, duplications, and lost motion that all parties, had they only known, would have wished to avoid. Government agencies (in India as elsewhere) are not very well cast for this information-exchange role. But someone should have a go at it.

Finally, a brief word about those research and academic institutions that are increasingly entering the rural area development scene. Quite plainly there are important roles that such agencies can play, usually in one way or another in collaboration with the state or local governments in their region but the better for being at one or two removes from government. In the case of district planning, for example, such institutes could usefully, on a continuing basis, perform at least three valuable services: advise on data needs and procurement, and on planning methodology; provide training for district planners; and supply systematic selective evaluations of districts' planning and implementation.

The capacities to do such work that already are forming around Indian state capitals — often in clusters of organisationally independent institutions — are quite impressive, and so is the effort of some state governments to promote the development of such analytical infrastructure. In a number of cases divisions of labour will need to be worked out. There is need for better communications among the institutions, especially between different disciplinary and cultural sets (e g, between town planners and economic planners, agricultural economists and other economists, engineers and sociologists). There is particular need for the weaker institutions, as is so often the academic tendency, not to let themselves get defensively cut off from what is going on in the mainstreams of research nationally and internationally. In short, there is need for some good research networking as a special case of the more general net-working the field requires.

But it was a pleasure this summer to see the zest and confidence with which regional research institutions were tackling regional problems. The old compulsion whereunder the regional institutes in order to prove their credentials had to tackle national problems seemed happily to have abated. The marshalling of research capacities is not likely to be the principal bottleneck impeding bolder pursuit of rural area development initiatives.

Village Lease Markets for Agricultural Land

Some Approaches for Analysis

V M Rao

This paper describes an analysis of village-level data on lease transactions.

Viewing these transactions as constituting a market for leased land, the analysis seeks to bring out the features of this market as reflected in the comparative characteristics of lessees and lessors participating in the market and the pattern of inter-relationship among these participants arising from lease transactions.

The results are reported primarily to suggest the utility of the approaches used in analysing the research and policy issues relating to the question of tenancy. However, they could also be of some substantive interest to researchers for the glimpses they provide into the nature of lease transactions prevailing in a sample of villages located in Maharashtra and Gujarat on the eve of the implementation of an important piece of tenancy reform in 1957.

IT has been evident for some time past that the technological change underway in Indian agriculture is leading to a renewed interest among the researchers and policy-makers in the reforms needed in the agrarian structure. After the first round of the post-Independence land reform legislation in the fifties, especially after its evaluation showed little by way of any dramatic impact on production, there was a discernible shift in the emphasis in policy-making from measures for structural reforms to programmes, such as IADP, for overcoming the technological stagnation in agriculture. While the achievements of these programmes so far have been impressive, voices are already being heard that the prevailing agrarian structure, unless substantially reformed, may become an impediment in the way of sustained adoption of technological change by all the strata of farmers. It is not unlikely; therefore, that in the period ahead structural issues like inequality in the distribution of land-ownership and the nature and consequences of landlord-tenant relationship may figure again prominently in the agenda of researchers.

This paper describes an analysis of data on lease-transactions carried out as a part of a recent research project of the Department of Economics, University of Bombay.[1] The purpose is to present the framework used — which differs in some respects from the current modes of analysis of these data — along with a brief indication of the results obtained. It is hoped that the framework would be of some use to researchers having occasion to analyse data on lease transactions; also, the results, though pertaining to a small number of villages located in the ryotwari areas of Western India, could be of interest to them, at least as illustrating the inadequacy of the idea that there is nothing more to lease relationships than exploitation of landless tenants by absentee owners.

We may begin by taking note of the two main features of the framework. The first relates to classification in the analysis of the parties to lease transactions, viz, the lessees and the lessors. It would appear to be a common practice in the analysis of lease transactions to classify the parties according to the size-class of their cultivation holding alone or that of their ownership holding alone. It is our feeling that such a classification while convenient in the analysis in the sense of giving a small number of classes can have the consequence of grouping together parties with possibly dissimilar status and bargaining power in lease transactions. Consider, for example, the category of lessees with small cultivated holdings; in principle, this category can include cultivators ranging all the way from those having no owned land of their own to those with sizeable ownership holdings, an obviously motley group. Hence, it would appear more appropriate to classify the parties into relatively more homogeneous categories based on a simultaneous consideration of ownership size-class and cultivation size-class of each party yielding categories such as small owner-cum-small cultivators, small-owner-cum-large cultivators, etc. Our analysis proceeds in terms of such categories which we indicate by two-letter codes with the first letter showing the ownership size-class and the second showing the cultivation size-class of the parties in each category; the categories obtained in this manner are referred to below as "mixed-code groups" of lessors/lessees.[2]

The second feature of the framework is an intentional emphasis on bringing out the characteristics of inter-relationships among lessors and lessees arising from lease transactions. While the literature of recent years based on rural surveys has provided a useful body of information on leasing in/out of land by owners/cultivators belonging to different size-classes of holding, data seem to be very meagre to answer even a simple question pertaining to inter-relationships such as "who leases in land from whom?" It is possible that the sampling designs employed in large rural surveys — multi-stage, stratified, etc, leading to coverage of small number of families from each surveyed village — make it difficult to piece together such inter-relationships from survey data. It is easy to see that in the absence of such data any interesting features of the inter-relationships — such as, say, small landless tenants obtaining their leased land entirely from large absentee owners — would go unnoticed. Since the data available to us came from a full enumeration of ownership, cultivation and leasing of land in the surveyed villages, it was decided to pay particular attention in the analysis to inter-relationships arising from lease transactions.

The analysis was done village-wise by viewing all the lease transactions pertaining to land within each surveyed village as constituting a lease market. The task was to bring out the features of this market in terms of the mixed-code groups of the lessors and lessees included in it and the inter-relationships among these groups. Twenty-three villages located in three districts — Satara and Kolaba from Maharashtra and Kaira from Gujarat — were covered in the analysis. The results reported here relate to the year 1956-57 and we believe that they are broadly representative of the lease relationships prevailing in the ryotwari areas of the three districts on the eve of the implementation of the Tiller's Day Amendment to The Bombay Tenancy and Agricultural Lands Act in 1957. Section 2, which follows, describes the characteristics of the lessors and lessees functioning in the lease markets and

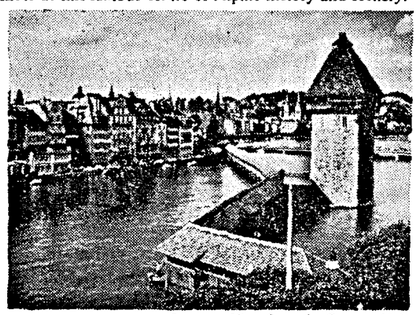
GLACIER LANDINGS JOIN BOBSLEDDING AS ALPINE SPORT THRILL

SION (Valais)—An organization here offers year-round courses in glacier and mountain-top landing for licensed amateur pilots. Bookings may be made through the airline of the Alps* (no monopolist at heart).

At one time the glacier over the present site of this historic Rhone valley town was almost 1.6 km thick, and extended 80 km northwest to the Jura mountains.



Swiss glaciers now cover about 2000 square km; the Aletsch Glacier, with 168 square km, is one of Europe's biggest.

Perhaps naturally, it was a Swiss engineer, Ignaz Venetz-Sitten by name, who first propounded the theory of the Ice Ages, in 1829. The great Swiss naturalist Louis Agassiz carried the idea around the world against vigorous scientific opposition.

From A to Y: The Sound of Music in the Alps

LUCERNE—The rich musical life of the Alps is typified by the International Festival weeks held annually in August and September at this famous centre of Alpine history and scenery.

Lucerne. View from the Concert Hall.

Further events appear in a colour brochure called *Alpine Highlife Cultural Programs* — a publication no traveller to Europe should miss reading.

Alphabetically, A–Y, some other specimens.

Alpenhorn/Appenzell. You can take lessons in playing these instruments (some are 6 metres long) at the above town.

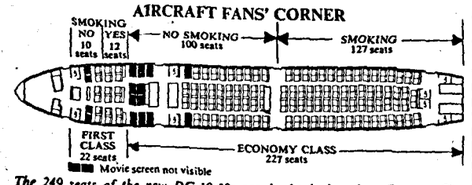
Bell-ringers, Swiss. Cows; and "every herdsman has a harmonious set of at least two or three bells chiming in" on the famous alpenhorn tunes (*Encyclopaedia Britannica, 1801*).

DC-10-30. See Fans' Corner:

8 programmes available on each flight.

Honegger, Arthur (1892–1956) worked in Paris, but was as Swiss as his name.

Ranz-des-vaches. "One of the melodies or signals of the Swiss herdsmen, commonly played on the alpenhorn." The bands of Swiss regiments in foreign services were forbidden to play it. See below, *Yodelling.*



Salzburg. Summer Festival. Mozart, a one-man festival in himself, was born here in a house now a museum.

Yodelling. The very first Swissair hostess could yodel in-flight, but now they are encouraged to do so only in private. Apparently someone was scared by Sir Walter Scott's "I cannot but think... yodelling is a variation upon the tones of a jackass."

(Z. If there is a leading Swiss musician called Zimmermann, *Skyland Express* doesn't want to know it until next time.)

AIRCRAFT FANS' CORNER

The 249 seats of the new DC-10-30s can be booked as in a first-run film theatre. Four seats in First and 24 in Economy are reserved for passengers who find their own thoughts the best entertainment; from these seats the screen is not visible. In Economy Class 100 seats are for non-smokers, 127 for smokers. The plane itself is a non-smoker and non-roarer, thanks to the sophisticated GE jet power plants, whose noise level at takeoff is perhaps half that of earlier types.

NEW YORK: NOW A HOP, SKIP AND JUMP AWAY

Hop to Zurich non-stop by a Friday night DC-10 flight ("Swiss Express", anyone?)...skip into a B747 over there...and jump out at New York airport on Saturday afternoon.

News of this one-stop Bombay–New York flight will pleasantly ruffle the brows of those who aren't too enthusiastic about halting at half-a-dozen places en route.

Interested parties have only to hurry to their friendly neighbourhood Swissair dealer for the lowdown on this new breakthrough.

CONTROVERSY: Best Day to Fly

BOMBAY — A HEATED ARGUMENT was recently overheard between two worthy gentlemen (whose identities, alas, cannot be disclosed) as to which day of the week was most appropriate for flying. One strongly advocated Friday: the other harped on Sunday, as being the day that didn't break a busy working week.

Swissair hastens to elucidate that no unanimous 'best day' exists. To each according to his convenience. And to cater to all, the airline has a flight virtually every day...more than one on most days. In all, 12 flights from Bombay each week...six to the West and six to the East.

Section 3 discusses the inter-relationships among them.

TYPES OF PARTICIPANTS IN THE LEASE MARKET

The attempt in this section is to show that useful insights into the nature of the lease markets can be obtained by considering the mixed-code status of the lessees and lessors included in them. To see this feature of the market in a simple and direct way, one may ask which mixed-code groups of participants were common being present in a majority of markets studied and which were relatively rare being present only in a small number of markets. To provide a synoptic picture of the lease markets under study from this point of view, Table 1 lists the mixed-code groups of lessors and of lessees which were present in two-thirds or more of the villages covered in the analysis (termed as "Common Groups") as also those which were present in one-third or less of the villages (termed as "Rare Groups").

The following observations on the nature and origins of lease relationships seem very plausible in the light of Table 1. The lessors, evidently, are of three broad types — non-cultivating residents with small holdings (SO), presumably artisans or erstwhile cultivators who have left farming, not necessarily voluntarily, to take up some non-farm activity within the village; small and medium owners who have migrated to urban areas [SO(U), MO(U)]; small or medium resident owners with some cultivation of their own, presumably leasing out plots of land not conveniently located for self-cultivation (SS, MS and MM). It would, thus, appear that the factors giving rise to leasing out of land are the leaving of cultivation by the not-so-affluent and fragmentation of owned holding rather than accumulation of land in the hands of non-cultivators with big or large ownership holdings.[3] On the side of lessees, the feature worth-noting is their marked heterogeneity with respect to ownership of land; the class of lessees is seen to consist of such extreme types as those without any owned land at all as well as those with big ownership holding. It is easy to see that in the light of such heterogeneity within the class of lessees it would hardly be reasonable to characterise the entire class as having weak bargaining power and, hence, susceptible to exploitation in the lease market. This would seem particularly true of groups of lessees like MM and BB.

TABLE 1: COMMON AND RARE GROUPS OF PARTICIPANTS IN LEASE MARKETS

Common Groups (i e Groups present in two-thirds or more of villages covered)							
Lessors :	SO,	SS,	MS,	MM,	SO(U),	MO(U),	NR
Lessees :	OS,	SS,	SM,	MM,	BB	NR	
Rare Groups (i e Groups present in one-third or less of villages covered)							
Lessors :	LO,*	LO(U),	BO,	LS,	LM,	LB	
Lessees :	OB,	OL,	SL,	ML,	BL,	LL	

* Present in no village.
Note: Please see footnote 2 for an explanation of the codes.

We now mention very briefly some further features of the lease market which are discussed more fully in the source referred to in footnote 1. Firstly, the analysis did not reveal any mixed-code group of lessors or of lessees having consistently large share in the leased land from village to village. In fact, very different groups of lessees and of lessors turned up as "First" groups (i e, groups getting the first rank in the listing of mixed-code groups according to their share in leased land) in different villages.[4] Secondly, small tenants with no owned land of their own (group OS) accounted for less than 10 per cent of leased-in land in as many as four-fifths of the village covered in the analysis. Thirdly, there was no evidence to show that the lease markets tend to be monopolistic in nature. While the concentration ratio relating to the size-wise distribution of leased-out land among the lessors had rather high values in the villages covered in the analysis ranging between 0.50 and 0.70, this was also true of the concentration ratio for the leased-in land with its values ranging between 0.40 and 0.60. To judge from the two concentration ratios, the lease market could not be described unambiguously either as monopolistic or as purely competitive.

The picture of lease market emerging from the comments made above should have interesting implications to the researcher as well as to the policy-maker. Since we are treating the data as illustrative, it would be more appropriate to stress here the implications of the picture from the researcher's point of view. In a negative vein, the picture seems to show up the inadequacy of any simple-minded conception that the lease market is a result simply, or even mainly, of a sustained process of alienation of land by owner-cultivators and its concentration in the hands of a small number of non-cultivating rentiers. It is instructive to compare the features of the lease market observed above with what they would have been if the market were simply an outcome of such a process.[5]

More positively, we suggest that it may be worthwhile to investigate further the following presumptions regarding the factors behind the lease market, primarily — though not exclusively — in the region covered in our study. Firstly, while concentration in land-ownership might be increasing over time in the region, it could be that the concentration occurs in the hands of cultivators rather than non-cultivators so that increased concentration does not necessarily and automatically lead to leasing out of the land acquired.[6] In fact, the cultivators acquiring land might even be taking resort to the lease market to extend their cultivated holdings beyond the size reached by acquisition of land through purchase. As regards the cultivators who lose land in the process of increasing concentration in ownership, it could be that some of them get completely pushed out of cultivation and, hence, come to the lease market to lease out the little land that they retain. It is, thus, our hunch that increasing concentration in land-ownership instead of leading to sharply polarised categories of landlords and tenants might actually be operating to make each category heterogeneous within itself; as hinted above, this could be due to the fact that those acquiring land in the process need not all become lessors and those losing land in the process need not all become lessees.

Secondly, there are also possibly other factors which enhance the heterogeneity of the categories within themselves. Two that readily occur to us are: (i) migration of landowners to urban areas resulting in leasing out of their lands, and (ii) fragmentation of owned holdings leading to leasing out of distant plots and leasing in of nearer plots by the cultivators. In both these cases, a lessor need not necessarily be a large non-cultivating owner and a lessee need not necessarily be a tenant with little or no land of his own.

The heterogeneity within the classes of lessors and lessees and the factors possibly causing it, as noted above, provide a relevant and important context for assessing the functioning and consequences of the lease market. In particular, it would suggest that the

participants in the market are likely to vary considerably in their degree of dependence on the market for their livelihood and in their capacity and motivation to impose unfair terms on those with whom they deal. Consequently, it would be an oversimplification, if not an error, to view the lease market as nothing more than an instrument facilitating exploitation of poor tenants by a few rich landlords. In the circumstances, a more appropriate approach on the part of researchers would be to treat the problem of identification and further analysis of exploitation in the lease market as an open research issue rather than as a fact too obvious to need any investigation to discover it.

Inter-Relationships among the Participants

Two approaches were used to study the inter-relationships among the participants in the lease market. The intention of the first approach was to make a rough guess about the extent to which lease transactions tend to be exploitative. In the absence of usable data on terms of tenancy, this was done under the assumption that a transaction is likely to be exploitative if the parties to it — lessor and lessee — differ considerably in status as reflected in their mixed-code groups. Procedurally, a bargaining power score was assigned to each mixed-code and the distribution of leased land according to the difference in the bargaining power of lessor and lessee to each transaction was obtained village-wise.[7] Very briefly, the results showed that in a *majority of villages* the leased land involved in transactions with considerable difference in the bargaining power of the two parties to the transaction formed less than 30 per cent of total leased land in the village. This should provide some further substantiation to the two points made above, *viz*, that exploitative lease transactions may not be typical of the dealings in the lease market and that, hence, research and analytical procedures for detecting exploitation in the lease market would reserve a measure of attention from the researchers. The scheme used in our study could be of some interest from this point of view.

The second approach to studying the inter-relationships among the participants was in the nature of an attempt to see a meaningful pattern in the inter-relationships prevailing in a market as shown by the two-way classification of the lease transactions in a village according to the mixed-code group of lessor and of lessee to each transaction. Such a table would show the *different groups* of lessees with whom a given group of lessors has transactions and *vice versa*. Our attempt to see a pattern in such a table is based on the proposition that it would be interesting to know whether the different mixed-code groups of lessors and of lessees existing in a market can be regarded as being in contact with each other so that the market comprising them can be taken to function as a single entity. By way of an illustration, if it is seen in village that lessee group OS lessor group LO have transactions with each other *exclusively*, i e, there being no transactions between these two groups and other groups of lessors and lessees in the market, one may suspect that the two groups might be existing in relative isolation in the market with the terms and conditions of transactions between them being little influenced by what goes on among the other groups in the market. While such features revealed by a two-way classification would by themselves prove nothing, they could be helpful as clues for further investigation, particularly if certain groups turn up persistently — cross-sectionally or over time — as groups existing in relative isolation from the other groups in the market. We looked at the two-way classifications primarily from this point of view in discerning a pattern in the inter-relationships among the participants in the lease market. Lease markets not showing up any groups existing in relative isolation are referred to in this paper as "integrated" markets.

The procedure used to analyse the two-way classifications of lease transactions from the point of view of integration of the lease market is contained in the Appendix given at the end. In addition to concretising the concept of an integrated market to enable its application in practice, the procedure suggests a few alternative indices to serve as measures of the extent of integration of an integrated market and presents a criterion of distance among the participants in a market for classifying the participants according to the intensity of their contacts with the other participants in the market; the idea underlying the latter criterion is that a participant with higher intensity of contacts in the market might turn out to be one who sets the pace in the market and the criterion would be of help in separating such participants from the other participants in the market. It needs to be mentioned even at some risk of stressing the obvious that the procedure merely brings out certain features of the two-way classification which itself is in the nature of information of most rudimentary kind on the market; these features would be of use in research not as a source of definitive evidence on the lease market but as pieces of information of help in obtaining clues to and in forming hunches about the way the market and some of the participants comprised in it function. The procedure is outlined in some detail in the Appendix in the hope that researchers concerned with market analysis in general might find it of some interest and utility as a simple framework for investigating certain significant aspects of functioning of markets.

