It is interesting to take a look at some of the projections, circulating in the West, about the extent of surplus oil funds. According to World Bank President McNamara, the increase in foreign exchange reserves and external investments of the oil exporting countries, excluding Indonisia and Nigeria, would be from $ 24 billion at the end of 1974 to $ 624 billion at the end of 1980. He projected the foreign investment income of these countries to increase from $ 2 billion in 1973 to $ 40 billion in 1980. Such projections assume, unrealistically, that the current account surplus of the major oil-exporting countries, estimated at $ 65 billion in 1974, will further increase in the coming years upto 1980; also, that the rest of the world will not try to readjust its payments position but would try to somehow finance its ever-increasing deficits through larger borrowings. The OECD estimates that the oil exporters' cumulative surplus would increase to $ 553 billion if the price of oil falls to $ 7.2 per barrel or to $ 741 billion if it remains unchanged. These estimates are as unrealistic as the World Bank President's. The world political system is unlikely to accept such massive surpluses in the hands of a few, otherwise economically and militarily weak, oil-exporters. Thus behind the apparently technical debate over 'recycling' there lies a political tussle, with the developed Western countries resisting the new-found power of the oil-exporters.

Maharashtra

Shifting Deadline

Our Maharashtra Correspondent writes:

GOING, going ... not going. This has been the story of V P Naik's chief ministership of Maharashtra for the last three years at least. After another bout of speculation about his departure, on Wednesday last Naik secured the Prime Minister's permission to expand his council of ministers and further entrench himself in power. Three of the major contenders for the chief ministership from the powerful Maratha caste — Vasantrao Dada Patil, Minister for Irrigation and Power, Shankarrao B Chavan, Minister for Agriculture, and Y J Mohite, Minister for Co-operation and Food and Civil Supplies — had strongly opposed Naik's move to expand the Cabinet. In fact, they had let it be known that they would not countenance Naik's continuance in office any further; In this stand they were supported by the Maharashtra Pradesh Congress President, P K Sawant. Also, in their bid to dislodge Naik, Vasantrao Patil, Shankarrao Chavan and Mohite had closed their ranks and informed the Prime Minister that they would abide by her choice of the new chief minister.

The Prime Minister had let it be known as long ago as in September 1971 that Naik would be eased out before the Assembly election in 1972. With this assurance, Shankarrao Chavan had revolted against Y B Chavan, with the support of Vasantrao Dada Patil, Y J Mohite and P K Sawant who was then Minister for Agriculture. Then came the Assembly election and the Prime Minister once again gave the "firm assurance" that Naik would be replaced as Chief Minister after the Assembly election, at the time of formation of the new government. The deadline for Naik's departure was then shifted to his sixtieth birthday in July 1973. Naik went on to complete ten years as chief minister in November 1973. Still he continued in power. And now, exactly one year after his completion of ten years as chief minister, Naik has secured the Prime Minister's permission to expand his cabinet.

Considering the political, economic and social power that the Maratha community wields in the state, it is no small achievement that the chief ministership has been denied to it for 11 years. Largely this is the result of the Prime Minister's attempt to safe-

There will be no issue of *Economic and Political Weekly* on November 16 on account of Divali holidays in the press.

—*Ed.*

guard her control over Maharashtra Congress by not allowing the chief ministership to be captured by the already powerful Marathas. However, External Affairs Minister, Y B Chavan, himself a Maratha, too has contributed to this outcome since he does not much care for any of the three major Maratha contenders for the chief ministership. No doubt he is also apprehensive that a Maratha chief minister might pose a serious threat to his leadership of the state Congress. The three Maratha aspirants for the chief ministership have, therefore, sought to achieve their objective by pledging their undying loyalty to the Prime Minister. And each time the Prime Minister has disappointed them, Chavan has been able to hold up to ridicule, before the state Congress party, the futility of these leaders currying favour with the Prime Minister. For his part, Naik has cleverly played on the Prime Minister's apprehensions about a Maratha chief minister and Y B Chavan's antipathy to the principal Maratha contenders for power. As a result, while he has continued in office with the support of the Prime Minister, he has been on excellent terms with Y B Chavan, accepting his leadership of the Maharashtra Congress party.

The composition of the enlarged council of ministers brings out the major considerations pursued by Chief Minister Naik to strengthen his position. Most important, he has included in the government a number of known opponents of the most important contenders for the chief ministership. For instance, Ratnappa Kumbhar, a sugar co-operative overlord from Kolhapur, is a bitter enemy of Vasantrao Dada Patil. Kumbhar, though only a minister of state, has been given the crucial portfolio of Home and Publicity under the chief minister. Similarly, MPCC Vice-President, Shankarrao Gedam, K M Patil, a powerful co-operator from Jalgaon, Shivajirao Nilangekar-Patil from Marathwada and Uday Singh Gaikwad are all opposed to the dissident leaders. Of these two at least, Kalyanrao Patil and Nilangekar-Patil, have been specifically rewarded for their opposition to Shankarrao Chavan. From among the seven promotees to the Cabinet rank from the position of ministers of state, six are staunch supporters of Naik. At the same time, Y B Chavan has been propitiated by the promotion of his protege, Sharad Pawar. Finally, Naik has tried to balance the Marathas through larger representation for non-Brahmin, non-Maratha politicians, mainly Harijans and scheduled tribes.

US and Chile

Food and Faith

THE only way in which Henry Kissinger's statement, made at his press conference in New Delhi on October 30, that "the United State did not foment the overthrow of a constitutional government in Chile", can be reconciled with the known facts of the case is by recourse to the adage about it being part of a diplomat's responsibilities to lie for his country. Early in September, the US ambassador to India, Daniel Moynihan, had sent a confidential cable to Kissinger warning that the recent disclosures about the CIA's role in Chile had confirmed Prime Minister Indira Gandhi's "worst suspicions and genuine fears" about Washington's policy towards her government. Moynihan had said that the Indian Prime Minister "knows full well that we have done our share and more of bloody and dishonourable deeds". At this press conference, Kissinger brushed all this aside with the laconic statement that "Ambassador Moynihan sends me many cables of great eloquence designed to explain to me the point of view of Indians". However, Moynihan's cable to his secretary of state is notable not for any particular perceptiveness about "the point of view of Indians". Indeed, it should have been obvious to the US ambassador that the Indian Prime Minister's attempt to equate her government with that of the late President Allende in Chile and to raise the bogey of US intervention was intended to give herself and her government wholly unintended socialist airs for domestic consumption. What was significant about Moynihan's cable was that he, an ambassador representing the United States, seemed to have no doubts about his country's "bloody and dishonourable deeds".

At a news conference in Washington on September 16, President Gerald Ford himself had been forced to admit that the CIA had carried out cloak-and-dagger operations against the Allende government. These operations, according to the US President, were intended "to help and assist the preservation of opposition newspaper and electronic media and to preserve opposition political parties". President Ford justified these activities, as well as others carried on in other countries, as being necessary "to help implement foreign policy and protect national security".

President Ford's admission had come in the wake of the publication of CIA director William Colby's secret testimony before a Congressional sub-committee. Colby had disclosed that between 1970 and 1973 the Nixon Administration had authorised more than $ 8 million to finance CIA activities aimed at overthrowing the Allende government. Not all of this money — which was worth the equivalent of about $ 40 million in Chile, since it was funnelled into the country through the black market and at the 'unofficial' exchange rate — only to prop up opposition newspapers and political parties, as President Ford had claimed. The *New York Times*, basing itself on sources within the CIA, disclosed that the funds were used to finance the anti-Allende strikes of truck-owners and shop-keepers in 1972 and 1973. The paper's Washington correspondent reported as follows on September 20 :

> "Among those heavily subsidised were the organisers of a nationwide truck strike that lasted 26 days in in the fall of 1972 seriously disrupting Chile's economy and provoking the first of a series of labour crises for President Allende.
>
> "Direct subsidies ... also were provide for a strike of middle-class shopkeepers and a taxi strike among others, that disrupted the capital city of Santiago in the summer of 1973, shortly before Mr Allende was overthrown by a military coup.
>
> "At its peak, the 1973 strikes involved more than 250,000 truck-drivers, shopkeepers and professionals who banded together in a middle-class movement that, many analysts have concluded, made a violent overthrow inevitable."

Even earlier, immediately after the election which brought Allende to power there was no mistaking the US government's attitude to the new government in Chile. According to the *New York Times*, once again, Kissinger himself "personally directed a far-reaching Nixon administration programme designed to curtail economic aid and credit to Chile" after Allende's election in 1970. As a result of these efforts, not only the Export-Import Bank which after all is a US government agency, but even the supposedly international World Bank denied loans to the Allende government.

On the strength of the available evidence, the Foreign Relations Committee of the US Senate on September 17 voted unanimously to investigate the CIA's role in Chile. Yet Kissinger would have his Indian audience in New Delhi believe that the US had nothing to do with the overthrow of the Allende government in Chile. Perhaps he reckoned that with a million tonnes of food-grains and many other goodies hanging in the balance, the Indians would believe anything he told them.

Islamic World and Muslim Minorities

PERMIT me to point out certain errors made by Pran Chopra in his reporting of the Islamic conference ("The Islamic World and Muslim Minorities", August 31).

To quote his very first sentence: "The dominant theme at the ... Conference ... was Palestine, an issue which evokes a strong Islamic affinity between many Muslims." *This is not true.* The conference adopted 18 political resolutions, of which only one, resolution No 10, was on "The Middle East and Palestine Issues". Palestine is a very important issue not only at Islamic conferences but also at the meetings of African States under the Organisation of African Unity, at non-aligned conferences, at the UN and at every major international conference dealing with political issues. It was given the same importance at Kuala Lumpur, but it certainly *did not dominate the conference.*

Palestine is one of the most important issues of the world today not because of its Islamic "affinity" (whatever Pran Chopra means by that). Islamic countries are not demanding restoration of the national rights of Muslim Palestinians only, they seek to restore the national rights of all Palestinians, including a large number of Christians and a fair number of Jews (all those who lived in Palestine before it was partitioned). The conference did not ask for the "political right of the Palestinians", as Pran Chopra has put it. It, like other international gatherings, said the Palestinian people form a nation and should have their national rights restored to them by the setting up of a Palestinian State.

Pran Chopra's main theme appears to be that in their attempt to support the struggle of Islamic minorities for their rights, the Islamic countries are prepared to encroach upon the sovereignty of non-Islamic nations, but that these Islamic nations to not really have the courage to go further along that path, at least at the moment, because, in his words, "many Islamic countries are themselves as pluralistic in different ways as many non-Islamic ones and therefore equally vulnerable to 'interference' in their domestic affairs". The reality is that the Islamic countries have been and still are victims of colonialism, neo-colonialism and imperialism. Now they are, for the first time, trying to organise resistance to those forces but their attempts at protecting themselves are being cited as attempts at aggression.

The first sentence of Pran Chopra's second para reads: "But when the Conference took up the question of the treatment of Muslim minorities in free and independent non-Muslim countries, specially the Philippines, it came close to furnishing a true measure of how far Muslim countries think it proper to carry religious affinity. The discussion on this question showed a most interesting play between constitutional rectitude and concern for fellow Muslims. The way this play works out in the future will largely help to determine how trans-national Islamic affinities will adjust themselves to the demands of national sovereignty." I fail to understand what Chopra means by constitutional rectitude. Is it written down in the constitution of various countries that they would not show "concern for fellow Muslims" in order to remain constitutionally correct? Chopra takes for granted that Islamic people have "trans-national affinities" and he says that it is to be seen how these loyalties "adjust themselves to the demand of national sovereignty". What are these trans-national affinities or, in other words, which country or countries are the Muslims in other countries loyal to or have affinities with? Are there countries to which Muslims of other countries are loyal?

If Chopra had seen the conference papers he would have noted that the words used by delegates for describing their objective were "Islamic solidarity" (the conference resolutions also use the same words). But instead of using the term mentioned in the conference, Chopra preferred to coin his own phrase, "Islamic affinity", which he has used liberally and which conveys very little meaning politically.

One gets the impression that Pran Chopra has written the article in question on the basis of his prejudices about the Islamic nations wanting to take aggressive attitudes and interfering in the affairs of other nations in the name of supporting the rights of Muslim minorities living in them.

On Keeping Silent

IN "On Keeping Silent" (October 26), the author has been surprisingly naive about what he considers to be the latest step towards the dismantling of democracy in India — namely, the firing of editor B G Verghese of the *Hindustan Times* by its proprietors, the Birlas, at the behest of the Government of Indira Gandhi. What precisely does this latest step threaten? As I see it, what is under threat is only the freedom of the middle class intelligentsia to communicate among its own kind.

The freedom of the Press cannot have a wider validity in a nation which has kept 70 per cent of its population illiterate. Where every effort has been made to keep out political education, freedom of expression cannot have a validity outside the middle class. Is not a vast majority of the people kept leashed in by the caste system? Is not ours a slave society which practises untouchability without any qualms?

This middle class acquiesced in the deprivation of the vast majority of Indian of many rights: the right to eat, the right to self-respect, the right to human aspirations. It was not a case of indifference as suggested by the author of the piece under discussion. In return, the middle class has been assured of luxury consumption. This necessarily meant perpetuation of inequalities, over which the middle class howls.

This howling too is a part of the arrangement. The Press can complain about illiteracy untouchability, hunger, famine, death, Naxalite prisoners, black money, the decline of the Left and, finally, Sartre and the responsibility of the individual. However, since the arrangement is part of patronage, no precise list of do's and don'ts need be prescribed. The government can shorten the list at will.

And even though the list may exclude Sikkim or the bogus foundation stones laid as part of electioneering in UP, you may still pull up the government for quibbling between starvation and sundry maladies that cause death during famine. That is the essence of patronage. And glory be to the Congress if the government retraces the latest step.

But what if a further step is taken? Alas, if you let down the bottom 30 per cent, and accommodate the middle sixty per cent on sufferance, how long can you maintain the niceties of liberal democracy for the top 10 per cent? *... jader korecho apaman/apamaney hote habe tader sabar saman* (Tagore).

Bombay G GAONKAR

Calcutta Diary

A M

THAT was a different kind of world. Calcutta, the early 1930s, the era of Subhas Bose, J M Sen Gupta, and *ersatz* self-government which was the Calcutta Corporation. Nobody had heard of the poor, or bothered about them: they, or at least the bulk of them, were peasants — and Muslim. Kazi Nazrul Islam was all right, but he was as good as being one of us, he had even married a Hindu girl. But pampering of the Muslims would not do, somebody must tell Gandhi; Jinnah must be told off; the antics of Fazlul Huq must not be tolerated any more. The Congress, after all, was three-quarters solid Hindu zamindar. They had their beautiful mansions down Camac Street and Lansdowne Road. It was the nadir of depression, but so what? The Permanent Settlement had built-in virtues, the peasantry suffered, not the landlords. The landlords' real income in fact went up, as also the real income of the fixed income-earning middle class. Those were the days that were; Calcutta still had class; Begum Akhtar was still only Akhtar Bai — slip of a girl, singing before the taluqdars at Lucknow, or the zamindars down Camac Street or Lansdowne Road in Calcutta, mostly light classical.

On occasion, the terrorists would break loose and create news. Some silly girl would take a pot shot at Sir John Anderson, one or two police agents would get assassinated, there would be some comment in the newspapers, the despatches between the Secretary of State and the Viceroy, and between the Viceroy and the provincial Governors would intensify. The Congress leaders would be torn by ambivalence: disapproval of the doings of hot-headed young people would be combined with agitated condemnation of British obtuseness. After a brief while, the racket would die down. The Muslim peasantry would continue to be pressed down upon. The landlords would supervise, through their umpteen agents, the efficient collection of revenue. Come December, the Viceroy would address the Bengal Chamber of Commerce. The zamindars would be in their full regalia. In the evenings, Akhtar Bai would perform. During the day, there would be cricket. Remember all those names who constituted the core of the Calcutta and Ballygunge Cricket Clubs? Longfield, Behrend, Van der Gutch, Hosie? Rabindranath Tagore would be in Santiniketan, and all would be right with the world. The Bengali poets were a considerable community; they would be short of funds, but, no matter; in the early 1930s they would always somehow manage to bring out *avant garde* journals which, though as a matter of principle against Tagore, would publish as their opening piece his long letters praising or castigating them. The Bengali young men, that is, those who were Hindus, would divide themselves in two easily identifiable goods: would-be terrorists and would-be poets. Sometimes would-be terrorists would outnumber the would-be poets, sometimes it would the other way round; here and there there would be some overlap. Every now and then, this or that odd professor would quote from Lunacharsky or Leon Trotsky. What the Russians were doing unto themselves would be the staple of some infrequent discussion or other. But barely anybody lost his sleep because of the distant thunder which was Moscow or Leningrad. The poor were quiet and submissive, they were mostly peasants, and they were Muslims. All one had to do was to tell blighters like A K Fazlul Huq where to get off; the rest would be peace and tranquility. The Metro Cinema would perhaps have on a Janet Gaynor film, and there would always be Akhtar Bai to listen to at this or that zamindar's place. There would be no occasion to chant in mournful numbers that life was one long empty dream: It was not, it could not be, the poor were not around, and Akhtar Bai was performing in the evening.

Came the War — and the partition. It was a terrible wrench for the Bengali Hindu zamindars. The next thirty years they have continued their desultory attempts at rehabilitating themselves — spiritually as much as physically. There was an end to indolence: the houses on Camac Street and Lansdowne Street caved in, the revenue disappeared, the Hosies and the Longfields departed — maybe to Australia or maybe to Canada — but they also took with them a certain style of living. The surplus was raised in the paddy fields of north and east Bengal, though it used to circulate in Calcutta. Now the British had let up the arrangement. The Hindu zamindars, lawyers and doctors gave corpus to it: luncheon at the Firpo's, fruitcake and other *patisserie* for Christmas, illumination at Chowringhee and Park Street, gala ball at the Governor's house; the Calcutta Club would be agog, the Viceroy would be at the Belvedere, he would receive the gentry from nine in the morning till late in the afternoon, the realities of poverty and pestilence would fade into the dark background. Bade Ghulam Ali would be in town, so would Akhtar Bai, then a slip of a girl.

As the war ended, and the country was split in two, this style of life was dealt the *coup de grace*. Other modalities for the circulation of surplus value had to be thought of. The problem was not in the germination of surplus; in our land the poor are for ever, they are always squeezable. But there could have been — as they love to say in economics — a 'realisation' problem. The disappearance of the filthily rich could have heralded a cultural crisis. The new class of industrialists did succeed in filling the vacuum, but only upto a point. For, meanwhile, even culture had proliferated — with its thousand promenades and *cul-de-sacs*. The wretched of the earth remained the wretched of the earth; culture flourished, however — and grew. What the industrialists on their own failed to accomplish, they lost to the State. Those who, ensconced in comfort, had once read Leon Trotsky on proletcult, suddenly felt elated. The State stepped in, and the realisation crisis was over! Akhtar Bai blossomed forth as Begum Akhtar.

Thus, at the Centre, a Ministry, supposedly charged with the responsibility of looking after Education, also took over Culture. The 'Akadamis' — not *academies* — came into their own. Culture was nationalised, and a policy of discriminating pricing came into operation. It was monopoly in the product market and, simultaneously, monopsony in the factors market. What favours to dispense to which artiste or singer or playwright or painter or poet, became the prerogative of those in authority. And the distribution of the works of the poets and playwrights and artistes also became the subject of centralised decision-making. Till as long as Jawaharlal Nehru happened to be around, the supplanting of the taluqdars and the zamindars by the State did not perhaps make a difference — after all, Nehru's style of operation was hardly distinguishable from that of a nineteenth-century Hindu overlord. In the sphere of culture at least, his intervention ensured a continuance in the character of patronage. Akhtar Bai was transformed into Begum Akhtar, but there was a whiff of past memories in the modulations of her voice; from time to time, the slip of a girl would attempt to rush to the stage and dislodge the doughty dowager which Begum Akhtar had become.

As you look around, first to this side and then to that, it is a queer mixture of a set-up: slapdash semi- and quasi-feudalism co-exists with degenerate mercantilism and gawky-eyed capitalism. The nationalisation of Culture, spell it with a big C, could not but give rise to a series of oddities, and a large portmantean of outrages. Culture was taken over by the State. But the nature of the State being what it has been, the masses have been doled out only droll tunes, expiating on the virtues of family planning through the community wireless sets; occasionally, supplementary meals have been served too — such as how, through the heroic endeavours launched and guided by whoever happened to be Prime Minister, this noble land was saved from the designs of the nefarious Chinese. But all the while, the good things of life were reserved for the rich — the ruling class, who alone had entitlement to listen to Begum Akhtar or watching Yamini Krishnamurthy on State-sponsored occasions.

The slip of a girl made good, she transcended her humble origins, she became rich and famous, she, Akhtar Bai, became Begum Akhtar, recipient of many State awards. And she travelled outside the country — a cultural ambassadress, spreading the gospel of India's aesthetic refinements. In other words, she was captured, became a clog in the machine. When she was not rich and famous, she would come down to Calcutta, the clientele of affluent landlords would of course be there, but she also had a different category of admirers. Young people — and some of the old — from middle-class homes would ask her to sing for them free of charge; and she would agree. Even before the IPTA, there was therefore this — howsoever tepid or feeble — effort to sing for the masses. Once the State took over Culture, it was altogether a different proposition. Akhtar Bai was nationalised. She became Begum Akhtar. She had little time to spare for ordinary people. After catering to the whims of those in authority, whatever little leisure she had went for the edification of the rich. Akhtar Bai, Begum Akhtar, died in harness. It is a pity she could not be liberated before her death: the nightingale, as long as she was around, remained chained to the cage.

COMPANIES

Expanding despite Financial Stress

Hansavivek

KANORIA CHEMICALS AND INDUSTRIES is expanding existing manufacturing facilities and undertaking new projects. It has secured 'letters of intent' to expand the capacity of its caustic soda plant from 33,000 tonnes to 66,000 tonnes per annum and of its stable bleaching powder plant from 5,000 tonnes to 15,000 tonnes per annum. After obtaining government approval, a collaboration agreement has been entered into with Rohm and Haas of USA for manufacture of methyl methacrylate monomer. The company's application for increase in capacity for manufacture of toluene di-isocyanate from 3,600 tonnes to 6,000 tonnes per annum, however, is still being considered by government. Meanwhile, imported plant and machinery for expansion of capacity of the benzene hexachloride plant from 3,000 to 6,000 tonnes per annum is under erection and the expanded capacity is expected to be commissioned soon. During 1973-74, the company produced 4,402 tonnes of BHC. Production of caustic soda at 17,103 tonnes was lower owing to power shortage throughout the year. The stable bleaching plant produced 4,475 tonnes and steps are being taken to rectify the lime kiln under advice of Ingras of Yugoslavia. Bleaching powder of the value of about Rs 8 lakhs was exported by the company. The salt works acquired by the company commenced production towards the end of the year and produced only 1,291 tonnes of salt.

The company's sales and profit were slightly lower compared to the previous year. Equity dividend, paid at 10 per cent last year, has been skipped. Both wages and inventories in relation to sales have increased over the year. A sum of Rs 19,376 has been paid in excess to the managing director, for which government approval is being sought. The company's ways and means position was strained owing to capital expenditure incurred on the expansion and modernisation programme. IFCI and ICICI have agreed to reschedule the company's debt obligations. The date of redemption of the 20,000 cumulative preference shares of Rs 100 each has been extended by 10 years to March 28, 1984 and the rate of dividend enhanced from 9.5 per cent to 9.8 per cent. Swadeshi Chemicals has been re-appointed as distributor for BHC for the whole of India for a further period of five years from April last on a commission of 5 per cent on the ex-factory price. Last year the company paid by way of commission Rs 8,83,310 to sole selling agents and Rs 1,63,680 to others.

R K Kanoria, who had been a director of the company from its inception and its chairman for more than 10 years, resigned from the board in February last. S S Kanoria, managing director, has been elected as chairman in his place. S M Bannerjee, another director, resigned in September 1973.

The directors expect the company to turn out better working results this year, as production of caustic soda is likely to improve and demand for BHC and stable bleaching powder is already very good.

INDIAN RARE EARTHS has taken up some preliminary work on the mineral sands separation plant, which is part of an industrial complex based on beach and sand minerals proposed to be set up near Chatrapur in Orissa. The project would consist of, apart from the mineral sands separation plant, a synthetic rutile plant, a zirconium chemical plant and a caustic soda plant and is estimated to involve a capital outlay of Rs 38.30 crores. Steps are being taken to obtain funds for the project and to finalise consultancy and collaboration agreements. During the year to March 1974, the company's production of minerals was higher than in the previous year owing to slightly higher raw sand processed and better recoveries. Production was below the target at Manavalakurichi due mainly to power cut and shortage of furnace oil. The capacity of the plant at Chavara was raised by 30,000 tonnes to 1,30,000 tonnes per annum. The zircon opacifier plant was operated to full capacity to meet the increased demand for zirflor. Production at the rare earths plant at Alwaye was lower owing to shortage of raw materials. Thorium hydroxide was stocked in the wet form as in the past. The government of India paid about Rs 10 lakhs to the company for thorium hydroxide. The company obtained increased prices for its products in the export market and, for the first time, exported zirflor. Total turnover rose by 43 per cent to an all-time high of Rs 469 lakhs. Of this, increase in turn-

over of the minerals division was 69 per cent and of the rare earths division 18 per cent. The foreign exchange earnings increased by about 83 per cent to Rs 311 lakhs. Gross profit also leapt by about 85 per cent to hit a new peak in the company's 24-year career. Both the ratios of wages and inventories to sales were substantially lower compared to the previous year. In view of the restrictions on payment of dividends, distribution was maintained at 8 per cent. Workmen of the Manavalakurichi plant went on a strike on the question of compensation for the lay-of period, which resulted in loss of production for nearly a month.

CROMPTON GREAVES has turned out good results for the year ended June last in spite of the power crisis in many states, transport dislocations and shortages and increased costs of raw materials. Production of all items, except metal cased plugs and sockets and carbon brushes, was lower than in the previous year, but sales were 10 per cent more and gross profit was 36 per cent higher. Part of the dividend, reduced from 15 per cent to 8 per cent on the capital enhanced by a one-for-two bonus issue, is expected to be exempt from tax. Exports at Rs 159 lakhs showed an increase of 41 per cent over the year. CG has been recognised as an 'export house' and expects to further increase exports this year. No provision has been made for claim by ex-employees of the amalgamated company for additional bonus for 1964 (Rs 6 lakhs), claims by employees arising out of certain awards by industrial tribunals/courts against which appeals/petitions are pending (Rs 17 lakhs), claims of the daily-rated workmen arising from a demand for revision of wages, dearness allowance, etc, which are pending before the industrial tribunal (amount not ascertainable) and other claims against the company not acknowledged as debts (Rs 17 lakhs). Remuneration, including allowances and other benefits, paid to managing director and other directors increased over the year by about Rs 2 lakhs to Rs 10 lakhs. The company has purchased 1,660 equity shares of the paid up value of Rs 1,000 each in Kersons Manufacturing Company of India at Rs 125 per share and on a review has decided not to pursue the proposal for purchase of shares in Khatau Junker.

FACIT ASIA, maker of hand-operated calculators and adding machines, apprehends competition from electronic calculators and is diversifying its activities. It has obtained a 'letter of intent' for manufacture of 20,000 numbers typewriters per annum and is seeking government approval to the terms of collaboration negotiated with FACIT of Sweden for this purpose. During 1973-74, the company's production was marginally higher than in the previous year despite some labour problems which persisted during a substantial part of the year. In addition, the company had to contend with increased costs on account of inflationary trends and lower realisations on export sales. The working results, however, turned out to be satisfactory, although profit margins were reduced. In view of the dividend restrictions, equity distribution was lower from 15 per cent to 11 per cent. Exports more than doubled at Rs 11 lakhs and are expected to further increase in the current year. With the expiry of sole distributorship agreement with Rayala Corporation for manual calculators and adding machines in November 1973, the company has appointed four distributors to handle sale of these products in different parts of India. Arrangement made for sale of electronic calculators did not show desired progress, mainly on account of inadequacy of supplies.

Financing Famine Relief: Calling the Bluff

Amrita Rangaswami

THE UNION Government's strategy to finance famine this year is based on a gamble. The Centre is betting on the chance that in the affected states, this lean year will be followed by four good years. And on the basis of this rather Biblical assumption, it is releasing to the states in advance funds from the Central assistance for the entire Fifth Plan period.

The decision has not been taken with reference to the meteorological department. The Union Finance Ministry is merely implementing the policy laid down by the Sixth Finance Commission. *The Commission said: "While in the* normal years the Schemes included in the Plan for development of drought/flood-prone areas will be included according to the annual phasing visualised in the Plan, the pace of execution of such programmes should be suitably accelerated when the area is stricken by natural calamities. Such advance release of Central assistance for the Plan in a year in which a state is stricken by a natural calamity will not only meet its immediate needs but also expedite the process of development of drought-affected areas. At the same time, the states would be put on notice from the beginning that any assistance which is thus secured by them would be subject to the overall ceiling of Central assistance for the Plan period as a whole."

Relief, according to the Sixth Finance Commission, is the states' constitutional responsibility. In any case the Reports submitted by the Central teams is that only in Gujarat the state as a whole is facing scarcity. Orissa is affected in parts, particularly Ganjam district. Bengal of course presents the classic famine trap. Plenty of grain is available in the state but the government seems to be neither willing nor able to rush it to the affected areas.

A glance at the monthly expenditure reports during previous famine years makes it clear that the first six months (September to March) of relief operations will not present a serious financial crisis to the states. If the states were capable of setting up adequate relief machinery, the crisis would come in the next financial year — April, May and June.

The states, however, are making a frantic bid to break the Centre's resolve to hold on to the Finance Commission's award. Images of total crop damage, of mass starvation, are being evoked in the propaganda against the Centre's financing policy. That in this ugly campaign, even human lives have become expendable only shows the the lengths to which states will go to force the Centre to go back to the halcyon days when there was a free and ready flow of funds. This is the tragedy. To the people, the 'recognition' of 'famine' has always meant a promise of a season of plenty — a meal every day of the week.

If the Union Finance Ministry is aware of the dimensions of the problem, it does not wish to appear to be so. The spending orgy of the states during the 1972-73 famine and the Centre's present financial situation leave it with no choice. It is, therefore, determined to give the Sixth Finance Commission's award a fair trial.

Test Case

It is fortunate therefore that Gujarat will be the test case. There is no popular government in the state and there is little fear of politicisation of relief funds. Gujarat also has a good relief machinery which has already put nearly three lakhs to work.

The state's bureaucrats are also keen on giving support to the Centre's policy. They are seeking to diversify the number of agencies both to finance relief operations and to provide employment. The state is attempting to raise a higher level of revenues through sales and entertainment taxes, is presently addressing the Life Insurance Corporation to finance water supply schemes, and is appealing to the Railways to extend a siding here and double a short line elsewhere.

The state is estimating an expenditure of Rs 100 crores, of which Rs 40 crores is to be spent in the current financial year. It is expecting to raise Rs 19 crores from the Centre's share in the drought-prone areas development programme alone. But the financial crisis is not the state's real dilemma. The relief machinery already set up is providing work for lakhs of people and on plan schemes. At least an additional three lakh mandays of work per day will have to be provided in the next six weeks. This will go up to a minimum of ten lakh mandays per day in March-April. Will it be possible to change the character of the relief system to match the formula for financing?

The present relief system implies:

(a) providing work for lakhs of people;
(b) ensuring continuity in employment for six to eight months, and
(c) providing work at a low 'unit' or per head cost.

The new formula implies integrating relief works with Plan schemes — irrigation and other projects that would bring about the development of the drought-prone area. The per unit cost of labour on schemes of this nature ranges from Rs 12 to Rs 24. The per unit cost on a relief work is Rs 3. If any of these schemes have to be selected (assuming that the construction portion alone would not be taken up) the numbers on relief will have to be drastically cut down. During the days of the British, at least ten per cent of the population of the affected district had to be provided for. Will that continue to be feasible?

Secondly, what are the gigantic projects that can be taken up in the backward talukas of Panchmahals, Banaskantha, Kutch and Rajkot? If projects under Plan schemes have to be taken up for destitute relief, would that constitute a greater or lesser drain on the state's finance? Can the two concepts "plan work" and "destitute relief works" be at all integrated?

This is a basic exercise that the Union Finance Ministry should undertake for all states. Evading it might only bring about a far more serious adhocism in relief financing than any we have so far faced.

And the Finance Ministry cannot rely on the policy evolved by the Sixth Finance Commission. The Commission's approach was faulty on three counts: (i) its policy was based on the wrong premises; (ii) the Commission's analysis of the problem clubbed together the abuses of the system with the inherent defects in the system; and (iii) it misunderstood the nature of the calamity.

Wrong Premises

The Commission's policy was based on the premise that it is possible, "through a massive, time-bound programme", to "substantially reduce, if not eliminate the vulnerability of these areas to drought".

From the meteorological standpoint, this is a rash statement. Firstly, neither the Soviet Union nor the United States

has been able to eliminate drought. The wheat fields of Australia and the Ukraine are as vulnerable as the paddy and bajra fields of Orissa and Kutch. Secondly, drought can occur anywhere, in any part of India. The term drought-prone area has become an obsession with Indian planners. And it is likely to cause more havoc (in terms of crop damage) in Orissa, an area of high rainfall dependability than in Kutch, an area of high rainfall variability. Thirdly, as the British discovered way back in 1898, the distress need not be restricted to the area of drought occurrence. And, lastly, the distress need not occur in area of crop failure, but may occur in the adjoining districts. Gujarat, for example, knows that crop failure in the Kaira district means distress in the Panchmahals — the area from which the labour is drawn.

The recommendations for a "massive time-bound programme of action" is naive. The Second Irrigation Commission set for itself the very task of working out a programme to release these areas from dependence on rainfall. It said: "Finally, there is the question of suggesting a minimum programme for drought districts. At present about 13 per cent of the cropped area of the drought affected region is irrigated. This is likely to rise to about 19 per cent when the schemes under execution are completed. Even so, as much as 80 per cent of the drought-affected region is unirrigated. In the drought areas of Madhya Pradesh, Karnataka, Maharashtra and Gujarat, where the present level of irrigation is lower than 13 per cent, the position will be even worse. The extent of the area irrigated in the drought districts will go up to about 25 per cent of the cropped area when all the works which these states have proposed are completed. It is possible some of the works proposed may not prove to be feasible, and some on the inter-state rivers may have to be dropped if competing schemes for the use of water are given precedence. For these reasons, we feel that the needs of the drought areas will not be adequately met by any minimum programme of irrigation. What is needed is a maximum programme because *even* if such a programme is implemented, drought areas will lag behind, since only 25 per cent of the cropped area will come under irrigation as against fifty per cent for country as a whole."

Looked at from this point of view, it seems that the programme of development of drought-prone areas is a myth. Should we, on the basis of this assumption, evade an exercise on the dimensions of the problem of relief for these areas?

Abuses and Defects

In its analysis of the problem of financing relief, the Sixth Finance Commission found "two serious defects". "Firstly, the states have no incentive for economy in expenditure ... They try to get as much as possible by way of Central assistance for drought relief. Secondly, the schemes on which drought funds are utilised are not always integrated with the overall plans for development of these areas."

The first constitutes an abuse, the second a defect in the system. The states, it is undeniable, looked upon the 1966 formula for financing relief as framed in a moment of mindlessness. It is a 'kamadhenu', a Finance Secretary of one of the states exclaimed. Like the mythological cow, it offered its gifts without pre-condition. It left the nature of the calamity vague, but made the financing system explicit. 'Rainfall failure' or 'crop damage' was a definition so flexible, a measure so relative that it could, with ease, be applied to every district in the state. Drought funds were used not to provide relief but to finance Plan schemes. As a collector in one of these states jokingly put it, "We had a drought of Plan funds, so we worked out a plan for drought funds." The flagrant abuse lay not in the financing of petty plan items such as the expenditure of lakhs of rupees on the cement lining of a canal, or the building of a wall for an arboretum or the repairs undertaken for a collector's bungalow, all accounted for under the head of Famine Relief; the abuse lay in the financing of major plan schemes in places remote from the affected districts. These states are now chuckling under their breath that under the award the abuse has attained a certain sanctity. "We have been pleading with Mr Dhar for this very thing", they declare. All pretence of providing relief may now be waived.

The Sixth Finance Commission came down heavily on schemes for relief that were not integrated with the plans for development. These were schemes "formulated in a desperate hurry". The salutary practice, envisaged in the Famine Codes, of keeping the list of works ready for execution as relief had fallen into disuse. In making this statement, the Finance Commission had ignored the change that had come over the relief system, particularly since Independence. The old codes, evolved at the turn of the century, envisaged two kinds of emergencies that droughts could cause. The first was scarcity, a calamity that could be faced by opening a number of village works, small, scattered, to cater to units of labour never larger than 3,000. The second was 'famine' which demanded the opening of large works such as irrigation projects, railway embankments and others. This could cope with many thousands of people demanding relief. Obviously, they could not be started near the villages — it meant the setting up of labour camps near the project site. The distinction was primarily in terms of the numbers that had to be provided for; 'famine' always implied relief on a mass scale.

In the thirties, a period when famines had faded away from public memory, some of the provinces began to discover that as a system "scarcity relief" was preferable. It would provide relief to people in their homes; it would ensure continuity of farming operations; by preventing concentration of labour in camps, it would help avoid the outbreak of epidemics. The fundamental change in the approach was that relief works should be started *before* distress set in. Described as the 'prophylactic system' of relief administration, the system aimed at preventing, by timely extension of employment on ordinary terms, a deterioration of the people in health consequent on unemployment. Relief was provided by opening small works scattered throughout the area where the crop failure was severe. Sufficient wages are paid to enable the worker to support himself and his dependants, the object being to assimilate the conditions of labour more nearly to those of ordinary times and thus reduce the element of pauperisation."

After Independence, faith in the system was reinforced by the rather naive belief that "famines" had been done away with. The distress, in independent India, could only be of smaller magnitude. 'Famine' was abolished by administrative fiat. (It continued, strangely enough, as a head of account.)

The term 'famine', declared a rather squeamish bureaucrat in 1953, "evokes horror". That the term remained in use in the vernacular was perhaps irrelevant to Yardi, the then Commissioner of Famine Relief in the old Bombay State. He felt, however, that provisions for large works could be made even within the scarcity relief system. It became mandatory therefore that relief

be provided within five miles of the village. 'Scarcity relief' and its corollary, the villages system of relief works, have continued since then. After 1966, the system began to show signs of strain. In Maharashtra, during the 1966-67 famine, there were six lakhs of people on relief works. By late 1972, this number had grown to 19 lakhs. I will not consider here whether administrative and financial constraints had helped to keep the numbers on relief low in the earlier years. The issue is very simply whether a scheme of village works can at all cope with providing work for nearly five million people on relief.

Every Collector in Maharashtra was in acute distress that he had not ordered a survey of sites for percolation tanks before famine struck. But many Collectors, faced with the problem of providing continuity in relief, deliberately chose to crowd a mob of 3,000 into a metal-breaking quarry than supervise them on a hundred tank works. When members of the Central team insisted on their taking up "productive works", some of them emulated the rather foxy Sarpanch of a village in Kutch who has been arranging, for the last ten years, for the same tank to be dug every year. Most of them found it impossible to cater to this awful appetite for work — the Nagpur Road plan that would have kept a whole generation of contractors content was completed by the end of 1972, eight years ahead of schedule!

Given the system of relief, what choice did the collectors have except to order the tearing off of flanks of the Maharashtra hillsides for the mobs to pound into a million, even-sized pieces? In Maharashtra, the nightmare ended, if only because the Centre and the State ran out of funds. In Rajasthan for the last ten years the people have been sifting sand. It continues even through a sandstorm with a gale of 80 kilometres per hour, when a hundred million particles of silica and quartz cover the sky and their fluid milky colour shuts out the light of both night and day and hides a thousand men, women and children at work. The work cannot stop. ("What can I do, I have no orders to give them a day off", says the deputy collector of Jaisalmer.)

The people loathe the work they are given. "We are 'Marathas'; only 'oddars' break stone" they said in Maharashtra but found to their deep shame that they were forced to accept the work. "Ask the government" they beg in Rajasthan, "to measure the sand we dig at the end of the day. At night the wind blows back the sand into the pits we have dug". During the 1972-73 famine year there were nine million people on relief works all over the country. What massive plan do we have for providing work for perhaps 10 million people who might demand relief in 1977? How did the Finance Commission overlook the 'nature' of the calamity?

Nature of the Calamity

It would be good here to juxtapose the findings of the 1901 Famine Commission with those of the Sixth Finance Commission. The Famine Commission found (rather to its consternation) that an expenditure of Rs 9,99,95,307 had been incurred in just four provinces. "We fear", cried the commission "that even these high figures would have been found to have under-stated the actual expenditure. Advances have been made to the extent of more than one and three quarter crores of rupees, a large proportion of which will be irrecoverable and suspensions of revenue to the amounts of two crores of rupees, a large portion of which will have to be remitted. Making allowances for loss of revenue in other departments, we think that this famine will in the end have cost the state not less than rupees fifteen crores or ten million pounds sterling. This expenditure far exceeds any previous famine."

The Sixth Finance Commission's chapter on financing relief expenditure bears a remarkable similarity. "One cannot but feel perturbed", exclaims the Commission, "by the sharp increase in expenditure on relief, particularly since 1966-67. As against an annual average expenditure of Rs 13.41 *crores during* the period of the Third Plan, expenditure under famine relief in the state budgets rose to an average of Rs 81.01 crores during the period of the three annual plans. This rising trend gathered unprecedented momentum during the period of the Fourth Plan. The expenditure of Rs 151.87 crores in 1969-70 rose to an all-time peak of Rs 318 crores in 1972-73. Central assistance to the states has also registered an equally disturbing increase ...".

The 1901 Famine Commission found an increasing tendency on the part of the people to depend on relief works. There was almost an expectation, they felt, that the government would provide work. The pressure on relief works brought about the attendant evils — "schemes that were formulated in a desperate hurry". "Experience has shown", the Famine Commission said, not without a touch of pompousness, "that the object can be attained at a moderate cost and with little demoralisation if prudence and foresight be duly exercised, and if means be properly adjusted to ends".

The findings of the Sixth Finance Commission seem to be almost an echo. "it is our distinct impression that there has been a good deal of avoidable waste in expenditure in the name of drought relief and also that with better planning and organisation more enduring benefits could have occurred."

However, the policy recommendations made are strikingly dissimilar. "We do not for a moment advocate a departure from the humane policy (of saving every life) laid down by the Government of India", the Famine Commission said. "We are convinced", the Finance Commission declares, "that the present arrangements for providing assistance to the states need to be completely overhauled".

Nobody would deny that the 1966 policy was responsible for the rise in the expenditure on relief. But the policy was a mere liberalisation of an understanding over a hundred years old between the states and the Centre — that the Centre would rush to the assistance of the states in the event of a natural calamity. The Finance Commission has revoked that understanding. The term "natural calamity" — an unfortunate term that has consolations that the event is heaven-sent — had been coined by the British, but the British did not define it in terms of crop damage or measure its dimensions with data on rainfall. Famine was a "pauperisation of a whole population". The numbers for whom relief had to be provided for in each district were computed with some reference to the economic base level of the district. It ranged from providing relief for a five per cent of the population in the comparatively better-developed areas to nearly 20 per cent of the population in the poorer tracts. The British had even undertaken a census of people on relief to find out data on occupation, landholding, etc. We do not seem to see the need for such an exercise. There has been no attempt to gauge even the vague dimensions of the problem in terms of the numbers, who in normal times live below the subsistence line and cannot take even a marginal fall in the level of consumption.

The British Government did consider enacting a poor law for Indian paupers but balked at the sheer size of

the problem. They shrugged it off by declaring that in ordinary times the caste system and the sense of mutual obligation and duty it engendered ought to suffice. But "famine" was a condition that was altogether different. As the Famine Commission of 1880 stated, "The pressing circumstances under which it becomes right and necessary that the resources of the state should be applied to the relief of want and suffering must differ in different countries but the general condition by which the obligation is governed appear to be these.

"(1) that the calamity should be one which places it beyond the power of the individual to obtain the requisite relief or efficacious remedy otherwise than with the aid of the state.

"(2) That the intervention of the state is likely to produce a practical beneficial result. There can be no doubt that much a calamity as famine, exceptional in its nature and arising from causes wholly beyond human control, which deprives an *entire population* of its customary food supply and the ordinary employment of the wage-earning classes, is one which in a country such as India wholly transcends individual effort and power of resistance.

"It accordingly becomes a permanent duty of the state to give all practicable assistance to the people in time of famine and to devote all its available resources to this end. And this duty is emphasised by the fact that the government stands in the place of the landlord to the agriculturists who form the great mass of the population."

Relief was to be provided and there was to be no ceiling on the expenditure. "Public works were to be opened at very low rates of pay, but without limit of expenditure." Implicit in this statement is the right to relief for the destitute. It seems that right to subsistence has now been done away with.

Simple Arithmetic

The award of the Sixth Finance Commission has not taken into account the needs of the states. The Commission, obviously in a great hurry, looked over the shoulder of the Fifth Finance Commission to copy (with a minor variation) its exercise in simple arithmetic. The Fifth Finance Commission had worked out the estimates on the basis of the average expenditure for the nine years 1957-58 to 1965-66, increased by 25 per cent in each case. The expenditure during the years 1966-67 and 1967-68 was considered 'abnormal' and, therefore, not included in the reckoning.

The Sixth Finance Commission felt that "for all practical purposes the average expenditure from 1956-57 to 1971-72 (1972-73 being left out both because it was abnormal and because the totals were not available) could be the basis on which the provisions needed by the states could be decided upon. It granted that its procedure was unscientific. "By far the most scientific procedure ... would be to assess the proneness of the different areas to ... natural calamities with reference to meteorological and other data". How can the Finance Commission blame the central teams for their lack of criteria in assessing relief needs when, by its own confession, it had none either? The Commission had noted that the present system had "introduced serious distortions in the scheme of allocation of central trends and ... would accentuate inter-state jealousies and rivalries". How far did its own award confirm these distortions?

Take, for example, the margin under the award for Orissa. In the previous award, Orissa government got Rs 125 lakhs — nearly Rs 50 lakhs more than Maharashtra and Andhra. In the present award Orissa has received Rs 3.58 crores while Gujarat gets Rs 4.55 crores and Maharashtra Rs 4.17 crores. (The figures were taken into account in arriving at the grants, if any, needed by the states under Article 275 of the Constitution.) But should not the Commission have adopted a more rational method to determine the margins?

Unasked Questions?

If only the Finance Commission had not looked at the totals of Central assistance but at the break-up of expenditure on relief, it might have attempted a different kind of exercise. What are the totals of expenditure incurred by the states on famine, including expenditure on taccavi, other subsidies, remission of revenue, remission of loans payable to co-operatives, etc? What proportion of the total expenditure has been incurred on relief works?

What was the wage component in the expenditure on relief works? In which areas was the expenditure incurred? Is there a high inter-state and intra-state variation? Did some districts also show a high inter-taluka variation?

Would these areas also necessarily coincide with areas of 'drought' or 'crop' failure?

Would it be possible to identify the talukas where "pauperisation of the population" tends to recur?

If so, would the dimension of the problem also become clearer? Can plan expenditure, committed as it is on projects commenced during the earlier plans, be diverted to these areas?

Has the Plan been framed with any reference to the levels of unemployment in these areas? If it has not been, how can it cope with the additional numbers thrown out of employment during a famine?

What would be the cost of maintenance of these paupers during an emergency?

What would be the long-term plan to reduce the numbers of those that now tend to depend on government for their subsistence?

Without asking any of these questions, how did the Finance Commission arrive at the answers?

Steel Complex

STEEL COMPLEX reports increased of about Rs 75 lakhs in the cost of its project. The revised cost also includes Rs 10 lakhs to be spent on certain additional capital items, not envisaged in the original estimate. The company is approaching the financial institutions for additional assistance. Regular production on arc furnace number one commenced in September 1973 and on furnace number two in February last. Delivery of concast plant, originally envisaged by about the same time as the furnaces, has been delayed partly on account of delay in receipt of import licence and partly owing to restrictions of power and oil experienced by the UK supplier at its factory. This plant is now expected to go on stream by January next. Meanwhile, the company has been producing ingots by the conventional method of casting. It has had to contend with initial problems with the second furnace. Moreover, shortage of cement and power in the country affected sales. The company's accounting year has been changed and during the 15 months ended June 1974 production and sale of ingots aggregated 13,736 tonnes and 11,032 tonnes respectively. Annual installed capacity is 37,000 tonnes and licensed capacity is 50,000 tonnes. On net sales of Rs 172 lakhs, the outcome was a deficit of Rs 40 lakhs, after providing Rs 17 lakhs for depreciation and Rs 23 lakhs for development rebate. The directors say the profitability will improve with the commissioning of the concast plant.

KERALA

Election Antics

Apararka

KERALA is one state where the people have not become habituated to Congress rule, and the main opposition to the Congress in the state, the CPM, is anxious to ensure that the next government will be one dominated by itself. At present, indications are favourable to the short-term success of the CPM and its allies. This is less because of any dynamic initiatives on their part than because of splits in the ranks of their opponents.

In particular, the Congress in Kerala is a divided party. While KPCC President Antony has, through some delicate footwork, managed to make himself acceptable to all except the diehard big-farmer wing of the party, the rest of his colleagues have separated into two broad camps, one under the Home Minister, Karunakaran, and the other comprising of the youth leaders. Among the latter is Vayalar Ravi, whose personal antipathy to Karunakaran is well known.

Sullen Attitude

Behind Karunakaran stand all but one of his four Congress ministerial colleagues, as well as the bulk of the traditional organisational structure of the party. The youth wing has gained control over a few district committees, notably Calicut and Trivandrum, but the bulk of its strength is located in the Youth Congress and the Kerala Students Union, both of which are even publicly adopting a very sullen attitude towards the government.

The maverick among the five Congress ministers is Vaikom Purushothaman, a newcomer to the Congress party. Purushothaman owed his quick rise in politics largely to the backing of the powerful owners of the *Kerala Kaumudi*, Kerala's third biggest newspaper. Paradoxically, it is this very connection which has cast a dark shadow on his political future now. This is because of the so-called 'Adiyodi affair'. Some weeks back the *Kaumudi* published a series of allegations of wrongdoing in the Forest Department and implicitly laid the blame at the door of the Finance and Forests Minister, K G Adiyodi, a Congressman. The charges concerning improper denudation of forests by private contractors were later reported to be untrue, and an outraged Adiyodi made the Kerala Government file a defamation suit against the paper. There had been bad blood between Adiyodi and Purushothaman, and attention naturally focused on Purushothaman as the probable source of the leaks of highly confidential papers to the *Kaumudi*. As a consequence, relations between him and his colleagues got further strained.

Another factor that has gone against the integration of Purushothaman into the Karunakaran group is his close identification with Vayalar Ravi, the *bete noir* of the Karunakaran camp. This privilege has been earned by Ravi because he is regarded as being responsible for the youth wing's frequent attacks on Karunakaran.

Senior party leaders have toned town this antipathy to some extent, so that these days at least externally all is calm between the factions. The finishing stage of "unity" between the factions is the despatch of the state Youth Congress President, P C Chacko, to Delhi as all-India Youth Congress General Secretary. Chacko is being replaced by the mild-mannered V M Sudheeran, whose relationship with Karunakaran is cordial. In contrast, Chacko was one of the fiercest critics of the powerful Home Minister.

Severe Splits

The most severe splits, however, are not those within the Congress but those between the Congress and other Front parties, in particular the CPI and the Muslim League.

The CPI leaders in the state have been making no secret of their disenchantment with the Prime Minister and the working of her government. This has created tension between the CPI and diehard loyalists within the KPCC, tension that has sometimes surfaced into public view. More important than this as a factor marking off the CPI from the Congress is the fact that the two are basically competing for the same base. This is particularly marked in the student/youth and trade union fields, where the Congress, under the aggressive leadership of its younger elements, has seized several unions and units from the CPI. The CPI, therefore, wants strong curbs on the younger elements in the Congress, but as these elements constitute a strong segment in the KPCC, no question of restraint exists.

The Muslim League too is adopting a wary attitude towards the Congress. Strenuous efforts have been made by Congress leaders to bring back the recalcitrant members to a pro-Congress stance, but so far without much success. The main argument used by the Congress ideologues is that the Prime Minister is waging a life-and-death struggle with RSS-Jan Sangh goondaism in Bihar, and that now is not the time to weaken her by jettisoning support for her party in Kerala. League leaders such as C H Mohammed Koya and E A Ahmed have also been using this line in discussions with their party workers and are hopeful of thus stemming opposition for the Congress in League ranks.

It is of course extremely unlikely that — barring a few tantrums — the Muslim League will desert the Congress alliance. The consequences of that on its leadership, and the fear of falling into the clutches of the CPM, will prevent such a total split. The same will apply to the CPI, which too will not want to go as far as a spilt with the Congress. By the time elections approach, therefore, a closing of ranks is likely.

Highest Stakes

The CPM is the party with the highest stakes in the present political struggle. Financially the party is almost bankrupt. Also, there is the threat of a split in its ranks, with the youth-student wing getting restive at the party's "parliamentary antics". The party's strategist, E M S Namboodiripad, is banking on two anticipated developments to stay afloat — one, that the CPM will grab about half the seats in the next Assembly; and two that the power of the Central government will the sharply reduced by the time the new Assembly meets, because of JP-type chaos. Given these conditions, he is hopeful of recreating a powerful financial and organisational base for the party in Kerala.

Namboodiripad's hundred per cent insurance against an election upset was his alliance with the Kerala Congress. With the help of the marginal votes attached to this party in the Malabar side, E M S hoped to increase the Marxist tally of seats there. Again, by preventing the Kerala Congress votes

from going to the Congress in the Travancore-Cochin area, he hoped to diminish the Congress success there.

The split in the Kerala Congress made his calculations go awry. While the John Jacob faction may not win many seats, it will cut into the support the CPM expected in Malabar, and into the seat totals in Travancore-Cochin. This split has been followed by criticism of the alliance of the Kerala Congress with the atheist Marxists by the Christian community. This has led to the fear that large numbers of Christians will abstain from the elections rather than vote for a coalition in which the CPM is the major partner. These developments have led K M George, the Kerala Congress leader, to have second thoughts about an alliance with the CPM. George is now keen on entering the Congress-led alliance, but is, presently at least, being met by a "wait and see" attitude on the part of the Congress leaders.

Source of Worry

A new entrant into the electoral scene has stirred up a considerable amount of dust. This is the National Democratic Party, the political wing of the Nair Service Society. Nairs have traditionally been Congress supporters, and the emergence of the NDP is therefore the source of much worry in the KPCC. The initial response was, as usual, to ignore it. But the NDP's success in the recent corporation elections in the CPM stronghold of Kesavadasapuram, in which it ran an impressive second to the CPM, leaving the ruling parties far behind has encouraged fresh thinking on how to meet this danger. While as yet no formal proposal of a poll alliance has come up, it is expected that the government will agree to the NDP's major plank, which is the extension of reservation for jobs to the economically-weaker sections of those communities now outside the system of reservations. Such a step would greatly increase the popularity of the government among the Nair and Christian communities, and would cut at the base of the NDP. Who knows but after this step the NDP may not merge with the Congress again!

The CPM has lost its revolutionary fervour in the state, and has been identified as no better and no worse than any other of the state's other political parties. There has been much cadre unrest as a consequence of the alliance with the Kerala Congress, and whole units such as the Cannanore one are in a state of simmering rebellion.

Perhaps as a consequence of this, the CPM has not been able to get its anti-government agitation moving in full gear. The demonstration when the Assembly opened was a bare ten thousand strong, small in a state where rallies of a lakh are usual. The attempts to prevent business being transacted in the Assembly backfired, as the ruling front partners quietly ignored the din raised by CPM members and passed several bills in a space of time of about a minute per bill. Once the total quota of business was transacted, the government prorogued the Assembly, leaving the CPM members fuming but helpless. The cynical last word on the entire affair was said by the Finance Minister Adiyodi, who stated that as a consequence of shutting down the Assembly a month ahead of schedule, the state government would save two-and-a-half rupees!

The Thirteenth Seminar on

MANAGEMENT BY OBJECTIVES

(February 3-8, 1975)

OBJECTIVE : Management by Objectives is a top management planning and control approach to improve performance of both the individual executive and the enterprise. The primary objective of this brief and intensive seminar is to provide deep understanding of this approach and to help the top executives develop commitment for Management by Objectives based on proper understanding.

CONTENTS : The Seminar will cover all the elements of Management by Objectives, including the concepts and methods, setting of corporate and unit objectives, action planning, improvement of managerial performance, management job description, performance review, management development, process of implementation and role of management adviser. Indian case histories of MBO practice will also be presented.

ELIGIBILITY . This is a top management seminar designed for the executives of the private and public sector enterprises as well as the Government. Only chief executives and top executives directly reporting to the chief executive participate in this seminar.

PROGRAMME DIRECTOR : Dr. B. L. Maheswari
FEE : Rs. 2000/- to cover course material, tuition, boarding, lodging etc.

LAST DATE FOR NOMINATIONS : December 30, 1974.

For brochure and nomination form please write to: The Programmes Officer, Administrative Staff College of India, Bella Vista, Hyderabad-500004

Grams : BELLAVISTA - Phone : 36952/56 - Telex : 015 - 390.

adventure

LABOUR

Miners in the Lurch

COALMINERS, numbering about 5.5 lakhs, are among the most wretched sections of the Indian working class. Local workers reside mainly in their villages and walk many miles to work each day. Immigrant workers, formerly brought in as the semi-serf CRO labour, continue to live packed in camps. Since labour was plentiful and cheap, and inquiries into accidents produced little results, private mine-owners ignored safety measures with impunity. This tradition is being continued by the governments' mine managements. The result is that the accident rate in Indian coal mines is amongst the highest in the world. More serious than accidents are the occupational/malnutritional diseases — TB and other bronchial disorders.

Numerous workers' struggles, particularly in the Bengal-Bihar region, have forced government to take certain regulatory measures — the latest of these being the Wage Board Award in 1967. In the period before nationalisation, the provisions of this semi-judicial award were barely applied, even in regard to those on the permanent staff of the mines. Many union leaders, whose strength lay in their capacity to bring pressure on the workers, were content to take money from the managements and not press for the implementation of the Wage Board recommendations.

Direct Interest

With nationalisation and the abolition of the CRO system there was an addition to the strength of the workers. At the same time the management was no longer as interested in denying workers their legally due wages. There was no immediate and all-round improvement in wages, but numerous struggles have forced individual managers and area general managers to implement the wage board recommendations. But this improvement was on the whole confined to the workers on the permanent rolls. Contract labour has continued unabated, even in those operations where it was forbidden by the Wage Board. In this sphere, the managers and other officials have a direct interest in the continuation of the system since they get a cut out of the difference between what the workers are paid by the contractor (not more than Rs 5 per day) and the minimum of Rs 8 per worker per day paid to the contractor by the company. Further, the number of casual workers and their turnover have been increased. This profits both managements and union leaders, who are able to regularly sell and re-sell these jobs to the masses of unemployed workers.

With the expiry last year of the Wage Board award, the bipartite negotiating committee for coal mines arrived at an agreement on a new wage structure. According to the agreement, the minimum basic wage would be Rs 325 per month as against the present Rs 130 and total wages would go up from Rs 319 to 384. Certain other benefits like underground allowance and house rent allowance would also be increased.

Longstanding Demand

The new agreement, however, has nothing on conditions of work. A longstanding demand of coalminers, which was rejected by the Wage Board but could certainly be implemented in the conditions of unified management relates to loaders. Loaders, who are piece-rated workers and work at the coal-face, have the highest accident rate among all workers. Those who, as a result of an accident or weakness, become unfit for loading are not taken in any of the higher time-rated jobs. The argument of the private mine-owners at the time of the Wage Board was that since they may not have sufficient time-rated jobs this would be a burden. In the present conditions of a single management it should be very easy to provide alternative jobs for those injured. This, however, does not figure in the new agreement.

Any agreement signed by the public-sector coal-mine management has to be later approved by the Ministry of Finance. The government is unwilling to accept this agreement signed by its own representatives.

Token Strike

Instead of uniting all major unions (AITUC, INTUC, CITU and HMS) to fight for their implementation and to present to the workers a semblance of struggle, AITUC and INTUC decided to go on a one-day token strike on October 7. The strike was fairly successful, but there was no immediate response from the government. The next stage of the agitation was to have been a two-day strike on October 28 and 29, followed by an indefinite strike from November 18. The two unions, not really wanting to press the struggle to a conclusion, have now postponed the next phase to November 25 and 26. The lame excuse given was that the new Energy Minister, K C Pant, had given "an assurance to consider on a top priority basis the implementation of the agreed decisions".

With the Congress opposition to the Railway strike and CPI's half-hearted participation in the same, it would be too much to expect that the INTUC and AITUC will really press on with the struggle for the coalminers' demands. If the demands are even partially satisfied, well and good: it will help these unions increase their membership. But to rely on the workers' strength and increase this strength in the course of the struggle would be dangerous for both the government and union leaders such as those of the INTUC and AITUC.

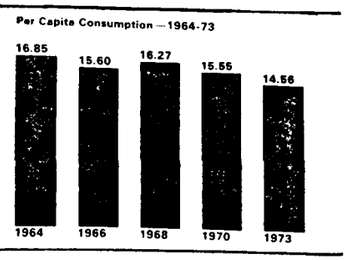
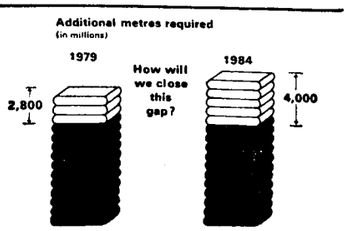
The Association of Polyester Staple Fibre Manufacturers



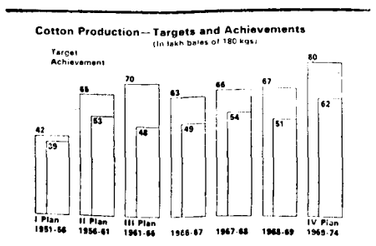
Excerpts from the speech by the President Mr B W Ritchie at the first Annual General Meeting in Bombay on 9th November, 1974.



"Given the opportunities the polyester fibre industry can provide the most practical and economic answer to meet our clothing needs."

India's clothing gap

After food, clothing and shelter are basic human needs, and one of the problems we are faced with is how to clothe India's growing millions. The population of our country is outstripping the production of the textile industry. Per capita cloth availability in 1964 was nearly 17 metres. Today it is 14.5 metres. The target for the Fourth Five Year Plan was 17.5 metres. This tells its own story: the growing clothing gap of India's millions.



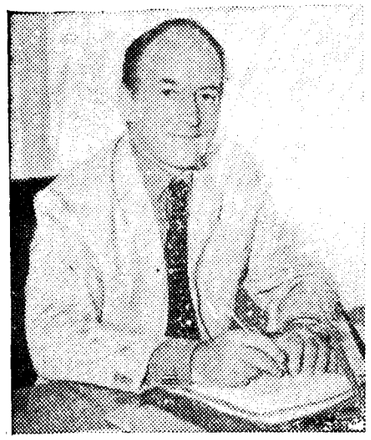
Looking ahead, if we are to achieve the objective of 17.5 metres per head by 1979, we shall need an extra 2800 million metres of cloth and by 1984 an extra 4000 million metres. This represents a 35% increase over the present availability in five years and a 50% increase over ten years. In view of the trends over the past ten years does this seem possible? It is, however, an urgent human problem that the clothing needs of the people must be met—and in the most economical way.

Do we have the resources?

Many expert committees have debated this pressing problem. The traditional answer would call for an assured annual production of 90 lakh bales of cotton by 1979. But the past performance clearly shows the difficulty of this task. Cotton production has averaged around 62 lakh bales for the last five years and there are many other pressing demands on our agricultural resources. The investment required is massive—Rs. 900 crores just to provide the additional equipment in the textile industry—not to mention the substantial increase in power generation and the additional requirements of fuel oil. At a time when the country is passing through severe economic difficulties are there other less demanding options?

Investment for producing extra 2,800 million metres of cotton cloth
Total Rs. 900 crores
for
6 million extra spindles
1 lakh extra looms

1,200 m.kw extra power
1 lakh tonne extra fuel oil

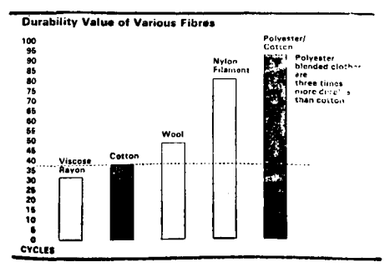


How have others faced the problem?

It is no accident of chance that people throughout the world are increasingly relying on synthetic fibres to meet their clothing needs. The whole world recognises that the prior claim on land is to produce food to feed the growing population. Our compulsions are no less—once we recognise the unquestionable priority for using our agricultural resources to increase food production.

Polyester Staple Fibre—availability 1973

	India	World
Availability	12,000 Tonnes	16,40,000 Tonnes
Population	574 Million	3,700 Million
Per capita availability	20 Gms.	440 Gms.



World per capita availability of polyester staple fibre is 22 times that of India.

Although the present high prices of crude have undoubtedly affected petro chemical products and synthetic fibres through out the world, it would be wrong to allow popular misconception to distort our thinking. A mere 0.4% of the total world consumption of crude, is used for the production of synthetic fibres which provide 30% of the world's clothing. And what's more important to us—they do not rely on either agricultural or forest resources. Under these circumstances, can there be any doubt about the importance of the contribution the synthetic fibre industry can make to meet our own clothing needs?

Polyester staple fibre—a luxury or a necessity?

Although still in a stage of infancy in India, the polyester staple fibre industry has already made an impact on the community. Surveys conducted by the Commerce Ministry and organisations such as SASMIRA, as well as our own Association, conclusively show that people, even in the lowest income groups, recognise the significant economic benefits that flow from the extraordinary durability of fabrics made from polyester fibre—in precisely the same manner as people do elsewhere in the world. Unfortunately, whereas in other countries polyester fabrics have been fulfilling the clothing aspirations of the least affluent sections of the community, yet in India today, the weaker sections of our population, cannot afford these benefits. Why is this so, and is it right that this should be allowed to continue?

Polyester prices—some misconceptions

It has been said, that the polyester fibre industry is solely responsible for the high prices of polyester clothing in India. This misconception must be firmly dispelled. A closer look at costs and particularly excise duties, will show that in reality the major responsibility lies elsewhere. Today, polyester fabrics bear excise duty at every stage of manufacture—from DMT to the final cloth—and in less th five years the incidence has risen fro Rs. 50/kg to over Rs. 100/kg of fibre made into cloth. It is primarily the heavy burden of excise duties—adde to the raw material cost which is fou times higher than world prices—whic bears the responsibility for the high prices of polyester fabrics, and has served to deny their benefits to the most deserving section of our population.

Total excise levy on cloth made from 1 kg of Polyester Staple Fibre

1969		1974	Difference
Nil	DMT	Rs. 4.20	
Rs. 28.00	Polyester Staple Fibre	Rs. 40.00	
Rs. 21.00	Polyester Spun Yarn	Rs. 22.50	
Rs. 1.55	Polyester blended cloth	Rs. 34.41	
Rs. 50.55	TOTAL	Rs. 101.11	100%

Effects of present policies

Polyester capacity in India was licensed with the laudable objective of saving foreign exchange by substituting imported cotton and wool. Even today, when the polyester fibre industry is operating at less than 40% of capacity, imports of cotton and wool are still being encouraged while the country is faced with severe problems of foreign exchange. Is it right that scarce foreign exchange resources should be used to subsidise the foreign farmer, at the expense of the country's polyester industry on which Rs 60 crores have been invested?

Not only do we appear to have lost sight of the original objectives, but we are not realising the other substantial benefits which can flow from full utilisation of the industry's capacity. Much has been said about the role that synthetic filament yarns are playing in providing employment to the relatively small art silk sector which caters to the elite. But we seem to have overlooked the potential benefits polyester fibre could provide to over 70 lakh people employed in the decentralised sector of the vast cotton and wool industry.

Polyester staple fibre—a practical answer

Given the opportunities, the polyester fibre industry can provide the most practical and economic answer to meet our clothing needs. Polyester fabrics, with three times the durability of fabrics made from natural and cellulosic fibres, require correspondingly less investment and resources to meet equivalent clothing needs.

It is in the overall interest of the country that the capacity that already exists should be fully utilised. But this will not be possible, until realistic fiscal levies and raw material prices enable the industry to play its rightful and constructive part.

Note: This does not purport to be a record of the proceedings of the meeting.

CHAITRA

Flight from Famine

MANY people from the famine-stricken areas of Maharashtra have migrated into Bombay, in search of food, shelter, and employment. Even now, the stream of people coming to Bombay from the villages is unabated. Most of these immigrants are from the districts of Aurangabad, Osmanabad, and Parbhani of the Marathwada region of Maharashtra. A large number are from Buldhana, Sholapur, and Nagar. Some have even come from Gulbarga in Karnataka state.

A majority of the immigrants are Buddhists; a large number belong to the Matang community (one of the scheduled castes in Maharashtra); and several of the others belong to such backward castes/tribes as Laman, Vanjari, Pardhi or Dhor. A few belong to the upper castes. Some are owners of four to five acres of land, but most are landless labourers or small farmers cum farm labourers.

These people are new to Bombay. They have not moved here out of any knowledge of opportunities but have been driven here out of desperation and hunger at home. Indeed, they seem ignorant of both the opportunities and the hazards of a metropolitan city for persons without established means. Initially, they camped on the railway platforms for shelter. Platforms, from Dadar to Kalyan on the central railway and from Dadar to Borivli on the Western Railway were strewn with these families — without material security, without knowledge of what they could or could not hope for in these alien surroundings. Recently, the railway authorities, with the help of railway police, drove them off the station platforms. The families are now living on the road-sides, or in lanes where the traffic is relatively sparse. They are seen in especially large numbers in the suburbs of Kurla, Bhandup, Thana and Kalyan on the Central Railway line, and in Mahim, Khar, Santa Cruz, Vile Parle, and Andheri on the Western Railway line. At Kurla alone, at least 100 such families have been about for not less than two to three months.

The immigrants have been treated with scant consideration by the railway authorities and the railway police. Many were beaten up mercilessly by the railway police, some were arrested on trivial charges such as 'suspicious movements', and some just disappeared without trace. This correspondent, on one outing, came across two aged people who had so disappeared; the wife of one of them, with four children to feed, reported that her husband had left to get some alms, never to return; the old woman herself is seriously ill. Local goondas and bullies also exploit these newcomers to the city. Their belongings are stolen, or they are induced into shady activities without their realising the implications of what they are doing. A family from Jalna bemoaned that all their belongings had been stolen by goondas on the very night of their arrival. An old man of 70, who has come with his teenage grand-daughter, looks so ill that he might die any time as he goes in search of food and work.

The immigrants, meanwhile, move about in search of work. Sometimes they get work as coolies or hamals. They then earn Rs 3-4 per day. But the work is sporadic and not assured. Besides, many of the rustics do not quite know how to go about winning employment. They subsist, at times, with food obtained from various restaurants and homes — stale food which, instead of being thrown away, comes to them. When they run out of food or work for any length of time, they turn to begging — though, even here, they lack the skills of the accustomed urban beggars. Many of the immigrants are still hardy-looking village men; they do not make good candidates as beggars. It is anyway shameful and insulting for them to have to beg. Thus those who cannot beg skilfully are simply ill with undernourishment and starvation. Many small children are emaciated and dying because their mother's milk has gone dry, and a few cases of infant deaths due to starvation have been reported.

At least 10,000 homeless persons have thus arrived in Bombay. Yet no organisation or party has got exercised about their plight. The government could not, of course; for that would show up that the conditions in the countryside, for which it is responsible, are indeed bad. Hence the Press, too, has not taken this issue. Just a few 'human interest' stories appeared, and that was that. The Yuvak Kranti Dal and some workers of the Socialist Party tried to organise the immigrants; on October 9, they organised a morcha to the Secretariat in order to focus attention on the numbers involved and their plight. A delegation of the morcha met Chief Minister Naik. Naik promptly promised to hold a survey of the immigrants and to provide them with jobs at Tarapur. The survey — ostensibly to find out where the immigrants are from, why they have come here, how they are living — is going on, but seems only a way of postponing the time when the authorities will really have to take action to employ them or to take care of them in some way. Naturally, to date, no arrangement has been made to give jobs to the immigrants. In any case, Tarapur, where the jobs are to be hopefully found, has been entrusted to the State Industrial and Investment Corporation of Maharashtra (SIICOM) for development to attract private industrial projects. The availability of jobs there depends, therefore, on decisions by the private sector. Any immediate fructifying of that source of employment may well be written off.

Meanwhile, reports have it that orders have been issued to all district collectors for provision of work to would-be immigrants under the Employment Guarantee Scheme. The government, which has refused to admit to famine in parts of the state, will obviously not consider starting drought relief work in such areas. In any case, the finance provided under the Employment Guarantee Scheme is reportedly so meagre that it will very likely get absorbed in the 'preliminary work' of the Scheme.

A telling comment on the more militant groups in the city is to be had from the following observation. A bulk — about 95 per cent — of this inflow of people belongs to the scheduled castes. Yet, even an organisation such as the Dalit Panthers, dedicated specifically to the uplift of the Dalits, has not bothered to take note of these brethren. There are many so-called Republican Party people too among these immigrants; but they do not know where their 'leaders' are located in Bombay, nor what they might rightfully expect as support from these 'leaders'.

The districts mentioned earlier have experienced drought conditions since 1970. A drought is torture to the small farmers and landless labourers, whose only option is to leave their villages and homesteads — moving from place to place in search of food, shelter, and work. By experience, famines are almost more regular than the monsoons. And while much more sweeping land reform and restructuring of agricultural activities will have to take place before the famines can be prevented from regularly stalking the countryside, the least that political activists and parties can do till then is to educate and organise those affected by the famines today in their own areas so that the day of deliverance might be brought closer.