The analysis of integration of lease market showed that in twenty-one out of the twenty-three villages studied the lease market was integrated; in all of these villages the extent of integration was found to be high. We take this to mean that it is exceptional for the mixed-code groups of lessors and of lessees comprised in the lease markets in the region of investigation to exist in relative isolation from the other groups in the market. More interestingly, the groups with relatively high intensity of contacts in the market were seen to be SS and SM lessees and SO(U) and NR lessors, i e, excepting the last ambiguous groups, small owners and small and medium owner-cum-tenants. Since this part of our analysis concerned with the integration of lease market is highly tentative, we refrain from drawing any further inferences at this point; the fuller findings are given in the Appendix for the purpose of those interested in their further examination.

Conclusion

The main purpose of this paper has been to describe some approaches used by us in analysing a body of data on lease transactions. Viewing the transactions as constituting a market and reckoning the parties to the transactions in terms of their mixed-code status, these approaches seek to bring out the types of lessors and of lessees functioning in the market and the extent and pattern of contacts among them arising from the transactions. The picture that we obtain seems to depart significantly from what one would expect if the lease market were an outcome only, or even mainly, of a process polarising the rural community into two strata — those owning land without cultivating and those cultivating land without owning — sharply marked out from each other. We have noted some interesting implications of the picture regarding the factors shaping the lease market and the extent to which the transactions in the market might be exploitative in nature. The results are presented primarily to suggest the utility of the approaches used as a framework for analysis and to indicate the kinds of insights they yield; hence, the comments are confined to the common features of the markets studied leaving out the differences among them and the reasons thereof. While they are illustrative being based on a limited sample of villages, the results could still be of some substantive interest to researchers as indicating the lease market prevailing in an important ryotwari region of India prior to its virtual termination through legislation implemented in the late fifties.

Appendix

A Procedure for Analysing the Integration and Configuration of a Market

Let the market consist of m purchasers p_i ... (i = 1, ... m) and n sellers s_j ... (j = 1, ... n) and let the transactions in the market be indicated by a matrix — of dimension m by n in the present case — with a cross in the cells having transactions and with a zero in the remaining cells. If we start with any participant, say p_1, and enumerate in successive steps the participants having transactions with those in the immediately preceding step excluding at each step the participants enumerated at an earlier step, we would obtain a list of participants shown schematically below :

p_1

Step 1 — All the sellers having transactions with p_1

Step 2 — All the purchasers, other than p_1, having transactions with the sellers enumerated at at step 1

Step 3 — All the sellers, other than those enumerated at step 1, having transactions with the purchasers enumerated at step 2, and so on until the list terminates with no new participant turning up for enumeration.

We call such a list the Step-Wise Representation (SWR for short) of the market.

The procedure of analysis suggested here is based on the assumption that the contacts among the participants in the market arise only through the transactions occurring in the market. Considering the SWR shown above in the light of this assumption, it would be reasonable to regard that the participant p_1, with whom the SWR starts, is in contact with all the participants enumerated in the SWR, directly with those in the first step and indirectly with those in the later steps; for example, any move or decision taken by p_1 may be expected to evoke a response from all the enumerated participants with the initial response coming from those in step 1 followed successively by the response from those in the later steps. This would suggest that we can regard all the participants in a market as being in contact with each other if the SWR of the market (starting with any arbitrarily selected participant) includes all of the participants. Formally, therefore, we define a market to be "integrated" if and only if its SWR is exhaustive.[8] Secondly, considering again the SWR shown above, a notion of distance among the participants in the market can be formulated on the basis of the proposition that the distance between p_1 and those with whom he has direct contact through transactions, i e, those enumerated in step 1, is zero and that this distance increases with the number of steps intervening between p_1 and any other specified participant enumerated in the SWR. Adopting this line of reasoning, we define the distance between p_1 and a participant enumerated in step i to be equal to i — 1. Procedurally, the distance defined in this manner can be computed for any given participant from the other participants by preparing the SWR of the market starting with that participant. One implication of this definition is that the distance is defined only for pairs of participants enumerated in a SWR and it is computable for all possible distinct pairs of participants if and only if the market is integrated.

We now indicate a typology for participants in an integrated market and a scheme for configurational description of such a market based on the concept of distance defined above. To start with, we define the participant with the minimum total — or, equivalently, minimum average distance — from all other participants in the market as the central participant. We call the Step-Wise Representation of a market starting with the central participant as the Standard Step-Wise Representation (SSWR) of the market.[9] Once the SSWR is prepared for an integrated market, participants in each step may be classified on the basis of whether they have or do not have transactions with those in the next step. It would appear meaningful to regard the participants having transactions with at least one participant in the next step as being in the interior of the market and the participants having no such transaction as being on the boundary of the market. Hence, we designate the former as interior participants and the latter as peripheral participants. With this typology for participants — central, interior and peripheral —, we can visualise an integrated market as having a centre, an interior part and a boundary.[10] A notion which is of further help in this direction is that of a sectionalised market by which we mean an integrated market which becomes non-integrated on *removing the* row/column corresponding to the central participant from the matrix of the market; the sub-markets in such a market yielded by the removal of the central participant may be regarded as forming different sections in the market held together by the central participant.[11]

In principle, the SSWR of an

Table A

Characteristic	*Minimum* and Maximum Values of the Characteristic in an Integrated Market of Dimension m x n (with m assumed to be less than n)	
	Minimum	Maximum
Number of steps in the SSWR	2	m if m is odd; m + 1 if m is even
Number of Direct contacts in the Market, i e, number of cells having transactions in the matrix of the market	m + n — 1	m x n
Average Distance of the central participant from all other participants in the market	$\frac{(m-1)}{(m+n-1)}$	$\frac{(m^2-4m+2+mn)}{2(m+n-1)}$ if m is even; $\frac{(m^2-4m+2+mn-n-m)}{2(m+n-1)}$ if m is odd.

integrated market may have only a few steps or a large number of steps depending on the pattern of contacts in the market. Intuitively, a market with a few steps can be regarded as more closely integrated than the one having a large number of steps; in other words, the degree of integration of an integrated market may plausibly be taken to decrease with the number of steps in its SSWR. A measure for degree of integration arising from this point of view is the following. Let S stand for the number of steps in the SSWR of an observed integrated market of dimension $m \times n$. Let us assume that we are able to specify the minimum value and the maximum value of S in the set of all possible integrated markets of the same dimension and let these be indicated, respectively, by S_m and S_M.

Then, it can be verified that $\frac{S_M - S}{S_M - S_m}$ can serve as a suitable measure of degree of integration. It would be possible to have equally plausible alternative measures for degree of integration by basing it on a characteristic other than the number of steps in SSWR. For example, one may define a measure based on the number of direct contacts in the market (i e, the number of cells with transactions in the matrix of the market) viewing the degree of integration as increasing with the number of direct contacts. Still another alternative would be to base the measure on the average distance of the central participant from all other participants in the market under the assumption that the degree of integration varies inversely with this distance. It is possible that further investigation might indicate one of these measures, or some altogether different measure, as more appropriate and useful in practice. Our intention here is, merely to point out the possibilities suggested directly by the notions of distance and configuration adopted by us. The minimum and maximum values that are needed to define the alternative measures are indicated in Table A.

Excepting the maximum value of the last characteristic, it can be easily shown that the other values are indeed in the nature of minimum/maximum values attainable in an integrated market; the result shown for the maximum value of the last characteristic appears to be true though a rigorous proof could not be provided.[12] The minimum and maximum values shown above, along with the actual values of the characteristics for an observed integrated market,

will enable computation of alternative measures for degree of integration once a suitable formula is adopted; the formula based on the number of steps in the SSWR presented earlier above would serve as an illustration.

In noting the limitations of the procedure set out above, it is necessary to distinguish clearly between its two main aspects. The first relates to the perspective and motivation; the procedure views a market as a system of contacts among the participants and suggests certain features of the system — integration, configuration, etc — as being of interest in understanding the nature and functioning of the market. This perspective might very likely prove to be relevant and useful in any market analysis, particularly when the market being considered is small enough for participant-wise analysis. The second aspect — the one from which the limitations and restrictive applicability of the procedure arise — relates to the nature of information made use of in the procedure to concretise the notions like integration, distance, etc. Since the procedure uses only the information of the type "who deals with whom" — and nothing else — it neglects the fact that contacts among the participants in a market need not arise only through transactions occurring in the market and that even the contacts established by transactions may vary in nature and quality depending on features of transactions such as their quantum, recurrence, etc. It would, obviously, be desirable to find a way to utilise such information in analysing the system of contacts in a market. The procedure suggested here is offered primarily as a device useful in preliminary analyses or in investigations, such as ours, with very limited information on the market.

The analysis of our data along the lines outlined above suggested strongly that the lease markets in the region of investigation tend to be closely integrated. Only two out of the twenty-three markets — covered in the analysis were found to be non-integrated; more significantly, out of the twenty-one integrated markets, only one was found to be sectionalised and in no case did the number of steps in the SSWR exceed three. The findings on configuration are presented in the two appended lists — List 1 covers lessees and List 2 covers lessors. Each row in these lists indicates for a specified mixed-code group of lessees/lessors the number of villages in which the group was the central participant, the number of villages in which it was an interior participant and so on. In view of the close integration of the lease market, the distinction between an interior participant and a peripheral participant loses some of its significance in our analysis. Hence, it is suggested that while examining the two lists attention may be confined to central participants and single-transaction peripheral participants (i e, those having a single cell with transactions and who, as seen in footnote 9, are necessarily peripheral) who, in a sense, may be regarded as the least active partici-

pants in the market. To facilitate this, the single — transaction peripheral participants and the other peripheral participants are distinguished from each other in the two lists.

Notes

1 The purpose of this research project was to study the implementation and impact of the Tiller's Day Amendment (1956) to the Bombay Tenancy and Agricultural Lands Act over the period 1956-57 to 1964-65. The field-investigation for the study, conducted in the year 1965-66, covered thirty-six villages selected from the ryotwari areas of three districts — Satara and Kolaba in Maharashtra and Kaira in Gujarat. The data on ownership, cultivation and leasing of agricultural land relating to the end-years of the period of study were collected from all the families in the selected villages having interest in land as owners/cultivators. The field material also included other data — some collected from village records and some from sample families. The findings of the study are contained in "Evaluation of Land Reforms (with special reference to the Western Region of India)" M L Dantwala and C H Shah, Department of Economics, University of Bombay, 1971. The analysis of lease transactions referred to in this paper is contained in chapter VII "Structural Features of Village Lease Markets". For a number of reasons explained in the chapter, this analysis could not cover all the villages investigated.

2 Four size-classes were used for this purpose — small (upto 5 acres), medium (5 to 15 acres), big (15 to 30 acres) and large (30 acres and above) symbolised, respectively, by letters S, M, B and L; letter 0 indicates zero ownership/cultivation holding depending on the place occupied by the letter in the mixed-code. The suffix (U) added to a mixed-code indicates that the lessors are urban-dwellers; these have been classified on the basis of extent of their ownership of land in the selected village. NR (Non-resident) stands for lessors/lessees residing in villages other than the selected village; they could not be classified into mixed-code groups since full details of ownership/cultivation of land by them were not available.

3 The following are some further indications of fragmentation of owned holding as a possible factor behind leasing of land. Firstly, it was seen that a major part of the land leased out by the NR lessors, a common group of lessors as seen in Table 1, came from lessors residing within five miles of the selected village. Secondly, a perusal of the two lists given in the Appendix would show the presence in a few villages of anomalous-looking groups of lessors/lessees, e g, lessor groups SM, MB, etc, with ownership size-class less than cultivation size-class and lessee groups like MS, BM, etc, with ownership size-class exceeding cultivation size-class; plausibly, such groups owe their existence to fragmentation of ownership holding.

4 On the side of lessees, the "first" groups varied from OS and SS at one extreme to BB and ML at the other with the group SM being the "First" group in a little over one-third of all villages. On the side of lessors, the "first" groups varied from SS at one extreme to LO(U) and LL at the other with no single group turning up as the "first" group in more than one-fifth of all villages.

5 In that case one would reasonably expect the lease market to have the following features (i) groups of lessors like LO and BO to be common groups, (ii) groups of lessees, other than OS and SS, to be rare groups, (iii) groups of lessees OS and SS accounting for a major part of leased-in land in a majority of villages, and (iv) high concentration ratio for leased-out land and low for leased-in land. As seen earlier above, the lease markets covered in our analysis do not have these features.

6 The analysis of land transfers reported in the author's "Land Transfers in Rural Communities — Some Findings for a Ryotwari Regime in India" provides some indications of such a process. *Economic and Political Weekly*, September 30, 1972.

7 The scores assigned varied from + 8 — given to mixed-codes LL, LB — to −3 given to mixed-code OS. The score assigned to each mixed-code was the summation of scores given to ownership size-class, cultivation size-class, the difference between the two size-classes and the residence-characteristic of the mixed-code. The scheme of scoring used and the results obtained are contained in the source noted in footnote 1.

8 In terms of matrix representation of market, the distinction between integrated market and non-integrated market is similar to that between indecomposable and decomposable matrices. Formally, a non-integrated market is one which permits (i) partitioning of each of two sets (p_i) and (s_j) into K subsets P_a and S_b (a and b = 1, ... K), and (ii) a one-to-one correspondence between subsets P_a and S_b such that transactions occur only among participants belonging to the corresponding subsets. An integrated market can then be defined as one which does not permit such partitioning. The corresponding subsets in a non-integrated market can be regarded as forming sub-markets with no contact with each other. It can be shown that a non-integrated market can be decomposed into two or more sub-markets, each an integrated

market by itself, and that such sub-markets will reveal themselves in the process of preparing the SWR of a non-integrated market. Since a sub-market must contain at least one purchaser and one seller, it is easy to see that a non-integrated market of dimension m x n cannot have more than m or n (whichever is smaller) sub-markets.

9 A complication neglected here is that more than one participant may tie up for the central position. When this happens, one will have either to proceed in terms of multi-centred markets or choose one as the central participant from among the competing participants on the basis of some other relevant criteria. It may be mentioned that during our analysis this difficulty arose only in two markets.

10 It may be asked at this stage whether propositions in the nature of necessary/sufficient conditions for a participant to be central, interior or peripheral can be derived. It can be shown that participants having a single transaction (i e, having a single cell with transactions in the row/column corresponding to them) are necessarily peripheral. It can also be shown that in a market with m purchasers and n sellers (with m assumed to be less than n) a purchaser having transactions with all the sellers is necessarily the central participant. Note that the second proposition is conditional upon "m less than n". It is doubtful whether further propositions of this kind can be obtained.

11 Please see footnote 6 for the definition of sub-market. It would obviously be possible to investigate the sectionalisation of the market by removing other participants from the market. We may define a participant as a "connecting participant" if his removal from the market has one or both of the following consequences — (a) market becomes non-integrated, and (b) one or more other participants get excluded from the market. In a similar vein, we may define a cell with transactions in the matrix of the market as a "connecting cell" if placing of a zero in that cell has one or both of these consequences. The notion of "connecting" participants and cells is useful in investigating the properties of a market. Please see the next footnote for an example.

12 It may be interesting to know in what types of markets the minimum/maximum values of the characteristics are attained. It is easy to show that the market at one extreme is such that every cell in the matrix has transactions; in such a market no participant or cell, by itself, is a connecting participant/cell. At the other extreme, the market is such that every cell with transactions is a connecting cell. It can be shown that in such a market the cells with transactions are necessarily m + n − 1 in number and that, with some further conditions, the number of steps in the SSWR and the average distance of the central participant from the other participants will attain their maximum values. We may regard the first type of market noted in this footnote as a "closely integrated" market and the second type as a "barely integrated" market.

Power For Rural Prosperity

Rural Electrification Corporation has so far sanctioned OVER RS. 311 CRORES for the extension of power to rural areas.

To-date 654 projects have been sanctioned to electrify 55,400 villages, energise 5.75 lakh pumpsets and over 91,300 rural industries.

The Bamboo Tubewell

A Low Cost Device for Exploiting Ground Water

P S Appu

The bamboo tubewell, introduced in Saharsa in Bihar in December 1968, has brought the tapping of groundwater well within the reach of small cultivators. This paper discusses the special advantages of the bamboo tubewell and the remarkable results achieved in the districts of Saharsa and Purnea in Bihar.

The success of the bamboo tubewell in Saharsa and Purnea has thrown into bold relief the pressing necessity to enforce ceiling and tenancy laws. These two districts are well known for extreme inequality in ownership of land. Big landowners are not interested in the intensive cultivation of their holdings and very few among them have gone in for bamboo tubewells. Most of the bamboo tubewells have been sunk by small and medium farmers. Strict implementation of the ceiling law will pave the way for more efficient utilisation of the available land. A considerable part of the cultivated area in the two districts, particularly in Purnea, is cultivated through share-croppers. It is unlikely that these lands will be irrigated by bamboo tubewells until permanent and heritable rights are conferred on the share-croppers.

Strict enforcement of ceiling and tenancy laws is thus a condition precedent for the optimum utilisation of groundwater resources in the districts of Purnea and Saharsa.

[The views expressed here are the personal views of the author.]

THE bamboo tubewell is an innovation introduced in the Saharsa District of Bihar in December 1968. It bids fair to presage a spectacular breakthrough in the exploitation of ground water. The materials used are all locally available, the only skilled technician needed is the village blacksmith, the work can be completed in a few hours and the cost is only about Rs 250 or so. The bamboo tubewell has brought the tapping of ground water well within the means of small cultivators. This paper tells the story of the invention of the bamboo tubewell, its special advantages and the remarkable results achieved in the districts of Purnea and Saharsa.

The Indo-Gangetic plain and the deltas of the great rivers are endowed with rich ground water resources. The recent spurt in agricultural production in some patches of these tracts, picturesquely, but rather inaccurately, styled as the "Green Revolution", is largely based on the intensive exploitation of ground water through tubewells. It is no accident that the home of the so-called Green Revolution is the Punjab-Haryana region where about 80 per cent of the ground water is being currently tapped to support multiple cropping. Only a small part of the ground water potential is, however, utilised at present in large parts of the Gangetic plain, particulary in Eastern Uttar Pradesh and Bihar. It is beyond the scope of this paper to go into the reasons for the tardy progress in the exploitation of ground water. The conditions in the districts of Purnea and Saharsa in North Bihar are in several ways ideal for the easy exploitation of ground water. With an average annual precipitation of 60 to 65 inches, ground water resources are more plentiful than in the Western part of the Gangetic plain. The aquifers get recharged by the Kosi Canal system which waters large parts of the two districts. A perennial stratum of ground water is usually struck at a depth of 15 to 60 feet from the surface. The soil being sandy or sandy loam, it takes only a few hours to sink a tubewell anywhere in these districts. In spite of these great natural advantages the exploitation of ground water had not made much headway in this region until recent months.

The first tubewells were sunk in this area some fifteen years ago. At that time a tubewell equipped with brass strainer used to cost over Rs 6,000. In the year 1969 a scheme was drawn up with assistance from the Agricultural Refinance Corporation to sink a large number of 4" tubewells. The cost of a tubewell was estimated at Rs 4,000. Including the price of diesel pumpset, the total cost of installing a tubewell was Rs 8,000. These tubewells tapped ground water at a depth of 150 feet. When it was found that it was enough to go down to a depth of only about 80 feet, the cost of the tubewell could be reduced to about Rs 3,000. Even so the installation of a tubewell remained far beyond the means of small and medium farmers and, therefore, the scheme did not register much progress. So far only 1,580 such tubewells could be installed in the two districts during the last four years.

A cheaper kind of tubewell had been in vogue in the neighbouring districts of West Bengal. In these tubewells, often known as filter points, iron pipes were substituted by cylindrical frames formed by welding 1/4" steel rods around iron rings. Coir string was wound around the cylindrical frame to serve as strainer. The cost was about Rs 800 to Rs 900. Though these filter points did not get any encouragement from government departments, a few of them had been installed by some enterprising farmers of Purnea and Saharsa.

It was against this background that the bamboo tubewell was invented in December 1968. As in many cases in history, this invention was also mothered by necessity. Ram Prasad Chaudhary Jaiswal of village Lalpur in the Singheshwar Asthan Block of Saharsa is a medium farmer owning about 15 acres of land. Some years ago he had purchased a diesel pumpset with a government loan and had taken to modern farming. But he had no dependable source of irrigation. In the winter of 1968 he entered into an agreement with a farmer of another block to buy his old tubewell. He hoped to have it pulled out and installed in his own land. In the safe assurance that he would be able to have a tubewell in time, Ram Prasad went ahead and sowed an improved variety of wheat seed in his land. The vendor, however, backed out of the agreement subsequently, and Ram Prasad found himself at a loose end. He spent several sleepless nights wondering how his wheat crop could be saved. The fact,

that coir string could be used for making strainers was known to him. It occurred to him in a flash that he could try to fabricate a strainer by using strips of bamboo and coir string. He made a long cylindrical frame by fixing strips of bamboo with nails around iron rings of 4" diameter. Coir string was then tightly wound around the bamboo frame. The upper portion of the cylinder was made water-tight by wrapping gunny bags around it and smearing coal tar over the gunny bags. The bamboo tubewell was ready. All the villagers including his own brother thought that Ram Prasad had gone off his head. In the sandy soil of his village boring a deep hole in the ground was an easy job. At the first attempt the bamboo cylinder broke into two while being lowered into the ground. But the second attempt was successful. He brought his diesel pumpset, inserted the hose pipe inside the tubewell and started the engine. All the spectators and Ram Prasad himself were greatly astonished to see water gushing out. These were the circumstances in which the first bamboo tubewell was born.

The news spread quickly. The Block Development Officer of Singheshwar Asthan and the Special Deputy Director of Agriculture of Saharsa were greatly impressed and they tried to persuade other farmers to sink bamboo tubewells. But government's tubewell department did not take kindly to bamboo tubewells. The department had several objections. Bamboo is easily affected by air and water, is destroyed by white ants and rodents, and may not resist the soil pressure. The tubewell department would not encourage bamboo tubewells. During the next four years about 3,000 bamboo tubewells were sunk in Saharsa and about 1,000 in Purnea without any assistance from government sources.

The severe drought of 1972 turned out to be the proverbial blessing in disguise for the districts of Purnea and Saharsa. As part of the programme to step up rabi production, government placed funds at the disposal of the District Collectors for sanctioning loans to small farmers for sinking bamboo tubewells. Early in October 1972 the Divisional Commissioner fixed a target of 6,500 bamboo tubewells for Saharsa and 5,000 for Purnea to be sunk before the end of March 1973. Three months later, in January 1973, the state government raised the target to 6,500 for Purnea too. As luck would have it, J M Lyngdoh, Collector of Purnea and G Krishnan, Collector of Saharsa were keen, energetic, young men with initiative and drive. They gave the highest priority to the sinking of bamboo tubewells and geared up the entire administrative machinery to push up the programme. The officers at the Block level were told that their work for the year would be assessed primarily on the basis of the number of bamboo tubewells sunk in the Block. These efforts paid handsome dividends. During the four months from the middle of October 1972, 7,451 bamboo tubewells were sunk in Purnea and 6,637 in Saharsa with loan assistance from government. The farmers on their own without any help from government sunk during the same period 2,004 bamboo tubewells in Purnea and 2,791 in Saharsa. Thus over 19,000 bamboo tubewells were sunk in the two districts in four months. The discharge from a bamboo tubewell is about the same as from an ordinary 4" tubewell. In the conditions obtaining in Purnea and Saharsa a bamboo tubewell irrigates 5 to 10 acres of land. Thus over one lakh acres of agricultural land has been brought under irrigation in the two districts in recent months with a small financial outlay. Only a sum of about Rs 50 lakhs has been given as loan to farmers in the two districts for sinking bamboo tubewells.

Bamboo tubewells serve no purpose unless there are satisfactory arrangements for lifting water. As electricty has not reached most villages, reliance had to be placed on diesel pumpsets. The programme of sinking bamboo tubewells was accompanied by a vigorous drive to sanction loans to farmers through the Land Mortgage Bank and commercial banks to finance the purchase of diesel pumps. The pumps are usually mounted on wheels and experience has shown that one pump can service up to five bamboo tubewells. Diesel pumps are now available on hire in the rural areas of the two districts. Including the cost of fuel the hire charges range from Rs 4 to Rs 6 per hour. Thus bamboo tubewells coupled with the availability of mobile diesel pumpsets on hire have brought the exploitation of ground water well within the means of small farmers.

The materials required for fabricating a bamboo tubewell are three or four bamboos, about 20 kilogrammes of coir string, a few iron rings of 4" diameter, a few yards of steel wire, iron nails, coal tar and old gunny bags. The following method is usually employed in making bamboo tubewells. Bamboo is cut into narrow strips, about 1" broad and twenty feet long. The bamboo strips are then circularly laid over iron rings of 4" diameter and fixed to the rings with nails and wires. Coir string is then tightly wound around the bamboo frame. Two or three such cylinders joined to each other while being lowered into the ground are used in a bamboo tubewell. One of the cylinders which will constitute the top portion of the tubewell is covered by gunny bags and then coal tar is smeared on the gunny bags to make the cylinder water-tight. The bottom cylinder or cylinders constitute the strainer. Not much effort is needed to make a sixty feet hole in the sandy soil of Purnea and Saharsa and, therefore, the installation of a bamboo tubewell takes only a few hours.

The bamboo tubewell has several obvious advantages. All the materials required are locally available. The only skilled technician needed is the village blacksmith. In the context of the acute shortage of steel, its substitution by bamboo is a welcome development from the point of view of the national economy. The most attractive feature of the bamboo tubewell is its extremely low cost which seldom exceeds Rs 250. The life of a bamboo tubewell is not as short as originally apprehended. Some have already been in existence for over 4 years. The bamboo tubewell has brought the exploitation of ground water within the reach of small cultivators. Even cultivators who own as little as half an acre of land have installed bamboo tubewells. Most of the holdings being fragmented, hitherto even well-to-do farmers found it difficult and uneconomic to provide irrigation for all the plots of land owned by them. Now they are in a position to install a bamboo tubewell in each scattered plot and bring the entire holding under irrigation. Furthermore, the investment in bamboo tubewells being so low, their sinking will not render future consolidation of holdings more difficult. The bamboo tubewell has also generated considerable employment in the rural areas. The fabrication and installation of one bamboo tubewell gives employment to about ten labourers for one day. And finally, the large-scale exploitation of ground water by sinking bamboo tubewells will remedy to a great extent the water-logging caused by the Kosi irrigation system and may prevent any possible rise in the water table. Thus the bamboo tubewell may turn out to be a corrective and complement to canal irrigation.

The ambitious programme of sinking bamboo tubewells is being executed without having undertaken any detailed survey of ground water resources. Knowledgeable men with whom the writer has casually discussed the matter are inclined to think that considering the rate of recharge of the aquifers in this region, there is no danger of the dropping of the water table. Even so, it is absolutely necessary to conduct a detailed survey, fix limits of safe exploitation of ground water and lay down a mandatory minimum distance between bamboo tubewells. This question should receive the immediate attention of the state government and of the Central Ground Water Board.

Another aspect of the programme which calls for special attention is the need to ensure easy availability of diesel pumpsets. If pumps are in short supply there is every possibility of the hire charges shooting up, and that will cause great hardship to small farmers. It is, therefore, necessary to remove the hurdles in securing loans from the Land Mortgage Bank and commercial banks, ensure adequate supply of diesel pumpsets of good quality and provide for efficient after-sale service.

In the absence of access to inputs an adequate extension services, the small farmers of the area have not been able to make the best use of the new irrigation facilities. Even a casual observer will not fail to notice the poor crops grown on irrigated land. Optimum doses of fertilisers are seldom used and modern farming practices are almost unknown. Special efforts are necessary to extend massive institutional credit to small farmers. Vigorous agricultural extension services are also equally necessary.

The success of the bamboo tubewell programme has thrown into bold relief the pressing necessity to enforce honestly and efficiently the ceiling and tenancy laws. These two districts are well known for extreme inequality in the ownership of land. It has been noticed that big landowners are not interested in the intensive cultivation of their holdings and very few among them have gone in for bamboo tubewells. Most of the bamboo tubewells have been sunk by small and medium farmers. Strict implementation of the ceiling law will pave the way for the more efficient utilisation of the available agricultural land. It has also been observed that bamboo tubewells are seldom sunk on land cultivated through share-croppers. A considerable part of the cultivated area in the two districts, particularly in Purnea, is cultivated through share-croppers. It is unlikely that these lands will be irrigated by bamboo tubewells until permanent and heritable rights are conferred on the share-croppers. In the event of the land-owner deciding to invest in a bamboo tubewell, he will certainly take effective measures to eject the share-cropper before he sinks the tubewell. It is, therefore, a matter of paramount importance to take effective steps immediately to confer security of tenure on share-croppers. Thus the strict enforcement of the ceiling and tenancy laws is a condition precedent for the optimum utilisation of ground water resoures in the districts of Purnea and Saharsa.

The success of the bamboo tubewell programme amply demonstrates that the farmers are intelligent and cost-conscious. When they found that the investment was worthwhile, they went in for sinking bamboo tubewells in a big way with only nominal assistance from government. In all probability this low cost device for the exploitation of ground water will bring considerable agricultural prosperity to Purnea and Saharsa in the next two or three years. If some of the steps indicated in this paper are taken in good time it may be possible to ensure rapid agricultural growth without widening the existing disparities in wealth and income.

Pre-Harvest Loss of Rice Due to Field Rodents

Subodh Kumar Roy

Assessment of pre-harvest field loss of foodgrain due to rodents is an intricate problem, since the extent and cost of damage vary with the crop, the season and the tract. Moreover, the methods of recording have not been standardised making it difficult to compare results of different studies.

This is a preliminary report on the pre-harvest physical loss of aman rice caused by field rats in the agricultural farm of the Indian Statistical Institute in Giridih in south Bihar.

This preliminary report suggests that further investigations are required in different tracts of India, on research farms as also on farmers' fields to get a clear picture of the pre-harvest loss of foodgrains about which we hardly have any dependable statistics at present.

A data-based estimate of the foodgrain losses due to rodents might reveal that, if such losses are prevented or minimised, the present production is enough not only to meet normal national requirement but to have a reasonable reserve for emergencies.

LOSS of foodgrains may occur in two stages, namely, the pre-harvest loss in the field and the post-harvest loss during the period between harvest and human consumption. Damages to crops in the field and foodgrains in storage are caused by various biological agents like micro-organisms, insects, birds, rodents and other mammalian pests. Losses also occur during transport, handling and processing in addition to losses in hotels and households. The loss is measured in terms of loss of weight. But loss may also be chemical in nature due to degradation of chemical properties caused by insect attack and microbial infection, making the foodgrains unsuitable for human consumption.

Reliable statistical information on the annual availability of foodgrains is very important for policy decisions regarding procurement, distribution, price, imports and agricultural endeavours. But reliable statistics on availability can be obtained only through dependable estimates of production and loss. Estimation of foodgrain production in India has received attention for a long time and methods of estimation have been standardised now. But attempts to estimate the loss of foodgrains have been mostly speculative or have been based on inadequately designed studies.

However, some estimates on the annual physical losses of foodgrains in India are available [1 to 8, 10 to 14]. Kunhardt [7] estimated that the annual material loss to crops and grains in India caused by rodents was about Rs 300 million which Hussain and Banerjee [6] considered to be very much below the actual figures. According to Singh [11] the estimated loss of foodstuffs due to rodents in the United Punjab was 0.33 million tons in 1921 and that in the divided Punjab in 1952 was 0.16 million tons. According to Coyne [1] and Srivastava [14] the annual losses of foodgrains in India due to rats were 1.00 million tons and 2.4 million tons respectively. It was reported that paddy crops in Cuttack and West Godavari [2] and also maize crop in Aligarh districts [3] suffered no loss from damage by rats and that loss of wheat crop was 'very nominal' in Aligarh district [3]. Loss of paddy crop due to rats in Thanjavur district have been estimated as follows: Kuruvai 1.38 to 2.91 per cent; Samba 1.63 per cent and Thaladi 2.96 per cent. In a study under a co-ordinated scheme sponsored by the Indian Council of Agricultural Research (ICAR), damage caused by rats to barley, wheat, rice, groundnut, coconut, maize and jowar crops ranged from 2.5 per cent to 11.8 per cent [10]. Parpia [8] estimated that 25 per cent of all crops grown in India are lost in the field due to insects, pests, diseases and rodents, 15 per cent are lost due to the activities of insects, fungi, moisture, birds and other pests during storage and an additional 10 per cent are lost due to handling, etc — adding up to 26 million tons annually. The FAO reported a total loss of 50 per cent of foodgrains in India with about 10 per cent by rats alone [5]. The Union Ministry gave highly variable estimates of foodgrain losses in India to rodents such as 2.4 per cent, 3 to 7 per cent and 42 per cent at different points of time [13].

Most of these estimates, including those of pre-harvest loss due to rodents, were apparently based on speculation rather than actual evidence from hoarding retrieval. And when hoarded grains were retrieved [12] the production figures of the 'reclamation plots' were not recorded, making it impossible to estimate the proportion of loss.

This confusing situation prompted us to undertake the present investigation with a view to removing or at least minimising the current confusion regarding pre-harvest loss of foodgrains caused by rodents. The present report is a preliminary account of the pre-harvest physical loss of *aman* rice caused by field rats in the agricultural farm of the Indian Statistical Institute in Giridih in South Bihar.

Assessment of pre-harvest field loss of foodgrains due to rodents is an intricate problem, since the extent and cost of damage vary with the crop, the season and the tract. Moreover, the methods of recording have not been standardised making it difficult to compare results of different studies.

The Method

All rat burrows in certain selected fields were excavated during or immediately after the rice harvest in December-January. The hoarded earheads and grains were retrieved, threshed, washed, cleaned and sundried to a constant weight. The dry weights of grains for each 'store' were recorded separately and the weight of the hoarded grains compared with the yields of the respective 'reclamation plots'.

It is recognised that this method is open to the criticisms that (a) full recovery of hoarded grains from a rat burrow is impossible; (b) the quantity of consumption of grains during the period starting from hoarding to excavation is difficult to estimate; and (c) the extent of loss of grains from earhead during transport from plants to

Table 1: Yield of Paddy Harvested and Paddy Reclaimed from 'Stores' of Rat Burrows in 'Reclamation Plots during Two Agricultural Years and Estimated Loss

Agricultural Year	Total No of 'Stores' Retrieved from 'Reclamation Plots'	Dry Weight of Paddy (kg) in 'Reclamation Plots'			Average Dry Weight (kg) Grains per 'Store'	Per Cent of Grains Hoarded	Estimated Loss (Per Cent)
		Harvested	Retrieved from Rat Burrows	Total			
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
1969-70	186	1540	103	1643	0.554	6.27	7.84
1970-71	347	3182	183	3365	0.527	5.44	6.80
Total	533	4722	286	5008	0.537	5.71	7.14

burrow, though small, cannot be determined.

It would thus appear that hoarding retrieval may not represent the actual pre-harvest loss of paddy and that the estimate given in this report is very likely to be an underestimate. Nevertheless, the order of magnitude of pre-harvest loss can undoubtedly be ascertained by this method.

Field rats began effective procurement of rice earheads at maturity of the crop and continued till harvesting. They cut the earheads at a fairly fixed point. The 'stores' were rather neat and compact. The intact and dry earheads were arranged in remarkable uniformity with the bases mostly (over 95 per cent) placed on one side and not randomly mixed.

From the field observation and pen study it was evident that there was no apparent preference of one variety over others for procurement and hoarding. During the harvest of *aman* rice it was observed that heaps of different quantities of rice earheads were occasionally placed on the ground near the opening of the burrow. The general arrangement of the earheads in such 'interim stores', as we call them, was very similar to those in the underground 'stores'.

It was observed that the field rats abandoned their burrows in a recently harvested barren *aman* rice field and migrated to the neighbouring fields having standing wheat and pulse crops which offered a new source of food.

The details of the fate of the hoarded grains is not fully known. While the field rats evidently eat some of their hoarded food, it is not clear in what circumstances it is done and most of the hoarded grains, at any rate, is lost to the rat since the grains germinate, mould and eventually rot in the abandoned burrows.

Results and Discussion

The dry weight of clean paddy for each underground 'store' and yields of paddy of the 'reclamation plots' were recorded for the agricultural years 1969-70 and 1970-71. Average weights of dry paddy per store, percentage of hoarded grains and estimated loss were computed. The results are shown in Table 1.

It will be seen that an average weight of 0.537 kg of dry grains per 'store' was hoarded and that the difference between the average weight of grains per 'store' between seasons was negligible. It will further be observed that the grains hoarded by rats in the burrows was 5.71 per cent of the total rice produced in the 'reclamation plots'.

If we presume, as demonstrated by Parrack [9] in an experimental (captive) setting, that hoarding by rats represents 80 per cent of their procurement, then about 7.1 per cent of matured paddy was lost to rodents in the field, which is obviously an underestimate of the actual loss during the hoarding process.

These findings can be applied to the agricultural farm in Giridih where the investigation was made. It is also desirable to bear in mind that the results obtained in an experimental farm are not necessarily applicable to cultivators' fields. Because of these restrictions, any generalisation about pre-harvest loss is not possible from the results of this study.

This preliminary report suggests that further investigations are required to be pursued in different tracts of India, in research farms and also in farmers' fields to have a clear picture of the extent of pre-harvest loss of foodgrains about which we hardly have any dependable statistics at present.

A data-based estimate of India's foodgrain losses to rodents might reveal that, if such losses are prevented or minimised, the present production is enough not only to meet normal national requirement but to have a reasonable reserve for emergencies.

Wages of Foreign Collaboration

K R Bhattacharya

Import of Capital and Technology: A Study of Foreign Collaboration in Indian Industry; by K K Subrahmanian; People's Publishing House, New Delhi, 1972; pp vii + 248; Rs 25.

A MASSIVE international effort for the economic development of the countries of the Third World has been a major feature of the post-Second World War world. This effort has been based primarily on assistance — in the form of aid, investment, technical collaboration and expertise — offered to the poor countries, the erstwhile colonies and semi-colonies, by the rich countries, their erstwhile colonisers now turned friends.

What have been the premises of this effort? As postulated, the rates of saving and investment and the level of technology in poor countries are low; they also suffer from adverse balance of payments due to their heavy need for capital goods imports. It it then premised that their poverty is due to these four gaps, which foreign aid, investment and collaboration would fill, whereupon the countries would easily embark upon a process of growth and prosperity.