MALAYSIA

Electoral Arrangements to Fudge Class Lines

Ratna Dutta

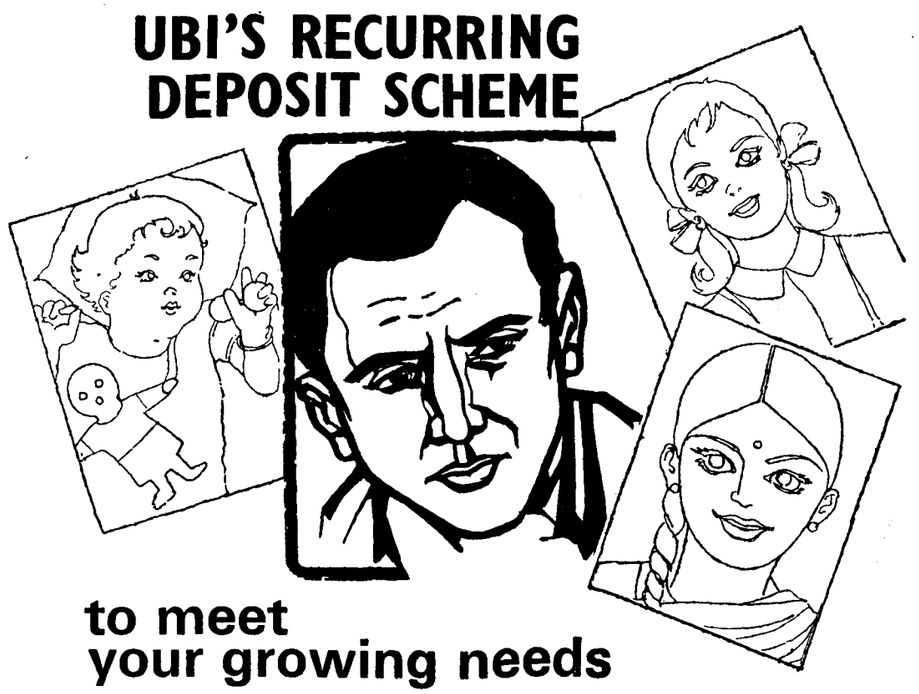
THE National Front, which recently won the general elections in Malaysia, is the outcome of sustained efforts to dilute communal tension by giving to the leaders of such opposition adequate representation in government. This Malaysian method of containing communal rivalry makes interesting study.

The communal conflict in Malaysia is among the three national 'minorities' of the Chinese, the Indians (mainly Tamilians), and the Malay Muslims who are in fact the original inhabitants of the Peninsula. The Malays constitute 46.8 per cent, the Chinese 34.1 per cent, and the Indians 9 per cent of the population (1970 census). The rivalry, however, is mainly between the Malays and the Chinese, and stems from the fact that whereas the Chinese hold the economic levers in their hands the Malays dominate the government and politics of the country. The communal calculus thus plays a major role in the electoral process.

During the Municipal elections in Kuala Lumpur in 1952, the Malayan political party, the United Malay National Organisation (UMNO), and the Chinese party, the Malay Chinese Association (MCA), formed an electoral alliance between themselves to confront the ideology of the non-communal Independence of Malay Party (IMP). The approach of the alliance was the straightforward one of putting up Malay candidates in predominantly Malay constituencies and Chinese candidates in predominantly Chinese constituencies — on the assumption that the electorate was prone to trust representatives from their own community. It was the success of the electoral alliance in the Kuala Lumpur Municipal elections which gave the impetus to the Alliance Party.

The Alliance Party consists essentially of a collaboration among the three communally based political parties — the UMNO, the MCA, and the MIC (Malayan Indian Congress). One might underline the fact that the initiative for the Alliance came from the Malays who are the single largest community in Malaysia. The Malay political elite continued the strategy, adopted in the 1952 Kuala Lumpur Municipal elections, at the 1955 general elections when it was not really necessary for electoral victory. For, in 1955, the Malays consisted of 84.2 per cent of the electorate, with, at that time, 75 per cent of the Indian and Chinese citizens under 21 years of age. The UMNO thus, could well have swept the polls on its own at that time, but it chose an alliance with MCA and the MIC. That is how all the communities happened to be represented in Parliament and Cabinet — each through its own political organisation — during the crucial months preceding the drawing up of the 1957 constitution and the transformation of the country from dependent to independent status. There was, therefore, relatively little bickering among the communities over the terms of the 1957 Constitution. One might even assert that the agreement among the communities on the provisions of the new constitution was arrived at beforehand, by the peculiar mechanism of the Alliance Party system which had captured the necessary representation in the legislatures.

For more than a decade the Alliance Party system worked well to keep the lid on communal ill-feeling. By the end of the sixties, however, the increasing gap between the aspirations and the economic wellbeing of the masses put a greater load on the Alliance system. During the 1969 general elections, it became clear that the upper-class Alliance members were losing popularity among the masses of all the communities. The discontent among the masses was taken advantage of — ironically — by political entrepreneurs with extremist communal leanings. The Alliance emerged from the May 1969 elections with greatly reduced strength in the Parliament and the state legislatures. More seriously, the victory parades at the end of the elections led to communal violence, so severe as to invite the declaration of 'national emergency' by the government and the temporary liquidation of Parliament and other institutions of 'democratic government'. Tunku Abdul Rahman resigned, leaving Tun Abdul Razak in charge during the 21-month emergency period.



While Razak allowed the extreme communal parties to form governments in the states where they had the support of the majority in the legislatures (namely Kelantan and Penang), he must have even then started to plan the Nationalist Front. The Nationalist Front, which captured power in the elections recently, consists of a coalition of nine parties. Significant among these are the Pan-Malaysian Islamic Party (PMIP), the Parti Gerakan Ra'ayat, and the People's Progressive Party (PPP).

The PMIP is the spokesman for extreme Malay communalism and Malay poverty. The PMIP articulates the interests of the relatively backward east coast states of Kelantan, Trengganu, Kedah, and Perlis. These states are inhabited mainly by Malay peasants who are devout Muslims and have little modern education. Party campaigns reach them through the *kampong* (village) school and religious teachers. They promise them an exclusively Malay-dominated Islamic state, to ease rural poverty and to clip the wings of Chinese trading activities. UMNO's answer to the PMIP challenge has been a greatly accelerated rural development programme. But development programmes in Malaysia, as elsewhere, are no panacea for rising aspirations. The PMIP leaders have been suggesting that Chinese contractors, Chinese traders, and Chinese, and Indian labourers, have been the beneficiaries of the rural development programmes. So eventually, Tun Abdul Razak resorted to the traditional Malaysian strategy, offering PMIP leaders seats in the Treasury Benches. Razak concluded an agreement with PMIP in December 1972, to form coalition governments both at the federal and state levels. The PMIP was represented in Razak's Cabinet by its President, Dato Haji Mohammad Asri, who gave up his demand for an Islamic state in Malaysia.

Non-Malay opposition to the Alliance comes from the PPP, the Gerakan, and the Democratic Action Party (DAP). Among these, only the DAP held ground and refused coalition with the Alliance. It will now function as the legal opposition (with nine members) in the Parliament. The first coalition agreement with the non-Malay opposition was reached as early as in February 1972. This was the coalition government, formed by Gerakan and the Alliance in Penang "in the interests of national unity, stability and security". The coalition was active both at the federal and the state levels. Later, coalition agreements were reached with the PPP and the Sarawak United People's Party, with deep roots in Perak and Sarawak,

respectively. The recent elections were tactically held 18 months ahead of schedule, to seek the voters' support for the Nationalist Front which has been functioning for the last two years.

The Malay ruling circles thus seem to have learned from the May 1969 disaster that there was need for greater vigilance in order to allay racial tensions. What is important in Tun Abdul Razak's success is not merely that the Barison National (National Front) should have swept the polls, gaining majorities in all the 11 states and in the Parliament, but that the bitter edge of communal ill-feeling will have been electorally blunted for some years at least for lack of spokesmen — either for its cause or to turn it to a class war spanning all the communities.

to meet your growing needs

When do you **next** need a tidy sum?

Here's the way to save in a **planned** manner. Save every month any **fixed** amount between Rs. 5/- and Rs. 500/- according to your **capacity**. Select your **suitable** term and watch your savings grow at **compound** interest!

Even **small** amounts put by regularly grow into a useful sum. A monthly deposit of Rs. 10/- for 72 months will amount to only **Rs.720/-**. But UBI will pay you **Rs. 983/-**. Open a Recurring Deposit Account today.

New Garb of Imperialistic Historiography

C S

Locality, Province and Nation: Essays on Indian Politics, 1870 to 1940 (ed) John Gallagher, Gordon Johnson and Anil Seal; Cambridge University Press, 1973; pp vi + 326; £ 3.50.

IT is a shame that the study of Indian nationalism still remains what it always has been: an arena for the clash of interests and ideologies. That this very simple fact has some unsuspected ramifications which, precisely because they are unsuspected, subtly and insidiously colour the perception of even eminent Indian historians should be clear to any serious student of the historiography of Indian nationalism. The intellectual history of modern India and the dynamics of material self-interest have combined inextricably to create a situation in which intellectual and extra-intellectual factors, at both the conscious and the sub-conscious planes, operate to blur the perception of the actual phenomenon of Indian nationalism. This is about the pithiest explanation possible of the basic contradictions that characterise the writings of most Indian historians on the subject. For these contradictions are more or less the projections of the material and intellectual predicament of their authors.

In this twilight of historical perception, which is sustained by the continuing interaction between intellectual unclarity and material pressures, one shudders to think of the possible consequences of the appearance of a sinister volume from the Cambridge University Press; especially because it is bound to retard the growth of Indian historiography of Indian nationalism.

This is bound to happen because modern Indian historiography has by and large been derivative or/and reactive. Given their situational placement in terms of the intellectual-material complex which sustains the twilight of perception, Indians will either perpetuate the spurious history that Anil Seal and Co have been for some time busy manufacturing; or else they will waste precious human resources on disputing and disproving it. The problem is a real one, rooted as it is in the contemporary Indian situation with the experiential texture and pattern of responses that it makes available to the average individual.

The statement is not one of doom. It contains within it elements of voluntaristic emancipation. For history is a kind of perception the clarity of which is commensurate with the degree of self-understanding achieved by the mind attempting the perception.

From these preliminary remarks it follows that while the volume under review possesses substantial potential for mischief, it does not deserve a detailed refutation. Those who are not carried away by forceful English alone or by an English print line will have no difficulty in realising that the authors of this collection of essays have adopted a very limited approach to the study of modern Indian history, and have in the process distorted the very reality of it. Since the dimensions ignored by them happen to be of glaring significance, and the final picture that emerges from these studies considerably rehabilitates British imperialism — occasional jibes at it notwithstanding —, it is too much to believe that purely methodological considerations have gone into the adoption of this particular approach, and that the resultant distortion of reality has been only fortuitous.

There are, it seems, two broad divisions of British imperialistic historiography so far as the study of Indian nationalism is concerned: Liberal and Tory. Liberal imperialistic historiography recognised the emergence of what was called New India, and attempted to present it as the result of a carefully planned British Indian policy. Notable contribution has been made to the development of this trend of imperialistic historiography by eminent Indian historians though among themselves they might have nothing in common except their homage to the tenets of Liberal imperialistic historiography.

The Tory imperialistic historiography premised quite early in the day that India was a notion and utterly incapable of ever becoming a nation. One should have hoped that 1947 had irretrievably buried this notion of Tory imperialistic historiography, and that names like Herbert Risley and John Strachey would give way to John Seeley who at least had the merit of logical caution when he posited a dichotomous relationship between imperialism and nationalism even as he thought, or hoped, like Risley and Strachey that Indian conditions were inimical to such an eventuality. The hope has been belied by the emergence of reincarnations of the Risleys and the Stracheys who, so late in the day, have denied the reality of Indian nationalism.

Pretending to be inspired by Lewis Namier, the authors of the Essays under review have made no attempt to apply the methods with the help of which Namier had arrived at his conclusions. They have conveniently overlooked the fact that each 'historical universe' demands its own methods and methodology, and that conclusions reached elsewhere cannot just be imposed on it. They have talked of a matching structure of politics which Indians of necessity had to devise because they had to deal with the *raj* at various levels. This was done through linkages at the local, provincial and national levels. And at each level could be seen in operation a patron-client model, the model operating in response to the pursuit of power and interest. There are some deviations, as in C A Bayly's article on 'Patrons and Politics in Northern India', which permit a less constricted look at the objective reality. But there is no major departure from the basic approach to the study of Indian politics between 1870 and 1940, which has been admirably presented by Anil Seal in his opening article in the volume. In the process Seal has moved somewhat away from his position of 1968. (See "The Emergence of Indian Nationalism" reviewed by Sudhir Chandra in *Economic and Political Weekly*, September 7, 1968, pp 1363-64.) Though he has done so for the wrong reasons; and his 1968 stance retains the dubious merit of looking at the reality from the narrow angle of politics. It is significant that the Essays deal with politics and do not talk of nationalism.

This is a narrow framework, too narrow to comprehend the historical reality in its totality. While almost touching — and in any case implying their validity —, the fringes of arenas that lay apart but not in isolation from politics, this framework takes care of only the political dimension of the complex situation that gave birth to modern Indian politics. True, in any colonial situation, the interrelation between the structure of imperial authority and the matching structure of politics devised by those obliged to

react to the presence of imperialism cannot be ignored. Also, the role of interests becomes crucial in this interrelation. But no aspect of 19th-20th century Indian socio-political history can be studied without taking into consideration the emergence of a new category of social cohesion with its own phenomenon of group consciousness, as also its changing relationship with the phenomenon of traditional social cohesion and group consciousness. A very significant aspect of the study of pre-1947 Indian politics — and it can never be emphasised too much that this politics forms an integral part of the rise of nationalism in India — is provided by the simultaneous weakening of traditional loyalties and the gradual stabilising of new group loyalties. In other words, there were constraints within which perceived material interests were able to operate: the structure of traditional authority within the colonial society dictated the limits within which a member of it could act in accordance with his perception of his own interests. Not that the structure of traditional authority was a fixed quantity. It was also responding to the forces unleashed by the imperial authority, and was consequently losing not only some of its traditional areas of control, but also the degree of its control in areas in which it continued to wield influence. Whatever the pace and nature of this diminution of traditional authority, the mentality of people responding to the existence of imperialism was only slowly modified by the new situation. The old grooves of thought were only slightly flattened by the ethos coming in the wake of foreign imperialism. What is perhaps more important, the continuing hold of traditional social units and the mentality associated with their survival influenced the kind of response elicited by imperialism. More than mere interests, or pursuit of power, would be required to explain pre-1947 Indian politics.

What is needed is a series of attempts at discovering the totality of the situation which made possible the emergence of what is conveniently called modern India. Piecemeal efforts are unlikely to help in the reconstruction of the historical reality of modern India. Motivated or otherwise, they will continue to distort both the perspective and the reality.

Prisoner Can Do Nothing for Himself

A G Noorani

Amnesty International: Annual Report, 1973-74; Amnesty International Publications, 53, Theobald's Road, London, WC 1, X, 8SP, UK; pp 88; 75p ($ 1.85).

IF the Government of India found Amnesty International's figures of political prisoners who have been detained without trial in West Bengal to be a "gross exaggeration", it is clearly out of wilful choice. Amnesty International's Secretary-General, Martin Ennals, sent Amnesty's findings to Prime Minister Indira Gandhi, but received no reply.

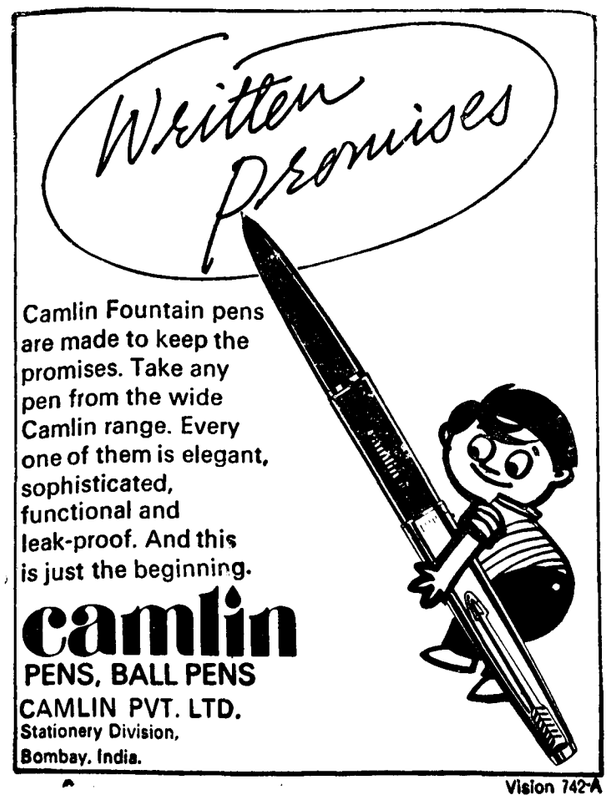
Amnesty's Annual Report for 1973-74 gives a fair picture of its concern and its techniques. As Ennals writes in his Introduction: "The full and part-time staff of the International Secretariat now numbers some 70 persons, including an Information and Publications Department, a Campaign Staff for the Abolition of Torture, a Special Co-ordination Unit to work closely with sections and groups, separate research units on Africa, the Americas, Asia, Europe and the Middle East, and volunteers ... Amnesty International has always been fortunate in its staff: young people, on the whole, who have acquired before joining the Secretariat a degree of expertise in their field of work, which has to be adapted to the rather specialised needs of the organisation. An International Secretariat of some 16 nationalities, covering the problems of 100 countries, and unable to offer the advantages of international salary scales and allowances, is not easily recruited or maintained."

Amnesty has a Research Department headed by Stephanie Grant. Her comments deserve particular attention in view of the controversy over the report on West Bengal: "In the year covered by this report, June 1973-May 1974, Amnesty International took action directed towards the release of prisoners in over 100 countries: 26 missions were sent to observe trials, negotiate with governments and collect information in a total of 27 countries, 2,190 prisoners' cases were written up for groups, and 1,080 of those already under adoption or investigation were released. As this report is written, 1,483 AI groups are working for a total of 3,640 prisoners, a figure which represents a net increase of 900 since May 1973." She adds: "Except where a political situation has undergone radical change during this period, we do not describe the phenomenon of political imprisonment in each country, but rather report the action taken by AI to change it. So, in the case of Chile, where AI has faced an entirely new situation since September 1973, the political context of imprisonment is shown in more detail than, for example, in the USSR, where the form taken by political persecution remains constant. Figures for the total number of prisoners in a country have been given only where the Research Department can support the estimate with facts."

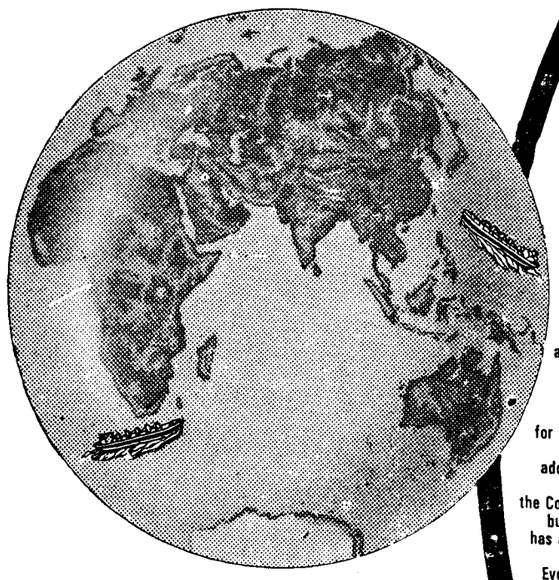
Such is the meticulousness of the organisation in ascertaining the facts. The least that could be expected of the authorities in ostensibly democratic societies is co-operation with it in the sifting of evidence. The Report consists mostly of situation reports, country-wise, which are written with an impartiality which compels admiration. The persecution of dissenters in the Soviet Union by the vilest of methods (such as internment in mental hospitals), and the brutalities perpetrated by the military junta in Chile, are set out here for all to read.

Of India the Report says: "Some 1,740 Left-wing political prisoners held in West Bengal were to be released under an important decision of the Supreme Court which ruled on April 19, 1973, that arrest under the Maintenance of Internal Security Act (MISA) was illegal. But most were immediately re-arrested either under other sections of the same Act or on different charges. In October, Secretary-General Martin Ennals wrote to the West Bengal Home Minister asking for information about 66 cases. AI estimates the number of political prisoners held in West Bengal to be as high as 20,000, of whom 18,000 have not been charged in court. Most detainees are held under preventive detention legislation, in force since the ending of the Pakistan war: the Defence of India Rules and the Maintenance of Internal Security Act. But those prisoners accused of Naxalite activities are held on a variety of criminal charges. AI knows of very few cases where prisoners were brought to trial. In a letter to the West Bengal Chief Minister in February 1974, Martin Ennals expressed AI's great concern about the situation and urged that the prisoners be brought to trial as soon as possible, or, in the absence of criminal evidence, be released immediately. Many have already spent some three years in prison without trial.

"The first general railway strike, which started on May 8, 1974, at a time of economic crisis, provoked a very strong government reaction and massive arrests. AI estimates that 30,000 trade unionists were detained, most held under preventive detention laws. Those arrested included not only members of the strike action Committee and leading trade unionists — like George Fernandes, a Member of Parliament, who is also a member of Amnesty International — but also railwaymen who participated in the strike. Martin Ennals sent a telegram and a letter protesting strongly against the arrest of people 'for exercising what are generally recognised as legal trade union rights'. The International Secretariat organised an urgent action campaign for all national sections to demand the immediate release of all prisoners held under preventive detention. On May 27, the strike was called off. Although large numbers of prisoners were released, among them Fernandes, some thousands remain in detention, charged with specific offences."



Pakistan's record in civil liberties has long been a sorry one: "Under the emergency, the Defence of Pakistan Rules (DPR) remain in force, and their application is presently AI's main concern in Pakistan. These rules provide for preventive detention and place the burden of proof on the defendant in a bail application. Special tribunals are empowered to deal summarily with offences carrying prison sentences of more than seven years. ... These powers of arrest and detention are being used broadly to detain dissenting editors, journalists, publishers, politicians and even lawyers and judges, some of whose cases AI has adopted. It is significant that all 100 *habeas corpus* petitions before the High Court of Sindh and Baluchistan from January 1972 to June 1973 were successful as the court could find no grounds for detention. The short prison terms mean that AI groups are working for only 15 cases, a figure which in no way reflects the scope of political detention under the DPR."



The situation in Bangladesh too is far from happy: "Political prisoners are not, however, only detained under the Collaborators Order. A progressively deteriorating law and order situation has led to the enactment of President's Order Number 50, originally devised to deal with offences like hoarding and black-marketing. Its wide powers of arrest, detention without trial, and denial of bail were increasingly used to detain large numbers of members of the left-wing opposition, particularly the JSD (Jatijo Samajtantrik Dal), a matter about which AI expressed concern to the Prime Minister in December. In February 1974, Presidential Order Number 50 was repealed, but immediately replaced by two orders which were severely criticised by various prominent persons and organisations inside Bangladesh, such as the Bar Associations.

"The Special Powers Act, passed in February 1974, allows for detention of people without trial — in fact, indefinitely but with certain legal safeguards — to prevent them from indulging in 'anti-state activities' and from printing or publishing reports which are deemed prejudicial. At the same time, the Rakkhi Bahini, a para-military armed force, was endowed with very wide powers of arrest and detention under the Rakkhi Bahini Amendment Act, and its members were allowed immunity for their actions from scrutiny by the courts. These new powers were used both to detain journalists — Shamsul Alam, editor of the weekly *Nayajug*, and Al. Mahmud, editor of *Ganakantha*, are both presently adopted by AI groups — and an estimated 2,000 members of the JSD, including its leaders A S M Abdur Rab, M A Jalil and Mumtaz Begum. They were arrested by the Rakkhi Bahini following a JSD protest demonstration at the house of the Home Minister on March 17, 1974, in which at least five JSD supporters were killed. AI, at the moment of writing this Report, is still collecting details about these last arrests. It has learned with pleasure that a Committee for Civil Liberties and Legal Aid, called 'Samakal', and consisting of prominent Bengali citizens, has been formed in Dacca, its main aim is to provide legal aid to prisoners held without trial."

The Amnesty's Report is thus a most useful document and makes one feel thankful that there is an organisation such as this working the way it has been working for nearly a decade and a half. For truly, as the Report says, the political prisoner "can do nothing for himself: our freedom gives us both the opportunity and the duty to do what we can fashion."

The establishment of an Indian Section of Amnesty was due almost entirely to the untiring efforts of Mridula Sarabhai. It makes one sad to think that this valiant fighter for liberty is no more.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

NILHAT SHIPPING CO. LTD.

(Incorporated under the Companies Act, 1956.)

Regd. Office: 'Nilhat House', 11, R. N. Mukherjee Road, Calcutta-700 001.

ANNOUNCEMENT REGARDING THE ISSUE OF 10,20,000 EQUITY SHARES OF RS. 10/- EACH FOR CASH AT PAR

Board of Directors:
Shri D. C. Kothari, (Chairman),

The above underwriters brokers (except the Financial Institutions, Insurance Companies and Banks) are also acting as Brokers to the Issue.

How to Apply

1. Obtain copies of Prospectus and Application Forms from the Registered office of the Company and/or from the Brokers, Underwriters, Bankers and Managers to the issue mentioned above.

2. Fill and sign the Application Forms (Applications must be for 50 shares or for multiples of 50) and deliver them together with Cash or Bank Draft or Cheque at the rate of Rs. 5/-per share to any of the branch of Banks listed in the application form: Cheques and Drafts should be drawn on Bank/s situated in the town where applications are submitted.

Opening Date
Monday, the 18th November 1974

Closing Date
Thursday, the 28th November, 1974, but not earlier than Thursday, the 21st November. 1974

History:
The Company was promoted by J. Thomas & Co. Pvt. Ltd., Calcutta, on 20th August, 1973, and commenced its business on 10th October, 1973.

Objects of the Issue:
The Issue is being made for providing finance required for working capital, repayment of unsecured loans from the promoters, and to meet part of commitments on foreign currency loans.

Project and Progress:
In February 1974 the Company purchased two 24,600DWT sister-ships namely M. V. Falkanger and M. V. Fossanger (since renamed as M. V. Alexandra 'N' and M. V. Charisma 'N') respectively)from M/s. Westfal Larsen & Co., A/S of Bergen, Norway, each at a price of U. S. $ 7,200,000. Identical in all essential respects, each ship is equipped with the latest navigational aids and cargo handling equipment. The Company has entered into two separate Agreements in December, 1972 with Messrs. Himoff Maritime Enterprises Ltd.—a large American Company, under which the Company chartered both the ships at very attractive rates for a period of 24 months for world wide trading within Institute Warranty limits. Under the terms of the Time Charter Agreements, the cost of bunker fuel is entirely on account of the Charterers. The Company has also entered into an agreement with Mackinnon Mackenzie & Co. Pvt. Ltd., Bombay, a Member of the P & O Group, one of the largest shipping combines in the world. Under this agreement, the Company will have the benefit of their association in all operational aspects of international maritime trade.

Prospects and Profitability:
Shipping Industry in India is still in a nascent stage and the scope for profitable expansion appears to be limitless. The estimated 5th plan target for Indian Shipping is 8.6 million tonnes GRT which means adding a million tonnes of shipping strength each year to the country's tonnage. Based on their faith in the shipping future in the country, the Company is planning to initiate negotiations for purchase of additional bulk carriers of similar tonnage in the immediate future. The Company has also plans to diversify in other correlated shipping activities such as coastal shipping, inland water transport and chartering in of ships. Even on its present operation of two bulk carriers, the projected return on capital employed is quite remunerative in the overall context in India. Considering the commercial expertise and knowledge of the Directors and the Company's operating agents, the growth prospects appears to the bright. The Directors consider that, barring unforeseen circumstances, the Company would be in a position to pay a reasonable dividend after the second year of operation. Development Rebate is admissible to the Company in respect of the two ships purchased.

Share Capital:

Authorised:	
20,00,000 Equity shares of Rs. 10/- each	Rs. 2,00,00,000
Issued, Subscribed and fully paid-up:	
6,80,000 Equity shares of Rs. 10/- each	Rs. 68,00,000
Present Issue:	
10,20,000 Equity shares of Rs. 10/- each	Rs. 1,02,00,000

Terms of Payment:
On application: Rs. 5 per share
On allotment: Rs. 5 per share

Applications are being made to the Calcutta [illegible] Bombay Stock Exchanges for permission to deal in and for an official quotation for the Equity shares of the Company.

Educational Opportunities for the Scheduled Castes

Role of Protective Discrimination in Equalisation

Kusum K Premi

Marked progress has been made by the scheduled castes in education, as is manifest from the rise in their literacy rates, enrolment co-efficients and the proportion of their numbers in Class I and II categories of jobs in Central and state services.

Two questions still seem relevant from the oint of view of equalisation of educational opportunities for the scheduled castes vis-a-vis *others.*

(1) To what extent can this educational progress be attributed to the special concessions?

(2) Is the scheme of special facilities conceived in the spirit of ensuring equality to all the members of the scheduled castes or, in the process, do they suffer from deficiencies that tend to create certain subtle inequalities among them?

FOLLOWING the guiding principles of State policy enshrined in our Constitution which assure social justice and equality of opportunity to all, several special facilities are offered to the scheduled castes in higher education[1] to help them overcome the handicaps arising from deep-rooted inequalities and to enable them to secure the same opportunities and position in life as others. Marked progress has been made by the scheduled castes in education, as is manifest from the rise in their literacy rates,[2] enrolment co-efficients[3] and the proportion of their numbers in Class I and II categories of jobs in Central and state services.[4]

Two questions still seem relevant from the point of view of equalisation of educational opportunities for the scheduled castes *vis-a-vis* others.

(1) To what extent can this educational progress be attributed to the special concessions?

(2) Is the scheme of special facilities conceived in the spirit of ensuring equality to all the members of the scheduled castes or, in the process, do they suffer from deficiencies that tend to create certain subtle inequalities among them?

Both these questions are pertinent today. The first one, because time and again we are confronted with the question whether to continue or discontinue the facilities and privileges, as it is stressed that these are justified only as long as they remain temporary.[5] Heated arguments often take place in Parliament on the working of these privileges and on the question of their continuance. There are some who not only want these privileges to continue for an indefinite period but also plead for widening their scope; there are others who wish them to be scrapped as they have been in operation long enough. In view of the heavy pressure on public resources and all round narrowing of opportunity in the Indian economy the second group seem to be gaining ascendancy.

The second question assumes importance because, of late, a number of social scientists are becoming critical of the manner in which the whole scheme of distribution of educational privileges is operating and are expressing misgivings about its outcome. Suma Chitnis, on the basis of an empirical study of Maharashtra, has attacked the post-matric scholarship scheme, the central pillar of educational facilities for the scheduled castes at the higher stages. She has shown that scholarships are not optimally and equitably used and are creating new inequalities.[6] Reservation for the scheduled castes is causing much tension as competition for higher education and training intensifies. Relaxation in marks poses great problems for the scheduled castes students themselves and, it is generally feared, it has resulted in the lowering of standards.

The role of protection and publicly-provided privileges in the field of edution could have been determined if a control group of the scheduled castes who were not using a particular category of facilities could be isolated. Such a group, however, is hard to come by as almost all the scheduled castes students use some special privilege or the other. A second possible alternative is to compare pre-concession education growth with post-concession education growth. But that too is not without serious limitations because special status to the scheduled castes was accorded mainly after Independence and, since then, many other factors like general awakening, industrialisation and urbanisation, etc, have started playing their role in the overall educational growth. In the absence of any other objective criteria, the extent of educational development of the scheduled castes due to special facilities is measured by the awareness, actual utilisation, and perceived importance of these by the pupils belonging to scheduled castes themselves.[7] The assumption here is that "legislation is a partial or incomplete agency of change in the sense that it creates new situations or provides for change in the desired direction but does not, in a comprehensive sense, ensure the process of change which includes awareness, knowledge, and acceptance".[8] Awareness is essential for utilisation, and utilisation, in turn, helps to know what obtains in actual practice and to detect possible gaps between theory and practice. Perceived importance of the concessions help us understand the group's subjective judgment about the importance of the facilities in their educational career.

Answer to the second question is attempted both on the basis of certain empirical findings as also on certain *a priori* considerations. The caste and class pattern of use of facilities is analysed to see whether the same are being used equitably. A critical analysis of the

TABLE 1: AWARENESS OF DIFFERENT TYPES OF EDUCATIONAL FACILITIES AVAILABLE TO THE SCHEDULED CASTES

education facilities made available to the scheduled castes is attempted to focus on certain inherent shortcomings in the scheme.

In the end certain suggestions are put forward to make the schemes more effective and their distribution more equitable. For this purpose suggestions received from the respondents have proved to be valuable.

AWARENESS OF VARIOUS CONCESSIONS

Analysis of the data collected in the present study shows that there is general awareness of the financial concessions, specially of stipends, scholarships and freeships. A few, however, are aware of the other privileges like free meals and clothing, free books, book loans and assistance to stay in the hostel. Three-fourths of the respondents are aware of the principle of reservation of seats in colleges and jobs though only half of them know about the exact percentage of seats or jobs reserved for them. About 60 per cent of the respondents have awareness regarding the principle of relaxation of marks and age while, again, only half of them know about the exact degree of relaxation. Only one-third of the respondents are aware of the availability of coaching facilities (Table 1).

Greater awareness of freeships, stipends and scholarships suggests that these facilities are universally available and widely used. Lesser awareness of other financial facilities suggests that either these particular facilities have not been properly publicised or they have not been introduced at many places.

Marked differences between the morning group on the one hand and the evening and professional group on the other are visible in awareness of reservation and relaxation. These may be explained by the fact that it is the latter groups which use these facilities in view of restricted admissions as also that they are more clear about job potentialities for themselves.

UTILISATION OF FACILITIES

A majority of respondents has used financial concessions, such as freeships, stipends at high school, and scholarships in college. However, none among them used free meals or free clothing. Only 12 respondents ever had the opportunity to utilise book loans for purchase of books. Hostel facilities are utilised by ten per cent respondents but only 4 cases out of a total sample of 209 took advantage of coaching facilities (Table 2).

All the engineering college students, teacher trainees and some of the law students, who were covered in the survey, got admitted to the respective courses from the reserved quota. All the engineering college students and most of the teacher trainees also utilised relaxation of marks facility for their admission. Some of the post-graduate students in general subjects also got admitted on the basis of relaxation of marks. Age relaxation has been utilised by a lone case from the evening group.

Since financial concessions are utilised by most, it indicates that the majority of the scheduled castes belong to low-income group and economically it would have been very hard for them to get education, specially higher education, without the assistance given to them in the form of freeships, stipends and scholarships. Use of hostel facility by only a few seems to suggest that hostel assistance is not enough to motivate the scheduled caste students to come to stay in hostels. Depressingly, a substantial number of respondents stay in rented rooms — two or three living together — which is not very congenial from the point of view of studies. Many of the students commute from Kharar (a town at a distance of about 12 km from Chandigarh) or nearby areas since they find it cheaper to live with their parents. This tends to generate a type of regional inequality in which persons living within commuting distance can make greater use of educational facilities offered by big cities and towns whereas others have to content themselves with lower educational attainments.

The facility of book loan is either restricted to a few places or not given enough publicity. There is, therefore, need to find out where the book loan facilities exist and also their extent. Further, these facilities should be made more widespread as obviously books are essential for proper education.

The use of reserved quota and relaxation of marks criteria by the professional group points to the importance of these concessions in entry to the professional courses. On the other hand,

TABLE 2: UTILISATION OF DIFFERENT TYPES OF EDUCATIONAL FACILITIES AVAILABLE TO THE SCHEDULED CASTES

the number of scheduled caste students in professional institutions is far below their quota. If we want to equalise opportunity, then more and more scheduled caste students are to be brought into these institutions which in view of the poorer performance of these students seems to be possible only when adequate pre-admission coaching facilities are provided to them.

PERCEIVED IMPORTANCE OF CONCESSIONS

In reply to the question whether it would have been "possible for you to study without the special facilities at primary school, high school, and college stage" the responses are :

	Number of Respondents	
	Yes	No
Elementary level	141	54
High School	93	92
College	41	154

Although for most of the scheduled castes schooling at elementary stage would have been possible even without financial support, at the college stage the picture is reversed, that is, more than three-fourths of the respondents would have found it extremely difficult to go in for higher education without financial help. At the high school level the distribution is more or less even. These results are as one would expect. Since education at the elementary level is already free and the cost is not comparatively high either in terms of time or money, many could have gone into this level without special efforts. Caution is, however, needed in interpreting the above finding in view of the fact that responses relate to those persons who have survived the selection process. Thus there is every possibility that those who dropped out at the early stages were those persons for whom it was difficult to study without aid. It is essential to have a study conducted to find out as to who among the scheduled castes drop out : is it the economically poorer group or the academically inferior group? For higher education financial and other concessions are perceived as important by the group, suggesting thereby the role of these in the higher education of the scheduled castes.

In reply to the question "what was the most important motivating force for pursuing higher education?" the respondents were asked to rank as I, II and III the three items which they regarded as constituting the most important motivating force out of a list of six items provided to them. An analysis of the first choice (Table 3) indicates that financial concessions are regarded as the most important motivating force by the respondents. However, when all the three responses are taken into consideration by weighting the first choice by 3, the second by 2, and the third by 1, the "urge to improve status" emerges as the most important motivating force for going in for higher education; financial concessions and reservation in jobs closely follow the former suggesting thereby the importance of the concessions in motivating the scheduled castes to go in for higher education (Table 4).

A separate analysis of the data of the combined ranks for morning, evening, and professional respondents shows clear-cut group differences. While

TABLE 3: DISTRIBUTION OF RESPONDENTS ACCORDING TO THE MOST IMPORTANT MOTIVATING FORCE RESPONSIBLE FOR THEIR PURSUANCE OF HIGHER EDUCATION

Motivating Force	Population Group			Total
	Morning	Evening	Professional	
(i) Financial help from the government	19	20	18	57
(ii) An urge to improve status	9	20	23	52
(iii) Reservation in jobs	12	16	10	38
(iv) Inner urge to get knowledge	20	8	7	35
(v) Parental efforts	6	3	5	14
(vi) Influence of missionary or philanthropic organisations	1	0	0	1
(vii) No response	—3	6	3	13
Total respondents	70	73	66	209

TABLE 4: DISTRIBUTION OF RESPONDENTS ACCORDING TO THE COMBINED RANKING OF THREE IMPORTANT MOTIVATING FORCES FOR THE PURSUANCE OF HIGHER EDUCATION

Motivating Force	Population Groups			
	Morning	Evening	Professional	Total
(i) Financial help from the government	81	88	78	247
(ii) An urge to improve status	65	108	108	281
(iii) Reservation in jobs	77	99	74	250
(iv) Inner urge to get knowledge	97	48	60	205
(v) Parental efforts	55	22	47	124
(vi) Influence of missionary or philanthropic organisations	17	8	1	26

professional and evening group respondents are realistic in admitting that it is the "urge to improve status" which is the most important motivating force, the morning group respondents are more idealistic when they said that they are motivated to study by "an inner urge to get knowledge".

The above results of the study point to the positive role of special privileges and facilities in the educational advancement of the scheduled castes as revealed by their awareness, use and perceived importance of these in their educational careers. They substantiate the observation of Harold Isaacs that, "they would not be where they are and would not be having these experiences, if it were not for special help and preferences fixed by law in their behalf .... Hardly a fraction of the present progress would have been made".[9]

Yet we are far from the goal of equalisation not only in the limited sense of equal parity ratio, but, worse still, in the process certain new inequalities are creeping up.

EMERGING INEQUALITIES ON CASTE AND CLASS BASIS AMONG SCHEDULED CASTES

Chauhan[10] has expressed the fear that the spread of education among the scheduled castes may have consequences of creating social classes among them on lines parallel to those existing in higher society. Suma Chitnis[11] concludes that the scheme of post-matric scholarship is neither equitably distributed nor optimally used. She presents evidence to show how caste patterns operate in the use of the post-matric scholarship scheme in Maharashtra. She observes that Mahars who constitute 35.1 per cent of the scheduled castes population in the state account for 85.8 per cent of the total scholarships disbursed. In contrast, the Mangs who constitute 32.6 per cent of the total scheduled castes population account for only 2.2 per cent of the total number of scholarships. The present study indicates that the same pattern obtains in Punjab, though to a limited extent. Here Ramdasias and Chamars who constitute 38.6 per cent of total scheduled castes population in the State according to the 1961 census, use 56.5 per cent of seats in higher education. In contrast, Mazhabi who constitute 16.1 per cent of the population of scheduled castes utilise only 4.5 per cent of the seats in higher education. The other two more important groups among the the scheduled castes of Punjab are Addharmis (10.9 per cent) and Balmikis (16.6 per cent), but the proportion of seats held by their members in higher education are 11.0 per cent and 10.5 per cent respectively. Thus, whereas Addharmis are entering higher education according to their proportion in the scheduled caste population, this proportion among Balmikis is only two-thirds.

There is also a distinct class pattern in the utilisation of seats in higher education. Professional education is used by scheduled castes belonging to the relatively higher classes as indicated by their parental education, occupation and income. Thus while in the case of the general group the percentage of illiterate parents is 68.5, in the case of the professional group it is 50 (Table 5). Similarly, while 77.5 per cent of the general group is in the category of income less than Rs 200 per month, only 50 per cent of the professional group are in that income range (Table 6). Again, while 63 per cent parents of the general group are agricultural labourers and other unskilled workers, only 44.6 per cent of parents of professional group respondents are in this category (Table 7). The mean class score worked out on the basis of combined education, income and occupation index is 6.2 for the general group and 7.9 for the professional. This study thus corroborates the earlier findings that certain caste and class groups are in a more favourable position, as compared to others, in the utilisation of privileges accorded to the scheduled castes.

CAUSES OF EDUCATIONAL INEQUALITIES

Special protection is justified on grounds of social justice. It is meant for the groups who are most backward socially and economically and have suffered for centuries for no fault of their own. But, it is clear, in its actual operation, the protection has tended to favour the more fortunate of them and has not reached the most down-trodden groups. A critical analysis of some of the provisions of the scheme is attempted in the paragraphs that follow to detect the possible reasons.

MYTH OF FILTERATION THEORY

Ambedkar, the Law member in the Constituent Assembly, advocated that it is 200 times better to educate a few scheduled castes in higher educational institutions, send them abroad and then place them in key positions rather than to educate 2,000 boys in Marathi and Gujarati. His conviction was that these few, when invested with authority, would look after the welfare of rest of

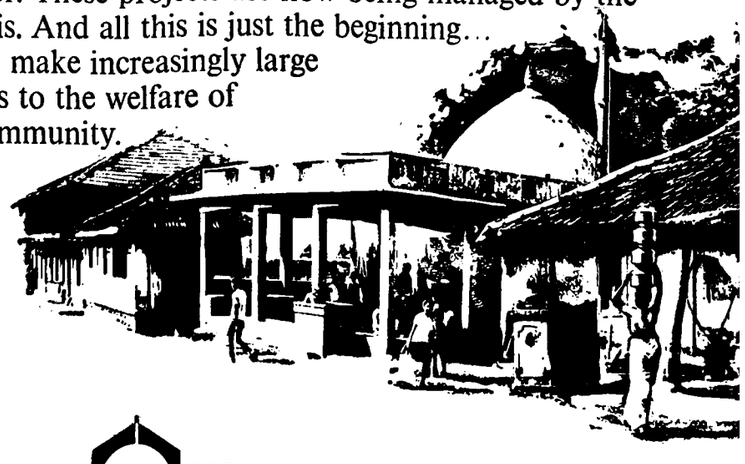
A country's future depends largely on a healthy population. Safeguarding the health of the masses is a national

responsibility



At NOCIL, we believe that organised industry must play a more positive role in this field. And so, we've made a modest beginning towards this end.

Our efforts have been concentrated in the villages of Ghansoli, Talavali and Gothivali, near the NOCIL Petrochemicals Complex in Maharashtra. With technical and financial assistance from NOCIL and associate Companies, a Community Welfare Programme is helping to improve the environment, and thus safeguard the health of the villagers. An important aspect of this Programme, is that the villagers themselves have selected key areas of development and, through voluntary labour, constructed sanitary blocks and drainage systems. Water tanks have also been built to supply potable water. These projects are now being managed by the villagers on a co-operative basis. And all this is just the beginning...

At NOCIL, we plan to make increasingly large contributions to the welfare of the community.

Total	70	73	66	209

Note: * In the evening group a large number of respondents are living independently on their own and, hence, they did not divulge their parents' income.

their brethren.[12] This resembles the famous filteration theory of Lord Macaulay which had failed so miserably in the case of Western education in India. In the case of spread of education among the scheduled castes also nothing better could be expected. Suneila Malik[13] presents empirical evidence to show that education minimises one's contact with the group in the case of scheduled castes. To what extent the educational privileges percolate down will be an interesting area of research.

TOO LATE FOR EQUALISATION

Special protection is extended to the scheduled castes only after high school, though financial assistance in the form of free tuition and stipend is made available to them from class IX onwards. The constitutional directive of universal and free education is supposed to ensure equal access to all at elementary school level. It is believed that free tuition and availability of school will enable everyone to avail of the educational facilities at this stage. A little probe will, however, convince anyone that neither is education free at this stage nor is the opportunity to avail of the existing educational facilities equal for all. Tuition, no doubt, is free for all but there are other costs of education as expenditure on books and stationery, clothing and sometimes transport "which amount not infrequently to several times the tuition".[14] More important than these is the 'opportunity cost'[15] which tells more heavily on these groups and they are more likely to withdraw their children from schools once they reach the age when they can be of use in economic activity. Similarly, the opportunities to avail of the existing educational facilities are not equal for the scheduled castes and there seems to be substantial truth in the statement "equal access or opportunity is not true equality when different groups are anything but equal".[16] In fact to treat unequal groups or individuals as equals is a social injustice. The reasons are obvious. Most of the scheduled castes are first generation learners with no tradition of learning. Their parents can hardly be expected to appreciate the value of education. Secondly, scheduled caste children are protein-starved and so they can hardly compete with others on equal terms. Thus free tuition and equal access are not sufficient conditions for the scheduled castes to go in for education and use the facilities optimally.

The result of all this expansion of elementary education and abolition of fee has been that the facilities are availed of more by "haves" than by deprived sections of society whose children do not go to school or who drop out at various stages. The bulk of those who survive come from comparatively better families. If, therefore, equal opportunities are to be assured for the deprived sections then more monetary and psychological incentives have to be provided at the elementary school stage. Only then will it be possible to have the broad base which is necessary for better and more equitable selection at the higher stage. Otherwise, only the economically better-off can make use of the facilities at the higher stage.

PARTIAL HELP FAVOURS HAVES

At the higher stage also when positive discrimination is extended to the scheduled castes, the scheme is not conceived in the spirit of helping the poorer sections of the scheduled castes. The scheme of post-matric scholarships, the central pillar of all educational facilities at the higher stage, tends to favour the 'haves' rather than 'have-nots' among the scheduled castes. The amount of aid is mainly responsible for this. The scholarship money at this stage ranges from Rs 27 (day scholar in general colleges) to a maximum of Rs 60 (boarder in professional courses) per month. This money can hardly be expected to induce the really poor to go in for higher education and, even if one does go in for it, to continue till he completes the course. Only those who have some other sources to rely on can avail of these scholarships. A few respondents were frank enough to admit that this money provides them with pocket expenditure while their parents bear the major portion of the educational expenditure.

Besides stipend, the other help that a student gets is refund of admission and examination fee. But the fact that a student is required to pay this amount defeats the purpose of the aid. Those who are very poor find it difficult to arrange for the lump sum, hence many a times it is possible that these forgo the chance of higher education.

ADMINISTRATIVE BOTTLENECKS

The implementation of the scheme leaves much to be desired and various reports of the Scheduled Castes Commissioner have made references to this. Indifference of the authorities and delay in reimbursement of scholarship are the main administrative hurdles pointed out by the respondents. The survey revealed that the students were not sure till December whether they would get the stipend and many had not received the first instalment till the month of March (two months prior to examination). Money coming at the fag end of the year cannot be expected to help the poorer who are likely to succumb to financial difficulties. Financial instability has been pointed out as constant source of worry by most. Ignorance of the procedure has been mentioned by many as cause of great difficulty. Many among the group were found to be unaware of book loan facities. The authorities are responsible for this by either not making the facilities available or not giving them proper publicity.

The indifference, delay and lack of proper publicity tend to tell more heavily on the poorer sections of the scheduled castes than on the better off and thus operate as a source of inequality among different sections of the scheduled castes.

Conclusions and Suggestions

To recapitulate, the results of the study make it clear that educational progress of the scheduled castes, specially at post-school stage, has been possible because of the special facilities and preferences fixed by law in their behalf. Yet the success is partial as evidenced by the parity ratios at all levels, specially at higher levels. What is worse, in the process, certain new inequalities are creeping up among the scheduled castes themselves. An attempt to discern the causes of slow progress of education among the scheduled castes in general and creeping up of new inequalities on caste and class lines among the scheduled castes have resulted in the following findings:

Mere existence of facilities does not ensure their optimum use. Awareness and acceptance are essential for utilisation. To maximise the use it is necessary to generate better awareness. More publicity is needed to ensure the wider use of facilities like book loans, hostel assistance and pre-admission coaching facilities. There is need to find out the extent of existence of these facilities and reasons for the poor use.

In spite of the preferences fixed by law in their behalf, the number of scheduled castes in professional institutions falls far short of their quota. This means the required number of qualified candidates are not available. This is hardly possible under the present circumstances when the parity ratios at High School are 10.0.[17] It is not possible for these 10 per cent to fill in 24.7 per cent of the seats at the higher level without substantially undermining the standards.

To discern the causes, the basic assumptions underlying the scheme of educational facilities as well as the nature of facilities were critically examined and the following conclusions emerge:

Education among the scheduled castes may not filter down as expected;

Equal access for unequal groups is not true equality;

Free tuition does not mean free education to the majority of the scheduled castes who are extremely ill fed and ill clad. Besides, the opportunity cost is much higher for them; partial help tends to benefit the 'haves' rather than deprived sections of the scheduled castes and as one respondent quickly puts "Government policy is to create 'Tatas and Batas' among the scheduled castes";

Administrative delays and official indifference tends to tell more heavily on the poorer groups of scheduled castes.

To make the scheme broad-based and the distribution more equitable, there is need to end the anomalous situation of all help at higher level and no special facility at the elementary school stage. At the elementary school level there is need to have more incentives, both financial as well as psychological. At the higher stage, admission should be selective and those who are taken should be totally cared for. Children of Class I and II categories of scheduled caste officers should not be accorded any preferential treatment as in their case the environmental handicaps have been largely overcome. This will ensure more just opportunities to the deprived as well as a good beginning for gradual discontinuance of privileged status.

Total	70	73	66	209

Notes

[The author is grateful to T Majumdar and other colleagues at the Zakir Husain Centre for Educational Studies, J N University, for their valuable comments.]

1 In higher education the main educational facilities and privileges are:
   (a) Financial assistance in the form of stipend, free tution, refund of admission and examination fee, book loans, assistance to stay in hostel and free coaching facilities;
   (b) Reservation of seats in professional institutions for the scheduled castes in proportion to their population in the state;
   (c) Relaxation in admission criteria where the same are prescribed, i e, 5 to 10 per cent relaxation in marks and 5 years of age relaxation at the time of admission.

2 According to the Census of 1961 and 1971, the literacy rates among the scheduled castes and total population are as follows:

Year	Scheduled Castes	Total
1961	10.2	24.0
1971	16.1	29.3

Investment Behaviour of Monopoly Houses

III—Time-Profile of Fixed Investment and Other Implications of the Structure of Investment Decisions

Aurobindo Ghose

The phenomenal growth of monopoly houses during 1955-73 was accompanied by a progressive break-down of planning, particularly of industrial licensing as an instrument of regulation of private investment. To explain this development, it is necessary to understand the monopoly houses' behaviour with respect to fixed capital investment.

For this purpose, the investment decision itself has to be identified. The investment decision is not a simple decision. It has a structure. The identification of this structure has important implications. This paper is an attempt at understanding some of these aspects.

In Section I of the paper, a detailed attempt was made to identify the structure of Indian monopoly houses' investment decisions, conceptually as well as empirically. In Section II certain underlying attributes of the structure were sought to be highlighted in terms of the economics of pre-emption. In this, the concluding, part an attempt is made to derive some of the more important implications of the structure of investment decisions, particularly for understanding the time-path of the monopoly houses' fixed investment.

IDENTIFICATION of the structure and determinants of monopoly's investment decisions is a pre-condition to an understanding of its actual investment behaviour over time.

The identification of the structure of Indian monopoly's investment decisions has been attempted above. The identification of the determinants of Indian monopoly's investment has been attempted elsewhere and it is sufficient to summarise the broad results here. It is not current profits which determine current investment. Current profits, through internal accumulation, along with the planned investment programme for the public and the private sectors, determine monopoly's current investment intentions. Investment intentions are followed by other intermediate decisions. These investment intentions are highly pre-emptive, such that only a small proportion of the volume of investment intentions in any period are transformed into actual investment subsequently. Even the time-lag of investment is not a parameter, but is variable and its variability depends mainly on the extent of monopolistic pre-emption.

Table 8 shows the trend in gross fixed investment (at current prices) between 1956-57 and 1969-70 for Tata, Birla, Mafatlal, Sri Ram and Kirloskar.

The corresponding data on the rate of investment (at current prices) along with indicators of current performance such as profitability, for the large corporate private sector between 1965-66 and 1970-71, is shown in Table 9. Since the data relate to 290 non-financial non-Government, public limited companies each having a paid-up capital of Rs 1 crore and above, it would seem to represent the monopoly sector.

Two broad conclusions about the time-profile of monopoly's actual fixed capital investment, follow from Tables 8 and 9.

First, it is discontinuous and jerky, spread unevenly over time and marked by one if not two sharp peaks.

Secondly, it is deceptive, even paradoxical in appearance. For instance, the peak of monopoly's fixed capital investment occurred during 1966-67 and 1967-68, the very years of industrial recession.* Similarly, the rate of growth of monopoly's fixed capital is observed to fall sharply during the years 1969-70 and 1970-71, which the indicators of current corporate performance, like the rate of profit, showed a recovery.

There is nothing unusual about either of these conclusions, once the structure and determinants of monopoly's investment decisions are identified.

Considering the first conclusion, the discontinuity of fixed capital investment is because of (a) the indivisibility or lumpiness of individual projects, and (b) the observed bunching in the completion of different projects.

Hence the Tata peak of 1958-59 is explained by the bunching in the completion of three very lumpy projects; the TISCO 1 million ton steel expansion scheme financed by World Bank loan, the TELCO truck and diesel engines project and the hydro-electric projects of the three electricity companies, also financed by World Bank loans.

The peak of investment in 1966-67 for Birla is explained by the bunching of a large number of investment completions, e g, the tipping gears and LP gas cylinder projects of Hyderabad Allwyn, the steel casting projects of Hindustan Motors and National Engineering Industries, the sodium bicarbonate project of Saurashtra Chemicals, the HT insulators project of Jayshree Textiles, the Chittorgarh cement project of Birla Jute and the paper capacitors project of Universal Cables. Similarly, the jump in Birla investment in 1960-61 and 1961-62 is explained by the implementation of the Hindustan Aluminium project.

The peak in investment of Sri Ram in 1968-69 is explained virtually by the implementation of its Rs 25 crores Kotah fertiliser project.

The peak in investment of Mafatlal in 1967-68 is explained by the indivisibility or lumpiness of the NOCIL and Polyolefins projects and also by the simultaneous completion of Indian Dyestuff's anthraquinone and aluminium chloride projects, Standard Mill's caustic soda and chlorine projects and Navinc Flourine's chemical project.

It would seem that the determinants of monopoly's investment decisions along with the 4 to 5 years average gestation lag, explain rather well this observed discontinuity in monopoly's actual fixed capital investment.

Coming to the second conclusion. There is nothing unusual in the peak of monopoly's fixed capital investment occurring in the years of the industrial

* This result follows even if a real investment series is obtained, though such a series is subject to serious reservations mainly because of the index number problem. See Table 10 for such a series.

TABLE 8: ANNUAL GROSS FIXED INVESTMENT OF SELECTED INDUSTRIAL HOUSES: 1956-57 TO 1969-70

(Rs lakhs)

House	1956-57	1957-58	1958-59	1959-60	1960-61	1961-62	1962-63	1963-64	1964-65	1965-66	1966-67	1967-68	1968-69	1969-70
1 Tata	3462	6643	3733	1533	1923	1049	1597	2426	2381	2672	5225	3157	2311	3038
2 Birla	1107	1266	1021	1142	2055	2434	1741	3612	3862	4257	8917	3659	2616	2840
3 Mafatlal	154	131	138	241	229	243	513	679	755	289	1088	4988	1166	460
4 Sri Ram	120	53	118	145	200	244	773	889	449	332	478	2245	829	185
5 Kirloskar	25	56	88	77	81	148	225	301	487	494	533	265	279	585

Note: Gross fixed investment is defined as annual additions to the balance sheet value of gross fixed assets. This is an undeflated series.

Source: Author's sample. See Appendix A for details on the sample.

recession. The initial decisions for these investments were taken not during the recession, but much earlier: in the period 1960-62 which was also the period of boom for the private sector as a whole, including monopoly.

Similarly, there is nothing paradoxical about the falling rate of growth of fixed capital during the recovery years of 1969-70 and 1970-71. The low rate of investment today reflects the low volume of investment decisions taken by monopoly about 4 to 5 years earlier, from 1964-65 onwards, which was the time of recession. Though monopoly's highly diversified production structure and staying power makes it less vulnerable to a recession as compared to small business, even then the total volume of monopoly's investment decisions, especially its investment implementation decisions, is reduced during a recessionary phase.

However, on the basis of the observed fall in the rate of growth of fixed capital during the boom of 1969-70 and 1970-71, it has been contended by some that monopoly is having no inducement or inclination to invest. The phenomenon has also been popularly described as an 'investment strike'. If investment is identified only with the fact of actual investment then such a conclusion may be justified, but such an identification itself is false. As has been explained earlier, investment in fixed capital is not an indivisible, instantaneous act. It is rather a process spread over time consisting essentially of two parts: a decision-making part and a part where the decisions materialise into actual investment. The investment decision in turn is not monolithic but consists of different identifiable components.

Thus whether monopoly is having an inducement or disinducement to invest today is to be judged not by current indicators of the different components of the investment decision. The volume of industrial licences, foreign collaboration approvals, capital issue consents, sanction of financial assistance, and licences for capital goods imports obtained by monopoly, and the amount of capital raised by monopoly through public issue — these would be the indicators of monopoly's current inducement to invest. A statistical verification for each of these indicators show that during 1970-71 to 1971-72, there was a recovery in the volume of different investment decisions. The inducement to invest seems to be high in the current recovery, as revealed by the following indicators. This is a major finding of this study and runs counter to the "continuing stagnation" thesis advanced by some.

(1) *Indicator of Investment Intentions*:

Licensing:

(a) The number of letters of intent issued went up from 333 in 1969 to 439 in 1970, jumping to 1,013 in 1971 and of industrial licences from 197 in 1969 to 240 in 1970 and further to 315 in 1971 (excluding shifting and COB licences).

(b) Of the 82 applications considered and disposed of by the Monopolies Commission between June 1970 and November 1972, 77 cases were approved involving an outlay of Rs 315 crores.

(2) *Indicators of Investment Undertaking*:

(i) Capital Issues Consent:

The trend in value of consents of non-bonus capital issue in the private corporate sector between 1967 and 1971-72 was as follows.

	Non-Bonus Capital Issue Consent of Non-Govt Cos (Rs Crores)
1967	167.3
1968	98.0
1969	108.4
1970	72.2
1971	141.2
1971 (January-September)	54.9
1972 (January-September)	127.6

It is to be noted that the value of capital issue consents doubled between the calendar years 1970 and 1971 and further between January-September 1971 and 1972.

(ii) Sanctions of Institutional Finance:

The trend in assistance sanctioned by IFCI, ICICI and IDBI to the corporate sector between 1967-68 and 1971-72 was as below. Here also the sudden jump in sanctions between 1969-70 and 1971-72 is noticeable.

	Assistance Sanctioned by IFCI, ICICI and IDBI (Rs Crores)
1967-68	62.7
1968-69	97.3
1969-70	94.5
1970-71	146.8
1971-72	214.4
1971 (April-September)	97.5
1972 (April-September)	122.0

(3) *Indicators of Investment Implementation*

(i) Raising of Capital:

The trend in actual raising of capital from the market by non-government companies was as follows. The amount of capital raised nearly trebled between April-December 1972 and 1973.

	Capital Raised (Rs Crores)
1967-68	76.9
1968-69	68.9
1969-70	55.9
1970-71	55.9
1971-72	45.6
1972 (April-December)	25.4
1973 (April-December)	72.9

(ii) Licensing of Capital Goods Imports:

The trend in value of licences issued between 1969 and 1972 for import of capital goods and heavy electrical plant was as follows.

	Value of CG and HEP Licences Issued (Rs Crores)
1969	73.2
1970	127.1
1971	252.2
1971 (April-November)	138.8
1972 (April-November)	153.6

Here again the sharp rise in the value of CG licences issued between 1970 and 1971 is evident.

Although the above indicators relate to the private corporate sector as a whole, they apply equally to the monopoly sector. Thus, whichever indicator of monopoly's inducement to invest is considered, the conclusion is inescapable that currently monopoly is quite far from any 'investment strike'. Nevertheless, even when a slump in actual investment might coincide with a period of recovery in the current performance of monopoly (as indicated by rising profits) as well as a recovery in monopoly's investment decisions, monopoly might still want the government to facilitate investment through conscious intervention. The intensification of monopoly's demand for the joint sector during 1970-72, when actual private investment was falling but investment decisions were increasing, is illustrative of Indian monopoly's varied tactics.[24]

The structure of Indian monopoly's fixed investment decisions has equally important implications regarding the functioning of the economy and can help to explain in part the failure of industrial policy during 1956-66, i e, during the Second and Third Plans.

First, monopolistic pre-emption, i e, foreclosure of licensable capacity in excess of monopoly's ability to invest in a certain period, implies a built-in tendency in the system for Plan targets of total private investment, in physical terms, to be underfulfilled. The assumption here is that implementation of licensed investment does not spill over from one Plan to another.

This built-in tendency of under-fulfilment of the total targeted private investment would work in the following manner. Even if monopoly invests an amount equal to its total ability to invest, a part of its licensed investment would remain unimplemented. The magnitude of this unimplemented part was significant during the Second and Third Plans. As estimated earlier, half or more of Indian monopoly's licensed investment did not proceed beyond a stage in the investment process, so that less than half of its licensed investment was actually implemented between 1956 and 1966.

A consequence of such monopolistic pre-emption is that a part of the invest-

Notes: (1) *Definition:* Annual Investment on plant and equipment is the annual addition to the gross value of plant and equipment as recorded in balance sheets. Real investment has been derived by deflating the money values by a price index of plant and equipment (see below).

(2) *Sample:* (i) The Reserve Bank Sample refers to the sample of large and medium companies (both Public and Private Limited) covered by the *Reserve Bank of India Bulletin* in its periodic studies on the finances of the private corporate sector. The data refer to two separate sample series with different coverages, for 1960-61 to 1965-66 and 1965-66 to 1970-71. A uniform series has been obtained by blowing up the figures in the respective samples. The Reserve Bank Sample is not comparable to the house samples.
(ii) The house samples refer to the author's sample derived from the Bombay Stock Exchange Directory. See Appendx A for details on the samples. The figures nave been used as given, except for netting out new acquisitions and disinvestments, i e, only new investment figures have been used. No blow-ups have been used.

(3) *Deflator:* The deflator used is the price index of plant and equipment (at 1960-61 prices) which is implicit in the real investment series for the corporate sector as a whole (public sector and private sector) given in the CSO's latest *Estimates of National Product, Savings and Capital Formation: 1960-61 to 1971-72*, CSO, November 1973. The Price Index is as follows:

1960-61	1961-62	1962-63	1963-64	1964-65	1965-66	1966-67	1967-68	1968-69	1969-70	1970-71
100.00	102.45	105.16	113.77	114.94	122.01	143.44	149.18	149.63	150.61	163.56

ment licensed in the non-monopoly sector would also remain unimplemented. This is because small and medium-sized investments in the non-monopoly sector are usually complementary to and dependent on large-sized investments licensed in the monopoly sector. Thus it is observed that half or more of the investment licensed to the non-monopoly sector also remained unimplemented during the period 1956-66 (see Table 3).

This tendency of underfulfilment of Plan targets of physical investment in the private sector would work, unless a part of the investment finance meant for the public sector were itself channellised to the private monopoly sector. If such channellisation were in fact to take place, then even if the private sector's investment target is fulfilled, there would emerge a corresponding underfulfilment of Plan targets of physical investment in the public sector.

This kind of reasoning seems to be confirmed by actual happenings during the Second and Third Plans. It has been established elsewhere that the Plan targets of physical investment in the Second and Third Plans were not fulfilled for industry as a whole, as well as in the public and private sectors taken separately.[25] During the Third Plan, even though the financial target of private investment was overfulfilled, this was at the expense of a corresponding underfulfilment in the public sector; in addition, funds meant for the public sector seem to have been channellised to the private sector through the public financial institutions. (Of the Rs 1,975 crores of actual private investment in industry during the Second and Third Plans, Rs 584 crores or about 30 per cent came from public financial institutions.)

It may be pointed out here that the above argument rests on the assumption that industrial licensing conforms and corresponds to the Plan targets of private investment. That in case of underlicensing, the underfulfilment of the Plan target is not attributable to monopolistic pre-emption; and in case of over-licensing, the underfulfilment of targeted private investment is not inevitable. The point, however, is that all these factors work towards the same result — the underfulfilment of targeted investment — but that pre-emption would achieve such a result independently, and that in the presence of the other factors, it would only reinforce such a tendency.[26]

Pre-emption in turn implies considerable reversibility of investment decisions for an individual monopolist, as has been established earlier in Section I, Such reversibility, expressed through the time-phasing of a monopolist's different investment decisions, no doubt reduces the effect of primary uncertainties on a monopolist's own investment process, and keeps his investment activity as uninterrupted as possible. But this in turn creates considerable uncertainties in the rest of the economy and affects production and investment activity both in the private non-monopoly sector and also in the public sector.

The possibility of time-phasing of the different intermediate decisions relating to a single investment or of time-phasing in the implementation of different investment projects available to the house as a whole, leads to the emergence of intentional time-lags. These intentional lags, as has been analysed in Section II, are the most dominant aspect of variable time-lags, i e, the variability of time-lags in the implementation of similar investment projects between different industrial houses or even within the same industrial house.

If time-lags in investment are variable, it means that the government has no control over the timing of different private investments. There is hence no way to ensure the balanced creation of capacities in different related industries, at a point of time or over time.

This explains the variability in the fulfilment of Plan targets of capacity in different industries during the Second and Third Plans.[27] In other words, the physical imbalances that emerged during the Second and Third Plans were not the outcome of chance or accidental or even exogenous factors but resulted mainly on account of Indian monopoly's investment behaviour.

An important outcome of the variability in the implementation of monopoly's investment, was that the linkage between public and private investments — which is part of any planning process — was broken. Thus whereas the public sector, during the Second Plan at least, considerably invested in basic and mother-machinery industries, monopoly did not invest in the industries using their outputs to the extent required or at the required time. This is one important reason for the emergence of excess capacity in the public sector — more capacity was created than could be used by the private sector.

The implications that such a lopsided industrial structure hold for the emergence of an industrial recession during and after 1966 are obvious enough not to be elaborated. It is true that recession is the outcome of several factors — the variations in public investment, foreign trade and aid and agricultural output.[28] It is not the purpose of this study to examine each of these factors and point out their relative significance in the determination of the recession. What is being indicated, however, is that the implications of monopolistic investment behaviour — particularly the variations in monopoly's intermediate investment decisions — are important enough not to be neglected.

25 See P B Medhora, "Industrial Growth since 1950", Bombay University, 1968, pp 77-78; G K Shirokov, "Industrialisation of India", Moscow, 1973, pp-175-176; and Aurobindo Ghose and Arvind Vyas. "Industrial Structure and Industrial Policies", *Alternate Policies for the Fourth Plan*, State Planning Board, Kerala, 1969.

26 Overlicensing of any industry, for instance, deters the licencees from implementing their full licensed capacities for fear of excessive capacity creation in the industry. Thus industries overlicensed during the Third Plan were marked by significant underfulfilment of Third Plan capacity targets. These were the very industries where large industrial houses obtained disproportionate shares of the licensed capacity. See in this connection P B Medhora, 'Industrial Growth Since 1950", *op cit*, pp 57-60.

Pakistan-India Relations: First Step towards Regional Co-operation

H T Parekh

In spite of traditional enmities and bitter war memories, France and Germany, together with the smaller countries of Western Europe have been able to establish a European Common Market.

Countries of South Asia are in some ways even better placed to bring about some form of regional economic and cultural co-operation.

The recent improvement in Indo-Pakistani relations needs to be grasped by the governments and peoples of the two countries as the first step towards regional co-operation in South Asia.

AMONG all the prevailing gloom, there has appeared one sign of hope on the horizon that may bring much sunshine to what was once the Indian subcontinent but which is now made up of Pakistan, Bangladesh and India. Never before in the last 25 years since Independence, have Indo-Pakistan relations become as normal and peaceful as they are promising to become today and this may well be only the beginning of an era of peace and amity between the two countries and even three countries, including Bangladesh. Much more of good neighbourliness and fruitful co-operation lies before us, but we all need to seize the present opportunity and pursue actively a positive policy which can benefit all the people of this region.

It is indeed a pleasant experience to feel that the most knotty and formidable problem which has dominated the scene for a quarter century and which perhaps was the price we paid for our Independence, is well on the way to resolution. The talks now going on between the Prime Minister and Sheikh Abdullah hold out some promise, however slow they may be moving. Among the many political achievements of the Prime Minister, her skilful negotiations with Kashmir leaders for the ultimate integration of Kashmir into India is very significant because of its great potential value. Though no settlement has yet been reached, sustained negotiations have at least helped to clear the ground and considerable understanding seems to have taken place. In any event, leaders of Kashmir seem reconciled to Kashmir being part of India with some recognition of its special status.

Since the establishment of Bangladesh, slowly and steadily not only is the Kashmir problem as seen by Sheikh Abdullah and the Kashmiri people on the way to some settlement but, after several diversions and interruptions, the Kashmir problem is no longer looming on the horizon to vitiate the political atmosphere for re-establishing a normal, good-neighbourly relationship with Pakistan. Today there exists much less tension between the two countries and perhaps much less anti-Indian propaganda in Pakistan than in the past. It is heartening that the first successful step has been taken by the Governments of Pakistan and India in restoring postal, telecommunication and travel links. This should mark the beginning of a new era of friendliness between the two peoples.

The recent visit of the Shah of Iran and the wide publicity given to his views that the countries of South Asia should get together for their own regional development has helped focus public opinion on this important issue.

On humanistic considerations also, to alleviate needless suffering and separation, the peoples of Pakistan and India must get rid of the wall that separates them. In a recent article in the *Illustrated Weekly*, Dewan Berindranath has drawn attention to the problem of the 'Prisoners of Peace', as he has called them.

However, it is doubtful whether the public in the two countries have appreciated the full value and significance of this new relationship and its potential and whether they are seizing this moment to put it to best use. Today there are no major political issues between Pakistan and India and only bitter memories of the past act as a break to a better relationship. A new generation has grown up since the Partition of India and its aftermath in both the countries and that generation has no ground for any real bitterness. What is now needed is to take a bold and constructive view in regard to developing a new relationship between the two countries with an eye to the future. We need to capitalise on the new agreement. Normalcy in regard to post, communications and travel arrangements between the two countries has now been established and it has received wide welcome. We need now to create a climate for encouraging travel by people in the two countries and even get ready with plans to send goodwill delegations in cultural fields to build up greater accord as also exchange of locally produced films. Of course, this is only possible on a reciprocal basis. A great deal of publicity is needed on both sides to generate a new climate, but as yet there seems to be very little enthusiasm on both sides. With so much in common in regard to outlook, thinking, way of living and with so many family ties between the two countries, there should be a burst of enthusiasm everywhere to achieve a breakthrough in Indo-Pak relations. This should spark efforts to restore many broken links in social, cultural and economic relationships between the two countries. In the cultural field, a great deal is possible, but this would require a new initiative on the part of both countries.

The first step is now taken to make effective the recent agreements. The second step on the part of Governments at both ends would depend upon the public response and reaction which unfortunately is lacking. Cultural associations, the press, trade bodies and the general public are not yet reacting and are not yet demanding from both Governments that they take early steps. Under democracy, essentially it is the public which should make the Government to act.

What is of even greater importance is to re-establish economic links. Mutual trade between the two countries requires to be restored. Negotiations for a trade agreement between the two countries are now to be taken up and we may hope that they will take place with a sense of urgency. India is in the grip of inflation and even to fight inflation restoration of trade with Pakistan can be of some help. Pakistan has surplus of cotton, rice, wheat, which India needs badly. Pakistan exports these commodities and India is in a better position to buy these than any other country. Pakistan can also obtain profitably from India many manufactured products, including machinery, which India can supply at highly competitive prices. Econo-

mic developments often facilitate improvement of the political situation.

In this direction, trade associations in the two countries also seem to be indifferent. For example, though there is a clamour for import of cotton due to shortage of local production, neither cotton importers nor the textile industry has shown any signs of awareness that possibly we can buy cotton from Pakistan on more favourable terms.

Even though travel restrictions are being removed, there seems to be no move by business firms to explore possibilities with each other. It is difficult to say who is more responsible for inaction — the business community or the Government. Any objective view about the next five to ten years would suggest the potential of growth in business relationship with Pakistan. Since the political hurdles are now largely cleared, all signs are favourable for the restoration of normal economic relationship with Pakistan, which will be of great mutual benefit to trade and industry in both countries.

Pakistan's economic links with Bangladesh are also bound to be restored sooner or later, and passage through India of goods by both countries would be essential to develop their mutual trade. This would be possible only when the three countries are able to re-establish normal trade and travel arrangements. India's trade with neighbouring countries, such as Afghanistan and Iran, suffers today because transit facilities through Pakistan are far from normal. Whatever hurdles exist in regard to issue of visa, passport, etc, and movement of people and goods need to be sorted out with a sense of urgency and with goodwill, in order to obtain quick results. This is the responsibility of people at both ends.

Once a normal neighbourly relationship is restored between Pakistan and India, and therefore, *ipso facto*, also between Bangladesh and these two countries, the ground will be ready for moving forward to develop a more broad-based relationship with other neighbours, such as Burma and Ceylon and Iran, Afghanistan, etc. Occasional references are made about the need for regional co-operation, but hardly any progress has been made so far between India and her neighbours. Even the possibility of establishing a common market is sometimes stressed. What is meant by regional co-operation and common market is not defined nor would there be unanimity about what the region may be. Even countries such as Ceylon and Burma find themselves in a difficult predicament. Nonetheless, for India, it is vital that the possibilities of regional economic co-operation are examined in depth for the long-term economic wellbeing of all. India is in a position to do much spade-work. No progress in this direction is possible unless Pakistan-India ties are first restored. It is not clear whether the Governments and peoples of Pakistan and India are ready to look forward and work for this cherished goal.