But what has been the result? K K Subrahmanian's study provides a detailed assessment with respect to private foreign investment and technical collaboration in India. There have been many competent and more comprehensive analyses of the foreign investment aspect earlier.[1] But Subrahmanian's is the most comprehensive work on technical collaboration so far. We will first present a summary of his findings in section I and then turn to an analytical discussion in section II.

I

Originally foreign investment in India was typically colonial, inclined to develop trade rather than industry, and primary products (plantation, mining) in the latter. This pattern changed after Independence when activity shifted to manufacture, because the import-substitution policy of the government reduced the scope of import trading in finished goods while the infrastructure development by the public sector and the tariff walls made local investment highly profitable. The government also gave encouragement to foreign participation with progressive liberalisation of policy particularly following the two foreign exchange crises of 1957 and 1963. All this gradually led to a boom in the import of foreign capital and technology.

But has the investment moved into spheres where it was most needed? Unfortunately no. A comparison of the plan priorities for investment and foreign-exchange needs with the actual pattern of foreign investment achieved showed a clear dichotomy between the two. (For example, while chemical products received only 11th rank in the plan investment programme and 9th rank in terms of import requirement, it ranked the 4th place in joint-venture investment and absorbed the largest share of foreign capital.)

Actually private foreign investment has been concentrated mostly in technology-intensive product lines (particularly basic chemicals, industrial machinery and electrical machinery). This was because technology was the key input for investment in these fields, which was the monopoly of big foreign firms by virtue of international patent protection. Besides, the technique of kind-investment enabled the firms to invest easily in these fields by exchanging capital goods and knowhow for equity shares even without committing any free funds. Interestingly, financial collaboration occurred also in consumer goods industries that do not involve complex technology — such as milk powder, glassware, transistors, air-conditioners, gums, cosmetics. Clearly, the main consideration here was to utilise foreign brand names for profit rather than to build up a dynamic industrial structure.

Book value of outstanding foreign private investment in the private sector increased from Rs 265 crores in 1948 to Rs 440 crores after 1955 to Rs 830 crores after 1965 and Rs 980 crores by March 1967 (Rs 265, 442, 995 and 1,230 crores, respectively, including inflow of official credit into the private sector). The net inflow of private foreign capital during the first, second and third plan periods were Rs 115, Rs 110 and Rs 220 crores, respectively. The share of these amounts in the total investment in the corporate sector (14-18 per cent) was obviously small.

But even this small share appears much bigger than it really is. Foreign investment may take place through either fresh inflow (new investment) or reinvestment of profits. Reinvestment results only in the growth of the outstanding value of foreign liabilities by reinvestment of profits and revaluation of the existing assests and adds nothing to the import capacity. No doubt it reduces current profit transfer, but it raises the capital liability and the servicing burden subsequently. New investment on the other hand transfers resources generated abroad and thus augments the foreign-exchange receipts and import capacity of the host country. However, even here there are cash and non-cash flows. In non-cash flows the investment is in kind, *viz*, capital goods and knowhow. Exchange of goods for equity shares amounts to but export of the investor's product on a deferred payment basis, usually at marked-up prices, along with obtaining dividend and ownership rights. As for acquisition of equity shares in exchange of knowhow fees and services, it is most lucrative to the foreign collaborator because the cost is indeterminate, while the dividend liability soon outweighs the temporary benefit of postponement of direct payment for the host country.

In this background it is significant that fresh capital flow constituted only some 40 per cent of the total net private foreign inflow. But even with respect to this fresh inflow, a study of the 79 new companies that were started with financial collaboration during 1960-1964 showed that nearly half of the foreign ownership was acquired through investment-in-kind, and a substantial part of it through capitalisation of knowhow fees. In 49 cases out of the 79, free equity shares were obtained in exchange of fees for technical services and knowhow. As a matter of fact the collaborator's equity participation accounted for only 27 per cent of the total imported plant cost in the 79 cases, which had to rely upon other foreign-exchange loans for financing the bulk of their capital goods import. Clearly, foreign investment has played only a small part in helping capital formation and in easing the foreign-exchange constraints in India, though obtaining substantial ownership stake at the same time.

As for the form of foreign investment, the importance of branch organisation declined after Independence

(although still substantial in the plantation sector), being progressively replaced by foreign subsidiaries and joint-ventures, particularly the latter. This shift to joint-ventures has in fact been a world-wide phenomenon. It arises from the desire of the host countries to lessen the foreign control in their manufacturing sector. For the foreign firm too, association of domestic investors helps the mobilisation of local resources and becomes a sort of insurance against the vagaries of government policy. Joint-ventures were 42, 100 and 164 in the first, second and third (first 4 years only) Plan periods, respectively. As a percentage of all new companies, the respective shares were 16, 36, and 41 per cent.

But to what extent has the policy of joint-venture been able to bring about diminution of foreign control in industry? Joint-ventures with foreigners holding equity shares of 40 per cent and above may be classed as foreign-controlled (because a shareholding of even 40-50 per cent, with the rest divided between promoters and general public, gives the foreigner effective control). On this basis more than half the number of joint-ventures started during the first three Plan periods were under foreign control. These were concentrated in technology-intensive fields and also in certain consumer items like dairy products, vegetable oils and beverages. Clearly in a large proportion of the companies, especially in technology-intensive product-lines, the collaborators managed the dilution of ownership-mix in such a way as not to diminish their control. Yet such control did not mean a greater inflow of private foreign capital. In general, the control was acquired merely by keeping the equity base small and then making the foreign equity holding equal to the foreign-exchange cost of the project. Nor were the foreign-controlled firms superior in terms of profitability, efficiency or management than their Indian-controlled counterparts.

Technical Collaboration

Coming now to the technical collaboration (i e, in knowhow with or without capital participation), they were at first relatively few but a spurt came from the government's encouragement after the foreign exchange crisis of 1957-58. Between 1956 and 1965 technical collaborations aggregated to 2,524 cases. The countrywise distribution was: UK 32 per cent, USA 20 per cent, West Germany 15 per cent, and Japan 7 per cent.

A feature of these agreements was their indiscriminate nature, i e, even for manufacture of products which were non-essential or which could be produced on the basis of local technology. These items included vacuum flasks, lipstick, toothpaste, cosmetics, brassieres, ice-cream, gin, beer, biscuits, dry batteries, readymade garments — for which in fact collaborations were granted often in multiple numbers and renewed on expiry. Clearly it is only the advantage of a foreign brand name and the demand of the higher income group that led to such collaborations rather than any contribution to economic growth. As a matter of fact there has been a collaboration mania in the country, both among licence seekers and givers, and even in the public sector.

Another feature was multiple collaboration, i e, repetitive import of the same or similar technology. Sometimes this happened for similar products at the same time and sometimes even with the same foreign collaborator for the same product. This arose from a policy of not importing technology on a national basis, and building additional capacities not by expansion or sub-licensing but by a fresh collaboration in each case. The result naturally was repetitive payments without adding to the stock of technical knowhow in the country.

But a more serious effect of multiple collaborations is the introduction of standards of various countries (in raw materials, spare parts, designs, specifications, and even terms of measurement) into the Indian industry even for very similar products or within the same firm. This multiplicity leads to large inventory accumulation and uneconomic locking up of working capital; it also hinders standardisation and variety reduction, which are of utmost importance in raising industrial productivity. Actually this is one of the important reasons for the low productivity of Indian industry. The same also follows from the establishment of multiple units disregarding scale considerations which in addition leads to underutilisation because the need to ration out limited raw material and foreign exchange among a number of units causes idling of installed capacity.

The terms of agreements again were invariably weighted in favour of the foreign collaborators because they were able to cash in on the lack of bargaining power or desire of the Indian side and the government's eagerness to acquire foreign participation in the face of foreign exchange stringency. It was found that too many functions were entrusted to the foreign collaborators under the head of initial services, whereby they reaped substantial benefits as engineering fees which moreover they usually capitalised to secure ownership in the ventures. This also deprived the Indian personnel of the opportunity of learning from experience. Thus the project report was usually the sole responsibility of the foreign collaborator; so were plant layout, specifications of equipment and selection of materials, list of machinery to be imported and fabricated, their supply and testing, supervising of erection and the trial runs. The same was sometimes true even of drawings of utility items and factory buildings, civil engineering work, selection of plant site, preparaton of market report, etc.

This also led to another serious drawback. The dual function of specification as well as supply of equipment, implying a close tie-up between the designers and suppliers, resulted not only in price mark-up but also in over-import of equipment. Equipments were imported even when these or their parts were easily available locally. Often the processes were more highly mechanised and sophisticated than were desirable or necessary. And sometimes these equipments then remained idle for want of spares leading to imbalance, idle capacity and high overhead cost. Obsolete, inefficient or untried technology were also imported sometimes.

The terms of payment (royalty and/or technical fees) too were so framed as to squeeze out the maximum payment under one terminology or other. Generally 5 per cent of the annual turnover for 10 years as royalty plus 5 per cent of the imported plant cost as technical fees in the case of royalty-cum-technical fees, or 10 per cent of the issued capital as lumpsum payment for technical fees alone, were the limits of official policy; but these tended to become routine.

But the most significant feature was the presence of various restrictive clauses in the agreements. (a) One was against diffusion of technology whereby the Indian ventures were to keep the knowhow secret and not transfer or sub-licence it to any one, in some cases even after the expiry of the agreement. This policy is one of the reasons for multiplicity of collaborations. (b) Another restriction was against the introduction of local changes by stipulating that the manufacture be carried out strictly as per the specifications, or

by limiting the right to use the brand name subject to manufacturing to the collaborator's satisfaction. Paradoxically many agreements required the Indian ventures to continuously incorporate changes introduced by the foreign collaborator. Clearly these clauses prevent the local adaptation and assimilation of imported technology, hinder the progress of standardisation and variety reduction in Indian industry, and impose a built-in condition for high import dependence. (c) Control over overseas purchase was exercised by the stipulation that it had to be made directly or indirectly through the collaborator. Since it was also he who prepared the list of plant and equipment to be purchased locally and from abroad, opportunities of raising the price as well as the import content are obvious. (d) Production also was usually tightly controlled. Sometimes foreign technicians were required to be appointed who virtually became in charge of technical management. Alternatively the guarantee of quality control was made conditional on the production being supervised by the collaborator's personnel. (They moreover were not always the best qualified or cost-conscious, leading to frustration and apathy of the Indian personnel.) (e) Pricing and marketing of the products were also often controlled by requiring that a part of the production was to be sold to the collaborator's subsidiary in India at a fixed commission or that specified firms were to be made the sole selling agents. (f) Export was also restricted. Where it was not totally banned, the right to export was given only to specific countries or on certain preconditions such as that the collaborator's agent would be the exclusive export agent (entailing a loss of a part of the foreign exchange earned as commission) or a demand of an extra royalty of 1-1.5 per cent on the export sale. Recently the government has been trying to prohibit such restrictions and actually insisting on certain export undertakings. But the enforceability of such restrictions is doubtful.

Clearly, the foreign collaborator designs the agreement not only for extorting excessive profits but as an instrument of defence against a losing market. Hence the strict specifications, the control over supply, production and sale, and the restrictions against local adaptation and export — so as to make the process as much import-encouraging and export-discouraging as possible.

As for assimilation of foreign technology, the long queue for renewal of collaboration agreements, even for technology-non-intensive products, told its own tale. Evidently in India foreign collaboration has been considered as a perennial source of technology. The same point was also borne out by the striking observation that the extent of R and D by industry, extremely low as it was in general in India, was least or absent in collaboration ventures. R and D, if any, or technical consultancy in in these ventures was mostly a foreign responsibility for which a special fee had to be paid.

Overall Evaluation

The balance-sheet of foreign exchange transactions in private foreign collaboration remained negative throughout the second and third plan periods. (Payment of dividends was Rs 128 and Rs 163 crores and of royalty and technical fees Rs 37 and Rs 74 crores; while net foreign exchange inflow was only Rs 109 and Rs 160 crores during the two periods, respectively.) The servicing burden (service payments as a percentage of total export earnings) in fact rose from 5.4 per cent in the second plan to 6.6 per cent in the third plan period. As for export earnings these were on an average only 8 per cent of production, which was insufficient to cover the service payment and the current import. Actually an increasing proportion of traditional export earnings was absorbed in servicing the new private foreign investment.

Summing up, despite substantial growth, private foreign investment helped only marginally in bridging the saving-investment gap or in reducing the foreign-exchange constraint. Existing firms grew mostly by mobilising local resources through reinvestment while newcomers acquired ownership rights in lieu of machinery, knowhow and services, keeping the commitment of funds to a minimum. Even initial import of capital goods had to be financed largely through other loans. The joint-venture became the organisation of choice, but foreign control was not significantly diminished thereby, especially in chosen technology-intensive fields. The profit-extracting terms of collaboration and the high profitability in the sheltered monopolistic market raised foreign-exchange outflow, which together with the import-encouraging and export-discouraging terms of collaboration put a heavy pressure on the balance of payments. As a matter of fact despite domestic manufacture, foreign collaborators were generally able to maintain or even improve upon their erstwhile export market in India.

The terms of agreements also effectively prevented the local adaptation and assimilation of technology and inhibited utilisation of indigenous technology. The whole process discouraged local innovation and made the entire industrialisation process costly and inefficient.

Another very important social cost has been the growth of monopolies and concentration. The Indian market was characterised by both product-wise concentration (market monopoly of a product item) and country-wise concentration (assets size of business). Both these were closely correlated with foreign investment/collaboration. Foreign subsidiaries were usually dominant undertakings in the fields of their operation; likewise most of the top companies and big business groups in the country had foreign investment/collaboration. The reason for this association is that in the background of foreign-exchange being scarce and industrial knowhow being monopolised by foreign companies under patent cover, foreign investment/collaboration becomes an important determinant of entry into industry; and in the context of the small Indian market, such groups exhaust the licensable capacity of a product and become monopolies in their fields. The foreign link also facilitates big business to acquire strategic advantages (patent, resources, foreign exchange) and thus diversify and expand.

II

Subrahmanian has of course made several policy suggestions to plug the loopholes revealed in the study but we need not consider them here. It is always possible to work out a set of conditions under which foreign collaboration will work to the best advantage. But the question is whether they are practicable. In the real world social processes proceed not according to abstract desirability but social dynamics. One must then examine, from experience in real life and from *a priori* considerations, whether dependence on foreign capital and technology for a country like India is at all compatible with its all-round development.

Some aspects of the practical experience have been presented competently by Subrahmanian himself. But foreign collaboration is obviously no more than just one aspect of the whole: the model of development based on assistance from abroad. Another aspect of this is foreign 'aid' — the magnitude of which will be better understood from the fact that our current debt servicing charge

on past aid is some Rs 500 crores per year, i e, about 30 per cent of our total export earning. What we need to consider then is the overall impact of this model so far on the country.[2]

What have these assistance and collaboration programmes really built? The pronounced *dualism* in the country provides the answer. That poverty has not decreased by this 'development' process is now widely acknowledged. What has happened is that islands of modernity have sprung up. The spectacular urban developments, luxury hotels, soaring urban land prices, dazzling shopping arcades, the myriad luxury consumer goods, the all-pervasive venal advertisements, the flood of the comic-books and glamour-magazines, the mushrooming institutes of 'higher learning' and 'development studies' and 'management' — all clearly show where the development with foreign assistance has really gone. Besides, it is not that the 'assistance' funds alone have gone to these luxury enclaves; by predetermining the direction of development they have funnelled the bulk of local resources also to the same destination.

The cycle of this distortion has been finally completed by the need of repayment of the aid and collaboration. The resulting need to *export at any cost* has had two consequences.[3] On the one hand it has entailed a net loss to the country in much of the export transactions, payment of huge subsidies and inducements to promote exports, and enormous rackets — the cost of all of which has had to come ultimately from the poverty sector. Secondly it has meant a massive diversion of the country's remaining resources to build the export infrastructure (ports, ships, railways, mines, roads, plantations, fisheries development, free trade zones, transfer of whole plants from abroad).

Clearly, the 'assistance' has automatically set the pattern of economic activity: building luxury enclaves with the 'assistance' and a part of the local resources on the one hand — which has provided a lucrative market for the aid-givers — and mobilising the rest of the economy to pay for it on the other.

This distortion has been reflected in the social sphere as well. Thus the process has totally pre-empted an indigenous development of science and technology, for maintaining a technological market for the rich countries through aid and collaboration is its ultimate motive. Again, despite 25 years' effort promises of primary and adult education remain utterly unfulfilled with 71 per cent people still illiterate, at the very time that 'higher learning' grows and grows (partly for export). Unemployment expands, even among technical people, as development proceeds. And in culture, the top oligarchy (including the intelligentsia) has become more alienated from the society, more Westernised and more profit-seeking than ever before.

Is the process not then in effect a continuation of the process of development of underdevelopment that was set up during the colonial times, indeed a continuation of colonialism in a new garb?

Such are the lessons of experience — not merely in India but in the entire Third World. Surely this experience indicates something, some social force, which cannot be checkmated simply by some legal regulations to plug some loopholes.

Theoretical Considerations

But what about theory? Is development through assistance theoretically tenable? If all poor countries of today were colonies or semicolonies of past and all aid-givers are directly or indirectly ex-colonisers, and if the poverty of one and the affluence of the other are at all interrelated, it is indeed most incongruous to imagine that such a relationship would suddenly change into a beneficiary-benefactor one. Given the utter poverty of the plundered Third World, ringed around with the highly industrialised countries hungry for markets and raw materials (the USA with hardly 8 per cent of the world's population consumes some 40 per cent of the world's current resources), it requires extraordinary imagination indeed to believe that 'aid' from the latter will help the former to become self-sufficient and not more dependent (of course at the cost of a small bribe to the top oligarchy in the form of building some luxury enclaves).

But let us examine the case of technology a little more closely. The theory is being constantly touted that with so much technology already available in the world today it is no longer necessary for the poor countries to go through the initial development process again; they can borrow and leap-frog into a modern stage in one jump. The eternal bait for the trap. Firstly, taking our factor proportions into consideration (the massive population, the huge unemployment, the shortage of capital), much of the sophisticated technology is not only not suitable but absolutely suicidal for us. What we need to start with is widely dispersed, small-scale, capital- and import-saving, labour-intensive techniques of production in as many spheres as possible. This technology is not available anywhere else in the world. It has to be created right here. Secondly, even if it were available, it is not free. Knowledge, specially practical knowledge, is from after the advent of capitalism no longer a common possession of mankind as it used to be but a private commodity for sale. Quite plausibly the cost to purchase it may often be higher than to develop it afresh. Thirdly, who is the buyer? Surely, it is not the 'country' but its tiny Westernised elite who would naturally buy only such technology as would be compatible with its cultural values and economic-psychological aspirations. This, combined with the urge of the technology-seller to sell his most sophisticated and luxury-oriented technology to perpetuate import dependence, would automatically lead to enclave development and eternal dependence as discussed earlier.

Finally, what will borrowed technology achieve anyway? Is development simply a question of applying technology, of making factories and gadgets? Is it technology *per se* that changes society or is it social ferment that brings forth technology? Is it shortage of technology that is the cause of our poverty or is the shortage itself a reflection of institutional distortions? Then will not borrowed technology necessarily remain sterile, in fact reinforce the institutional distortions further?