In spite of the traditional enmities and bitter war memories between France and Germany, these leading countries of Europe together with other smaller countries have been able to establish a European Common Market. At one time, this was just a dream of a few intellectuals, but by sustained work that dream became a reality. Europe had a common culture which was the bond bringing these countries together in spite of the barrier of language and institutional differences. Progress in science and technology also played a significant part in bringing about such an integration. We in South Asia are in some ways better placed to bring about some form of regional economic and cultural co-operation. Perhaps, without an intellectual conviction and a desire for such an evolution, a popular movement may be slow to grow.

Distribution of Urban Household Wealth in India

A Comment

(Contributed)

V M JAKHADE and S L Shetty (April 27 and May 4, 1974) claim to have worked out distribution of reproducible tangible wealth among urban households for 1949-50, 1960-61, and 1966-67. The first part of the study deals mainly with the estimation of reproducible tangible wealth of the so-called urban households, and the second part, with its distribution among the urban households for the three years. The reproducible tangible wealth with urban households for each of the three years, has been obtained as a residual, by subtracting from the total reproducible wealth of the country the wealth with the government sector, private organised sector, and farm-households. While use has been made of earlier published estimates of reproducible tangible wealth in the country for 1949-50 and 1960-61, the estimates for 1966-67 have been derived by the authors themselves. The official series of the wealth-tax data and the income-tax revenue statistics have then been juxtaposed for arriving at the urban household wealth distribution.

The authors are apologetic from the very start of the study, admitting that the methodology adopted for the analysis is a crude one and in further saying: "It should be emphasised that this paper does not claim to have provided any conclusive evidence on the pattern of distribution of urban household wealth; at best, it provides a basis for discussion". Having themselves accepted the weakness of the analysis and non-utility of the results, it is but proper that a reader should screen their study to further highlight the serious limitations of the analysis and the results derived therefrom to have discussions on the methodology and concepts and to warn the co-readers about the pitfalls of using the results of this study. With this end in view, we make certain comments in the following paragraphs.

At the outset, it may be stated that the very caption of the article is misleading. The authors have ignored the latest position about the available data on the subject. The analysis is very roundabout, on the basis of several inappropriate and unrealistic assumptions. While going through the study, it is evident that it relates to all the urban households and to the non-farm households belonging to rural areas. In no way does it relate to urban households alone. It would thus be proper that the caption of the article should have been 'Distribution of Non-Farm Household Wealth' instead of 'Distribution of Urban Household Wealth'. The choice of the third and last year of the study (1966-67) has been justified by the authors on the grounds that wealth tax and income-tax revenue statistics are available up to 1966-67 only. However, wealth tax and income-tax statistics are published for three more years, i e, upto 1969-70, and naturally such a time-gap cannot be accounted for by the process of preparation and publication of the study.

Before going deep into the many unrealistic assumptions adopted and the conceptual and computational errors

made for arriving at the estimates, it may be pointed out that detailed estimates of total reproducible tangible wealth — sector-wise as well as ownership-wise (household wealth also available separately) — were published for 1960-61 and 1965-66 in the October 1972 issue of *Reserve Bank of India Bulletin*. In the entire study of Jakhade and Shetty, there is no mention of this comprehensive and detailed work, not to speak of failure to use the results of this study. In fact, the authors say: "The only estimates of tangible wealth in some of the functional sectors are those given by Mukherjee and Sastry for 1949-50 and by the Reserve Bank of India for 1960-61". If that is so, perhaps, there is no point in blaming the authors for not referring to the estimates for the year 1965-66 and also for not using the revised figures for 1960-61 in place of weak estimates published earlier. Had the authors been aware of the latest study they could have used much valuable data to advantage.

We agree with the authors that, at this stage of the country's economic development, no official 'administrative' statistics would provide a correct picture of the reality regarding wealth distribution and that the only method of obtaining such a valid picture is thorough systematic surveys. Having agreed on this, we fail to understand why an attempt has at all been made then to derive such a distribution on the basis precisely of such 'administrative' statistics.

Weak Estimates

To start with, the total reproducible tangible wealth of the country for 1966-67 has been estimated by the authors by two methods. The first method, the estimate of which has also been chosen for further analysis, is to take the Reserve Bank's earlier published estimate for 1960-61 as the benchmark, and to convert the same to current prices of 1966-67 with the help of an implied index of investment cost (obtained from CSO series of capital formation at current and constant prices). Thereafter, the price-adjusted net capital formation achieved during the period 1961-62 to 1966-67 is added to this. The most serious objection to this approach is the use of RBI's earlier estimate (Rs 32,164 crores) as benchmark — which according to the source was weak — and when the revised estimate (Rs 46,622 crores) is available for that year in the October 1972 issue of the *Reserve Bank of India Bulletin*. The derivation of capitalisation rate in the second method, to estimate the total reproducible tangible wealth of the country, has many limitations. The estimates based on this procedure lose further ground as the same are obtained by assuming constancy of capital-output ratios over time for the different sectors of the economy for the entire period, 1960-61 to 1966-67, which according to the authors is a short period. The reproducible tangible wealth of the country for 1966-67 has thus been estimated at Rs 63,773 crores by the first method and at Rs 61,411 crores by the second method as against the estimate of Rs 73,120 crores for 1965-66 published in the October 1972 issue of the *RBI Bulletin*.

Interestingly, the authors derive satisfaction by saying, "There is thus a close correspondence between the above two estimates, though the methods of estimation are independent of each other". It may be emphasised that the first estimate is higher than the second one by as much as Rs 2,400 crores although Jakhade and Shetty have managed to bring out close correspondence between the two by pointing out underestimation in the government services sector, of some Rs 2,000 crores, in the second estimate. Thus it becomes clear that the aggregate estimate of wealth, as worked out by the authors, is based on shaky ground and is very weak.

The assumptions made for working out the RTW of the government sector and private organised sector, which have been deducted from the aggregate wealth to obtain the household wealth, are very weak. To mention a few, the share of the private organised sector in the total wealth of the country, at 15 per cent for 1960-61, has been assumed to be the same for the entire period of 1960-61 to 1966-67. The implied index of investment cost as worked out from CSO's estimates of capital formation for the entire economy, has also been used for the government sector as a whole and also for a sub-sector of the government sector, *viz*, improvements in land, irrigation, etc.

To cite one example out of many of gross conceptual errors and inaccuracies noticed in the calculations, which are unpardonable, reference is made to Table 8 on page 680 (April 27, 1974), presenting estimation of public sector wealth in the form of improvements in land, irrigation, etc. While column 1 of this Table gives capital outlays on such works for each of the years 1960-61 to 1966-67, column 2 presents the figures after adjustment for depreciation. However, depreciation is adjusted only on the current year's capital outlays and not on cumulative net investments since 1960-61, plus that on the current year's outlay. It is a very elementary principle that depreciation on investment has not only to be provided for in the outlay for a year in which investment is actually made but for the preceding years. Thus, apart from conceptual errors, to what extent the final estimates will be affected by such errors in calculation, is anybody's guess.

In order to derive the non-farm household wealth, the entire wealth held in the group, "Agriculture, Animal Husbandry, and Allied Activities", and 80 per cent of house property in rural areas is assumed to belong to the farm household sector and is deducted from the total household wealth which itself, as stated earlier, has been obtained in a roundabout way. This assumption has been made on a very rough ground and needs to be corroborated by an independent source.

Fallacies of Distribution

Jakhade and Shetty, after arriving at the estimates of reproducible tangible wealth of the non-farm households, go on to present its distribution with the help of official data on wealth-tax and income-tax. It has been assumed that, in a given year, all wealth tax assessees belong to the highest income brackets as revealed by the income-tax assessment data. That is, when income-tax assessees are arranged in ascending order of the income scale, the number of income-tax assessees in the highest income brackets equivalent to the total number of wealth tax assessees are assumed to correspond to each other so that the wealth held by them corresponds to their income assessed. From a comparison of the total wealth assessed and total income assessed for the total number of wealth tax assessees, which also correspond to income-tax assessees in the highest groups of income, the capitalisation rate for the year has been worked out. This capitalisation rate has been used to convert the income assessed into reproducible tangible wealth and also the various ranges of income assessed to the various ranges of the reproducible tangible wealth held by the households. Thus, the working implies that the coverage of the items assessed under wealth-tax is the same as those falling under the concept of reproducible tangible wealth. Unfortunately for the authors, this is not so as they can themselves verify inclusion and exclusion of many items in the former from that of the latter. Thus their capitalisation rate will not yield the distribution of reproducible tangible wealth with the non-cultivating households; at best, it may point out the assessed value of assets included under the Wealth-Tax Act.

It deserves to be noted that the capitalisation ratio is based on *assessed* wealth and assessed incomes. Assessed wealth is arrived at after deducting for certain exemptions. Today, such exemptions amount to almost Rs 2.5 lakhs. Any rational human being would so invest his fortunes as to claim the exemptions, e g, shares and residential houses. So also, assessed income is worked out after deducting certain admissible exemptions. Thus, the capitalisation ratio, derived from *assessed* wealth to *assessed* income, will not be the same as it really obtains between aggregate wealth to aggregate income of a household. Any attempt to ignore this aspect will give misleading results.

As pointed out in the paper, according to 1966-67 data, the percentage of households paying income-tax to total urban households is 4.1 and the percentage of households paying wealth-tax to total income-tax assessed households is 4.6. Thus, the households paying wealth tax to total urban households form a mere 0.19 per cent. This insignificantly small percentage of households has been used by the authors to derive the distribution of wealth for the entire non-farm households.

Arbitrary Procedure

As indicated in the earlier paragraphs, the distribution of wealth has been derived by juxtaposition of wealth tax data and income-tax revenue statistics for the same number of assessees and the working of this part is really interesting. Starting with the highest income slab and coming towards the lower income slabs, an attempt has been made to equate the number of such income-tax assessees with the total number of wealth-tax assessees. In any normal situation, it is impossible to have an exact tally of this type. To have this, the authors have chosen to divide the number of assessees and their income assessed in a particular range of income on just *pro rata* basis. When arrangement of the income-tax assessees in ascending order of income is the first assumption of this analysis, it is very incorrect to adopt such an arbitrary procedure of division. In fact, inclusion or exclusion of even a small number of assessees in the dividing income range will materially change the capitalisation rate. This observation holds good also for Tables 14, 16, 20 and 21 where too this crude way of division of income range/asset groups has been adopted.

As pointed out earlier, the entire exercise of deriving the wealth distribution is based on households paying wealth tax which form a meagre fraction (0.19 per cent) of total number of urban households. Such households belong to the net wealth assessed groups of Rs 2 lakhs and more, and according to the income assessed group in the income range of Rs 40,001 and more for 1960-61. The capitalisation rate obtained for such a meagre fraction, and special category, of people has been applied to an entirely different category of people belonging to the income assessed groups of Rs 3,001 to Rs 40,000. The usage of the capitalisation rate of the first category of income-tax assessees to that of the second category of wealth tax assessees is entirely inappropriate and misleading. Even after all this, the authors could not say anything about the wealth distribution of the remaining non-income-tax paying urban households, which form more than 96 per cent of the total urban households — except that for these households the total reproducible tangible wealth has been derived as residual.

The entire attempt of getting the wealth distribution is futile. Since, to obtain the ranges of wealth and the wealth possessed, the same capitalisation rate has been applied to the ranges of income and also to income assessed, the resultant distribution of wealth is nothing but the income distribution according to the income ranges. Thus, for example, the proportion of households and proportion of their wealth in the two size groups of wealth, as presented in the Table on page 729 (May 4, 1974), will be the same as that of corresponding income ranges.

As pointed out in the earlier paragraph, adoption of the same capitalisation rate to different income groups for the same year, is highly objectionable. As observed by Gulati, the rate of capitalisation may be high at higher income levels. Our objection becomes stronger when it is found that the same rate as obtained in 1960-61 has also been applied to the other two study years, so wide apart, i e, 1949-50 and 1966-67. The authors have justified the use of the uniform capitalisation rate by saying that different rates have not been applied because they would have been arbitrary. Thus the constancy of rate has been maintained for all the three years — though, for 1966-67, separate capitalisation rate has been worked out which the authors somehow find unacceptable. Since the entire exercise of getting the wealth distribution, which is the main theme of the paper, depends on the capitalisation rate, it should be expected that the authors take more trouble to look into the official statistics in detail for studying the differences in capitalisation rates at different levels of income in the same year and also in different years. Such an exercise, even on sample basis, could have given a somewhat better picture of the distribution of wealth.

Major Pitfalls

The authors of the article indeed create confusion after confusion — perhaps because they were eager to present some results. For instance, they have also tried to compare the wealth distribution (as derived by them) of so-called 'urban households' with that of 'rural households' as available from the Reserve Bank's All-India Rural Debt and Investment Survey of 1961-62. The two major pitfalls of this attempt are:

(i) the two types of households are not at all comparable as they are not mutually exclusive; the first type of households include all urban (including cultivating households) and rural non-cultivating households, while in the second type of households are included the rural cultivating and non-cultivating households; and

(ii) while the size-classes of the study are based on wealth assessed under the wealth-tax laws, that of the Reserve Bank's study relate to assets in possession of the households. Naturally, the coverage of the items under the wealth-tax and that under the assets holdings in the AIRDIS is not the same; as such, the results based on these two different classifications are not comparable.

To conclude, the whole study is just a confused attempt to depict a distribution of wealth based on many unrealistic assumptions, and is full of conceptual and computational errors. It does not lead the reader anywhere; rather it misleads on the important subject of the distribution of wealth. It might have been better to wait for proper data and then apply appropriate techniques to the same, to get results really useful to the public and the planners. If this is not possible, one should do without any such distributions.

Distant Thunder Breaks over India

Ranjit Sau

And all the while, ... an Indian fell
in the morning:
a body spun off, an anonymous chattel.
some numeral tumbling,
a branch with its death running out of
it in the vat of the carrion, fruit
laden and foul.

— Pablo Neruda

IN the silhouette of gathering darkness they appear: first, a hesitating few; then by tens, by hundreds, and soon in the torrents of thousands upon thousands — those emaciated shadows of human beings trekking to cities in search of food. The heavy footsteps of ravaging famine shatter the eardrum. Safe at a distance, Ganga, shaken out of wits, looks for reassurance at the pretty face of his pregnant wife, Ananga, the bourgeois symbol of eternal love, immanent continuity, and resignation to inexorable fate. And so the curtain falls on Satyajit Ray's latest movie, *Ashani Shanket*, or *Distant Thunder*.

The distant thunder has now broken over India. Reports are pouring in — mothers killing, selling or abandoning their children; women turning prostitutes; hungry hordes swarming the towns and cities; millions trying to survive on grass, seeds and wild roots in villages, and dying in the wilderness. The Gangas and Anangas though safe at a distance are counting the days with heightened anxiety. The dying is piling up on the dead. 1943 has come back with a vengeance.

Conflicts and Tensions in Bold Relief

Crisis is a product of contradictions; a crisis intensifies the contradictions. This crisis will sooner or later pass over into the pages of history. But will the society as a result move one step forward, or will it retreat two steps back? Will the revolutionary forces of the society be accelerated? Will the consciousness of the masses be aroused? Or, will the reactionary elements in the society get another lease of life with even more ferocity?

This famine has arrived in the crest of a prolonged over-all economic setback. In the flash of its thunder you can see some of the conflicts and tensions of the economy in bold relief. Along the long-term trend line the home market of India's industry is vanishing as an average consumer is spending proportionately less and less of his budget on industrial goods.[1] Agricultural output has failed to keep pace with time; and the soaring foodgrains prices have eroded the consumer's budget. The parade of five-year plans with all its paraphernalia and windfalls has totally bypassed the vast majority. More than ever before, the farm lobby holds the country to ransom.

Meanwhile, the country has been sold out to the gnomes of aid. By March 1973, India had swallowed 'foreign aid' to the tune of Rs 12,510 crores which is equivalent to about half of the national income. That is to say, the cumulative 'foreign aid' per capita amounts to the consumer expenditure of an average Indian for nearly six months. Today, four-fifths of the 'foreign aid' received every year is being spent on servicing only the past debts.[2] What else is bankruptcy?

Caught in the Pincer

Caught in the pincer of a dwindling domestic market and the drying up of 'foreign assistance', India's industry is feeling extremely jittery. The hyper-inflation of the last few years is now capped by the famine: the industrial bourgeoisie of India has fallen in its worst days since Independence. The contradiction within the ruling classes of India has matured.

The class interests of the industrial or commercial bourgeoisie do come into conflict with those of the agricultural bourgeoisie or feudal elements at different stages of economic development and in various forms. The history of England in the eighteenth and nineteenth centuries, of Germany in the nineteenth and twentieth, and of the inter-war Japan, for instance, abounds with illustrations.[3] And if that is any index, the tussle of the interests of exploiting classes gets resolved through the escape route of repression of workers and peasants at home, and aggression abroad. Imperialism-cum-fascism is the golden key to disentangling the knot of conflicting class interests of exploiters. The stagnation-inflation-famine of India therefore augurs if anything a renewed phase of more ferocious exploitation within, and calculated sub-imperialism without. The clock of history then would be turned back.

Of these endless line of uprooted, hungry men, women and children, some will return home with their bones in one place; others will fall by the wayside. These famished millions who languish in starvation to death will cast their long shadow over the others who barely scrape through. For the years to come their ghosts will thicken the darkness in rural India.

Those who survive in the fierce struggle to live on the rotten garbage in the streets of Calcutta will either melt away in this city's boiling pot of the underworld, or go back to the village only to be sold as a chattel to a landlord or jotedar. From crisis to crisis the noose around their neck thus gets tightened by few more notches.

Not a Matter of Elasticities

It is an irony which borders on inanity that the economists consider the present crisis basically as a matter of four elasticities of demand and supply, or of 'too much money chasing too few goods'. When the exploiting classes are riddled with internal contradictions; when they are trying but not yet ready to regroup in order to mount a fresh offensive on the workers and peasants as a solution to the current crisis; when the situation is in flux; it is idle, if not worse, to be lost in myopia. This is the opportune time for the progressive forces to converge on high missions. This is the time to make history. Hold the price line; distribute more food at low price; yes, these are good slogans, kind gestures and absolutely minimum demands. But that is not all.

Despite the zigzag, India is certainly heading towards a fundamental social and economic transformation. Economists should realise that they have a role to play in this great epic. Neutrality is a misnomer. Neutrality is the *nom-de-plume* of supporting the *status quo*. You cannot be neutral between the life and death of the millions.

Efforts directed to development and improvement **Glaxo**

Statement of the Chairman, Mr. S. Bhoothalingam

THE economy of India is still reeling under the effects of high inflation. Policies recently introduced by the government are beginning to make themselves felt. However, we can hope for an enduring change for the better only after further effective measures are implemented to enable an all-round increase in production in all sectors — agriculture, power, transport and industry. Although this will take time, I have enough faith in the reserves of resilience of India to be convinced that economic health will be restored and the country will resume development at a faster pace.

THE YEAR'S RESULTS

Glaxo has so far been reasonably successful in coping with the problems created by inflation. Sales in 1973/74 reached Rs 35.38 crores, an increase of 14.2 per cent over the previous year. Increased volume of sales accounted 10.8 per cent and price increases only 3.4 per cent. Due to price control there was hardly any upward movement in pharmaceutical prices. This has been our experience for several years. Compared to 1961/62 the price index of all commodities moved from 100 in that year to 254 in 1973/74. For the same period, the index of pharmaceutical prices moved from 100 to only 142. Over the last four years there has been virtually no rise in pharmaceutical prices, although costs of the inputs have been going up steadily and fast. The increase in the cost of material has been particularly steep during 1974. By unremitting pursuit of productivity and efficiency it has been possible to maintain reasonable profitability, but this process cannot go on indefinitely. Suitable and timely price increases to compensate for rising costs cannot hereafter be postponed or delayed except at the cost of damaging the industry.

PRICING POLICIES

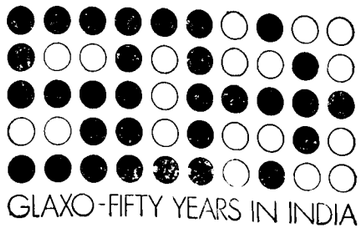
Whilst I fully accept the need for restraint and the regulation of prices, an overhaul of pricing policy is needed urgently since such regulation, intended to benefit the consumer, must not be self-defeating. A sound pricing policy must always offer both incentives and opportunity for increasing production. The paradox of price control, not only in pharmaceuticals but in many other commodities as well, is that the temptation to fix prices too low on the ground that the commodity is required for mass consumption eventually leads to exactly the opposite effect — inhibiting the growth of production of these very commodities.

One simple and obvious way of protecting the interest of the consumer has been neglected for far too long. That is the conscious use of competitive forces in the marketplace in the interests of the consumer. For every important end use there must be at least two or three reasonably effective products made by different manufacturers of comparable efficiency and resourcefulness. The rigid application of industrial licensing policies has needlessly reduced the scope of this type of beneficial competition.

IMPORTS

Dependence on imported materials in the pharmaceutical industry is now not very great. In 1973/74 the CIF value of imports, including canalised imports, was only 8.8 per cent of the total production of the industry at sale value. In the case of Glaxo the percentage was only 3.2. Although the quantum of imports is thus very small, a small increase in imports can bring about a large increase in production, more than ten times as large. This surely ought to be one of the main criteria for fixing the import allocation for the pharmaceutical industry. This allocation must take realistic note of the effects of inflation on the prices of imports. This is of particular importance since shortages have begun to appear in the case of several drugs and this may spread if production is not enhanced urgently.

In spite of recessionary tendencies in some sectors of the economy, the effective demand for pharmaceuticals will continue to increase by at least 15 per cent per year. The industry has reached a stage of development when further import substitution will take a little longer than before. In the short run, therefore, it is necessary that there should be an increase in the import allocation commensurate with the desired increase of production. While some extra liberal treatment may be justified and even called for in the case of the smaller units, this should not come in the way of allowing the larger units



the kind of imports which they really need.

In conclusion, I would like to say that while grappling with current problems our eyes remain steadily fixed on development and improvement. This I believe would be possible within the ambit of broader government policies if, as I hope, they are implemented in a constructive spirit.

When several thousand countrymen put their savings in your business, it's called trust.

It goes back a long way—to a time when the Tata Iron and Steel Company was being formed. Thousands of people, "some with stools and lunch boxes" lined up outside the Tata office to buy shares in the new Company.

Rich and poor alike subscribed.

And when it took just three weeks for some eight thousand people to raise 23 million rupees towards the new industry, Dorabji Tata wrote of this achievement with pride—"it was a purely Swadeshi enterprise, financed by Swadeshi money and managed by Swadeshi brains".

That was in 1907. Today at Tata Steel, this same spirit remains. The same pride that some seventy-five thousand people of India own shares in the Tata Iron and Steel Company—in a way that has now become the Tata tradition.

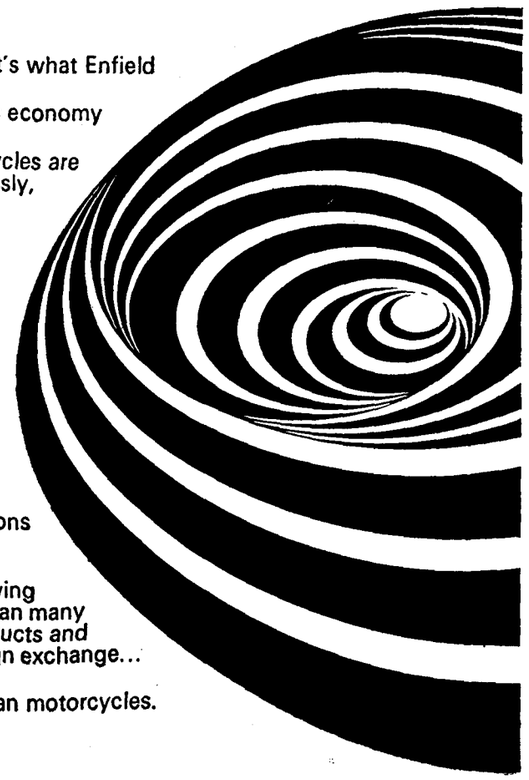
at ENFIELD progress is a continuous process

Continuous, sustained progress—that's what Enfield India is all about.

Enfield's contribution to the country's economy is varied...

Enfield's Bullet and Crusader motorcycles are the pride of the roads—serving tirelessly, faithfully over long periods.



And Villiers Engines are the good companions of many a farmer in the country for plant protection and irrigation purposes, apart from being useful for a wide range of industrial applications, and for generating sets for Defence Forces.

And Enfield's second factory for motorcycles is at Anaikaraipatti—a backward area in Tamil Nadu.

Enfield's role in promoting ancillary industries is well known. The groups of ancillaries sponsored by Enfield at Madras and Anaikaraipatti are indications of its involvement in the growth of small-scale units.

All these efforts, plus the rapidly growing export markets for Enfield products mean many things—more employment, more products and services, savings and earnings of foreign exchange... and a boost to the economy.

In short, Enfield means much more than motorcycles.

A Matter of Definition

THE government is already armed with extensive powers to deal with those whom it, for one reason or another, happens to dislike. It has also shown its readiness to use these powers to the hilt. It may, therefore, appear rather pointless to protest against a further enlargement of these powers. The government has kept close to 20,000 political prisoners in detention indefinitely without trial; it has been charged with torture and liquidation of large numbers of those whose political views and activities it has found unpalatable. It has been able to do all this without being called into question by the judiciary of the land. Such a government, it may be argued with some force, does not stand in need of further legal powers.

Yet the appetite for arbitrary power is evidently insatiable. On Saturday last the President issued yet another ordinance, depriving those detained under section 3(1)(c) of the Maintenance of Internal Security Act of the right to move the courts for enforcement of the rights conferred under Articles 14, 21 and 22 of the Constitution for a period of six months. The rights in question are, among others, those of equality before law and equal protection of the law and the right not to be deprived of life and personal liberty except according to procedure established by law.

Here was the government, it may be noted for form's sake, issuing an ordinance when Parliament was actually in session; what is more, six days after the proclamation of the ordinance the bill to replace the ordinance had still not been introduced in Parliament. This, let us repeat, is largely a matter of form; for, with the majority which it has in Parliament, there is not the slightest doubt that the government will be granted any powers which it asks for.

Let there be no illusions, however, that the ordinance will make any material difference to the government's sagging campaign against smuggling. Out of the 580 or so alleged smugglers arrested under MISA, the courts had ordered the release of some 20 at the time the ordinance was issued. In most of these cases the courts had overturned the government's detention orders on the ground that the reasons for detention had been framed so vaguely that the detenu would not be able to make an effective representation against his detention. As a result, the Central government had been constrained to ask the states to exercise more care in framing charges against alleged smugglers. Certainly, the Central and state governments have all the information they need to frame the charges properly. In fact, even newspapers, despite our stringent libel laws, have come up with articles on the doings of individual smugglers, complete with exact dates and precise details of particular transactions. That in many cases the charges against alleged smugglers were nevertheless framed so vaguely as not to fulfil even the very unexacting requirements of MISA can only point to negligence or worse on the part of the detaining authorities.

Indeed, the manner in which the charges against alleged smugglers have been framed strongly supports the view that, for all the propaganda mileage it has derived out of it, the government is not really very serious about its drive against smuggling. No steps have been taken to break up the organisational networks of the smugglers or to close the distributive channels for smuggled goods. The government has also not cared to take the most obvious measures to check the illegal flow of foreign exchange out of the country with which the smuggling business is financed. It would not be uncharitable at all, therefore, to suggest that what the government is after is to create the popular impression that it is straining every nerve to curb the menace of smuggling, without actually hurting smuggling activity overmuch.

Last Saturday's ordinance fits neatly into this design. While seeming to be a truly draconian measure, it is unlikely to worry the smugglers overmuch. The majority of the alleged smugglers under arrest are apparently in no hurry to embarrass the government by securing their release through appeals to the courts. That apart, despite the ordinance, the Delhi High Court on Friday ordered the release of two alleged smugglers — once again for the reason that the grounds of detention were irrelevant and non-existent and that the detaining authority had not applied his mind while making the detention order.

The implications of the ordinance are thus ominous not for the smugglers but for those political elements who have been so far the main victims of the exercise of the government's powers under the MISA. The explanation that the

ordinance applies only to those arrested under section 3(1)(c) of MISA, which refers to smuggling and smugglers, fails to carry conviction. Such niceties of definition are unlikely to come to the rescue of those whom the government is determined to put down. Recently, when faced with the Amnesty International's disclosure that there were between 15,000 and 20,000 political prisoners in West Bengal, the government coolly countered that the number of "political prisoners" in the state was precisely 1,609; the rest were simply not defined as political prisoners. Only the very naive will, therefore, place their trust in the manner in which the government may at future dates and in particular cases choose to define who is a smuggler and who is not or who is likely to act in a manner prejudicial to the conservation of the country's foreign exchange resources and who not.

The government's evolving morality in these matters was spelt out the other day — appropriately, considering his own personal credentials in such matters — by the chief minister of Haryana, Bansi Lal. The chief minister declared in Karnal on Thursday that all those students who participate in any JP-inspired agitation against his government would be debarred for ever from state government jobs: worse, their names would be entered in the 'history-sheets' at police stations in their home villages, presumably laying them open to life-long police harassment. Now, there are supposed to be reasonably definite rules about what does, and what does not, constitute a disqualification for government jobs, whether in the states or at the Centre. But, obviously, the government has no use for these rules. If it becomes necessary to blackmail young men and women to prevent them from expressing their dissatisfaction with the government, then the government will do precisely that, by threatening them with denial of employment opportunities. And to hell with the rules.

Engineering Industry

Fruits of Lobbying

A HIGH-POWERED committee, headed by the Secretary to the Department of Heavy Industry and consisting of senior officials from other ministries, has come up with recommendations for stepping up exports of engineering goods to Rs 600 crores by the end of the Fifth Plan. That it was able to persuade the government to appoint the committee testifies to the lobbying influence of the engineering industry. What is more, the recommendations of the committee would have been scarcely different had it been composed not of government officials but of representatives of the large companies in the engineering industry.

The importance of stepping up exports of engineering goods is not in question; but what is one to make of recommendations such as that "questions of economic concentration, large houses, small-scale industries, etc. should not be injected into our export policies"? The committee's other recommendations also bring out its bias. It argues, for instance, that stipulating an export obligation for substantial expansion or permitting foreign collaboration only for development of new products or allowing production in areas reserved for the small-scale sector only if the major portion of the output is exported, all nullify the main objective of export promotion. In the Committee's view, attaching such conditions amounts to putting fresh obstacles in the way of our export effort, in addition to the existing ones like inadequate production, shortage of raw materials and the intense competition in foreign markets from established exporters from other countries. According to the committee, producers should be assured automatic permission to expand output within the broad guidelines set by government.

There is merit in the suggestion that production for export, in excess of the stipulated minimum quantum of exports, should be allowed and raw materials and other inputs for this made available. But it is quite a different proposition to suggest that government approval should not be necessary for expansion of production and that it should suffice if the unit simply notifies the government about the expansion. This recommendation is justified on the ground that there are procedural delays in approving expansion of capacity even where the unit proposes to export the entire additional production. But would it not have been more to the point if the committee had examined possible ways of reducing these delays instead of recommending the removal of controls on industry? Equally startling is the suggestion, made in the same context, that the present policy of insisting on Indian participation should be given up and even 100 per cent foreign equity allowed. This is an attempt to further dilute the operation of the Foreign Exchange Regulation Act, in addition to what has already been accomplished in the Guidelines to the Act issued by the government nearly a year ago.

The engineering goods industry enjoys several attractive incentives for export of its products. Despite these incentives, exports of engineering goods during the last few years have been very disappointing. Yet the committee considers it necessary to lavish still more incentives on the industry. It is suggested, among other things, that the government should work out a formula for allowing export investment rebate on investment for export production on the same lines as the erstwhile development rebate.

Except for the suggestions for reducing procedural delays and removing difficulties in the disbursement of cash incentives and tax rebates, the effect of the substantive recommendations of the committee would be to dismantle the bulk of the existing regulations governing the engineering industry. It is difficult to be convinced that these recommendations are intended to step up exports of engineering goods. Despite its formal terms of reference, a general relaxation of the regulations to which units, especially the larger ones, in the engineering industry are subject, rather than specifically the expansion of exports, appears to have been uppermost in the committee's mind. How else can one explain the committee's position that export obligations need not be insisted upon, that the areas reserved for small-scale industry should be thrown upon to all without any commitment to export and that 100 per cent foreign participation should be permitted without an undertaking to export the entire output. It is, of course, true that in the past the imposition of export obligations has not resulted in a commensurate expansion of exports. But this has been so because the export obligations have been half-heartedly enforced. The solution, therefore, is not to release units from the obligation to export, as the committee suggests, but to ensure that the obligation is in fact fulfilled.

Food Aid

A Matter of Internal Distribution

THE much-flaunted World Food Conference at Rome has ended in a predictable manner. A certain style of functioning has become a necessary part of all United Nations operations. The periodic conferences, the working

party meetings, and the rest of the hocus pocus organised by the organisation are by now little more than a facade for clandestine manoeuvres and manipulations. The meeting in Rome was no different: It was as if a shadow play was being enacted for the edification of ordinary spectators, while the real drama was unfolding behind the scene. As at all such conferences, there was interminable talk with a lot of expenditure of public funds. A whole lot of resolutions, meaning all things to all men, also got passed. Each of these — including the one proposing a Security Council for Food — can be viewed as a total waste; but then, such waste has become inseparable from the *modus operandi* of international existence. Such wastage has been recognised as a necessary adjunct of survival in an open world, if tension in it is not to break out into open warfare.

That the conference on food met at all, indicates a certain stirring of emotions, however. It reflected perhaps a developing awareness that the phenomenon of hunger and deaths from famine in particular parts of the world could be a destabilising factor and could affect the security of even well-fed and well-entrenched nations. A better order of distribution of food, insofar as this could be arranged without harming the overall interests of the food-surplus nations, has been recognised, however obliquely, as an integral part of the code of international living. It would still be a gross mistake to assume that the task of a more equitable distribution of food can be completely abstracted from the interplay of national interests and egos. Food-surplus nations come to such conferences and, for reasons of public relations, talk in lofty terms on the imperative need to provide for the hungry. But there is going to be no open commitment on their part to supply food for the needy. Such commitments will still be the end-product of intense bilateral negotiations alone: At such negotiations, there will be a toting up of the plus and minus points, and the trade-offs will be carefully worked out. In any case, there will be no binding, long-term arrangements. What each surplus nation will agree to give will be determined by the degree of commitment on the part of other, similarly placed, nations. It will also depend on the reciprocities likely to flow, whether political or economic. Inevitably, the open conferences are reduced to rituals; and the poorer nations in their frustration are driven to convert them into so many replicas of the UNCTAD or of the Second or Third Committee of the UN General Assembly.

The deficit nations may wax indignant that such should be the case. This indignation too can only receive short shrift. In this matter, introspection is called for on the part of all nations — surplus as well as deficit. What prerogative, for example, has the Government of India to look askance at the United States of America or the Soviet Union or Australia or Canada, when some of its own behaviour could be called in question?

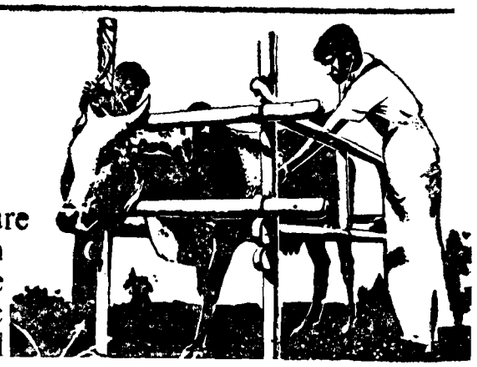
On the purely academic plane, as of now there should be close to 70 to 80 million tonnes of surplus foodgrains available in various parts of the world, a significant part of which could be sent out at concessional terms for the succour of nations whose populations are currently dying of hunger. But such argument can be extended. A Government of India representative moved a resolution at the Rome conference suggesting that "every well-fed person in the world — that is, anybody consuming more than 2,000 calories a day — should give up a meal as humble gesture which would have meaning in the present context of the world food crisis". The government of a food-surplus country could well have needled the Government of India on whether it has been able to enforce within its own territory the dictum it is preaching. It would be easy for any off-beat professor from a surplus country to calculate the per capita availability of foodgrains in the different regions of this country and to counsel a more equitable order of internal distribution as a preliminary measure for tackling the country's food crisis. It would be equally easy for an administrator belonging to, say, the US Department of Agriculture to suggest that till as long as India does not improve its own internal system of procurement and distribution, she has little case to press for a freer flow of grains from the United States.

The need for greater forthrightness and candour could hardly be overemphasised. Is it not extraordinary that, in all the discussions taking place in the country and outside, not one official admission has been forthcoming of the fact that, in the current season, food has been short in some parts of India and that the government failed to reach food to at least a few thousands who have died of starvation? At Rome, the Union Agriculture Minister blandly repeated the falsehood that not one starvation death has taken place. One talks of a failure of conscience among the surplus nations. Can not one talk of abdication of morality among those at home as well? One laments over the fact that the issue of a fairer distribution of food has become a plaything of international politics. Is it any different within the country?

The Prime Minister, for instance, has found time to visit quite a number of places in the course of the past two months. She has found time to participate in any number of inaugural occasions and anniversary meetings. But she has not found time to visit any of the eastern states where people have been dying because of lack of food. No doubt, such visit would be open admission of starvation in parts of the country — which the government *will* not admit to. Such deaths have nothing to do with the alleged lack of sympathy on the part of foreign nations. People have died, and are dying, because food available within the country was not, and is not, being distributed in any equitable manner.

The problem is thus again seen to be clearly linked up with the problem of income distribution; the bulk of those who have died in the eastern states did so because they did not have the income with which to buy the grain that was there: It was not so much a failure of food supply as of lack of income. If income continues to be distributed in a frighteningly skewed manner, extra supplies of food would be of no avail; and some people will continue to die.

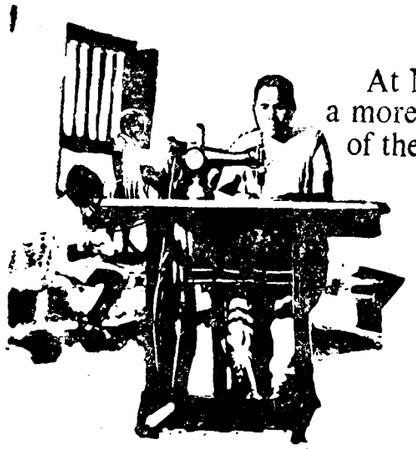
Gujarat



Uses of the Sardar

Our Gujarat Correspondent writes:

THE celebration of the 100th birth anniversary of Sardar Patel on October 31 had a special significance in Gujarat. The celebrations provided an opportunity for politicians of all parties to break the lull in their activities after the imposition of President's rule in March. The public image of the professional politician had been so severely tarnished as a result of the mass movement led by the Nav Nirman Samiti that the politicians could not have dared to address public meetings except on the pretext of paying homage to Sardar Patel. No political party, therefore, missed the opportunity to re-establish its contact with the people.



In a sense, the Sardar centenary marked the beginning of the campaign for the next assembly elections which are expected to be held early in 1975

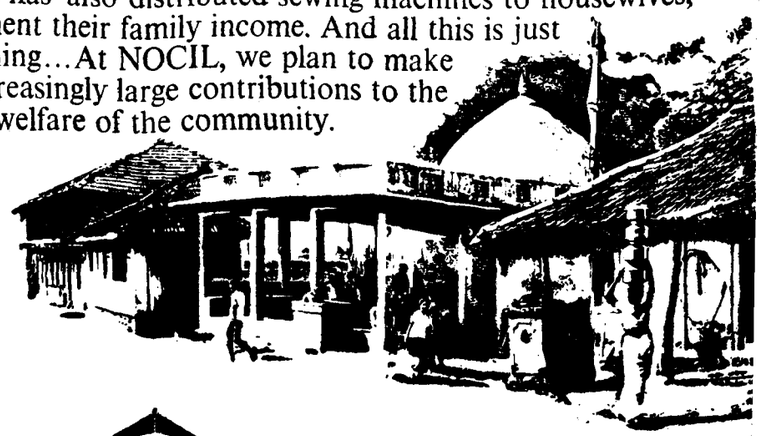
MADRAS-5

A country's future depends largely on the vitality of its economy. The attainment of economic prosperity is a national

challenge



At NOCIL, we believe that organised industry must play a more positive role in contributing to the economic well-being of the people. And so, we've made a modest beginning towards this end. Our efforts have been concentrated in the villages of Ghansoli, Talavali and Gothivali, near the NOCIL Petrochemicals Complex in Maharashtra. With technical and financial assistance from NOCIL, a Community Welfare Programme is helping to raise the standard of living of the villagers.

The villagers, having themselves selected projects which could supplement their income, actively participated in the setting up of a Cattle Insemination Centre— supervised by a full-time veterinarian. This Centre will soon help boost milk yields, and increase the income of the villagers. The scheme is now being run by the villagers on a co-operative basis.

NOCIL has also distributed sewing machines to housewives, to help supplement their family income. And all this is just the beginning...At NOCIL, we plan to make increasingly large contributions to the welfare of the community.

AIYARS-NOCIL

Preparing for the elections is going to be tricky for all the political parties, for the movement launched by the Nav Nirman Samiti shook the people's confidence in not only politicians and political parties but also in the system of elections and in parliamentary institutions. That the popular disenchantment was by no means limited to the Congress is amply evident from the fact that all the opposition parties, including those which had supported the Nav Nirman Samiti's movement, have had to lie low for the last many months. These parties now face the difficult task of persuading the electorate, particularly in the urban areas, to take their campaigning for the forthcoming elections seriously.

This is not to suggest that the Nav Nirman Samiti itself had a coherent revolutionary ideology or an extra-parliamentary programme of political action. If it had, it would not have fizzled out as it did after the dissolution of the assembly. Nevertheless, the Samiti's movement did succeed in making explicit the people's loss of faith in the corrupt politicians, political parties and political institutions.

The first task of the political parties in Gujarat, therefore, is to bring the masses back to the election arena, so to say. It is in making a beginning with this task that the parties found the occasion of the Sardar's birth centenary very useful. By drawing attention to their connection, however peripheral, with Sardar Patel during the Independence movement, they tried to re-establish their political credentials.

Almost every political party fielded its big-wigs to address public meetings as part of the centenary celebrations. Most active among all the parties was the Congress(O) which, under Morarji's leadership, remained in the forefront of the celebrations. It arranged public meetings in at least five districts. Asoka Mehta, too, joined the show — rather pathetically, because during his life time the Sardar had rarely a kind word to say about JP's young Socialist group in the Congress of which Asoka Mehta was a prominent member. It is an irony of contemporary Indian politics that, instead of helping JP in Bihar, Asoka Mehta should be hobnobbing with Morarji in Gujarat.

The ruling Congress, realising the extent of its loss of face during the Nav Nirman movement thought it wiser to arrange a visit by the President of India to the state on the occasion of the centenary. Fakhruddin Ahmed went to Karamsad, the birth place of Sardar Patel near Anand. The discredited Gujarat Congress leaders clung desperately to the President's coat-tails. It is difficult to say, however, how much good the President's visit did the Congress. The vulgarity of the expenditure of several lakhs of rupees for such purposes as acquiring a brand new, specially long, red carpet for the President's reception at the Ahmedabad airport and the putting up of iron railings on both sides of the roads by which the Presidential motorcade travelled — at a time when the government is pleading its inability to provide funds for continuing relief works in the 13,000 villages which have been officially declared drought-stricken — could not have been entirely lost on the people.

The most unexpected visitor who descended on Gujarat during the Sardar centenary was Charan Singh, president of the newly-formed Bharatiya Lok Dal (BLD) from far away UP. His visit had been arranged by the new Gujarat party, Kisan Majdoor Lok Paksh (KMLP), formed by the disgraced former Chief Minister Chimanbhai Patel. Charan Singh started his tour of Gujarat from Bardoli where Sardar Patel had led the successful satyagraha by farmers against the British. Bardoli's present significance in Gujarat politics is that it is one of the strongholds of the growing kulak class in the state. As a complete stranger to this part and with pretensions of being a farmer himself, Charan Singh proved to be quite a draw.

Jan Sangh's part in the centenary celebrations was very restrained. The only parties which could not, given their ideology and history, participate in glorifying Sardar Patel were the communist parties. But then, the communist parties exist only nominally in Gujarat politics.

Soviet Union

For a Mess of Dollars

A Correspondent writes :

IMPERIALISM is the striving for "spheres of influence, *i e*, spheres for profitable deals, concessions, monopoly profits and is an economic territory in general" (Lenin). Spheres of influence or "special relationships" have been very profitable for the Soviet Union and detrimental to the Third World countries involved. At the height of the oil embargo last December, the Soviet Union was able to buy from Iraq a quantity of oil worth £ 6 million in return for arms. Even before it was delivered, the same oil had been sold to West Germany for £ 18 million.

Another country caught in the net of a special relationship with the Soviet Union is Afghanistan. Russia has been buying gas from Afghanistan at the rate of 19.5 cents 1,000 cft while the price paid to Iran was 30 cents and the price at which Russia itself sold gas to Western Europe was 44 cents in 1970. Despite the rapid increase in international prices, Russia refused to pay a higher price. Only from October this year has the price of Afghan gas been increased to 34 cents, which is still a bargain at current international prices.

In this ruthless pursuit of profit, the Soviet Union sacrifices all principles and betrays the liberation movements of the oppressed peoples. Not only did the Soviet Union profit from and weaken the oil embargo, it has been aiding Israel in its occupation of the territories captured from Arabs.

Immigration was crucial in the formation of the Israeli state, and has continued to be important ever since. Colonisation in military-cum-agricultural settlements has been the classical Zionist way of increasing the territory under its control. Since 1967 more than 1½ lakh Soviet Jews have emigrated to Israel — they account for the vast majority of recent immigrants.

As if this were not sufficient betrayal of the Arab and, particularly, the Palestinian people's struggles, the Soviet Union has now gone further and agreed to an increased flow of Jewish emigrants — from the current 30,000 to 60,000 per annum.

The US, no newcomer to this kind of game, has been able to exact this as the prices of relaxing the discriminatory tariffs against the USSR. Both countries are keen on expanding trade and economic relations with each other. But the move to give the Soviet Union "most favoured nation" status has been blocked for more than a year by a senate group holding out for a prior relaxation of restrictions on the emigration of Soviet Jews.

Now the matter has been settled to the convenience of all concerned, except the Palestinians. Israel has already set up 45 settlements in the occupied territories of the Jordan West Bank. Israeli government agencies have bought up 15,000 acres of land and admitted to substantial purchases by private parties. Increased immigration of Soviet Jews — made possible by the Soviet Union in return for a mess of dollars — will strengthen Israel and allow it to increase the territory colonised.

Law or Ordinance?

Romesh Thapar

HAS the system of governance been so corrupted and decimated over the last few years that there is no alternative to rule through Ordinances which make a mockery of democratic functioning? Are we now to accept a fearful concentration of official power in order to keep a tattered political and administrative structure together? Is there no other way out of the strange *cul-de-sac* into which we have pushed ourselves over these years of freedom? These are some of the fundamental questions which are being asked as stories pile up, factual and false, about the general breakdown of national discipline and the amateurish ways of government to halt the spreading rot.

There is not a situation in India which cannot be handled by the normal law of the land, that is, if the instruments of policy implementation are kept intact and not reduced to disarray by politicians and fawning bureaucrats. When we view the scene at any level of administration, we realise the damage done. Witness the handling of the MPs Licence Scandal. Not a single instrument in the civil area of administration is effective or, for that matter, fully trustworthy. Indeed, it has been made clear to all and sundry that there is a future only in playing the game that's called. The repeated resort to Ordinances — and, now, even during a parliamentary session — is tantamount to declaring the political and administrative system defunct.

We can go on playing this game of Democracy-by-Ordinance until the cows come home (*sic*!), and organise an obedient, Greek-style chorus to excite us about lurking dangers of a fascist take-over, but we will not be any nearer a solution to the problems which create the pressure for rule by Ordinance. This dull but solid fact needs to be driven into the thick heads of the Congress leadership and those who follow it. We are going down a terribly slippery incline. Powers increase as governmental ineffectiveness mounts. In the end, the people will, in fact, turn to those who really know how to exercise the power that has been concentrated — the fascists and the communists.

Long before the Ordinances and other legal gimmickries took hold of us, Chairman Dange of the CPI used to claim that in India it was possible to "usher in" communism "legally". He was absolutely correct in his assessment of the prevailing legalisms, but how much more surcharged is the situation today. Interestingly, the concentration of executive power is favoured by the CPI. It baptises the Congress-Communist alignment in Kerala, Bihar, Orissa, Bengal and Andhra. A spreading net which might even become the envy of the CPM.

If the Congress is wedded to democratic functioning — and it had better be, for without such a commitment it loses its reason for existence! — the time has come to take the administrative system firmly in hand, shake it out of its corrupt and lazy ways, mould it to build national discipline and give it back the elan it has lost. This means insulating it from the racketeer politicians and operators who now function openly around the centres of power. It also means breaking the backs of friends and foes alike in the process of the clean-up.

It cannot be argued that there is no other way but Ordinance Raj. The averagely intelligent observer (and he makes public opinion!) knows how the ordinary citizen is harassed and hamstrung by an administrative system gone wrong. He also knows how the "smugglers and foreign exchange racketeers", the current bad men, receive velvet glove treatment — yes, even after they have been rounded up under MISA. There is talk of torture in the jails. I am sure there is, for even outside we have evolved procedures and practices which could in their totality derange the sanest of citizens. The trouble in India is that honest and decent folk, law abiding and disciplined, are destroyed by the Indian official jungle. The crooked smile their way through. And, alas, this is fast becoming the dominant fact of life, MISA or no MISA.

Indira Gandhi and her ministers, nondescript as they are, have to be pummelled with these truths — that is, when they are not lost in reveries with Gurus and Meditators and such like, including an old rising star in the Capital who heads "The Servants of God Society", he being God or His voice (I've forgotten which!). What ever the controversy around Jaya Prakash Narayan, he has at least articulated some pointed lessons for the ruling party. Instead of being pushed and pressurised by JP, and others who will certainly follow, the Congress chieftains could begin their own revolution of revival. Someone has to strike that inner chord (to use the phrases they cherish!) — or have their chords atrophied in the atmosphere of Ordinance Raj?

In this near medieval situation of durbars, petulant governance, magic men, ambitious favourites, endless intrigues and aloofness from the pain and suffering of the people, one cannot help wondering whether it is the lack of gumption on the part of bureaucrats and policy planners which really paralyses corrective and structural action. The manipulative politician is concerned only with his — or her! — wretched votes. But there is a vast area of potential advance which does not impinge on votes — indeed, action here might re-create the kind of credibility which existed with the GOI not so long ago when Bangladesh was born. Or, maybe, the gumption is developing through Ordinances, through MISA. Sad, because a harder working system could have shocked us back to some sense of discipline and good sense without playing with Fundamental Rights.

It is going to be a long march back to normality. The breakdown of national discipline, which creates the crisis of the administrative and political system, cannot be tackled with a narrow MISA approach. And so long as discipline is in disarray, there will be a growing confusion between Law and Ordinance.

Tailpiece: The President of India is busy distributing prizes awarded by a magazine produced by the Soviet Embassy. If the Capital's diplomatic missions take the tip, he will be busy for half the year!

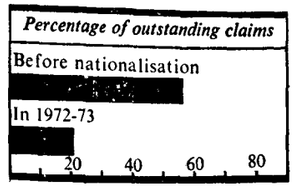
"criticomments"

DO PARENTS SEE THEIR CHILDREN GROW?

Often one hears a visitor, who hasn't seen a child for a long time, exclaim to the parents: "My, how big he has grown!"



The parents are astonished at first, because the child has been with them all the time, and they never noticed him grow. They now take a second look, and it comes home to them that their son has indeed added a few centimetres to his height.

Improvements over a period of time are often missed by people, who are closely involved, unless someone draws their attention to these. Take for example what LIC has been trying to do in the matter of expediting the settlement of claims of life insurance policies.

In 1955, prior to nationalisation, the ratio of outstanding claims to claims intimated varied from 36 to 75 per cent. The average was 47 per cent for seven leading insurance companies, and 57 per cent for the entire life insurance business. This was at a time when the claims amounted to Rs. 25 crores.

By the end of 1972-73, the LIC had brought down the percentage of outstanding claims to 20.63 per cent of claims intimated. In that year the claims due for payment amounted to Rs. 103 crores.

Thus, in spite of a four-fold increase in the volume of claims due, the ratio of outstanding claims had improved from 57 per cent in 1956 to 20.63 per cent in 1972-73.

LIC's field officers are under constant pressure to go in search of policy-holders who have not put in their claims. A Claim Payments Service has already been formed and pressed into action—perhaps the only one of its kind in India. Procedures are being reviewed frequently to ensure that delays are reduced to the minimum.

Speedy settlement of claims depends to some extent on the claimants also. They are being educated by the LIC on the technical details that have to be attended to, so that delays may be eliminated.

Calcutta Diary

A M

WHO is to reason with whom over what? It is no longer a matter of polite pleading across the table, where you make a point, I make a counterpoint, and after a while, we adjourn for tea. The nodal point is passed; quantity has broken into quality. The gentlemen of the Press were called in and duly coached by whoever coaches them on such occasions. On the Sunday morning, the headlines of the newspapers bore a family resemblance with one another; the editorial comments that followed were almost equally unanimous in their tenor. The ordinance, don't you understand, was an imperative necessity, since without it the wretched smugglers would have rushed to court and been let out; do be sensible, join us and support our step; pray, unless you yourself are a guilty one, why should you lose your sleep over the ordinance, it is directed only against the anti-social elements, not against law-abiding citizens. How do I know? The presidential order takes away the rights of not just a few stray smugglers, it confiscates the rights of all those who have been privileged to be gathered in under Section 3(1)(c) of the MISA. An impressive list of fundamental rights is breached by the Ordinance; Article 14, Article 21 as well as Clauses 4, 5, 6 and 7 of Article 22 of the Constitution, each now goes the way of all flesh. Fee foh fi fum provided you have been apprehended under the celebrated section of the great liberal Act, you shall henceforth be denied equal protection of the law within the territory of India; you shall be kept in detention indefinitely and no reference to any advisory board would any longer be called for; the authorities would be no more bothered by the absurd legal requirement to let you know the grounds on which you have been detained. Section 3(1)(c) of the MISA, mind you, need not apply to smugglers alone; in fact, until September 17 of this year, the smugglers were not even claimed by the Act. Just anybody can be picked up under it, as they have been under the other sections of the Act. It you engage in an unbecoming argument with a State Chief Minister's spouse, the order might go out to get you under the section; if the second cousin of police functionary wants to possess your little plot of land and you are not amenable to persuasion to do a *bhoodan*, the order might go out; if a petty politician's nephew wants to jump the queue outside a cinema hall and you demur, watch the fun, by sundown the order under section 3(1)(c) could be issued, and you would have nowhere to go. This is no hallucination. One can simply collate the bits and pieces of information on the actual grounds on which people in the different states have been arrested under the MISA during the past few years; often the reasons for the arrests have been even more frivolous than in such hypothetical examples. If I — to use the vernacular — want to cook your goose, I now know which section of the Act to choose. All that you might have done is to write a mischievous letter to a literary journal running down my poetry; I am satisfied that I have to place you behind the bars with a view to preventing you from acting in any manner prejudicial to the conservation of foreign exchange; none in this territory will be in a position to question my satisfaction. Give the dog a bad name, and keep him in prison for ever. If you have tears, do not prepare to shed them now; you might get arrested for shedding the tears.

What, after all, is the point of mincing words? If the courts were letting out arrested smugglers, something must have been basically wrong in the way the orders for their detention were worked out. No similar difficulties are being experienced in keeping behind the bars the hundreds and thousands of political workers arrested under the MISA, even if there is a certain chariness to describe them as such. Even in instances where the order of detention of a political worker under a particular section of the Act has been found faulty by some court or other, the authorities have immediately moved in with a surrogate order: the person concerned has been kept in detention for years on end, without being let out even for a bare half hour. The smugglers do not belong to an ethereal category, such that equally punctilious arrangements cannot be worked out in their case. If nonetheless courts discover gross deficiencies in the orders under which they are detained, the

obvious thing would be to sack some nincompoops in the Government. For whose benefit is this particular parlour game? Young men and women, who have not committed any ostensible crime save the one of loving the nation's working class, can be put away indefinitely, and no legal impediments stand in the way; these impediments rear their head only when the social scum, generally described as smugglers and black marketeers, are to be picked up.

If twenty-odd smugglers have been released by the High Courts, the culpability for that must therefore rest squarely on the authorities. And, in a different climate, one could have dwelt at length upon the total lack of any sense of proportion exemplified by what is happening: in order to cope with five hundred or thereabouts of ordinary smugglers, the liberty of close to six hundred millions is curtailed with great eclat. For there is nothing in the recent behaviour of the Government which entitles it to claim any benefit of doubt. For all one knows, it could all be part of one elaborate, prearranged device. It is an ill wind which does not blow anybody any good: the hulabaloo raised over the alleged liaison between ruling politicians with gangs of smugglers could accordingly be put to good use; it could be deployed to take away at one stroke the fundamental rights of all prisoners arrested under the MISA. For each smuggler arrested under the Act, there must be around the country at least one hundred political ideologues, trade union workers and peasant activists arrested under a neighbouring section of the Act. Sooner or later, ruling politicians might arrive at a deal with the smugglers; sooner or later, first rate lawyers, at enormous fee, might discover some other loopholes in the orders of detention and the smugglers would regain their liberty; after hours, there are reasons to suspect, a few politicians are already at work trying to locate the lawyers who could pull out their smuggler comrades. But the young men and women taken in for allegedly political offences would be in prison for ever, for the Emergency would be there for ever, and the professed section under which they would be detained could be quietly changed from 3(1)(a) or 3(1)(b) to 3(1)(c). Honour the smugglers, there could be no greater patriots than them, they have provided the rulers with the alibi to end the rule of law in this country. If the smugglers were not around, perhaps the rulers would have gone to the length of inventing them.

Celebrate, the ordinance will of course be passed into law by the docile majority in Parliament, and the era of Constitutional authoritarianism will be duly ushered in. To complain of a formal breach in parliamentary etiquette may seem silly in this context. But let the minor point be nonetheless made, even if it be merely for the sake of record. The Thirty-fifth Constitutional Amendment Bill, which gave this nation the dubious prerogative of welcoming Sikkim as an associate State, could be pushed through Parliament in the course of a bare five-day week. Was the subterfuge of the Divali weekend then at all necessary for this final scrapping of the fundamental rights? The Lok Sabha and the Rajya Sabha were in session, and if the Government felt so strongly about having a hurried piece of legislation amending the MISA — as it has obviously felt —, its will would have been done in no time. In any event, the judiciary too were not sitting over the week-end; neither smugglers nor political prisoners could have been let out while the crackers were bursting. If through some accident they got released, the trail blazed by the police here in West Bengal could have been followed, and the smugglers kept back in prison under some other interim charge. Obviously, the style had to be different: it was intended to be different — a certain total contempt for the parliamentary hocus pocus had to be written into the proceedings. Even when Parliament is formally in session, an ordinance is therefore promulgated, and no one's leave is sought for the act. It is as if a notice is being served: you do not matter, we want to get rid of you, why don't you behave like good boys and go home. The Prime Minister may shout herself hoarse that there is no freer, lovelier democracy in this world, but by now her verbiage has lost nearly all of its original lustre. She has begun to be judged not by her words, but by the atrocities she indulges in. If she has the patience any more — or the humility —, in a moment of tranquillity she could do worse than attempt to measure the totality of the impression she has succeeded in creating about the manner of her reigning. Style defines the person; will it be unpardonable if, from her style, one deduces that if we are not exactly a quarter of an hour away from an authoritarian regime, we are at most half a dozen hours away.

Who goes home, the watchman is supposed to cry at midnight each night, or so goes the parliamentary folklore. Indira Gandhi's Divali week-end has brought along the tidings. Very soon, we all are going to go home.

Acme of Poor Performance

Hansavivek

NATIONAL NEWSPRINT AND PAPER (NEPA MILLS) has wiped out the entire loss brought forward from the previous year. This has been possible with higher production and increases in selling prices of newsprint. Output of newsprint increased from 40,770 tonnes to 48,671 tonnes, of caustic soda from 2,839 tonnes to 3,258 tonnes, and of chlorine from 2,521 tonnes to 2,890 tonnes. The installed and licensed capacities, however, were much higher at 67,500 tonnes and 75,000 tonnes, respectively, of newsprint; 4,025 tonnes and 8,928 tonnes of caustic soda; and 3,572 tonnes and 7,910 tonnes of chlorine. Selling price of newsprint was revised, from October 1973, from Rs 1,362 to Rs 1,500 per tonne upto the level of previous year's despatches (36,550 tonnes) and to Rs 1,800 per tonne on supplies over and above that quantum. Notes appended to accounts reveal that the two-tier selling price could not be given retrospective effect from April 1, 1973, and that the suggestion of a single pool price to be effective from October 1, 1973, is still under consideration of the Government of India. Meanwhile, the company has billed customers provisionally at different rates, subject to the final decision of government. In the event of government not agreeing to the provisional price charged, the company will have to refund certain amounts. As per the original government order, such refundable amount is estimated at Rs 29 lakhs; and as per a subsequent clarification by government, it is estimated to be Rs 45 lakhs. On the other hand, if the formula submitted by the company is accepted, an additional amount over the provisional price billed to customers, estimated at Rs 11 lakhs, would be recoverable. The profit and loss account for 1973-74 is, therefor, subject to alterations consequent on the government finally fixing the selling price. In the meantime, the selling price has been further revised to Rs 2,300 per tonne from September 1974.

The company is entitled to development rebate aggregating Rs 151 lakhs. No allocation to development rebate reserve has been made, apart from Rs 3 lakhs set aside in 1968-69 and Rs 5 lakhs in the 1973-74 accounts. There is a contingent liability of over Rs 88 lakhs for higher payment of replacement cost to the forest department of the Government of MP, on account of salai extracted from government forests from February 9, 1961, to November 8, 1973 — i e upto the date of nationalisation of salai forests. The matter is under correspondence, and no account has been taken of the contingent liability pending settlement. However, provision for the period November 9, 1973, to March 31, 1974, has been made in the accounts on the basis of receipt of MP government's decision. Also, detailed terms and conditions in respect of the additional bamboo felling areas allotted to the company by the forest department, on year to year basis, for extraction of pulp wood have not been settled as yet; hence, additional liability upto November 8, 1973, if any, has been provided for, as it is not ascertainable. There were also claims against the company — not acknowledged as debts — aggregating Rs 10 lakhs. Provision has not been made even in respect of future liability, estimated at Rs 41 lakhs, for gratuity. Value of imports on c i f basis in respect of stores and spare parts amounted to about Rs 15 lakhs and expenditure in foreign currencies on account of interest, etc, aggregated Rs 6 lakhs. Value of imported stores and spare parts, consumed during 1973-74, exceeded Rs 21 lakhs. In addition, the company remitted Rs 29 lakhs towards instalments due on account of deferred payment.

The expansion and development work is in progress. A Major portion of structural steel work, awarded to Triveni Structurals, has been completed. The acid alkhli resistant tile-lining work of various chests, towers, vats, etc, has already started. Erection of plant and machinery in the cold soda pulping plant and bamboo sulphate plant area is nearing completion, and that of soda recovery boiler is expected to be completed by the end of 1974. The work of inter-connecting

* Adjusted against previous loss.

piping of various plants and laying of cables and electrical control wiring should be over by the end of March next, and the plants should be commissioned by March 1976. Order has been placed for the plant and machinery and detailed engineering and technical services for expansion of the caustic soda, chlorine plant with Krebs of Zurich. Efforts are being made to procure the rectifier and booster transformers indigenously and to complete the plant by the last quarter of 1975-76. Last year, further loans of Rs 150 lakhs were received from government of India, liftiag total borrowings from that source to Rs 662 lakhs, (after repayment of Rs 113 lakhs). The estimated further loan requirement for completion of the expansion scheme is estimated at Rs 524 lakhs. NEPA's proposal for reorganising the capital structure by conversion of a part of government loan into equity capital, which is under consideration of the government of India, is intended to reduce the interest burden on loans and to improve profitability.

GRAMOPHONE COMPANY OF INDIA has fared very well on the export front. Its export sales during 1973-74 at Rs 96 lakhs recorded an all-time growth of more than 52 per cent over the previous year. In addition, royalty earnings brought in another Rs 11 lakhs. What is still more significant, is that one out of every three LP records was exported. The company made a breakthrough by exporting some of the domestic electronic products to West Asia, Africa, East Europe and Bangladesh. It is now engaged in developing record playing equipment for export markets, and expects to maintain the growth in exports. Meanwhile, modernisation and development programmes, undertaken in the previous years, are progressing according to schedule. The company has turned out good results, with a 32 per cent gain in net sales, followed by a 24 per cent rise in gross profit. Dividend has been slashed by 6 points to 12 per cent, on account of the restrictions on distribution. These results were obtained despite lower production of gramophone records (70,68,938 pieces against 70,88,768 pieces) and radio sets (14,083 pieces against 25,003 pieces). Production of record players and reproducers, however, was a little higher (63,579 pieces against 63,110 pieces). The company's installed capacities are much higher at 90,21,250 pieces of gramophone records, 40,000 pieces of radio sets, and 96,000 pieces of record players and reproducers — all on a single-shift basis. The auditors were paid, in addition to the audit fees of Rs 60,000, Rs 6,000 by way of out-of-pocket expenses and Rs 27,914 for other services. Remuneration to directors and managing director as fees, salaries, and other emoluments, amounted to Rs 4.07.624 in 1973-74 — compared to Rs 2,75,431 in the previous year.

INDORE WIRE showed a fresh loss of Rs 4 lakhs in the thirteenth year of its career and increased the total deficit to Rs 19 lakhs to stand against the issued and subscribed capital of Rs 25 lakhs. In addition, as at the end of April last, arrears of depreciation amounted to Rs 13 lakhs, and of dividends on cumulative preference shares Rs 3 lakhs. Liability for gratuity to employees was neither ascertained nor provided for. Also, cash defalcation of Rs 78,811 by ex-cashier, in past years, was shown under 'miscellaneous expenditure'. During 1973-74, the company produced 61 tonnes of high carbon wire and 278 tonnes of mild steel wire, against the combined installed capacity of 13,800 tonnes per annum. It is stated that operations at the factory were virtually at a standstill for two-thirds of the year, for want of raw materials and non-commissioning of the patenting furnace. The directors, however, envisage good outlook for the current year's working. Apart from the full benefit flowing from the patenting furnace — commissioned in January last — the company expects contribution from the stress-relieving furnace and full utilisation of high carbon manufacturing facilities.

ADMINISTRATIVE STAFF COLLEGE OF INDIA

INVITES

Applications for Faculty Positions and Research Associates in Economics

Administrative Staff College of India are developing programmes of Research, Consultancy and Training in Economics with special reference to Quantitative Methods in Economic Planning. The Faculty members will be expected to teach, conduct and supervise research and consultancy in these areas; and the Research Associates will generally assist their colleagues.

Qualifications :

FACULTY :

The applicants for the Faculty positions should have a Doctoral degree or equivalent research experience in Economics with a good background in quantitative methods and interest in allied social sciences and Engineering Economic Analysis.

RESEARCH ASSOCIATE :

The applicants for the Research Associates should have a first or a high second class degree in (i) Economics with Statistics and Mathematics as optionals or (ii) Mathematics or Statistics with a good knowledge of Economics (iii) Engineering with good knowledge of Economics. Research experience is desirable.

REMUNERATION :

The positions offer good prospects in research, training and consultancy. Starting salary will be commensurate with qualifications and experience of the individual. Gross emoluments can be upto Rs 20,000 per annum for a faculty member and Rs 12,000 per annum for a Research Associate.

GENERAL :

Applications with detailed bio-data, details about present job and names of three referees, should be sent to the Registrar, Administrative Staff College of India, Bella Vista, Hyderabad-500 004, so as to reach him within 20 days from the date of this advertisement. After preliminary screening, selection interviews will be arranged in the month of December. All applications will be treated as strictly confidential.

New Light on Central Excise

VARIOUS arguments are advanced from time to time in defence of the enormous growth of commodity taxes in India in recent years: that they serve to reduce inessential consumption; that they are easy to collect; and that, contrary to the general impression, they are not regressive, but are progressive. Any suggestion that the taxes on consumption, such as excise duties might be aggravating the inflationary pressures is countered with the argument that articles like food and industrial raw materials, the rise in prices of which has contributed most to the current inflation, are by and large untouched by these taxes. The contention about the non-inflationary impact of indirect taxes is untenable for the simple reason that a sizeable fraction of the revenue from Central excise comes from the duties on industrial raw materials and intermediate products — according to one estimate, 38-40 per cent (Ladkavawalla and Nambiar, "Commodity Taxation in India", p 42). That these taxes might help reduce private demand and thereby ease the inflationary tendencies is a different proposition. As for the supposed progressivity of Indian commodity taxes, no one with sufficient awareness of the pitfalls of studies of tax incidence — according to a recent survey of such studies, conceptually and statistically they are a dubious exercise (*IMF Staff Papers*, November 1973) — would draw much comfort from their findings.

The factor that really explains the increasing reliance on commodity taxation all over the world is the ease of administration of such taxes as compared to the pain, and what is perhaps more important, the noise that accompanies the enforcement of direct taxes. Widespread evasion of income and capital taxes in the less developed countries (LDCs as they are called now) has led many experts to believe that in the environment prevailing in these countries an equitable tax structure is better achieved through commodity taxation.

Hard Blow to Fond Beliefs

The Report of the Central Excise (Self-Removal Procedure) Review Committee, which was submitted towards the end of the last session of Parliament, deals a hard blow to all these fond beliefs and assumptions. Set up in 1971 under the chairmanship of B Venkatappiah to review what is known as the Self-Removal Procedure (SRP), which was introduced in 1968 as a measure of simplification of the system of collection of Central excise, the Committee has gone into almost all important aspects of Central excise administration and has brought out facts which, more than its recommendations, should make policy-makers sit up and do some hard rethinking on the entire strategy of taxation in India.

Though its attempts to quantify the extent of evasion did not succeed, the Committee has come to the conclusion, on the basis of evidence collected extensively from various sources, that evasion of Central exise is considerable and, in certain sectors, pervasive. So much so that it felt impelled to remark: "...we are free to confess that we were not prepared for, and are therefore painfully surprised at, the range, diversity and in certain segments of production, almost the universality of the evasion which is practised by those who produce the goods" (para 10.9).

The methods adopted to evade excise range from misclassification of goods to plain concealment of actual production. A common method is to remove dutiable goods in the guise of exempted or partially exempted goods. Sound fabrics were often declared as fents. "In one case a composite mill was found to have cleared 16,25,584 sq metres of fresh cotton cloth by cutting it into rags and in the process had evaded duty to the extent of more than Rs 15 lakhs". Such practices are not confined to backyard factories or petty weavers. "Some reputable concerns were reported to have been packing art silk fabrics in rolls and clearing them without payment of duty by declaring them as fents" (para 10.18). Of course, the duties on fents have since been raised. But the amount lost to revenue remains unknown.

Goods prone to evasion are equally wide-ranging. Those particularly mentioned are matches, steel furniture, tea, copper and copper alloys, patent and proprietary medicines, refrigerating and air-conditioning machinery and appliances, iron and steel products, sodium, silicate, electric motors and cotton fabrics. Art silk fabrics are also notorious for evasion.

Factors which, according to the Committee, facilitate evasion are, primarily, (1) "slack, non-existent or dishonest supervision" by the enforcing machinery; and (2) "unnecessarily complicated tariff items and unrealistically designed exemptions". Complexity of the tariff structure results from the exemptions notified by the Government in respect of the duties fixed by Parliament. The Committee has found that "there are nearly one thousand live notifications today by virtue of which duty reliefs are afforded" and that "some three hundred tariff rates have, as a result of the issue of notification of exemption, been multiplied into more than two thousand effective rates" (para 6.2).

Dominant Aim of Exemptions

The exemptions and reliefs are said to be prompted by a variety of objectives: promotion of exports, increase of production, conservation of resources, development of backward areas, convenience of administration, support to programmes of public health and family planning and mitigation of cumulative impact of multipoint levies. But the dominant aim underlying the exemptions has been to encourage the growth of small-scale industries. In translating this aim into practice, "so many parameters and criteria have been used as to what is, and what is not, a small unit with reference to particular commodities that a bewildering variety of exemptions has come into being all of which purport to help the small sector" (6.3).

A three-pronged attack on the problem of effective enforcement of excise duties is proposed by the Committee. First, the basic approach to the task of enforcement should be through a system of selective control. Second, there should be a thorough review of the tariff structure and all exemptions with a view to simplification and rationalisation. And, third, the administrative machinery should be geared up for the task of selective control.

Observing that the dutiable commodities and their producing units fall into some well-defined categories, the Committee has suggested different modes of control for the different categories. The three main ingredients of this strategy would be Account Based Control (ABC), Production Based Control (PBC) and Clearance Based Control (CBC). ABC contemplates reliance on the accounts of the tax-paying unit and is meant for the organised sector and for commodities for which the tariff structure is not too complicated. Twenty-nine com-

modities, accounting for 60 per cent of the total excise revenue (as of 1973-74), are expected to be brought under this form of control. The mode of enforcement for other commodities — accounting for 34 per cent of the revenue — would in general be the PBC, which is supposed to be an improved version of the SRP. For the unorganised small-scale sector the method would be CBC which would be akin to the old system of physical control. But even for commodities produced by a large number of small units a simple procedure for payment of duty on a compounded basis is contemplated. The duty liability under the simplified system would be related to the average value or quantum of duty clearances during the three preceding years or the last year, whichever is higher and this would normally remain fixed for three years. There will be a review of units working under the simplified procedure at the beginning of a fresh three-year bloc. The Committee wants all excisable goods, even when exempt, to be brought under the simplified procedure, as this would be useful for statistical and administrative purposes. The simplified procedure is designed to reconcile the need for stricter vigilance over small units and the capacity of the administrative machinery to bear the burden of work likely to be thrown up if all such units are to be supervised physically throughout the year.

Complex Tariff Structure

Simultaneously, a thorough examination is needed of the tariff structure which has grown complex for various reasons. One factor particularly mentioned in this context is the extension of tariff to a large number of commodities with poor revenue potential, which, because of the sheer number of producing units, has strained the administration unduly. The Committee, therefore, recommends withdrawal of all levies that yield less than Rs 50 lakhs. Tariff definitions and descriptions also need to be reformulated to reflect the commercial identity of the commodities more easily. Exemptions too should be refused except where they serve a well defined purpose, where the cost does not outweigh the benefits and where they are easily administrable. All exemptions related to end use, the Committee feels, are of doubtful utility, involve protracted *post-facto* verification and need to be drastically curtailed.

In essence, the scheme of controls envisaged by the Committee does not make a radical departure from the SRP over a large area that accounts for the bulk of the Central excise. In fact the ABC seems to be based on faith in the honesty of the units responsible for paying excise duty to a much greater extent than the SRP. The PBC, though said to be an improvement over the SRP, is also unlikely in actual working to be much different from the SRP. The operation of CBC, which is the nearest to the old system of physical control, will also be limited to a relatively narrow area comprising units which choose not to opt for the simplified procedure. If all goes well, this will impart a degree of automaticity in the collection of Central excise which can be the envy of any tax collecting machinery anywhere. But will all this really work as expected?

In a country like India and with the growing complexity of the structure of the economy, some selectivity is essential in any sphere requiring policing by a government agency if the country is not to turn into two rival camps with one-half of the population engaged in overseeing that the other half keeps on the right side of the laws. The important question is how far should the selectivity be carried; in other words, what is the optimum?

The answer obviously depends on many things and as in most areas of public policy calls for a realistic assessment of what can be achieved, given the social and political environment of the country. The system of automatic collection of taxes to which the government seems to be endeavouring to move works so well in the Western countries primarily because of the fear of detection and the penalties that visit the offender unfailingly. In the absence of this crucial factor simplification and rationalisation of tax laws, if carried too far, is likely to provide a licence for infringement to the unscrupulous and the resourceful. This probably is the most important lesson to be drawn from the costly experiment with SRP. Though the Committee is a little coy about attributing any rise in evasion to the introduction of the SRP, except in the small and medium sectors, it comes out clearly from the Report that the SRP did not work and its failure could be due, to a considerable extent, to the failure of the deterrent provisions of the law. To quote the Committee, "... despite the strengthening of the penal provisions, the number of offence cases where confiscation was ordered without penalty declined both in absolute terms and in relative proportion to the total number of registered cases. In 95 per cent of the cases the penalties imposed were less than Rs 250. More importantly, the percentage of cases in which fines amounting to more than Rs 1,000 were imposed dropped from 1.51 per cent under pre-SRP to 0.58 per cent under SRP. It appears to us that the deterrent provisions built into SRP have not been adequately invoked" (para 9.37).

What is the guarantee that the provisions will be invoked now? The Committee has of course devoted one whole volume of its report (vol II) to the gearing up of the administration machinery, paying attention to such detail as the vehicle requirements of the enforcing staff — almost paralleling the concern expressed by the Wanchoo Committee over the inadequacy of staff cars placed at the disposal of the intelligence branch of the Income Tax Department. One can be sure that no effort will be spared to improve the promotion prospects of the officers in the upper echelons, and to import the latest management cliches in the formulation of personnel policy. But experience so far holds out little hope that all that will deliver the goods. Greater reliance on faith and goodwill in the administration of tax laws will, one fears, lead to more evasion.

Planning Tax Policy

It must be said however that the Committee has tried to strike a balance between opposing considerations and come out with a blueprint on which the future administration of Central excise can be built. The precise degree to which selectivity should be carried now must however be based on a correct appreciation of the risks involved.

That there can be so much of evasion in excise is by itself of considerable significance for the planning of tax policy. If commodity taxes can be evaded so widely, where lies their superiority over taxes on income and capital? It is plain that governments rely on commodity taxes for no other reason than that they yield revenue smoothly and noiselessly. But whatever the theorists might say, it is unlikely that findings such as those of this Committee will bring about any major shift in tax policy and it seems certain that government revenue will continue to be collected more and more from taxes on commodities. For, that way, who bears the final burden remains conveniently unknown.

Hunting the Harijans

N K Singh

PERSECUTION and harassment of the 4.5 million scheduled castes of Madhya Pradesh continue unabated. Every week brings fresh reports of atrocities against them by caste Hindus.

Caste Hindus raided a Harijan village in Vidisha district in July and demolished the newly-built houses which had been allotted to the Harijans under the government's housing scheme. Another instance of the Hindus' intolerance of any improvement in the socio-economic condition of the Harijans was seen some months ago in the Chambal ravines, which are the strongest base of feudalism in the state.

Last June, Bhadolikapura, a Harijan village in Morena district, was raided by an armed mob of upper caste Hindus. The mob set fire to the entire village, looted property and burnt alive an old Harijan woman who had been left behind by the fleeing villagers. Bhadolikapura is barely 2 km from the tehsil headquarters of Ambha. Most of its 46 Harijan families are prosperous, as the land they own is some of the most fertile in the area and irrigation facilities are good. Many of them produce as much as 25 quintals of grain per acre. Most of the neighbouring villages are inhabited by Tomar Thakurs who are jealous of the economic prosperity of Bhadolikapura's Harijans.

The main cause of the outbreak of violence in June was that the Harijans, encouraged by their economic prosperity, had sought to cross age-old social barriers of the region. Many of them had begun to violate traditional restrictions on them — such as those on taking out processions with bands playing music and on the use of horses on the occasions of marriages.

Personally feuds, too, assumed social dimensions. Thus, about two years ago, 35 Thakurs of nearby Barwai were prosecuted in a criminal suit filed by the Harijans. The Thakurs of the whole area took this as an insult. The Thakurs had the support of a Brahmin moneylender of the area. About 200 acres of land belonging to the Harijans of Bhadolikapura were mortgaged with this moneylender. Though the loan amounts had been repaid in almost all cases, the documents were still with the moneylender. The moneylender would have grabbed the entire land — valued at about Rs 10 lakhs — but for the new awareness among the Harijans who know of the loan repayment laws for scheduled castes and tribes. A member of the moneylender's family is a leader of the Jan Sangh. Some time ago he had distributed a handbill on behalf of his party calling upon the Thakurs to "teach a good lesson to the *shudras*".

On June 11, a Thakur and his sister were robbed of their belongings while they were walking from Ambha to their village Barwai. They reported the matter to the police, who (the Thakurs alleged) failed to take serious note of the matter and merely arrested three Harijans. The Thakurs of Barwai assumed that the crime was the work of the Harijans of Bhadolikapura. They held a meeting on June 12 at which feelings ran high. The Thakurs were evidently most enraged about the humiliation of a Thakur woman by "low-caste" Harijans; they resolved to retaliate "to maintain village prestige".

As news of the Thakurs' intentions reached Bhadolikapura, peace messengers were rushed to meet the Thakurs. Some prominent Harijans met the Thakurs; they apologised with folded hands for the possible misdeeds of some fellow Harijans and begged their pardon. They also offered to raise money from among themselves to make up for the loss suffered by the Thakurs. The Thakurs were, however, determined. Most Harijans left the village in panic and sought refuge in the nearby police station at Ambha.

On June 13, an armed mob of about 5,000 raided Bhadolikapura. A six-man strong police party, under a DSP, was sent to 'meet the situation'. The mob became even more aggressive when it sighted the police party. The attackers broke open houses, ransacked them and looted everything, including foodgrains. (They had even brought bullock carts and camels to carry away the booty.) The entire village was set on fire. An old woman, Bithal Bai, was caught and thrown into the fire. According to the Harijan Yuvak Sangh, an infant also died of burn injuries. It is estimated that property worth over Rs 5 lakhs was either destroyed or looted by the crowd. The policemen remained spectators to the rape of the village.

The DSP and the officer in charge of the Ambha police station are themselves Thakurs. A majority of the other officials too are either Thakurs or Brahmins. It has been alleged that they did not take strong action because of their 'good relations' with the assailants. Thus, although the police station is just 2 km from Bhadolikapura and there are many units of armed police at the station on account of this being a dacoit-infested area, no additional force was rushed to the village — even as the loot and arson continued till late in the evening. Official sources at Bhopal too kept quiet about the incident. It was only from Press reports that the public came to know of the incident. And it was only when Rajaram Singh, a Harijan and at that time a Minister in the state government, raised a hue and cry that the authorities took some action in the form of arresting a few Thakurs.

But soon a Jan Sangh delegation from the area, led by two Thakur MLAs, waited on the Chief Minister and the Governor, himself a Thakur, to complain that the Thakurs had been "victims of a high level conspiracy". They ascribed the incident to provocation by the Harijans and the "inaction of the police" who had treated the Thakurs' complaint casually. They also alleged that Rajaram Singh was terrorising the Thakurs by using his official position and demanded that he be removed from the ministry. (This latter demand was conceded in the cabinet reshuffle in the following month.) The Thakurs even warned that, if the harassment continued, the 5,000 Thakur families of the area would take up arms and take to the ravines to create a fresh dacoits problem in the area. A senior Socialist Party leader of the area, Thakur Raghubir Singh, was heard complaining that the police was more guilty than the Thakurs.

The final act in the drama came in the form of a warning from dacoit-leader Madho Singh who had earlier surrendered to the police. He wrote to the Chief Minister threatening a revival of dacoity in the area should action be taken against the Thakurs. Politically ambitious, Madho Singh is now emerging as a sort of leader of the Thakurs; he uses his frequent paroles to address meetings in his home district of Morena. On October 25, he even addressed a meeting of the state's Rajput Parishad at Bhopal.

The threats worked. The Chief Minister who visited the area on July 19, did not venture a visit to the ravished village, despite repeated requests by the Harijans. Instead, he addressed a meeting of the Thakurs at Ambha, 2

km from the village, where he actually presented a pursue containing Rs 2,500 to the victim of the robbery. The Thakur woman's loss had been estimated at only about Rs 1,800. The Harijans, who had lost their life's earning and capital, were given Rs 1,000 per family.

None of the police officials concerned has been transferred; nor has the demand for a judicial enquiry been agreed to. The government has ordered an enquiry by a police official! Yet, after a few days, the same government expressed serious concern over the growing incidents of atrocities committed on the Harijans and announced with much fanfare the creation of a special cell at the police headquarters to check them.

MANIPUR

Centre's Political Sniping

NEW DELHI's manoeuvres to bolster the Congress position in Manipur, by winning over the non-Congress Chief Minister and then causing defections from his party into the Congress, may well trigger off a sequence of events which will further undermine the Centre's political position in this area.

In early September, when Yangmaso Shaiza, Chief Minister of Manipur, was in New Delhi, the Congress High Command asked him to join the Congress and merge the Manipur Hill Union (MHU), which is currently heading the ministry in Manipur as the biggest constituent in the Assembly, with the Congress. Shaiza resisted the pressure but agreed to refer the proposal to the MHU. As nothing emerged from this promise the Congress High Command deputed Purabi Mukerji, the AICC Secretary, to Imphal, to pursue the matter. She undertook the mission but returned empty-handed. Shaiza has been called to Delhi again — evidently to drive home the point that his Chief Ministership would be guaranteed by the Centre's mighty powers if he would merge the MHU in the Congress and so help induct a Congress ministry into office in the state. It seems unlikely that Shaiza and MHU would accept the proposal for the very sound reason that it is unacceptable to the rank and file of the MHU.

The Congress in Manipur is in a sorry state. Seven Congress MLAs have deserted the party and declared themselves Independents, promising support to the Shaiza ministry. The rest of the Congress MLAs are almost evenly divided into two factions, led by Rishang Keishang (a Naga leader without a following except in his own constituency) and Koireng Singh. While the Centre's attempts are intended to strengthen the Congress, they will more likely succeed in creating permanent instability in this state which has only recently managed to shake off President's rule. Congress is in no shape to gather strength from a merger with the MHU, even should such a merger come through.

The MHU might react to the Centre's pressure on it to merge with the Congress by trying to join forces with with the underground Nagas not only in Manipur but also in Nagaland. And that would put the clock back. For, a Naga-headed ministry in Manipur has certainly inspired some confidence among the Nagas about their place in the state's politics; it has also won the support of the linguistic minorities in the state. But the ministry is not altogether secure. The extremist Nagas are already calling the Shaiza ministry a *mayang* (outsider) ministry. Formerly, this label used to be given to the Congress ministries in the state. No sooner had Shaiza assumed office than, on July 19, two Assamese youths, aged 21 and 22, were murdered, allegedly by assassins hired by chauvinist elements operating under the banners of the Manipur People's Party and the Kanglai League. The two young men had been transferred to the Deputy Accountant General's office in Imphal from Kohima. Another employee of the DAG's office escaped with injuries and a fourth, a lecturer in the Manipur College, is recovering from his injuries in hospital. All the four victims were Assamese. Under prodding by the Chief Minister of Assam, New Delhi urged the Government of Manipur to speedily apprehend the criminals. For the first time in the history of the state, such action was taken. Meanwhile, the Meiteis, or the valley Hindus of Imphal, have tried to spread the propaganda that the murders were the work of Nagas. In fact, however, the Nagas have never believed in murdering civilians.

The chauvinist elements have demanded that Manipuri be made a compulsory paper in the Public Service examination. This is intended to keep 'outsiders' out of government jobs in the state. The Chief Minister did not, however, allow the examination to be disrupted. The first Manipur Public Service Commission examination was held under police and military invigilation.

Insurgency is far more extensive and takes a severer toll of lives in Manipur then in Mizoram or even in Nagaland. The Kanglai League and the Youth League have demanded secession and total independence for Manipur. Some of their cadres are underground. If, nevertheless, it is the two tribal states, Mizoram and Nagaland, which invite the special fury of New Delhi, it is because those being killed in Manipur are not men in uniform. Also, crime and massive corruption in Manipur can be winked at, as it is perpetrated by Hindus and not by tribals or Christians. The activities of the extremists and the contrast between New Delhi's attitude towards Mizoram and Nagaland and that towards Manipur are fanning Naga and tribal discontent. This points in the direction of a strengthening of the Nagas' emphasis on their separate linguistic and cultural identity and their demand for the merger of the Naga areas of Manipur with the state of Nagaland.

The Union Government has always shown singular insensitivity in relation to the eastern states. For the first time, a credible popular government is in office in Manipur. Instead of allowing it to function normally, the Centre has continued to snipe at it politically. This is to play into the hands of the chauvinists represented by parties like the MPP.

For the first time in Nagaland too there is a government which enjoys the confidence of the people, including to some extent even the so-called underground. For the Centre to undermine chief minister Vizol by suspecting his government's bonafides is again self-defeating. Law and order within the state should have been the responsibility of the state government, as it is in the other states. But New Delhi has established its supra-authority over the popular government of the state. In addition, there is the North Eastern Council which is meant to keep the eastern states in tow. Had only defence and development been the NEC's concerns, the Council would have been tolerable. As it is, to the people of the region it appears as a serious check on the autonomy of the states concerned. No wonder popular resentment against the Council is so strong.

SOUTH

What of Andhra?

Mohit Sen

GOING about this state one is quite likely to get the impression that the days of storm are over and that it has become again a quiet area. And this surface impression is not altogether false. Certainly the state is settling down after all those days when its very existence was in the balance. But certain important changes are taking place which surface here and there and which require a certain sensitive partisanship to spot.

Most important among these would be the stirring among, and better organisation of, agricultural labourers. Atrocities against the Harijans certainly continue to sear the Andhra countryside. Not the routine insult and injury but a certain calculated ferocity as well. But this is not new. What is, is the hitting back and a sense of awakened power. One finds this phenomenon in the delta districts as well as in the arid areas of Rayalaseema.

What has not hit the headlines except in the Communist Press is the very successful mobilisation that was carried out in Cuddapah district recently around the assaults on agricultural labourers. All kinds of action were resorted to — from hunger strike and satyagraha to actual physical beating back of assaults. And what was most encouraging was the unity of the Harijans. It is not often enough realised that the agricultural labourers face a terrible problem of their own division. Untouchability is not only imposed on the untouchables but practised among themselves. Then there is a kind of clan division which is battened upon by group leaders who are as oppressive, crafty and opportunist as anyone can hope to find. It is a kind of submechanism of exploitation and oppression which begins as a reflex against the dominant mode of exploitation and oppression but goes on in fact to coordinate with and even sustain it. This, too, has to be fought against. Additionally, there is the problem of the Christian converts, the problem of political division and the problem of a certain incipient stratification. What was heartening, therefore, was the solidarity against insult and assault. So much so that one found even the *padres* telling their followers to go to the Red Flag so that their grievances could find some chance of redressal. And there was a measure of gain in the current agitation and action.

That the awakening is not confined to the problem of social discrimination was proved by the almost simultaneous wave of strikes, sit-downs and demonstrations that swept across the delta districts on the question of higher daily wages. Here the gains were really considerable and could become the pace-setter throughout the state. Incidentally, an interesting implication of these actions is that when it comes to raising the value of the labour power of the agricultural proletariat, who can by no stretch of imagination be called 'privileged', the struggle has to be as sustained and as well-geared as any that the industrial worker takes recourse to. And, to say the least, one does not find the government in the slightest bit sympathetic to the struggle of these submerged sections, professing sympathy for which it unleashes all the force of its state apparatus against the working class in the towns.

It is characteristic of the Andhra scene and in many ways, perhaps, of the country as a whole that while the grapes of wrath are accumulating in the countryside the most sophisticated and modern segments of the industrial working class are also moving into action. The Electronics Corporation of India has a fine factory on the outskirts of Andhra's capital. It has been doing well for itself and for the nation as well. One finds there the objective coming into being — with the subjective factor still lacking — of a technical intelligentsia that is in physical contact with the production of value and the producers of value and a working class that increasingly illustrates the truth of the thesis that science is becoming a direct productive force. Also, in a great majority of cases the working class comes from the same source as the technical intelligentsia, i e, the universities. Before one's eyes one sees the contours of the new historical bloc which Gramsci had written about so perceptively some decades ago.

There are problems on both sides of the process of convergence. The technical intelligentsia can sympathise and even derive a surrogate's satisfaction from the miseries and efforts of those below the poverty line; but those who tread on its heels or, rather, those it has to go only a few steps to meet it would like to recoil from. And as for the new type of skilled worker there is the problem of what Lenin had called the intellectuals' aversion to being stewed in the factory kettle. The trade union leaders face charges from these new entrants that would have bewildered them had they not themselves been so recently through the same process — the factory doubles its complement every two or three years. The anarchy of the petty bourgeoisie has to be ironed out!

It is this factory and its workers who have decisively entered the arena of direct mass action in the recent weeks. The historical bloc proved its productive worth by practically doubling net profits but then faced bureaucratic obduracy both at the level of the national capital and, rather unexpectedly, at the top echelon of the factory itself, when it came to the question of material incentives.

What was excellent was the response of practically the entire work force to the call of the union for factory-gate meetings, public demonstrations and the acceptance of solidarity from other sections of the industrial working class. The last-mentioned point will appear odd to the uninitiated but in many ways it is the most significant pointer of the entire action. Class consciousness grows through this break with particularism which means that acceptance of solidarity implies the giving of it, too. Gains have been made with regard to the direct issues involved and others have been taken up for negotiation, but the biggest advance is the coming of this growing point of India into the national mainstream of struggle.

A final point to indicate the gathering democratic revival in Andhra Pradesh. One of the great contributions that the united Communist movement had made to the national regeneration of India was the intitiation of a fusion of popular and folk culture. This was really a dialectical unity of the discovery and the remaking of the cultural idiom of our people. It was done, characteristically, not by a towering individual genius but by myriad talents. It was done by the young and done with all the passionate abandon of those who break old moorings only by forging new links. Andhra had been one of the most important centres of this great advance. It is now again being brought to life. The Andhra Praja Natya Mandali showed this in its recent gathering at Vijayawada.

INTERNATIONAL AFFAIRS

Kings and Couriers

G P D

They were offered the choice between becoming kings or the couriers of kings. The way children would, they all wanted to be couriers. Therefore they are only couriers who hurry about the world, shouting to each other messages that have become meaningless.

— Franz Kafka

REPLACE the word 'meaningless' with unnecessary, and that is the full description of the Kissinger phenomenon. The Kissinger diplomacy amounts to an exchange of unnecessary messages. His three days in New Delhi provided a classic example of unnecessary messages exchanged amidst equally unnecessary fanfare, pomp and glory.

It all began with the repetition of a myth, of Indo-American relations being a problem of two large 'democracies'. What democracy has got to do with either Indian or American foreign policy is incomprehensible. In any case, it is certain that Kissinger does not believe a word of that rhetoric. We probably do. It is an old Indian reflex at work: the more unreal we are in our utterances, the more seriously we tend to take ourselves. Repeatedly saying that the US and India are two 'great' democracies, we actually start to believe they are so. It is a short step from there to hoping that the relations between the two would be cordial.

The straightforward fact of the matter is that the relationship between a patron and a client ought to be as free of both real and apparent tensions as possible. Appearances are important in politics and, as such, an apparent reconciliation after an apparent misunderstanding is extremely desirable. Going by the Indian official view of the Kissinger trip, the visit was intended to assure us that the US is not at all worried about our policies and that it values us as much as, if not more than, China. Our deepening economic crisis and our food requirements were items on the agenda all right; but essentially, Kissinger was here to recognise us as a power on the subcontinent, to recognise our leading role in international affairs and, more important, to recognise the validity and utility of 'non-alignment'. The US also had to atone for its sin of having moved the "Enterprise" up the Bay of Bengal during the 1971 Indo-Pak war.

Kissinger complied with all this. He even emerged as the greatest champion of non-alignment. In his address to the Indian Council of World Affairs, he made it appear as if non-alignment was more relevant for the US than for India! He even quoted Nehru, which is something his hosts in New Delhi hardly ever do these days. He pleaded that the idea of blocs had become anachronistic and that bloc diplomacy did not make any sense. At long last, we had entered a world of sovereign equal States. This is, of course, the message which has, to use Kafka's words, "become meaningless".

What is relevant is American power and money. That, Kissinger assured Indira Gandhi, was behind her government. Some socialists, in their peculiar vision of 'social realism', seemed to equate Indira Gandhi and the late Allende; but Kissinger's bourgeois realism was much too sound to be disturbed by that kind of daydreaming. He assured the government that, whatever the US might do elsewhere, it was not out to overthrow constitutionally-elected governments — "much less so in India". Again, it was a characteristically unnecessary message. For, Indira Gandhi never really doubted American intentions. All that she complained about was "the marginal role" which the US always saw India to be playing. Indeed, India is willing to play the central role. And it is a pity that successive American couriers have failed to convey this message to their kings. The game of unnecessary messages has to be played by both sides.

Thus completely respecting the 'sovereign equality' of patrons and clients alike and the leading role of India in the subcontinent, Kissinger went on to call our *bi-alignment* the name we most like to hear: *non-alignment*. He traced its origin to Nehru. In short, he made enough noise to totally satisfy our ego: as if it was not India but the US that had turned a new page in foreign policy. He went further to assure us that the Soviets were not particularly perturbed over his visit to New Delhi. We could therefore claim that, in all major matters, we had stood our ground firmly and with determination.

There were some 'minor' matters though, like pulling us out of the economic mess and providing us with some food to eat. Some funds would be needed to prevent the imminent recession. The Indo-American Joint Commission will hereafter look into these matters. Nobody should interpret this as a concession or a surrender, because the Commission will address itself merely to building lasting Indo-American co-operation in such minor areas as: the economic and commercial, scientific and technological, educational and cultural. Three sub-commissions will go into detailed consideration of the problems in each area. Presumably, the US will help us out of several problems without making us sacrifice our dear principle of non-alignment. In short, we are going to discuss almost every aspect of our economy with various US agencies -- official and private. The intellectual and academic base of co-operation cannot be ignored either: The third sub-commission will explore ways of introducing new techniques in our social science research.

It it spurious to enquire whether the far-reaching implications of this new agreement have been fully grasped. No comprehensive agreements, such as this one, are signed in a hurry. Three years ago, we signed a treaty with one super power. Now we have bagged another agreement with the other super power. Probably Kissinger had this in mind when he said that 'blocpolitics' has lost all its relevance; everyone in the international system now has only one order to strengthen. The two super powers will bail you out of every difficult situation — provided you play the game according to their common rules.

It is not as though the super powers will not let you play with your favourite terms and images. Kissinger seemed more than willing there. He merely wished to underline that non-alignment could not be interpreted as independence and self-reliance in international affairs. Dulles feared that non-alignment meant self-reliance, and so called it immoral. Of course, Dulles was wrong. Kissinger has seen that non-alignment is easily amoral. In fact, India, over the last three years, has laid to rest the ghost of independent, self-reliant, foreign policy. Kissinger can now safely lay to rest the ghost of John Foster Dulles. That's probably the only meaning of the message he has carried back to his king.

ASEAN

A Blueprint for Neutrality

Pran Chopra

THE neutralisation of Southeast Asia has so far been only a set of pious intentions. But it is now taking the shape of a proposition. Senior officials of the ASEAN countries have nearly completed a blueprint for neutrality, and if Malaysian hopes bear fruit — Malaysian efforts are strenuous — it will be placed before the political leaders of ASEAN some time early next year. It is then that the problem of hard choices will start, for the five ASEAN countries, for the four states of the Indo-China peninsula, and for all other countries, especially the major powers, which are asked to define their responsibilities and attitudes towards the proposition.

ASEAN is much closer to this critical stage than the Indian Ocean area as a whole though it too has been aiming at neutralisation for the past few years. Three things have helped ASEAN to get to this stage.

First, the decline of the American military involvement in Vietnam, without which there would have been no way at all for Thailand to persuade America to withdraw its military bases, a withdrawal without which talk of Thai neutrality would have been an eyewash.

Second, the change in relations between China and the US, which makes it possible for Washington, or at least so Kuala Lumpur hopes, to contemplate withdrawing from those bases too, such as the ones in the Philippines, which were set up more for USA's global needs, not specifically for the war in Vietnam; without their withdrawal neutrality of the Philippines would be an eyewash too. Withdrawal of foreign forces stationed in Malaysia under arrangements involving Britain, Australia and New Zealand offers no difficulty, it is believed in Kuala Lumpur.

Third, removal of misunderstandings within ASEAN. Some member countries, such as Singapore and the Philippines, believed that what Malaysia was proposing was some sort of an ASEAN alliance with military implications, and they shied off, thinking that there might be a conflict here with their own bilateral commitments with countries outside ASEAN. In recent months they have been persuaded that this is not so.

Therefore it is now easier for Malaysia to suggest, as Tan Sri Ghazali Shafie, at present Home Minister but one of Malaysia's best known foreign policy experts, suggested at a defence seminar in Jakarta at the end of October, that the "conflict environment of Southeast Asia" is indivisible, that some internal security problems of the members have external dimensions, not only external to the country but to the region as well, that "threats or blandishments by external powers" might call for "a collective response by ASEAN member states" or a "regional resilience", towards which ASEAN is a "first step".

Probably the region's best known foreign policy authority, the Foreign Minister of Indonesia, Adam Malik, who also spoke at the same seminar of the continued danger, in some ways an enhanced danger, of external power interference in this region, also urged that the time had come for taking "some fundamental decisions and options". Some appear to have been taken now, at the level of officials, and are being written into what Tan Sri Ghazali Shafie has described as a "neutrality system"; they form the basis of the emerging blueprint.

Progress was painfully slow to begin with, leading to some impatience, especially in Kuala Lumpur. In the three years since the ASEAN Declaration of neutrality was signed in 1971, the follow-up committee of senior officials met only thrice, and then too remained lost in the question whether the concept of neutrality should be spelt out first or an action programme framed from which the concept could gradually emerge. The "Swiss pattern" was pitted against the "EEC pattern" and both against the "UN charter pattern" and all three against something else and much time was lost, some of it through filibuster.

A bit of both approaches won out in the end, judging by recent events. Equidistance from the big powers was accepted as a concept — not a difficult one to accept nowadays since diplomatic relations with China do not any longer offend anyone, and none of the big powers wants exclusive clients; the only problem may be that what is seen as equidistance from one capital may not seem so from another.

On the other hand, the key to a "neutrality system" began to be sought in the removal of external threats, either to the ASEAN area from outside it or to one member country from another, because it is fear of these threats which makes member countries seek foreign intervention or enables foreign powers to impose it.

A set of "guidelines" and "principles" therefore has been drawn up first by which ASEAN members should settle their mutual disputes, including border disputes. They do not envisage any super-national machinery, such as a court or an arbitral body which would infringe upon national sovereignties. But they enlarge and underscore various political approaches and seek greater acceptance thereof.

An old idea was debated also for a while: a big powers' guarantee for ASEAN members' borders, which would reassure each in respect of the other members and all in respect of infringements from outside the area. But this, it was feared, would open the way for exactly the same outside interference which neutralisation seeks to shut out. It might also amount to a commitment which would be too comprehensive, too open-ended to be acceptable to some major powers and may be accepted by others only for ulterior reasons.

Therefore the approach now more favoured is that external assistance should be accepted only if the ASEAN mem-

bers themselves ask for it, and they should only ask if they think the threat, whether from inside or outside the region, is too great for the region's own resources to cope with.

Once the ASEAN member countries agree on what they expect of each other in terms of the guidelines and principles, the next stage will be to tell other countries what ASEAN expects of them. The precise alternative to guarantees will emerge only then, as an interaction between what each side expects and the other can accept.

Borders by themselves are not expected to offer much difficulty to external powers. They are no longer very greatly concerned as to where the borders between the ASEAN members lie so long as the members are agreed among themselves. Even the external frontiers of ASEAN would not worry them much.

But the borders can be a problem for the member countries themselves, for the countries which are members at present and even more for the countries which are likely to be invited to join one day: Burma, which has only a vaguely defined border with Thailand, and the countries of the Indo-China peninsula, where all border questions are wide open. One obvious consequence of this is very likely going to be that none of these countries will be invited, especially none of the Indo-China countries, until all can be, because that can only be done when they are all agreed where these countries are.

But even before that there will be an embarrassing hurdle to cross: to whom should ASEAN explain, in Cambodia let us say, what it expects of that country? On whether it approaches one Cambodian government or another may turn Hanoi's attitude towards it, and thence maybe Peking's, Moscow's or Washington's. The domino theory may work in reverse.

For this reason a smooth interlocking between concepts and specific policies will be needed, and much time may have to pass before the guidelines and principles can become a working reality. But if the effort is as serious as present postures suggest, 1975 may become a year of more concrete ASEAN diplomacy than any year has been since ASEAN came into being seven years ago.

THE FOURTH ESTATE

From Mission to Industry

Nireekshak

THE indigent, home-spun, embattled editors of the days of the freedom struggle were a different lot from the slick wizards with cultivated graces in public relations who adorn the editorial swivel chairs today. Before Independence, the Indian Press belonged to two broad categories: what was known as the Anglo-Indian Press, which was on the right side of the Establishment; and the nationalist Press, content to survive from one crisis to another, fighting to assert its right to freedom of expression and bedevilled by strict censorship and security regulations. To the editors and journalists who slogged in dingy offices (air conditioning was unknown and even fans were not common) for paltry salaries, the thrill of participating in a mission was the only recompense for all their risks and toils.

J N Sahni, endearingly known as Guruji to those who happened to work with him, entered journalism over 50 years ago when it had not yet become a profession. He became editor of *The Hindustan Times* at 26. The paper had almost collapsed, and he built it up. It is remarkable that Sahni should have waited 20 years after giving up active journalism to write his story* in these times of instant memoirs and quickies from the gentlemen of the Fourth Estate.

It is perhaps symbolic that Sahni quit as editor of a New Delhi daily when that which had been as a mission was gradually metamorphosing into an industry. The *noveau riche* proprietors began taking over the newspaper built up by the labour of journalists like Sahni. Their mission fulfilled and enough debts accumulated, the journalists had now to seek employment under proprietors. The *National Call*, which Sahni was editing when the freedom struggle was drawing to an end, had to be sold to a big business house, which had already acquired *The Times of India* group from the British interests who had owned it. Sahni continued as editor of *The Indian News Chronicle* — as the *National Call* came to be known under the new dispensation. Sahni's vignettes — of the semi-literate proprietor who claimed the Goddess spoke to him frequently even about the choice of editors for his papers, of the proprietor's new-found commitment to protecting Mother Cow, and of the sugar factory manager who was put in charge of the paper's management — make fascinating reading, and provide an insight into the life under the new class of proprietors for whom ownership of newspapers is but an extension of big money operations and stock market speculation. As Sahni cryptically says, they "naturally succumbed most easily to government pressures. Some of them were so much involved in shady transactions that, let alone ministers, the raising of an eyebrow by even an under-secretary could throw them into jitters and send them rushing to the editors for a change of tune".

Sahni is right. "During the succeeding years, just as government preserved the facade of legal freedom of the Press, resilient editors also tried to retain some image of independence in the eyes of their readers." Such pretences were meant to be kept up. Official and proprietorial pressures were mounting, and were different only in respect of the special interests involved. "Any editor or top journalist, therefore, who wanted to hold a job and a fat salary had to develop a flexible conscience. Even though brilliant, some editors almost became spineless. If the proprietors were unwilling, the editors were least inclined to take risks, not only because their own jobs would be at stake but because other proprietors also preferred adaptability to ideological obstinacy. A safe element of integrity, sugarcoated with a lot of brilliance, seemed to the proprietors an ideal combination. If this was not possible, proprietors preferred to take charge as editors themselves, or to appoint even non-entities to avoid legal and professional difficulties."

A new psychology thus began to permeate the politician-proprietor-editor relationship after Independence. The categories of editors began to proliferate in India — the proprietor-editor, the managing editor, the editor-in-chief, the resident editor, and the dummy editor — alongside of the erosion of professional morality. As Sahni looks back with a tinge of sadness, the Indian Press has gained very much in stature

* "Truth About the Indian Press", by J N Sahni. Allied, New Delhi; 1974; pp 259; Rs 45.

during the last 25 years: "It has grown into a massive giant, regrettably, though, a giant with cold feet".

The decline of the editor is a story not fully told yet. The nexus between big business and the newspapers tells, perhaps, only a part of the story — though it be a very relevant part. The government, which announced with gusto its intention to diffuse newspaper ownership, has now settled for de-linking the newspapers from big business houses. The now-on now-off bill to achieve this — one is assured — will certainly be introduced in the winter session of Parliament, and the Law Ministry is actually engaged in scrutinising the draft bill. D R Mankekar's book** gains topicality, thanks to the reported dismissal notice served on B G Verghese by the *Hindustan Times* management, and the proposed bill in Parliament. Many of the problems of the Indian Press have been attributed to structural deficiencies and the ownership pattern. Discussing editorial autonomy, the Press Commission commented in 1954 that a general agreement among all employees of a newspaper on its policy was a precondition for the form of ownership which could really succeed. In recent years, the *Le Monde* experiment has attracted a great deal of attention. Following protests by the staff over the change of its editor, the management handed over 28 per cent of the shares to the editorial staff, giving it a decisive voice in policy-making. A non-profit 'Corporation of Journalists of *Le Monde*' came into being and it named 14 journalist representatives on the paper's board of directors. With more than 25 per cent of shares controlled by them, the editorial representatives had 80 of the 280 votes and could veto anything they did not like. It ensures that the editorial director would be of their choice. The shares, to which the journalists subscribed at nominal value, do not belong to them individually. The share profits are not accepted by the Corporation and are held by the management for the benefit of all staff. The journalist staff of *Le Figaro* adopted the *Le Monde* model in 1971, with a few variations. *Stern*, a well known weekly from Hamburg in West Germany has framed a statute to safeguard the freedom of the editorial staff.

These experiments aim at safeguarding editorial independence. Mankekar, a veteran journalist who has held several editorial positions of note and emerged as a distinguished counsel on behalf of the newspapers before the Press Council (he pleaded with success on behalf of the *Searchlight* and *Pradeep* against the Bihar government; is representing the *Nai Duniya* against the Chief Justice of Madhya Pradesh; and has taken the *Hindustan Times* case on behalf of its editorial staff before the Council), has a few well-thought-out suggestions to make towards protecting editorial freedom. He thinks it can be assured only by a foolproof provision — statutory if necessary — for editorial autonomy against proprietorial and managerial intrusions and pressure. The editor's status should be raised and he should be included on the board of directors. The editor's autonomy can be fully exercised only when it is underwritten by economic security.

Much, of course, would depend on how the managements or proprietors choose their editors or change them. Mankekar has a point when he says the well-established Anglo-Indian newspapers in India accorded a high status to their editors and had them as members of the board of directors and were placed on par with the general managers. The Anglo-Indian papers of the past are now part of the *desi* Press, where the non-professional, financier-proprietor, looks upon the newspaper as yet another marketing package. The general managers have gradually become supreme, alongside the tragic decline of the editor. The long-promised bill might provide for the formal de-linking of the newspapers from big business houses, but that would not by itself guarantee editorial independence. The move for this has to come from within the newspapers; indeed, from the working journalists.

'Handbook' on North-East Hill Politics

M Horam

Hill Politics in North-East India by S C Chaube; Orient Longman, Calcutta; Rs 27.

THE five states of Assam, Meghalaya, Nagaland, Tripura and Manipur, along with the two Union Territories of Mizoram and Arunachal Pradesh, make up the mosaic of the North-East. These are sensitive regions, with complex socio-political problems which have defied New Delhi's attempted solutions. With the new territorial delineation of Assam, the Assamese and the plains tribes such as the Mikirs, Miris, Garos, etc, have been left in the state of Assam; the Khasi, Jaintia, and Garo Hills form Meghalaya; and the Naga-inhabited areas form Nagaland. Manipur has the Meiteis (plainsmen) as well as the Nagas, Kukis, Lushais, Mundas, and Garos. The two Union Territories are inhabited predominantly by tribals: the Lushais live in Mizoram, whereas the Monpas, Daflas, Apatanis, Abors (or Adis), Mishmis, Wanchos, Noctes, and an assortment of smaller tribes live in Arunachal.

Each area has political problems peculiar to itself, and Chaube has ventured to deal with them all in a single volume of 232 odd pages, which also include references at the end of each chapter and extensive quotations. While this is a bold undertaking, its very large scope hinders treatment in depth of issues endemic in each state or territory. The book might have been more effective as a study of the problems of this region if the author had focused on areas most familiar to him. His aims, mentioned in his Preface, are excellent; but the subsequent chapters, many of which are sketchy, render his claim pretentious.

Thus the first chapters briefly mention the most important historical events and issues — from the 18th century onwards. Many of the topics which could do with detailed treatment are mentioned with little or no explanation. The author merely refers to the 'Inner Line' policy, and offers a brief discussion on the advent of Christianity. Yet the importance and the far-reaching implications of both issues in the politics of North-East India today cannot be exaggerated. Chaube has dealt summarily also with a few other major subjects. Actually, his main work begins from Chapter 4 — 'Genesis of Hills Politics'. But regrettably, even this chapter is too short. A reader, already well-conversant with the political strands in the North-East, can easily recognise the main landmarks of political history set down in this chapter. But for readers whose knowledge of the politics of these areas is patchy, this chapter is of little help.

Easily the best and most comprehensive section of the book is to be found in Chapters 7 and 8. Here Chaube seems to be on familiar territory; he has done his homework well, and he writes with deep insight on account of his long association with Assam and especially the Khasi and Jaintia Hills. By contrast, the subsequent chapters on the politics of Nagaland and Mizoram, Tripura and Manipur, are based mainly on newspaper reports and other available literature. Also, the author has evidently relied on some interviews of people who have reasons for promoting certain points of view rather than any interest in presenting actual facts. In Nagaland, Manipur, and to a great extent in Mizoram, there are many ver-

INDIAN INSTITUTE OF MANAGEMENT, CALCUTTA

invites applications for **Research Positions** in its

Entrepreneurship Research Cell

The applicant should have a record of academic achievements; at least a high second class Master's Degree or equivalent in any of the social sciences including economics, history and management sciences; and preferably teaching/research experience of not less than one year. Age should ordinarily be below 25 years.

Positions offered will be contractual, initially for one to two years' duration and, depending upon qualifications, in the pay-scales.

Research Associate	:	Rs 700-50-1250 (to be revised)
Research Fellow	:	Rs 400-40-800-EB-50-950 (to be revised)
Research Assistant	:	Rs 550-25-750-EB-30-900 (revised)

with admissible allowances. Provident Fund benefit may be considered in special cases.

The positions will primarily entail research work on socio-economic, scientific, technological and political problems of entrepreneurship — agricultural and industrial, public and private, large and small-scale.

Applications stating all relevant particulars, names and addresses of two referees and accompanied by a two-page typed note on specific research interests should reach Director, **Indian Institute of Management, Calcutta,** 56-A, B. T. Road, Calcutta-700050 within three weeks. Please mention Entrepreneurship Research Cell on envelope cover.

RADIANT

sions possible of any given issue; and what meets the casual eye does not reflect reality as it is palpably felt by the people.

Hence critical observation and investigation is missed throughout the book — notwithstanding the claim in the Preface to "historical perspective" and use of "history, geography and sociology". There is little of historical perspective and even less of tribal social system, economic conditions, social interaction, stratification, and basic geographical data which might aid understanding. Scientific investigation of several very pertinent, and determinative, questions is also missing. Consequently, tribal leadership, tribal search for identity, the extraordinary influence of Christianity on politics and society, and the touchy relationship between the plains and the hills people have not been touched. The book would have been better entitled "An Introduction to North-East Indian Hill Politics" since it is really a handy compendium of related facts, covering a large area over a long period of time.

There are a few inaccuracies in spelling, names, dates and facts; but these are minor errors. Examples are: on page 2, the reference to the 'wavy hair' of the Angamis, though Angamis unlike the other Naga and North Eastern tribes do not have wavy or curly hair; they are in incidentally, tall and fair-complexioned. On page 36, it is erroneously stated that the hill tribes were under the influence of Hinduism; in the pre-Christian days, on the contrary, most tribals were animists and some continue to be nature-worshippers even today and Khasis who are Christians in fact call the non-Christians 'shnong' or 'non-believers'. Then again, the Meiteis are not hill 'tribals' but plainsmen of Manipur; and whatever the origin of the Meiteis, they have not followed the tribal system of society. The claim on page 39 that the Baptist Church in Nagaland was 'nationalised' is not correct; and Christianity came to Nagaland in 1872 — not in 1876 (p 49). Mhasieu Angami has not left politics after his release (p 154). The 'Bordoloi sub-committee' (p 42), the 'Coupland Plan', and 'Crown Colony' (p 69), etc, are mentioned by name without so much as mentioning what they were — though references are given.

Still, with all its shortcomings, Chaube's book is the very first of its kind on the area. He has handled an unwieldy subject with courage, and what the book lacks in treatment it makes up in sincerity of approach. As a pioneer volume it will be useful to researchers.

Overview of Industrial Regulation

Tarjani Vakil

Indian Industrial Environment by Aravind Bakre; Business India Publications; Rs 80.

IT is easy for executives of industrial enterprises to get lost in the maze of legislation and regulations governing industrial activity in India today. And, at present, there is no known single agency whose function it is to guide them in problems relating to industrial licensing, finance, industrial relations, taxation, and trade marks. The book under review attempts to give a macro-view of the prevailing legislative environment. It is essentially a compilation of relevant data, selected from various sources and presented subject-wise.

There are 12 chapters. The first chapter deals briefly with the genesis and evolution of our industrial policy — its ostensible emphasis on the objectives of growth, social justice, and self-reliance. The second chapter outlines various schemes of the Central and state governments, which offer incentives for location of industries in backward areas with a view to promoting dispersal of industries and rectifying regional imbalances. The third chapter discusses important provisions of the Companies Act, 1956, such as those relating to transfer of shares, managerial remuneration, accounts and audit, and powers of the Central and state governments to inspect and investigate. There is also a reference to the salient features of the Companies Amendment Bill, now before Parliament. The next chapter deals with the provisions of the Monopolies and Restrictive Trade Practices Act, 1969, which seeks to restrain concentration of wealth and to develop a wider base of entrepreneurship. The fifth chapter is devoted to the Industries (Development and Regulation) Act, 1951 — a major instrument of industrial policy. There follows delineation of government policy on foreign collaborations. A brief description of the Capital Issues Control and the activities of the all-India financial institutions takes up the seventh chapter. The chapter on Import-Export Controls has some useful appendices, giving names, addresses, and jurisdiction of the various licensing/registering authorities. The concluding chapters deal with industrial law, corporate taxation, and consumer protection enactments, etc.

The inherent danger in writing a book with this range and ambition is that it is apt to become out-of-date soon. However, the author says he is aware of the need to improve the quality of the book's contents and to update it from time to time.

The publication is priced Rs 80, which might limit the demand for it. Greater attention could be paid to the editing and the proof reading in the next edition of the book. Yet, for all that, the book will prove of considerable benefit to company executives and students of present day Indian industrial environment.

International Pharmaceutical Industry and Less-Developed Countries

I—Oligopolistic Power of Leading Firms

Sanjaya Lall

The pharmaceutical industry is one of the most 'multinational' of modern manufacturing industries; the firms which dominate it in the developed countries also operate in almost every less-developed country outside the socialist bloc.

The social importance of the pharmaceutical industry is such that in recent years it has been subjected to increasing enquiry and criticism in several countries. It is an indication of the industry's power that few of these criticisms have led to reforms in its basic structure.

Part I of this paper, which appears this week, examines the main characteristics of the international pharmaceutical industry, highlighting the anomalies and distortions that exist because of the peculiar structure of the drugs market and because of the great oligopolistic power exercised by the leading firms.

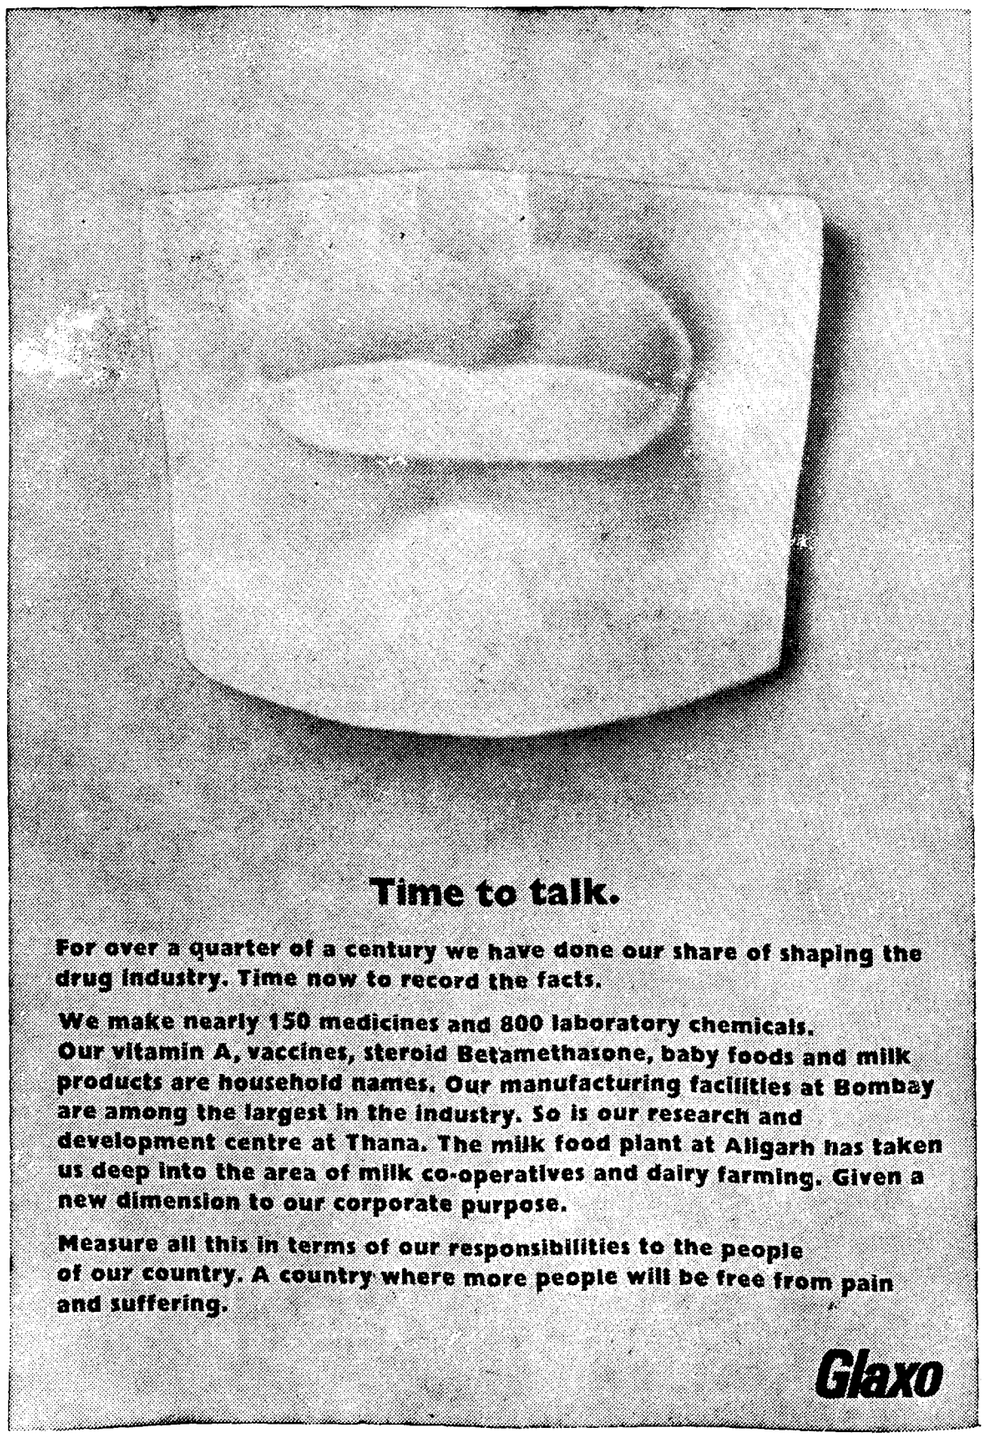
The implications of the structure of the international pharmaceutical industry for the developing countries, to which many of its less desirable features are transferred wholesale, are discussed in Part II of the article, which will appear next week. The additional social costs imposed on these countries by their playing host to the drug multinationals are described, using the Indian case as an example. The options open to the governments of the developing countries to reduce the cost of obtaining drugs are also considered.

THE pharmaceutical industry is today one of the most 'multinational' of modern manufacturing industries. The firms which dominate it in the developed countries are in some capacity present in almost every less-developed country outside the Socialist bloc. It is a dynamic and important industry: indeed the social importance of its products is such that in recent years it has been subjected to increasing enquiry and criticism in several countries. It is indicative of its strength that few of these criticisms have led to reforms in its basic structure.

This paper examines the main characteristics of the international pharmaceutical industry as it functions in the developed world, highlighting the anomalies and distortions that exist because of the peculiar structure of the drug market* and because of the great oligopolistic power exercised by the leading firms.

The implications of this industry for developing countries — to which many of its less desirable features are transferred wholesale — are discussed. The additional social costs imposed on these countries by their playing host to the drug multinationals are described — using the Indian case as an example.

The options open to the governments of the developing countries to reduce the cost obtaining drugs are also considered.



The paper draws heavily on the research into the pharmaceutical industry in the US and the UK, where official enquiries have uncovered a great deal of information on the industry's performance and practices not normally apparent to outsiders. Special attention is paid to the Swiss pharmaceutical firm, Hoffman-La Roche — which is now the largest drug company in the world — as detailed work has been done on it by the British Monopolies Commission and as information is available on its operation in the US, Colombia and India.

* The analysis applies mainly to 'ethical' drugs, medicines sold under brand names on prescription, but many characteristics of such drugs are also common to 'household' medicines sold directly to the consumer.

The Background

The modern pharmaceutical industry is a relatively recent phenomenon. One may trace its present research-based, rapid-product-change, synthetic-process, characteristics to the 1920s and 1930s. By 1969, the total market for pharmaceutical products exceeded US $ 10 billion for the OECD areas. This market was served by some 4,000-5,000 companies — ranging from tiny establishments and off-shoots of chemical concerns to enormous specialised manufacturers with turnovers of over $ 1,000 million per annum.[1] The vast majority of these firms were, however, very small, and production in each country has been dominated by a relatively few firms which are truly 'multinational' in their operations — though their ownership tends to remain closely held in their countries of origin. A recent report lists 38 firms with turnovers of over $ 50 million in 1970, led by Roche, and comprising 18 firms from the US, 4 from the UK, 4 from Germany, 3 from Switzerland, 2 each from France, Italy and Japan, and 3 from other countries.[2]

The British pharmaceutical market is fairly representative of the general structure: the Sainsbury Committee (1967) reported that, in 1965, of total sales of £ 161 million by 53 firms of NHS (National Health Service) products, over 60 per cent were supplied by 11 firms, and over 80 per cent by 20 firms. Of these largest 20 firms, only 5 were British; the rest were composed of 11 American, 3 Swiss and 1 other European firm. The 53 firms in the Committee's sample accounted for about 90 per cent of the total value of prescription medicines in the UK, with several hundred smaller firms sharing the remainder of the pharmaceutical market. Similarly, of some 500-700 phar-

maceutical firms in the US, the largest 35 accounted for 80-95 per cent sales in 1961,[3] and included most of the large European international concerns. This pattern is, according to the OECD study, common to all developed countries.

Little was known about the peculiar characteristics of the industry before 1959, when the Kefauver Committee undertook to examine 'Administered Prices in the Drug Industry' in the US.[4] Senator Kefauver was responsible for introducing legislation to remedy some of the least desirable practices of the drug industry, but later Senate hearings, under G P Nelson and currently under E Kennedy, show clearly that the basic economic and social problems were left unresolved. Investigations in the UK revealed similar problems, and, again, recommendations for reform were left largely unimplemented.

The official enquiries stimulated a strong and penetrating academic response, especially in the US, and several works critical of the industry appeared in the early and mid sixties by Harris, Steele, Schifrin and others. Academic interest, however, appears to have flagged — with the exception of Walker (1971) — since, the industry continued to expand strongly in the developed countries and elsewhere, with its worrying features left intact. Social concern has, on the other hand, grown greatly, and many countries are continuing to study the sector closely in order to tighten control over its operations.

So much for the background. Let us now briefly consider some of the characteristics of the drug industry, to see the causes of the concern felt, and to gauge whether its social costs have been higher than is justified with reference to the risks, expenses and responsibilities of the industry.

Main Characteristics of the Industry

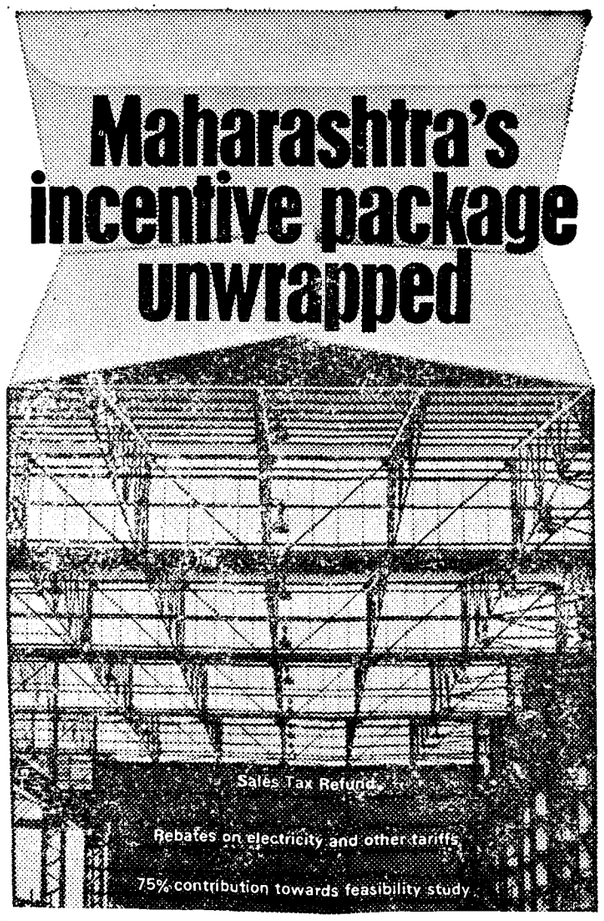
The salient features of the pharmaceutical industry in developed countries may be conveniently grouped under four headings: production structure, technology, marketing practices, and profitability.

(i) Production Structure:

We have already noted that the pharmaceutical industry in each country consists of a large number of small, locally-owned, firms supplying a marginal proportion (say 10-15 per cent) of the medical preparations, side by side with a small number of large, mainly international, firms controlling the remainder. The reasons for such a structure are to be found in the concentration — and nature — of technology and the marketing practices of large firms. These we discuss below; but first we need make two points.

First, it has been argued that, despite the overwhelming presence of large firms, the degree of concentration is 'slight' because "the maximum share of the market held by any one company rarely exceeds 7 per cent ... 2 to 5 per cent are common for the larger companies, whether they are locally owned or international subsidiaries".[5] Such an argument is misleading, because the pharmaceutical market is extremely heterogeneous, and comprises a number of sub-markets within which firms have tended to specialise.[6] This has led to *concentration within product classes which is high both "in degree and stability"*,[7] and which spreads over both products protected by patents as well as older products. Thus, in each of the 13 major groups, the four largest firms accounted for 60-80 per cent of sales, *sometimes even* more.[8] In tranquillisers, for instance, Roche's two main products, Librium and Valium, accounted for almost 70 per cent of the value of British NHS prescriptions in this area; these two products are also claimed to hold over one-third of the entire world tranquilliser market.[9]

Second, in marked contrast to most other manufacturing industries, especially those dominated by the multinationals, the pharmaceutical industry enjoys practically *no economies of scale* in production (Steele, 1962, and OECD, 1969). The active ingredients are normaly manufactured in relatively small volumes, and in many cases an increase in production merely requires the addition of fermentation vessels of standard size. As far as production technology is concerned, therefore, large firms have no special advantage over small firms, and there is no economic benefit to be gained, in terms of production costs, from encouraging bigness : The fact that bigness has succeeded is due to an entirely different set of reasons.



(ii) *Technology:*

The pharmaceutical industry is highly research-intensive; indeed, of all non-military industries in the US, it recorded the highest ratio of research expenditure to sales in the mid-sixties; and it devoted the largest part of its R and D expenditures to 'basic' research as opposed to other kinds of research and product development.[10] Total R and D expenditure in the UK on NHS products came to £18.5 million in 1965 (Sainsbury Committee), and to £20.2 million in 1968,[11] while in the US it was over 10 times higher in 1965 and approached $431 million in 1967.[12] The US was by far the largest spender on pharmaceutical R and D, and also accounted for the bulk of new drugs marketed in the post-War period. Switzerland and West Germany, followed by the UK and France, were also responsible for a number of new discoveries — though in the US market, they each accounted for 7 per cent or less of the new drugs introduced in 1941-64, while US firms accounted for 61 per cent.[13]

In general, large pharmaceutical firms spent about 10 per cent of their turnover on R and D in the US and UK in the mid-sixties.[14] Roche currently claims to be spending almost 15 per cent on R and D —[15] which is high, but by no means unusual in this industry. There is no doubt that the pharmaceutical industry spends a lot on R and D and has produced a number of valuable new medicines. However, this admission tells us little about whether the expenditures have been *efficient from a social point of view*, in other words, whether or not the same number of effective new drugs could have been developed at a smaller cost to society.

It is, by the very nature of the problem, difficult to pass any definite judgment on this score, since no alternative and complete system of conducting pharmaceutical research exists in the West. The firms themselves stress the long gestation period (up to 7 years) and high (and rising costs) involved in developing, testing, and marketing of drugs; and they point out that the element of risk in such R and D is extremely high. Critics have to rely on more circumstantial evidence, and this suggests that the firms' claims — while true to some extent — conceal a number of factors which contribute to their R and D costs without conferring much benefit on society. Let us consider these.

[A] First, R and D expenditure is very highly concentrated among large firms: in the US, for instance, the four largest firms accounted for 40 per cent, the eight largest for 63 per cent, and the twenty largest for 95 per cent of the total R and D in the industry.[16] In the UK, the Sainsbury Committee found that the four largest firms spent over 70 per cent of the total, the higher concentration being partly explained by the fact that foreign firms did relatively

The Package Scheme of Graded Incentives makes all areas equally attractive.

"Grading"—an added advantage

Maharashtra's Package Scheme of Graded Incentives divides the State into 4 zones —the developed areas and the developing areas. All developing areas are graded according to existing circumstances and higher scales of benefits apply in areas which are relatively less favourably placed. For instance the Sales Tax Refund is offered for 6 years in certain areas but for 10 years in other areas.

Similar gradations apply to incentives like relief from incidence of certain rates (electricity tariff, octroi, water royalties, and non-agricultural assessment) and preferential treatment under the Government purchase programme.

And assistance—SICOM style

This scheme is implemented by SICOM —the people who work hard with expertise and guts. What's more, you can take advantage of SICOM's flexible financial assistance and plant location, project investigation and project implementation services. All given to you in SICOM style.

Avail of the Maharashtra Government's Package Scheme of Graded Incentives. Now!

little R and D in this country. Such concentration would be desirable if there existed economies of scale in conducting pharmaceutical research. The empirical work which has been done in this subject is not conclusive; but it does suggest that there are economies of scale (*measured in terms of innovations resulting from R and D expenditures*) up to a certain size of firm, after which *research productivity* tends to decline.[17] Most of the big drug firms have establishments much larger than the 'optimum' size, which indicates that the present allocation of R and D resources is not the most efficient possible.

It is not clear why such diseconomies of scale in R and D should come into play for very large establishments: perhaps the problems of co-ordination and administration rise sharply after a certain level, or perhaps the nature of research activity is such that a certain amount of decentralisation and freedom is essential. If diseconomies do exist, however, why do firms maintain such large facilities? The explanation may be that diseconomies of scale in R and D are *not incompatible* with high expenditures being profitable for the firms concerned — since the *private benefits*, yielded by innovations from extra R and D, may continue to exceed the costs involved for substantial increases in size. Profitability in this industry depends greatly on individual firms' hold over patents as one source of market power (see below), and R and D costs and benefits are necessarily difficult to compute in advance; thus, it is not surprising that the largest firms should finance vast laboratories.

[B] Even if diseconomies of scale in research did not exist, it could be argued that the basic *nature* of private R and D in this industry — aiming at patentable products and processes — leads to the misallocation of research expenditures. The vital role of patents in the drug industry is well known, and we discuss some implications of the patent system below. The point to note here, however, is that a great deal of R and D — which is generally treated as a current tax-deductible expense — is devoted to squeezing out the maximum possible amount of profits from the patent system. Thus, *for a firm which innovates a new drug, patents can serve not only to protect the initial discovery, but can, with judicious timing and some careful changes, help to introduce 'new' products and so prolong patent-protection much after the initial patent has expired.* For rival firms, it may prove very profitable to imitate the innovation by 'molecule manipulation' and thus secure a marketable product.[18]

The common practice of imitative patenting leads to a great deal of socially worthless, but privately profitable, research. Though a certain amount of imitative research leads to useful new compounds of existing chemicals, it is certainly arguable that the same improvements could be achieved at a much lower overall cost at non-competitive research establishments. Naturally, there are problems in evaluating the real contribution of 'molecule manipulation', which enable drug firms to make claims that are difficult to challenge. The consensus of opinion among economists is, however, that the present system is wasteful and inefficient, and that an appropriate change in the direction of R and D would be beneficial.

[C] Though the industry claims to do a large amount of 'basic' research, and though the claim is — if not to the full extent stated — justifiable, there has evolved a *certain division of research* labour between the private sector and government/academic institutions. Comanor, 1966, and the Sainsbury Committee, both argue that there is a necessary complementarity between the more fundamental and non-profit-oriented work done in the latter and the market-oriented work of the former. It is not clear, however, that such a division of labour is 'natural' or 'necessary'; *on the contrary, it has evolved precisely because marketing and production have been left to a profit-maximising private sector, and because the public sector researchers are not geared to producing finished drugs.* If the research structure had been different, it is easy to imagine that a less wasteful form of R and D would have been undertaken without any loss in the quality and quantity of drugs produced.

This case can be strengthened by two points. First, the amount of state-sponsored research is very large, coming to about £20 million in the UK, and £440 million in the US, in 1965 — and exceeding private research in this field by 200-300 per cent.[19] Since the results of such research is published (and so provided free) or sold for nominal licence fees to the private drug firms for further development, it serves, where appropriate, to provide a valuable input to the latter without their paying the due cost to society. Since the profit on new drugs tends to be higher than on old ones, moreover, it also serves to raise the overall rate of profit of the firms concerned. Second, where official agencies, such as the Medical Research Council in the UK, *have* tried their hand at producing marketable drugs, they have been extremely successful.[20] There does not seem to be any intrinsic disadvantage in public research in this field, and the fact that private firms conduct most of the final R and D is not because private efforts are necessarily more productive but because public R and D is rigidly accorded second place.

[D] The problem of *drug patents* has been a vexed one, and much has been written on both sides of the debate,[21] without a clear answer emerging on the optimal form of legal protection to be granted to private innovators. In most developed countries, patent protection is granted for 16-20 years (16 years in the UK and 17 in the US); in the pharmaceutical field, a distinction is drawn between processes and products, with many countries (e g, Switzerland) permitting only process-patents and some permitting both (the UK with some restrictions, and the US with none).[22] The US lies at one extreme, with very liberal patent laws (which include normally unpatentable 'naturally occurring' substances); and Italy and Finland at the other, with no pharmaceutical product or process patents permitted at all.

The essential case for granting patent protection is similar to that for granting any other form of protection against competition: the recipient of the privilege is given a monopolistic position which enables him to charge higher prices than he otherwise could, the short-term welfare loss due to these higher prices supposedly being offset in the long run by a higher rate of innovative-output and a decline in the price of the protected product after recoupment of a 'fair' return on the R and D investment. The original conception of such protection was, of course, to encourage small innovating firms or individual inventors — though it is very likely that large private research-based firms need this protection just as much if they are to survive the rigours of oligopolistic competition.

The pharmaceutical industry has often been accused of 'abusing' the patent privilege granted it. What constitutes 'abuse' in this context? There may be several forms:

(a) We have already noted how the system encourages a great deal of wasteful expenditure on imitative R and D and patenting, by directing re-

search primarily at the production of marketable, rather than therapeutically, new products.

(b) The complexity of patent laws and the high cost of litigation works strongly in favour of large firms; small firms often find it easier to sell their innovations to their giant competitors for a lump sum, rather than to contest infringements in protracted court cases.[23] To this extent, patents limit rather than promote competition in research.

(c) A substantial portion of allegedly R and D expenditure in fact goes into buying international patents. For instance, the cost of international patenting to 3 large US drug companies in 1972-73 came to £ 15 million, *and was charged as a research expense.*[24] Such measures are purely for extending the monopoly position of firms from domestic to international markets; moreover, it is misleading, for the purpose of evaluating research effort, to place them in this category.

(d) The main abuse of patent-protected monopoly is, however, that it permits *excessive profits* to be earned by pharmaceutical firms. We shall return to the profitability of the industry later, but it should be noted that the granting of a long period of virtual monopoly in a product, which faces very inelastic demand and which is very heavily promoted (these market characteristics are described in the following section), violates the main economic justification of patenting — *viz*, that the returns earned are 'fair' in some sense of the word.[25] The returns, in fact earned by the pharmaceutical industry, are high by any standards; and, as is argued below, they cannot be justified by the riskiness of the R and D effort. Moreover, the pricing policies of the large drug firms are based on purely monopolistic principles of 'what the market can bear', rather than on the socially responsible one of lowering them after recovering research costs. Roche, for instance, had not lowered the price of Librium at all in the UK since its introduction in 1960, until the government forced a price reduction on the firm in 1973. The case is now being hotly contested.

To summarise this section, the structure of private research and development in the pharmaceutical industry, and its supporting base of patent laws, leads to heavy and not necessarily efficient concentration of R and D in large firms, to a great deal of wasteful expenditure on competitive patenting, and to granting patent protection which can lead to 'excessive' profits.

(iii) *Marketing Practices*:

The technological structure of the pharmaceutical industry provides only one explanation — and probably the minor one — of its oligopolistic market power and its ability to earn high profits. The other lies in the peculiar market structure — and the resulting marketing practices — of the industry. It is this which leads it to have practically the highest ratio of promotion and advertising costs to sales, ranging, in the US, from *three to four times its R and D expenditures*, and accounting for about *one-third of the value of* sales![26] In many cases, the promotion costs have actually exceeded the cost of goods sold — though, on the figures available, the cost of promotion in the UK has been much lower than in the US.[27]

There are three reasons for this state of affairs:

First, there is a complete separation of identity between the purchaser (the patient) and the choice-maker (the doctor) in the pharmaceutical market. In countries which have nationalised health services, the patient also becomes separated from the purchaser — the State; in either case, the person who pays for the drug is totally distinct from the one who actually chooses them. There is, therefore, no *direct* pressure on the effective buyer — the doctor — to economise, though he may, *if* he had full knowledge of prices and no brand preference, prescribe drugs according to the income of the patient; the patient is, of course, obliged to obey the doctor's orders and his demand curve is likely to be fairly inelastic to the extent that he can reduce the other expenses under his control. In fact, there is little evidence that doctors are very price-conscious, as figures on price differentials given below show.

Second, there is a sharp distinction between products marketed under generic names and those sold under brand names.[28] The bulk of the promotion effort goes into persuading doctors to prescribe by brand names — introducing what is in many cases, a completely spurious product-differentiation between drugs with identical pharmacological properties. In cases where there is patent protection, advertising helps to promote the brand image and to secure it for long after the protection has expired. In other cases, it introduces a strong monopolistic element into what would otherwise be a more competitive market.

Third, the very speed of introduction of new products, the profusion of brands (there are, for instance, about 700 drugs sold under 20,000 names in the US), and the virtual absence of official provision of systematic information in the field, has made the medical profession heavily dependent on the firms themselves for information about new treatments![29] The industry can, therefore, claim to be serving a social function by its promotion — when, in fact, the purely informational content is low, relative to the commercial content, but can be most profitably blended with it.

These factors, combined with the fact that marketing is the one aspect of drug manufacture where there *do* exist considerable economies of scale,[30] have led to the evolution of marketing practices which rely heavily on free samples, frequent visits by representatives, voluminous and glossy mail literature, banquets on the introduction of 'new' products, free trips and expensive presents, and Madison Avenue-style magazine and journal advertising — and which cost over $750 million in the US in 1958, and about £41 million in the UK in 1970.

The effects of such promotion have been extensively discussed, especially in the US Senate hearings. The main effects are as follows.

(a) The use of brand as opposed to generic names is actively promoted by large firms — in that, they themselves, subject to approval, can choose generic names upon the patenting of new products but deliberately choose complicated generic names; brand names are always simpler and more catchy in comparison. Furthermore, in the layout of drug advertisements, brand names are invariably more prominently displayed than generic names.

(b) It is very difficult, if not practically impossible, for the prescribing doctors to have immediate access to information which would enable them to compare prices of identical drugs, despite the amount of promotion undertaken. Advertisements hardly ever mention prices — ignoring one of the basic precepts of 'socially responsible' marketing — while representatives are trained to promote their wares on non-price grounds. In fact, in the US, it is even *illegal* for generic name catalogues to compare their prices with those of branded equivalents, or even to mention brand name equivalents of generic name products.[31] This state of affairs, combined with the effects of patent protection, has led to price anomalies

which would be difficult to imagine in almost any other industry:

(i) Differences in the price of the same brand between different parts of a country or to different purchasers: for instance, Roche's Librium was being sold, within the US in 1965, at $ 45 (for 500 capsules of 25 mg each) in Des Moines, at $18.50 in Philadelphia, and at $21.75 to the Veterans' Administration — the difference between the lowest and highest city prices being 243 per cent.[32]

(ii) Differences in the price of the same brand between different countries: to take Roche again, Librium cost the pharmacist (before the compulsory price cuts) $2.40 in England (for 100 tablets of 10 mg) and $6.82 in US, in 1973,[33] while Valium cost twice as much in Australia, and over 6 times as much in Switzerland, as it did in this country.[34]

(iii) Most surprising of all, differences in the price of the same drug between brand names and generic equivalents, or between heavily promoted brand names and those of small firms in the same market: There are innumerable examples (especially in Kefauver, 1966, and Steele, 1964) of branded products being sold at prices ranging up to over 1,000 per cent higher than others, with no effect on the large market shares held by them. In Roche's case, a small British firm, DDSA, supplies its equivalent of Librium under a compulsory licence at prices 25 per cent lower than Roche yet had not been able to capture even 3 per cent of the market for this drug by 1970.[35] Furthermore, to illustrate the importance of promotion, as opposed to patent protection: in Italy, where no patents are allowed on pharmaceuticals, there are a number of copiers of Librium. Seven firms sell at prices 30 per cent lower than Roche, yet have "failed to make any headway in the market", with Roche holding 80 per cent of the market.[36] It is important to note that such differences apply to drugs whose patents have expired as well as to patent drugs manufactured under compulsory licence. In other words, there is no relationship at all between the price differential and the returns 'legitimately' earned on R and D; promotion serves simply to create and maintain an artificial monopoly position.

(c) Pharmaceutical marketing does not gain its ends only by a repetition of the scientifically established virtues of its products. Many instances have been reported of excessive claims, suppression of information about side-effects, or incomplete reporting of results; as is only to be expected in circumstances where profitability depends on such promotion, firms take their claims to the limits of scientific acceptability, and often exceed them.[37] Roche, among many other firms, has also been accused of unfair advertising tactics; to quote evidence given before the US Senate:

> "The advertisement (for Valium) did not mention some important qualifications ... background information and qualifications which might appear in a scientific article (were) omitted and the results exaggerated beyond what the authors intended. This particular advertisement has now been withdrawn but ... it was the subject of the most extensive advertising campaign which I have ever seen for a psychotropic drug."[38]

The role of representatives ('detailmen' in America) is of particular importance in such promotion. Not only do their visits save doctors the trouble of having to read, but their conversations are unrecorded, they use such tactics as 'gifts and fast-talk gimmicks' to win over nurses and receptionists, they sometimes gain access to confidential files to discover doctors' prescribing practices, and they subject recalcitrant doctors to "concentrated sales assaults" to win them over to their products.[39] Evidence now being presented before Senator Kennedy's Committee in Washington has led him to consider very strong measures to control and reform the marketing system there.

(d) A similar problem to that of the 'hard sell' arises from the promotion and sale of *ineffective* drugs. Recent reports in *The Guardian* (1974) have claimed that US and Swiss firms are selling over 100 drugs, costing several million pounds each year, in the UK, which have been withdrawn from the American market after being found to "lack evidence of effectiveness" by the Food and Drug Administration. There is no official body in Britain which evaluates the effectiveness of drugs now on the market — the Committee on Safety of Medicines does not compare the effectiveness of existing drugs and is primarily concerned with safety[40] — and the only body competent to do so (the Macgregor Committee) was disbanded in 1970, allegedly under pressure from the industry.[41] While there do exist difficulties in testing the effectiveness of drugs, which have caused the drug firms' representative body (the Association of British Pharmaceutical Industries) to call the US official rating 'relatively useless', this problem cannot be dismissed casually, and all serious investigators have recommended urgent reform of a system so patently liable to abuse.