The theory of leap-frogging with borrowed technology is thus a myth and a trap. As a matter of fact the history of the entire Third World is a living example of this myth. Development after all means a process of self-growth. Its motive power is social ferment, tearing down of institutional barriers, and a release of innovative capacity of the people. Technological revolution cannot be achieved, has never been achieved, without a social revolution. Foreign 'help' will not facilitate but only obstruct such a transformation.

Perhaps a few words on the inevitable popular phrase 'as the example of Japan shows' — Japan is supposed to have shot up into spectacular growth with foreign technology and assistance — are in order before closing.

Firstly, contrary to the myth assiduously built up, Japan was already a highly developed country much before the Second World War. Its development (or whatever it be called) occurred around the turn of the century; it had defeated Russia in 1905. In fact Japan was already a great imperialist country; is had vast colonies (Korea, Taiwan, Manchuria ...) and had fought great world powers for many years and captured many lands during the Second World War. To suggest that its development occurred only in the last two decades (and by implication that it was another India or China before that period) is thus no more than a great triumph of the modern Goebbelsian information technology. No doubt Japan was devastated during the war, but so was Germany (both East and West) or Russia for that matter; its subsequent reconstruction can no more be considered a *de novo* development than that of West Europe or Russia. Now, having already been a developed country earlier, Japan's socio-institutional structures were such as to enable it unlike the ex-colonies (or ex-semi colonies), to assert and utilise any assistance for its own advantage rather than for that of the assister. The aid-givers too knew very well that it would be futile and suicidal to try to keep an already developed capitalistic country as a neo-colony (unlike an ex-colony pre-capitalist country like India, where the incipient capitalists in a semi-feudal structure can do no more than agree to profit-sharing as a junior partner). This is the meaning of the well known fact, for example, that Japan, although going in for large-scale foreign collaboration, spent 4 dollars in R and D for any technology for which it spent 1 dollar in technology import. If such a policy is not followed in India, it is not because of lack of money or of wisdom but because the necessary social force is lacking.

Second, the reconstruction of Japan with genuine aid as a bulwark against China (like that of West Europe against Russia) was considered an essential task in the 'free' world's crusade of 'containing communism'. Third, it must not be forgotten that much of the recent 'miracle' of Japan was the gift of the Korean and Vietnamese wars, in which wars Japan acted simply as the biggest floating warship of the USA.

To claim Japan's admittedly spectacular recent growth (whatever its intrinsic human merit) as proof of the alleged virtues of foreign collaboration is thus a delusion or a deception. Quite the contrary, the glaring distinction between the post-war economic histories of Japan (and Europe) and the Third World is the clearest evidence of when aid helps and when it kills.

There is thus nothing to lament or wonder at India's crippling experience with foreign collaboration, so ably documented by Subrahmanian. Nothing else could have been expected.

Through Tolerant Western Eyes ...

Jai Nimbkar

The Indian Experiment, Key to Asia's Future, by Giselher Wirsing; Orient Longman; pp 318; Rs 25.

THERE is supposed to be a certain value in books written about India by foreigners: they can approach the subject with greater objectivity than Indians can summon. But more significant is the factor that information and personalities are somehow more accessible to them: foreign, especially West European and American, journalists have always had a more favoured position than Indian journalists in this respect. Giselher Wirsing too had this factor in his favour, as is clear from the numerous references he makes to personal conversations with important personages in the Indian drama.

Assuming that what India is and what it becomes holds the key to Asia's future—an assumption with which some political observers might quarrel—Wirsing examines the content of India's democracy in the light of events over the last two decades. He then attempts to predict its future.

Thus, he analyses some of the internal conflicts and problems: the still-entrenched caste system; the problems of unemployment and the growing educated proletariat; the problem of overpopulation and inadequate food production; the fissiparous tendencies of the states. Balkanisation of India, he asserts, will be the beginning of the end: India can survive as a power only if it can stay integrated and become self-sufficient in food. All this says nothing new, though it is a readable review of India's recent history.

Analysing India's foreign policy which, he says, is determined by its relationships with its neighbours and the exigencies that make it dependent on other nations, Wirsing is able to explain otherwise complex facets of it — such as the whole Kashmir question or India's stand on the Arab-Israel conflict, or the importance of the USSR in our decision-making process.

The author is primarily concerned with whether India will survive as a democracy. India alone among the new countries of Africa and Asia, he says, has the combination of three institutions that has helped and will continue to help it to survive as a democracy. These are an independent judiciary, a bureaucracy with a strong tradition, and a free Press which works without any censorship. Of course, he says that these will not by themselves make India survive. Though India's achievements, in the face of great odds, have been impressive, much more needs to be done. Ultimately it is our own effort which will determine our survival. Wirsing sadly notes that recently there has been a slackening of interest, a shrinking of aid: India still needs help, not in the spirit of charity but because it is in the interests of these countries to keep India a viable democracy!

The author overestimates the position of India as an integrated and more or less neutral country, a stable zone between the crises centres of the Middle East and Indochina. As far as the super-powers are concerned, India's usefulness to them as such has greatly diminished. No doubt, this accounts for the slackening of interest which he mentions earlier. For the same reasons, predicting Asia's future by the part India will play in it, is largely guesswork. China is, Wirsing points out, one big unknown. There is also the American presence in Asia to reckon with. The Americans' presence, the author claims, has a significance far beyond their specific acts. Their complete withdrawal will have a vacuum! Co-operation between India and Japan should fill this vacuum. However, the author admits that this is probably wishful thinking: India and Japan have never had a particularly trustful or friendly relationship with each other. Would the fact that, since the publication of this book, there have been developments which suggest Japan's keenness not to jeopardise its trade relations with China for a not-so-profitable relationship with India, strengthen this doubt?

SPECIAL ARTICLE

D R Gadgil: The Last Phase

A R Kamat

When D R Gadgil accepted the deputy chairmanship of the Planning Commission in 1967, he had already behind him more than 40 years of vigorous activity in economics and in allied fields.

A glance through his writings is enough to convince anyone of the wide range of his work: from industrial evolution and current industrial development, to problems in agriculture and attempts at agricultural reform, to education, the federal problem in India, the Indian Constitution, city and town development, regional planning, to social change, caste and untouchability, social obligations of advanced sections of society, etc.

In each of these and other areas, he laid great stress on the systematic garnering of facts, made careful study of the underlying relationships, and suggested immediate and long-term measures that could be adopted without upsetting the existing framework. Joining the Planning Commission was regarded as a natural culmination of his wide-ranging activities and his long and sustained work on the problems of the Indian economy.

This article attempts a review of the last phase of Gadgil's life when he headed the Planning Commission.

I

PROFESSOR D R Gadgil died on May 3, 1971, the day after he relinquished the deputy chairmanship of the Planning Commission. He had accepted this post on September 1, 1967, at the age of 66. While there have been many obituarial tributes written after his death, there has been no comprehending account of Gadgil's varied ideas and activities spanning more than forty-five years — from 1974 when he returned from Cambridge to 1971 when he died. The only attempt made so far in that direction has been by V M Dandekar in a note which by his own admission gives "a brief ... statement of facts of his career and activities", and makes "no attempt to assess or evaluate his views and achievements";* the concluding paragraph in the slightly revised version published after his death, however, does imply an assessment of his work as Deputy Chairman of the Planning Commission.

Students of economics, and the large number of Gadgil's admirers, have therefore to wait for a fuller and more systematic exposition of his life and work. In this article, I attempt a review of the last phase of his life when he headed the Planning Comsion. I cannot claim to have the benefit of a long or close association with Gadgil, but this has a certain advantage. Having spent the formative years of one's life outside of the orbit of his powerful personality, one might be better placed to take a more dispassionate view of the man and his field, unhampered by the love-hate relationship which often develops for people who have to grow under the shadow of a larger presence.

II

When Gadgil accepted the deputy chairmanship of the Planning Commission in 1967, he had already put behind him more than forty years of vigorous activity in economics and in allied fields. A glance through his writings listed in 'The Making of the Man' (referred to earlier) is enough to convince everyone of the wide range of his works in the field: from industrial evolution in India and current industrial development, to problems in agriculture and attempts at agricultural reform, to education, the federal problem in India, the Indian Constitution, city and town development, regional planning, to social change, caste and untouchability, social obligations of advanced sections of the society, etc. In each of these and others, he laid great stress on the systematic garnering of facts, made careful study of the underlying relationships, and suggested immediate and long-term measures that could be adopted without upsetting the existing framework. He had also served on several committees and in several organisations dealing with many of these questions. Because of the wide compass of his activities and his long and sustained work on the problems of Indian economy, Gadgil had become the acknowledged doyen of Indian economists several years before he was called upon to join the Planning Commission. His joining the Commission was thus regarded as a natural culmination of his academic and extra-academic activities over the previous forty years.

III

Gadgil had already expressed himself on planning and economic development in India before the start of the Five-Year Plans, and had served on the planning organisations of at least three princely states in the Deccan before their merger. After the commencement of the Five-Year Plans planning and economic development in India had been the dominant theme of all his writings and activities. "Planning and Economic Policy in India" was his major publication of this period; it was first published in 1961. The collection consists of several of his essays, speeches, notes and memoranda dealing with the content of planning in India and its results, the planning process, and the planning organisation. His criticism of the planning effort and the economic policy of the Government of India is often trenchant, particularly when it deals with the shortsightedness and political opportunism of the political leadership, the inertia, inefficiency and lackadaisical manner of the bureaucracy, and above all the greed and the garish ostentation of the vested interests and their allies. He pressed for alternative policies, alternative measures, alternative values. This was no academic criticism by an outsider, for during the whole of this period Gadgil was continuously associated with the Planning Commission. He had served on several of its committees, and particularly on the Economists' Panel of which he was Vice-Chairman for several years. In fact, many of his critical exercises on planning in India during these years are notes that were addressed to the Commission and its committees.

In the Working Paper 'Planning Without a Policy Frame', which he wrote for the symposium organised by the National Book Club in New Delhi in December 1966, he underlined the total absence of a policy frame. He suggested that the government deliberately avoided constructing such a frame because of the influence of vested interests in private industry and trade, and because of the belief of the planners that once a given rate of investment is achieved the economy would automatically function satisfactorily without an integrated regulatory framework. Thus, notwithstanding the large numbers of specific controls, which were often unnecessarily complicated and irritating and gave rise to pervading corruption, the economy as a whole actually operated like a *laissez faire* economy, with its benefits accruing mostly to the small minority of the rich and powerful. This had resulted in growing dependence on foreign assistance, an ever-increasing rise in prices, and a worsening inequality in society, affecting seriously not only economic but also political and social stability.

Gadgil suggested an alternative approach, of which the main elements were a price policy and an incomes policy. The main purpose of the price policy was 'to keep inflationary forces in check and price levels stable' and that of the incomes policy 'to stabilise incomes in general, to augment, to the extent possible, the incomes of the disadvantaged, and to curb those of the rich'. The price policy would consist of stabilisation of the price-structure by establishing a comprehensive system of socialised purchase, storage, and sale of a main agricultural commodities, and by arranging a regular minimum supply of essential consumer goods to needy people through a widespread network of retail outlets. For stabilisation of prices of manufactured products it was necessary also to control prices of intermediate and capital goods, through regulated allocation. Gadgil felt that a correct development policy required the establishment of comprehensive price control measures and authorities to enforce them as in a war economy. The incomes policy which he advocated was to stabilise agricultural incomes largely through the stabilisation of agricultural prices, to utilise to the utmost the existing skills and equipment of the rural non-agricultural occupations, and to make the plan employment-oriented for the benefit of the landless rural poor and the mass of the urban poor. Correspondingly, the incomes policy should control through fiscal measures the rising incomes of producers and traders in the advancing sectors of the economy. Gadgil suggested that the private capital market, already diminished, should be further reduced by appropriate fiscal and credit measures and that there should be a closer control on the operation of large-scale private industry for increasing self-reliance on the one hand and for protecting the interests of consumers on the other. For this purpose, he recommended the appointment, and active functioning, of government directors wherever large public investments were made by official and semi-official agencies such as the LIC and the introduction of a system of public audit through the nationalisation of the profession of chartered accountants. Finally, Gadgil advocated decentralisation and dispersal of planning activities so as to take into account the requirements and potentialities of the states, regions and districts. He insisted on the dispersal of industries so as to remove regional imbalances of development.

IV

The paper containing these recommendations for an alternative policy frame was written in December 1966. Gadgil accepted the deputy chairmanship of the Planning Commission eight months later. He was at the helm of the Planning Commission for a period of 44 months. What were his achievements in respect of these ideas of his earlier years during his term of office at the Planning Commission?

Gadgil continued to stress most of what he had said before: stabilisation of prices, building of buffer stocks of the main agricultural commodities, self-reliance (from foreign assistance), restraint of domestic consumption of exportable goods, decentralisation and dispersal of industries, development of small-scale industries, importance of co-operatives in rural development, encouragement to middle and small farmers, welfare of the weaker sections of rural and urban population, planning of metropolitan areas, regional and district planning, etc. The note, "The Fourth Plan: Basic Issues of Objectives and Strategy" and its further crystallisation into "The Approach to the Fourth Five-Year Plan" spell out his basic formulations during this period. These are again reflected in the first two chapters of the subsequent document of the Planning Commission, "The Fourth Five-Year Plan". Gadgil wanted the intelligentsia in the country to discuss these ideas, to react to them.

However, in the writings and speeches of this period one does not find Gadgil's former insistence on the policy frame and the regulatory framework required for planning. Nor does one find traces of his earlier incisive and insistent criticism of the government, the political leadership, the bureaucracy, and the vested interests. This change is not unexpected. In his new position, he was no less a part of the establishment. After joining the Commission his views appear to have lost their sharp edge, at least in their public expression. As chief of the Planning Commission, he must have thought that public controversy on the policy frame and regulatory framework would not be in order. It was now for him and the Commission to take up these issues with the government, and to exercise their powers of persuasion on these issues. At the same time, he would try to create public opinion favourable to his views by placing them before a wider audience in a form and in style which would not be incompatible with his new responsibility.

The proposals in the Fourth Plan

* See: "Dhananjaya Ramchandra Gadgil: Making of the Man", by V M Dandekar, Gokhale Institute, Poona (1967) and its updated version, 'Dhananjaya Ramchandra Gadgil (1901-1971)' in *Artha Vijnana*, Volume 13, No 2, pp i-xxiv. The other systematic attempts known to the present author are: (i) "Gadgil and the Economics of Indian Democracy", by S A Dange, Peoples Publishing House (June 1971) (ii) 'Professor Dhananjaya Ramchandra Gadgil', (in Marathi), by Kshiti Mohan Mukherjee in *Samaj Prabodhan Patrika*, May-June 1972; (iii) the preface to the volume of Gadgil's Marathi writings by Sulabha Brahme; and (iv) an unpublished paper by N V Sovani. The first numbered written immediately after Gadgil's death, is based on his earlier writings on planning, and in it Dange tries to establish that Gadgil's ideas on planning have the content of 'revolutionary democracy'. The second, a Marathi article, gives the author's impressions and evaluation of Gadgil as an economist, a social scientist and the head of Gokhale Institute. The third summarises Gadgil's thought as expressed in his Marathi writings. The fourth, as yet unpublished, is reported to be a comprehensive appreciation of Gadgil's personality, ideas and activities. Sovani's long and close association with Gadgil is expected to make it authentic and authoritative.

do not appear strikingly different from those in the three earlier Plans. Perhaps this was because the Plan was prepared in the initial period of his tenure, and it could not be easy for an organisation like the Planning Commission to shake off its past legacy. It seems his views on stabilisation of agricultural prices, through building up of buffer stocks, did have some effect on government policy — in that, during the last years of the PL-480 programme, stocks began to be maintained with imported wheat and through purchase of local wheat during good harvests. The measures, however, were nowhere like the socialisation of purchase, storage, and sale of the marketable surplus of major agricultural commodities — which is what Gadgil had earlier advocated. (Recent experience has underlined the political pressures rendering ineffective the prices recommended by the Agricultural Prices Commission, the total inadequacy of stocks to tide over a lean year, and the extremely unsatisfactory working of the Food Corporation of India.) Gadgil's presence in the Planning Commission does not seem to have made any appreciable impact on governmental policies — whether industrial, fiscal, monetary, or financial. He was evidently unable to move the government towards accepting an adequate price incomes policy, let alone making them accept the imperative of an overall policy frame and regulatory framework for achieving their oft-proclaimed objectives.

Nevertheless, there were a few notable achievements which, though peripheral, have a long-term significance for planning in India. The most important of these is the introduction by Gadgil of an element of objectivity in the Centre's financial assistance to the states' plans. Formerly, there was a multiplicity of specific plan programmes with elaborate rules and regulations governing Central assistance. The procedure generally favoured the relatively better-off states. Moreover, the state plans were often the result of bargaining which took place between the Chief Ministers and the Deputy Chairman of the Planning Commission before the finalisation of the Five-Year Plan. With the agreement of the states, Gadgil discontinued this practice. Instead, a block grant was to be made to each state on the basis of the plan it had prepared and the resources it could muster; this block grant was to depend on a set of previously defined criteria. This made a substantial difference to the economically backward states as 10 per cent of the Central assistance was initially set apart for distribution to the states with a per capita income lower than the national average. Secondly, the regional and district approach to planning, which Gadgil had always advocated, began to take root; some states like Kerala established their own planning commissions or planning boards. At the same time, a beginning was made in evolving special programmes for the development of backward areas (e g, development plans for backward districts and for providing employment to the weaker sections of society (e g, the Page scheme in Maharashtra).

A noticeable change also came about in the functioning and style of work of the Planning Commission under the stewardship of Gadgil. The earlier Planning Commissions had hardly ever worked as a united team towards a common purpose. The members had not only differences amongst themselves but each one of them felt free to think and work in his own way, and often sought prominence and publicity for himself and his views. For the first time, Gadgil was allowed to select his own team. The Planning Commission now worked more or less like a unified group and very often it was the Deputy Chairman who was their only spokesman. Secondly, Gadgil dissolved the plethora of working groups and committees which had grown around the Commission and he kept down the number of such committees to the minimum necessary for its efficient functioning. During the Second and Third Five-Year Plans the Planning Commission had managed to acquire certain executive responsibilities for supervision of a large number of specific plan schemes for which finance was allocated by the Commission. These executive activities were drastically cut down by Gadgil who was of the view that the work of the Planning Commission should be primarily of an advisory character. The Administrative Reforms Committee had proposed reorganisation of the Planning Commission; Gadgil did not take any steps in that direction beyond appointing another committee in the Commission. It is an interesting aside that, in accepting the post of the Deputy Chairman, he had acted against one of his own proposals for reorganising the Commission — *viz*, that the person 'should be, by preference, an administrator of wide experience'!

V

This brief description of Gadgil's views on Indian planning before he joined the Planning Commission and of his actions during his tenure, is relatively easy. What is a lot more difficult and likely to prove controversial is any attempt to understand, interpret and assess this last phase of his career. This is attempted below, not without some hesitation. The hesitation is mainly in the area of understanding, but it inevitably spills over to other areas. It is difficult to come across any intimate or close friends with whom Gadgil had exchanged confidences, either in personal letters or in conversation, during this period. In an attempt to understand the important decisions which he had to take in this period, one has to depend on the impressions of some of his associates and people around him, on the developments in the country, and on the general make-up of his personality as one knew him through the years.