(e) Finally, a great deal of advertising by large pharmaceutical concerns is intended to disparage the lower-price products of small competitors, especially by the unwritten means of representative persuasion. "There is probably no other industry in existence where the disparagement of the quality of lower priced products can so completely substitute for actual price competition".[42] Detailed surveys of the evidence in the US give no reason to believe that the generic equivalents of branded drugs are inferior in quality or checked less intensively for a quality-control: If there exists any basis for hesitation, a small diversion of the present advertising expenses of the large firms would be enough to strengthen official drug inspection sufficiently to remove it.[43]

The case against the existing structure of private drug marketing — a peculiar configuration of private profitability, doctors' convenience, and official inaction — is thus very strong. There is no doubt that the drug companies' promotion serves the useful social function of bringing new discoveries to doctors' notice; but there is also no doubt that this promotion creates powerful monopoly positions, confuses the flow of correct information, may induce inappropriate prescribing, and generally leads to considerable social waste. The problem is weightier than that raised by private R and D, and has been recognised for many years.[44] *Yet nothing has been done to effectively remedy it* — a triumph for the economic and political power of the drug industry,[45] which has enabled them to maintain their profit-earning capacity over long periods. We turn now to this aspect.

(iv) *Profitability*:

It is hardly surprising, in view of the extent of market control exercised through the factors discussed above, that the pharmaceutical industry is one of the most profitable industries in the developed world. It has, since the mid-fifties, consistently recorded profits substantially higher than the average for all industry, in both the US and the UK.[46] In 1966, the industry earned 21 per cent on capital employed in the US as compared to 13 per cent for all manufacturing; and in the UK, a survey of 110 pharmaceutical compa-

Visions of warmth and laughter

Our new 747Bs have more hostesses and stewards than most other airlines dream of... to help us maintain a standard of inflight service even other airlines talk about.

For what really makes Singapore Airlines such a warm experience is our cabin crew: serene hostesses in sarong kebayas, caring for you as only they know how.

155A

nies showed a return of 26 per cent for 1967-69 as compared to 12.6 per cent for all manufacturing.[47] A recent publication reveals that the returns on capital employed for the three leading British drug companies in 1972 were: Becham Group, 41 per cent, Glaxo, 22 per cent and Boots, 45 per cent; Beecham and Boots were beaten by only one firm, Rank Xerox, in the top 100 British firms in that year.[48] The Sainsbury Committee report, while expressing reservations about the declared profits of foreign drug firms, shows that of the 27 largest firms in the UK, 23 had returns on capital employed of over 10 per cent, 8 of over 30 per cent, and 3 of over 50 per cent.[49]

The stated profitability figures are, of course, rather difficult to interpret, partly because of the existence of hidden profits in the form of transfer prices and various charges (discussed below), and partly because of the unreliability of the book value of assets as a measure of the real value of investment. Inflation (particularly in recent years) has rendered the book value of fixed capital a very unrealistic gauge of their present worth, and it may be argued that the denominator in the profitability ratio should include 'investments' in goodwill, brand names, marketing channels and patents. While such adjustments would certainly bring down the rates now seen to be earned, we should bear in mind that inflation affects all industries and should not bias a *comparison* of inter-industry profits, as also that expenditures on patents and marketing are all charged as current costs and may not be seen as 'investments' by firms allocating capital resources. Thus, it still seems valid to assert that the pharmaceutical industry is, as a whole, exceptionally profitable relative to other industries, and that this position has been maintained by virtue of its great market power over a very long period.[50]

The defenders of the drug industry, while admitting to its high profitability, have sought to counter the charge that the profitability is 'excessive'. They point to the *exceptional risk* attached to research-based operations. If the claim of exceptional risk were valid, we would expect an analysis of the data to show that risk and uncertainty, as opposed to other factors, exercise a significant influence on the profitability of drug firms; furthermore, we would expect the industry to show considerable fluctuations in its earnings, relative to less risky industries, and we would expect to find drug firms which were exceptionally unproductive of innovations to show relatively low returns. None of these factors is supported by the evidence: econometric analysis of the determinants of profits *does not* show that risk is a very significant variable;[51] the industry has *consistently* earned profits higher than the average; and firms producing few innovations have nevertheless shown very high profits.[52]

It is difficult, therefore, to accept that the drug industry faces *exceptional* risks which can justify its abnormally high profits; indeed, the evidence at hand leads one to believe that profits derive mainly from a monopolistic situation which seems to be very secure rather than very vulnerable. Risk would be a more convincing bogey if the stranglehold exercised by patents and marketing were not so tight: in present conditions, it is hardly surprising that the industry has been so often accused of charging 'excessive prices', in relation to costs of production and permissible profits, by people who have made a close study of its costs and practices.[53]

We must, at this point, consider an aspect of profitability which is directly related to the international operations of pharmaceutical firms. There is a close integration of operations, *via* the trade of intermediate chemicals, between different branches of international pharmaceutical firms, which offers ample opportunities for the misuse of *transfer-pricing* (on the commodities so traded) to ship profits clandestinely from one country to another. There are many reasons why firms may wish to declare profits in one country rather than another — the main ones being tax differentials, restrictions on repatriation, and some threat to profitability if it is seen to be too high.[54] The drug industry is especially vulnerable to threats because of its social importance, especially in less-developed countries, but it is also exceptionally profitable and offers exceptional facilities to use this channel, because intra-firm trade is quite large and chemical prices very difficult to check.

The Roche case in the UK, offers a clear illustration of the possibilities. This firm has always declared very low profits in England, generally below 5 per cent of capital employed. Yet the Monopolies Commission found, on very careful and conservative estimates, that its real profitability was *over 70* per cent of capital employed (£ 25 million) for the period 1966-72, and declared profits comprised only 12 per cent of this total.[55] The Sainsbury Committee also remarked (paragraph 301) on the possible use of transfer-prices by foreign firms,[56] *no* doubt the profitability of the firms as reported would have been much higher if such prices could have been checked.[57]

This concludes our survey of the main characteristics of the pharmaceutical industry in the developed world; let us now sum up its main social costs as seen from the above discussion.

Social Costs of the Industry

The social costs of the pharmaceutical industry may be defined very broadly as the costs of providing its products over and above the costs of the next best alternative. The alternative posited here, for illustrative purposes, is a completely socially-owned industry, with publicly financed research and a central non-competitive information service, and earning acceptable (whatever that may be for public services) or zero profits.[58] It would be foolish to attempt to put figures on any such estimate; a mere indication of the factors involved will have to suffice.

The costs of the present structure exceed the costs of the alternative in the following respects:

(i) The same amount of useful *research and development* results could probably be achieved at a much lower cost; the industry wastes a lot of money at present in imitative and misdirected R and D, in buying up international patents, in inefficient concentration, and in unnecessary litigation.[59]

(ii) There is even greater wastage involved in the *promotion activities* of pharmaceutical firms: these involve the creation of monopoly privilege which permits enormous and unjustified price differentials, the confusion of necessary market information, the wastage of doctors' time in meeting representatives, and the denigration of cheaper products which prevents effective competition.[60]

(iii) The level of *profits* is much higher than private capital earns elsewhere in the economy, and cannot be justified by the existence of any special degree of risk.[61]

These costs are borne either directly by the patient or indirectly by the taxpayer. In the first case, where medicines are privately purchased, the hardship created is much greater than in the second — because many ill people (probably disproportionately more than income distribution figures would indicate) are poor, and must either divert resources from other necessary uses or

must do without the medicines altogether. In the second case, though everyone is able to receive medication, it is possible that the State allocates a certain total sum to social expenditure, and a high medical bill diverts resources from other social activities.

(To be concluded)

Notes

[The author is grateful to a number of people who discussed an earlier draft of this paper; I would, in particular, like to thank Michael Ashfield, Angus Hone, Deepak Nayyar, Edith Penrose, Frances Stewart and Raymond Vernon for comments and criticisms. I retain full responsibility for the views expressed here.]

1 See the survey by OECD, 1969.

2 Appendix 5, Monopolies Commission, 1972. Of the *first 10 firms* by size of drug sales, 3 were Swiss, 1 German and 6 American. The 4 British firms were considerably smaller, and their combined drug sales came to only about one-third of the sales of the Swiss firms.

3 The exact number of pharmaceutical firms and value of their production is not known for the US, but estimates by Schifrin, 1967, and Walker, 1971, put the figures in the broad range mentioned above.

4 For a summary of this Committee's findings, see Kefauver, 1966.

5 OECD, 1969, p 49. The report by NEDO, 1972, makes a similar point.

6 See OECD, p 69, for a breakdown of different products in 5 European countries: of the 13 groups, 'other' accounts for 33-44 per cent of the total.

7 Schifrin, 1967.

8 *Ibid.*

9 *Financial Times*, 1973. This estimate is given by the firm itself, and may, in view of the pressures put on Roche in several countries, be highly conservative.

10 Schifrin, 1967. The Sainsbury Committee notes that 'fundamental' research accounted for 57 per cent of total R and D expenditures in the UK in 1963-65, though it expresses grave reservations about the definition of the term as used by the firms. The comparable US figure is 17 per cent, which seems more realistic (see Walker).

11 *Trade and Industry*, 1974. The figure is for 'Pharmaceuticals and Toilet Preparations'; in terms of ranking, this industry came fourth for R and D as a percentage of turnover and fifth for R and D as a percentage of net output and value added.

12 Wortzel, 1971, Table 5. Note that the figures for the two countries are stated in their respective currencies.

13 *Ibid.* See also the OECD study for a comparative description of R and D in various countries.

14 OECD and Sainsbury Committee.

15 *Financial Times*, 1974a.

16 Walker, 1971, p 128.

17 *Comanor*, 1965, and *Monopolies* Commission, 1972, Appendix 6.

18 Schifrin, 1967, quotes an official US publication to the effect that of the total number of new products (5,386) introduced in 1949-63, most were duplicates of existing products or new compounds of existing products; only 618 (11 per cent) contained new chemical entities not previously known. *The Economist*, 1974, points out that of 1,500 patents filed in 1972, only 45 were 'genuine new drugs' and 150 were 'major modifications'; the rest were purely imitative. To some extent, therefore, R and D by drug firms consists simply of 'market research', scouting the *industry for copiable products.*

19 Cain, 1967. Private research is defined to include research undertaken at the firms' cost at universities.

20 *Ibid.* In some cases the 'skills' of the Medical Research Council are hired to private firms and joint research projects are becoming *more common*; as with research output, such co-operation rebounds mainly to the benefit of the firms.

21 For a brief survey of patent laws in 34 countries, see UN, 1964; for a defence of patents as a stimulant to pharmaceutical innovation see Cooper, 1967, and for critiques see Schifrin, 1967, Scherer, 1971, Johnson, 1970, and Steele, 1964. The effect of patents on less-developed countries is discussed later.

22 Process rather than product patents are supposed to stimulate the research for more efficient ways of producing given products rather than simply to imitate existing products.

23 See Steele, 1962, and Scherer, 1971. Unfortunately no figures are available on the legal expenses of drug firms.

24 *The Economist*, 1974. The charge made that a large number of patents are bought in less-developed countries and left unused is considered later.

25 Nearly all countries, with a major exception of the US, have provisions for compulsory licensing after a few years of granting patent protection in order to stimulate competition. The Roche case (Monopolies Commission, 1973) illustrates the limited effectiveness of this provision. It is worth noting, however, that the US Supreme Court does occasionally grant compulsory licences; it recently forced ICI and Glaxo to give a compulsory and free, unrestricted licence for an antibiotic (*Financial Times*, 1974b). It remains to be seen how far this constitutes a basic change in policy towards patenting. On various proposals for reform, see Scherer, 1971.

26 *See Kefauver, 1966, Steele, 1962* and Schifrin, 1967. The most thorough discussion of this topic is in Walker, 1971. In 1967 the industry accounted for the highest single share (17 per cent) of advertising of the total for 27 US industries, its sales accounted for less than 5 per cent in that year. See Wilder, 1974.

27 OECD, 1969, and Sainsbury Committee. It is possible that a part of the expenditures classified under 'administration' are in fact on marketing; even the reported level of promotion expenditures have, however, been severely criticised by the Sainsbury Committee, which concludes (p 71) that pharmaceutical manufacturers have in their sales promotion efforts failed to measure up to the 'appropriate responsibility'. The Monopolies Commission (1973) shows a steadily rising cost of promotion as percentage of sales, from 13.9 per cent in 1965 to 14.8 per cent in 1970 (p 40).

28 Walker, 1971, (p 32) estimates that of the total of 696 drugs in use in the US in 1961, 377 (58 per cent) were produced by single firms only; of these, 293 (78 per cent of 277) were marketed under brand names by the 33 large firms. Of the 588 drugs marketed by large firms, 450 (77 per cent) were under brand names and only 138 under generic names; of the 384 drugs marketed by small firms, 227 (59 per cent) were under generic and the rest under brand names. In many countries prescriptions using brand names cannot legally be substituted by the pharmacist for cheaper generic products.

29 This state of affairs is also the result partly of inadequate teaching of clinical pharmacology in medical schools and partly of apathy on the part of the doctors who do not take the trouble to read medical journals or other serious literature. The only guide to the effectiveness and cost of drugs in the UK, Prop List, was stopped three years ago by the Department of Health, allegedly on grounds of economy, but perhaps under pressure from the drug industry. See *New Scientist* and *Guardian* 1974.

30 See Monopolies Commission, 1973, p 40, for a breakdown of sales promotion expenditure by size of firms.

31 Steele, 1962. Charges have been levelled recently in the UK that the industry's promotion methods often lead to over-prescribing and mis-prescribing by doctors. Gould in the *New Scientist*, 1974, concludes after a survey of the evidence that "There is thus no existing body in Britain with the responsibility for acquiring the information needed for the intelligent handling of medicines" (p 471). Raphael in *The Guardian* makes a similar point.

32 *US Senate, part 5, p 1,745, and* Steele, 1964.

33 *The Times*, 1973, Librium prices in India are discussed below.

34 *The Financial Times*, 1973, 1974. Roche is now under investigation in West Germany, Sweden, Australia, the US, Holland and the EEC Secretariat for its pricing policies.

35 *Monopolies Commission*, 1973. DDSA advanced a number of reasons why Roche had advantages in marketing from its sheer size and tactics.

36 Cooper, 1967. A report in the *Sunday Times*, 1973, compared the prices of some leading drugs in the UK with the comparable 'free market' price (from non-patent observing countries like Italy and Finland) and found, for instance, that Eaton (US) was charging the NHS *102 times* the alternative price for Nitrofuraitoin, ICI (UK) was charging *60 times* higher for Propanolol, and Smith Kline (US) was charging *145 times* higher for Trifluoroperazine. A comparison of the cost of 4 leading drugs in the UK (Aldomet, Penbritin, Intal and Indocid) to the NHS (total US $71.3m, year unspecified) with their free market cost ($18.5m) shows that the NHS could have obtained these drugs for about 25 per cent of their actual cost. These figures are computed from the *Sunday Times* report.

37 See, for instance, Walker, 1971, pp 84-7. Not only are representatives briefed to play down all unfavourable aspects, a great deal of money is spent on financing clinical studies and buying 'testimonials' which are misleading and sometimes bogus, and serve only to promote sales. Walker notes how many of the questionable tactics of selling toothpaste or household medicines, with the backing of spurious "doctors' advice", are also used in drug advertising.

38 US Senate Hearings, Part 13, 1969, p 5417.

39 These findings are reported in the *New Scientist*, 1974, p 491.

40 On the defects in the present system of official scrutiny and subsequent mis-prescribing by doctors, see *New Scientist*, 1974. Such is the "general ignorance about medicines [that] there must be official control over advertisements and other techniques for promoting drugs sales, since doctors and patients are normally in no position to judge the validity of claims made by the manufacturer" (p 471).

41 *The Guardian*, May 14, 1974, page 1. The accusation was made by Labour MPs dealing with health problems.

42 Steele, 1962.

43 *Ibid.*

44 The Sainsbury Committee, whose recommendations were largely unimplemented, suggested strict control over promotion and a gradual official takeover of the information function from private firms. Various American authors, cited above, have recommended the abolition of brand names and alternative means of providing information; the bill to be introduced by Senator Kennedy will set up a centre to study, among other things, the possibility of using *independent* representatives to keep doctors informed.

45 The political implications, though fascinating, are difficult to analyse for an outsider; it is worth noting that a forthcoming book by R W Lang, "The Politics of Drugs: A Comparative Study of the British and Canadian Pharmaceutical Industries, 1930-1973", (D C Heath, Ltd), may cast light on just this. According to the publisher's advance notice, the author, Director of the Legislation Department of the Canadian Labour Congress, discusses "why British manufacturers were successful in resisting the Labour government's legislative programme to reduce costs".

46 See Parker and Kelly, 1968, Sainsbury Committee, 1967, Schifrin, 1967, Smith, 1972; and Monopolies Commission, 1972 (Appendix 14).

47 NEDO, 1972, p 30. This report notes the higher profitability of the larger firms as compared to smaller ones in the industry.

48 *The Times 1000*. The profits earned are on all the activities of the firms, not only drugs.

49 Sainsbury Committee, p 110.

50 The latest figures, reported in the business section of *The Guardian* (June 11, 1974, p 17), show that "Profitability is *considerably higher for drugs than most other manufacturing industries* even though the actual level has been falling. The average return on capital is still 18 per cent . . ." (italics added).

51 Parker and Kelly, 1968, conducted a comprehensive econometric test of the causes of abnormal profits in the drug industry and concluded "the high profit experience of the drug industry is related only minimally to risk and uncertainty in a causal way . . . *[it is] more closely* associated with high barriers to entry of new competition" (p 165).

52 Schifrin, 1967.

53 For instance, by the Kefauver Committee, which found that the actual cost of goods sold was less than one-third the value of sales for the 22 largest drug firms in the US.

54 See Lall, 1973.

55 Monopolies Commission, 1973, pp 45-9.

56 See Table 7 of Appendix 1 of the report.

57 One estimate of transfer-pricing profits is £ 400 million per annum as a whole, and £ 35 million for France. See *The Economist*, 1974.

58 The alternative of restoring competition in some form, by breaking up the large firms into small private firms, is not considered as efficient as the alternative of a socially-owned industry because it would not prevent either a misdirection of R and D expenditure or costly and misleading advertising practices; in the long run, therefore, it would be impossible to prevent a re-emergence of the present situation.

59 This assertion begs a number of questions about the operation of publicly-financed R and D institutions — their efficiency, their need to buy international patents, their size in relation to the 'optimum' scale — which we cannot enter into here in detail. The experience of public research is very encouraging, as we have argued previously, and it certainly cuts out imitative patenting; a public corporation could, if it wanted, buy foreign patents and sell licences, though this is not recommended below for LDCs; the size o fresearch establishments could of course be adjusted to any desirable scale, given the massive total R and D expenditure involved.

60 This particular feature could presumbaly be remedied within the present framework of ownership by stricter control over marketing and promotion and the abolition of brand names; however, a really efficient control system would in practice amount to a state selling service, not very different in this respect from our alternative.

61 As with marketing, an efficient State buying service could in theory ensure 'reasonable' profits for private firms, but the Voluntary Price Regulation Scheme in the UK has not been able to achieve this for the NHS, and it is difficult, for political reasons, to envisage comprehensive negotiation on prices and profits. However, any move in this direction should lead to a lowering of costs.

Kothari Sugars

KOTHARI SUGARS AND CHEMICALS has produced good results for the year ended June 30, 1974. The gross profit of the company was Rs 87.38 lakhs as against Rs 45.58 lakhs for the ten-month period of the previous year. After providing Rs 43.16 lakhs (Rs 17.60 lakhs) for depreciation, Rs 34.47 lakhs (Rs 10.80 lakhs) for development rebate reserve and other adjustments, out of the balance amount of Rs 21.18 lakhs, a dividend of 9 per cent on equity shares aggregating to Rs 14.40 lakhs has been recommended by the Directors. The Directors could have recommended a higher dividend but for the restrictions imposed by the government on the distribution of dividend. The company's new factory at Siruguppa was erected and commissioned in a record time of 18 months and crushed 1.08 lakh tonnes of cane and produced 97,800 quintals of sugar. The total crushing at the Kattur and Siruguppa factories was of the order of 4.76 lakh tonnes as against 2.25 lakh tonnes in the previous season, yielding a total quantity of 4.04 lakh quintals of sugar as against 1.97 lakh quintals in the previous season. The average recovery at Kattur was 8.33 per cent and at Siruguppa 9.13 per cent. The company has received an industrial licence for increasing its crushing capacity at Kattur to 4,000 tonnes per day from the existing 1,500 tonnes per day. An application has been made for increasing the crushing capacity at Siruguppa to 4,000 tonnes per day from the present 1,500 tonnes per day. It is estimated that during 1974-75, the crushing will be of the order of 5.88 lakh tonnes, producing about 5.28 lakh quintals of sugar.

Self-Identity among Scheduled Castes

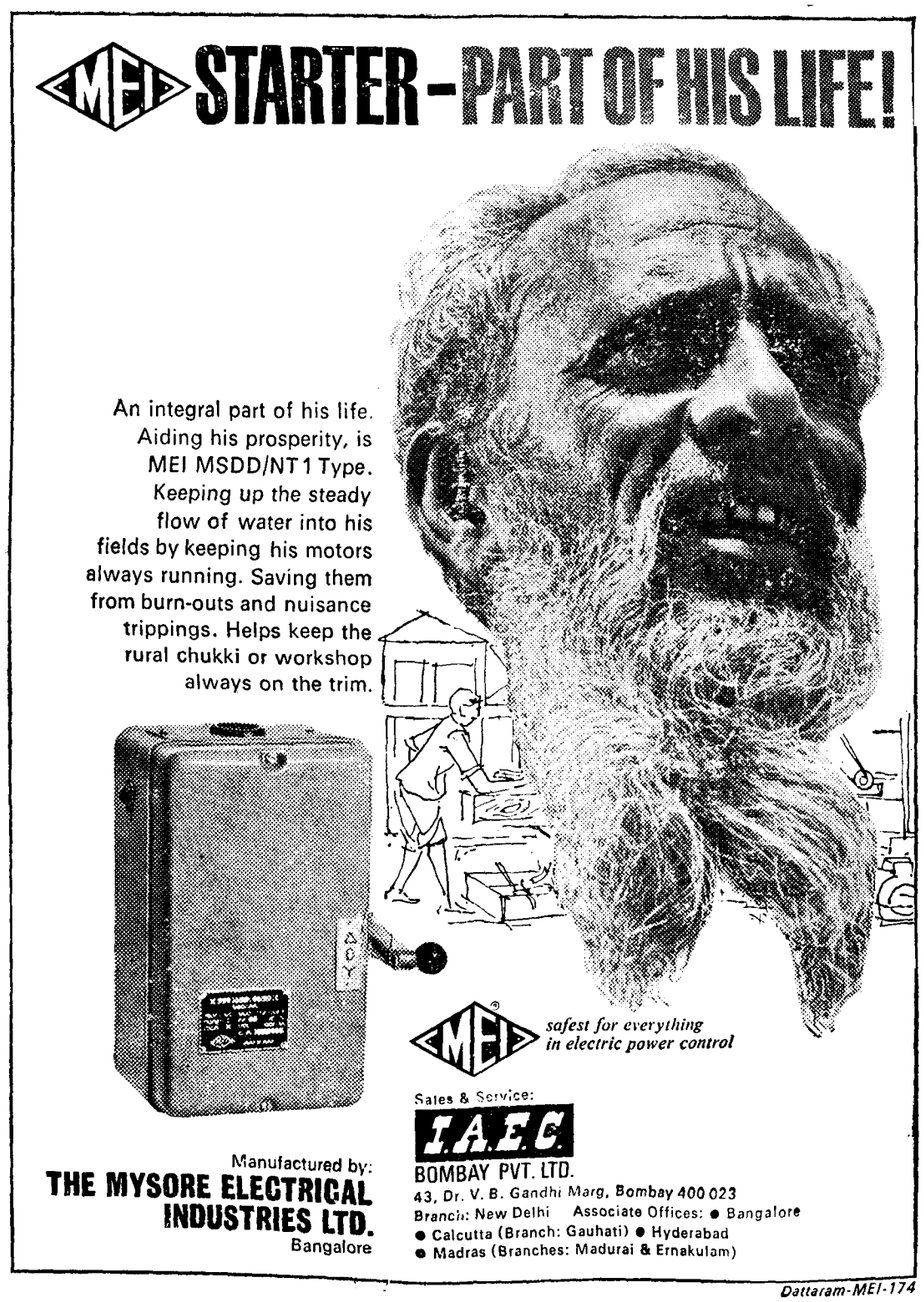
A Study of Andhra

Uma Ramaswamy

In terms of social and economic status there are clear differences among the Scheduled Castes. There is a well-recognised hierarchy among them. No all of them are untouchable; even among those that are, there are degrees of pollution. There are also religious cleavages among the Scheduled Castes.

Despite these differences, however, the Scheduled Castes have been ascribed a clear identity by society and they themselves are growing aware of a shared status. This paper examines some aspects of the historical process by which the Scheduled Castes in Andhra Pradesh — and in particular in the coastal districts of the state — have gained a sense of shared identity.

THE Scheduled Castes are a disparate category in terms of social and economic status. There is a clearly recognised hierarchy among them too, with some not even accepting water from others. Not all of them are untouchable. Even among those who are, there are degrees of pollution. Although associated in popular thinking with polluting occupations, the bulk of them are engaged in a number of secular occupations, most prominently agriculture. There are also religious cleavages among them, even excluding those who have been converted to Christianity. Yet, the Scheduled Castes have been ascribed a clear identity by society, and they themselves are growing aware of a *shared* status. At first sight it would appear that, the identity these castes have is in opposition to that of those who are above them, and that it results from their low socio-economic position — in spite of the internal differentiation. This paper attempts to examine some aspects of the historical process by which the Scheduled Castes in Andhra Pradesh — and in particular the coastal districts, generally referred to as 'Circars' — have gained a sense of shared identity.



The first attempt to impute an identity to these people arose from the need to extend educational facilities to the lowest rungs of society. Certain sections of society had to be delimited in order to be treated preferentially. A number of terms, such as Panchama, Harijan, Exterior Castes, etc, came to be used to refer to these people, but the one that gained the greatest currency was 'Depressed Classes'. The most significant act of the British, which set the trend of subsequent policy, was the denotation of castes rather than individuals as depressed. Nevertheless, the category 'Depressed Classes' was an amorphous one — often including low-ranking castes other than untouchables, besides the tribals who lived alongside the Hindu population. Interestingly, as late as in 1930, the Indian Statutory Commission defined Depressed Classes in as ambiguous a fashion as before: "In origin, these castes seem to be partly 'functional', comprising those who followed occupations held to be unclean or degrading, such as scavenging or leather working, and partly 'tribal', i e, aboriginal tribes absorbed into Hindu fold and transformed into an impure caste."[1]

Even as the British were considering the extension of educational facilities to improve the lot of the lowest castes, Christian missions were actively proselytising them. The association of the Christian missionaries with the Telugu speaking people stretches back to the 15th century, when two Jesuit fathers and a brother worked their way to Chandragiri in Chittoor district. The missionaries were most active in some of the coastal districts, such as East and West Godavari, Guntur, and Krishna. In these districts, like elsewhere in the country, the people who were most amenable to conversion were those who had the least to lose from leaving the existing order. The professed catholicity of Christianity proved attractive to people who were long subjugated by caste Hindus.

Two kinds of forces worked strongly in favour of their conversion. On the one hand, there were tangible benefits to be gained by way of education, medical help, and employment opportunities by their entry into the Christian fold. On the other, Christianity was an egalitarian religion in the formal sense. The notion of equality — and even more the idea of abandoning caste distinctions — were attractive to the converts, especially to the untouchables who were only too willing to give up their stigmatised identity. Gazetteers cite instances of individuals who entered missionary schools in the hope of gaining Western education and got converted to the Christian faith. Fishman, a missionary who did a study of Madigas in Kurnool, shows how conversion was induced through the offer of material gains. The Madigas of Cumbum taluq were converted *en masse* when one J E Clough, who took up construction work on the Buckingham Canal, offered employment to the untouchables in sharp contrast to Hindu contractors who discriminated against them. The number of converts to Christianity in this taluq increased fourfold within one year.[2]

While the missionaries made use of the stigma of untouchability to proselytise these castes, they did nothing to whittle down caste distinctions within the church itself. Rather, they exploited caste cleavages in their efforts at conversion. Reddy, for instance, observes that the missions tended to exploit the traditional antagonism between the Malas and Madigas. The Mala converts at Malkapuram in Kurnool district were by and large Roman Catholics while the Madigas were Baptists. He writes. "In places where two missions are at work, each comes to claim the allegiance of one particular community, evoking the aversion of the other".[3] Fishman's data also support this conclusion.[4] Most of the converts in his area were Madigas. Typically the converts have carried over caste distinctions to Christianity. As a consequence, caste distinctions have become an integral feature of the Christian community. Yeatts writes, "The Christian communities can rarely free themselves from caste differences and prejudices ... There are wide variations in the degree to which these prejudices exist along with alleged Christianity. They are stronger among Roman Catholics than Protestants, possibly because the former have a larger proportion of adherants of higher caste origin; they are worse in the south than in the north or west and rural areas than in towns."[5]

Conversion to Christianity helped the untouchables to register significant gains in the fields of education and employ-

ment. The Indian Statutory Commission observes: "The Indian Christians stand high in the table of literacy. More than one in five of them have returned as able to satisfy the test — a remarkable result, considering that so many of them are drawn from the lowest strata of Hindu society."[6] Christian converts also did better in the matter of securing employment. Between 1930 and 1940, the Christians in Madras presidency secured on an average between 7 and 8 per cent of the jobs in the various categories of government service as against less than one-half of one per cent by the non-Christian Scheduled Castes.[7] But, as *Fishman observes, the* efforts of the missionaries to uplift these castes solidified outcaste community feeling among them and furthered the development of a *new group* loyalty.[8]

The coastal districts of Andhra, which witnessed missionary activity, were also exposed to the influence of Brahmo Samaj, beginning with the end of the 19th century. The Brahmo Samaj in Andhra was more a reform movement than a religious faith, and received its impetus from the rapid conversion of caste Hindus to Christianity. Expectedly, Brahmoism gained the greatest ground in the coastal districts which witnessed hectic missionary activity.

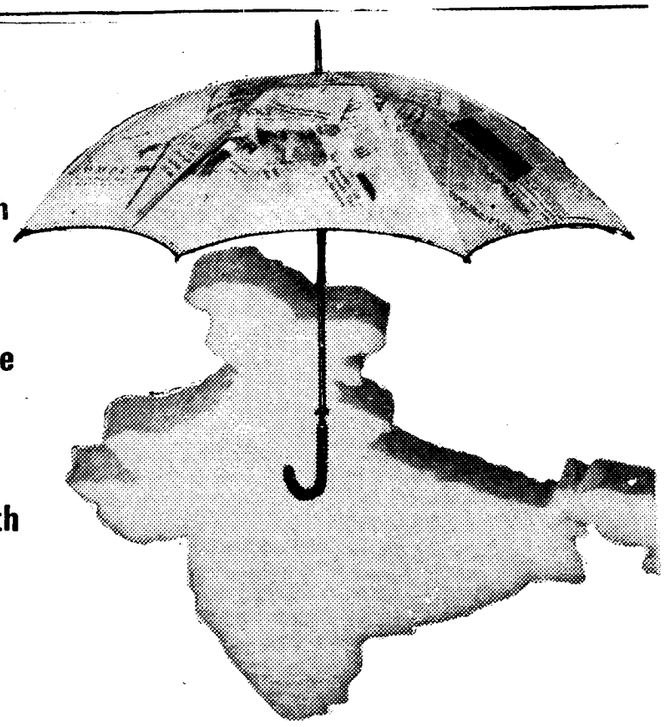
Although Christianity eventually appealed more to the untouchables, its earliest association was with the upper castes. The missionaries went so far as to imitate upper caste style of life and were even referred to as 'Romapuri Sanyasis'.[9] In Masulipatam, Kakinada, and Guntur, several prominent members from the upper castes, including Brahmins, entered the Christian fold. Kaleswara Rao cites an instance where 12 Brahmin youths in Kakinada converted to Christianity within a short span of time.[10] Alarmed by the rapidity of such conversions, several Brahmo leaders took upon themselves the task of countervailing Christian influence.

Pattabhi Sitaramayya, the well known Congress leader, notes that Brahmoism offered an effective alternative to Christianity. Sitaramayya writes, "Reverend Mr Eddy [who was appointed to investigate the decline in conversions in Masulipatam] came to the conclusion that the heterodoxy which was widely prevalent in the town did not mature into conversions because of the halfway house between orthodoxy and conversions to Christianity through Brahmoism taught and practised by Sri R Venkataratnam Naidu.... He was truly a halfway house because the orthodox forces in the town who had started a society called the Hindu Matha Bala Samaj, looked upon Brahmoism as inimical to and subversive of the old conservative faith, and the Christian missionaries were detesting this Brahmo faith which, while preaching social reform and a certain measure of heterodoxy, successfully stopped further progress that might have resulted in outright conversion to Christianity."[11] Consequent upon Brahmo activity there was a steep fall in conversions to Christianity. For instance, in Masulipatam, which was the centre of missionary activity, there were only two conversions between 1890 and 1895.

Apart from resisting Christian activity, Brahmoism was also concerned with uplifting the untouchables. Brahmo leaders, drawn mainly from among Brahmins, were active in providing education to these people and in inculcating a social consciousness among them. Venkataratnam Naidu went so far as to adopt untouchable girls and get them married to high caste boys.[12] Other prominent Brahmo leaders of this time were K V Pantulu, Unnavalakshminarayana, Ramjee Rao, and Chilakamarthi Lakshminarasimham. Several of them were active in the Congress and Justice parties. The few, who were out of party politics, had important political connections which helped their reform activity. At a time when orthodox Hindus were rationalising the condition of the untouchables, these leaders braved public opinion to help these people out of their wretched condition. Untouchable children were provided free education and hostel facilities. The best known of these institutions were the school and orphanage at Pithapuram and the college at Kakinada.

Most of the Brahmos were prominent literary figures. The satirical works of Veeresalingam Pantulu, hitting out at orthodox Hindu practices such as untouchability, gained tremendous popularity. But the greatest impact was had by "Malapalle" written by Unnavalakshminarayana, a Brahmin Brahmo leader. This book portrays the trials and tribulations of the untouchable Malas. The publication of this book led to such an outcry that the British government, fearing serious upheavals, banned it. Its author was excommunicated by the Brahmin community. It was only in 1926, at the instance of Kaleswara Rao, a well known Congress leader and champion of untouchables, that the ban on the book was lifted.[13]

Several Congress leaders, in the twenties and thirties, were sympathetic to Brahmo ideals. They were active in the Library Movement which was sweeping Andhra in the twenties. One of the aims of this was to win admission for the untouchables into public libraries. They succeeded in this in the teeth of opposition from orthodox Hindus, who threatened to boycott the libraries if Harijans were admitted to them. The Brahmos were instrumental in grooming several of the educated Harijan leaders outside the Christian fold. Many of them were, in fact, educated in schools run by Brahmos. By the 1920s, when Gandhiji took up their cause at the national level, there was widespread awareness of their condition among the untouchables in Andhra, and several untouchable leaders had already come to the fore.



Brahmos were different from the Christian missionaries, in the sense that, rather than convert the untouchables to a different faith they sought to integrate them with the Hindu community. This was the burden of the literary works of Brahmo leaders and of efforts to get untouchable girls married to members of high castes. What Brahmoism, however, succeeded in doing was to impart a social consciousness which nevertheless fostered a sense of identity among the untouchables, instead of integrating them with the wider society. For instance, many of the schools started by them were exclusively for the untouchables, and were recognised as such by the wider society. The school started by Ramjee Rao at Masulipatam restricted admission to Malas and Madigas. Similarly, Unnavalakshminarayana started a college at Guntur for Harijans and Christians who, in any case, were converted Harijans. Brahmo influence in Andhra was shortlived and had tapered off by the late thirties.

The Malas and Madigas, who constitute three-fourths of the Scheduled Caste population in the state, pursued Brahmo attempts at emancipating them by sanskritising their life-style and ritual. Their attempt conformed to the pattern described by Srinivas: "The method of making a claim was more or less stereotyped. The occupation, style of life, or name of the caste group, would be mentioned in support of the claim. The similarity of caste name to the historical name of a respectable caste or tribe would be pointed out; the myth regarding the origin of the caste would be described, and its linkage with an epic hero or divine or semi-divine figure, would be stressed."[14]

A Panchama association was organised around 1919, with the blessings of

Reflecting the changing times

Time was, when to reach an all-India audience, advertisers had to use several newspapers, since there was no single national newspaper.

All that has changed with

THE ECONOMIC TIMES

ONLY THE ECONOMIC TIMES GIVES ALL-INDIA COVERAGE, AND THAT TOO OF THE PEOPLE AT THE TOP.

While ordinary dailies have only regional or localised circulation, only The Economic Times circulates all over India, offering first class coverage of people in the high income groups.

Readers of The Economic Times are people at the top-Directors, Executives, Managers, Professionals, Businessmen-the decision-makers. You can reach them only through THE ECONOMIC TIMES—India's leading economic and social affairs journal.

GET MORE IMPACT WITH THE FRONT PAGE SOLUS POSITION— 20 cms x 3 cols.
And when you are talking to the people at the top, get maximum attention with the front page solus. It costs only 50% more, but gets you loads of extra exposure and prestige.

Put your advertising message where the money is—

THE ECONOMIC TIMES
—the only newspaper that gives you all-India coverage

Congress and Brahmo leaders. Many of the leaders of the association were former students of the separate schools started by Brahmos. The association impressed on the untouchables the value of cleanliness, unity and teetotalism. A congregation of the community was organised by the association at Vijayawada at the time of Montagu's visit, under the presidency of a well known Harijan leader from Hyderabad. The congregation replaced personal names, such as Ramigadu and Subbigadu, which smacked of an untouchable origin with sanskritic names, such as Ramayya and Subbayya. It was resolved that the Panchamas should henceforth be referred to as Adi Andhras, and that they should be granted separate representation in the Madras legislature.

These demands were placed before Montagu. Two of the 10 seats reserved for the untouchables in the Madras legislature, under the Act of 1919, went to the Malas and Madigas. Encouraged by their leaders, the untouchables started their own temples and took to reading the sacred scriptures. They also organised resistance to the mass conversion of untouchables to Christianity.[15]

Another important sanskritising activity was to claim a respectable nomenclature through the medium of the census. Till the 1921 census, the Malas and Madigas were the only two castes to be listed as 'Depressed Classes' in the Telugu speaking areas of Madras presidency. But, by 1931, the list included a number of castes under the title 'Exterior Castes'. The Table gives the list of these castes and their population. Most of these castes claiming impressive titles such as Matangi, Arunthathi, and Godari, were none other than the offshoots of the Malas and Madigas. By claiming these titles they were seeking to disown their low status and, at the same time, to avail of the privileges that were being provided to the untouchables independently of the Malas and Madigas.

Jambavulu, according to Thurston, "claim to be descended from Jambu or Adi Jambavalu, who is perhaps the Jambuvan of the Ramayana."[16] Matangi is a "synonym of Madiga. The Madigas sometimes call themselves Matangi Makkalu, or children of Matangi, who is their favourite goddess."[17] Godari, once again, is "... a synonym of Madiga, and not a separate caste."[18] The mushrooming of these castes, along with conversion to Christianity, caused a decline in the population of Malas and Madigas in the twenties and thirties. Discussing the conspicuous variation in the population composition of the Depressed Classes Yeatts writes: "... Madigas have diminished apparently 16 per cent. More pronounced decline, however, is apparent in their hereditary enemies, the Malas, who have shed a million ... The Andhra section [of Adi Andhras], now two-thirds million strong, had no returns in 1921 ..."[19] Commenting on the claims of these castes, Yeatts writes: "There is something infinitely pathetic in the vain idea that a change of name can reverse the stigma of centuries; yet the community would apparently retort to Juliet that all lies in a name. It is a mistake to encourage terms which obscure real social units. That so ugly and clumsy a term as Adi-Andhra should come to obliterate such real and lively distinctions as Mala and Madiga is hardly to the good."[20]

The policy of protective discrimination, developed in stages since the Woods Despatch of 1854, has had implications similar to those of religious and social reform for the relation between the Scheduled Castes and caste Hindus. This principle was first applied in the field of education. The lower castes had been excluded from higher education till 1854 in accordance with the Downward Filtration Theory which advocated higher education to the higher castes alone.

The Board of Directors of Education observed: "The improvements in education, however, which most effectively contribute to elevate the moral and intellectual condition of the people are those which concern the education of higher classes, of persons possessing leisure and natural influence over the minds of their countrymen. By raising the standard of education among these classes you would eventually produce a much greater and beneficial change in the ideas and feelings of the community than you can hope to produce by acting directly on the more numerous class."[21] There were also problems in throwing open the government schools to the Scheduled Castes. The Board of Directors of Education felt that "... until the prejudices of the people in this respect were overcome, what was intended to enlighten the great mass of people might otherwise, from their prejudice, degenerate into a boon to the lowest classes alone."[22] The Woods Despatch of 1854 threw open education to all classes and the Despatch of 1857 discouraged the idea of separate schools for the lower castes.

However, the opposition of the high castes to the admission of students from the Depressed Classes in ordinary schools was very strong in the Madras presidency. The government considered its earlier decision and the Education Commission Report of 1883 recommended the establishment of separate schools wherever necessary. In 1893, the Madras government sanctioned a series of proposals, which were widely hailed as the Magna Carta of Panchama education.[23] Among the measures recommended by it, were higher stipends for Panchama students and teacher trainees, grant of *poromboke* lands for Panchama schools, and the opening of special schools by local boards and municipalities for the Panchamas in all large Panchama villages.

The next important step was in 1921, when the Madras government appointed a commissioner of labour to take charge of the education of the Depressed Classes. Among the important measures adopted at this time were the admission of students from these castes to all public-managed schools and stoppage of grants to private schools which excluded them, the creation of separate schools and hostels for them, and the financial assistance through fellowships and remission of fees. Although some of the later proposals sought to integrate students from the different castes, the emphasis was clearly on the creation of separate facilities for the untouchables. M C Rajah, a prominent untouchable leader in the Madras presidency, advocate a *via media* in a memorandum submitted to

the Statutory Commission. He argued, "Separate schools for the Depressed Classes should not be the rule but should only be started in places where boys of the Depressed Classes are not likely to be treated with that regard for their welfare which they have a right to expect at least from the teachers."[24]

The reservation of jobs for the Scheduled Castes in government service came as an incidental benefit from the efforts of the non-Brahmins. The Communal GO introduced in the Madras Legislative Assembly in 1922, allotting government jobs on a communal basis, included the untouchables in the category Backward Classes — which itself was part of a residual category. The residual category was assigned one out of every 12 posts. The Communal GO exposed the stepmotherly treatment of the Justice party towards the untouchables, and aroused the indignation of untouchable leaders. M C Rajah, the president of the Depressed Classes Association, broke off from the Justice party. The appointments made under the Communal GO benefited the Scheduled Castes the least. Even the Indian Christians — including a large number of converts from among the untouchables — had bagged around 8 per cent of the posts in all categories between 1930 and 1940. The Scheduled Castes, in contrast, could corner less than one-half of one per cent of the posts. By 1947, when the Communal GO was revised, the untouchables — now categorised as Harijans — managed to fare better, having been allotted 2 out of every 14 posts.[25] Even though the Justice party did little to advance the cause of the untouchables in the matter of employment, they picked up the notion of self-respect from the non-Brahmin leaders. The Justice party leaders in fact exhorted the untouchables to cultivate self-respect. K V Reddi Nayudu once remarked: "Remember this. You can never rise in the estimation of the world until you exercise a sense of self-respect. Then of course, there are other things. You must insist upon getting free education for your children up to a certain standard, proper wages, and being treated freely and squarely by those who might employ you. If these things are properly attended to, I am certain that in a very short time your position will be much better than it is now."[26]

Political representation is another major area in which the Scheduled Castes have received separate treatment since 1919. The implications of this policy for the relation between the Scheduled Castes and caste Hindus have been the subject of national debate. The arguments on both sides of the question are too well known to bear repetition. Briefly, the cleavage has been between those who argue that the Scheduled Castes would have no chance of coming up unless treated preferentially and those who hold that the significant thing is a change of heart among the upper castes.

It would be simplistic to suggest that missionary activity, Brahmo social reform, or protective legislation, unequivocally enhanced the seclusion of the Scheduled Castes from the rest of the population. Christianity — at least in theory — denied caste distinctions. Brahmo reformers sought for the Scheduled Castes a respectable place in Hindu society. The objective of protective legislation, similarly, has been to pave the way for equality of status among the different castes.

The assumption has all along been that the polluting condition and low secular status of the Scheduled Castes reinforce their present condition. Apart from the laws banning the practice of untouchability — which are far ahead of social reality and may never be fully implemented — the primary targets of attack have been certain factors contributing to their *secular* condition. The expectation has been that a higher secular status would eventually raise their ritual status. It is too early to say whether this expectation has been borne out, and it is debatable whether the latter would at all follow the former. Gandhiji firmly believed that only a change of heart among the upper castes can rid the lowest castes of their stigma. The long run aside, the provision of scholarships, reservation of seats in educational institutions and legislatures, and special allocation of jobs, have served to reinforce the separate identity of these castes rather than integrate them with the rest of the society.

American Tool Inc. wanted HMT to put on weight

The HMT Pre-selector Centre Lathe A24UP is an efficient machine, preferred by customers in India.

It has many admirers abroad, too. Like American Tool Inc. of Cincinnatti.

Who thought it suitable to their production needs. Provided it was "beefed up"

Responding to their needs, HMT got together with American Tool Inc. and completely re-designed the Pre-selector Centre Lathe.

The result: a heavier machine incorporating strength where it was required; a compact head stock, a more rigid tail stock and more power.

This is yet another example of customers' active participation and co-operation resulting in more successful developments, improvements and modifications in machine tools.

And this kind of customer participation is necessary because nobody can judge an HMT machine tool better than an HMT customer. (After all, they work together — year after year!)

So, HMT talked to Sandvik Asia, MICO, Gajra Gears, TELCO, Indo-Nippon, ICF, Ideal Jawa, HAL, Krishna Engineering Works, Ashok Leyland, ITCI, and Wickman of UK.

The suggestions, advice and participation of both big and small-scale industries resulted in improving existing machines as also developing new ones.

This, in turn, resulted in HMT machine tools becoming even more effective and versatile. And also more acceptable to potential customers.

Yes, it certainly takes two to match skills to needs.

You and HMT.

That's the HMT way to self-reliance.

We make the machine tools. You help us make them better.

The world would be out of its element if India had not generated atomic thought

Today the world is in its element as it finds itself in the atomic age. But the discoveries of modern times echo the atomic theories of ancient India—theories that were brilliant explanations of the physical structure of the universe. An atomic theory was taught by Pakudha Kātyāyana an older contemporary of Buddha. Indian atomic thought thus originated before Democritus the great Greek philosopher—one of the founders of the atomic theory. In physics and other spheres Indian talents have enriched the world. We at L&T continue the tradition by enriching life through industrial development. The source of our energy is the vast reservoir of technical know-how generated over 35 years. It has spurred us on to manufacture equipment for India's nuclear power projects. The reactor vessel, fabricated for the first time in India, is an example. In order to foster the growth of nuclear power we have set up modern fabrication facilities; formed a specialist cell for handling design, fabrication, application of new techniques. We are a vast industrial complex designing, manufacturing installing plant and equipment for every vital industry. The secret of our success lies in the individual talents of over 10,000 people in our associate and subsidiary companies and our network of offices all over India.

Sticky Fingers

THE Congress party's technique for saying one thing in public and doing precisely the opposite can be seen to advantage once again in the current discussion in the party on the subject of reducing the influence of money in elections. The party leaders are apparently very much exercised over this issue, but the actions through which they have chosen to give expression to their concern have been strange indeed.

The first of these acts was the ordinance issued last month to nullify the Supreme Court's judgment unseating a Congress MP from Delhi. The Court had found that the expenditure incurred by the MP in question personally, taken together with that incurred on his behalf by the Congress party, far exceeded the limit set by the Representation of the People's Act, 1951. The government's ordinance came to the rescue of the unseated MP — as well as of a large number of other MPs whose elections would certainly have been set aside on the same grounds — by simply laying down that "notwithstanding any judgment or order or decision of any court", expenditure "incurred or authorised" in connection with the election of a candidate by "a political party or by any other association or body of persons or by any individual (other than the candidate or his election agent)" would be ignored in determining whether the candidate's election expenses are within the legally permissible limits.

This, rather curious, attempt to reduce the influence of money in elections by re-defining election expenditure is to be followed now by an even curiouser move. The government is reported to have decided to revoke the ban, imposed some years ago, on donations by companies to political parties. The subject was discussed by the political affairs committee of the Union Cabinet and by the Congress Parliamentary Party which met last Wednesday to consider changes in the electoral system to eliminate the influence of money power in elections. Speakers at the latter meeting, without exception, raged at the corrupting influence of money; yet all of them supported the move to scrap the ban on donations by companies to political parties. Some went even further. According to newspaper reports, one speaker, who has the reputation of being a radical among Congress MPs, actually suggested that companies should be allowed "income-tax rebate for contributions to political parties even upto 100 per cent"! In other words, companies must not only be allowed to contribute to the funds of political parties, they must be *induced* to do so. Indeed, what better way could there be of ridding the political process of the influence of money. (This may even be seen as a typical Congress twist to the idea that the election expenses of political parties should be financed out of contributions from the State, since a tax rebate would mean that a part of the donation by a company to a political party would in effect come from government revenues!)

The legal ban on company donation has not, it is true, materially affected the flow of funds from business and industry to lubricate the political system. The under-the-counter flow has continued, through the medium of intermediaries like selling agents. Political parties and politicians have thus secured a juicy cut out of the premiums commanded by goods in short supply like cement and paper. The sugar industry, as is well known, made its own considerable contribution to safeguarding democracy in UP during last year's elections there. Nor have companies had much difficulty in circumventing the legal ban on donations and openly making funds available to political parties. There is even now nothing to stop them from making handsome donations to institutions, set up as front organisations for precisely this purpose by political parties and politicians. They are also free to advertise in journals and souvenirs brought out by political parties. Few copies of these journals and souvenirs may see the light of day, but that does not stop many companies from spending more on such advertising than on advertising of the conventional kind. For instance, a textile company belonging to one of the large houses lavished Rs 12 lakhs on political 'advertising' last year.

To round off these efforts, the Prime Minister has now set up a nine-member committee to suggest electoral reforms and steps to eliminate the influence of money in elections. It need surprise no one that prominent among the members of the committee are some of those whose position in the Congress party rests solely on their role as contact men with industrialists and businessmen. It is a notice on what may be expected of the committee that, just a few days ago, one of the members of the committee had said at a meeting of the consultative committee of parliament attached to the Law Ministry that political parties should be left free to spend as much money on elections as they considered necessary.

Government's Finances

Mounting Deficit

MINISTERS in this country are able to give solemn assurances in Parliament and then quietly forget about them. One such assurance relates to the amount of deficit financing by the Centre in 1974-75. Faced with an apparently uncontrollable inflationary situation, the Union Finance Minister had repeatedly assured the country that the level of deficit financing in the current fiscal year would not exceed the budgeted figure of Rs 126 crores. In the supplementary budget there was a tacit admission that the deficit might go up to Rs 325 crores, despite a massive tax effort of Rs 720 crores and a cutback of Rs 200 crores in Plan and non-Plan expenditure. In early October a Finance Ministry spokesman had discounted reports that the Centre's deficit had risen to Rs 656 crores as on September 13 by referring to the level of net reserve Bank credit to the government which was said to be lower. It was also argued on behalf of the government that the Centre's budgetary position would improve from mid-October onward with the normal flow of funds from the states on account of repayment of Central loans and payment of interest.

The government's position on both these points was questionable. The deficit of Rs 656 crores as on September 13 referred to the concept of the budgetary deficit as used by the government itself. Deficit financing at the Centre is defined as the total of (i) increase in the outstandings of treasury bills and (ii) decrease in the government's cash balances. It was irrelevant, therefore, to refer to the figure of net Reserve Bank credit to the government. In any case, the figure of net Reserve Bank credit to government happened to be low in September only because a large part of the increase in outstanding treasury bills was then held by commercial banks and possibly state governments. This was, however, a seasonal and temporary phenomenon. Once the treasury bills got discounted with the Reserve Bank, the figure of net Reserve Bank credit to the government was bound to go up. On the question of the possibility of a striking improvement in the finances of the Central government after mid-October, it had been pointed out that against the flow of receipts from the states to the Centre there would be pressures for more funds from states which have been affected by droughts and floods.

In the event, the improvement in the Centre's finances expected by the Finance Ministry has not come about. At the same time, the figure of net Reserve Bank credit to the government has begun to pick up very sharply. Thus the Centre's deficit had touched Rs 954 crores on November 15. Treasury bills outstandings had increased by Rs 778 crores from Rs 4,384 crores at end-March to Rs 5,162 crores on November 15. Besides, the Centre had drawn down its balances to the tune of Rs 176 crores.

Net Reserve Bank credit to the government has also been rising. Upto November 1, the increase in net Reserve Bank credit to the government had worked out to Rs 393 crores, against Rs 816 crores during the corresponding period of the last fiscal year. However, by November 15, the figure had risen to Rs 635 crores (against Rs 846 crores last year), suggesting that treasury bills held by commercial banks and others were finding their way to the Reserve Bank through discounting and purchases. This is partly evident from the fact that the other banks' net credit to the government had come down from Rs 401 crores as on November 1 to Rs 367 crores as on November 15.

The expansionary impact of government borrowing is getting reflected in terms of money supply also. Upto November 1, money supply had grown by Rs 195 crores (or by 1.8 per cent) against Rs 581 crores (or 6.2 per cent) in the corresponding period last year. However, as on November 15, the increase in money supply stood at Rs 353 crores (or 3.3 per cent) against Rs 635 crores (or 6.7 per cent) last year.

With deficit financing already at Rs 954 crores i e, almost the same level as last year, Treasury Bills held outside the banking system will find their way to the Reserve Bank and swell the monetary expansion in the coming months. Despite the substantial budgetary support derived from fortuitous developments such as the spurt in sugar exports, the deficit this year is unlikely to be less than Rs 750 to Rs 800 crores.

Capital Market

Support for Strong

TRENDS in capital issues in the three years from 1971 to 1973 are discussed in an article in the latest issue of the Reserve Bank of India *Bulletin*. Capital issues are analysed security-wise, size-wise and industry-wise. Also analysed are issue of new and existing companies and for different purposes such as new projects, expansion/diversification/renovation, raising Indian participation, etc. The study further examines the cost of projects for which fresh share capital is being raised and the proposed sources of finance. The second part of the study, relating to the details of the amount offered to the public, underwriting by various agencies, public response and cost of raising capital is particularly interesting.

This study, together with the earlier ones in the series and other corroborative evidence, brings out certain unhealthy trends in the capital market, observed almost continuously since the beginning of the Plan holiday in 1966-67. First, the quantum of share capital, particularly equity capital, raised from the market has been low, even allowing for the stagnation in industrial investment in the private sector. This has been the result of easy availability of loan capital from the term-financing institutions at attractive rates of interest. Secondly, the concentration of share ownership appears to have increased over these years. This is reflected particularly in the sizeable increase in bonus issues, which was facilitated by the removal of the tax on bonus shares. Thirdly, assistance extended by the term-financing institutions in raising fresh capital from the market, particularly in the form of underwriting, has been weighted in favour of large companies. The Reserve Bank study makes a pointed reference to this. Lastly, companies have increased their patronage to brokers and financial companies in the form of larger underwriting commission and brokerage, as a result of which the average cost of issue of capital has risen sharply. Understandably, there has also occurred a proliferation of financial and investment companies.

During the five-year period 1961 to 1965, the average number of companies issuing capital was as high as 125 per year. The peak number was 160 in 1961 and 156 in 1962. In the next quinquennium (1966 to 1970), the average dropped to 89 companies and the peak was 97 in 1967. The peak levels reached in the earlier period were not surpassed even in 1972 and 1973 when there occurred some improvement in capital issues. The number of companies issuing capital was 78 in 1971, 104 in 1972 and 145 in 1973. In terms of the amount of capital issued, ordinary shares

averaged Rs 52.4 crores during 1961-65 and Rs 34.4 crores in the next five-year period. The peak level of ordinary shares issued was Rs 65.4 crores in 1964. This amount has not been equalled in the last decade. If the private corporate sector had experienced normal growth, the annual issue of equity capital should have been around Rs 100 crores now, whereas in fact it was only Rs 62.7 crores in 1973.

During the same period there has occurred an enormous increase in direct assistance by term-financing institutions from about Rs 108 crores in 1965-66 to Rs 253 crores in 1973-74. The amount of such assistance has been consistently rising since 1968-69, while the supporting share capital has not risen commensurately. For instance, in 1971 the equity capital raised was Rs 34.8 crores but there was an increase of 27 per cent or Rs 53 crores in disbursements under direct assistance by the term-financing institutions. Similarly, in 1973, equity capital raised declined from Rs 69.9 crores in 1972 to Rs 62.7 crores but disbursement of assistance is estimated to have increased from Rs 199 crores in 1972-73 to Rs 274 crores in 1973-74. On the whole, the large and increasing dependence of the private corporate sector on assistance from the public sector term-financing institutions is established beyond doubt. It is also known that much of this assistance goes to the bigger companies.

The Reserve Bank study is quite categoric that the underwriting support of the financial institutions also goes to the larger companies. For the first time a number of small companies entered the capital market in 1973. But the term-financing institutions shied away from underwriting their public issue. As the study puts it: "All the financial institutions together provided underwriting support to the extent of only 43 per cent against 62 per cent in 1972. To that extent the financial institutions do not seem to be playing adequately the role expected of them. One of the important objectives in setting up these institutions was to encourage new/small enterprises/companies whose capital issues may not be attractive to the general public on their own".

The increasing reliance on assistance from the public sector financial institutions has come in the way of dispersal of share ownership in the private corporate sector. The growth of concentration of share ownership is indirectly reflected in the quantum of bonus issues in recent years. The proliferation of bonus issues has been marked since 1966 after the abolition of the 12.5 per cent bonus issues tax and the notional capital gains tax on bonus shares. The average amount of bonus issues consented to by the Controller of Capital Issues was Rs 8.8 crores per year in the five-year period 1961-65, but during 1966-70 it was Rs 49.6 crores. In the subsequent years such consents amounted to Rs 36 crores in 1971, Rs 32.1 crores in 1972 and Rs 50.8 crores in 1973.

Lastly, the average cost of raising capital from the market was 3.4 per cent in 1971 and 3.8 per cent in 1972 but rose to 5.6 per cent in 1973. The study argues that besides the general increase in the cost of servicing capital issues in 1973, this was in part explained by a large number of small-sized issues during the year which perforce involved higher cost per unit of capital issued. However, it is also likely that the trend reflects the tendency among the large industrial houses to incorporate financial companies and drain out funds from bigger companies in the form of commissions and brokerage. Thus the number of financial companies (including banking companies) issuing capital rarely used to exceed 2 or 3 a year. In 1972 and 1973, however, as many as 12 and 10 financial companies, respectively, came to the market for fresh capital. The use of financial companies by business houses and groups to siphon funds from companies under their control needs to be curbed by the government.

Election Expenses

Come, Be Corrupt with Me

IN a certain sense, Indira Gandhi could not be more right. The crisis of morality currently afflicting the nation cannot be solved in a piecemeal manner. The dissolution of the state Assembly in Gujarat made no qualitative difference to the situation. The dissolution of the Assembly in Bihar would also not affect the face of reality: a skirmish would have been won and lost, but none of the underlying issues would be nearer solution. If the syllogism is to be advanced only upto this point, the Prime Minister is right and Jayaprakash Narayan's judgment is wrong. She is on relatively firm ground, too, when she maintains that JP's concept of a partyless democracy appears to be altogether nebulous. In a supposedly partyless hegemony, a certain collection of people will yet have to come together and administer the affairs of the nation. As long as the material/economic base and the ideological/cultural superstructure is such that human minds continue to think in terms of only self-interest, formation of interest groups will be inevitable: Those who run the administration will commit mistakes, or arrange things in their own favour, others will point these out; soon, egos and interests will clash; from then on frictions will arise and, give or take an interval of time, the new political arrangement will begin to resemble the old one. The utopia Jayaprakash Narayan has in mind can hardly come to bloom in today's cynical world; indeed, the danger is that, once it is convincingly served as a remedy for the pervasive malaise gripping the nation, mailorder opportunities can use it to have a whole untutored populace play into their hands.

Even admitting that she is right, however, what counterpoint has Indira Gandhi to offer? The justification, for example, she has advanced in support of the ordinance nullifying the Supreme Court's judgment relating to election expenses has a frightening implication. If the ordinance had not been issued, she is reported to have told the Congress Parliamentary Party, not only would men belonging to her own party have suffered, even a number of MPs belonging to the opposition would have lost their seats, for election petitions were also pending against several of them. By thus formulating the rationale of her decision, the Prime Minister was admitting to, as well as issuing an open invitation to, political corruption. The Supreme Court's views in this particular matter were unambiguous. It pointed out that, not to take into account the expenses incurred by a party on behalf of a particular candidate amounts to flouting the spirit of the Representation of the Peoples Act, opening the floodgate for indiscriminate expenditure, and paving the way for the incursion of untrammelled money power into the political arena. This, in turn, becomes the precursor for widespread corruption, the coruption which is now corroding the very foundations of the nation. The Court's judgment provided a major opportunity for turning over a new leaf and initiating a new morality in the country. True, of the one hundred fifty and odd petitions that were pending, close to four-fifths were against members of the ruling party. True, one of the petitions was against the Prime Minister herself. Indeed, but for ordinance, many of the MPs might have been unseated and a period of parliamentary confusion ensued.

Nevertheless, a crisis of this nature

could have had a cathartic effect on the political system. The Prime Minister, if she were anxious enough — as she claims she is — to to get the nation out of the present quagmire, could have used the occasion to go to the people. She could have approached the electorate in an open manner and, as a result, perhaps a different kind of emotion could have been sparked off.

Of course, that is not to be. Instead, the Prime Minister bases herself upon gross arguments, and pitches her appeal to the instinct or narrow self-aggrandisement among members of the opposition. It needs a certain imagination to strike a bold new path. It needs a certain stock of candidness too. The Prime Minister has obviously decided that such candidness is not for her, nor for her party. She justifies the conduct of her government in the manner of a petty lawyer. She solicits the support of the opposition for the ordinance by throwing out the hint that they too would be equal beneficiaries from the immorality latent in it. It is such calculations and motivations that make the situation so much more tragic, not just the bare statistics of corruption. Individual acts of corruption are mere symptoms, the malady lies in the ethics that is now firmly implanted, and the economic soil that breeds it. By now, the Prime Minister perhaps even fails to see the distinction between the symptom and the malady. The rest of the talk of how many smugglers have been put away would seem to be totally spurious in such a context.

Aid

The New Givers

THE oil exporting countries have managed to resist the pleas of the underdeveloped oil importing countries that they be charged lower prices for oil compared to the industrialised countries. Instead, the oil exporters have sought to mollify the poor countries by offering them aid and credit. It is understandable that the oil exporters should be disinclined to accept a dual pricing system for oil. First, once differential pricing is accepted on the basis of certain considerations, such as the poverty of the importing countries, pressures might build up for reducing the price of oil on the basis of other considerations and this could be used by the industrialised countrits to create divisions among the oil exporters. Second, bilateral economic aid would give the oil exporters much greater leverage with the importing poor countries than what they would have once the principle of lower prices for a particular group of countries is accepted. The quantum and terms of aid and credit can be varied to suit the political, religious, military or economic factors influencing the oil exporting countries' attitude to particular importing countries. The grand reception given to the Shah of Iran by the Government of India, despite the Indian suspicions about Iran's role in the Indo-Pakistani wars, is significant in this context. Thirdly, the offers of aid have helped the oil exporting countries to win international support in facing the covert threats, including those of forcible take-over of their oilfields, by the United States and other powerful oil importers.

That the oil exporters are playing the aid game with considerable diplomatic skill can be seen from the fact that it is not they but the Organisation for Economic Co-operation and Development (OECD), representing the industrially developed countries, which has taken the trouble of compiling and releasing information about the flow of economic aid from the oil exporting countries to the developing countries. According to the OECD's figures, official assistance by the oil exporting countries to the developing countries in the first nine months of 1974 amounted to $ 8.6 billion. This was in addition to the $ 3.1 billion made available by them to the IMF's oil facility and the $ 1 billion loaned to the World Bank. These figures are quite impressive in comparison with those of aid extended by the members of the Development Assistance Committee (DAC) sponsored by the majority of the OECD members. Total development assistance extended by the DAC countries in the whole of 1973 amounted to rather less than $ 12 billion. This figure includes bilateral assistance, official export credits as well as aid extended through the international development financing bodies like the World Bank and the Asian Development Bank.

Of the assistance of $ 8.2 billion extended by the oil exporting countries, $ 6.2 billion consisted of bilateral commitments and $ 2.4 billion of multilateral aid. About $ 2.1 billion, or one-third of the bilateral assistance, went to the developing countries worst affected by the steep rise in oil prices. About $ 3.9 billion was in the form of non-project assistance and $ 2.3 billion was given as project assistance. The largest donors, in terms of bilateral commitments, have been Iran ($ 2.8 billion) and Saudi Arabia ($ 2.4 billion). Multilateral assistance comprised $ 900 million to the Islamic Development Bank $ 500 million to the Inter-American Development Bank, $ 250 million to the Arab Bank for Africa, $ 200 million to the Special Arab Fund for Africa, $ 150 million to the UN Emergency Fund and $ 150 million to the OPEC Development Fund.

India has received a total of $ 900 million from Iran. Of this, $ 500 million is for import of crude over a period of five years and is to be repaid during the next five years at 2.5 per cent per annum interest. In August this year Iran also agreed to provide $400 million of untied credit to India Iran is reported to have agreed in principle to extending aid to India for an iron ore project, for expansion of a refinery and for the establishment of a joint shipping line. The other oil exporting country which has given sizable aid to India is Iraq. In March last Iraq signed an agreement for the sale of 2 mn tonnes of oil to India, of which almost one-half is to be financed by a $ 100-110 mn of credit at 2.5 per cent interest to be repaid over 10 years with a five-year grace period. It is an interesting fact that none of the Arab oil exporting countries, other than Iraq, has shown much interest in India.

3 years	Rs 80

Concessional rates are not applicable to students and teachers outside India

Calcutta Diary

A M

ONCE upon a time, it was possible to lay claims to having friends in the CPI. They would not often agree with your formulation, you would often not agree with their formulation, but you would still meet, argue, try to understand one another's point of view. Often, they would violently disagree with your position, and you with theirs; the dialogue would still be kept going. You do not meet them any more; you have been cast out. These are days of instant judgments and instant invectives; friends in the CPI, presumably because of Central directives, would henceforth refuse to recognise you; the decision has been taken, you now belong to the camp of the enemy, you have to be destroyed. Anything is fair in love and war. This is war. Those who are not with them are against them. You are not for them; *ergo*, you are against them. It being a matter of life and death, you have to be called the vilest of names and, if possible, wiped out.

So there it is. And why be mushily sentimental, either, about such a *denouement*? To attempt to destroy someone who is, objectively speaking, harming your cause and who, in addition, is considered to be altogether unsalvageable, is accepted radical practice. There is, so to speak, nothing personal about it. Dogs have to be given bad names. It is a matter of life and death, what is involved is the survival of your ideal and ideology.

Is it really? Does the survival of the socialist cause in India depend upon the liquidation of fundamental rights, under the auspices of a narrow cabal operating from New Delhi? It is not even twenty-five years since the early 1950s, when civil liberties committees proliferated around the country, with communists of all hues — including those who billet in Ajoy Bhavan today — very much their principal functionaries. How jealously they used to plead for civil liberties and fundamental rights! One still remembers the occasion when a High Court judge in Calcutta became a hero with the communists, because he refused to be bullied by the brandishings of B C Roy and let go of some political prisoners who were being held under a preventive detention order which violated elementary principles of the so-called rule of law. Friends in the CPI would perhaps squirm if reminded of those libertine years. Or, would they snarl back and tell you that there is hardly any basis for comparison, that there could be no fundamental rights for smugglers? But, since none amongst us was born yesterday, cannot one ask: who is to decide who is a 'smuggler'? Your neighbourly policeman, the noted blackmarketeer who has been elected to Parliament or the state Assembly on the ruling party's ticket and with the CPI's support, the comfortably placed rural oligarch who is casting covetous eyes on your relatively lush one-acre plot? Friends in the CPI are not dumb dolls, they are acquainted with the facts, they know how many thousands have been picked up, under what pretext, and are being kept indefinitely in detention without trial; they also know how many smugglers are included in this lot. They must be as aware as the housewife next door that, if the authorities are really determined to keep in prison a certain number of people for an indefinite period, they could do so even under our ordinary legal procedures, and nothing could be done about it. Indian smugglers are not *sui generis*: the tribe is not specific to this great land; in other countries, smugglers have been taken care of without breaching the fundamental rights of citizens.

But then there could be a party mandate, and no CPI functionary or cadre would like to come forward to discuss such issues with you: they would rather be dead than seen in the company of 'reactionaries' and 'adventurists'. So one can only continue to speculate. For instance, could it be that they honestly think the class character of the Indian State has undergone a sea change — so much so, that slogans and programmes belonging to a quarter of a century ago have ceased to be relevant and normal civil liberties too could be dispensed with? Has a stray Indo-Soviet Friendship Treaty been the clincher — the indubitable evidence of a shift in the class character of the ruling party? How does one decide whether such a shift has or has not taken place? Are the Indian masses subjected to a lesser order of exploitation than they were, say, in the early 1950s? Is the working class breathing a freer air or enjoying a higher level of real wages? In the countryside, is the concentration of land holdings less acute than in the past, the plight of the landless and small farmers — in absolute as well as relative terms — better, the burden of usury and indebtedness any lower? Has the monopoly power exerted by the capitalist-landlord elements declined over the decades? Is the use of State machinery for suppressing the desires and aspirations of ordinary people abated, even marginally, in the course of the years? Has the proportion of the population below the so-called poverty line gone down? Has literacy improved? Do the downtrodden communities feel any more secure and assured of their place under the sun than they felt a quarter of a century ago? What is it, then, that makes friends in the CPI so spell-bound? Is a single Indo-Soviet Friendship Treaty by itself capable of transforming the reality of domestic class alignments?

Or does the attraction lie in the radicalisation of the ruling party's slogans? Yet none knows better than CPI cadres that, barring the invectives addressed to the Jewry, the bulk of the rest of the programme of the Nationalist Socialist Party in Hindenburg's Germany had an equally catchy lilt; that, however, hardly helped the German working class from near-total annihilation once that lance-corporal from across the border took charge. Or is the muteness in CPI quarters the outcome of another phenomenon, namely, the fact that several of its former enthusiasts are now a part of the ruling establishment? Does the presence of a Raghunath Reddy or a Chandrajit Yadav, or, for that matter, a Durga Prasad Dhar, or a Keshav Dev Malaviya expiate for all the horrendous happenings, for the murders in cold blood of thousands of young communist cadres who were often flesh of the flesh of many CPI functionaries themselves, for the torture and beatings inside prison as well as outside for the massive terrorisation of the people in areas previously dominated by the Left, for the general brutalisation of the forces of law and order, for the galloping inflation which is immiserising at a frighteningly rapid pace the nation's vast majority, for the insensate persecution of railwaymen and other members of the working class, for the greatly accentuated exploitation of the peasantry? It would be a queer piece of ideological sophistry, indeed, if the class character of a ruling junta were to be determined by the existence or otherwise of a bunch of names in a particular list. At a certain point of history (who does not remember?) Benito Mussolini belonged to the same party as Antonio Gramsci. It did not make the least difference to Mussolini's subsequent style of operations.

Or is it the spectre of Jayaprakash Narayan that is haunting the CPI? Jayaprakash Narayan, laying claim to the same constituency in Aryavarta

which till now was the bailiwick of Indira Gandhi; Jayaprakash Narayan doling out a concoction of utopia and mishmash nearly identical with somebody else's speciality? But what makes Jayaprakash Narayan a greater menace than those currently in authority? The conviction that the local reactionaries are solidly in league wih him? The suspicion that the Americans are secretly behind him? Could it not be the other way round, however? Sometimes you choose your friends, more often you choose your foes. Once you decide, on *a priori* grounds, to designate Jayaprakash Narayan your enemy, he *becomes* your adversary; willy nilly, he then has to turn toward thine sworn enemies for support and succour.

They will not be seen dead with you any more, those erstwhile friends belonging to the CPI. A man is known by the company he keeps, the CPI functionaries and cadres, alike, must be under some injunction not to be seen in your company. Presumably the judgment has already been reached that you are a foreign agent, some of your friends from the CPI may genuinely believe that you are one. Still an uneasy feeling keeps nagging at you: how do their mental reflexes operate at such times? Jayaprakash Narayan may be upto no good, but what objective evidence is there that those ensconced in New Delhi are any superior to him? Suppose the *savant* of Kadam Kuan makes the right noises on international issues, he too agrees to accept an Order of Lenin, he too sings paeans of praise for the Indo-Soviet Friendship Treaty, and, having tolerated a Raj Narain, begins to suffer the buffoonery of a Dev Kanta Barooah; would all this change the CPI's assessment of the class character of his movement?

Or is the explanation even more straightforward: a known devil is to be preferred to an unknown one, a bird in hand is worth two in the bush? What, however, is this bird that the CPI is holding in its hand? Somebody knew somebody else in Oxford? Or, at a still mundaner level, the chairmanship of this or that public undertaking is occupied by a former functionary of one of those umpteen fellow-travelling outfits of yore?

CAPITAL VIEW

Consolidations and Polarisations

Romesh Thapar

AS the Opposition tries desperately to involve the Prime Minister or her family directly in the financial scandals that are sprouting by the dozen — and scores deadly hits with the allegation of the daughter-in-law's involvement in insurance commissions on Maruti — the ruling party takes to "secret" confabulations outside Delhi to settle the broad lines of economic and political development. It was believed that these winter months would be explosive, what with severe shortages of essentials and uncontrolled price spirals, but we find ourselves locked in debates and discussions about electoral reform, democratic rights, corruption and the like. And this, of course, persuades the incurable optimist that India is, in some strange ayurvedic way, on the mend.

The verbal diarrhoea from which most of our politicians suffer has reduced the secrecy of the Congress confabulations at Narora to a farce. The Congress President, a compulsive talker who has been labelled a court jester by Jayaprakash Narayan, has tried to underline the significance of the meeting. A tremendous mobilisation of the cadres is planned during the next three months, it is declared. But unofficial information suggests that the meeting was fuzzy, meaningless and leaderless.

Probably, the very cordial *tete-a-tete* between JP and some sixty Congress MPs, headed by Working Committee member Chandrasekhar, derailed the Narora Meeting which was designed to assess thinking at the higher echelons of the party. Indeed, at Narora we got another glimpse of the developing polarisation in Indian political life since the resurgence of JP and the attempt to smear him as an agent of reaction. Political amateurishness on both sides has created the strangest of situations.