There have been similar attempts by others. For instance, the veteran communist leader, S A Dange, in a tribute written within a month of Gadgil's death, discovers the content of 'revolutionary democracy' in Gadgil's views on Indian economic development; he avers that it was because of this that the present ruling circles and the vested interests in the country would not allow him to continue any longer in such a leading position. Others, like V M Dandekar, have observed that he failed to deliver the goods he had promised, that he was reluctant to try and put into practice what he had preached earlier. It has also been suggested that the reasons possibly included the fact of his old age, or latent conservatism, or political miscalculation. Perhaps these were more like *obiter dicta* since they did not take into account his complex personality nor the character of the objective situation in which he operated. What is required is closer analysis of the personality and the situation, taken together. For this purpose, one has to formulate a different set of questions and seek answers to them.

The questions which, in my opinion, are more relevant — than his success or failure in the Planning Commission — are: What were the considerations of the ruling Congress circles in inviting Gadgil to head the Planning Commission in 1967? What considerations could have weighed with him in accepting the post even when that meant staking his life-time's reputation? Did his views on planning and economic development in India change a great deal after he joined the Planning Commission? Could he have performed substantially better than he actually did? Could his policies and programmes be pushed substantially further or harder in the prevailing situation? How does one characterise Gadgil and his performance, in those 44 months? Why did the ruling circles dispense with his services before the end of his five-year term when they had themselves solicited for them four years earlier? Should he have resigned earlier? These and other related questions, I think, are much more relevant than mere judgment on Gadgil's success or failure in the Planning Commission. The questions may appear unnecessarily elaborative; but their formulation has helped me towards a more satisfactory understanding of this last phase of Gadgil's life.

VI

Let us recall the economic and political situation in the country in 1967 when Gadgil was approached to head the Planning Commission. The years from 1962 onwards were difficult years for Indian planning. Two wars with neighbouring countries, the subsequent large budgetary allocations for defence, and two successive years (1965-67) of drought, created enormous strains for the country's economy. The policy of relying heavily on foreign assistance and PL-480 supplies for economic development was coming home to roost. The growing burden of loan-repayment and interest, the shortfall in exports, the deterioration in the balance-of-payments position, and the ever-mounting inflation, had resulted in a situation where economic development had almost come to a standstill.

The infructuous economic policies and programmes of the period came to be associated in the public mind with Asoka Mehta and C Subramaniam, who were also thought to have been mainly responsible for the devaluation of 1966 — a decision which was believed to have been forced on India by her creditors. Mehta, with his usual sophistications was pleading for more foreign aid, further foreign investment, and 'back-seat driving' by American interests. Moreover, big business in India and its spokesmen, inside and outside of the Congress, were openly clamouring for calling a halt to developmental planning; the slogans ranged from a plan holiday to its total scrapping. Planning had almost become an ugly phrase.

All this had a major impact on the political climate in the country. Political opposition, from the Right and the Left, held the ruling Congress party responsible for the predicament of the country. Anti-Congressism became the order of the day. In the 1967 general elections, the Congress which had enjoyed an unbroken spell of power for 20 years over most of the country got a rude knocking at the hands of the electorate. Its majority in the parliament was eroded, and in a number of states non-Congress ministries came to power: Communist-led coalitions in Kerala and Bengal, the DMK in Madras, the Swatantra-led coalition in Orissa, and motley groups of the Right and Left joining hands to form governments in Bihar and UP. The Congress party itself, which had considerably lost its binding force after the death of Nehru in 1964 and of Shastri in 1966, was subject to opposing political pulls and pressures, and was in a state of uneasy balance. Indira Gandhi, who owed her leading position as the Prime Minister to the Kamaraj method of consensus, was yet without a specific image of her own and without decisive political influence within or without the party.

In this situation, when the very idea of planning had come into disrepute and formidable forces were poised within and without the party to discard it altogether, in the conditions of political disequilibrium in the states and at the Centre, the ruling circles in Delhi were badly in need of a man who, as the head of the Planning Commission, could revive some of the confidence in, and credibility of, planning. After the utter bankruptcy of Asoka Mehta and his associates who had been earlier in the saddle, nomination of a Congress politician to the post would be to invite immediate hostility and bitter criticism from all quarters and particularly from the Left. It was against this background that it was proposed to approach Gadgil, a proposal which met with the approval of the Prime Minister and which had firm personal support of Morarji Desai who was then Finance Minister and Deputy Prime Minister. Others, who had given little thought to the reorganisation of the Planning Commission or who were unenthusiastic about or hostile to planning, acquiesced. A future colleague of Gadgil, who was then close to the Prime Minister, is also said to have played a significant role in this respect.

The Congress leaders — or, to be precise, those amongst them who wanted to salvage development planning — could not have made a better choice. Here was a man of great personal integrity and detachment, well known for his concern for the common man, esteemed by the country's economists, respected by the opposition parties (particularly of the Left), acceptable to the non-Congress governments in the states, respected (and also feared to some extent) by the bureaucracy, and yet completely above party politics. He was sure to bring a great deal of prestige and dignity to the high office he was invited to accept. True, he had been a persistent, and often bitter, critic of government policies for all these years, and he had projected 'radical' views. Such a background in fact had a certain advantage in the prevailing situation. On the other hand, for all his criticism, Gadgil was not a doctrinnaire Left intellectual and certainly not a 'revolutionary'. He would work within the four corners of the established framework, and was not likely to cause uncomfortable jolts — let alone try to upset the apple-cart.

VII

Gadgil accepted the invitation and joined the Planning Commission as Deputy Chairman in September 1967. He was then 66 — in the last lap of any ordinarily active life. Although he had relinquished the directorship of the Gokhale Institute a year earlier he was still Professor Emeritus in the Institute, Vice-Chancellor of the Poona University, Member of the Rajya Sabha, Chairman of the Maharashtra State Co-operative Bank, President of the Federation of All-India State Co-operative Banks, etc. He thus had to choose between continuing in this way and assuming an altogether new and far more onerous responsibility. Why did he opt for the latter and the attendant risk that he may not be able to live up to his reputation? I think he did so out of a strong sense of duty and because of his firm faith in action. Although he had always deliberately precluded political activity from his field of operation, he was not an ivory-tower academician. For him, "a [true] man of learning was one [who matched it] with action". Here was a call for action, a call which challenged him to try and put into practice what he had been preaching all these years. It was also a call of duty: he was called upon by the situation to resurrect the public faith in development planning when the very idea of planning had become an anathema and when all the imaginable ills of the country were placed at its doorstep. There must also have been another factor to reckon with. If he spurned the offer, he must have felt, it would have amounted to exposing himself to the charge that he was an idle critic who, when the time came, refused to shoulder responsibility.

The political situation, described above, must have also weighed with Gadgil. With the loosening of the Congress hold on the country's politics and prospects of a further development in the same direction, it must have seemed that there was an opportunity for the Planning Commission to assume an independent role and greater advisory impact which he had all along visualised for it. The Commission could

now offer expert advice to the Centre and the states on the one hand, and educate the public about planning policies on the other. The very fact that he, a life-long critic of the government, was being invited to take charge of planning and was being allowed to choose his own colleagues on the Commission could be taken as sufficient indication of the feasibility of this process. True, he would be required to work with Morarji Desai who, as the Finance Minister, would be the most proximate to him from the cabinet. But Morarji's obduracy and conservatism were likely to be neutralised by the oppositional forces in the situation; on the other hand his (Morarji's) stubborn reliability might well prove an asset in pushing Gadgil's policy proposals. Such an opportunity to give a new orientation to Indian planning would not repeat — certainly not for him, because he was already on the last stretch of the long road.

Obviously, Gadgil did not think his mission would end in total failure; otherwise it is inconceivable that he would have joined. On the other hand, the realist in him must have realised that there was no chance of achieving resounding success at Delhi. A man such as Gadgil would be satisfied if the economic policies of the country under planning would start to move in the correct direction. If things did not work out in this way he was still free to give up and return to his old pursuits.

VIII

So Gadgil joined the Planning Commission. His appointment provoked a rash of bitter criticism in the so-called national Press. The Left was generally more hopeful and expectant. Many of his admirers wished him well and some, doubtful about the outcome, kept their fingers crossed. Gadgil chose his colleagues, did the initial pruning of the organisation, and sat down to take stock of the situation and to formulate the new guidelines. The guidelines appeared in May 1968, in the form of the Approach Paper which he caused to be widely discussed. He himself spoke and wrote about it to different official and non-official audiences in the country. This was followed, a year later, by the Fourth Five-Year Plan document and its revision in March 1970. By 1969, the legacy of the Asoka Mehta-Subramaniam period was mostly wiped off; agricultural production was looking up thanks to the success of hybrid varieties in wheat and two successive years of good monsoon. Now one could have expected Gadgil to push forward his policy proposals.

However, all of a sudden, a mighty political storm started to blow in altogether unexpected quarters.

From June 1969, there was a convulsive struggle within the Congress party itself. Starting from the Bangalore session of the All-India Congress Committee in June, when Indira Gandhi made her first decisive move through the election of Giri — a non-Congress candidate — as President of India, the struggle ended in a vertical split through the party by the end of the year. The majority section grouped around the Prime Minister and the old guard or the 'Syndicate' organised itself into a separate party. In the process, Morarji Desai found himself stripped of his finance portfolio and lost his dominant position at the Centre. Indira Gandhi acquired a new charisma and a halo of radicalism, which was heightened by the bank nationalisation and the emerging slogan of *garibi hatao*. In the two years after March 1967, non-Congress politics in the states had also come to a stalemate. Now, with the split in the Congress, some of the non-Congress parties — Left and Left of the Centre — helped Indira Gandhi to remain on her uneasy perch as Prime Minister. Consolidating her position in the Congress and in the country and forging a measure of understanding with some non-Congress allies, she decided to risk a mid-term dissolution of parliament and in March 1971 went to the electorate with a radical manifesto for a fresh mandate. The Congress of Indira Gandhi was returned by the electorate with a huge majority in the House, and the Syndicate Congress and other parties, which had formed the so-called 'Grand Alliance', were completely routed.

Immediately after the Congress of Indira Gandhi won its thumping majority in parliament, hopes were revived that at last the ruling circles in Delhi, unfettered by internal opposition, would adopt a radical policy-frame and regulatory measures for fulfilling their election promise of a rapid and more egalitarian economic development.

But, even before the clanging about of the electoral victory had subsided, the news arrived that Gadgil — the outstanding exponent of precisely such economic development — had been asked to resign. The sudden termination of Gadgil's services, 16 months before the stipulated term of five years, came as a rude surprise to many. Gadgil himself was taken completely unawares, and considered it a virtual dismissal. The ruling party seemed in almost indecent hurry to place its own brand of men everywhere — including in the Planning Commission.

IX

What had happened that rendered Gadgil 'unsuited' to the Indira Congress requirements? Earlier, we have summed up briefly Gadgil's achievements during his tenure in the Planning Commission relative to the high expectations aroused by his appointment. His formulations on planning at this time had, we pointed out, lost their earlier sharpness. His colleague, the late Pitambar Pant, explained this change to me as follows: After joining the Planning Commission, Gadgil found that some of his earlier criticism of planning and working of the Commission were not well-informed, but were often vague; he was a realist and believed in hard work; during his first six months at the Commission he carefully studied the many volumes by the World Bank on India; although he did not always accept their conclusions, he modified his own ideas in the light of the reports and used the analysis in concretising plan policies and proposals; in short, Gadgil accepted the parameters of the existing situation as they now appeared to him.

It is clear, however, that he did not succeed in persuading the government to accept — even in the modified version a definite policy-frame and the regulatory framework required to enforce the policy measures flowing from the policy-frame. Moreover, his planning proposals, too, often appear to lack definiteness and detailed treatment (e g, industrial policy, land reform, and employment policy). Perhaps this could be traced to a fundamental weakness in his earlier criticisms which had been concerned more with the distributional aspect of the economy than with its production aspect and its production relations. It is also possible that he did not think it worthwhile to make detailed proposals until the government had accepted and resolved to implement the broad policy-frame. But it may be surmised from the Planning Commission's refusal to approve the small-car manufacture and its rejection of the big Mithapur project that Gadgil's basic thinking had not altered substantially.

X

Gadgil's economic model had elements making for an anti-imperialist, anti-feudal, and anti-monopolist weightage in development, linked with egalitarian humanist values amounting to concern for the weaker sections of society. His view of the Indian socio-economic progress was essentially that of a moderately radical upper-middle-class intellectual who takes for granted the existing social framework of capitalist growth with State help and intervention. Progress and transition had to be achieved in conditions of economic and political stability, and at a pace consistent with that stability — by means of hard work, self-discipline, and thrift, both individual and collective. It is well known that Gadgil was full of appreciation for Japan and Japanese economic transformation. Thus his model is that of early (non-monopolist) capitalism, with its puritan ethic of frugality, and carrying with it modern ideas of social welfare adapted to Indian conditions and traditional Hindu ethic. The socio-economic transition were to be brought about in the four corners of the present framework which would be stretched out in the process especially to accommodate its humanistic aspects.

Let me clarify that this is not how Gadgil himself described his model of socio-economic transition in India. In fact, he has nowhere elaborated any well-organised statement of his concept of the Indian economic and social development. His ideas appear to be of a 'reactive' character — in that, he appears to react to specific economic and social problems rather than to deal with them as different facets of a single whole.

This, perhaps, explains why Gadgil does not use the word 'socialism' in most of his writings. He was conscious that what he was talking about was certainly not socialism. His conscious distance from active politics and political parties, must have been another reason for his scrupulous avoidance of the word which should indicate an ideological or political commitment. I suspect that this was also why his formulations — despite their seemingly radical objectives — were vague, lacked internal organisation, and betrayed a piecemeal approach. Had he set about to introduce order and organisation in their formulation they might soon have pointed to contradiction with the existing framework and landed him outside the limits of middle-class radicalism. That would have affected considerably the role in which he visualised himself: the role of an active adviser to the established order in its professed commitment to socio-economic change Perhaps if the Left forces in the country had been far more powerful and organised, it might have helped to make Gadgil's views more precise, more integrated, and more well-articulated.

XI

It is now possible to comprehend Gadgil's unceremonious departure from the Planning Commission. Basically, after the Congress had regained its erstwhile power at the Centre, and with the prospects of its doing so in the states, the ruling circles in Delhi had no use of Gadgil. There was a record harvest of foodgrains and electoral votes: the extremist forces on the Right and the Left had been curbed; the ruling circles no longer needed an 'outsider' as head of the Planning Commission. On the other hand, his detached unmanipulable presence in such a strategic position might have become troublesome. He had, in effect, served the intended purpose of saving the citadels of capitalist planning from the onslaughts of the fringe on the Right. He had now to make a hurried exit.

In any case, it is to be expected that the political party in power should prefer to have its own man as chief of its planning arm. Gadgil's model of an expert, wise, detached man of integrity with an advisory role in planning is untenable. The head of the planning effort is, after all, a politically significant position. In socialist countries, or in those under a committed Left leadership, the planning chief has to be a man of their own party, standing for rapid economic development and equally rapid socio-political transformation. In developing countries like India also, with planning essentially on capitalist lines, ruling circles must have their own man as chief of planning. It is only in the more or less stabilised politics of a developed capitalist country that a non-party person may be in charge of economic planning.

In the long run, Gadgil was clearly out of place in the emerging situation after the 1971 parliamentary election. It may be argued, however, that Indira Gandhi acted without foresight in removing him before his term was over. Subramaniam, who was brought in to succeed Gadgil in the Planning Commission had to be eased out within a year — almost as unceremoniously as Asoka Mehta was in 1967. By retaining him for his full term Indira Gandhi might have been able to demonstrate a gracious non-partisan attitude. On the other hand, that Gadgil did not foresee the possibility of his removal is just another illustration of the area of political capacity in his otherwise clear and logical thinking. It was this opacity again that at least partly explains his standing antipathy to almost everything that the National Congress, Gandhi, and Nehru had advocated or done; and his critical attitude in this respect was not always based on a reasoned valuation of their policies. Its expressive vehemence almost smacked of personal envy and animosity.

Yet, why did he not think of resigning earlier in his term of office as Vice Chairman of the Planning Commission, particularly since he was making little headway in giving a new major direction to the planning and economic policies of the country? After all, he was greatly vexed to see the sordid political infighting in the ruling party and also by the prospects of instability following the Congress split. He was also sick of the ostentation and callousness in the political and social life of Delhi. The physical comforts of that life did not hold much attraction for him. The last couple of years had also been difficult ones in his personal life: a tragic bereavement in the family, the distressing state of affairs in the Gokhale Institute, and his own heart attack in December 1969 that laid him down for four months.

It seems to me that serious thoughts about resigning could have come to him only after the preparation of the Fourth Plan. Two years in the Commission were necessary to form a fair assessment of his effectiveness in the post. And, before he completed the two years, came the split in the Congress party with the possibility of the political disequilibrium precipitating a veritable chaos. Gadgil would not have liked to contribute to this by leaving his post in the midst of a storm; he would rather stay on and make sure that at least the planning pillar remained undamaged. In the first two years his only rapport was with the Finance Minister, Morarji Desai. In the post-Morarji period, it seems he felt that the Prime Minister was well-disposed towards him and wanted him to stay on. After the winds of election began to blow in October 1970, it was inopportune to submit his resignation. If Indira Gandhi, with her radical slogans, won a stable majority, she might like to implement her promises and so to accept many of his policy prescriptions. If she did not regain stability, the same old disequilibrium would continue in which case she might lean further Leftward. In either case there were better chances of his maintaining an independent position. After the elections in which Indira Gandhi was returned to parliament with an overwhelming majority, he had evidently planned to meet her and submit fresh proposals. If these were not accepted, he had intended to resign. He did not realise that the powers that be did not need him any longer. Despite all his knowledge, erudition, wisdom, and logical thinking, he could not anticipate, and save himself from, this final mortification.

Note

[The author was greatly benefited in writing this appreciation by useful personal discussions with the late Pitambar Pant, M V Desai, Sulabha Brahme, and H K Paranjape, whose co-operation is gratefully acknowledged. The author alone is responsible for the views and opinions expressed in the article and for the errors of fact which may have crept in.]

AUDITORS' REPORT

The President of India :

1. We have audited the foregoing Balance Sheet of Canara Bank as at the 31st December 1973, and also the foregoing Profit and Loss Account of the Bank for the year ended upon that date, in which are incorporated the returns of 72 branches audited by us, and 224 branches audited by other auditors and unaudited returns in respect of 456 branches not visited by us. The branches to be audited by us and the branches to be audited by other auditors have been selected by the Bank, in accordance with the guidelines issued to the bank by the Reserve Bank of India.
2. The Balance Sheet and Profit & Loss Account have been drawn up in Forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act, as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that :
   a) In our opinion and to the best of our information and the explanations given to us and as shown by the books of the bank :
      i) The Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at the 31st December 1973;
      ii) The Profit & Loss Account read with the notes thereon shows a true balance of profit for the period covered by the Account;
   b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;
   c) The transactions of the Bank which have come to our notice have been within the powers of the Bank;
   d) The returns received from the offices and branches of the Bank have been found adequate for the purpose of our audit.

Mahindra Ugine Steel Company Limited

Statement of the Chairman, Mr Harish Mahindra

THE following is the statement of the Chairman, Mr Harish Mahindra to the Members on the occasion of the Eleventh Annual General Meeting of the Company held in Bombay on 25th June 1974:

Before I dwell upon the economic situation in general and the affairs of your Company, I would like to refer to the remarkable achievement of our Scientists in the field of Nuclear Technology. I trust you will agree with me that the nation as a whole is justifiably proud of this event. The spectacular breakthrough in technological advancement signalling the graduation from Reactor Technology to Implosion Technology is positive proof, if such were required, that the nation, with its almost inexhaustible reserves of talent, imagination and brilliance is capable of scaling any height in any field of human endeavour, provided human resources are mobilised and harnessed in a constructive manner. I feel proud in offering my heartiest felicitations to the Prime Minister and the Atomic Energy Commission.

It would be a rather staggering task to undertake to trace the tumultous developments during the past year, which have in no small measure influenced the course of the economy since we met last. Nor is it very essential to do so here. One could, however, pick some of the more far-reaching of them with either an exogenous or an endogenous influence on corporate activity and then with a certain amount of equanimity of mind and objectivity take a perspective look at them.

Industrial Production

Since the beginning of the middle of the sixties, there has been very little growth in industrial output, the rate of growth in which has been of the order of less than 4 per cent per annum against the envisaged 9 per cent during the Fourth Plan period. Over the past two years the shortages in Power and other indispensable industrial raw materials have arrested any gains in production in almost every sector of the Indian Industry. On account of the adverse developments such as the fall in the production of agricultural raw materials and the consequent sharp increase in prices, industrial production and investment are unlikely to pick up appreciably during the current year.

The levels of capacity utilisation have remained very low. What exacerbates the already complex and difficult situation is the deceleration in the production of key items with heavy backward and forward linkages with the rest of the economy such as fertilisers, coal, steel, cement, and so forth and in Power generation. Non-availability of any one of them or their insufficiency would have multiplier effects leading to a fall in production in scores of other industries. As such any attempt to boost industrial production would invariably involve the drawing up of a master plan for working these core industries to their full rated capacities.

By way of counting one's blessings one may however mention that with the decrease in the severity of the foreign exchange constraint in respect of essential imports, consequent to the aid commitment of the order of $ 1,400 million by the Consortium countries, the industrial outlook has improved for the coming months.

Licensing of Electric Furnace Units

Coming down from the macro level observation to those relating to our Industry, it is observed that there is a major policy change relating to the Electric Furnace Industry which it is appropriate to mention here by way of keeping a track of such developments referred to in my statement to you last year. This refers to the new February-1974 Licensing Policy announcement of the Government which requires the hitherto Registered Electric Furnace units, irrespective of the investments therein, to obtain COB Licences. This new stipulation requiring the obtaining of industrial licence is welcome in more ways than one. Firstly, there has been a disorderly proliferation of such units all over the country and as such the Electric Furnace Industry has been rendered an over-crowded area of endeavour with the demand for all essential inputs far outstripping the supplies, particularly, of Power, ferrous scrap, graphite electrodes and so forth. As a result supplies are very problematic and their prices keep climbing to dizzier levels. While there can be little doubt as to the compelling need to expand indigenous steel capacity and displace imports to the maximum extent possible, this should not however lead to creation of such capacities without a due and careful study of the availability of all essential inputs.

Crises in Input Supplies

Since the 9th Annual Report of 1971, it has become almost conventional to draw attention to the ever deteriorating input supply situation. The only difference happens to be in the magnitude of such shortages which tend sometimes to assume serious proportions. There is a dual aspect to the input crisis, viz, the substantial shortages and secondly the upward pressure on the prices which have kept spiralling. This is particularly so in respect of scrap, fuel oil and graphite electrodes, though the increases in prices of other inputs, sharp as they are, nevertheless are relatively modest in comparison.

The Industry has come some distance in quantifying the supplies and the demand for scrap as well as graphite electrodes. The quantity that would have to be made available both through indigenous production and from abroad has also been clearly indicated by the Industry to the Government. In respect of scrap, though the Industry made a determined bid to arrange for imports through Agencies solely authorised to import it, it is disappointing that no imports have so far materialised even after a lapse of more than 20 months from the time the proposal was mooted. It has yet to be appreciated that bureaucratic practices in commercial organisations even in the best of times fail to achieve the desirable results. This fact acquires added significance in world trade in an item such as scrap or electrodes. Thanks to the wide gap between their supplies and the expanding global demand, in fact there is a virtual world-wide scramble for them. Needless therefore to underline that the deals and transactions are put through with lightning speed instead of shuttling papers from one department or agency to another. The entire plan for imports of these indispensable inputs may fail miserably thereby sharply accentuating what is already a very tight supply situation unless our ways of trading are mended and streamlined.

Even at the risk of being rather trite, it needs to be underlined that in respect of graphite electrodes every attempt should be made to maximise indigenous production. Also speedy creation of additional capacities is urgently called for. It is, no doubt, a matter of concern for the Industry as a whole that the requirements of electrodes are running far ahead of supplies, both indigenous as well as imports. If instead of Power, or any other input, electrode shortages constrict capacity utilisation in the Industry, the immediate loss in production therefrom and the consequential impact thereof on the economy can be easily realised.

At a time when units in the country depend upon such imports, partially or even completely, for their requirements and units are faced with a hand-to-mouth raw materials position with the buffer stocks almost fully depleted, there is an overwhelming need to reconsider the very question of canalisation through State trading organisations. In this connection, two suggestions can be made. First, either the imports of at least key items may be partially or wholly decanalised. By partial decanalisation I mean that a particular production unit may be allowed to import only the first 6 months requirements or in an emergency situation and the regular imports of such items may be continued to be canalised through a State trader. Alternatively, the Government may also consider arranging for imports of such items through Export Houses, which are by and large reputed for their swift trading practices.

Power

In respect of Power, it has become almost ritualistic to refer to the very unhappy situation everywhere in the country with the possible exception of a few States such as Kerala, Himachal Pradesh, Rajasthan and Orissa. Faulty Power planning, neglect of maintenance of Power generation equipment, heavy transmission losses in the range of 20 to 30 per cent as against the normal 6 to 7 per cent in most other countries and so forth are a familiar ground and I see no point in traversing the same.

Though by and large the Power supply situation is not very worrisome for us in Maharashtra, however, on account of the erratic functioning of the Tarapur Power Plant and the shutdown of the Nasik Thermal Plant, the Government had to impose certain restrictions on maximum demand.

Recently, the Government has accepted the proposal of experts that the functions of the Central Electricity Authority should be reconstituted, so that it may expeditiously execute the Power projects which otherwise normally languish. Simultaneously, it is proposed to revamp the working of the State Electricity Boards so that there is a more efficient and streamlined working of such Boards. There is also scope in this new arrangement for the Central Water and Power Commission to play its role as a technical and design consultant. Hopefully these organisational changes would considerably improve Power management in the country.

Power engineers in this country have also applied their mind to the Planning of new Power generation capacities as well as to the efficient operation of existing facilities. The recommendations in respect of the operation of generation and transmission equipment such as establishment of fully integrated regional grids, augmenting inter-regional ties for purposes of creation of a national grid, establishment of regional load despatch centres, avoiding remote tripping of loads, permitting captive plants, promoting total energy concepts, introducing efficient standards for equipment, ensuring higher investment on transmission and distribution as well as adopting higher voltages for preventing system losses and voltage fluctuations and so forth must be implemented without further deliberation on account of the basic soundness of these proposals.

In respect of allocation of new capacities, on account of the concentration of coal deposits mainly in and around Eastern and Central India, Hydro-Electric Power generation capacity should be established on a priority basis in other regions of the country. The present generation capacity of the order of about 18 million KW is chronically inadequate for the country's requirements of about 25 million KW. In Plan after Plan, there have been serious shortfalls in attaining the targets as for instance 15.4 per cent in the First Plan, 35.7 per cent in the Second Plan, 35.8 per cent in the Third Plan, 24.1 per cent in the three Annual Plans and a spanking 54 per cent in the Fourth Plan. During the 5th Plan period it is planned to allocate Rs 6,190 crores enabling the establishment of an additional 16.55 million KW of new capacity so that a generation capacity of 33 million KW may be reached, after taking into account capacity in obsolete plants which has to be made good. As an indispensable infrastructure facility and in our case as one of the essential inputs, apart from being a prime mover of production facilities, it would be rather superfluous to exaggerate the over-riding importance of attaining this target in terms of generation capacity if there has to be any meaning and substance in the Plant for overall economic development.

Expansion

I had reported to you last year that we would be able to spell out the details of the Expansion Scheme in the next report of the Directors. Accordingly, the Directors' Report for 1973 has briefly listed some of the effective steps that have been taken towards implementation of the Expansion Scheme. I would like to merely supplement these remarks.

Your Company's formal communication to the Government for conversion of the Letter of Intent into an Industrial Licence was sent in November 1973 after making an appreciable progress in preparing the ground for conversion of the Letter of Intent issued in April last year, which was subsequently amended in September. Every effort was and is being put forth to satisfy the Government's preconditions for the issuance of the Licence. The first relates to the clearance of the import of Plant and Equipment by the Capital Goods Committee. Our application for import of Capital Plant and Equipment has been scrutinised and we expect the formal clearance very shortly. The second precondition relates to the finalisation of the terms of financial assistance by the International Finance Corporation, and the Industrial Credit and Investment Corporation of India. After the Government authorised us to explore the possibilities of obtaining financial assistance from IFC(W), early this month a team from this institution visited us for making an appraisal of our Expansion Scheme. We expect a favourable decision from IFC(W)/ICICI by September this year. A third effective step relates to the execution of the Supplementary Collaboration Agreements duly approved by the Government.

With a view to speed up the Civil construction work the Company had sent its senior design staff to the Ugine Plant in France to enable them to finalise the Shop Layouts and other basic engineering data by July 1974. As such the actual work of civil construction is expected to start by the end of the year. It is a matter of gratification that the Maharashtra Electricity Board

has readily come forward to meet our increased Power requirements. A formal sanction to this effect has also been obtained from the Government in April this year. In respect of water, the Company's Plant is assured of supplies of the necessary additional cusecs from the trail-race of the Tata Hydro-Power Station. Simultaneous action in respect of each one of these items is being taken expeditiously, so that the execution of the entire Expansion Scheme may be completed and commercial operations may be commenced by the beginning of the second quarter of 1977.

Amalgamation

A very closely connected subject of considerable significance to your Company, which incidentally is also the happiest event of the year, is the Scheme of Amalgamation of The Bank of Baroda Ltd, with your Company. The Scheme is scheduled to take effect from 1st July, 1974. Even if there should be any delay in obtaining the necessary approval of the Controller of Capital Issues, the Scheme would be operative with retrospective effect from 1st July, 1974. You would appreciate that by any measure an amount of Rs 8 crores which your Company would be further endowed with by virtue of the Amalgamation, is fairly large an addition to the readily available funds of your Company. This would enable us to go ahead with the Expansion Scheme and complete it on a crash basis.

Outlook for 1974

From the Directors' Report you would have seen that during 1973, your Company was able to implement a balancing scheme and thereby ensure a fuller utilisation of the rated capacity in most of the key production departments of the Company's integrated Plant. In this report, the Directors have already reported that the performance during 1974 is likely to be of the same order as during 1973. However, it is worth keeping in mind the squeeze on the profit margins on account of the extraordinary price rises in respect of inputs to which I have referred earlier.

In the first five months of the current year, Sales stand at a level of Rs 538.73 lakhs as against Rs 403.04 lakhs and Rs 427.96 lakhs in the corresponding periods of 1973 and 1972 respectively. This 33.6 per cent increase in Sales realisation, however, reflects the inflation in the prices of essential inputs.

Directors

The Members of the Board deeply regret the passing away of Mr Aloke K Mitra on 4th April, 1974. Late A K Mitra was on the Board of Directors of the Company since its very inception and the Board had the benefit of his wisdom and guidance during his tenure of office as Director till 17th May, 1973 on which date he had resigned due to ill health.

Mr S Bhoothalingam joined the Board of Directors on 29th April 1974 and I am sure that the Board will greatly benefit by his experience in the Government and the Steel Industry in particular.

Before I conclude, I would like to place on record our sincere appreciation of the dedicated work put in by all the employees, without which it would not have been possible for the Company to achieve the satisfactory results. Close co-operation which we have been able to develop with our Collaborators, Ugine Aciers, particularly in respect of resolving technical problems, has also contributed in no small measure to the continuing success of your Company.

Note: This does not purport to be the record of the proceedings of the Eleventh Annual General Meeting of the Company.

The Madras Aluminium Company Limited

'Jayalakshmi'

Race Course, Coimbatore-18

Statement by the Managing Director, Shri R Venkataswamy Naidu

THE following is the address to the Members of the Company delivered by Shri R Venkataswamy Naidu, Managing Director at the 14th Annual General Meeting of The Madras Aluminium Company Limited held at "Shanmuga Manram", Race Course, Coimbatore-18 on Wednesday, the 26th June 1974.

With pleasure I welcome you all to the 14th Annual General Meeting of the Company.

Before we start the proceedings of this meeting, I would like to refer to the sad demise of Shri T T Krishnamachari, former Minister for Finance and Commerce and Industry, of the Government of India. While his services to the nation in various fields are widely known, I would like to refer to the personal interest he took in the formation of this Company. I may even add that, but for his initiative this Company could not have come into existence. I request the members to observe a minute's silence as a mark of respect to the departed leader.

Crucial Year

I presume that members would have studied the Profit and Loss Account, Balance Sheet and Auditors' Report, which have been with you for sometime past. The year 1973 was crucial to our Company in view of the adverse factors we had to face. From the month of February to the end of July, for an approximate period of six months, our plant was almost completely shutdown due to the power cut. During this period, our loss of production was to the extent of 5,500 tonnes, which has considerably reduced our profitability. Moreover, for starting up of the stopped pots after the power cut was lifted, we had to incur heavy expenditure towards cost of start up and lining materials. This had increased our expenditure and with great difficulty we managed to equalise the burden of expenditure without any outflow of funds from the Company. In our expansion programme we have envisaged the ploughing in of cash generation of our Company for meeting capital expenditure to the extent of Rs 6 crores approximately. On account of unforeseen circumstances mentioned above the Company's cash generation was severely affected and we had to resort to acceptance of deposits from the public and also arrange for postponement of repayments of debts to financial institutions so as to avoid financial strain for the Company. I am glad to inform you that our company has started gaining cash generation fast and is in a sound position financially now. Considering the hurdles that we had to face in 1973, I consider the results achieved as satisfactory even though we could not absorb the Depreciation for the year. I think members will appreciate the difficulties through which our company has passed during the year 1973 and reconcile with the decision of your Board to skip the dividends for the year 1973 also.

Production Loss

I have been assuring members about the potential profit making ability of our Company in view of the importance that the aluminium metal enjoys in world economy. Even during the year 1972, we were ready to put in line our first stage of expansion, but on account of difficult power supply conditions we had to postpone it for an year approximately. In the year 1973, since the lifting of the power cut, we could energise only 40 per cent of new pots on account of non-availability of sufficient power. Unfortunately, again from the month of October 1973, a power cut was imposed and subsequently from April and May 1974 further power cuts have been imposed curtailing our production. Hence, we have to incur production loss this year also of which a fair estimate cannot now be made. Subject to availability of power, we have programmed to commission all the new pots by the end of 1974 to raise our production capacity to 25,000 tonnes of primary metal and we hope it will be possible for us to do so, since power cut is likely to be lifted in stages as monsoon advances and hydel generation is stepped up.

I had referred in my previous report to the successful breakthrough we had made in the manufacture of rolled products by continuous casting process and anticipated that we will be in a position to market finished products before the end of 1973. Our hopes have not come true because of the critical power position which forced us to reduce our production to nearly 50 per cent of our original capacity. We hope that with better power position in 1974, we will be able to continue our efforts in that direction.

I am glad to inform you that Government of India have now revised the prices of aluminium products increasing the selling prices by about Rs 1,090 per M/T. We have been representing to the Government of India for a revision of prices of aluminium products, which was fixed on the basis of cost of production of 1969-70. Prices of all materials were increasing every year and recently, because of the change in the policy of the oil producing countries, prices of some of our essential raw materials had doubled. The present increase in price granted by the Government of India does not fully compensate for the increase in cost compared to the cost of production of 1970.

Good Demand

The Central Government has also notified us of its decision to control distribution of commercial grade aluminium. During the past few months, there had been a scarcity for aluminium in the market and the small scale industries had to suffer on account of non-availability of sufficient raw material for their production. It is only after Malco's development, there has been tremendous increase of Small Scale Units in our State utilising aluminimum. There are nearly 500 licencees in the small scale sector in the State depending upon commercial grade aluminium for their production. Since distribution of commercial grade aluminium was not in control before, we were able to ration our production of commercial grade ingots to a large number of industries in our State and avoid dislocation of production of their units to certain extent. With the control now introduced for the commercial grade aluminium also, I do not know whether we will be in a position to help small scale units in our State. We propose to represent to the Government of India to allow us some freedom in the matter of distribution of commercial grade aluminium metal, so as to enable us to meet to some extent the requirements of small scale sector of our State.

The demand for aluminium metal in the international market got a sudden boost on account of general fall in production due to power cuts. This gap between production and demand is responsible for the general scarcity felt in the Indian Market also. There is a good demand for some of our intermediary products.

The inflationary trend in our country's economy continues in spite of serious efforts by the Central as well as State Governments to saddle and control it. Though this sorry phenomenon is perhaps attributable to the slackness in agricultural and industrial production combined with irregular distribution, as some economists would have it, I am inclined to believe that it is largely due to the adverse global inflationary conditions consequent to the oil crisis in general and to the unfortunate drought conditions affecting agriculture and causing power crisis in our country in particular. I hope conditions would improve and become more cheerful.

The year 1974 will be remembered by every Indian with great gratification and will be marked in the history of our country for one of the greatest achievements we have made. India has now emerged out as the sixth atomic power by successfully blasting an atomic device under the ground. We can confidently look forward to a future when atomic power will solve our problem of fuel shortage and help us to gear up our economy for a faster growth. It has further established the fact that talent in the country is not lacking and given opportunities the problems facing our country are not difficult to solve within a reasonably short period of time.

Loyal Service

Before concluding my speech, I would like to assure you that the financial stability and profit potentiality of our Company is unquestionable and members can anticipate better years ahead when our company will move from strength to strength. I take this opportunity to thank Government of India, Government of Tamil Nadu, our Collaborators, M/s Mediobanca of Italy, Government financial institutions and our Bankers, M/s Indian Bank, for their continued co-operation and for the help rendered to us. I also wish to pay tribute to our employees at all levels for their loyal service.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

SUNDARAM FINANCE LIMITED
Mount Road, Madras 600 006

Speech of the Chairman, Shri T S Santhanam

THE following is the Speech of Shri T S Santhanam, Chairman, Sundaram Finance Limited, at the Twentieth Annual General Meeting of the Company held on June 21, 1974 at Madras:

FRIENDS:

It gives me great pleasure to welcome you to the 20th Annual General Meeting of your Company. The Directors' Report, the Audited Balance Sheet and the Profit and Loss Account have been circulated to you and with your permission. I shall take them as read.

ECONOMIC CONDITIONS

As all of you know, inflation is the most serious problem affecting the Indian economy today. It began to assure grave proportions during 1973, and if the experience of the first 5 months of 1974 is a guide, it threatens to become even graver in the months to come. The index of wholesale prices rose by 26 per cent in 1973: upto the end of May 1974 the rise was 14 per cent. Stringent credit curbs imposed by the Reserve Bank in November 1973 were an inevitable result. The entire industrial sector, of which the road transport industry is a part, is in the throes of adjusting itself to the rigours of this situation.

The selling prices of commercial vehicles have gone up by 15 to 20 per cent in the last 12 months. Steep rises in the price of tyres and spare parts have added to operating costs. The even steeper rise in the price of petroleum products, brought about by concerted action on the part of the oil producing countries, has had a tremendous and direct impact on this industry.