JP, who was supposed to create a movement to purge the political and administrative system of its more obvious vices, has allowed himself to be used by several parties of the Opposition as an anti-Congress rallying point. Today, picture after picture on the front pages of the newspapers shows JP surrounded by familiar politicians who have little respect in the country and have been thoroughly discredited in the past. A major force behind JP, in terms of organised cadres, is the Jan Sangh. The students are performers on the periphery. But the anger of the towns has been articulated and the possibility of this anger manifesting itself more widely is at last recognised.

The Congress Party now finds itself beseiged wherever the JP wave has built. It lacks active cadres who are prepared to counter the moves of the "grand alliance" under JP. For this reason, the thesis is being propounded that the ruling party should rely on the organisational skills of the CPI to counter the Jan Sanghi flavour of the JP movement. The Patna rallies are a pointer. And the thesis creates a polarisation in the ruling party, a polarisation which is reflected in the warnings being given about communist pressures within the Congress Party. For the first time, there is serious talk about Indira Gandhi being used as a pawn by the CPI, and not the other way around. This is obviously a serious matter for Indira Gandhi and her "image" builders.

Interestingly, the attempted anti-Congress consolidation under JP and the sparking of a polarisation within the Congress on the question of its alignments with the CPI is taking place at a time when the broad guideline for policy-making is to rely more and more on the market mechanisms and private entrepreneurship. But, then, India *is* strange in the way it throws up the most contrary developments. For example, the line of the CPM in this mix of ideologies should provide a colourful decoration in the coming months.

Meanwhile, the speculation continues about the possibility of an early election. Viewed from the Prime Minister's office, the prospect of getting it over with certainly pleases. The longer the delay, the more the political complications — at least, in a period of economic confusion and stagnation. But will Indira Gandhi have the courage to admit that fresh sanctions are needed at this stage to lift the country out of its despondency and despair? Or will she put her faith in the rains of 1975?

Alas, even before we have begun to get our teeth into a host of problems, we are in fact being pushed into election manoeuvrings. Within six months, if the normal schedules are observed, we will be in the mess of fund-raising, ticketeering, gangsterism and counter-gangsterism. The parliamentary process, as it has flowered in India, is now a major obstacle to economic growth and political health. This same process has also damaged many other more advanced nations. Clearly, the social and economic conditions which prevail today have outstripped the political system.

When we realise this core fact, we might shift our attention to the urgent re-structuring of the political system. JP could have helped, but then that was not to be. Another opportunity missed.

November 25

COMPANIES

Record Profits

Hansavivek

MODI SPINNING AND WEAVING's gross profit rose by 70 per cent in the year-ended April 30, to a new peak in the 28 years of the company's existence. This was achieved following only a 29 per cent increase in sales. The directors attribute the substantial widening of margins to product development and introduction of products in new markets at home and abroad. The management feels that in the coming years a substantial amount will have to be invested in research and development to achieve still greater efficiency and profitability. Equity dividend had to be lowered to 10 per cent on the enlarged capital from 12 per cent paid for the previous year on account of the government restrictions on dividends. The payment is covered over 3.4 times by earnings. Inventories in relation to sales increased over the year. Exports jumped from Rs 66 lakhs to Rs 158 lakhs and efforts are being made to further increase them. The value of imported raw materials consumed by the company, however, aggregated Rs 224 lakhs. In addition, expenditure in foreign currency on account of commission, travelling, royalty, etc, amounted to over Rs 5 lakhs. The CIF value of imports of raw materials was about Rs 45 lakhs and that of spare parts Rs 7 lakhs. The company continued to pursue its policy of modernisation, renovation and expansion of plant and machinery and spent about Rs 88 lakhs on this account. Notes appended to accounts reveal that the company incurred an expenditure of about Rs 12 lakhs on advertisements in brochures of political parties.

Having experienced severe power shortage, the company installed a generating set and four boilers to run the turbines at the factory premises. It has also entered into an agreement with Modi Industries, Modipon and Modi Rubber, sister concerns, to jointly own three old turbogenerating sets installed at Harduganj thermal power station, Kasimpur. The company will share in equal proportion the cost of these sets and the expenditure to be incurred on putting them into running condition and will be entitled to an equal share of electrical energy produced at cost. The electricity generated from its own generating set at Modinagar, coupled with that available from the Kasimpur plant is expected to adequately cover the shortage. The company has given an imported generating set, which was not immediately required, to Modi Industries to be in-

* 15 months

terchanged with one to be imported by the latter. The Central excise department raised excise duty demand of about Rs 4 lakhs on clearance of 'rags' pertaining to the period from September 1, 1971 to February 29, 1972, treating them as 'fresh cloth'. This amount has been provided for in full in the accounts, but the company has filed appeals against the orders and obtained stay of demand.

PREMIER TYRES has installed imported machinery for increasing scooter tyre production. It has also imported machinery to step up production capacity of heavy service tyres and tubes by 50,000 tyres per annum by obtaining a further foreign exchange sub-loan of Rs 21 lakhs from ICICI. To increase production further by 1,30,000 tyres, the company has secured import licence for Rs 118 lakhs and a rupee payment import licence for Rs 27 lakhs. Orders have been placed under these licences. In addition, a 'letter of intent' has been received to manufacture annually 2,500 tonnes camel back and repair materials. During the 15 months ended June 1974, Premier's production of automotive tyres was 4.25 lakhs and of automotive tubes 4.29 lakhs against 3.40 lakhs and 3.28 lakhs, respectively, produced in the preceding 12 months. The licensed and installed capacities were 6 lakhs and 4 lakhs each, respectively. Gross profit rose by about 77 per cent, following a 30 per cent increase in sales, although both wages and inventories in relation to sales were considerably higher compared to the previous year. Because of restrictions on payment of dividends, equity distribution was lower by 4 points at 11 per cent. Earnings in foreign exchange on account of export sales amounted to Rs 34 lakhs, but value of imports of raw materials, components and spare parts and capital goods aggregated Rs 48 lakhs.

MORARJEE GOCULDAS SPINNING AND WEAVING fared better during 1973-74, although in the second half the company had to contend with a 42-day general strike in the industry, increase in costs of all inputs, financial stringency and increased cost of borrowing. Besides, the obligation to manufacture controlled cloth was increased from 24 to 30 per cent from October last. What helped the company in this situation, according to directors, was the introduction of new varieties of cloth and innovations in processing and increased maufacture of blended varieties. Although net sales were only 4 per cent higher, gross profit leapt by 35 per cent, reflecting widening of margins. These results have been achieved after providing Rs 10 lakhs for additional bonus for earlier years and Rs 4 lakhs for donations. Borrowings increased considerably and the ratio of inventories to sales was markedly higher compared to the yast year. The company spent Rs 58 lakhs on additions to plant and machinery and land and buildings. Its earnings in foreign exchange on account of exports amounted to Rs 83 lakhs, while consumption of imported raw materials, stores and spare parts and components aggregated Rs 80 lakhs.

SESHASAYEE PAPER AND BOARDS experienced greater rigour of power-cut during the year ended March 1974, than during the previous year; but it produced slightly more at 32,515 tonnes of paper and board against 32,284 tonnes. Although actual sales were a shade lower at 32,245 tonnes against 32,255 tonnes previously, net turnover advanced by over 20 per cent and gross profit by over 55 per cent, even though about Rs 22 lakhs were provided for future gratuity liability. As before, there was no income-tax liability and the company has been able to keep total distribution unchanged at 12 per cent in spite of the dividend restrictions. No provision has been made for the tax liability of Rs 16 lakhs for 1970-71, which has resulted from the disallowance of Rs 54 lakhs claimed by the company as development rebate. The company has disputed the assessment, and its appeal with the Appellate Assistant Commissioner is pending. The seigniorage in respect of pulpable wood has been fixed by the government of Tamil Nadu, on a provisional basis. Additional liability, which is not ascertainable, has also not been provided for. The company exported 215 tonnes of kraft paper to Kuwait and earned about Rs 7 lakhs in foreign exchange. Its expenditure in foreign currencies, however, amounted to Rs 17 lakhs. The state government has allotted 30,000 tonnes of hybrid eucalyptus to the company, and it expects allotment of adequate quantities in future too. The company has also been increasingly using hardwoods, in view of the depleting supply position of bamboo. It has already established use of a wide range of soft and hard woods, upto 50 per cent in the raw material furnish. The management hopes that future supplies of essential raw materials will be comfortable, as the state government is establishing a forest plantation corporation which will undertake intensive planting of pulpable and other industrial wood. The company soon expects conversion of its 'letter of intent' into an industrial licence for the proposed expansion of the plant capacity from 35,000 tonnes to 50,000 tonnes per annum of pulp, paper and board. In the meantime, various technical data are being worked out.

C PRABHUDAS, which raised capital for expansion and diversification in July 1973, has disappointed its shareholders. J P Mehta, chairman, had then confidently forecast that during 1973 production would be around 7,650 tonnes and sales Rs 267 lakhs and that the company would be in a position to pay a dividend of 12 per cent. Accounts for the 15 months ended March 1974, however, show production of galvanised and ungalvanised wires at 6,842 tonnes, including 2,002 tonnes of wires converted on a job-work basis. Sales and conversion charges together brought in Rs 148 lakhs and the outcome was a gross surplus of only Rs 5 lakhs, which after providing for depreciation and development rebate turned into a deficit of Rs 2 lakhs and raised the accumulated loss to Rs 8 lakhs. In addition, there were arrears of depreciation and development rebate amounting to Rs 5 lakhs each. Also, no provision has been made for income-tax amounting to Rs 80,545, additional demand for sales-tax amounting to Rs 42,462 and bonus amounting to Rs 66,000. A debt of about Rs 14 lakhs is due to the company by Saurashtra Iron Foundry and Steel Works in which two directors are interested. In order to meet the increased requirement of working capital, the company has approached bankers for additional credit facilities and is also considering launching on a long-term scheme of borrowing money from shareholders in the shape of recurring deposits. C D Doshi and B P Sharma, two directors, have resigned from the board. The disappointing working results are ascribed to sharp increase in cost of main raw materials and poor demand for ACSR wires which, according to the original projection, was to account for 65 per cent of the production. The company is now trying to secure export orders for wires, but the directors point out that a downward trend of prices has started in world markets and that on account of competition from China and Japan prices are going down almost every day. They, however, express the hope that the company would be in a position to pay a maiden dividend, subject to the dividend restrictions imposed by government and the sanction of bankers. The Rs 10 share, which at one stage commanded a high premium in the unofficial market, is now quoted at less than half the par value.

WEST BENGAL

A Generation Being Wiped Out

Amrita Rangaswami

IN Cooch-Behar district, in West Bengal, the paddy fields are slowly turning a mustard-yellow. The paddy stands tall — an unbroken sea. It cannot rise higher. The sight strikes fear into the hearts of the people. When the harvest begins, and it has already begun in some places, the gruel kitchens will close.

The Ras-Leela festival, heralding the harvest, has started. But if you listen carefully, under the clash of cymbals and gongs and a hundred kettledrums, you can hear it. It is so low, so polite and apologetic, so close to the ground that you can scarcely catch it. It is the last quiet moaning of someone dying.

In Calcutta, the harvest, an all-time record, is hailed with glee — "Relief Works Can Close — the Emergency Is Over", the government has declared. The government has pulled out everywhere except in Cooch-Behar and Jalpaiguri where it will continue. "By the first of December, relief will begin to taper off", officials in Cooch-Behar predict. "The government will soon declare its policy", says an official from Calcutta, camping in Jalpaiguri. On the Twentieth of November, the sanction for December had yet to come.

"The prices here have begun to fall", the minister is crooning. Officials in Cooch-Behar know that this will have no impact on the lines at the gruel centres. "These are destitutes", they declare, "even if rice is sold at four annas a kilo they cannot buy."

Wages have already fallen, on an anticipatory estimate of surplus labour. "It was around Rs 3 last year, but has now come down to Rs 1.50." The men on the gruel line are willing to offer themselves for a rupee, thirtyfive paise, a handful of paddy, but the jotedars are firm — they will not employ them. The people at the gruel centres have ceased to resemble any human, living things.

Starvation alone has not rendered them sub-human. This is a populace that is half crazed with grief. These people have been witness to the slow death by starvation of hundreds of their children. They have watched the body prey on its own flesh, scoop hollows in checks, grow billiard cues for arms and legs (the shoulder blades jutting out like the thin ends of a paddle), the hair falls from the scalp, the skull grow dome-large, fez shaped, the pupils dilate, bird-bright, the rib cage standing out, as if the child wanted to scream. "My child does not open its eyes", "will it open its eyes again", asks Kantashree at the gruel centre, near Deochirai, near Toofanganj. She shakes the infant in exasperation and fear, but the neck falls limp upon her chest. Tultulibawa with her two children, sitting on the road, with her legs stretched before her shrunken breasts exposed, has reached the last stages of emaciation. Her children look about two and three and are drowsy, weak.

"My daughter does not walk, she stopped walking about a month ago", complains Nishibala Modak on the road to Sahibganj. The daughter sitting on her hip, is ten years old. Her legs hang below, long, brittle, useless. She has lost her hair. Her cheek bones have formed a conical box. She wears a nose-ring. Nishibala Modak's husband ran away about five months ago. She has six children to support.

At the primary health centre at Dinhata, a baby sits howling, a loud vernacular "Amma", for a mother that cannot hear. At the Sahibganj gruel centre, an infant was trying to wake its mother, lying beside it. It was crying loudly, calling; the mother was ill, they said, from gastro-enteritis.

In Cooch-Behar town at 10.30 in the morning, I saw an infant die in the arms of its mother, on a public street, a hundred yards from a temple and a police outpost. The mother lying beside the child had covered her face with her hands, uttering the low moans, now so familiar. The baby died, waving spidery arms and legs, mucous and stool coming out of it, in a last spasm. Called to, the mother never answered. Later, she sat up, took the sweet offered, not even glancing at the baby.

At the main market place, in Cooch-Behar Malathi Devi sat, stubborn. Her face was waxen-yellow when she took away the hands that covered them. The dead body of her baby lay beside her. She would not leave it for the municipal sweeper. She was collecting coins for its burial.

At the Sahibganj gruel centre, there were at least three hundred children, all below six years old. One of them, clutching at a piece of bark of a banana tree, was crying. That was his gruel plate. It was past twelve in the afternoon and he was hungry. "We have to transport gruel to five/six centres from here", explains Brahmacharya Sudhir of the Ramakrishna Mission. The Sahibganj centre is served last. There are three hundred children here —they live here near the centre. They have been abandoned by their parents, it is stated. "In the Bengal Famine of 1944, the parents always died first", an official told me later.

At Kumdibari, two infants were sitting in the sun, drowsy. They could not eat any more, cry any more.

The men in the gruel line, cannot offer the gruel to their children. The children will not eat it. Cup your palms together and fill it with gum and you have a fair idea of the West Bengal government's gruel ration. A day's ration at the old British Famine Code specifications should cost the government around Rs 2 per person. The gruel costs only forty paise per person (with another 30 paise added to it for fuel and transport costs). It is less than a child's ration; 160 grammes of wheat and 60 grammes of lentils, cooked with a slice of potato and pumkin, and sauced with red chillies. A glutinous mess, it adds up when cooked 750 grammes.

"In Gujarat, we served 1,600 grammes, four or five rotis, twice a day", says Swami Lokeshwaranand of the Bharat Sevak Sangh, Ahmedabad, one of the three main agencies in charge of the government's gruel centres. "When the Bangladesh refugees came, we gave them rice, dhal and vegetables. But this is Bengal."

The number of persons affected, according to official estimates, is 3.5 lakhs. The number of persons covered by gruel centres is restricted to 50,000. At each distribution centre, roughly about 1,000 people are served. And for every 1,000 cardholders there are at least 300 with no cards. The sight of the truck loads of food drives them nearly mad. Volunteers out of pity, mix the scrapping from the drums with a little

water and serve these. "Give me a card", she cried out, shrill, insistent. "My children and I have no food." A worker at the kitchen at Putmari, beat her on her knuckles with a short stick. "Go away", he cried, "go away." Anisa-bibi will not let go of the fence to which she is clinging. "Give me a card", she shouts louder. "Her husband gets dry rations", a worker explains. "My husband left long ago", she pleads.

Koka Shaikh also begs for a card. He holds a dead minnow, impaled on a stick. "I would have caught another, but the owner drove me away." His eyes have sunk into sockets that extend from ear to ear, in a famine mask. "I have not eaten", Koka Shaikh explains, gently. "I want a card." A crowd of about fifty presses around him. "Give us cards, please give us cards." The 'Anchal' Secretary, white-shirted, mouth full of pan-juice, strolls into sight.

The gruel ration for fifty thousand is shared by at least another fifteen thousand people. And the truck comes only once a day. Sometimes it can be late.

At 2.30 in the afternoon at Patlakhava, the truck had halted, but the food had not been served. The volunteer was peering at the gruel he had offered first to a five-year old. The child was licking it, slowly.

The gruel had fermented, gone sour. "It was cooked last night at 1 o'clock" he said, a trifle apologetic. There were over a thousand people waiting. The truck returned with fresh gruel at about four-thirty in the afternoon. This time the wheat and the dhal remained stiff, half-cooked. (Two days earlier, Nipendra Sarkar, a Marxist worker, had protested and had been promptly arrested. His wife Sumati, about nineteen years old, stood there crying.)

Diarrhoea has become common among those who live on government gruel. ("They are dying of indigestion", officials say.) "The red wheat that government supplies, often goes sour", Swami Lokeshwaranand admits. He offered a sample, worm-infested, powdery ("We also got bad wheat but we returned it", said the Swami at the Ramakrishna Ashram. "We dont want the mission to get a bad name.")

The Bharat Sevak Sangh serves two of the worst affected areas, Patlakhava and Kundibari. Gruel is cooked for 12,000 people a day — rations for 10,000 from the government and for 2,000 from the mission. Cooking begins at about 2 a m and goes on till noon. Their three trucks making four trips, carry a 20 drum-load, each drum with a 40-gallon capacity. These are old tar-drums and the food is covered with a thin polythene. When the truck halts, the sheet is removed. Passing cars cover the food with dust.

"Are the people complaining?", asks Ashok Basu, Deputy Commissioner, in genuine surprise. "Why, they were dissatisfied with the Kashi Vishwanath Samithi, so we called in the Bharat Sevak Sangh."

The government would be astounded if we asked whether they could have sent out tankers of potable water with the food. No official will drink water in these parts, it is cholera-infected. Yet it has never occurred to the government to send out potable water along with the food. (In the arid states, water tankers are a regular feature of famine relief.)

Along the highway, where the people wait, there is no water, there is no shelter. And the cold winds have begun to blow from the Himalayas. Of the tens of thousands of children on the roads, not one has a garment. The men wear a small towel around the waist. The women wear a saree, perhaps, four metres, duster-thin, that barely covers them. None of them has a blouse. Many of them wear a towel around the waist and another piece of cloth over the shoulder. The government distributed some sarees, sometime after the floods, one to each person but they have cut these up and shared. And for every woman on the gruel line in a saree there must be one or two at home hiding, unclothed.

"They will now start dying of the cold", says the Deputy Commissioner flatly. "I need three and a half lakh blankets." He wants at least one blanket per family. Rs 45,000 was kindly sanctioned out of the Chief Minister's Relief Fund. But orders have come that the purchases have to be made in Calcutta. "Some more 'blankets' are coming" Chatterjee, the Joint Secretary, Relief Department, announces, at Jalpaiguri. (Do you call them blankets at seven rupees each?) "Officially the cold weather does not set in until December first."

Would they be able to build their homes before that? Nobody in the relief department thinks so. The funds for house building are so little. "We have only Rs 8.5 lakhs — to how many can we distribute it", asks one of them in despair. We have already distributed Rs 77,680, another says, adopting the customary official tone. "Cases are being processed."

They sit on the highway and wait all day long, listening to the howling in their bellies. Men, women and children, naked under the sky. (And the gruel truck will soon stop coming.)

The cannot crawl into Cooch-Behar town and take shelter in the wide verandahs of government offices. It is now forbidden. They moved in, in September, when the floods came. And they died on the railway stations and on the streets and in the doorway of government buildings. Cholera had broken out. The municipality of Cooch-Behar, it is said, ordered that the free feeding by the business community be stopped and on Gandhi Jayanti day, loaded the people in trucks and had them moved out.

Cooch-Behar with its 300-bed hospital is now out of their reach. There are another 400 beds scattered all over the district in small clinics, each equipped for about 20. Those on the highway will never reach them. "But we cannot go about and pick up the cases", argues Dr J Nath, Deputy Director of Medical Services in West Bengal, visiting Cooch-Behar. "We have no machinery for that purpose. We can only treat them, if they are admitted to the hospital."

For the whole of the district, there are about 765 beds. At the primary health centre at Dinhata, an old gentleman has been brought in, in a cycle-rickshaw. He has been picked up by local youngmen who collected money from passers-by to bring him here. One foot is swollen upto the knee. A rag is wrapped around a wound, stiff with gangrene. The gentlemen has endless patience — he sits in the rickshaw surveying the hospital in silence. "We have no facilities here, we must refer him to the General Hospital" the doctor says.

At the World Lutheran Centre at Kundibhari there are about 20 beds for infants. The infants rest on cots. There is clothing on them. "A children's hospital will soon be opened in the district" officials say.

West Bengal government officials are irritated if you tell them about relief systems in other states. "We have three categories of relief in this state", they explain. The first covered by gruel centres, the second by "gratuitous relief" (dry rations) and the third by "test relief works".

The dry ration consists of eight kilos of grain a month per person, distributed free. The test relief is for the able-bodied and only one person per family is allowed to work. But he gets a ration of 750 grammes of wheat and cash of Rs 1.25 per day.

You have to opt for one of the categories. You cannot be employed on relief works, if you accept gruel. In Maharashtra, during the famine of 1972, a thousand people on a road-work, in a metal-breaking quarry, was a common sight. In Bengal it is hard to find a man at work.

"Where are the people?" I asked at the bund-cum-road work on the banks of Gadhadhar in Toofanganj. There was none in sight — a number of pits had been dug, but no fresh earth had been turned that day. There was a young man, standing under a tree, laughing, helpless. "The people have finished for the day. They come at six in the morning and leave around ten, they only have to dig one cubic foot per day. It takes only about two hours." Measurement, they added, was taken every day and payment was made daily.

At about one-thirty that afternoon, a few "gang leaders" had gathered on the highway, to collect the payment on behalf of the workers. They held slips, duly filled in. Every man had completed the allotted task, with no exceptions. "We are not strict" the official said. We pay them full wages, regardless of the work turned out.

But why is it called "test relief"? "I don't know, it has been called that ever since I joined the service" one of them says. The term 'test relief' has been handed down from the old Famine Code. Its purpose is "not to appease hunger, but to find out if people are hungry". If the numbers on the test relief swell, the time for testing is considered past and "scarcity" is declared.

In West Bengal, since the term 'famine' has been abolished, "test relief" has become a "permanent" feature. The contrast with relief systems in other states is painful.

In the Maharashtra and Gujarat systems

(1) there is no limit on the number of persons who can be admitted on relief work; and
(2) continuity of employment is offered for the persons on the works for six to nine months.

In West Bengal (as in Andhra Pradesh) employment provided is reckoned in mandays, not in numbers on relief works. Each scheme is small and the expenditure is limited to about Rs 7,000. Only 250 persons can work on one scheme and the work is expected to be completed in about ten days. 'We cannot offer continuity in employment", Basu states. "We cover as many areas as possible, starting at least one scheme in each".

The Maharashtra and Gujarat Scarcity Manuals have both the strength and the weaknesses of the old Famine Code. In Bengal, they have made drastic changes in the system. The Manual for relief of distress, which has replaced the codes of 1919 and 1941, has, in a burst of populist fervour, transferred control of relief operations to the elected representatives of the people.

In Maharashtra and Gujarat, the collector or any of his tehsildars can sanction gratuitous relief on the spot if they fear death by starvation of the affected population. In West Bengal, the deputy commissioner has to wait for the 'local relief committees' to draw up the lists of the 'deserving'.

For every "anchel" a relief committee is formed, consisting of a convener and secretary, a paid employee of the Panchayat, the Pradhan, the MLA or his representative and two nominees of government. Ten to fifteen anchals form one block. The Block Relief Committee includes the MLA or his representative and one nominee of the government. (The MLA has no time to attend; he normally appoints his representatives to each of the committees.) The functions of the Anchal Relief Committee are:

(1) To prepare lists of people deserving gratuitous relief.
(2) To initiate list relief schemes.
(3) To arrange for distribution of gratuitous relief.
(4) To prepare lists of test relief works.

For each test relief scheme there is one paymaster and two "muharirs" who supervise the work. These are appointed by the block development officer, in consultation with the block relief committee. The block committees finalise relief schemes, select sites for tube wells, and so on.

"Until about two years ago, the deputy commissioner appointed the paymasters on the recommendation of his sub-divisional officers. But now the block relief committee has been empowered to do so" it was stated.

The British Famine Code, following the Poor Laws of England of 1838, gave no right to relief to the Indian destitutes, but made them dependent on government benevolence. The Maharashtra government has not bestowed the right to relief but it has at least guaranteed the benevolence. The West Bengal Manual has made the people dependent on the political rabble.

Oddly, since the Panchayat elections have not been held in Cooch-Behar, it is said in the district that in the thirteen years the Panchayats have been in power, these gentlemen have matured into petty zamindars, zealous of their rights and privileges. With factionalism erupting into the Congress, there has been a bitter fight for the spoils of power. Both sides freely allege that the relief schemes are used to line the pockets of the people's representatives. The 'paymaster' is usually in their employ and the 'gangleaders' are their willing accomplices.

There is a fight for selecting sites for relief work, fight for including followers in the list of names for gratuitous relief. "Government expects to cover 35 per cent of the families in their sub-division", the officer in charge explained, but we have learnt that the Anchal Committees have disbursed it among 80 per cent of the people.

The deputy commissioner, unlike his counterpart in Maharashtra, plays a smaller role. He cannot make all the purchases — the relief department in Calcutta takes care of that. He cannot sanction relief — the Anchal Committees control that. He has however one important function. He warns the government at Calcutta of the impending disaster. (One can never learn — unless a famine enquiry commission is set up) — whether the Deputy Commissioner of Cooch-Behar reported the starvation deaths to Calcutta.)

The Department of Relief, however, began sending "distress" warnings in the appropriate forms, nearly six months ago. 'Alarming' signals (a term in the revenue department's dictionary that signifies acute distress) were hoisted as early as May this year. The Aus paddy and jute crops were reported lost and "the cost of foodgrains had gone out of reach of people".

On May 10 the Department had asked that it be permitted to cover at least two per cent of the population. On the 16th it implored again. It had estimates that 40 per cent of the crop had been lost. The rains (around 130 inches in this region) had set in early and people were totally without employment. The Department wanted to give relief to at least five per cent. On May 20, it reported heavy and continuous rainfall during the previous fortnight. "The possibility of floods cannot be ruled out." On May 21, it appealed for an increase in the quota of relief. "Reports of starvations had started pouring it". On May 23, Calcutta replied by telegram. "No further increase could be considered immediately."

On June 1, the government at Calcutta had agreed to cover one per cent of the population with gratuitous relief. In the first week of July the floods had come. "The floods came in three phases — right through July, August and September."

Until September first, the relief coverage was restricted to one per cent. During the second fortnight of September it was raised to 11 per cent. In October it went up to 15 per cent. Only this month, the Department had been able to cover 20 per cent of the the population. "If only we had recognised scarcity in April and given relief to 30 per cent of the population, there would have been no deaths", officials admit.

Nobody knows how many have died. Authoritative sources put the figure at 5,000. "We do not know" one of the officials said, "how many have died. We have the figures only of the deaths that occurred in the government clinics. We were not asked to register the deaths on the streets and in the railway stations."

They were not even allowed to bear the costs of the cremation of the dead. "At first we referred the cases of unidentified dead to the police", stated the Sub-Divisional Officer of one of the Divisions. But we soon found that the costs were prohibitive. They had therefore asked the municipality to request the sweepers to clear the streets. The new arrangement was cheap. Against the Rs 30 per body we would have had to spend, according to normal procedures, this cost only Rs 4 per body.

The medical teams from Calcutta have fulfilled their objectives. They fanned out into the district in a fight against cholera and, to their credit, the incidence is reported to be decreasing. Now they have time to gather in Circuit House to play word games.

"The victims have died, not from cholera but 'cholera-like' diseases." It was true that the team from the Indian Council of Medical Research had found a 72 per cent incidence. "But we do not agree." Stool samples were being carried by different teams for analysis in a desire for scientific exactitute.

Mortality rates? "About 32 per cent of cases", says Dr S Sen, Professor of Medicine, head of a team sent by the Ministry of Health. Dr R Gupta, chief medical officer of the district, denies it vehemently. "It can only be around 25 per cent."

But the Deputy Director of Medical Services agrees that the statistics of mortality are affected by the number of beds available for cholera cases. Of the 1,984 cases of cholera officially recorded, only 478 are reported to have died.

What about deaths from other causes? There are no starvation deaths, the doctors replied. There might have been some deaths due to "malnutrition with complications". The Directorate of Medical Services seems to be engaged in the task of assembling the figures for any enquiry that may be launched at a convenient moment. If relief operations close, and the people are dispersed, how can you conduct an enquiry anyway?

A Central team is due to visit this state in a week. But Central teams have been known to be notoriously short-sighted. Bred on a diet of Planning Commission tracts, they have been accustomed to associate "scarcity" with failure of rainfall and failure of crops. The paddy crop in Cooch-Behar, a record in the last ten years, will assuage their fears. They would be hard in their customary bargaining. The Sixth Finance Commission's recommendations have to be adhered to. And the Centre cannot run up large deficits.

From April 1 this year until the seventh of November, the expenditure on all categories of relief in the 20 districts adds up to approximately Rs 13.5 crores. Compare this with the Rs 5 crores each spent in the districts of Sholapur and Ahmednagar during the peak months of the Maharashtra famine and you have a measure of the distress in Bengal.

The Finance Commission's recommendations have, on the whole, proved to be flexible in Gujarat. Perhaps, the Central team has been willing to pander to the Centre's desire to win the coming elections in Gujarat. But does that justify their failure to see the faces of the starving in West Bengal?

*

Siddhartha Shankar Ray, the Chief Minister, who has been to the best schools, and leans heavily on the twin factions of Fazlul Huq and Santosh Roy, has, it is alleged, rebuked the administration in Cooch-Behar only once. "The BBC has found out", he mourned, "Mrs Gandhi is really annoyed."

Santosh Kumar Roy, the Minister for Relief, has worries of his own. All the cases and enquiries pending against him, although held outside the purview of the Wanchoo Commission, have been placed on the record and published in the local papers. According to the *Hindustan Standard* of August 1, the Cooch-Behar District Central Co-operative Bank of which he and Sudir Neogy were sometime secretaries, sometimes chairmen, has gone into moratorium. The Co-operative Rice Mill of which he had, at one time, been Chairman of the Board of Directors, has been closed. The mill has lost the suit at the sub-judge court, filed by the Food Corporation of India for a shortage in milling of FCI paddy of 1,47,627 quintals of Aman common rice and 6,725 gunny bags. The rice, it was alleged, was sold in the black market.

Santosh Roy flinches at the word 'famine'. "There is no famine in Bengal", he says. "Famine is a condition when lakhs of people die."

This is Catch-22. If there is no famine, how can people die of hunger? The crisis was caused only by the September flood. The floods have receded and the people can go home. The "emergency' is over.

In Writers' Building there are some who know. "A whole generation is being wiped out", said the voice. It did not raise itself above a whisper.

Saraya Steel

SARAYA STEEL's board is considering ways and means to raise additional finance required for meeting the overrun in the project cost caused by increase in prices of steel, cement and other construction materials. Meanwhile, issue of preference capital of Rs 11 lakhs has been approved to meet the enhanced capital requirement of the project in view of the financial curbs and restrictions on lending imposed by banks. Shareholders' consent has been obtained for offering these shares to financial institutions or others without their being offered to existing shareholders.

The company was lucky to get power connection in February last and was able to commission the factory with the first furnace of 4/5-tonne capacity from March on a trial basis. With the continuous availability of power for trial runs then, it could produce 102 tonnes of MS ingots by the end of that month. But the power supply position deteriorated thereafter and the company has not been able to achieve desired results. The issue is being tackled with the UPSEB and the state government with the assistance of the Steel Furnace Association of India. The directors hope that the position will improve soon and the company will be in a position to start full capacity production. The present installed capacity is 9,000 tonnes per annum on a three-shift basis.

MAHARASHTRA

Revolt of the Urban Middle Class

THE results of the elections to 193 of the 218 municipalities in Maharashtra, held on Novemer 18, have come as a rude shock to the Congress. These were the first municipal elections to be held under the new election law which provides for the direct election of presidents of municipal councils. The resounding defeat of the Congress will partially lift the pall cast by the seeming impregnability of the ruling party over the opposition parties as well as other forces working for economic and political change.

The Congress, it is true, had not contested all the elections for the posts of presidents on the party symbol nor had it put up official party candidates for all the elections of members of municipalities. However, according to official sources, the Congress party had contested all the elections of presidents of municipalities — some on the party symbol, some in collaboration with fronts of other parties and a large number as independents. In the event, the Congress secured only 20 out of 193 municipal presidentships to which direct elections were held. In addition, the Congress also failed to get a majority in more than half the municipalities.

Congress Fails

The Congress did not win the presidentships of, nor a majority in, any of the municipal councils in the towns around Bombay. The Shiv Sena won a majority in Thana and also the presidentship; the Socialist Party and the Peasants and Workers' Party have captured the Bassein and Panvel municipal councils, respectively. The elections in Dombivili and Kalyan have gone in favour of the Jan Sangh.

The Congress has fared miserably in Konkan, Marathwada and Vidarbha. It has also done poorly in Western Maharashtra, except in the Sangli, Satara and Kolhapur districts where it has retained its hold over the municipal councils. The party received rude shocks in the home districts of Chief Minister V P Naik (Yeotmal), Irrigation and Power Minister Vasantrao Dada Patil (Sangli), Agriculture Minister Shankarrao Chavan (Nanded), Finance Minister M D Chaudhuri (Jalgaon) and Maharashtra Pradesh Congress President P K Sawant (Ratnagiri). In Pusad town, from where the Chief Minister hails, the separatist Vidarbha Samiti won a majority of the seats as well as the post of president. Similarly, Congress candidates for the posts of presidents in Akola and Amraoti, the two major cities in Vidarbha after Nagpur ,were defeated. The Congress candidate in Akola is an MP and had held the post of president of the Akola municipality for 20 years.

The Congress defeats in the election of presidents and members of the municipalities in the cities of Ahmednagar, Nasik, Amravati, Akola, Jalgaon, Thana, Kalyan, Ratnagiri, Yeotmal, Nanded, Bassein, Panvel, Phaltan and Sangli are significant. The area covered in the elections to the posts of presidents in these major cities and towns is more or less equal to that of an assembly constituency. The Congress failed to get a majority in cities and towns with population of 50,000 and above where it had fought the elections on the official party symbol. Barring one or two places, the Congress had swept the polls both in the 1971 Lok Sabha and the 1972 Assembly elections in these cities and towns.

The outcome of the municipal elections shows that the Socialist Party has improved its strength in a number of cities and towns. The Jan Sangh has just managed to retain its strength. Joint fronts of Opposition parties and independents not attached to any political party have on the whole fared well.

The economic situation marked by galloping inflation, rising unemployment and acute shortage of food and other essential commodities obviously contributed to the Congress debacle. But even more important perhaps has been the inefficient and thoroughly corrupt administration which the Congress had provided in many of the cities and towns. In a number of cities and towns in Vidarbha, Marathwada and Western Maharashtra, teachers in primary and secondary municipal schools and in colleges run by Congressmen do not get their salaries for months on end. Secondary schools and colleges have been turned into commercial ventures for amassing wealth by Congressmen. The lower middle class population in the cities and towns, oppressed by the worsening economic situation and by Congress maladministration and corruption, may be said to have registered its strong protest in the municipal elections.

Brush Off

The leaders of the state Congress are trying to brush off the party's failure in the municipal election. They reckon that the party can retain power in the state with its massive rural support-base. The urban population, they say, has always been lukewarm to the Congress, if it has not been downright anti-Congress. Even so the state Congress leadership cannot but see the municipal elections as a bad start for the party's preparations for the next assembly election in 1977. The attitude of the lower middle classes in the towns towards the party is bound to have some influence on the party's position in the adjoining rural areas as well. At the same time, it has to be admitted that none of the opposition parties — including the two communist parties, the Peasants and Workers' Party and the Socialists — have the organisation and the cadres to exploit the mass dissatisfaction with the Congress.

Triveni Sheet Glass

TRIVENI Sheet Glass reports that the cost of its project, originally estimated at Rs 247 lakhs, has gone up to Rs 340 lakhs due to allround price increases and retardation of the construction schedule because of irregular supplies of steel and cement. Another important factor has been the rise in the rupee cost of imported machinery. The company's imports are mostly from West Germany, but the foreign exchange loan from ICICI is in dollars. As the exchange rate of DM in relation to dollar has increased, the rupee cost of imported machinery has risen. The consequential increase in import duty has also been substantial. The directors feel that the company may have to raise additional capital of Rs 25 lakhs by issuing preference shares to finance part of the enhanced cost of the project. Civil work is expected to be completed by the end of the year, and the plant should be ready for commissioning by May next. The overrun in the project cost notwithstanding, the directors envisage satisfactory prospects of the company and expect it to show "very good financial results within a year of going into production". This view is based on good demand and high ruling prices for sheet-glass.

Mobilisation of Urban Sweepers

Mary Chatterjee

THIS account is based on 2½ years' study of a particular endogamous section of sweepers in the city of Banaras. They number about 1,800 persons and originate from the Kanpur region where they are known as Dhanuks. They have been migrating to Banaras since the 1920s in response to the increasing demand for scavengers in towns. In the rural area they are mostly engaged in agricultural labour.

A city-wide survey of the caste was undertaken and in addition one particular locality of 33 households was studied intensively in the participant observer tradition. The sweepers studied are employed mainly in the municipality, with a few being in the railways. The rate of pay in the former in 1972 was Rs 103-110. (It has doubled since then.) Women also work and are paid at the same rates as men. The majority of households in the locality studied earn between Rs 200-300 from sweeping, though the average earning is higher. Eight out of 33 households earn over Rs 400, 3 over Rs 500 and 1 well over Rs 600. In addition to this most households earn Rs 9 per month from pig rearing. Many also have some sideline such as basket-work or sale of small items. Municipal sweepers have security of employment, 12 months' paid medical leave in their life-time, 1 month's paid privilege and 14 days' 'casual' leave every year. A woman is entitled to 42 days paid maternity leave after delivery for up to 3 children. There is no provident fund or pension, however. They are entitled to annual supply of clothing to the value of Rs 75 per winter. In fact, they do not always receive what they are entitled to as can be seen from the agitations of the Sanitation Workers' Union. Sweepers in banks, insurance, the Railways and the University earn considerably more than Municipal sweepers.

In Banaras, the sweeper castes are reacting to the new conditions of post-Independence India in a way that marks them off from other low categories such as Chamars or Mahars. Unlike these they exhibit only the most faint-hearted attempts to imitate the behaviour of the traditional high castes, by Sanskritising, as it is usually called; nor do they show signs of trying to claim a higher status in the caste hierarchy. Indeed they cannot do so for they are committed to an occupation which is secure, well paid relative to both unskilled and clerical work and yet which by its very nature must always remain polluting in the traditional scheme of things. Chamars, on the other hand, numerically the largest scheduled caste category in Banaras, provide the city with its low caste leadership. They are active in such welfare organisations as the Dalit Varg Sangh with its aim of ameliorating the conditions of untouchables, the Nishedh, a group that campaigns against drinking (the scourge of the low castes as the dowry is of the high), and the Harijan Sevak Sangh. Those calling themselves Raidasis, after the Chamar saint of the same name, organise annual conventions at which they pass Sanskritic resolutions banning the work of midwifery and handling of carcasses, both indicative of attempts to approximate to the norms of the traditional elite. They are to be found organising processions against Untouchability on such occasions as the birthday of Ambedkar. Chamars provide the bulk of the members as well as the leadership of the local neo-Buddhist movement, the Banaras branch of the Bharatiya Bodh Mahasabha, founded in 1972 by Moti Ram Sastri, himself a former Chamar. Only 10 per cent of the members belong to non-Chamar castes. Most of the incidents of discrimination brought to the attention of the Harijan Welfare Committee are reported by Chamars. They are, then, the most vocal of the low caste groups in the city. Nonetheless, they are still, by and large, attempting to secure respectability by traditional means either by Sanskritisation or by religious activity, by adopting Buddhism, a religion which is both Indian and casteless [Lynch, O, 1969: "Politics of Untouchability"], a step which is novel yet in accordance with traditional process s of religious sectarianism. They are not similarly active in politics or trade unions, being divided into a great variety of occupational categories.

Sweeper castes, on the other hand, are not attempting to rise in either traditional or 'modern' social hierarchies for they know that to be a totally unrealistic aspiration in their case. It is true that they have changed some of their practices in accordance with the values of the larger society but this has been haphazard and piecemeal, by a process of assimilation rather than as a result of any deliberate strategy. Sanskritisation may have ocourred at an earlier date in such matters as form of worship, discontinuing of bride price, and abandoning of beef and carrion eating. They still, however, have several distinct forms of worship not found in the Great Tradition. There is no sign at all of Sanskritisation in such matters as widow remarriage, rights of divorce for both males and females, freedom of women, eating of pork, etc. Sweepers continue to drink with zest though it is rare now to see women drunk in public places. This fact, along with their tendency on first meeting to conceal such of their customs as conflict with Sanskritic norms, can be explained as a case of Sanskritisation in the special sense in which Beteille uses the term as the diffusion of the styles of life once distinctive of the upper castes among wider sections of the society rather than as the result of a deliberate strategy, as I said earlier.

Sweepers, then, cannot identify with organisations which aim at raising social status, whether through emulating traditional elite behaviour, such as the Dalit Varg Sangh does in practice, or through conversion to a theoretically casteless religion such as Buddhism or Christianity. In Inglesia Lines, the locality studied intensively not one person had even heard the name of Ambedkar, the low caste leader who led the Mahars to Buddhism. Nor can sweepers identify with organisations controlled by the larger society such as the Municipality Co-operative Society committee or the Harijan Sevak Sangh (with its high caste welfare orientation), a form of behaviour typical of cultures of low status. So great is the apathy shown by sweepers that a ruling has been introduced specifying that Municipality Co-operative Committees must include a certain number of sweepers. They are no longer active even in their 'own' organisation, the Balmiki Sangh, now almost defunct, with its commitment to Gandhian techniques of persuasion and hunger strike.

Sweepers, then, are more apathetic than Chamars or other low castes in Banaras. Their social aspirations are low and illiteracy still being widespread (though it is decreasing) awareness of their legal rights is low. They do not register complaints about discrimination with the Harijan Welfare Committee. The old leaders no longer command support and new ones are only just emerging. However, insofar as sweepers are not apathetic they concentrate most of their energies on Trade Union activity and it is this which distinguishes them markedly from other low caste groups.

With a leadership that is only incipient, social grievances cannot be expressed. It is only the material and tangible approach of the Sanitation Workers Union that can call forth leaders and meet with response, for their aspirations are concrete and economic. The Union has 100 per cent membership and holds regular meetings. Interestingly enough, the Union is organised by a Brahmin. The secretary claimed that agitations on an all-UP basis over the last ten years had led to a doubling of wage rates, building of 800 new quarters for sweepers in the city of Banaras, reduction of the working day to 7 hours, introduction of a regular weekly holiday as well as festival days, expansion of the work force and general improvement of conditions of service and of special facilities. Clearly the Union has not been the only instrument of such change but it seems that it has played some considerable part. In 1972 there was a three-month programme of weekly processions through the city (attended by women as well) in support of 18 demands. Many of these were concerned with non-implementation of provisions already granted on paper though not in reality. Other petitions concerned lack of a pension or provident fund, the demand that pay should be up to the level of that given in Agra, Kanpur, Allahabad and Lucknow, that brooms and baskets should be given monthly, that weekly holidays should not be cancelled, that the posts of Jamadar and Daroga (supervisors of sweepers) should be filled by educated sweepers, that on retirement of a worker preference should be given to members of the same family, that quarters should be repaired, that those coming from afar should be given city allowances and that the requirements of the Public Health Manual should be in force.

Leadership in the Union is partly in the hands of traditional choudhuries but only of those who are more prosperous than is general, and sufficiently able to be conversant with the ways of the town and its bureaucracies. Younger committee men tend to be literate. In fact, there is a considerable amount of doubling up of the roles of headman, 'big man' and 'neta'.

Sweepers also participate in the political system. In 1972, 100 per cent claimed to have voted in the previous election (of Inglesia Lines informants at least). They are not yet revolutionary and two schools of thought can be seen among them. The majority of them vote for Congress and only a few of the more educated ones express support for the Communists. One or two still thought that if the caste system came to an end there would be chaos. Most of them do not consider their position to be divinely ordained and express some bitterness towards the middle class. What is new is that they see themselves as an interest or pressure group, as one competing against others, as a class almost. They are bypassing the processes of elite emulation, of Sanskritisation, and are already acting in ways that show structural change in the social system. Mere cultural change is of little interest to them and they do not trouble to change their style of life, despised though it is, though they have the means to do so. Sanskritisation or conversion to Buddhism cannot appeal to them collectively for they are likely to remain committed to the occupation of sweeping. Nor is it likely that in the near future increasing mechanisation will create unemployment among them. The widespread use of the flush system in Banaras has not affected their employment adversely. On the other hand, individuals and families which move into other occupational worlds may attempt to use more traditional techniques such as those described, in their attempt to 'better' themselves. Two sets of sweeper families of Hela subcaste in Delhi have converted to Buddhism under the initiative of educated male members now employed in other types of work. In Banaras, though, there is no sign of such a process. Indeed, occupational mobility is very low. However, those few persons who have succeeded in becoming supervisors of sweepers, clerks or teachers do not show signs of adopting any particular technique of social mobility.

The structural change that sweepers are already involved in is a movement towards a system based on class rather than caste. It is not as yet, a movement towards revolution or communism for sweepers are, in a sense, committed to the *status quo*. Having the monopoly of sweeping (only a limited number of other castes being prepared to replace them) they are not without power in the social system in which they find themselves. They tend, then, to vote for Congress. This power was revealed in the strikes of municipal sweepers in both Kanpur and Delhi in 1972.

NORTH

Politics of Drive against Smugglers

LIKE the prosperous farmers, the smugglers too have a flourishing and influential lobby in Punjab. Smuggling of gold, scarce consumer goods, and other articles across the border between the two Punjabs has enabled countless adventurers, especially in Amritsar district, to make fortunes. Many of the smugglers have turned politicians or have protectors in high quarters. Congressmen are as involved in such arrangements as members of the opposition parties. No wonder that Chief Minister Zail Singh's recent drive to apprehend smugglers has caused great consternation among legislators and others, irrespective of political affiliations. Under his directive, the state police is reported to have drawn up a list of politician-smugglers who are to be hauled in under MISA. Zail Singh started the anti-smuggling drive with the arrest of Jai Inder Singh, a former Congress MLA, who had made Amritsar the centre of his activity and is alleged to have made lakhs of rupees through a smuggling network. Naturally by having him arrested, the Chief Minister has brought down a hornets' nest about his ears. Pressures from all quarters and of all sorts are being brought to bear on him for the release of Jai Inder Singh and for the abandonment of the drive against smugglers.

Blurred Dimension

The drive has lately slowed down. The initial enthusiasm seems to have faded. According to a spokesman of the anti-Zail Singh group, the smuggler-politicians threatened to make things difficult for Zail Singh unless he reversed his policy. While the general public commended the step taken by Zail Singh against a powerful Congress leader, the fact that Jai Inder Singh had sharp differences with Zail Singh has given a new blurred dimension to the episode. Political vendetta has been alleged, and this view has been made credible by the government's failure to arrest any other important personage on similar charges. Akali and Jan Sangh leaders — lately acting in close co-operation in the anti-Zail Singh campaign — have been particularly critical. In a statement, Parkash Singh Badal, leader of the Akali opposition, and Hit Abhilashi, state Jan Sangh chief, warned that if the Chief Minister harassed rival politicians under cover of the anti-smuggling campaign, they would oppose his moves. The Chief Minister's many critics have pointed out that by contrast Zail Singh has taken no action against at least two of his ministers about whom there are specific allegations of complicity in smuggling. A group of Punjab Congress MLAs met Central leaders recently to persuade them to get Jai Inder Singh released.

Road Transport Racket

Nor is the smuggling racket the only gold mine for the politicians. They are alleged to have made handsome gains through road transport operations also. By shielding key functionaries of the nationalised transport (Punjab Roadways) — who have been running unauthorised trips of buses on state and inter-state routes — and by adjusting the timings of government buses so as to allow the cream of the traffic to private road operators, some politicians have caused losses to the public exchequer while lining their pockets. For years, in fact, private road operators have wielded extensive political power and have succeeded in dissuading the administration from nationalising more routes. Originally the road routes were shared by the government and private bus companies on a 50-50 basis. The government share was later raised to 60 per cent, but the routes allotted to the private operators were so manoeuvred as to leave their share of the total mileage unaffected — or even increased in some cases. What Punjab has thus lost is evident from the fact that Haryana, which has opted for almost 100 per cent nationalisation of routes, has made a success of its road transport. Punjab has maintained its 60-40 ratio for many years and does not intend to change it in the near future. Like the landlords and the smugglers, the major private road operators are known to make handsome contributions to the ruling party's funds.

There are also no smuggling scandals in Himachal Pradesh, though the state territory extends right up to the Tibetan border. But there is horse-trading of quite another kind. A major fertiliser scandal came to light a few weeks ago: while the farmers were clamouring for essential farm inputs, a large quantity of fertilisers is reported to have got 'wasted' because of the Agricultural Department officials' 'inefficiency'; indeed, reports have it that some officials in charge of fertiliser distribution connived with the big landlords to create an artificial shortage, as a result of which for many months the input was made available only at black-market prices; supplies were actually stored at far-flung places and were beyond the reach of those who could not pull strings at high levels.

In recent months, several industrial licences too have been misused in Himachal Pradesh. By establishing fake units and disposing of the allotted raw material in the black market, the so-called entrepreneurs have minted money. Some industries department officers too are suspected to have gained in the process.

Break-up of Rebel Group

While these reports have not made much of an impact on the public and have been passed over as nothing unusual, Chief Minister Y S Parmar's sudden success in splitting the 18-strong dissident group (which had been troubling him for many months) will surely change the course of Himachal politics. On November 15, three of the dissidents openly pledged unequivocal support to Parmar, signalling a break-up of the rebel group. One of the three is a former Deputy Minister. On November 18, yet another dissident returned to Parmar's fold.

Two main reasons are given for the virtual termination of dissidence in Himachal's ruling Congress — *viz*, frustration among the 18 rebels over their failure to dislodge Parmar despite a sustained campaign occasionally supported by some top Central leaders, and the inept handing of the dissident movement by its leaders. Parmar's emissaries had been trying meanwhile to lure away some of the rebels, but their efforts had proved futile so far. All the four former dissidents now stress the urgency of strengthening the Chief Minister's hands "in the interest of the state". Parmar must now heave a sigh of relief.

INTERNATIONAL AFFAIRS

A Meeting of Needs

G P D

FOR nearly five years now, the normalisation of Sino-Soviet relations is being talked about. In 1969, Premier Kosygin had stopped by in Peking, on his way to Moscow from Hanoi, for talks with Chou En-lai at the Peking airport. Ever since then speculation on the prospects of Sino-Soviet relations has been rife. And there have always been signs that the impasse in Sino-Soviet relations may not be quite so hopeless.

The latest in the series of such signs has been the message which the Chinese Communist Party has sent to the CPSU on November 7. The message talked of a non-aggression treaty between the two States provided it is followed by disengagement of troops on their borders. This was, clearly, a rather belated response to Brezhnev's proposal of a no-war pact. To balance this soft approach, the Chinese ambassador to Moscow staged a walk-out of the Anniversary banquet on November 7. Apparently, he did not approve of Gromyko clubbing the Chinese with 'extreme reactionaries'. This walk-out, once again, suggested that normalisation of Sino-Soviet relations was not as close as the Anniversary message might have led one to believe.

But, then, it might not be very far either. The Chinese are probably looking forward to peaceful co-existence with that revisionist social system. Having at last struck a working relationship with the anti-imperialists it should not be very difficult to work out strategies to co-exist with the revisionists. Where there is a will, there is normalisation.

A closer look at the present international system would show how the Sino-Soviet relationship is a particularly unnatural one. It would seem that, apart from the two super-powers who dominate the system, there are three other more or less autonomous centres of decision-making. They are: the EEC, Japan and China. This pentagonal distribution of world power has one major weakness. The Sino-Soviet arm of the pentagon is a broken one. The level of communication between China and the Soviet Union is much lower than the level between any other two points of the pentagon and even lower than the level between any other point and China or the Soviet Union. This unnatural relationship leaves the pentagon of international power today rather weak. It is not in the interests of any one of the five centres of power to let this unnatural state continue. More importantly, Europe and Japan would want to alter this situation. It cannot be difficult for them to see that the only power which benefits from the situation is the US. Already, the power-equations within the pentagon are by no means equal. The two super-powers are well ahead of Europe and Japan in everything. So both Europe and Japan have everything to gain from independent China's capability to talk with Moscow and Washington.

Even Moscow may want the situation to change. It cannot go on letting Kissinger have the initiative in the Far-East all of the time. However reluctantly, it will have to concede a certain equality to Peking. The major hurdle in the normalisation of Sino-Soviet relations has been the Soviet refusal to recognise the simple fact that the strategies which work in the West cannot, and do not, work in the East. In short, that East Asia is not East Europe.

Even US foreign policies in East Asia were based on the misunderstanding that East Asia was East Europe, that Vietnam was but another Bulgaria. It is strange but true that the Soviet leaders too did not recognise that China is neither Hungary or Czechoslovakia. The US has had to take a new look at the world. It would be small wonder if its partner, the USSR, did the same.

The ideological debate between China and the USSR would, of course, continue. That has nothing to do with the 'normalisation of relations'. In fact, it is possible to perceive quite clearly some phases in the Sino-Soviet relations. Upto roughly 1964, the Chinese attack on the Soviet Union was more ideological in character. The State to State relations, although far from good, were not explosive. With 1964-65, the bigger issues of ideology and theory seem to have given place to State to State quarrels culminating in the Ussuri crisis of 1969. The theoretical concerns became territorial concerns. The polemic was replaced by angry abuse.

But we might once again be quite close to a period when excessive concern with territory and arms is replaced by polemic on theory and ideology. After all, normalisation of relations does not mean the meeting of minds. It usually means the meeting of needs. I have a feeling that China and the Soviet Union may be on a threshold of just such a limited understanding — which eliminates small-scale conflicts or a war.

There is, besides, the proposed Communist Parties Congress early next year in Europe. The Chinese manoeuvrability *vis-a-vis* the European parties would suffer if they did not accept a fair and just settlement of the border dispute. It would appear that the CCP's November 7 message to the CPSU is ultimately aimed at demonstrating that the Chinese are always willing to enter into a no-war pact, to negotiate the disputed borders, and so on. The Soviets will now have to make an appropriate gesture — or else the proposed Communist Parties' Conference would not share the Soviet reading of the Chinese role. The chances, therefore, are that the Sino-Soviet dialogue, broken for quite some time, may be resumed once again.

IMC ECONOMIC RESEARCH AND TRAINING FOUNDATION

Offers a Working Session on

INDUSTRIAL LICENSING & M.R.T.P. CLEARANCE

(An opportunity to executives to acquire practical know-how)

Leader of Discussion

K. R. MONDKAR, Senior Executive Officer, TELCO

Saturday, 7th December 10 a.m. to 1.30 p.m.

Venue: Indian Merchants' Chamber, Churchgate, Bombay 20
Fee: Rs 75/- per applicant

Apply to: Director of Research
(76 Veer Nariman Road, Bombay 20
Tel: 29 66 33)

Alembic—where the pursuit of progress is endless!

Sixty-one years devoted to easing human pain, allaying suffering, bringing health to the people, fertility to the soil ...this has been Alembic's mission.

Alembic has placed in the hands of doctors the means to fight almost every disease. Alembic's antibiotic plant is the first in the private sector and the most modern in India. Alembic's home remedies, tonics and nutritional and cough preparations have become household words. Alembic also produces fertilizers, pesticides, cattle and poultry feed supplements to invigorate the land and livestock.

Alembic does not rest on its laurels—its endeavours are continuous. In its up-to-date, well-equipped, well-manned research division it carries out fundamental and applied research in Organic Chemistry, Biochemistry, Pharmacology, Chemotherapy, Microbiology, Immunology...to discover more potent weapons against disease, to find new ways to promote health and growth, and to set ever higher standards for further achievements.

Health assures happiness. Alembic *assures health*

Expanding Core

INDUSTRY MINISTER T A Pai's latest sally, in his breathless runnings-about, has been to sponsor a proposal to extend the concept of 'core industries' to include in it, apart from the basic industry groups, what he calls essential industries, such as cement, sugar, paper, fertiliser, insecticides, textiles and drugs. In effect, what Pai is proposing is a further obliteration of the distinction between the core and the non-core spheres of the industrial sector. Till now, relaxation of the provisions of the Industrial Development and Regulation Act was being talked of only for the so-called core industries. In these industries, units belonging to big industrial houses or those controlled or largely financed by foreign investors were to be allowed expansion. Now these concessions are apparently to be extended over practically the entire industrial sector.

For, once the additional industries mentioned by the Minister of Industry are included in the list, not more than 20 per cent or so of the total industrial sector would remain 'non-essential'. With a little bit of lobbying and patronage, just about any industry could be described as growth-oriented or as supplying essential inputs for some key activity or as producing wage-goods or mass consumption articles. And it could claim various benefits in consequence: it would be generously assisted by public financial institutions, the government would assure it regular supplies of raw materials and the necessary sanctions for expansion would be readily forthcoming. In addition, the Industry Minister has now held out a blanket promise of a minimum rate of return of 16 per cent on capital for these industries.

All this adds up to, quite simply, a negation of planned industrial growth and makes a mockery of ideas of reducing concentration of ownership and control in industry. Even in terms of the objective of short-run industrial growth, these policies are unlikely to work. The government should have learnt as much from its experience since the mid-sixties. It is the progressive dilution of priorities in the pursuit of so-called industrial growth during this period that has been responsible for shortages of vital industrial products which, in turn, have become constraints on industrial investment and growth and have necessitated rising levels of maintenance imports.

If inducements could have done the trick, a great deal should have happened during the past two years when industrial licensing has been liberalised, illegally installed industrial capacity has been regularised, the anti-concentration aspects of the MRTP Act have been virtually put in cold storage and generous increases have been effected in controlled prices. Yet the stagnation of industrial output and investment has deepened. The Industry Minister's lament that not even 25 per cent of the additional capacity licensed for cement is being implemented should prove the point. And should it be suggested that the price control on cement has something to do with this, there is the case of paper where successive increases in prices have failed to bring about either expansion of output or investment in fresh capacity.

The fundamental imbalance afflicting the industrial sector cannot be corrected by isolated acts of investment in the private sector. On the contrary, by allowing investment in all manner of industries and by guaranteeing a minimum rate of return to everybody, the government will only aggravate the chaos. Growth depends upon an assured market just as much as it depends upon the availability of adequate elasticities on the supply side. Because of the manner in which incomes and prices have been allowed to drift in recent years, both these conditions have ceased to obtain for a whole lot of industries. Indiscriminate underwriting of the rate of profit, as T A Pai has now promised — no doubt, by adjusting prices upwards for industries which are under pressure — will only make matters worse. By raising prices arbitrarily, the government would further aggravate the perversity in the pattern of pricing and income distribution, and so further distort the demand and supply situations facing industries.

In any systematic approach to overcoming the demand and supply bottlenecks to industrial growth, raising the level of public sector investment in industry will have a crucial place. Indeed, to understand the present industrial stagnation one has only to go over the long list of public sector projects in industries like fertilisers, aluminium, cement and paper which have been jettisoned or held up over the last five or ten years. Yet expansion of public sector investment in industry appears to figure nowhere in the Industry Minister's agenda for action for revival of the industrial sector. This is what makes it difficult to believe that, for all his apparent agitation, T A Pai means business.

Motivation and Organisational Effectiveness

Ishwar Dayal

Motivation and Organisational Effectiveness edited by S K Roy and A Sreekumar Menon; Shri Ram Centre for Industrial Relations and Human Resources, New Delhi, 1974; p XII + 267; Rs 35.

OF the ten papers in this volume nine are original and were written specially for it. The editors have done well to compile material on the two factors motivation and organisational effectiveness because these subjects do, as the editors say, explain in some measure the "problem of under-utilisation of abilities, frustration-instigated behaviour, unfavourable job attitudes, alienation, and low morale". These problems "... prevail as much among managers and supervisors as among workers". The editors feel, and I agree with them, that a mass of evidence and experience relevant to Indian conditions is available in this area and has implications for managerial effectiveness; the present collection is meant for both the practitioner and the academic.

The collection of ten essays covers four themes: (i) the socio-cultural milieu and work motivation; (ii) job satisfaction, motivation, and job behaviour; (iii) impact of organisation on employee; and (iv) achieving organisational effectiveness.

Socio-Cultural Factors

The first theme concerns the influence of socio-cultural factors on motivation at work. The three papers on this theme discuss how the values, attitudes and certain basic behaviour patterns develop in the process of growth, and how these are primarily influenced by the family, the community and the social environment of the individual concerned. The organisational policy and practices may or may not be consistent with the environment. In the latter event, the employees would find adjustment to work more difficult. The consequences of maladjustment would be estrangement with higher levels of management, alienation, high absenteeism, etc.

The three papers touch upon different aspects of the theme on the socio-cultural influence on the employee at work. J B P Sinha in the first paper emphasises through illustrations that the employees' own psychological needs, complexes, values, and habits affect adaptation to industrial patterns of working, even in cases where the institutional leadership is sensitive to human problems. Sinha's remedy, implied in his conclusions, is that the psychological dispositions of people in an organisation vary and the leadership has to be sensitive to these factors while developing relationships among people.

The second paper by J B Miner uses cross-cultural data to suggest that though there are similarities across cultures in motivational patterns related to work, there are sufficiently large differences that explain, at least in part, variations in economic productivity. Miner also suggests that there is evidence that culture change can occur and it can be induced so that external forces do not inhibit productivity.

The third paper, by B N Mukherji, concerns itself mainly with achievement values in a culture and conceptualisation of these values. This he terms as a three-facet model of achievement values. Mukherji's conceptual frame attempts to explain differences among people in achievement values. He suggests that "achievement values can be described not only in terms of variations with regard to stable dispositions towards how one attaches importance to competence, competition, and future time perspective but also in terms of the intensity, probability, and extensity of achievement values that are aroused by situational factors" (p 73). The suggested model in this paper is based on normative arguments and not empirical data.

Work Systems and Environment

All three papers, based on research findings abroad and some in India, use data in varying degrees to develop their respective theses. There is a considerable body of knowledge to support the conclusions drawn by Sinha and Miner. Perhaps the reasons for failure of participative practices in Indian industry may well be the different sets of experiences in the family and at work. By and large the family environment provides security and nurturence not normally available in the work environment. At any rate, a more personalised network of relationships, as against system or work-based relationships characterise the family, though industry seems to require the latter. There has been little attempt in India to examine what kind of work systems might be necessary in the Indian environment (Dayal, 1974). In contrast, it is interesting that Japan has evolved relationships at work which are consistent with their environment (Nakane, 1970).

There is evidence also to support Miner's thesis that change can be induced and people would adjust to the new requirements. Such an effort would have to be deliberate and planned (Dayal 1971, De 1971). A sharp break in the characteristics of the environment and those of the organisation may well be a significant factor for near-neurosis in most organisations in India where increasingly the emphasis is on the form rather than the substance, the results being less important than the preservation of one's status.

Individual Needs and Job Satisfaction

The second theme in the book on job satisfaction, motivation and job behaviour also has three papers. This section emphasises the impact of individual needs and dispositions on satisfaction at work and its impact on performance. The first paper by A M Dolke examines the empirical studies on job expectations of blue-collar workers and the effect of intrinsic and extrinsic factors in job satisfaction. Dolke suggests that job satisfaction is important from the point of view of performance at work and mental health of employees. These are both important for managing organisations. S K Roy and G A Raja have reviewed the literature on the motivation of managerial and supervisory personnel in industry. Their review leads to the conclusion that the practices followed in Indian industry to motivate supervisors and managers in fact lead to frustration and negative goal-oriented behaviour. The authors suggest that "motivation not only implies mobilising people's energy regardless of the means; a proper mix of these means must be selected with due emphasis on intrinsic motivation. Job satisfaction *per se* may not favourably influence work performance and behaviour unless the satisfaction is achieved by optimising intrinsic and extrinsic rewards" (p 135).

The third paper on the second theme is by D Sinha who has reviewed the literature on the subject and has raised the significant question that merely asking people how satisfied or otherwise they are with their jobs does not necessarily provide an index of job satisfaction or morale. Sinha has argued, and this view is fairly widely shared now, that job satisfaction is an overall complex of attitudes and factors in the social environment of work. It is a collective index and consists of a complex set of variables. Sinha has discussed the relationship of job satisfaction with job performance, absenteeism, turnover, accident and adjustment.

The three papers in section two usefully survey the empirical data on what makes a person apply himself in a job and how an organisation can induce behaviour that results in the wellbeing of both the organisation and the individual. Though the data is rich and competently handled by the authors in all three articles, I am left with the feeling that the weakness of social science research continues to lie in the limitations of the methodology used to study a real-life phenomena. Reality is far more complex than allowed for in the research design.

As pointed out by the authors, job satisfaction in itself is a complex summative index as profit is for business organisations and the expression of satisfaction or otherwise with individual aspects of work may inadequately predict how the person in fact behaves. There are many factors within the individual's make-up and in the environment which affect satisfaction but these are difficult to identify and to measure. The concept of job satisfaction has limited application in managing social systems. The concepts are useful and we need to continue research toward grasping a better understanding of the reality around us in all its complexity. At present these concepts can only be directional and, I believe, they cannot be fully used for developing managerial practices in organisations.

Impact of Organisation on Employee

The third theme included in the book is the impact of organisation on the employee and has two papers. The concern of the editors in this section is to highlight how the organisational design or the work practices influences the performance of the employee at work. Sreekumar Menon reviews the definition of organisational climate and suggests characteristics that influence and also differentiate one organisation from another in respect of human motivation. He suggests that the climate, as characterised here, influences the satisfaction or otherwise of employee needs and implies that this aspect is related to performance at work. D M Pestonjee reviews some studies to show that the way in which the organisation is structured or the style of a leader influences employee satisfaction and performance. The author concludes from his survey that "employee-oriented, supportive, democratic structure is highly conducive to satisfaction and high morale" (p 226).

I believe that in this section the review of literature is selective and the controversy in literature both in respect to climate and leader-behaviour is inadequately brought out. As in the case of studies on satisfaction, climate is also a summative concept and the sum total of the factors comprising climate as listed by Menon may not reflect the behaviour of people at work.

Leader-Behaviour

It is often found in organisations that the leader may not be the most popular person and people may not respond to him with as much warmth as they may do to others, but he may have provided an environment or a system which enables people to do well and gain greater confidence in their work. Many measures of climate explain inadequately the behaviour of people at work. The factors isolated by a social science researcher to obtain data on single aspects are at times misleading because the totality of an organisational reality fails to yield to simple measures, and I believe these measures are sometimes misleading. This comment also holds true of leader-style emphasised by Pestonjee. The democratic and other labels for leader-behaviour are limiting in conception, and variations of these in organisational situations should be fully taken into account. Leader behaviour may vary according to the situation and also according to the task system. The simple typology used by Pestonjee explains only a few situations and cannot be seen as a theory.

The fourth theme is organisational effectiveness and includes two papers. The first paper by P R Poduval suggests that an organisation is both a socio-technical system and one that is influenced by external society and its organisations. He suggests that effectiveness of an organisation depends upon all these interdependent aspects of the organisation. Ishwar Dayal has examined the impact of legislation on the effectiveness of an organisation. The internal system of a firm responds to the external demands by internally developing systems which correspond to those demands. Thus, the law-maker must recognise the implications of the laws on the enterprise system.

The themes included in the book are important. I am not sure how the last two themes on organisational climate and effectiveness relate to the first two which deal primarily with the impact of culture and psychological predispositions on performance at work. The relationship is remote. The themes chosen, however, are important in their own right and the most significant contribution of this book is that it brings together a large number of studies on motivation from dispersed sources. These could be useful to students of the subject.

The language of most of the papers is likely to be unfamiliar for most managers and administrators and it is unlikely that the book would sustain their interest. There is very little discussion of the application of research findings by the authors and the question that appears to puzzle most interested managers still remains wide open: how should management apply the knowledge culled from research, granted that the findings were generally accepted by them?

Briefly, the book's value lies in its choice of extremely relevant themes; and the data it provides which are of a kind not easily available to everyone interested in the subject. The book's usefulness would have been enhanced if its language had been less unfamiliar to those for whom it is written and had the editors spelled out how the findings of empirical research could be utilised by the management of an enterprise.

Stock Price Level—A Predictive Analysis

Pronab Sen

The level of stock prices and their movements over time have always been of prime interest to people—as large investors intent on making a 'killing' on the market, or small ones more concerned with finding a relatively safe depository for their savings. In the last twenty years or so, a number of fairly detailed studies have been made to determine the factors which most affect stock price movements. These studies usually focused on an industry and the individual firms therein, and attempted to isolate the attributes which made the stocks of one company more desirable than another's.

Distinct from these 'micro' type studies, other researches of the 'macro' variety have been made. These studies attempted to draw a linkage between movements in the general stock prices and the movements of certain other broad general economic indicators; and hence to try and predict the future levels of stock prices. It is the attempt of this paper also to examine the relationship between the level of stock prices in one time period and some general economic indicators of the previous time period.

The paper is divided into five major sections. In the first section, is presented the conceptual basis of the analysis. In the second, a brief review is made of some earlier literature on which our analysis is based. The third and fourth sections cover the data itself and the analysis of the data. In the fifth section, the analysis is summarised and its likely limitations indicated.

I

IN this paper, it is our effort to draw a causal — and hence predictive — linkage between a measure of the level of stock prices and some independent variables. As our independent variables we have selected the absolute level of money stock, the rate of change of money supply, the level of productive activity in the country, and the rate of change in the productive activity. It is our hypothesis' that such a relationship does exist and can be used for providing an indicator of the future. We have made use of US data for this case study only because of their quality and coverage. We have defined the level of stock prices to be the quarterly index of stock values as given by the Standard and Poor's Corporation.

The stock of money has been defined as the quarterly value of the sum of liquid currency and demand deposits in banks, seasonally adjusted. This is the definition used by the Federal Reserve Board for computing their value for the stock of money (M_1).

Finally, we have used the Gross National Product (GNP) to define the level of business activity. The other two independent variables, the rates of change in money stock and in the GNP, have been defined as the change in these variables from one period to the next as a percentage of the absolute figure for the first period.

We assumed, as our theoretical base, that the relationship between these variables would be of the following type :

$$SP_t = a + b\,(GNP)_{t-1} + c(Rg)_{t-1} + d(MS)_{t-1} + e\,(Rm)_{t-1}$$

$(SP)_t$ Index of stock prices in time period t

$(GNP)_{t-1}$ Cross National Product in period (t—1)

$(Rg)_{t-1}$ Rate of change of GNP in time period (t—1)

$(MS)_{t-1}$ Stock of money in time period (t—1)

$(Rm)_{t-1}$ Rate of change of money stock in time period (t—1)

This equation represents a linear relationship between the variables. In using this type of a model, the following assumptions were made :

(a) The determination of the stock of money in the economy is external to the private sector, who exercise no control whatever on it.

(b) Changes in the nations rate of growth of money supply are determined independently of private control.

(c) The nation's GNP and changes in the rate of growth of the GNP, though determined largely by the private sector, is not controlled by any collusion between the major corporations.

(d) Changes in the price level of the economy affect all the variables to the same extent, and hence leave the relationship relatively unaltered.

The research design used, was to run a multiple regression analysis between the dependent variable, index of stock prices, and the independent variables, money stock, rate of change of money supply, GNP, and the rate of change of GNP. To determine the order in which these variables should enter the regression equation, a partial correlation analysis was employed to evaluate the relative importance of the variables in terms of the correlation coefficients. This analysis is expected to generate a regression equation which may be used for predictive purposes.

II

It is is beyond the scope of this paper to examine exhaustively the literature which pertain to the investigation in hand. We shall briefly outline a few of the more important recent studies on the effects of money supply and GNP on stock prices. A short summary of the basic economic rationale behind these relationships would, however, be desirable.

As has been mentioned earlier, classical monetary theory has tended to hold that changes in money supply directly affects the total output of the economy, at least in nominal terms. The so-called 'Neo neo-classicists', led by Milton Friedman of Chicago, subsequently analysed the effects of changes in the money supply on the individual portfolio balances. They conclusively proved that there is a definite relationship between the two. Such changes in the optimum portfolio would naturally give rise to changes in the demand for securities in the stock market, which would push the stock prices up or down, as the case may be.

The relationship between the GNP — and changes in its level — and stock prices, is somewhat more diffused. Basic Keynesian theory holds that changes in the level of GNP directly affect the personal disposable income of individuals. This has two effects. First, the liquidity effect, which affects the individual's demand for assets with different levels of liquidity — and hence alters the stock market immediately. Secondly, it affects the consumers' demand for goods and services, which influences the investment climate in

A dream today, a reality tomorrow

Today at Mithapur, young India, conscious of the past, urged on by the present, confidently dreams of a glorious tomorrow.

Their immediate dream is of a new complex—massive, self-sustaining, long-range and innovative—harnessing the sea, the sun and ultimately the atom to banish hunger from their land and to generate greater economic self-sufficiency, more and more independence.

There is a beginning but there is no end to the work of bringing purposeful prosperity to the people of India. Harness the sea, the sun, the atom and from Okhamandal—the land of salt—fertility will flow to the entire country.

TATA CHEMICALS LIMITED

GMTC-10-284

the economy. This gives rise to variations on the pressure in the stock market — and hence on the stock prices.

We now proceed to some relatively recent literature. A number of studies have recently focussed attention on the channels of influence of money on stock prices. The more important of these authors are Hamburger and Kochin (1972), Homa and Jaffee (1971), Keran (1971), Palmer (1970) on Sprinkel (1964, 1971). Most of these authors have assumed that the influence of money on aggregate stock market values is mainly indirect, working primarily through its effects on interest rates and expected corporate earnings. A few however, have, made attempts to examine the more direct effects — such as through the level of risk.