Nevertheless, all indications are that road transport will maintain its share, may even be required to bear a greater share, in the transport needs of the country as a whole.

The need to contain and bring down prices of basic necessities, especially of food, clothing and transportation is of the first importance.

WORKING RESULTS 1973

As indicated by me in my speech at the last Annual General Meeting, our business picked up during the later part of 1973. The amount advanced on hire purchase contracts during 1973 stood at Rs 842.77 lakhs as against Rs 512.64 lakhs for 1972. The stock-on-hire representing the total outstanding amounts under hire purchase agreements was Rs 1,137.19 lakhs on 31-12-1973 as against Rs 986.42 lakhs on 31-12-72. However, the earnings under the hire purchase transaction for the year 1973 were lower at Rs 155.36 lakhs as against the sum of Rs 169.06 lakhs for the year 1972. This was due to the lower turn-over in 1972 and the fact that the improvement in advances in 1973 became marked only in the last quarter.

DEPOSITS

As members are aware, the Company stopped accepting fresh deposits in May 1972. Largely, as a result of this, the total deposits which stood at Rs 835.12 lakhs in the beginning of January 1973 came down to Rs 705.85 lakhs at the end of the year. Consequent on the upward trend of our business during the last quarter of 1973, the Company resumed acceptance of deposits with effect from 1-1-1974. I am happy to say that the response from the public has so far been gratifying.

HIRE PURCHASE ACT

It was notified in June 1973 that the Hire Purchase Act would come into force with effect from 1st September, 1973. However, it was later announced that the said notification stood rescinded.

PROSPECTS

There was a marked improvement in the business in the first 5 months of 1974 as compared to the corresponding period in 1973. The advances during this period were Rs 546.07 lakhs as against Rs 186.22 lakhs in 1973. The stock-on-hire as on 31-5-1974 exceeded Rs 1,400 lakhs.

The operational expenses of the Company are rising on account of the higher cost of borrowing and the increase in administrative expenses. The stringency in the money market is likely to continue for some more time. However, with the efforts your Directors have made for greater mobilisation of funds, they are hopeful that the favourable trend in the Company's business will be maintained during the rest of the year.

DIRECTOR

Shri T A Thiruvenkatachari retired as Deputy Managing Director of the Company on the expiry of his term of appointment on 31-12-1973. He has agreed to stay on as a Director of the Company and so, we will continue to have the advantage of his experience.

I would like to place on record our appreciation of the valuable services rendered by Shri T A Thiruvenkatachari, during his tenure of office as Deputy Managing Director.

ACKNOWLEDGEMENT

On behalf of the Board of Directors and myself, I wish to express my appreciation of the good work done by the administrative as well as the field staff of the Company. I also express my thanks on behalf of your Company to all the depositors and customers for their continued support.

Finally, I thank all the members present, for having found the time to attend the meeting.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Blue Star Limited

Speech of the Chairman, Shri B T Advani

THE following is the speech of Shri B T Advani, Chairman, Blue Star Limited, at the Twenty-fifth Annual General Meeting of the Company held on June 26, 1974:

LADIES AND GENTLEMEN:

It gives me great pleasure to welcome you to the 25th Annual General Meeting of the Company.

The Directors' Report and the Audited Accounts for the year ended December 31, 1973, were sent to you some time ago, and with your permission, I propose to take these as read.

Mr Mohan T Advani: This is the first occasion when I am addressing you as Chairman of the Company. I am sure you will understand my mixed feelings today. While I am grateful to my colleagues and to all of you for electing me to this high position, I miss the presence of our Founder Chairman, Mr Mohan T Advani who passed away suddenly on February 14 this year. What the Company is today is largely because of his pioneering vision and inspiring leadership. His untimely demise has left a great void in all our lives, a void which will be very difficult to fill. We can pay no finer tribute to his memory than to re-dedicate ourselves to the ideals for which he stood: integrity, hard work and a genuine concern for the betterment of our fellowmen. As a mark of respect for our Founder, I would request you all to stand up and observe a two-minute silence.

Performance: The year 1973 saw a substantial increase in our business with both income and profit showing a healthy growth. The Directors have recommended maintenance of the dividend rate at 15 per cent and the net addition of more than Rs 13 lakhs to the reserves. With business continuing to expand rapidly, we will need these additional funds to consolidate our financial position.

Five Years As A Public Limited Company: This is the fifth Annual General Meeting since this Company was converted into a Public Limited Company and this is perhaps a suitable occasion to review the progress we have made during this period. I think you can all feel justifiably proud of our performance. During these four years total income has grown from Rs 7.05 crores to Rs 17.24 crores, an increase of 145 per cent. This is equivalent to a compounded growth rate of more than 25 per cent per annum. Profit after taxes shows an equally healthy growth from Rs 8.58 lakhs to Rs 24.42 lakhs, while the capital employed has gone up from Rs 188.96 lakhs to Rs 270.16 lakhs.

The impetus for our rapid growth has been provided by a policy of diversification, which has been achieved by expanding the geographical coverage of our markets and by adding new product lines. Some of the highlights of this period have been the addition of a new range of sophisticated machine tools, advanced electronic equipment covering the fields of medical electronics, data processing, communications, test and measuring equipment as well as such diverse products as weighing machines, specialised controls and pumps.

Shri B T Advani

New branch offices have been established in Cochin, Bangalore and Ahmedabad while our dealer network now covers virtually the entire country. This expanded coverage enables us to offer more efficient sales and technical support to our customers.

Our manufacturing capacity has also grown impressively and we have introduced a wider range of bottle coolers, water coolers, deep freezers as well as heat exchangers, air handling units, and other heavy equipment for our Project Engineering Division. The emphasis in our manufacturing programme continues to be on quality, reliability and reasonable cost.

In the field of exports, we have continued to perform quite creditably as can be seen from the awards received by your Company from the Engineering Export Promotion Council for outstanding export performance in the last three years in succession. We have also pioneered the export of technical know-how for the manufacture of water coolers in Kuwait and have earned valuable foreign exchange from the sale of our knowhow and from the royalties we have received. We have also met with great success in our move towards obtaining turn-key contracts for air conditioning and refrigeration plants outside India and have secured several prestigious contracts from Malaysia, Thailand, Sudan and Mauritius.

Future Prospects: I wish I could speak with some confidence about the next five years. Unfortunately our country is going through a very difficult period and our economy is stagnating. Spiralling prices, acute shortages and power crises have led to large scale industrial unrest. Unless the Government can control this galloping inflation, our fifth Five-Year Plan will collapse even before it gets started. What we need at this juncture is not catchy slogans and pious resolutions, but the will and determination to work hard. I hope our leaders will show imagination and initiative to inspire the people to rise to the occasion and pull the country out of this economic quagmire.

So far as the current year is concerned, the operations of your Company have been satisfactory. The total income for the first five months amounts to Rs 7.21 crores as against Rs 5.88 crores during the same period in 1973. However, due to a steep rise in the cost of raw materials and components, our salary and wage bills and all other expenses, it is doubtful if the increase in profit will match the growth in income. Your Directors are keeping a careful watch on all controllable items of expense and are trying to maximise the use of resources available to us. However, if the inflationary conditions are not brought under control, it may become necessary for us to consider later in the year, a rights issue in order to augment the Company's cash resources to meet the requirements of Working Capital.

Our Thanks: I shall be failing in my duty if I did not express my gratitude to my colleagues on the Board and our team of senior executives for their en-

lightened guidance in managing the affairs of the Company. I must also express my appreciation and gratitude to the employees of the Company at all levels for their loyalty and devotion to duty, even under the trying conditions through which the country is passing. Without their co-operation our achievements would have been impossible. I am confident that the good industrial relations that exist in your Company will enable us to move ahead.

I now propose that the Audited Statement of Accounts and Directors' Report be adopted and passed.

Anglo French Textiles Limited

Statement of the Chairman, Shri T S Krishna

THE following is the Statement circulated to the Shareholders of Anglo French Textiles Limited by the Chairman Shri T S Krishna:

The year 1973 turned out to be a satisfactory year for the cotton textile mill industry, despite the fact that cotton production in 1972-73 fell sharply to 62.7 lakh bales from the bumper crop of 73.5 lakh bales realised in the preceding year 1971-72. The stock position of Indian cotton at the commencement of the 1972-73 season was, however, larger at 24.5 lakh bales as compared to 13.5 lakh bales at the commencement of the 1971-72 season. Production of cotton yarn during the year stood at 987 million kgs as against 972 million kgs in 1972 but the production of cloth by the mill sector declined from 4,245 million metres in 1972 to 4,153 million metres in 1973 mainly due to constraints in power supply. Exports of cotton textiles during 1973 reached an all time high of Rs 195 crores as against Rs 150 crores during 1972. Cotton piece-goods accounted for Rs 121 crores being the value of 572 million square metres as against 430 million square metres valued at Rs 81 crores in the preceding year.

So far as your Company was concerned, production, sales and profitability in 1973 were the best achieved so far in the Company's history. Production during the year compare favourably with that of the preceding four years as shown in the Table.

As a result of the continuous endeavours to promote export of its production, the Company achieved significant results in its export targets, making it the second largest manufacturer-exporter of cotton textiles in India.

Domestic sales which were maintained at the previous year's level accounted for 24.3 million metres (1972: 24.2 million metres) constituting over 55 per cent of the total sales. Exmill value of domestic sales increased during the year to Rs 755 lakhs as against Rs 612 lakhs in 1972.

Despite the gratifying results achieved during the year, your Directors have considered it prudent to maintain the equity dividend at the same rate as last year, namely Rs 15 per share. Your Directors have drawn up plans for the addition of 12,400 spindles, and 72 heavy duty looms at an estimated cost of Rs 401 lakhs. The new factory buildings are coming up rapidly, and it is expected that about 6,000 spindles will go into production before the end of 1974. Along with the above scheme your Directors will have to undertake replacement of a sizeable part of the ageing machinery. The need for generating internal resources is, therefore, of paramount importance. It is in this context that I commend your Directors' policy of maintaining the equity dividend at 15 per cent, though I appreciate that the Company's efforts towards consolidation and greater security are vitiated to a large extent by rapid increase in the cost of labour in the form of steadily increasing quantum of dearness allowance and bonus. This is further aggravated by the reluctance of labour to accept rationalisation of workloads which is essential for the well being of the Company and will contribute to better utilisation of machinery and increased production.

As for the prospects for the current year, there are a number of disturbing factors which make these prospects rather disquieting. Shortage of raw cotton, high costs of inputs, partly outdated machinery, low productivity, labour unrest and the credit squeeze are some of the problems now faced by the Indian cotton textile mill industry. Cotton shortage has plagued the industry for many years. Today, the gap between demand and supply has widened to over a million bales. The industry obtained some relief in 1972 following a bumper crop of over seventy lakh bales in the 1971-72 season. But cotton production declined in 1972-73 to sixty-two lakh bales and still further in 1973-74 to about sixty lakh bales with the result that the prices of indigenous cotton started rising and are now at an all time high. The activities of the Cotton Corporation of India which has for its objects the ensuring of a remunerative price to the growers and stabilising of cotton prices for the industry have not been very helpful to the industry. Its ill timed purchases far above ruling prices resulted in giving a further push to rising cotton prices. The industry has also been called upon to increase its socio-economic responsibility by contributing from 1st April 1974 about 24 per cent of its production in controlled varieties of cloth at prices far below cost of manufacture. In terms of quantity, this would represent about 800 million square metres for the industry. Any shortfall in the fulfilment of this obligation would have to be made good by the defaulting mills at the rate of Rs 2.50 per square metre. Thus, your

TABLE

		1969	1970	1971	1972	1973
Yarn	: Million Kg.	7.2	7.3	8.1	7.8	8.8
	Average Count	16.3	16.1	15.9	15.2	14.6
Cloth	: Million Metres	35.6	37.8	44.9	43.3	46.1
	Million Kg.	6.2	7.3	8.7	9.2	10.4

The f o b value of the Company's exports during the year scaled new heights as the following figures show:

	Rupees (Lakhs)				
	1969	1970	1971	1972	1973
Yarn :	32	11	—	—	—
Cloth:	310	258	477	460	710
Total	342	269	477	460	710

Company has an obligation to produce about 8 million square metres of controlled varieties of cloth during the nine months of 1974. It is however expected that rebate earned through exports would to some extent mitigate the harsh impact of this obligation on the Company's trading results for the ensuing year.

Labour relations since the beginning of the year have deteriorated largely due to inter-union rivalry. The settlement of a strike which lasted for 23 days in February/March 1974 has increased the Company's wage bill by over ten per cent without any corresponding increase in labour productivity. Unrelenting inflation has been exerting its pressure on all inputs particularly raw cotton, wages, dyes and chemicals, stores, machinery spares, etc. Power supply too has become uncertain. All these factors have combined to increase the cost of manufacture which apart from producing a debilitating effect on the industry will inevitably reduce the competitiveness of cotton fabrics of Indian manufacture in the overseas markets where Indian fabrics are already facing a fierce competition from other exporting countries.

The year under review has been a very successful year for your Company, and I should like to pay a tribute to my colleagues on the Board and to the staff and the employees for the co-operation and good work done by them. I must also compliment Messrs AFTCO Products (Textiles) Limited for continuing to handle the Company's products in the UK with their wonted efficiency.

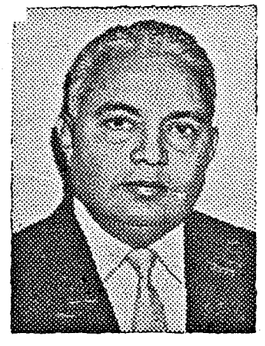
Alembic Chemical Works Company Limited

Baroda

Speech of the Chairman, Shri R B Amin

"PRICE CONTROL IS REGRESSIVE"
"GIVE MORE TO SOCIETY THAN WHAT YOU RECEIVE"

THE following is the Speech of Shri R B Amin, Chairman, Board of Directors, Alembic Chemical Works Company Limited, Baroda, at the Sixty-seventh Annual General Meeting of the Company held on June 27, 1974:



LADIES AND GENTLEMEN,

I have pleasure in welcoming you all to the 67th Annual General Meeting of the Company.

I have to report, with profound regret, the death of our Director Dr Mangaldas J Shah in October last year. I am sure you would all like to put on record our appreciation of his services as a member of the Board since 1947 when he first joined it.

The Accounts for the year ended 31st December, 1973 and the Directors' Report have been circulated to you and, with your permission, I shall take them as read. The increase in sales, as is seen from the Profit and Loss Account, is about Rs 1.30 crores. However, the sale of agro-chemical products after March 1, 1973 are included in the Account of Paushak Limited. If we take the sales of products other than agro-chemical items, the increase in sales in 1973 over 1972 is of the order of Rs 2.42 crores, which is a creditable achievement in the context of the fact that the selling prices have been pegged at 1970 levels by the Drugs (Price Control) Order.

All significant components of costs have been going up at an unprecedented rate. Prices of raw materials and packaging materials have gone up sharply; in a number of items the rise is as much as 200 to 300 per cent. The steep rise in cost of living has led to higher dearness allowances, an increase of 26 per cent during 1973,

Shri R B Amin

and a correspondingly higher wages and salaries bill and other charges on account of provident fund, etc. Interest charges have gone up for normal borrowings and are very high for requirements outside the limits of the credit squeeze imposed on industry. Compounded with higher costs of inputs and services are shortages, which cost your Company heavily in terms of interruptions in production schedules, disruption in supplies and inevitable adverse effects on profitability.

Pharmaceuticals are a priority industry but there is not much evidence that its problems are being understood by government, leave alone help being extended in solving these problems. The industry is tied to a price control which is as outmoded and unfair in its orientation as it is narrow and slow in its implementation. The working of Price Control refuses to include within its purview, changes in important cost components, particularly in conversion and packaging, which escalate the production costs of our goods. Even in those items which are taken into consideration, adequate allowance is not made for the full extent of the increase in the prices of materials and services. The process and procedure of price fixation and price revision also are time consuming. Costs go up continuously and considerably, making the prices and revisions thereof unrealistic and unprofitable even before the day they become effective.

Government Price Control, as it is operated now, is pushing the industry into an untenable position wherein it is unable to continue production of many items because of unrealistic fixation of prices. Due to the relent-

less squeeze on profits, ploughing back is becoming impossible. Further, because of the low and declining rate of return, the pharmaceutical industry will find it increasingly difficult to attract and draw upon equity as a source of capital. Under the existing interest rate structure, ordinary deposits are more remunerative than the risk capital invested in pharmaceuticals. Thus, price control has led the pharmaceutical industry into a critical situation. If government want the pharmaceutical industry to play its proper role, it must be allowed to adjust its prices to rising costs so that it can reach greater viability and larger production and provide more new drugs and medicines to our people. There is enough competition in the industry to ensure a fair deal to the users of medicine; and the tax structure is such as to be able to mop up excessive profits.

The way this industry and its affairs have so far been dealt with by government has led to its steadily running down towards stagnancy and regression. The symptoms of this damage are already evident in cutbacks in production and shortage of many items in the market. As these phenomena gather momentum, there will be no easy options to satisfy the consumer. Imports are already very difficult and new capacities cannot be set up in this atmosphere. Lasting damage is being done to an industry which is basic to the health and well being of our people. The number of formulations runs into thousands and no bureaucratic agency can cope adequately with it. So current production gets bogged down and new formulations get held up. People are denied newer and more effective medicines as a result. It is necessary, therefore, to end the present regime of Drugs Price Control which is based on confused objectives and which is humanly impossible to administer fairly.

Freedom of operation alone can increase the quantum, quality and variety of production, maintain adequate availability at reasonable prices and ensure enough alternatives for the user. Decontrol and decentralisation have to be adopted all along the line but they are inescapable and particularly urgent for a fast moving industry like pharmaceuticals. Government must act immediately and remove Price Control in the interests of adequate production and supply of pharmaceuticals in our country.

Another year of massive inflation has gone by. Taking the week ending 4th May, 1974, the wholesale price index was 290.9, 27.2 per cent higher than the level during the corresponding week last year and 50 per cent higher than the index for May, 1972. And all indications point to a further advance in prices of another 20 to 25 per cent during 1974-1975. So, in three years, the rupee will have shrunk in its purchasing power to 50 paise. No economy, however sound, can take a stock of this dimension without grave repercussions.

To recover from all this, we also need a big change in our personal attitudes, policies and actions everywhere. Our society and individuals in it are overpowered by the desire to take as much as possible for themselves and to give back as little as possible in return. This is leading to less effort, less production, less productivity and less progress. This can only result in economic insolvency and social chaos. This desire dominates all of us; it is high time we become aware of it and get over it. We should learn to give a little more to society than what we receive from society. This way of life will give stability and strength to our society. It will also impart dignity and meaning to our lives. Let us realise this truth, understand it and adopt it.

Before I close, allow me to put on record my appreciation of the wholehearted co-operation I have received from my colleagues on the Board as well as the Officers and employees of the Company during the past year.

I now recommend the Annual Accounts and the Directors' Report for consideration.

Note: This does not purport to be a record of the proceedings of the annual general meeting.

Black Smiths, Cobblers, Potters, Carpenters etc. constitute weaker sections of rural community. To help them secure gainful employment and improve their standard of living co-operative banks render financial assistance for working capital, improved tools and equipments. Guidance in technical and marketing matters is also provided by the State and District Central Co-operative Banks.