One of the earliest statements about an investment rule was made by Beryl Sprinkel in 1964: "a bear market in stock prices was predicted 15 months after each peak in monetary growth, and that a bull market was predicted two months after each monetary growth trough was reached."[1] This rule, however, held largely true from 1918 to 1960; since then it has not worked well. The problem is that in the 1960's the variations in the growth rate of the money stock have become less continuous and the cycles that do exist are less than 15 months.

Palmer drew a relationship between two sets of data — money supply and Stock Price Index. Both these monthly time series were first converted to percentage changes to minimise secular growth factors. Secondly, monthly percentage changes were transformed to annual rates. Finally, the annual rates of monthly change were converted to a six month moving average, to smooth out the time series. By analysing these two time series, Palmer arrived at the following three conclusions:

(a) There is a distinct relationship between changes in the money supply and movements of common stock prices.
(b) There is a close relationship between the turning points of the two. Money supply usually led by a few months in a lead-lag type of relationship.
(c) A one per cent change in the rate of growth of money supply led to an approximately ten per cent change in stock prices.

In 1971, Keran developed a fairly complex regression equation to predict the future levels of stock prices. His stock price equation was:

$$SP_t = -35.44 + \sum_{i=0}^{2} 1.39\dot{m}_{t-i} -$$

$$R^{-2} = 0.9772$$

$$\sum_{i=0}^{7} 6.44\dot{y}_{t-1} -$$

$$S.E. = 2.89$$

$$\sum_{i=0}^{16} 14.34\dot{P}_{t-1} + \sum_{i=0}^{19} 5.27e_{t-i}$$

$$D.W. = 1.63$$

$\dot{m}$ = percentage change in real money balances

$\dot{y}$ = rate of growth of real income

$\dot{P}$ = rate of change in the GNP deflator, 1958 = 100 (to include the effect of inflation)

e = corporate profits after taxes, deflated by a price index

Commenting on the results of his study, Keran stated: "According to this analysis, changes in the nominal money stock have little direct impact on the stock prices, but a major indirect influence on stock price through their effect on inflation and corporate earnings expectations."[2]

The study made by Homa and Jaffee in 1971, was also an attempt to use regression analysis, which would lead to greater flexibility in the specification of lagged relationships. Such an analysis, according to the authors, allows for more continuity in forecasting and the estimated relationship can be revised as more data becomes available. This method also generates forecasts which are quantitative and the standard error of such forecasts can be easily calculated.

They defined money supply to be seasonally adjusted demand deposits plus currency outstanding, six month moving average at the end of the quarter. The rate of growth of money supply was defined as $(M_t - M_t - 1/M_t - 1$, which was measured at a quarterly rate in percentage points. To this data they fitted a number of regressions with alternative lag structures. The relationship yielding the best fit was found when the level of the money supply variable was included with its current value and the growth rate of the money supply was specified with both its current value and a one quarter lag. The regression equation thus defined was:

$$SP = 26.77 + 0.61M + 3.14G + 1.46G_{-1} + 0.874_{u-1}$$

$R^2 = 0.968$ S.E. = 3.7 D.W. = 2.14

This equation explained 97 per cent of the data variance. This high correlation, however, was offset by the large co-efficient of serial correlation (0.87), which implies that 87 per cent of the previous periods error would recur if the serial correlation were not taken into account.

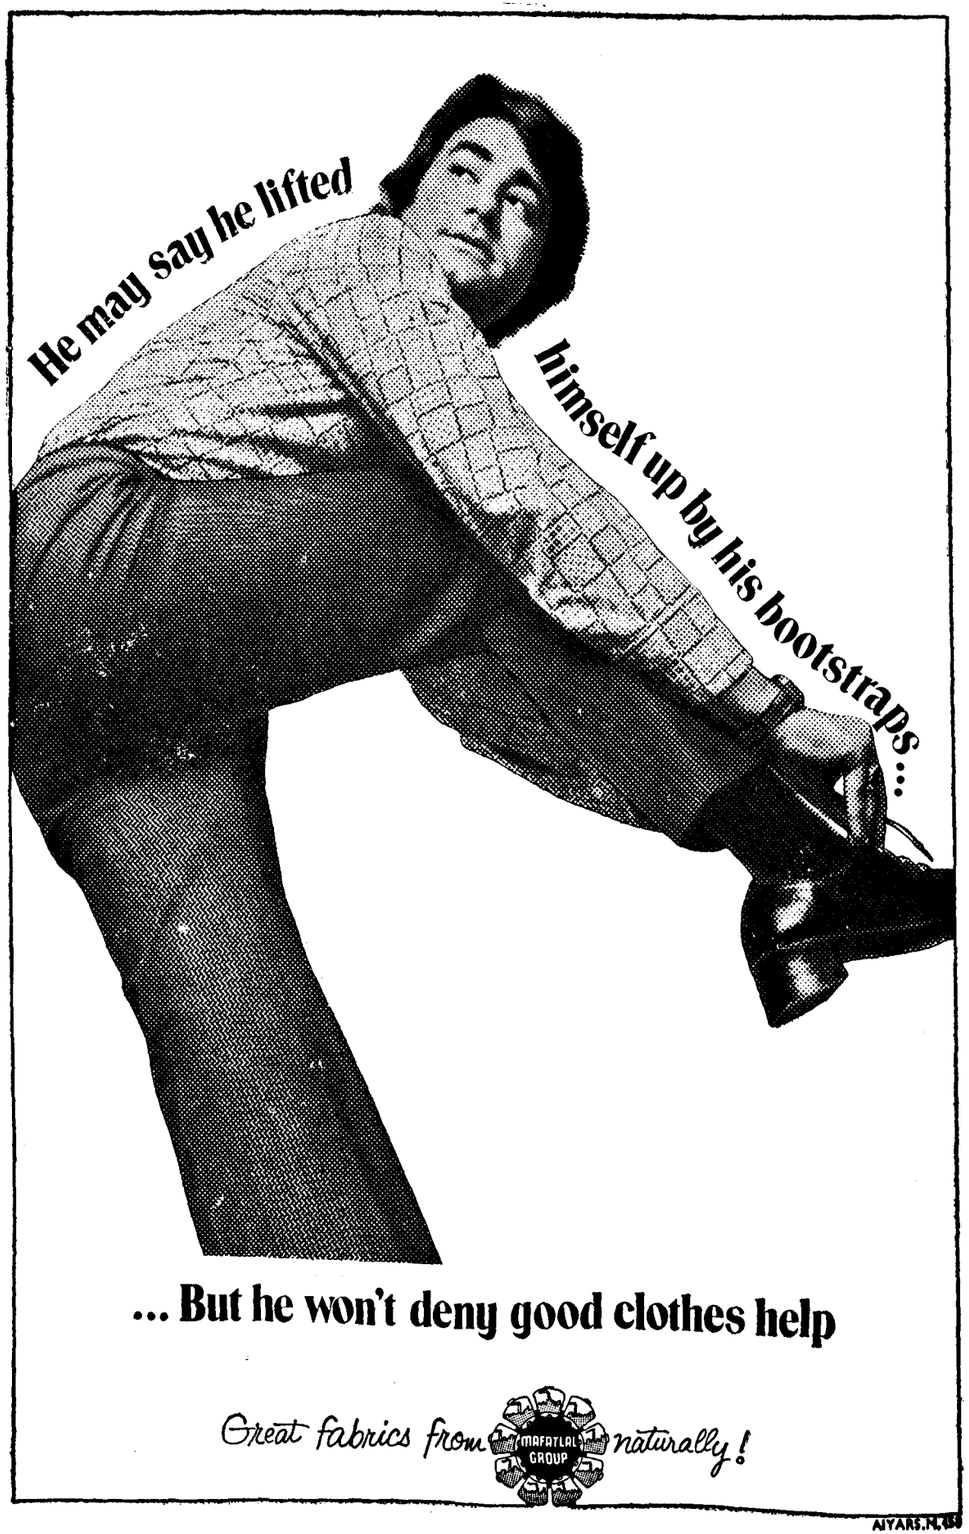
There was also another serious problem. If this model was to be used for predictive purposes, then some method would have to be devised by which it would be possible to predict the rate of growth of money supply, and hence the level of money supply in the coming period. In order to do this, the authors derived another regression equation of the following type:

$$G = a_o + a_1 u^2_{-1} + a_2 P_{-1} + a_3 BOP_{-1} + a_4 G_{-1}$$

u = unemployment
P = rate of inflation
BOP = ratio of US reserve assets to total US short term liabilities to foreigners.

Using these two regression equations, they were able to predict future stock prices with the accuracy indicated by the statistics:

Correlation (R^2) = 0.908
Root-Mean-Square Error = 4.847
Mean Error = —0.784



As we can see, this analysis gave excellent results as far as statistical predictability is concerned. Yet, despite its accuracy, the model is just too complex for the common investor to use. In fact, it would be practically impossible for most people to calculate the values of most of the variables included in the two equations.

Finally, the study carried out by Hamburger and Kochin in 1972, differed from the previous ones in terms of the object of the investigation. They were not so much concerned about the precise relationship between money and stock prices, but more about the channels of influence. Previous studies held that the money supply affected stock prices only indirectly through its effects on interest rates and expected corporate earnings. These authors postulated that there was a more direct relationship between the two. The model they used for equity pricing was:

$$P_0 = \sum_{0}^{\infty} M_t \frac{E_t}{(1 - i_t + r_t)^t}, \text{ where}$$

P_o = current price of an equity
E_t = expected earnings in time period 't'
i_t = risk-free rate to time 't'
r_t = risk premium to time 't'

Theoretically, they showed that changes in the stock of money affected all

of the determinants of stock price for individual companies. Hence they deduced that this effect would be magnified when the whole stock market was taken into account. To show this result empirically, they used the Keran model mentioned earlier, controlling for the different variables. Through this analysis they showed that money has ... "a direct portfolio effect, although it is difficult to completely disentangle this effect from the one operating through corporate earnings expectation."[3]

As is evident from these studies, there is sufficient evidence of the relationship between money supply — and changes in it — with the level of stock prices. These same studies also provide indication of the channels of influence of GNP on stock prices — for example, the effect on corporate earnings expectation.

III

As we have mentioned earlier, this study attempts to draw a regression relationship between the levels of stock prices, the level of money supply, rates of change of money supply, level of GNP and the rates of change in the GNP, with a given lead-lag structure of one quarter.

As a measure of the level of stock prices, we used Standard and Poor's 500 Stock Price Index — Composite. The monthly averages of the weekly indexes were further compressed to yield a quarterly average value for the Index. The level of money supply was defined as the sum of currency and demand deposits, seasonally adjusted. This is the equivalent of M_1 as defined by the Federal Reserve Board. The figures for this variable were also collected in monthly averages. These averages were further reduced to quarterly figures by simple averaging. The figures for the Gross National Product, or Expenditure, were gathered from the *Survey of Current Business*, a publication of the US Department of Commerce. The data was available as seasonally adjusted quarterly totals at annual rates.

The rates of change of money supply and the GNP were calculated on the basis of the following equations:

(a) $Rg = (GNP - GNP_{t-1})/GNP_{t-1}$

(b) $Rm = (MS_t - MS_{t-1})/MS_{t-1}$

Both these sets of values were expressed in percentage points. The complete set of data is presented in the Table.

TABLE A: THE DATA USED

Year		Stock Price ($)	Money Supply (billions of $)	GNP (billion of $)	Rate of Change of MS	Rate of Change GNP
1963	1	65.55	148.733	557.4		
	2	69.67	149.667	584.4	0.628	1.178
	3	70.967	151.267	594.7	1.069	1.797

IV

The first step in the analysis of the data available, was to run a simple correlation between the dependent variable and the independent variables. The results of this were as seen in Table B.

As we can see from these results, the stock prices are most affected by the quarterly levels of the GNP and the quarterly money supply. However, the other two variables, too, give correlation co-efficients which are fairly significant. As a result of this analysis we decided to include all of these variables in the regression analysis.

The next step was to determine whether any spurious relationships existed or not, and in which order the variables should enter the regression computations. In order to do this, we employed a partial correlation analysis between the dependent variable and each of the independent variables, while controlling for all of the other independent variables. The results of this analysis showed that, for all of the variables, the partial correlation co-efficients were still significant within the 5 per cent significance level. There was, however, one very surprising result: the co-efficient of partial correlation between the stock price and the

TABLE

	Stock prices (t)	
Rate of change of money supply (t—1)	R=0.3758	s=0.010
Quarterly money supply (t—1)	R=0.7117	s=0.001
Rate of change in GNP (t—1)	R=0.3802	s=0.009
Quarterly level of GNP (t—1)	R=0.7335	s=0.001

level of money supply, controlling for all of the other variables, was —0.2758 at a significance level of 4.8 per cent.

This would imply that there was a spurious, positive, correlation which had been indicated by the simple correlation co-efficients. The effects of the money supply on stock prices were probably not direct — as had been suggested earlier — but were linked indirectly by the level of the GNP. We decided, however, to retain that variable in the regression computation, since the significance level was still acceptable.

The next step was to run a multiple regression analysis between the variables. The order in which the independent variables were entered into the analysis was first the level of GNP, rate of change of the GNP, the level of money supply, and finally the rate of change of money supply. This analysis gave us a regression equation:

$$SP_t = 81.2297 + 0.1455(GNP)_{t-1} + 4.6178(Rg)_{t-1} - 0.6535(MS)_{t-1} + 1.3652(Rm)_{t-1}$$

SP_t = stock prices in time period 't'

$(GNP)_{t-1}$ = level of GNP in time period 't—1'

$(Rg)_{t-1}$ = rate of change of GNP in time period 't—1'

$(MS)_{t-1}$ = level of money supply in time period 't—1'

$(Rm)_{t-1}$ = rate of change of money supply in time period 't—1'

The statistics associated with this regression equation were:

Multiple R = 0.81721
RPsquare = 0.66784
RP square = 0.66786

Essentially what this means is that the regression generated above, explains about two-thirds of the variations occuring in the dependent variable. This is not a very high figure, but it is sufficient for estimating the direction of the stock price movements in the succeeding time period.

V

We have shown in this paper, that a definite relationship does exist between the level of stock prices and the level of the GNP, the level of money supply, the rate of change of the GNP, and the rate of change of the money supply. For the data used, this relationship is embodied in the following equation:

$$SP_t = 81.2297 + 0.1455(GNP)_{t-1} + 4.6178(Rg)_{t-1} + 1.3652(Rm)_{t-1} - 0.6535(MS)_{t-1}$$

This equation explaining about 68 per cent of the variations in the level of stcok prices.

Contrary to most previous studies, we found that the relationship between stock prices of one time period and the level of money supply of the previous time period is a negative one — if we control for some other variables. The positive correlation indicated by many analysts seems to be, according to our results, a spurious one, generated by the close relationship between money supply and the level of the GNP. It is the latter, however, which is the truly important determinant of the level of stock prices, explaining about 55 per cent of the variations.

This analysis does have a number of fairly serious limitations. First, it does not yield a highly accurate figure for the future levels of stock prices. But this limitation is deliberately accepted, since we feel that, if a trade-off has to be made between accuracy and ease of computation, we would prefer the latter beyond a certain point. Moreover, since this analysis is designed for use by the ordinary investor, it is of primary importance that the data used be easy to collect and manipulate, even though some accuracy is lost.

The second limitation is that the analysis gives no indication to what the true channels of influence are. At best, it gives us only a statistical relationship which has prevailed in the past, and may conceivably continue in the future. But without really knowing what the bases of these relationships are, we cannot modify the model over time — except in a purely statistical manner by using the same analysis over and over again on different sets of data. In other words, we have no idea whatsoever as to the limit of the future applicability of the model.

Thirdly, in retrospect, we feel that some measure of the changes in the price levels in the economy should have been included in the analysis. The reason for this is that we were originally postulating that money supply was the major causal factors, and the GNP was only secondary to it. Under that assumption, changes in the price level, which affect the GNP mainly, would lead to some changes in the GNP, but these changes would be offset by corresponding, but less powerful, changes in the real value of money. Now, however, we find that the GNP is the major causal variable. In this situation, the price level becomes very important and may, if included, improve the accuracy of the model tremendously. This deficiency, however, can be easily corrected.

In the final analysis, we feel that this investigation has achieved, to some extent, the purpose that was intended. The results obtained in this paper can be used by the common investors to have a rough idea as to the direction of the future stock price movements. The study can easily be made more accurate, if necessary, by including a few other significant variables which have a direct bearing on stock prices. Like most regression analyses, the results of this study are conducive to greater flexibility in the specifications of variables, and the lagged relationships among them.

Pricing of Safe Deposit Locker Service

Paul Mampilly

The drain on the revenues of commercial banks resulting from the present below-cost pricing of safe deposit locker service is enormous. The banks must be losing around Rs 10 lakhs per year for every 500 cabinets in metropolitan cities.

The consequences of the faulty pricing of lockers seem more alarming when it is realised that the benefit goes to the section of the society which, being relatively more affluent, does not deserve it. Avoidance of such a loss could actually subsidise, for every 500 cabinets, the lending of Rs 2 crores under the differential interest rates schemes.

ARRANGEMENTS for the safe custody of valuables are in demand in urban areas, and more so in the big cities. The Safe Deposit Locker Service was introduced by the commercial banks to cater to this demand. In the initial stages, the commercial banks looked upon this service as a powerful 'loss' leader, useful only to the extent that it was capable of attracting (or retaining existing) lucrative clientele in to the other lines, *viz*, deposits, loans, etc. Supply of Locker Service increased considerably over time. The high rate of occupancy of the commercial lockers in the cities at varying rental rates among the different banks indicates the high demand. The service has thus become an independent commercial activity like any other line of business — at least in the cities. This observation is also shared by branch managers of banks who hold that volume of business in other lines is independent of the availability of Locker Service facility at the branch.

The price-cost relationship developed in this paper, therefore, assumes that the prestige which the locker facility might add on the customer value-scale about the branch does not have significant commercial value. In other words, the study looks at this activity purely as an independent commercial proposition.

Any commercial proposition is justified if the commercial benefits it generates are greater than the sacrifices it leads to. The Safe Deposit Locker Service calls for sacrifices on the part of the bank in the form of:

(a) provision of physical facilities such as premises, strong room, and locker cabinets with the essential accessories; and

(b) expenditure on material, labour, and energy to service the customers.

The service, on the other hand, yields benefits in the form of:

(a) rentals on the lockers hired out, and

(b) margin on the extra business which the locker service might attract or conserve.

The propensity of the Locker Service to command more business in the other lines or to conserve any part of the existing business is hard to establish at least in the metropolitan cities. For the time being, therefore, we ignore the benefits likely arising out of such incremental business. What remains to be measured as benefits, then, is only the rental income on leasing out the locker space. The rental income will be a function of the number and size of lockers leased out, as measured over the life of the lockers and the rates of rental levied on the locker space.

The number and size of lockers leased out or the rate of occupancy will be determined by:

(a) The demand for the various sizes of lockers,

(b) the number of locker cabinets available, and

(c) the mix of the various classes of lockers in the cabinets.

The rates of rental for the various classes of lockers will depend on:

(a) the cost of other alternatives for safe custody available to the customers.

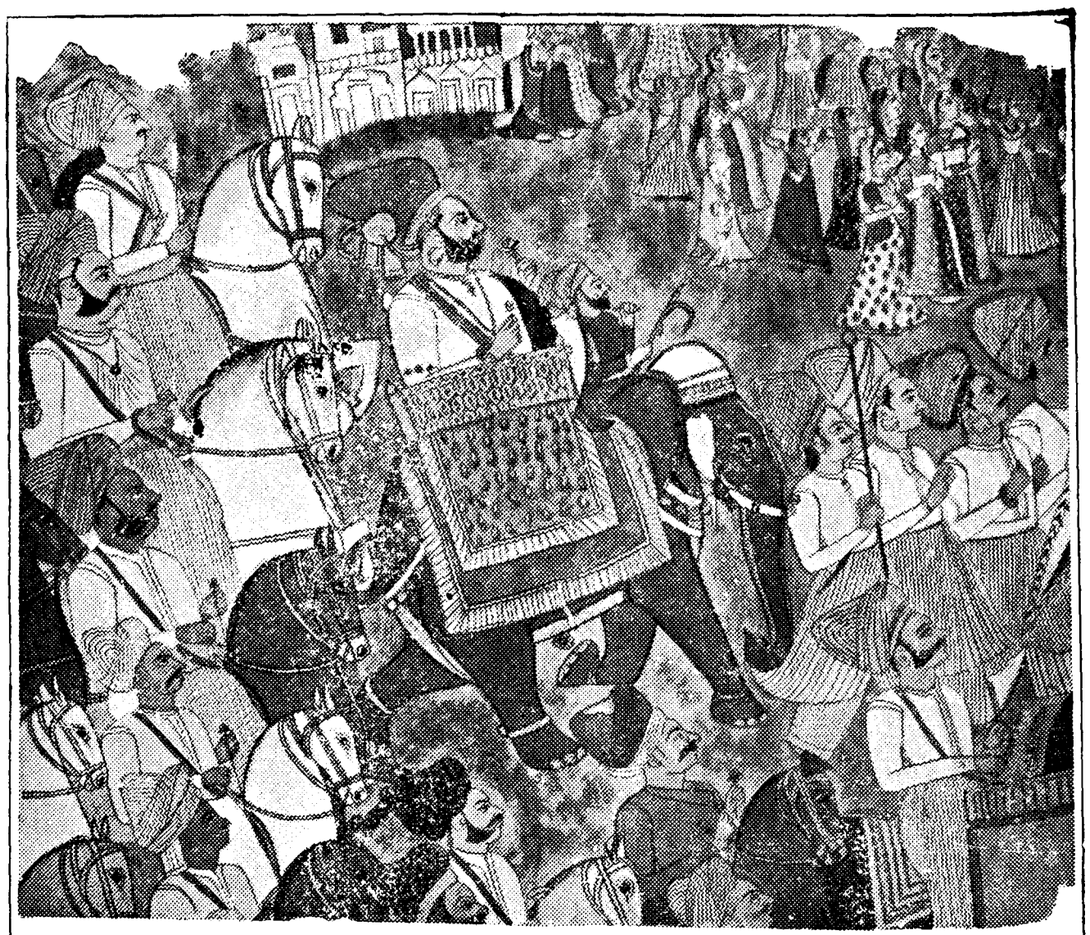
(b) the rates levied by the competitors in locker service, and the space they can supply,

(c) the pricing policy of the bank, and

(d) the price elasticity of demand.

We may note that, the rate of occupancy — influenced by factors listed above — might vary from one class of lockers to another, depending upon the nature and composition of the market in which the cabinet is installed. The nature and composition of the market is related to the class of the locality — such as metropolitan, urban, or rural — and the type of population — such as traders, households, etc.

Maximisation of benefit from a given locker cabinet would, therefore, require (among other things) the ensuring of a mix of lockers of various classes in a given cabinet such that it broadly accords with the expected pattern of demand at the place of installation.



However, Godrej and Boyce (Pvt) who are the manufacturers of locker cabinets make five standard locker cabinets with identical total dimensions (L x B x D) but with varying in the locker mix in five ways. There are 9 classes of lockers — named as A, B, C, D, E, F, G, H, K/L — with different surface areas. Banks buy only one or more of the standard types of cabinets, and invariably do not requisition a cabinet with tailor-made mix of lockers. They mix them to suit the particular demand pattern of the place. This study, therefore, proceeds on the assumption that banks buy cabinets designed by the manufacturers with no say in the size-mix. (It is, however, considered feasible and desirable that terms are worked out with the suppliers whereby banks could have a locker-mix of their choice to suit demand.)

The rates of rent now levied on Safe Deposit Lockers are neither uniform among the banks nor are rationally structured *inter se* various classes of lockers. For example, the State Bank of India levies Rs 12, as annual rent, on class A lockers; the National and Grindlays on the other hand charges Rs 30. Thus a Type 1 A locker cabinet (with 90 A class lockers) brings an annual rental of Rs 2,700 for National and Grindlays Bank under assumption of full occupancy, whereas the State Bank of India nets in only Rs 1,080. Similarly, the rates per square unit, effectively levied on various classes of lockers by the banks, vary irrationally, with no apparent relationship either to the relevant elements of cost or to the feasibility of exchanging space among various classes of lockers.

Ideally, the rates of rental levied on any class of locker should, at its minimum, take care of:

(i) the incremental (and recurring) cost of servicing the locker customer which may be regarded as independent of the class of locker. (We denote this by 'a', being expressed in units of money).

(ii) the feasibility of converting the locker space of one class, either at the purchase stage or thereafter, into that of another (to suit demands) — suggesting the need to reckon the opportunity cost per unit of locker space as uniform, irrespective of the class of lockers. (We denote this as Rs b per square unit of locker surface area.)

We carry our countrymen a little faster and more comfortably these days.

Respecting a rich heritage and improving upon it has always been an M & M tradition. From the versatile 'Jeep' to electronics to defence, we try to make life a little better, a trifle easier for our people. Because, for us, just to be part of the Indian mainstream of life is sufficient reason for all we do. To work together. To carry ourselves just that little further every day. So our country can stand proud among the nations of the world.

TABLE 1: DATA ON LOCKER UNITS
(Godrej)

Sl No	Type of Locker Unit	No of Lockers		Total	Price Including Taxes	Estimated Freight and Handling	Total Cost
		Class	Number				
(1)	Type 1A	A	90	90	11495	575	12070
(2)	Type 1	A	66	75	10415	520	10935
		C	6				
		F	3				
(3)	Type 2	B	48	52	8439	422	8861
		E	2				
		H	2				
	Type 2B	B	60	60	9153	458	9611
(5)	Type 3	D	28	32	7256	362	7618
		G	2				
		L	2				

Note : (i) Data have been collected from Godrej and Boyce and represent current prices and standards.
(ii) Freight and Handling have been estimated @ 5% in the absence of information on actuals.

(iii) the variance in the capital cost of different types of locker cabinets — the capital cost seems (and reasonably so) to increase with the number of lockers in the cabinet. This should suggest a reduction in the cost of making every unit of higher size (reckoned in relation to the least size) included in the cabinet. (We denote the reduction in the capital cost of a cabinet — in relation to a standard base — as Rs E_i for every unit of the ith class locker included therein, and the annual opportunity cost of this variance as e_i .)

The foregoing should suggest that if R_i denotes the rent levied per annum on the ith class locker, it can be expressed as

$$R_i = a + bA_i - e_i$$

Where A_i denotes the surface area (length x breadth) of the ith class locker, and a, b, and e_i are as explained earlier.

The benefit function would depend on the following variables:

a) the rent levied on each class of locker (R_i)
b) the number of lockers in each (n_i)
c) the expectation on the rate of occupancy of the ith class of lockers (p_i)

Benefit function:

$$B = \sum_{i=1}^{9} p_i n_i R_i$$

Substituting $a + bA_i - e_i$ for R_i) we get

$$B = \sum_{i=1}^{9} n_i p_i (a + bA_i - e_i).$$

As indicated earlier, the sacrifices which the introduction of a locker service imposes upon the bank fall under the following broad categories:

(a) provision of physical facilities for the locker service, and
(b) servicing the customers.

Provision of physical facilities would include:

(a) hiring or constructing additional accommodations,
(b) constructing the strong room,
(c) airconditioning the strong-room and customer-lounge, depending upon the type of locality,
(d) provisioning furniture and fixtures, and
(e) installing as many locker cabinet as the demand justifies, inclusive of accessories like permanent records, etc.

All these involve outlays of funds only once during the life-cycle of the product/assets whichever is earlier. (Where accommodation is hired, which is usually the case, it may be fair to assume that outlays recur every year, uniformly, throughout the life-cycle of the product.)

Expenditures on items (a) to (d) remain fairly constant, irrespective of the number of locker cabinets (normal) range), while expenditures on item (e) would vary with the number of cabinets (and hence with the demand for locker space.)

Servicing customers would involve continuous outlay on labour, material (stationery), and electricity. These outlays fall under the following categories:

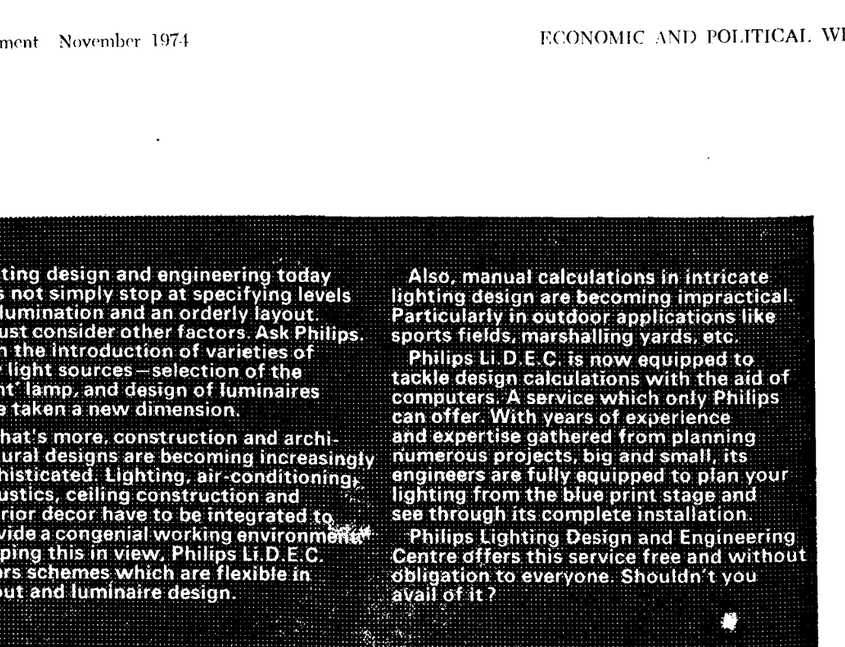
(a) fixed period costs *independent* of the number of locker cabinets, like electricity charges, etc,
(b) fixed period costs *dependent* on the number of locker cabinets like repairs, maintenance of the cabinets, etc,
(c) costs varying with the number of locker accounts, and
(d) costs dependent on the number of customer transactions.

The various costs enumerated above involve funds, which would have otherwise gone into the loan portfolio of the bank. Commitment of funds to locker service thus amounts to forgoing the loaning opportunities to an equivalent extent. The cost of the opportunity forgone may, therefore, be indexed by the yield on loans for corresponding amounts and periods. If the yield on loans were 8.5 per cent (net of costs), an investment of Rs 10,000 in constructing strong-rooms amounts to forgoing annual interest of Rs 850 as long as the investment lasts, together with an amount equal to the diminution in the value of the strong-room at the end of life of the asset/service — assuming that there is no other relevant inflow of funds incidental to, or arising out of the investment of Rs 10,000.

The task of measurement, however, does not end with fixing the values of the sacrifices. We can aggregate these values only if they are expressed in relation to a common time-dimension. Thus the outlays on the strong-room or the accommodation or even the cabinets could support operations throughout the life of the service, whereas the furniture may be of use for only 10-15 years. The costs of servicing the customers, on the other hand, fall under current operations only. Constructing a strong room for Rs 10,000 is equivalent to forgoing a loaning opportunity of Rs 10,000 for a period equal to the life of the asset/service. If we assume (as we did) that the loans yield 8.5 per cent, and that the life of the service is 50 years, construction of a strong-room would have an annual cost of Rs 850 to correspond to the annual interest on loans forgone *plus* an amount per annum as would, at 8.5 per cent, accumulate to Rs 10,000 at the end of 50 years to correspond to the principal recovered at the end of

Lighting design and engineering today does not simply stop at specifying levels of illumination and an orderly layout. It must consider other factors. Ask Philips. With the introduction of varieties of new light sources—selection of the 'right' lamp, and design of luminaires have taken a new dimension.

What's more, construction and architectural designs are becoming increasingly sophisticated. Lighting, air-conditioning, acoustics, ceiling construction and interior decor have to be integrated to provide a congenial working environment. Keeping this in view, Philips Li.D.E.C. offers schemes which are flexible in layout and luminaire design.



Also, manual calculations in intricate lighting design are becoming impractical. Particularly in outdoor applications like sports fields, marshalling yards, etc.

Philips Li.D.E.C. is now equipped to tackle design calculations with the aid of computers. A service which only Philips can offer. With years of experience and expertise gathered from planning numerous projects, big and small, its engineers are fully equipped to plan your lighting from the blue print stage and see through its complete installation.

Philips Lighting Design and Engineering Centre offers this service free and without obligation to everyone. Shouldn't you avail of it?

A gem of a 'light' house:

Philips Lighting Design & Engineering Centre. (Li.D.E.C.)

TABLE 2: ESTIMATED VALUES OF VARIABLES

Name of Variables	Categories of Places I	II	III	IV	Common to all Categories
I Physical facilities independent of number of cabinets					
(a) Strong rooms—annualised cost	365	365	593	730	—
(b) Furniture and fixtures—annualised cost	78	117	234	468	—
(c) Total (m_1)	443	482	827	1198	—
II Annualised cost of standard locker cabinet (m_2)	—	—	—	—	1229
III Fixed annual costs independent of number of cabinets					
(a) Rent for space	—	600	1800	3600	
(b) Electricity charges	60	120	300	600	
(c) Total (c_1)	60	720	2100	4200	
IV Repairs, maintenance, etc, of locker cabinets (c_2)	Assumed as Negligible				
V Rate of occupancy (n)	0.70	0.80	0.90	1.00	
VI Number of locker cabinets (N)	1	2	3	4	
VII Customer related costs					
(a) Annual cost per account (C_3)	0.50	0.50	3.00	3.00	
(b) Cost per transaction (C_4)	—	0.30	0.40	0.40	
(c) Expected number of transactions per annum (t)	6	6	12	12	

the loan term. In such a case, investment in strong-room (assuming that there will be nothing to salvage at the terminal point and no other relevant inflow incidental to and arising out of the investment to account for) breaks even with an equivalent loaning opportunity. It is possible, then, to annualise all onetime outlays (and thus solve the problems of differing time-dimensions) given

(a) the rate of opportunity forgone,
(b) the economic life of asset/service,
(c) the amount of respective outlays, and
(d) the inflows incidental to, and arising out of, the investment such as terminal realisations on assets, taxation benefits arising out of depreciation, development, rebate, etc.

We may now measure the sacrifices as the aggregate of the annual/annualised costs, reckoned on the basis of opportunities forgone.

Total (relevant) cost of locker business will, at the first stage, break down as:

(a) cost of facilities required for being in locker business (f), and
(b) cost of being of service to customers (s).

Cost of facilities (f) will break down as

(a) facilities independent of the number of locker cabinets (locker space demand), — f_1, and
(b) facilities dependent on locker demand — f_2.

Facilities independent of the locker cabinets will break down as:

(a) annualised opportunity cost of one-time outlays — strong room, furniture and fixtures, and construction of accommodation if involved, etc (m_1), and
(b) fixed annual costs, such as rent where the premises are additionally hired, and electricity (c_1) such that $f_1 = m_1 + c_1$

Facilities dependent on locker space demand will break down as:

(a) annualised opportunity cost of one-time outlays — locker cabinets, permanent records with locker cabinet, etc,
(b) fixed annual costs such as repairs and maintenance of lockers, safe deposit vault registers, etc.

The annualised opportunity cost at (a) above will vary with the capital cost of the various locker cabinets. This variance, we observed earlier, is largely explained by the one in the size-mix of lockers. More particularly, we stated that inclusion of every unit of the higher-size lockers in a cabinet is followed by a reduction in the capital cost, as the consequent reduction in the total number of lockers entails less consumption of material and labour (Table 1).

A class locker has the minimum size, and type 1 A cabinet has the maximum number of lockers, all being of class A. We now define Type 1 A cabinet as the standard type, and class A locker as the standard class. Then we have:

$$M_r = M_1 - \sum_{i=1}^{9} n_i E_i$$

where

(i) M_r represents the capital cost of rth type locker cabinet, $r = 1$ representing the standard type — viz, Type 1 A
(ii) M_1 is the capital cost of Type 1 A
(iii) E_i represents the reduction in the capital cost of the standard type cabinet due to the introduction of one unit of class locker to replace corresponding standard class (A) space: $E_i = 0$ when $i = 1$
(iv) n_i represents the number of lockers in the ith class

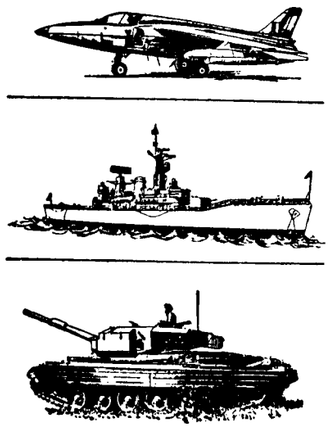
If we define a quantity m_2 as to represent the annualised opportunity cost of standard type (Type 1 A) corresponding to capital cost M_1 and a quantity e_i as to represent the annualised value of E_i, then the annualised opportunity cost of any type of locker cabinet will be given by the expression:

$$m_2 - \sum_{i=1}^{9} n_i e_i$$

And if there are N locker cabinets of varying types such that $N = \sum_{r=1}^{5} N_r$ (where N_r represents number of locker cabinets of rth type), then the annualised opportunity cost of the pool will be equal to: $Nm_2 - \sum_{i=1}^{9} n_i e_i$

The fixed annual cost on repairs etc referred to at (b) above may vary, rarely though, with relation to the type of the cabinet. Let this be defined as K_r for r^{th} cabinet. Then the cost of facilities dependent on number of locker cabinets (f_2) will be:

$$f_2 = Nm_2 + \sum_{r=1}^{5} N_r K_r - \sum_{i=1}^{9} n_i e_i$$



Cost of being of service to customers breaks down as

a) fixed annual costs per customer account (c_3), and
b) costs varying with number of times customer operates the locker (c_4) such that

$$S = \sum_{i=1}^{9} n_i p_i (c_3 + t_i c_4)$$

Where t_i is the expected number of operations per year by the ith class locker customer; and n_i and p_i have

INDIANOIL SERVICE TO SERVICES

India's Defence Services, no doubt are our valued customers. But we do not look at it that way. As a leading public enterprise, we deem it our prime responsibility and our duty to rally round the Services and help keep round-the-clock vigil across the national frontiers.

Army, Navy or Air Force—indianoil is there to meet all the requirements of petroleum products conforming to correct specifications wherever they are needed.

The recent Indo-Pakistan hostilities posed a challenge to provide the logistic support. Indianoilmen accepted the challenge and met it squarely, irrespective of the odds, risks and costs, thus earning the nation's gratitude for their efforts in war and no less in times of peace.

INDIANOIL

INDIAN OIL CORPORATION LIMITED

Dalleram-TOC-69

meanings as defined earlier.

$$C = f + s = f_1 + f_2 + s$$

That is:

$$C = m_1 + c_1 + Nm_2 + \sum_{r=1}^{5} N_r K_r - \sum_{i=1}^{9} n_i e_i + \sum_{i=1}^{9} n_i p_i (c_3 + t_i c_4)$$

Price-Cost Relationship

The basic rate per unit of locker space (b) should be such that

$$\sum_{i=1}^{9} n_i p_i (a + bA_i - e_i) > m_1 + c_1 + Nm_2 + \sum_{r=i}^{5} N_r K_r + \sum_{i=1}^{9} n_i p_i (c_3 + t_i c_4) - \sum_{i=1}^{9} n_i e_i$$

This inequality then defines the relationship between the floor price and relevant costs.

We defined above two types of customer-related costs; c_3 representing the annual fixed cost per customer account irrespective of the class of locker and transactions, and c_4 representing cost per transaction. We also defined a variable t_i as to denote the number of transactions per period by a customer of ith class locker. Now, the experiences at the banks suggest that the number of times a locker customer calls in a year has nothing significantly to do with the class of locker he holds in the normal course. In that case t_i would tend to be equal to t, uniform for all customers and the customers related annual cost as equal to $c_3 + tc_4$.

The component of rental towards meeting the incremental cost of servicing, denoted by 'a' could then be approximated as $c_3 + tc_4$, estimating t as close to the mean of its distribution. The inequality developed above will, in the light of the above, reduce to:

$$b > \frac{m_1 + c_1 + Nm_2 + \sum_{i=1}^{5} N_r K_r - \sum_{i=1}^{9} n_i e_i (1 - p_i)}{\sum_{i=1}^{9} n_i p_i A_i}$$

Table 3: Estimated Reduction Factors

Class of Locker	Chargeable Area (in sq inch)	Variance in Chargeable Area (in sq inch)	Capital Cost Reduction Factor Per Unit (E_i)	Annualised Value of Reduction Factor (e_i)
A	26	0	0	0
B	42	16	40.0	3.60
C	58	32	80.0	7.30
D	66	40	100.0	9.10
E	92	66	165.0	15.10
F	136	110	275.0	25.10
G	139	113	283.0	25.80
H	196	170	425.0	38.80
K/L	306	283	707.0	64.50

Note: (i) The values are estimated on the hypothesised relationship

$$M_r = M_1 - \sum_{i=1} n_i E_i$$

(i) This yields a result of Rs 2.50 reduction for increase of every sq inch in the chargeable area of the locker.

(iii) The expected values of various types of cabinet arrived at on the hypothesised equation, and the actual prices almost match.

(iv) The value of the standard type is taken as Rs 12,070.

This expression establishes the value of b; and R_j are given by

$$R_j = a + bA_i - e_i$$

For simplicity, however, we may introduce the following assumptions which nevertheless, accord to theoretical reasoning.

i) The *a priori* expectation on rate of occupancy, p_j should not vary substantially with the class of lockers, and if they were to be so, the bank could regulate the supplies (locker mix) to take care of the variance. This suggests that p_i tends to p.

ii) Banks instal locker cabinets only at places where the demand therefor is substantial (existing or potential) such that value of (1—p) is small, and consequently

$$\frac{\sum_{i=1}^{9} n_i e_i (1 - p_i)}{n_i p_i A_i}$$

appearing in the inequality above tends to be trivial.

iii) The fixed annual costs of repairs and maintenance of locker cabinets, represented by k_r, contains an element constant for all types of cabinets (such as safe deposit vault register, painting the cabinet, etc) and another element which may be a function of the number of lockers each cabinet consists of. Repairs and replacements attributable to the delinquence of the customer are made good by them. Therefore, items of repairs and maintenance which could cause a cash outflow from the bank may be regarded as independent of the type of cabinet, suggesting constancy of k_r for any 'r' as equal to (say) c_2, and the expression

$$\sum_{r=1}^{5} N_r K_r$$

as equal to Nc_2.

We may note that partial invalidation of any of the assumptions listed as (i) to (iii) above is not going to materially alter the value of 'b' which we want to establish. With these assumptions, the inequality reduces to:

$$b > \frac{(m_1 + c_1) + N(m_2 + c_2)}{p \sum_{i=1}^{9} n_i A_i}$$

Although, the different types of cabinets have overall uniform dimensions, the chargeable area, comprising the actual locker space, seems to vary from 2340 sq inch (Type 1 A) to 2740 sq inch (Type 3). This again arises out of accommodating different assortment of lockers in the cabinets the impact of which will be taken care of by the process of estimating the reduction factor E_i. In that case, we may approximate

$$\sum_{i=1}^{9} n_i A_i$$

as equal to NA where A represents the chargeable area of the standard type cabinet (Type 1 A). The inequality will then be

$$b > \frac{(m_1 + c_1) + N(m_2 + c_2)}{PNA}$$

The model developed above throws out the following as the most critical variables influencing the pricing of the locker service:

(i) the annualised cost of one-time outlays on physical facilities (m_1) and on equipments (m_2 and e_i)
(ii) the fixed annual costs independent of and dependent on the number of locker cabinets (c_1 and c_2)
(iii) the actual number of locker cabinets (N) or the volume of demand for locker service
(iv) the expected rate of occupancy (p)
(v) the incremental servicing cost and expected number of transactions (c_3, c_4 and t).

The values of m_1 and m_2 will be influenced by:

(a) the opportunity cost of funds which, at the moment, corresponds to the yield and loans.
(b) cost of constructing the strong room and of buying and installing the locker cabinets, furniture and other fixtures.
(c) the price variance attributable to size mix of lockers.
(d) the economic life of assets and of service and the normally expected pay back period adopted for investment decisions by the Institution.
(e) inflow of funds arising out of and incidental to the investments in assets such as expected realisable value at close down point, tax savings[1] due to depreciation, development rebate, etc.

Given the outflows of funds by way of costs and incidental inflows, the time-horizon over which the investments are to be salvaged and the rate of opportunity forgone, it is possible with the help of ready-made tables to annualise the costs, and fix the values of m_1 and m_2. The following points need, however, to be taken care of:

(i) The yield on loans adopted for the purpose of annualisation of costs should truly reflect the incremental opportunity forgone by the bank by locking up funds in the Safe Deposit Locker Service instead of adding to the loan portfolio. In other words, it should be capable of adding to revenue what an incremental loan of equal magnitude could have done. This rate should, therefore, distinguish itself from the average yield.

(ii) The outlays on construction of strong norms and provision of furniture are likely to vary, substantially, from one centre to another, and more particularly as among metropolitan urban and rural. This disparity can, perhaps, be taken care of by grouping centres into three or four categories, each of which will comprise places in which costs fall within a conscionable range. The obvious implication would, however, be to set differential floor prices varying with the type of localities, to be defined and grouped.

(iii) Estimation and subsequent revisions of annualised costs (m_1 and m_2) become easy wherever banks have laid down standard specifications for (a) physical space needed (b) construction of strong rooms, and (c) provision of furniture, airconditioning, etc. Such specifications may take into consideration the needs and possibilities of groups of centres implied in, (ii) above. This may be necessary for other interests of control.

(iv) The time horizon with reference to which the costs are annualised should be the least among the economic life of the asset concerned, the expected life of the Safe Deposit Locker Service itself or the pay back period adopted by the institution for its investment decisions.

Table 2 furnishes the values of m_1 and m_2 on the basis of the following data and assumptions.

(1) The rate of opportunity forgone, *viz*, the yield on loans, is taken as 9 per cent. Ignoring the lendings at concessional rates which the banks are obliged to make to certain sectors of the economy, the free lendings are at a gross rate of 11 per cent which, after providing for costs of, and lags in making, the loans, yields around 9 per cent.

(2) The commercial banks do not appear to have laid down expectations on pay-back periods for their investment decisions as such occasion could seldom arise. The product life of Safe Deposit Locker Service can, on the other hand, be taken as indefinite, close to perpetuity, on the basis of conditions obtaining today. The expected lives of the physical assets have, therefore, been chosen as the respective time-horizons for annualisation. These are 50 years for accommodation and strong-room, 25 years for locker cabinets, and 10 years for furniture and other fixtures.

(3) The terminal salvage value has been assumed as nil.

(4) Inflows on account of tax savings, etc, have also been taken as nil for reasons explained,* keeping public sector banks in mind.

* During the informal discussion of an earlier draft with the representative of one of the banks in the Public sector, it was pointed out to the author that the illustrations did not take into consideration the depreciation on assets and the resultant tax advantages. While depreciation is not relevant in the context of annualisation based on the economic life and salvage value of the asset, the tax advantage would amount only to a book-keeping adjustment in the case of public sector banks. In the case of banks in the private sector, however, the tax savings become relevant.

M-95

(5) The data from a sample of branches in Bombay suggested that the cost of construction of strong-rooms (excluding cost of space) ranged between Rs 6,500 and Rs 8,000 and of furniture and fittings from Rs 1,500 to Rs 3,000. In urban and rural centres, these costs must be substantially less. A reasonable assessment of these costs is possible if the banks were to lay down specifications as suggested earlier. For illustration, we have categorised the localities into four groups and alleged costs as under:

Places	Construction of Strong Rooms	Furniture and Fixtures
Category I	4000	500
Category II	4000	750
Category III	6500	1500
Category IV	8000	3000

(6) The cost of the standard cabinet (Type 1A) has been taken as Rs 12,070.

Based on the existing prices of locker cabinets (shown Table 1) and the factors determining facilities offered for locker-space demand, the cost reduction factors (E_i) have been estimated in Table 3. The annualised values of these factors (e_i) with reference to the same parameters as for the one of the locker cabinet (m_2) are also juxtaposed.

The fixed annual cost independent of the locker cabinet (c_1) consists mainly of rent for the premises and consumption of electricity for lighting and air-conditioning. Both these items are likely to vary substantially in relation to locale. At metropolitan places like Bombay, the space required for housing the cabinets (observed from a sample of branches as varying from 150 to 300 sq ft) may cost at least Rs 1 per square foot. Space can be obtained considerably cheaper in ordinary urban centres and may not cost anything, in the incremental sense, in rural centres. Similarly, electricity charges are observed to vary in a sample of city branches from Rs 25 to Rs 50 per month depending on the space, airconditioning, etc. We have, for illustrative purposes, adopted the fixed annual costs partly based on observed data and partly on assumptions.

It is possible for the banks to estimate fixed annual cost independent of locker-cabinet on a fairly accurate basis given the area requirements at going market rates, electrical fittings, and equipments, etc. In doing so, care should be taken to ensure that costs which are not causated by the provisioning or commissioning of locker service are not imputed. For example, if no accommodation is to be additionally hired to house the locker cabinets, as might happen in rural and semi-urban branches, the cost (incremental) on rent is nil. Similarly, were the electricity bill to be the same, irrespective of the locker service, no portion of the total bill need to be imputed into the locker cost; and so on. The same concept of incremental reasoning applies in respect of the customer related costs also.

The annual cost, dependent on the number of locker cabinets, has been assumed as negligible based on the data of a few Bombay city branches.

The operations of the SDL as observed from the data at a few branches would suggest that it may take 30 minutes a year to just maintain a customer account and around 5 minutes for every transaction.

In some banks attending to the locker-customer is the original duty of an officer, usually the Accountant. The addition of a locker service at a small branch may not result in an extra Accountant having to be provided, and therefore the customer-related costs (wages only) may be nil in an incremental sense. In larger branches, however, the additional work-load may determine the number of accountants, and so may be relevant. The consumption of stationery is estimated at 0.50 per account per annum.

On the basis of data as above, we have estimated the customer-related costs. Other assumptions are:

(i) the rate of occupancy in respect of the four groups of places are 0.70, 0.80, 0.90 and 1.00, the last two being validated by data from a sample of branches.

(ii) the demand for locker cabinets has been assumed as 1, 2, 3, 4, respectively for the four groups of places.

(iii) Number of transactions per year is observed at 12 for categories III and IV, and is assumed to be 6 for I and II.

The annual rental rates, established on the basis of values of variables as estimated above, are floor rates below which the banks might be making a sacrifice on the net; and the actual prices will be determined by the market factors.

Conclusions

The crucial assumption is that the locker service does not contribute any significant addition to the business in the other lines of banking activity. This must be true for most metropolitan branches — and it is here that the banks have commissioned the bulk of their locker service. Wherever the banks feel the locker service would add to other business, it is possible to make use of the same model to establish the floor prices. To be precise, if P represents the contribution out of expected incremental business, the inequality would look like:

$$b > \frac{m_1 + c_1 + N(m_2 + c_2) - P}{pNA}$$

The sensitivity of locker service to add to other business may be taken as one of the criteria in grouping centres.

It is possible to offer specially competitive rates at places where the demand generated would be such that a larger number of locker cabinets can be installed, for, as N increases the floor rate falls.

The major advantage of establishing the functional relationship between the critical cost variables and the floor price is that it is capable of signalling to the management the time when a revision of rates is justified or necessary. Although the critical variables in this situation — namely the loaning rates, the salaries of bankmen, the price of locker cabinet, the rentals of space and cost of construction of strong rooms — have all undergone incomparable changes during the last two decades, yet the banks do not seem to have revised the rates commensurately during this span of time. Were the assumptions behind the rental schedule, as worked out in Table 4, true, the drain on the revenues resulting from the present below-cost pricing is enormous. The banks must be losing around Rs 10 lakhs per year for every 500 cabinets in metropolitan cities.

The consequences seem more alarming when we realise that the benefit is funnelled out to the section of the society which, being relatively more affluent, does not deserve it. Avoidance of such a loss could actually subsidise financing Rs 2 crores (for every 500 cabinets) under the Differential Interest Rates scheme. It may be necessary that, as far as possible, we try to match our practice with policy.

[This paper was developed out of a study conducted by the author for one of the banks at the National Institute of Bank Management. He was helped in the study by Saurabh Mehta (NIBM) and some of the officers of the bank concerned. The author is grateful for the useful comments made by R Bandyopadhyay and M S Subbaraman during the course of the study.]

Evaluating Advertising Effectiveness

Sanat Lahiri

The search for measures of advertising effectiveness has been on for years. A number of questions have been raised: Can advertising be measured at all? What is to be measured. What criterion of effectiveness is to be applied? How is it to be measured?

This note seeks to consider some of the relevant issues, identify a few of the stumbling blocks in understanding them, and suggest the direction in which future research might be undertaken.

MUCH of the serious discussion among advertising professionals can be invariably found treated in Rosser Reeves' best-seller: "Reality in Advertising". If this article on evaluating the effectiveness of advertising opens with a passage from that classic work, it is merely because Reeves has already exposed in a succinct and apposite manner the fundamental issues in advertising.

Uncovering some advertising truths, he writes:

> 'A famous company president once said:
> "Advertising, to me, is really one of the mysteries of American business. I can inventory my stock. I can calculate the cost of my factories. I can figure my taxes, estimate my depreciation, determine my sales cost, derive my return per share. Yet, there are times when I spend as much as $ 18,000,000 a year on advertising — and have no idea what I am really getting for my money".
> 'He is not alone. Advertising, far too often, is a mysterious vortex into which millions of dollars are poured every year. These dollars swirl down and around and are sucked out of sight; and at the end of the year, company officials are often left to guess just what it was they bought with these heavy disbursements.
> 'One of the world's largest manufacturers put it another way. He said:
> "I know that at least half of my advertising money is being wasted. My problem is — I do not know which half".'[1]

Yet, why do people continue to advertise? According to one writer, it is largely because of their vague fear of what might happen if they didn't.[2]

This, then, is the problem before top management today. Hard pressed, on the one hand, with the escalating cost of raw material, salaries, and wages, and the higher taxes, on the other, they find it extremely difficult to justify continuously increasing advertising expenditure. Still, while admitting that advertising *does* make a difference, they are nevertheless sceptical of *how much* difference it makes — and primarily because they are unable to find absolute measures of effectiveness.

The search for measures of its effectiveness has been on for years. A number of questions have been raised: Can advertising be measured at all? What is to be measured? What criterion of effectiveness is to be applied? How is it to be measured?

Answers to these queries have been ventured and I propose to consider some of the relevant issues, identify a few of the stumbling blocks in understanding them, and suggest the direction in which future research might be undertaken.

To quote Russell H Colley, a leader in the measurement of advertising:

> "A big stumbling block is the word 'measurement'. Those who expect to find a formula which will accurately relate advertising efforts and short-term sales results will, with a few rare exceptions, be disappointed. But the answer to the question 'Can advertising be evaluated?' is unreservedly 'Yes'."[3]

The distinction between *measurement* and *evaluation* is not merely a semantic matter — of the former suggesting precision and the latter appraisal or estimate. To measure advertising effectiveness would mean quantifying the effect of the complex communication process, involving message, media and market. With so many variables over which the advertiser cannot hope to have complete control — not to mention, the intangibles of 'creativity' — the measurement of advertising *per se* is well nigh impossible. But evaluation, which is a less direct method of assessment, can certainly be undertaken. For, evaluation is, after all, a way of *setting a value* on something. And it is quite possible to 'establish a value on advertising's contribution in achieving specific communications obectives and ... to relate this value to the selling effort required to accomplish the overall sales-marketing goals for the particular product.'[4] It is relatively easier to measure the effectiveness of particular *advertisements* than the overall effectiveness of *advertising*. In fact, it is in the area of measuring the effectiveness of specific advertisements that much of the progress in advertising research — in methods and validity — has been made. Pre-testing and post-testing of individual advertisements is undertaken in a large number of cases, and the pioneering work of Gallup, Starch, Schwerin and others — even their Psychogalvanometers, Polygraphs, Audiometers, figure drawing techniques, Rorshach Ink Blot and Thematic Apperception Tests and the 'Eye Camera' and similar gadgets — all testify to the level of sophistication and the striving after accuracy.[5]

Measuring the overall effectiveness of advertising, however, is another question.

> 'Although partial measurement of result is nearly always possible, one is seldom able to measure *all* of the effects of advertising. At times, some of the results are so slow in materialising, that they cannot easily be traced to specific advertising efforts. These results must be measured over long periods of time, during which marketing factors other than advertising may influence them. At other times, the results of advertising are quite subtle and elusive, making measurement most difficult.'[6]

However, the pre-testing and post-testing of individual advertisements, taken together, can provide some insight into the overall effectiveness of the advertising. Beyond that, while advertising cannot perhaps be measured, it can be evaluated.[7]

In using sales as the ultimate criterion of advertising effectiveness, we are committing a common fallacy. Left to themselves, most marketing managements would undoubtedly opt for sales, as this is the yardstick applied to other marketing functions and it speaks the language easily understood by them. Admittedly, advertising is an enormous factor in making sales. But the relationship between advertising and sales is hardly a *direct* one. Sales are a function of many factors, of which advertising is but one. Advertising rarely works in isolation, or even as the single most important factor in promoting sales: distribution, price, packaging and many other factors are also instrumental in effecting sales. Measuring the sales effectiveness of advertising would mean isolating the partial effect which advertising has on sales from the multiple and interrelated effects of all the other elements in the marketing mix. Such an attempt, it has been found, requires unlimited time and money,

This is the prayer in the hearts of all those who read The Economic Times.

They are the decision-makers in the country.

The Economic Times covers the whole gamut of economic, political and social events. It is the paper that reflects social changes.

Brings you clear analyses of the political roots of economic developments.

Critical studies on industries.

Authoritative interpretations of Government's policies.

without any definite hope of a reasonably precise result.[8]

It is, indeed, this inadequacy of sales as a criterion of advertising effectiveness that faults many of the theoretical frameworks that have been formulated from time to time to explain what advertising does and how it works. It is important to realise that an acceptable theory of advertising is nevertheless a prerequisite for evolving suitable techniques of measurements. For, techniques of advertising research depend on the theories of advertising which they represent; the adequacy or otherwise of the theory will therefore determine the validity of the measurement. A look at some of the theories would explain why little headway has been made in evaluating the effectiveness of advertising.

The earliest theory of advertising was put forward by Daniel Starch in 1925. According to him, the successful advertisement is one that is 'seen, read, believed, remembered, and acted upon'. Although Starch did attempt to spell out the different stages of the consumer's involvement with a press advertisement, he ignored the product altogether. Besides, he assumed that the effect of successive exposures to the same advertisement did not 'build up' or interact with different advertisements in the same campaign.[9]

This 'build up' was accounted for by the DAGMAR theory of Defining Advertising Goals for Measured Advertising Results. According to this theory, all commercial communications must carry a prospect through four levels of understanding. These are: from 'unawareness to awareness, awareness to comprehension, comprehension to conviction, and from conviction to buying action'. Here the assumption is of a one-way flow of progression from message reception to overt behaviour. But this sequential order is questionable and there is no reason to believe that movement up each step of the hierarchy does, in fact, increase the probability of purchase: action may take place without belief or conviction. The internal psychological process which a typical consumer is supposed to experience — from the perception of an advertisement to purchase of the product — may, in fact, be quite different from what has been so neatly hypothesised, for every purchase decision is not necessarily a calculated rational act.[10]

A more realistic approach is that of Rosser Reeves. He defines advertising as the art of getting a Unique Selling Proposition (USP) into the heads of most people at the lowest possible cost. His method of measuring the effectiveness of a campaign — without reference to deals, distribution, pricing and other marketing variables — is to find out the number of customers who read and remember the advertising for the product, as against users who are not aware of it. The difference between the 'pulled' and the 'unpulled', according to Reeves, is a measure of advertising effectiveness, because this figure indicates those customers who know the advertising.

Reeves elaborates his theory by introducing the two concepts of Penetration and Usage Pull. The number of consumers into whose heads the USP has registered represents the penetrated people. The number of customers who have been pulled over to the usage of the product through the advertising represents the pulled-over people. Reeves' formula is to conduct a continuing series of penetration and usage pull studies, both for the brand in question and for competitors.

Now, it cannot be denied that these theories, crystallised after 20 years of intensive research in the packaged goods field, do afford the first objective look at the advertising craft. But Reeves' facile presentation requires a closer scrutiny of some of his concepts. For one thing, is it sufficient to assume that users of the product who know your advertising have been pulled over *because of* the advertising? What is the relationship between recall and usage? One could think of instances where the two are not at all connected in any direct manner. For another, as Reeves himself admits in footnote, penetration is not a perfect research tool. There are important statistical considerations, such as feedback and correlation, which have to be taken into account. Thirdly, Reeves is content with whatever claim or proposition that may be registered in the 'consumer's brain box' as a measure of recall. But when it comes to elaborating his concept of the USP — the proposition which is to register — Reeves stretches it to include the 'totality projected by the advertisement', i e, the complex of visual and verbal elements that is played back by the consumer. Obviously, Reeves would like to have the cake and eat it as well: in practice, leave the USP simple and easy enough for quick measurement, while theoretically conceptualising dimensions that cannot be denied by reality!

One gets the feeling that Reeves is tied down by the ultimate need to relate advertising to sales. The techniques of purely verbal recall, penetration studies, and so on, give the impression of a linear approach which has somehow missed out on the intangibles of feeling, mood, and image, which are no less a part of the reality of advertising.

For emphasis on non-verbal means of communication — the creation of moods and feelings — one has to turn to David Ogilvy's philosophy of Brand Image. According to Ogilvy, every product must be given 'a first class ticket through life'. This would help distinguish it in the public mind from other identical products. And in his inimitable style, Ogilvy was able to give a first class ticket to brands he helped advertise, whether it was a Hathaway shirt or a Rolls Royce car. Herein lies the strength and weakness of Ogilvy. His methods of demonstrating his idea were so peculiarly individual that no body of principles could easily be derived from them for others to follow! Moreover, Ogilvy did not set himself the task of explaining how advertising works or how it could be evaluated.[11]

The task of developing the image idea into a full-fledged theory of advertising was left to Stephen King. According to King, advertising works by adding 'values' to the functional ones already present in the brand. His theory, based on research among British housewives, is that consumers tend to view brands as having consistent personalities.

In a recent series of interviews with housewives, when they were asked to imagine certain brands as people, some described Lifebuoy as rather abrupt, Tide as gruff and ex-army, and Camay as a bit catty! A brand may be seen by some as happy and contented; others who probably condemn these values may find it dull and lacking in ambition. Brand image, then, is not necessarily a *single*, clearly discernible, one. Yet, however blurred or confused, consumers view brands as personalities more vivid than products.

The sources of a 'brand personality' could be the pack or some physical element of the product or even advertising. It could be a blend of efficient marketing, leadership, innovation, improvements, positive approach, and similar values. It is when the non-functional values are integrated with the physical and functional attributes, that the brand acquires a dominating and clear personality.

Viewed in this light, the role of advertising in transforming apparently like products into brands with distinctive and individual personalities should be clear. Thus, by being a primary means of expressing *the total personality of the brand*, advertising becomes an important element within the added values. Advertising helps to tie together all the elements of communication —

name, style, pricing, promotions, and the like — with the physical product and the pack, and gives the brand personality a coherent totality. By appealing to the senses, the reason, and the emotions, advertising enables the brand to stand out as immediate and constantly unique.

Once advertising is understood to oprate in this manner, it becomes easier to judge the contribution it makes. One can ask: Does it enhance the brand's total personality? Does it contribute to the blend of appeals to the senses, the reason and the emotions? Does it bring the brand into the front of the mind? One advantage of such an approach is that the objective setting becomes at once specific and well-directed in terms of the given communication task. All too often advertising is given vague, ill-defined, goals or aims which it is not qualified to fulfil. To allow evaluation, advertising objectives will have to be set down in terms of: What we want consumers to notice about the brand through the senses; what we want them to believe about it; what we want them to feel about it.[12]

Secondly, use of research then becomes meaningful and relevant. Much of the research effort of the past has consisted of attempts to test the different elements in communication, in isolation. But a campaign, like a brand, is not a lot of bits. It is a complex blend of elements and the relationship between them is as important as the elements themselves. There is no point, therefore, in a name test or pack test, independent of the totality of the brand personality. Nor does it make sense to undertake single exposure tests, whose results are based on short-term brand-switching, because the values are added not overnight but in the long run. Again, mere head-counting is of little help, for brands are living things with personalities. The right balance of qualitative and quantitative research will have to be struck.[13]

The basis for a balanced approach is provided by King's rounded theory. His framework, derived from facts and principles — not opinion or supposition — accommodates both claims and feelings, the concrete, and the intangible. It acknowledges the consumer, not merely as a buying animal or a brain box, but as a human being with sensuous, rational, and emotional faculties.

For the first time in advertising history, we have a carefully worked out theory of what advertising does, how it works, what it can contribute and what criteria can be applied to evaluate its effectiveness. With this as a starting point, techniques of research will have to be developed to answer the relevant questions. If attempts at measurement of advertising effectiveness move along these directions, a definite beginning will have been made. Advertising will have then become truly a profession and its practitioners confident enough to face the management query: What return do we get from our advertising expenditure?

Having reviewed the progress of advertising research, seen some of the stumbling blocks in the way, and arrived at a theory of advertising that explains its working and effect, where do we go from here? In the Indian context, where we are just beginning to scratch the surface of the problem of evaluation and measurement, much of what is said above might appear remote and theoretical. But, as I have tried to stress, a proper theoretical base is essential to any meaningful use of research. At this stage of development in Indian advertising research, it is most important that we know how far we have travelled and where we are heading.

As we take stock of what has been done and what remains to be achieved, I think each one of us should develop a sense of our individual responsibilities. As I see it, we have three responsibilities: First, we must ourselves, as practitioners, be quite clear of the role of advertising in the marketing of a product or service. We must know, in a realistic manner, what advertising can or cannot do, and what can or cannot be measured and evaluated. We must have more than nodding acquaintance with the tools and techniques of research. This is a continuous process because the consumer, who ultimately keeps us in business, is constantly changing and, therefore, all the forces that influence the change, the media, and the modes, must be our perennial concern.

Our second responsibility is to our management. We cannot afford to treat lightly the increasing number of doubting Thomases among top managements and marketing management circles. We must be able to acquaint them — 'educate' them, if you like — with the realities of advertising evaluation and measurement. And we must ensure that they *understand* the role of advertising in marketing and what advertising can or cannot do. This will not only help us in getting advertising established as an integral and essential part of professional management, but more importantly, our accountability.

Our third responsibility is to *apply* our knowledge in our work and thus close the gap between promise and performance. Advertising is not a body of abstract theory. Unless it is able to establish its value in the 'plebiscite of the market place', unless it is in a position to establish its contribution as a marketing tool, unless it is able to prove beyond reasonable doubt that it is the most effective and economic means of persuading the consumer, advertising will continue to be suspect.

It is in the fulfilment of these responsibilities that we, the practitioners of advertising — as advertising managers in companies, as account executives, media planners, and people who create advertising in advertising agencies — shall be helping to get advertising accepted as a profession and a discipline.

Futurology and Public Systems Analysis

A Major Social Need

J G Krishnayya

The Indian intelligentsia may be timid in some matters, but it has never shrunk from the establishment of new research institutions.

A sympathetic review of the work of these institutions would find a lot of solid data on the way things are (or were) and some analyses and judgments on who is benefiting how much, and why. A critical review, on the other hand, might assess the facts and framework as static and past-oriented and the reports as reflecting a judicial and "outsider-critic" posture, rather than that of a participant who faces all the constraints of the real-world situation.

The purpose of this brief note is to point to the urgent social need for institutions which will effectively work on the analysis of public policy and design of public systems along with surveys of the alternative futures which may befall us.

ALVIN TOFFLER's book "Future Shock" has made many readers aware of the rate of social and technological change that is overtaking the world. Today even India has a national Panel on Futurology. Various projections have been made by some researchers of India for the year 2000. For the state of Tamil Nadu, for instance, one of these predicted that by 2000 AD one in every three families would have a motor car. Maybe. My purpose in this essay is to point to the urgent social need for institutions which will effectively work on the analysis of public policy and design of public systems along with surveys of the alternative futures which may befall us.

The Indian intelligentsia may be timid in some matters, but it has never shrunk from the establishment of new research institutions. Thus, a brief glance at the Ahmedabad telephone directory reveals the Institute for Cooperative Management, the Gujarat Institute for Area Planning, The Sardar Patel Institute of Economic and Social Research, all new since 1968, alongside such venerable bodies as the IIMA and the University. In other capital cities throughout India there are Social Institutes and Economics Institutes and Political Science Institutes, all doing research on the problems of growth, economic development and social change. A sympathetic review of their work would find a lot of solid data on the way things are (or were) and some analyses and judgments on who is benefiting how much, and why. A critical review on the other hand, might assess the facts and framework as static and past-oriented and the reports as reflecting a judicial and "outsider-critic" posture, rather than that of a participant who faces all the constraints of the real-world situation.

Have these institutions, has this economic and social and political research had an influence on public policy in India? Surely it has had some influence (for example, Dandekar and Rath's report, in focusing attention on poverty in India). But has it had influence in the sense of bringing about policy A as against policy B? After an exhaustive study of social science research in India over the past two decades, the economist Raj Krishna, at least, has come to the conclusion that the influence has been marginal.[1]

Characteristics of Effective Institutions

On the other hand, there have been institutions abroad, conducting what might appear to be similar research, which are generally accepted to have had a significant effect upon public policy. These are the Rand Corporation, the Institute for Defence Analyses, the Urban Institute, and Resources for the Future in the USA and such organisations as the Weizmann Institute in Israel, the Nomura Institute in Japan, the International Institute for the Management of Technology in Italy, the Institute of Development Studies, the Science Policy Research Unit and the Institute for Operational Research (Tavistock Institute) in UK. What is it about these organisations that distinguishes them? One analyst[2] calls them a 'social invention', which happened in order to provide analytic assistance to government agencies in the resolution of public policy issues. They have certain other common characteristics: They are independent of government though concerned about policy issues; they are non-profit by charter; they are not primarily educational in purpose; they have a broad study charter; they are multi-disciplinary in staff; they are future-oriented; they use a systems approach; they develop and maintain long-term relations with one or more agencies of government.

These characteristics do also fit to a large extent some existing institutions in India, most notably the Centre for Management in Agriculture (CMA) at IIMA and the National Council for Applied Economic Research (NCAER) in Delhi. What then is missing? In this observer's view, the two missing elements relate to objective and methodology: The objective in most current research is analysis, whereas it needs to be *design*, in which analysis, or understanding, is an important step. When systems design is the objective, an intricate merging of insights and methods from several contributing disciplines — true *interdisciplinary* work is needed; it is not enough for each discipline specialist to view the problem from his own point of view and then to loosely stitch together the resultant appreciations, to produce what we might call *multidisciplinary* research and analysis. Yet another important process variable is self-consciousness about the need for continual refinement and improvement of methodology. "In the land of the blind, the one-eyed man is king" goes the adage, spelling out the trap that lurks before innovating organisations. (But there is no complacency at the Rand Corporation. There every report is critiqued in writing by two analysts outside the research team before it is approved for publication, and completed analyses are regularly restudied in internal professional development seminars.)

Type of Systems Analysis Needed

We have only to think of the doubling of India's population in the next thirty years to raise a host of issues requiring both analysis and systems design. These relate not only to resources and allocations, but even to the means

Agents at all principal ports of the world.

of transport and communication and distribution and also to community structures. It is likely that the technology needed for maintaining essential services, including food and housing will interact in new ways with the patterns of life traditional to India. During this period of rapid social change, all levels of government require to use a *systems design* capability because of the many new agencies to be created and new communication and information systems to be built. In the past, the initial design of new systems was not so crucial because they had time to evolve as new needs developed. The present rate of social change, however, requires that newly designed systems be capable of responding faster and more effectively to changes in the environment.

Government needs new sources of assistance in achieving these tasks. But the conventional institutions — government itself, private industry, even universities and similar teaching bodies — are handicapped in various ways, as we shall see.

Today many agencies of government believe in creating their own in-house analysis group or 'think tank'. These are very useful, yet they cannot take the place of agencies outside of government. Firstly, in most government agencies it would be impossible to bring together the critical mass of people needed to provide a proper mix of skills. Secondly, offices in government rarely can be independent or flexible enough to develop new approaches to big issues. Thirdly, studies within government must always focus on the immediate problem, usually on a crash basis.

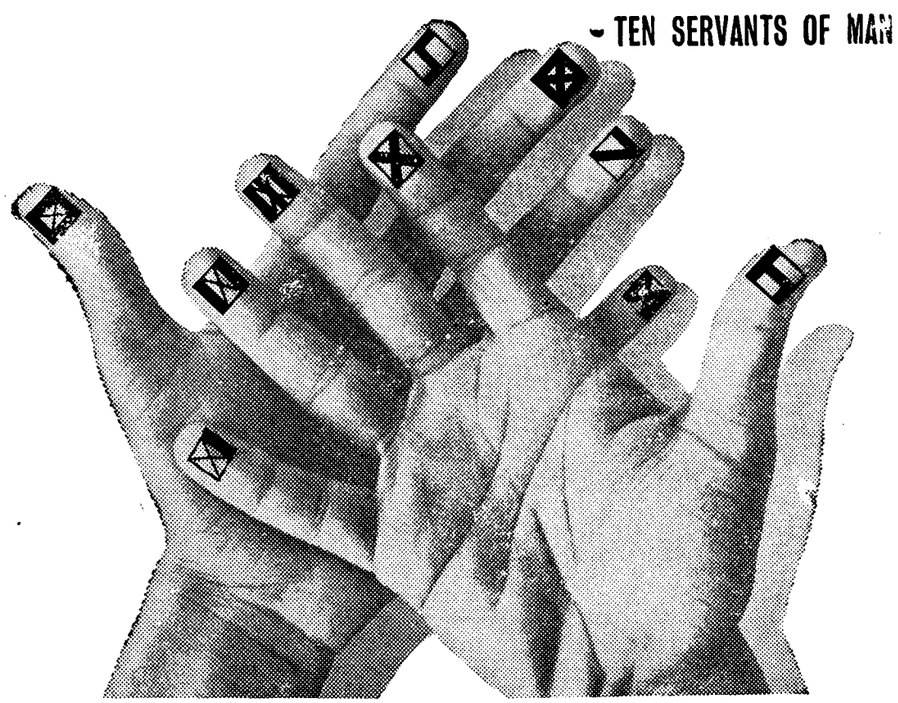
Management, engineering and accounting consulting firms are also a possibility. However, the type of task-contract through which their services can be purchased is unsuitable where often the first task is to define the problem. This type of advice requires an extensive knowledge of the agency and its activities which in turn requires a continuous close relationship between the analysts and agency. However, the firm must also deploy its manpower wherever profitable opportunities arise. These considerations would reduce the suitability of profit-making consulting firms to provide policy analyses and systems designs to government.

Can Universities Fill the Need?

Universities are another possible source. Indeed departments of social science in many universities as well as autonomous bodies like the IITs and IIMs have accepted grants or contracts to work on issues related to public policy. Many professors serve as governmental advisers. Yet universities do have a primary commitment to teaching and disciplinary research, and this conflicts with major requirements for assistance in government where issues are often technically unsophisticated and problem-related. Firstly, teaching institutions are not equipped to undertake long-term operational activities. Secondly, while faculty and students are anxious to perform activities that meet their own research and training interests, they rightly resist taking responsibility for day-to-day operations in a government agency. There are other problems, too, related to staffing and the incentive system. Public systems analysis requires not only faculty and student effort but also full time, operationally-oriented professional staff without faculty positions. At most universities such persons feel like second class citizens. The experience at the IIMA with the specialist staff of the Agriculture Co-operatives Group and the Banking Studies Group is germane.

In addition, the techniques appropriate and useful in public systems analysis may be less formal than those appropriate to the academic literature. The results of policy analyses may not be published, or may be read only by government officials, not academics. Sometimes a separate institution is set up at a university to house the full time professional analysts. However, such bodies as MIT's Instrumentation Laboratory or Stanford Research Institute are no more than in name part of the university. Finally, the university faces the difficulty of providing the continuity of personal contact so essential to building trust and generating influence in government. Though average faculty turnover in India is low by Western standards, it is lowest in departments which do no outside work, and higher where professors involve themselves with applied research. Faculty members must seek achievement and recognition in their discipline; committing long periods of time to interdisciplinary team work that is problem-centred will adversely affect their career prospects.

It is recognition of these disabilities of the conventional institutions which has led to the creation in so many countries abroad of the non-profit, policy oriented, public systems analysts organisation. The incentive structure of these organisations is designed to encourage and reward work according to its relevance to policy-makers. As non-profit organisations, their objective can be the public interest, without offending constituencies such as shareholders, faculty, students or alumni. With single-minded attention they can develop the long-term close relations with government agencies leading to trust and influence, which in turn enables them to choose topics from within a broad study charter which is oriented to anticipating future problems. Unlike a management, engineering or accounting consultancy, they are not characterised by cashing in on the current problems of government, but on working to avert future systemic difficulties. Here especially, their commitment to interdisciplinary research is matched by their ability to develop their staffing and incentive system accordingly.



Can such Rand-type institutions be created in India? The success of state, federal and local governments in outpacing change may depend upon it. As the first group of persons whose training provides a multidisciplinary capability, the faculty and graduates of the management institutes could play an important role in the design and building of such organisations.

Jayant Paper

JAYANT PAPER is going ahead with its expansion scheme and expects to commission its new plants by the end of March next. Construction work has been completed and machinery for the stock preparation and pulp section has been erected. The company's production was slightly higher in 1973-74 at 6,940 tonnes of paper and paper board against 6,879 tonnes last year and the installed capacity of 6,720 tonnes. But the financial results showed a marked improvement, with a 53 per cent rise in sales and a 75 per cent jump in gross profit. Although the tax liability was considerably more, net profit more than doubled. Costs of raw materials and labour were no doubt higher, but the ratios of inventories and wages in relation to sales were lower compared to the previous year. Dividend was lowered by 4 points to 8 per cent on the capital enlarged by a bonus issue and was covered more than three times.

How India gave the world one of its most useful inventions.

It is India that gave man the ingenious method of counting all numbers by ten symbols and freed him from the bondage of counting on his fingers.

Among these symbols the most modest, yet the most valuable of India's subtle gifts to mankind was the zero.

Derived from the square shape of the Yagnakunda used in worship, each of these symbols was given a value of position as well as an absolute value.

1 2 3 4 5

6 7 8 9 0

These numbers were in common use in India in Ashoka's time (273-232 B.C.). It was to be a thousand years later that Muhammad Ibn Musa al-Khawarazmi introduced them to Baghdad, from where they found their way to Europe.

Lending mathematical computations ease and simplicity, these symbols made possible the calculation of what before was incalculable.

Over the ages man's methods of solving mathematical problems have been growing to meet his complex needs. Today ingenious devices enable him to make intricate calculations in billionths of a second. Making it possible for him to attack problems in ways never possible before.

With computers.

We are proud that IBM introduced the manufacturing of computers and other data processing equipment in India, which are helping the nation meet the challenge of building a new tomorrow.

A Matter of 'Socialisation'?

Ajit Roy

West Bengal — The Violent Years by Sajal Basu; Prachi Prakasani, Calcutta, 1974; pp xii + 178; Rs 15.

IN common political gossip, 1969-72 are referred to as the violent years in the annals of West Bengal. According to a statement made in the West Bengal Assembly, 1,771 political murders took place in the state between 1969 and 1973. According to the same source, in the two years, 1970 and 1971, 415 policemen died in political disturbances and 199 persons lost their lives in police firings.

While focusing on this phase of West Bengal's history, Sajal Basu makes it clear, however, that violence has been a constant factor in the political process of Bengal as much as in that of India. The alien rulers were violent in suppressing the freedom struggles, and the propertied classes never hesitated to let loose their hired thugs on rebellious underdogs. Even the inter-party violence had been foreshadowed in the armed clashes between the Anushilan and Jugantar parties decades earlier. Indeed, Basu generalises, "every society is burdened by some degree of violence, either in the form of social rites or deviant behaviour that arises from imperfect socialisation ..." (p 118). He should have perhaps added: "so far".

The author also cites incontrovertible evidence to show that political violence has not disappeared from the state after 1972, but has acquired a new dimension — that of intra-Congress clashes resulting in a number of murders, including that of a sitting Congress MLA.

Its continuity with the past notwithstanding, the 1969-72 phase — Basu points out — had some original and unique features. Most particularly, there was a coalescence of political and gangster-underworld forces — a development ultimately sanctified by the police and the Research and Analytical Wing (RAW) of the Union Government's Cabinet Secretariat with a view to "terrorising people ... combating extremists, [and] disrupting Left movements" through "instant murder of extremist cadres, liquidating undesirable elements in [the] police [force], inter-party fights [and] trade union rivalries leading to armed fights". (p 115).

The counter-revolutionary terror unleashed by the ruling power, he says, "reached its climax in 1971 in Cossipore (a northern suburb of Calcutta) when large-scale witch-hunting against the Naxalites led to 100 casualties in the area" (p 80).

The author seeks to cover a large ground to get at the social roots of the violent episodes. Besides a broad outline of the socio-economic evolution of Bengal, he also presents the results of a number of micro-studies into various socio-political "cross-currents, conducted by him. However, he is not particularly successful in offering a plausible explanation for the violent phase under study. His main conclusion is that the CPI(M)'s policy and practice of partisan aggrandisement had started the process, which then followed its own logic: "The CPI(M) initiated violence was outweighed by Naxalite terrorism, Naxalite menace was again combated by Congress-police joint violence, which again has eaten up the very vitals of the Congress ..." (p 121).

Basu's diagnosis is too simplistic to be of real value for any understanding of the 'phase' under review. The compulsions and constraints of the situation resulting from a deep social crisis that had led the radical petty bourgeois mass, of a small constituent state of a vast country like India, to indulge in revolutionary shortcuts and play right into the hands of a calculating counter-revolution, do not receive adequate attention from the author. In fact, the author displays the same naivete when he expresses the hope that the current movement, led by JP Narayan in Bihar, would show the way to how non-violent mass resistance can defeat the State violence and "widen the legitimacy gap of the ruling clique"!

Misleading Preoccupations

Uma Ramaswamy

A Survey of Research in Sociology and Social Anthropology, ICCSR, Volume III; Popular Prakashan, Bombay; 1972; pp XV + 335; Rs 30.

THIS volume reviews research carried out by Indian scholars in the fields of cultural anthropology, tribal ethnography, material culture, folklore, applied anthropology and research methodology. Each of these sections is followed by a lengthy bibliography which could be a valuable research tool. It is, however, difficult to understand the logic of the preoccupation with research "carried out by Indians on Indian problems" considering that the series is to be concerned with locating gaps and identifying priorities in research. Where the authors mention the researches of foreign scholars they do so apologetically.

Tribal studies have had a long and rich tradition in India. Vidyarthi highlights the gradual shift in the scholars' attention from descriptive ethnographic accounts to analytical and empirical research. There is a plea to study tribal communities which are facing extinction or are fast getting absorbed into the wider society.

Material culture has received scant attention for, as Saraswathi points out, it is widely believed by scholars to be an "idle and unimaginative curiosity". However, he has taken pains to show that study of material culture can indeed, make significant contributions to other branches of anthropology. The entire cultural complex, it is argued, is reflected in material arts of a society.

It is unfortunate that such a colourful field as folklore has generally attracted the attention of scholars who have had little training in scientific fieldwork and little understanding of the material base of culture. A majority of them are mere collectors of folklore or literary men. The result has been a patchy collection of folklore in different parts of the country. Indra Deva rightly points out that a serious comparative study of folklore material can yield rich dividends.

One is struck by Naik's emphasis on tribal communities while reviewing research on applied anthropology. Applied work on non-tribal people has received scant attention. More seriously, the complete absence of reference to research on Scheduled Castes raises doubts about the coverage of this piece.

The burden of Madan's review is that, considering the extensive body of literature in social anthropology, there is striking paucity of interest in the refinement of methodology and research techniques. He argues that the scholars who have at all been concerned with these issues have done so in general terms. Hence the need to intensify interest in the field.

Family Planning in India

The Outlook for 2000 AD

D Banerji

Despite the enormous investment, despite all the goodwill of planners and political leaders, and despite taking recourse to means which are questionable on social, moral, ethical and political grounds, even in terms of reduction of birth rate, the family planning programme has abjectly failed to attain the objectives.

The decision-makers made a fundamental mistake in taking a very narrow view of the problem of rapidly rising population growth in India and in not realising adequately that, for controlling population growth, a family planning programme forms merely one segment of a much wider spectrum of programmes. Their alienation from the masses, their Westernised values, their lack of competence in technical matters, their abject dependence on foreign consultants for assistance, and their reluctance to come to grips with urgent social problems, along with pressure from certain powerful vested interests, both within the country and abroad, all combined to impel them to conceive of a family planning programme as the instrument for bringing down the birth rate.

I

Family Planning Movement in India

FAMILY PLANNING, or birth control, is a fairly old movement in India. [1] Pioneers like P K Wattal and R D Karve had advocated birth control way back in 1916 and 1921. The Mysore Government opened the first government-operated birth control clinic in the world in 1930. The All-India Women's Conference advocated birth control in 1932. The National Planning Committee of the Indian National Congress, set up in 1935, strongly supported family planning as a State policy.

After Independence, in the very First Five-Year Plan, the "urgency of the problem of family planning" was clearly recognised. [1] The 1961 Census dramatically revealed the explosive nature of population growth in India and the urgent need for controlling it. In the Third Plan, therefore, the objective of stabilising the growth of population was considered the very centre of planned development. Following this, in the Fourth Plan, family planning was named a programme of highest importance. [2, p 11].

As a result of the increasing importance attached to the programme, there has been a very steep rise in the investment in family planning in the successive Five-Year Plans — from a mere Rs 15 lakhs in the First, to Rs 22 crores in the Second, to Rs 24.66 crores in the Third, going up to Rs 330 crores in the Fourth Plan [2, p 11]. The outlay for the Fifth Plan is Rs 560 crores [3, p 253].

At a very early stage, the Government of India had laid down certain guiding principles for the development of the family planning programme in India [4]:

(1) the community must be prepared to feel the need for the services in order that, when provided, these may be accepted;

(2) parents alone must decide the number of children they want and their obligations towards them;

(3) people should be approached through the media they respect and through their recognised and trusted leaders and without offending their religious and moral values and susceptibilities;

(4) services should be made available to the people as near to their doorsteps as possible; and

(5) services have greater relevance and effectiveness if made an integral part of medical and public health services and especially of maternal and child health programmes.

In the fifties and in the early sixties, following the traditions of the 'planned parenthood movement' of Western countries, family planing clinics were established in urban and rural areas. When, however, it was realised that the range of such clinics is very limited, again taking the cue from the 'community development movement' in the United States, an extension wing was added to these clinics by establishing an enormous network of family planning extension workers [5]— for example, Parivar Kalyan Sahayakas and Sahayikas, family planning field workers, auxiliary nurse midwives, and the elaborate hierarchy of supervisory staff at the block, district, state and Central levels. Substantial additions were made in the programme in the mid-sixties, when some foreign consultants projected the intra-uterine device (IUD) as the miracle device and succeeded in persuading the decision-makers in India to undertake a massive programme to popularise the use of this device. [6]

When, however, the IUD programme too failed, it became a "target-oriented time-bound programme, adopting the cafeteria approach". This involved [2, pp 16-17]: (a) offer of "monetary incentives" to the doctors, the motivators, and to the acceptors; (b) mobilisation of the law and order and tax-collection machinery for family planning work; and (c) exerting of administrative pressure on field workers to ensure that they attain certain pre-determined family planning targets. When even this proved inadequate, recourse was taken, in the early seventies, to Mass Vasectomy Camps [7, p 63] which involved much more extensive use of the district administrative machinery along with much more enhanced "incentives" and a massive publicity drive.

II

Present Status of Programme

While several radical changes in the programme have resulted in a number of additions to it, efforts to weed out the redundant components have been very inadequate. This has given a very jumbled appearance to the programme. [7, pp 61-87], [8]

The urban population is served by a total of 1,952 family planning clinics and 2,333 other institutions which also do family planning work. There are 5,178 family welfare planning centres, and 31,151 sub-centres providing services to rural populations. There are 728 mobile units — 329 for IUD insertion and 399 for sterilisation — to supplement the activities of the rural family planning agencies. Conventional contraceptives, with the main emphasis on the condom (Nirodh), are distributed free of cost through all family planning institutions. Condoms are also sold commercially at highly subsidised rates through over 2,20,000 retail outlets. There are 319 pilot projects which provide oral contraceptive pills, and 124 institutions which provide post-partum family planning services. Family planning services are also provided through agencies of the organised sector — such as government ministries and departments, labour organisations, industrial undertakings and the Employees State Insurance Scheme.

Positions for more than 75,000 full-time paid or part-time voluntary workers have been sanctioned for direct extension work in the field. In addition, there are 66,200 workers for supervision and technical assistance at the block, district, and state levels. Apart from extensive mobilisation of all the mass media units of the Union Ministry of Information and Broadcasting and the strengthening of these units and establishing mobile audio-visual units at the district level, other media for mass communication — including indigenous media — have been requisitioned to provide a massive communication support to the programme. [2, pp 15-16] Payment of cash incentives, use of the law and order and tax collection machinery, and application of administrative pressure on health and family planning workers for attaining the assigned targets have been the other ways of "Motivating" people to accept family planning [2, p 17]. As a disincentive some states have withdrawn certain concessions — such as maternity leave to their non-industrial employees — for persons who do not adopt the small family norm. On the legislative front, the legal minimum age at marriage has been raised from 15 to 18 years for girls and from 18 to 21 years for boys, and the abortion law has been considerably liberalised. [2, p 17]

An extensive network of training institutions has been established to provide training to the very large numbers of family planning workers of different categories. Steps have been taken to ensure concurrent and periodic evaluation of the programme by government as well as independent agencies. Support has been provided to encourage research in the fields of bio-medicine, demography, and "communication-action" research [2, pp 21-23].

Far-reaching changes have been initiated in the organisation to sustain the programme. For instance, at the Central level, family planning work was taken out of the Directorate General of Health Services, and in 1966 a separate department of family planning was instituted in the Ministry of Health and Family Planning [2, pp 17-20]. There have been major organisational changes too at the regional, state, district and block levels.

III

Achievements of Programme

Because of setbacks and failures, the goals of the programme had to be "revised" on several occasions [2, p 7]. The aim at the beginning of the Fourth Plan [3, p 240] was to reduce the birth rate, from 39 per thousand in 1968 to 32 per thousand in 1972-73 and to bring it down to 25 per thousand by the end of the decade. However, despite the enormous investment, despite the goodwill of planners and political leaders, and despite the recourse to means that were questionable on social, moral, ethical and political grounds, the programme has abjectly failed even in terms of reduction of the birth rate. According to the Registrar General's Sample Registration Scheme of Births and Deaths [9, p 9], the birth rates per thousand for 1968, 1969, 1970 and 1971 were, respectively, 39.0, 38.8, 38.8 and 38.8 for the rural areas; interestingly, the birth rates for 1970 and 1971 for the urban population however was, respectively, 29.7 and 30.0 [9, p 17]. Nevertheless, it would be hasty to attribute this fall for the urban section to the programme alone; the impact of the socio-economic factors in urban areas have also to be taken into account.

Recognising that the Fourth Plan's demographic targets have not been attained, the targets for the Fifth Plan [3, pp 240-241] had to be revised once again: Rather optimistically, the birth rate at the beginning of the Fifth Plan is estimated to be 35 per thousand, and the revised aim is to bring it down to 30 by the end of the Fifth Plan, and further to 25 by 1984. This, according to the Ministry's estimate, will require 18 million sterilisations, 5,9 million IUD insertions, and equivalent annual Nirodh distribution reaching the figure of 633 million by 1979.

The Table, which is prepared from data published by the Ministry of Health and Family Planning [10], [11], [12], [13], [14], sums up the performance of the family planning programme since its inception — in terms of the number of sterilisations, IUD insertions, and the number of conventional contraceptives distributed.

One demographer, Agarwal [15], has estimated that it would have required a total of over 55 million sterilisations between 1966-1981 to bring down the birth rate to 30 in 1981. This requirement should be seen against the actual performance of the programme between 1956 and March 1963: 13.92 million sterilisations and 4.61 million IUD insertions — even assuming unquestioningly that the official figures are reliable and accurate and that they do not include people who have wives above 45 years of age or who are widowers or are separated or are unmarried.

It may also be noted that, in the three years following 1967-68, there has been a steady fall in the number of sterilisations. However, in 1971-72 and 1972-73, there has been a steep rise in the number of sterilisations. This rise can be attributed to the large-scale organisation of Mass Vasectomy Camps throughout the country. As has been pointed out elsewhere, these Mass Camps raise a number of serious social, political, moral, ethical and demographic issues. There are also information leaks about deaths due to tetanus and other such causes and of the widespread use of tactics of extortion and enticement to catch people for these camps. Above all, a very steep fall in the performance of the programme during the first five months of 1973-74, when the number of sterilisations fell by as much as 34.8 per cent as compared to in the corresponding period of 1972-73, [16] has underscored the fact that — quite apart from some of the basic issues raised above — even from a quantitative point of view the approach of Mass Vasectomy Camps does not ensure a sustained rise in the number of sterilisations.

There are serious doubts too about the reliability and accuracy of the very scanty and sketchy data on the mass camps collected by government agencies [17, p 3]. Even with these very serious limitations, the department of fa-

TABLE

Year	No. of Sterilisations	No of IUCD Insertions	No of Conventional Contraceptives Distributed in Equivalent Nirodhs (million)
1956 to March 1965	983,064	—	103.9
1965-1966	542,779	812,713	94.0
1966-1967	887,368	909,726	65.6
1967-1968	1,839,811	668,979	73.6
1968-1969	1,649,686	472,539	140.3
1969-1970	1,422,118	458,726	110.7
1970-1971	1,319,120	471,408	151.0
1971-1972	2,234,642	472,910	160.9
1972-1973	3,038,603	341,649	160.7
Total	13,917,011	4,608,650	1,060.7

mily planning's own data [8, pp 57-64] on the acceptors of Mass Vasectomy Camps provide a very disturbing description: the government records indicate that the average number of living children were 4.1, 3.92 and 4.4 and the recorded age of the wife was below 30 years in 43.2, 24.2 and 6.4 per cent, respectively, in the Ernakulam, in the Madurai and Ramanathapuram, and in the Gorakhpur Mass Vasectomy Camps. In the Bulandshahr Camp, the average recorded age of the wife was 35.2 and in the Madurai and Ramanathapuram Camps, the average recorded age of the last living child was 8.2 years. More careful and independent studies conducted by agencies such as the Planning Research and Action Institute, Lucknow [18], and the Gandhigram Institute of Rural Health and Family Planning [19] indicate that, in over 60 per cent of the cases, the performance of vasectomy was of little demographic significance.

IV

A Critique of the Programme

Has there been a sound and coherent policy, based on scientific data, to ensure that with the passage of time India's family planning programme gains enough momentum so that the declared goal of bringing down the birth rate to 32 is achieved by 1973-74 and of bringing it down to 25 is achieved by 1980? The answer, unfortunately, has to be a clear "No".

The decision-makers committed a very fundamental mistake in taking a very narrow view of the problem of rapidly rising population growth in India. They did not adequately realise that, for controlling population growth, a family planning programme is a mere component of a wider spectrum which has to embrace a combination of programmes for dealing with different social and economic problems of the country. Population control was considered — rather simplistically — to be a precursor of developments in other social and economic fields.

Apart from this fundamental weakness in policy formulation, even when the programme is seen within very narrow confines, as an isolated monolith, its top leadership has shown an astonishing lack of dexterity in formulating some of the programme's crucial components. As is apparent from the evolution of the programme, in the course of the past decade and a half, the programme has stumbled from one major blunder to another — from the "clinic" approach to the extension approach, to emphasis on the IUD to the target-oriented time-bound programme, leading eventually to the disastrous mass vasectomy camp approach.

The leadership has used the term "motivation" in too loose a manner, without showing adequate understanding of the complex processes which lead to the generation of motivation in favour of small family norm in the community. Perhaps the greatest mistake in the formulation of the family planning programme has been the gross overestimation of the effectiveness of "motivators" and an equally gross underestimation of the resistance to be encountered in motivating a community as whole. They persuaded themselves that an ill-educated, ill-motivated, ill-suited and ill-trained extension educator from a city, merely by using the "skills" of motivation, could kindle a virtual social revolution in rural communities so that the small family norm would become a part of their way of life. Motivation techniques were considered to be some sort of a magic which could be applied by everybody to make anybody accept family planning!

An examination of the social, cultural and economic profile of the population of India reveals that, to a majority, life is a continuous and a grim struggle for existence [20], [21], [22]. This huge chunk of humanity has no choice open to it, nothing to look forward to, and "a surplus of fresh human stock is the only tangible capital that can be invoked" [23]. If they agree to have only three children, who is going to guarantee that these children would not die and they would live a healthy life? Who is to guarantee that they will get a better deal from society and their living conditions will be any better than what they are?

Even from the very scanty, sketchy, and often unreliable, data that are available concerning utilisation of the services, it is evident that only a very small fraction of the capacity of the institutions providing family planning services — very often not even 10 per cent — is being utilised [2, pp 35-37].

The training institutions have found it almost impossible to keep pace with the very rapid, and not very rational, alterations in the programme. This has taken away the very purpose of the training programme and the whole training process has degenerated to become an agonising and very expensive ritual, leading to considerable waste of very scarce resources [2, pp 37-39].

Indeed, the four external evaluations of the programme — two by the United Nations Advisory Missions and two by the Programme Evaluation Organisation of the Planning Commission — have ended up by giving a false scientific respectability to the progamme [2, pp 38-42]. None of these reports gives any indication that the recommendations were based on scientific measurement of the objective achieved. It is not even possible to say that these recommendations were based on a well-considered, though manifestly impressionstic, analysis of the programme. One has only to single out the gravest of all errors in scientific assessment — the element of personal bias — to account for the abject failure of the distinguished members of the teams to notice certain most obvious weaknesses in the programme.

The complex issues of policy and administration of the family planning programme had opened out new fields of research, posing new challenges to research workers. However, once again, only one special type of research — the so-called communication action research — which had gained in importance in this country because it happened to be in tune with the research background of some of the key foreign consultants, got the spotlight. This approach turned out to be grossly inadequate to meet the requirements of the programme [2, pp 42-44].

Despite strong pleas by the Administrative Reforms Commission of the Government of India [24] and several other eminent authorities in the field of public administration [25], the organisation and management of the programme follows old colonial practice and continues to be dominated by generalist administrators. Decisions of far-reaching importance are taken by committees in which generalist administrators, who are usually very busy, who have little technical background, and who are adherents of the colonial law and order traditions and values, are given key positions. This approach has been adopted again and again [2, pp 44-50]. Such archaic and obviously inadequate approaches to decision-making are responsible for quite a few of the present maladies of the family planning programme.

V

The Prospects

At first sight, such a long succession of failures in the family planning programme appear very bewildering. How could the decision makers "succeed" in making so many mistakes, and how could they get away with them? However, when these serious lapses in decision-making are seen against the background of the political, social, economic and international forces which have given shape to the various development programmes in India since Independence, the failures can be explained.

The Indian political leaders, who took over the reins of government after Independence, were the pace-setters. While they felt compelled to commit themselves to the norms of an egalitarian society and to enshrine their commitments in the Directive Principles for State Policy in the Constitution [26, pp 230-235], they were not prepared to effect the social, political, and administrative changes necessary to attain such goals. The political leaders presumed that the values of a highly privileged class, which most of them had inherited from the colonial era, would not come in the way of effecting a social and economic revolution in the country. Nor did they think that, for bringing about the revolution, it would be essential to stand up against the forces of the *status quo* in the urban and rural areas. Similarly, they also believed that they would usher in the revolution without changing the structure and the functions of the bureaucracy which continued to hold steadfastly to its colonial traditions. Heavy dependence on foreign agencies for "technical" assistance was thus natural corollary to the unwillingness of the political leaders to squarely face the basic problems of the country.

Because of the shortcomings in the political leadership, gross administrative inadequacies, and pressure from vested interests — both from within the country and outside — the country is still very far away from implementing the Directive Principles of State Policy enshrined in the Constitution. For instance, while the Directive Principles enjoin free compulsory education to children up to 14 years by 1960, the Planning Commission estimates [22] (very optimistically) that only 40 per cent of the children in the 11-14 year group will be enrolled in schools by 1974.

It is, indeed, the same forces which have found a common interest in raising the spectre of a runaway population growth in India. A rapidly growing population not only posed a threat to the perpetuation of the existing social structure, but the bogey of a rapidly rising population came in very handy for covering up the massive failures of the leadership to comply with the Directive Principles. The family planning programme was set up as *the* instrument for bringing down the rate of population growth in India. It was duly given a central position on the Third and Fourth Five-Year Plans and huge resources were made available to the programme.

It is not surprising that, in dealing with the population problem, the decision-makers simply circumvented the basic problems of poverty, social injustice, ill-health, primary education, and illiteracy. Nor is it surprising that they tried to cover up the inherent weaknesses in their own approach by stooping to use "incentives" to procure "acceptors" to use police methods to "motivate" the people, and to swell the performance figures by sterilising persons who have little or very limited demographic relevance [18], [19]. As a result, it is also not surprising that, despite their taking recourse to means which are politically and ethically, questionable, they fell far short of their objective of rapidly bringing down the birth rate.

OUTLOOK FOR 1974-2000

Because of the colonial heritage and the continuing affinity and strong links of the ruling elites of India with their counterparts abroad with — particularly in the Western industrialised countries— almost every facet of the social, economic and cultural activities in India has been considerably influenced, if not often actually controlled, by the bigger global system — which, itself, has a deep vested interest in maintaining and actively promoting a polarisation between the haves and the havenots [29, p 273, 66, 113 and 227].

Fortunately, this polarisation among the nations of the world and within individual nations — particularly within the developing nations — has introduced strong elements of instability. Responding to these pressures, some minor steps have been taken to make the power of a few among the vested interests appear diminished — for example, abolition of the Privy Purses, nationalisation of banks and general insurance, and constitutional amendments on the Fundamental Rights. The Central and the state governments have also committed themselves to launching "a direct attack or unemployment, underemployment and poverty" in the Fifth Five-Year Plan (1974-79) [22]. A National Programme of Minimum Needs [28, pp 87-91], consisting of an integrated package of programmes covering the fields of elementary education, rural health, nutrition, rural water supply, rural roads, house sites for the landless, slum improvement and rural electrification, is supposed to be the blueprint for ensuring social and economic justice to the weaker sections of the population of the country. Out of an outlay of Rs 5,790 crores in the public sector under the head "other services", an outlay of Rs 2,803 crores has been specifically set aside to finance the National Minimum Needs Programme.

Attempts have been made, moreover, to tailor the programmes under health, family planning and nutrition to the Fifth Plan strategy — particularly to the package of the National Minimum Needs Programme [3, pp 232-246]. The plan is to provide minimum public health facilities, integrated with family planning and nutrition, for the vulnerable groups — children and pregnant and lactating mothers — and preferential treatment to backward and tribal regions. Obviously, following the model of the "barefoot doctors" of China, there are reports of government plans of having "peasant physicians" for each of the over 560,000 villages of India.

Recognition of the dismal failure of the Fourth Plan to attain its demographic objectives has set in motion an agonising reappraisal of the entire pro-

gramme. Some steps have already been taken to dismantle the major props of the specialised 'vertical' programme, in order to merge it more fully with the health and nutrition services [3, p 241].

The unipurpose family health assistant has been merged with the basic health worker to form a new functionary — the multipurpose health auxiliary. Approaches having overtones of coercion or monetary enticement — such as target orientation, mass vasectomy camps, use of paid agents to procure sterilisation cases, and payment to doctors and other health workers — are being given up. Conforming to the changed strategy for family planning, steps are also being taken to evolve a new strategy for mass communication and extension education to replace the old approach. There is also a reappraisal of the role of mobile IUD and sterilisation units and of the urban family planning bureaus and clinics. A "New Motivation Strategy" is being developed to build "those aspirations and urges that go to foster the small family norm" by providing "better health, more economic security, better education, less fragmentation of property and land holdings, greater concern for mother and children, and higher age at marriage for girls"[29].

It is significant that the present change process is partial and a mere concession. Thus, following the trend of the previous plans, the resources allocated to the National Minimum Needs Programme for the Fifth Plan are only a fraction of what is needed to meet the minimum needs of the weaker sections of the population of the country. It is also highly questionable whether in the context of the present lack of political will and steeply rising prices, it will actually be possible to mobilise even the limited resources that have been allocated for the minimum needs programme. It can also be forecast that the existing leadership will not venture to confront and overcome the obstacles from the big power elites — e g, the urban gentry, the big business houses, and the powerful rich farmers — who are bound to come in the way of implementing even a very watered down version of the minimum needs programme. The same considerations will inhibit them in bringing about changes in the "culture" of the bureaucratic and the technocratic administrative systems and in the "culture" of the institutions for education, training and research. The new Fifth Plan strategy will, therefore, be as ineffective as the previous ones.

Fortunately, such patently unconvincing efforts to patch up the problems of the country will lead to an erosion of the credibility of the leadership at an exponential rate. The pressure for change on the system is likely to increase correspondingly. There will be much greater frustration, disillusionment and disenchantment within the ruling camp. There will also be mass unrest of much greater intensity. These two positive forces for change — mass movements and pressure for change from a segment within the ruling elites — will reinforce the passive force of rebound which will be generated as a result of failure of the Fifth Plan strategy and they all will contribute to trigger off a chain reaction of a series of frontal encounters between the forces of change and the forces of *status quo*. If, as a result of this struggle, in another decade, the existing alliance of forces is replaced by a much more harmonious, dynamic and progressive alliance of forces which will effectively respond to the urges of the masses, it will then be possible to make more energetic efforts to implement the Directive Principles of State Policy. In this changed political, social and administrative climate it will also be possble not only to bring about a major shift in the balance of the existing health services, from urban to the rural, from curative to the preventive, and from providing services only to the privileged few to making services available also to the weaker sections of the population. The family planning programme too can be totally submerged within such a restructured and strengthened health services structure and it will lose its identity as a separate programme. Services for family planning, such as vasectomy, tubectomy, IUD, induced abortion, and contraceptive pills, can then be offered as an integral part of the health services.

Concurrent progress in social, economic and political fields would not only create favourable conditions for generating the motivation for accepting the health and family planning services, but also and perhaps much more importantly, such programme itself would make a very major impact on the health and fertility status of the population. An increase in the marriageable age of boys and girls and a significant improvement in the social, cultural, educational and economic status of women, for example, would have a major influence on fertility rates. Because of these developments — and more because of the far-reaching changes in the social, political and economic fields than because of the family planning services offered through the health services — the fertility rates should show some hopeful declining trends. The annual population growth should, in time, decline to 0.5 per cent or even below.

The Planning Commission, assuming the birth rates to be 35.57, 29.57 and 24.82 for 1971-76, 1976-81 and 1981-86, respectively, makes a population projection of 705.2 million for 1986 [28, p 1]. Against the changes which are expected to take place during 1971-86, its assumption of birth rates appears to be on the optimistic side, concerning 1971-76 and 1976-81, while the estimation of the birth rate may prove to be reasonably correct for 1981-86. The population for 1986 may thus turn out to be between 712 million and 715 million rather than the projected 705 million. The rate of growth of population is expected to slacken sharply in the next 10 years and become negligible for the remaining five years of the century. India's population by 2000 AD is expected to be around 790 million.

VI

Summary

Despite the enormous investment, despite all the goodwill of planners and political leaders, and despite taking recourse to means which are questionable on social, moral, ethical and political grounds, even in terms of reduction of birth rate, the programme has abjectly failed to attain the prescribed objective. The decision-makers made a fundamental mistake in taking a very narrow view of the problem of rapidly rising population growth in India and in not realising adequately that, for controlling population growth, a family planning programme forms merely one segment of a much wider spectrum of programmes. Their alienation from the masses, their Westernised values, their lack of competence in technical matters, their abject dependence on foreign consultants for assistance, and their reluctance to come to grips with urgent social problems, along with pressure from certain powerful vested interests, both within the country and abroad, all combined to impel them to conceive a family planning programme as *the* instrument for bringing down the birth rate and huge quantities of resources were made available for implementing such a programme.

A polarisation exists between the haves and the havenots, both among the nations of the world and within individual nations, particularly within the developing nations. Fortunately, this polarisation itself generates instability within the system. Because of this, for instance, even twenty-seven years after Independence, it has not been possible to meet some of the basic requirements of a big segment of the population of the country, which, in turn, has generated considerable pressure on the system for change. Compelled by this situation, the ruling elites have yielded, rather reluctantly, only to the most pressing demands which can no longer be resisted so that they are in a position to resist other demands for change which may be equally urgent and justified.

As a result of this lack of inner motivation for change among the ruling elites, the Fifth Plan strategy, including the National Programme for Minimum Needs and the proposed new approach of integrated health, family planning, and nutrition is not expected to yield the desired results. Such repeated failures will, however, generate at an exponential rate, some positive pressures for change — pressure from within the masses of the people as well as from within the ruling elites themselves. This combined pressure will be able to counter the totalitarian forces which will be generated as a reaction to the proposed changes. If this succeeds against the existing elites and forces, the country may then be launched on a path of all round social, political and economic development, including integrated developments in the fields of health, family planning and nutrition. This will lead to a sharp decline in the fertility rate and, before the end of the century the annual population growth rate will decline to 0.5 per cent, or even below. Because of these changes in the fertility rate, India's population by 2000 AD is expected to around 790 million.

International Pharmaceutical Industry and Less-Developed Countries

II—Costs and Alternatives

Sanjaya Lall

The pharmaceutical industry is one of the most 'multinational' modern manufacturing industries; the firms which dominate it in the developed countries also operate in almost every less-developed country outside the socialist bloc.

The social importance of the pharmaceutical industry is such that in recent years it has been subjected to increasing enquiry and criticism in several countries. It is an indication of the industry's power that few of these criticisms have led to reforms in its basic structure.

Part I of this paper, which appeared last week, examined the main characteristics of the international pharmaceutical industry, highlighting the anomalies and distortions that exist because of the peculiar structure of the drugs market and because of the great oligopolistic power exercised by the leading firms.

The implications of the structure of the international pharmaceutical industry for the developing countries, to which many of its less desirable features are transferred wholesale, are discussed in Part II of the article published below. The additional social costs imposed on these countries by their playing host to the drug multinationals are described, using the Indian case as an example. The options open to the governments of the developing countries to reduce the cost of obtaining drugs are also considered.

THE pharmaceutical industry in the less developed countries embodies all the essential features of the industry in the West. Most of the large international concerns operate in those less developed countries (LDCs) which actively promote import substitution in drug manufacturing — though, in most cases, the manufacturing operation consists simply of formulating and packaging imported chemicals.[1] In a few relatively industrialised countries, such as India, Mexico, Argentina, Brazil, and the UAR, the industry has managed — behind protective barriers — to achieve considerable backward integration with the growth of an indigenous fine chemicals sector; in others, however, import dependence remains very heavy.

The technology of drug manufacture is, of course, almost entirely imported from the developed countries, and the system of patenting, the marketing methods, and the levels of profitability, are all very similar to those described in the previous sections. As in the developed countries, the more industrialised LDCs have large numbers of local firms which supply very small proportions of total pharmaceutical sales, in the foreign multinational firms possessing overwhelmingly dominant positions in their markets.[2] Given the profitability of their own manufacturing investments, the multinationals are naturally unwilling — unless forced to do so by local laws — to license indigenous firms to manufacture their patented products; and, given the existence of patent protection as well as the entire paraphernalia of drug marketing backed by the prestige of established foreign brand and company names, the multinationals can easily maintain — and have done so till now — their dominant positions in perpetuity.

The social costs of this structure, as noted for the developed countries, apply even more strongly to the LDCs — in that, there are certain special factors in the latter which further raise the burden on the host economies:

(*i*) Though there is little original R and D done in LDCs by the pharmaceutical multinationals, beyond relatively minor adaptive research, their control over *patents* is even more complete than in developed countries.[3] In many LDCs, including the more industrialised ones (with the rather odd exception of Brazil), the percentage of total patents (including non-pharmaceutical ones) owned by foreigners borders on or exceeds 90 per cent;[4] of the 10 per cent owned by nationals, there is reason to suspect that a large proportion is of little commercial importance.[5] Though figures are not generally available on pharmaceutical patents separately, some data for Chile indicate that foreign ownership in this industry was the second highest of 10 industrial groupings in 1967,[6] while information from the UK, where only 6 per cent of pharmaceutical patents filed in the mid-1960s were nationally owned as opposed to 14 per cent some 12 years previously,[7] suggests that there is an increasing tendency in all countries with multinational drug firms to have foreign-owned patents.

What are the implications of this trend for LDCs? Do they have reason to dislike it any more than, say, the UK? Recent analysts of the patent system in LDCs agree that the rationale of its existence there is not so much to provide an inducement to innovative activity — since the innovating firms invest in R and D primarily with a view to their main markets in the developed countries[8] — as to stimulate the inflow of foreign direct investment and the transfer of new technology. These analysts, especially Vaitsos,[9] also express grave doubts about the acceptability of this rationale, on the ground that the patent system serves primarily to increase the monopoly power of foreign investors — and so enables them to restrict technological transfers, raise import prices, and indulge in various other restrictive practices.

There is little reason to doubt, on the basis of the experience of developed countries, that the patent system does increase the monopoly power of multinational firms in this particular industry, though it would be incorrect to put the entire blame for the monopolistic practices in LDCs on patents as distinct from other sources of market power, especially marketing practices. It is, however, impossible to envisage what the structure of the industry would be if the entire international patenting system were scrapped; patents may be only one of the supports of the present system, but it may be the vital one to its existence.

If we accept, then, that patents are of some value in enhancing monopoly in the pharmaceutical industry — as, indeed, they are intended to be — the charges which can be levelled against them are: (*a*) that they allow multinationals to buy up most of the patents in LDCs and *not use the vast majority of them*, thus providing a captive market for exports for the producers in developed countries, while preventing emergence of indigenous enterprise or the purchase of cheaper imports;[10] (*b*) that they stifle local research efforts; and (*c*) that they allow foreign sellers of technology to impose restrictive conditions in contracts, or to charge excessive prices for the technology transferred.

The most balanced review of these criticisms is by Penrose, 1973, who argues that many of these effects would exist even without the patent system, that there may be valid economic reasons for the non-working of patents, and that a more stringent official check could counter most of these abuses. However, she ends by saying that there is a strong, but not conclusive, presumption that LDCs "gain little or nothing, and may even lose, from granting patents on inventions developed, published, and primarily worked abroad."[11]

The reason why the case against patents is not conclusive is that they may "in some industries and in some circumstances ... promote technological transfer and its implantation in the local economy".[12] The circumstances in which this is particularly true are those requiring a lot of technological backing, beyond the mere sale of patented knowhow, and when, consequently, the willing support of foreign firms is valuable. This is *not*, however, true of the pharmaceutical industry: the production technology is simple, the backing of foreign firms is not necessary, and the concomitant monopolistic costs foreign control are particularly heavy. Thus, while abolition of patents may not by itself remove the existence of foreign monopoly in drugs in particular LDCs today, to the extent that the international patent system permits or enhances monopoly in this industry the system does appear to have more costs than benefits.

(*ii*) These costs, which we can attribute to the overall structure of the industry, and not simply to patents, are of two general kinds — financial and social. The *financial costs* of the multinational dominance of this industry are particularly important for those LDCs which are extremely short of foreign currency, since they all accrue in foreign exchange and benefit the foreign investors or their home governments.[13] They arise from various factors, the most important being the use of transfer-pricing (which we have noted above, but which, for reasons discussed elsewhere,[14] tends to work particularly against the welfare of LDCs), the charging of excessive royalties even on technology purchases from within the same firm, and the imposition of export restrictions. All these have been discussed in recent literature on multinational corporations and LDCs and need not be elaborated here. It need only be pointed out that most of the evidence on transfer-pricing has been based on investigations of the pharmaceutical industry, and that the incidence of export-restrictive clauses has been particularly common here. To return for a moment to Roche, investigations in Colombia for the late sixties showed that this firm was overcharging its subsidiary (as a percentage of world market prices) by 94 per cent for Atelor, by 96 per cent for Trimatoprium,[15] by over 6,000 per cent for Diazepam, and by over 5,000 per cent for Chlordiazepoxide.[16]

(*iii*) The *social costs* of the present pharmaceutical industry in the LDCs arise from the peculiar configuration of circumstances in such countries, where extreme poverty, lack of effective social welfare systems, high incidence of illness, and absence of modern medical treatment in rural areas are *combined* with the unreasonably high prices of medicines charged by the multinational drug companies. We have already noted the reasons for the excessive drug prices in the developed countries. In poor countries the welfare cost of such prices is immeasurably greater. Not only do expensive pharmaceuticals put a great deal of medication out of the reach of vast sections of the population and confine proper treatment to an elite preserve, they also prevent a more rapid spread of medication to non-urban areas where most of the people live and where illness is rife.

These are the special problems which the modern drug industry creates for LDCs — quite apart from the ones which were described in Part I. While the general structure of the industry is similar in the developed and the less-developed areas, there is one major difference: The developed countries produce the technology and will continue to do so, the less-developed ones import it and may expect to do so in the future. Since the operation of multinationals ensures that the latter also pay in full for the proliferation of products and for famous international brand-names, the problem of policy in the two areas is quite different. Both are concerned with minimising the cost of medicines, but for the developed countries the problem is to maintain or improve research while cutting out its present wasteful elements, whereas *for the LDCs the problem is to obtain the results of research done abroad as cheaply as possible*. We shall return to this when we discuss policy options for the LDCs; let us first consider the position of the industry in India.

Pharmaceutical Industry in India

In 1970-71, the total production of pharmaceuticals in India was approximately Rs 250 crores, ($ 333 million at the current exchange rate of Rs 7.5 = $ 1); of this 80-90 per cent was accounted for by some 100 large units, and about 70 per cent by the 30 largest firms.[17] Approximately 2,300 smaller units supplied the remainder of the market. The total consumption of pharmaceuticals in India in 1966-67, when comparable figures are available for other countries, was about $ 250-300 million, while it was $ 4,667,000 million in the US, $ 640,000 million in Italy, and $ 71,200 million in Belgium (the smallest consumer in the OECD).[18]

There are several plants in the public sector in India which produce both basic chemicals for use by the pharmaceutical industry as well as some finished pharmaceutical products. However, the bulk of pharmaceutical production still lies in the private sector, and here foreign firms are in a dominant position. Of the top 15 firms ranked by sales in 1966, only 4 were wholly Indian-owned;[19] of the 39 'medium and large' public limited pharmaceutical companies (which include nearly all firms of moderate size), 33 were foreign controlled in 1968-70.[20]

The 33 foreign-controlled drug firms accounted, in 1969-70, for 93 per cent of the value of sales of the 39 medium and large drug companies, for 96 per cent of their net fixed assets, and for 109 per cent of their profits-before-tax. If these 39 large companies are assumed to have provided 70-80 per cent of total pharmaceutical demand in the country, the 33 foreign controlled firms supplied about 65-75 per cent of the total market.[21]

These 33 firms — exactly 10 per cent, in numbers, of the 330 total 'foreign controlled rupee companies' surveyed by the Reserve Bank for 1969-70 — accounted for 9 per cent of the value of net sales of the total sample, for 8 per cent of net worth and for 6 per cent of net fixed capital employed. An earlier survey of India's international investment position (*RBI Bulletin*, 1971), as at end of March 1968, shows that

total foreign direct investment in branches and foreign-controlled firms in the pharmaceutical sector (Rs 38 crores) came to 11 per cent of total such foreign manufacturing investment in the country. Of total foreign equity investment in pharmaceuticals, 87 per cent was in branches and subsidiaries (i e, 50 per cent or over foreign shareholdings), 12 per cent in foreign-controlled minority companies, and only 1 per cent in non-foreign controlled companies. The high proportion of foreign control in this industry contrasts with manufacturing industry generally, where 12 per cent of total foreign equity capital was invested in non-foreign controlled enterprises.

Though the 33 foreign controlled pharmaceutical firms accounted for less than 10 per cent of sales and net worth of the 330 foreign controlled firms in 1969-70, they accounted for nearly 18 per cent of their total profits-before-tax. The percentages of profits-before-tax on total capital employed came to 15 per cent for the 330 firms and 30 per cent for the 33 drug firms; while those of profits-after-tax on net worth came to 14 per cent and 22 per cent, respectively. These ratios were, by way of contrast, 8 per cent and 7 per cent, respectively, for 1,926 Indian public limited companies in the same period. Furthermore, the 39 medium and large drug firms recorded profits-before-tax on capital employed of *over 20 per cent in every single year* from 1965 to 1971, when the average for the total of 1,501 medium and large firms was always 10 per cent or less. The drug industry was consistently the most profitable of all 23 sectors (including non-manufacturing) covered for the six-year period, with one exception in 1970-71 when mineral oils achieved somewhat higher profits. The foreign companies in the pharmaceutical industry were always more profitable than the local ones; in fact, the latter six firms recorded net losses in 1968 to 1970 when the former were earning extremely high profits. Thus, the foreign drug companies in India have been *not only the most profitable among manufacturing firms in the country generally but also among all types of foreign controlled enterprises, including those in non-manufacturing sectors.*

Of the foreign firms in the pharmaceutical sector, Roche is one of the most profitable. In 1968, for instance, when the 33 foreign controlled drug firms earned profits-before-tax of 24 per cent on capital employed, Roche recorded pre-tax profits of over 60 per cent on net capital employed and about 65 per cent *after* tax on net worth.[22] Similarly, the firm's ratio of profits-before-tax (net of depreciation) to sales was 37 per cent in 1968, as compared to 18 per cent for the 33 foreign companies, and to only 8 per cent for the total 1,501 medium and large public limited companies.

The existence of transfer pricing, of course, reduces the reliability of declared profits as indicators of true profitability. India is less vulnerable to this particular practice than most other countries — if only because the government's strenuous efforts at import-substitution have forced down imports to a relatively low level. The fall in imports as a percentage of production from 25 per cent in 1960-61 to 10 per cent in 1963-64 for foreign subsidiaries, and its further reduction to about 8 per cent for the industry as a whole by 1972,[23] shows that the industry has managed to achieve a fair degree of self-sufficiency. With the planned increase in production of chemicals by public sector plants, the extent of import dependence will probably continue to fall in the next few years.

This is not to argue, however, that transfer pricing is not used by foreign firms, nor that it does not make a substantial difference to the profitability of the firms concerned. There is a shortage of 'hard' data on the use of transfer pricing by multinational firms in India, though plenty of impressionistic and indirect evidence exists that it is widely used.[24] Certainly, there are many inducements to use it — high tax rates, price controls, political pressures, and so on — and no effective deterrents, such as the direct checks exercised by the Colombian government, exist. In Roche's case, for instance, imported chemicals came to 19 per cent of the value of production in 1968; if 90 per cent of the value of imports were simply the transfer of profits (a conservative estimate, on evidence from the UK and Colombia), the real profits-after-tax of the firm would be almost exactly *double* the declared profits. The figures are pure conjecture, of course, but there is little reason to doubt the real dangers inherent in the system.

India is a high drug-price country; even the Kefauver Committee in the US remarked on the level of pharmaceutical prices in India and on its perverse relationship to levels of per capita income.[25] The preceding discussion has explained why pharmaceuticals are high priced in general, and also why the level of prices fixed by the leading firms has little to do with the actual costs of production. With the obvious exception of heavy R and D expenditures, all the other usual costs of producing and marketing pharmaceuticals are present in India: there are heavy promotion expenditures (though the exact cost breakdown is not available); there are high profits and a proliferation of branded products; and there are vast differences between brand name products and generic name products. Roche's Librium was sold in 1972 for Rs 16 (per 100 tablets of 10 mg each) when generic name equivalents were available from small units for prices as low as Rs 1.52.[26] Similarly, public sector units were supplying Phenobarbitone at 1 paisa per tablet and Diethy Carbamazine Citrate at 3 paise per tablet — when brand name foreign equivalents were being sold at 3 paise and 8 paise, respectively.[27] Many such cases have been recorded for a wide range of products, with the price differentials being very large indeed; but this is hardly surprising, in view of comparable differences observed in developed countries.

The position of foreign brand name products is, if anything, stronger in a country such as India than in developed countries. Not only is there a long-standing prejudice against local products in every industry, "medical practitioners and consumers have a rigid faith in the quality of the high-priced drugs from foreign companies".[28] Two special factors in the Indian situation must, however, be noted in this discussion. First, the cost of intermediate chemicals supplied by public sector plants is high, relative to international prices; foreign firms often blame high retail drug prices on the high cost of their raw materials. Second, quality control by the authorities is neither comprehensive nor very efficient, and a number of cases of drug adulteration by small producers has been recorded.

These points may seem to support the case for promoting foreign drug firms and reducing public sector production. The first, however, is not very convincing, because the retail prices charged by these firms is very much higher than is justified with reference to raw material prices. Generic equivalents are marketed much more cheaply by smaller firms which use the same chemicals as raw materials. Even in cases where the public sector prices are over three times the import costs — as with Phenobarbitone, or Vitamin B — the prices of competing foreign brand name equivalents are much higher (about 50 per cent and 300 per cent, respectively). The cost of raw materials is always such a small proportion of the selling prices in this industry that it is in any case difficult to accept this argument at its face value. Of course, the public sector should be made more efficient, but *even an inefficient one provides cheaper drugs than the multinationals.*[29]

The second point is more serious. The enforcement of quality control varies greatly from state to state — with Bihar and Madhya Pradesh lacking drug control staff altogether.[30] The dangers of drug adulteration are very great, and, given the enormous profit margins, the inducement for small producers to indulge in it are also very great. To the extent that the foreign firms enforce rigid quality control, certainly a strong plea can be entered in their favour; the situation, however, is not one which calls for extending the scope of foreign manufacturers so much as for enforcing better quality control, or, as argued below, for extending public sector production. After all, there *are* good generic equivalents available from small producers and from public sector firms, and at much lower prices than foreign branded products; the obvious solution is to promote low-priced products, with adequate quality safeguards.

The Indian government's policy towards the pharmaceutical industry has been a combination of extreme stringency in some respects with gross leniency in others. Let us briefly consider the salient aspects of its policy.

(*i*) *Prices*: In 1970, the government issued a Drug Price Control Order, based on recommendations of a Tariff Commission study, to determine the prices of 18 basic drugs and their 69 formulations.[31] A formula, giving a 15 per cent pre-tax return on net capital employed for manufacturers, and another 15 per cent for formulators, was used. The implementation of the Order eventually led to a reduction in the prices of the controlled drugs, though we do not possess information on the exact magnitude of savings achieved. These 18 drugs accounted, however, for only 9 per cent of the total value of drugs marketed in India; the Order had the perverse effect of inducing an increase in the *overall* drug price index, of 12 points in 1970-71 — the highest annual increase recorded since 1960.[32] The pace of increase in drug prices quickened, in fact, after 1966, when the Tariff Commission investigation of prices was instituted. Whatever the merits or faults of the Order within its context of 18 drugs, therefore, it certainly did not provide a means of checking overall pharmaceutical prices in the country.

(*ii*) *Patents*: We have already noted the Indian government's early objections to the effects of the patent system. After a great deal of prolonged debate, a Patents Bill was passed in 1970, reducing the period of patent protection from 16 to 7 years, ruling out product patents and providing for compulsory licensing after 3 years for a royalty not exceeding 5 per cent of the value of production.[33] These measures put India among the countries with the strictest of patenting provisions, though clearly not in the class of Italy which allows no drug patents at all.

(*iii*) *Public Sector Production*: While the government is, in line with its general industrial policy, continuing to expand public sector production of drugs and related chemicals (in various plants of Hindustan Antibiotics and Indian Drugs and Pharmaceuticals), far more could have been achieved by now had the private sector not interfered in the early stages of the negotiations with the Soviet bloc for technical assistance. Kidron cites this as one of the instances of political pressure wielded by the foreign investors in collaboration with their Indian counterparts. In this case, a Russian offer was rejected in favour of more expensive private deals.[34] The main present 'problem' is one of high costs of production; it is hardly relevant to our present discussion to go into its solutions, though there seems to be no special reason why, in this industry, it should not be resolved with time — since economies of scale or production technology are not particularly important or sophisticated. To repeat an earlier point, *even an inefficient public sector markets drugs at lower prices than an efficient private foreign sector.*

(*iv*) *Transfer Prices*: The government has not formulated an effective policy to deal with this aspect of the drug companies' operations, despite many indications that foreign firms in this and other sectors use arbitrary pricing to remit profits abroad. The growing canalisation of imports through the State Trading Corporation may have alleviated the risks, along with the reduction in the degree of import dependence, but a substantial amount of foreign exchange is still spent on imports bought directly by the private companies. Given the inherent arbitrariness in pricing in the international pharmaceutical industry, the neglect (even in calculating costs for the 18 price controlled drugs) is unfortunate.

(*v*) *Marketing*: As with most other countries, the marketing of drugs is left entirely to the devices of the private manufacturers, and so it involves all the wastages already noted. This aspect of the industry is so fundamental to its present structure and functioning, that it is difficult to envisage reforms which leave it out of consideration. Yet the government has shown little awareness of the issues involved even in its bravest attempts to cut pharmaceutical prices. Not only has it not considered the setting up of a nationalised drug marketing system, it has even failed to implement measures to sell drugs by generic rather than brand names (which other countries, like Pakistan, have done).

In all these respects — as also in quality control and removal of export restrictive clauses[35] — there are gaps and defects in official policy. However, piecemeal measures to remedy one aspect or another of the drug industry will not result in the elimination of social waste and the lowering of drug prices. Only a comprehensive approach can resolve the basic anomalies in the industry. Let us now consider the policies open to the less developed countries, and especially to the Indian government, to achieve a practical solution.

Policy Options for LDCs

Let us restate the fundamental problem: the LDCs want the benefit of having the best drugs available to modern medicine; they want to import or produce them at the lowest possible cost, using the results of research which is generally conducted in developed countries;[36] they want to bring them to consumers with the lowest possible expenditure on marketing, and, at the same time, provide adequate and honest information on new preparations and their prices to prescribing doctors; and they want to eliminate monopolistic elements in pricing of brand name products and every possibility of drug adulteration.

How is all this best achieved? One solution — perhaps the best from a global point of view — would be a thorough reform of the pharmaceutical industry in the developed capitalist countries, along the lines mentioned at the end of Part I. If the undertaking of pharmaceutical research, production and marketing were socialised, and the products (finished or intermediate) made available to the LDCs at prices approximating the real costs of production, most of the undesirable elements in the present international structure of the industry would disappear. The LDCs would still be faced with the problems of internally processing and marketing the drugs, but any sensible distribution system would be able to deliver the goods at prices far below present ones.

However, this is not a policy which is open to the LDCs. Despite the occasional outbursts of protest, the pharmaceutical industry is likely to continue undisturbed in its present form in developed countries; if the LDCs want to lower their costs, they

will have to do so on their own, within the given structure of the industry in the West.

The policies which a particular LDC can adopt are determined, of course, by its own industrial capacity and the abilities of its domestic entrepreneurs and administrators. There are crucial differences on the production side between those countries which possess developed chemical industries and can therefore produce most pharmaceuticals entirely on their own, and those which have to import the finished drugs or the intermediates in an almost finished form. On the distribution side, similarly, there are crucial differences between countries which are capable of managing an information and marketing system on a nationalised basis (with no help from the international drug firms) and those which are not.

Countries which have simple processing facilities but possess neither developed chemical industries nor an administration capable of handling sophisticated information and marketing systems can choose between the following alternative 'packages' — in ascending order of desirability:

First, an industry dominated as at present, by multinationals, which performs all the requisite functions but at very high cost, and against whose brand names and patents local enterprises have little chance to compete.

Second, similar to the first, but with patents eliminated, in which case local enterprises can legally copy the multinationals' products but may still find it impossible to compete against their brand names.

Third, the next stage, the substitution of generic for brand names, which may still be ineffective because the multinationals can, as they do now in Pakistan, continue to persuade doctors that their products are superior, and so still create a monopolistic privilege by inducing consumers to buy drugs made by particular companies.

Fourth, the elimination of foreign enterprise altogether, with local manufacturers buying intermediate products from the lowest-priced world sources — from small firms selling under generic names in developed countries, or from producers which copy new technology cheaply (Italy), or from the Socialist bloc[37] — which may save a great deal of the foreign exchange cost of multinational profits, but may not prevent the social wastage inherent in private marketing of drugs.

Thus, a nationally-owned, but private, drug processing industry would be able to take advantage of price differentials and non-patent-observing producers in world markets, but it would continue to be dependent on imports and it would not resolve the basic contradictions involved in the private selling of medicines. Thus, local firms would probably end up using tactics of advertising and promotion similar to those used by large firms in the developed countries — and this would occur even if brand names were banned, as long as the manufacturer's name were identifiable — thus raising the final price to the consumers. The social costs would remain internal, rather than flowing abroad in the form of foreign profits, but the most important aim of reform would still not be achieved. Furthermore, the dangers of inadequate quality control may be higher if local firms are less stringent than foreign ones, and if the government is incapable of implementing proper controls. The ultimate advantages of reform may be substantial, however, if this particular risk is averted, and if the local oligopolists are able to sell at prices lower than the present ones.

The options open to LDCs, such as India, which have sophisticated public sector production units, advanced chemical industries and relatively well-developed administrations are much broader. To continue from the fourth 'package', therefore:

Fifth, a more or less complete self-reliance in the production of intermediate chemicals, in either the public or private sectors, copying technology from abroad whenever necessary without paying royalties, and completely locally owned production of pharmaceuticals (again without eliminating private marketing costs), with strict quality control measures by the government.

Sixth, continued reliance on private pharmaceutical production but with a national purchasing service which determines individual drug prices on a fair basis, markets drugs purely by generic names, and provides doctors with the requisite information on drug uses and innovations.

Seventh, a complete socialisation of drug production as well as marketing, thus minimising the extent of private profit and, if so desired, running the industry as a non-profit making public utility. It is obvious that this seventh package can, if it is practicable, provide medicines at the lowest possible cost both to the country and to the consumer. That it is in principle practicable, is illustrated by the Egyptian example (and by the more limited one of India); international patents can be disallowed, as in Italy; and socialised distribution can be introduced, as in the Socialist countries. Whether the actual costs will reach the optimum level envisaged or not will depend on whether public sector units can be run efficiently, whether quality control can be enforced, whether a government distribution and information system operates smoothly, and, of course, whether the political situation of the country will compell such a radical change.

In the particular case of India, while there is bound to be considerable political opposition to a complete public take-over of the pharmaceutical industry, matters have changed greatly from the fifties, when the private sector could actually hinder determined moves in this direction. The problem of quality control is, if anything, worse under the present system of thousands of small producers than it would be with a few large public sector units; the elimination of the small units would by itself rule out many of the present abuses. The provision of regular and up-to-date information on drugs to doctors should not prove very difficult, especially if the government uses the results of clinical tests and official checks done in the developed countries. Since the technology of drug production is basically not very complex, the copying of foreign products should be fairly straightforward. In the few cases where there are lags or difficulties, the drugs could always be imported from cheap sources abroad. The only remaining question concerns efficiency. However, as long as one accepts that there is no *intrinsic* reason why public sector units should be less productive than private ones, experience and effort should resolve it with time.

We conclude, therefore, that in the long-run, the best way to deal with the various complex problems of the present international pharmaceutical industry, as it operates in the LDCs, is to move towards a socially-owned indigenous pharmaceutical industry; which copies foreign technology, bans brand names, and markets the products through official agencies. Given the social importance of this industry, and the human costs involved in the present high-price structure, it is vital that the reform be undertaken as a matter of urgency. Prevarication can only serve to worsen the dependence on multinational firms and increase the social costs of such operation.

Notes

1 See Wortzel, 1971, for a brief description of the pharmaceutical industry in LDCs.

2 The market shares of multinational pharmaceutical firms in the late sixties were as follows in some selected LDCs; Brazil, 78 per cent, Argentina, 65 per cent, Peru, 95 per cent, Venezuela, 90 per cent, the Philippines and Central America, over 80 per cent. See Wortzel, 1971, and Vaitsos, 1973. See below for details on India.

3 On the effects of patents in LDCs see Penrose, 1973, Vaitsos, 1973, and UN, 1964.

4 UN, 1964, pp 94-5.

5 Vaitsos, 1973.

6 Vaitsos, 1973, p 75. The foreign ownership of pharmaceutical patents was 98.4 per cent as compared to 94.5 per cent for all industry.

7 Cooper, 1967, p 40.

8 This is probably even more true of the pharmaceutical industry, in which all the LDCs together account only for about 16 per cent of total non-Soviet Bloc pharmaceutical consumption. See Wortzel, 1971, p 40.

9 Vaitsos, 1973. See also the views of the Indian Government as expressed to the UN, in UN, 1964, p 57.

10 Vaitsos, 1973, estimates that 98-99 per cent of patents taken out by foreigners in Colombia and Peru were unexploited in 1970, the bulk of them in the pharmaceutical industry. The Indian Government, quoted in UN, 1964, levels the same charge, though the exact proportion of unexploited patents is not mentioned.

11 Penrose, *loc cit*, p 783.

12 *Ibid*, p 784.

13 Here we are considering costs above the 'normal' ones of excessive profits, which also results in foreign exchange drains, and high marketing expenses, which are generally in local currency unless the advertising firms are also foreign owned.

14 See Lall, 1973.

15 These two figures are derived from details of public prosecutions of pharmaceutical firms published by a Bogota newspaper (*El Tiempo*, 1971); the annual savings achieved by reducing the prices of these two chemicals came to US $ 384.6 thousand.

16 The last two are from Vaitsos, 1973, Table 7; where Diazepam is mentioned as 'substance of Valium'. These two figures are the highest recorded for overpricing in this table, but are not very startling when compared with the 4,000 per cent and 4,500 per cent overpricing respectively found by the British Monopolies Commission's investigation of Roche (p 38).

17 Agarwal, *et al*, 1962, and Ministry of Foreign Trade, 1972. A different estimate for 1966 puts the share of the largest 25 firms at 74 per cent of the total market, and claims that this has not changed much till now. (Mote and Pathak, 1972).

18 OECD, 1969, Table 2.

19 Mote and Pathak, 1972.

20 *RBI Bulletins*, 1972 and 1973. The definition of 'foreign controlled' used by the Reserve Bank of India includes firms with 40 per cent or more foreign equity and other firms which are foreign managed and have 25 per cent of their equity held abroad. As these firms cover only public limited companies, wholly owned branches of foreign firms are not included; these account for 12 per cent of total foreign direct investment in the pharmaceutical industry (*RBI Bulletin*, 1971).

21 This range may be slightly higher if branches of foreign firms are included, bringing it to 70-80 per cent.

22 From Roche's annual accounts. The firm has now been in operation in India for over 25 years with a foreign shareholding of 89 per cent in 1968.

23 See RBI, 1968, and Ministry of Foreign Trade, 1972. This may be compared with an average of 31 per cent for a sample of 20 pharmaceutical firms in Colombia. (Lall and Mayhew, 1973).

24 See, for instance, Kidron, 1965, Agarwal, *et al*, 1972, and Government of India, 1971.

25 See Kidron, 1965, p 251.

26 Agarwal, *loc cit*, Table 3. Roche's price was slightly lower than the equivalent in the UK (about Rs 18), but is much higher than the price recommended by the Monopolies Commission, and now enforced by the British government.

27 *Ibid*, Table 1. Both these products were introduced over 25 years ago, so they are in no way an embodiment of heavy recent research expenditures.

28 *Ibid*, p 2,290. Doctors also mention that high priced treatment is considered more effective, and is sometimes treated as a status symbol by rich patients.

29 This has also been noted for Egypt in an unpublished study by Handoussa, mentioned in a footnote on p 777 of Penrose, 1973.

30 Agarwal, *et al*, 1972.

31 For details, see Mote and Pathak, 1972.

32 Agarwal, 1972.

33 See Gupta, 1970.

34 Kidron, 1965, pp 163-5.

35 RBI, 1968, notes the heavy incidence of restrictive clauses in technical agreements of foreign subsidiaries in this industry, p 38. Despite official efforts, restrictive clauses are still present in many agreements.

36 While the following discussion does not go into the role of local R and D in LDCs, clearly indigenous research is not excluded; there is no reason why local efforts should not complement research done abroad, though it is unrealistic to envisage complete self-sufficiency in this field. For reasons explained above, there should be no detrimental effect on the amount of R and D done in developed countries if less-developed ones do not buy patents from the innovating firms; this is assumed throughout.

37 Total dependence on the Socialist bloc may, of course, lead to monopolistic pricing on the part of the suppliers. The role of continuously 'shopping around' is vital.

Semi-Feudalism, Usury Capital, Etcetera

Ashok Rudra

IT is a pity that such a discerning and careful observer as Pradhan Harishankar Prasad should make such careless sweeping statements as he does in his article on the role of usury capital in *Economic and Political Weekly*, Special Number, 1974. By Prasad's own statement his observations are based on his "intimate contact with some of the rural areas of Bihar", and by his own judgment his data-base is "too small for any generalisation for the country as a whole". This, however, does not deter him from making the statement that "the aforesaid semi-feudal model (but for variations in details) is, by and large, valid for most parts of the rural India". The few correlation co-efficients he calculates for this purpose are thoroughly inadequate to support such a strong proposition. If Prasad has got intimate knowledge of some parts of Bihar, the present writer has also acquired, during the last five years or so, some direct first hand knowledge of conditions prevailing in West Bengal agriculture. In particular, during the last one year he has been carrying out an enquiry in the different districts of West Bengal in to precisely the type of question in which Prasad is interested and the information so gathered will be soon released. While we have no "model" for West Bengal agriculture as a whole, let alone for conditions in "most parts of the country", we can only point out that many of the conditions described by Prasad does not seem to hold true for most parts of West Bengal. Let us quote *in extenso* from Prasad such characterisations as do not seem to hold for West Bengal in the same way as Prasad finds them to hold for Bihar. Speaking of the "big landowning class" Prasad writes: "... it is this class which shuns rapid development because it is likely to improve the economic condition of the semi-proletariat who can thereby free itself from bondage". Speaking of consumption loans taken by the "semi-proletariat" from the big landowners, he writes "The stipulated rates of interest on these loans are very high. Often as high as 100 per cent per annum". Usury, according to him, creates an "indissoluble bond between semi-proletariat and his overlord".

N K Chandra, writing in the same issue of this journal, gives an identical characterisation of "semi-feudalism", though he is much less sweeping and very much more cautious in asserting that such "semi-feudalism" prevails in the whole country, though he tends to think so. In his words, two characteristics of semi-feudalism are "perpetual indebtedness of the small tenants" and its preventing of "capital investments in agriculture, for such investments would increase production and if the tenant's share remained constant the tenant might get out of his debts".

In the course of our investigations in the different districts of West Bengal we have failed to encounter the land owning class that finds it more in its economic and social-power interest to resort to usury rather than to capital investments. In many parts of West Bengal we have encountered landowners who are very much engaged in capital investments in the form of irrigation, fertilisers and high-yielding variety seeds, and where this tendency is present, it is found to be equally shared by landowners who give their land out on lease to sharecroppers and those who cultivate it themselves with the help of hired labour. In the former case, it has become almost a universal practice in West Bengal for owners and tenants to share the costs of seeds and fertilisers in the same proportion in which output is shared (e g, 50 : 50 in most parts, 60 for owner and 40 for tenants in some others, 22 for owner and 18 for tenant in some others, 1/3 for the tenant and 2/3 for the owner in the Kisheni system of Birbhum); also universalised has become the practice of owners paying for the irrigation costs and advancing the tenant's share of the costs of seed and fertilisers. These advances are repaid by the tenant in terms of crops at the time of the harvest. No interest in charged by the owners on these advances in any of the numerous cases we have investigated. This arrangement amounts to the owner bearing the costs of seeds and fertilisers and a change in the traditional shares in favour of the owner by corresponding amounts. The fact that the landowner takes the trouble of bringing about such an arrangement which overcomes the disability and the disincentive of the sharecropper for making investments and the fact that he makes advances without charging interest on them belies the idea that he is not interested in productive investments but only in usury. It is because of this cost-sharing arrangements with interest-free advances that owner-operated farms and tenant-operated farms do not show any difference in their performance — a matter that we reported upon in our joint article with Aparajita Chakravarty. Prasad has made a very peculiar interpretation of our results which takes no account of the difference in performance we have noted for small tenant-farmers. Our explanation is simple. A small tenant-farmer, even when provided a helping hand by the owner, cannot go in for improvements in cultivating, whereas a big tenant-farmer can.

Another important point on which our findings differ from the model of Prasad and Chandra is in respect of consumption loans. That poor tenants, farm servants and casual labourers are bound to landowners through consumption loans is a universal fact in West Bengal; but in most of the cases we have encountered, such loans, when taken by a tenant from the landowner from whom he has leased in land or by a farm servant from the landowner for whom he works, is free of any interest charges. Consumption loans taken by landless labourers is typically repaid by him by providing the landlord with free labour at any time it is demanded by the latter, the quantity of labour to be so provided being calculated at a wage rate somewhat lower than the ruling wage rate at the time the labour is given. Interest at rates of 10 per cent or more per month is of course charged whenever one takes a loan from a rich landowner and/or a moneylender *other than* the one with whom the borrower has an attachment relation as tenant or farm servant. Thus, while usury does exist as the principal occupation of some moneylenders or the subsidiary source of income of the landowning class, it does not appear that the landowning class in West Bengal is primarily dependent on usury interest for its income. If our finding is correct then there has of course to be explanations in terms of the concepts that have been used by Prasad and Chandra, e g, "capitalism", "semi-feudalism", "surplus labour", etc. We shall postpone such a fuller discussion for the occasion when we shall present the findings of our survey. For the moment we wou'd like to make the following observations:

(i) If generation of surplus through the employment of wage labour, appropriation of that surplus by the owners of capital and reinvestment of that surplus for the purpose of expansion of that capital be a characteristic feature of capitalism, then there are indeed increasing manifestations of such capitalistic features in West Bengal agriculture. This statement would not be affected by Chandra's painstaking effort to show, with very meagre data, that there is not very much evidence of concentration of land holdings having increased. Chandra has, I believe, gone on the wrong track in looking for concentration of land measured in terms of its surface area. What ought to be crucially relevant is the value of land, not acreage. I suggest that there has indeed been a very acute increase in the concentration of the value of capital in the form of land as a result of investments on land carried out by the large landowners.

(ii) If being bound by various obligations to a particular employer, and thereby not being the owner of free-selling labour power, be a characteristic feature of feudalism, then such feudalistic features continue to exist in various forms both in farms cultivated by tenants and farms cultivated by hired labourers.

(iii) Chandra has talked a great deal about "labour surplus on a scale that is probably unparalleled in human history". A distinction has, however, to be drawn between a surplus in the actual labour supply and a surplus in the labour that the agricultural population is potentially capable of supplying. It is well known that because of class and caste considerations, a very large part of the agricultural population does not actually work on the field, so that the potential labour supply with them does not affect the labour market. Even among those who are by occupation labourers, a great deal of unemployment during the lean seasons co-exists in many parts of West Bengal with a scarcity of actual labour supply in relation to labour demand during the peak periods. This provides the economic incentive to the landowners to go in for arrangements that guarantee supply of labour during periods when they need it most.

Before concluding, we would like to make observations on two points made by Chandra. In spite of the great caution he displays in making any generalisations he permits himself to make the following very careless statement: "at least in the context of Bengal, no one has suggested that [tenancy] is a dying institution, even less that it is substituted by hired labour farms ... Rarely does the landlord himself take to cultivation hiring labourers under his own supervision." Let Chandra come to Birbhum district and visit any village and he will see how the Kisheni system has been almost completely replaced by cultivation with the hep of hired labourers. (Kisheni is a share-cropping system with some peculiar features that was until recently widely prevalent in the Birbhum district. The outstanding peculiarities of the system are: (1) Kishen, the sharecropper, supplies only his labour, everything else including bullock, plough and manures are supplied by the owner. (2) The Kishen's traditional share is only 1/3. (3) The Kishen does not have the right to work for more than one owner at a time. (The Kishens are very much tied to their masters by consumption loans, but the loans are typically interest free.)

The second point relates to the interpretation of Chandra's statistical results of his Table 4. In one place he notes that some of his b_1 co-efficients are significantly positive and some others are significantly negative and he abdicates by saying "we leave it to the statisticians to tell us its statistical implications". He does not seem to notice that the positive co-efficients hold for the villages that are "treated" and the negative ones for those that are "not treated". The obvious interpretation seems to be that there is positive association with size when cultivators have been "treated", that is exposed to and given facilities for improved methods of cultivation; and negative association when such is not the case. Incidentally, as Chandra did take resort to pooling of test results by the p-lambda technique, why did he not pool the results for the data contained in the different volumes?

Tata Chemicals Limited

Statement of the Chairman, Mr J R D Tata

THE following Statement by Mr J R D Tata, Chairman, Tata Chemicals Limited, dealing with the Company's working for the year ended June 30, 1974 has been issued to the shareholders:

Continued Progress

There is little for me to add to the Director's Report insofar as the operating and financial results of the past year are concerned. Once again, and for the twelfth year in succession, the Company has produced better results than in the previous year and thus continued to reward the confidence of those shareholders who stood by the Company and never lost faith in its ultimate success even during the first difficult sixteen years of its existence when their investment yielded no return.

The Road to Success

A fund of varied experience and many valuable lessons can be drawn from the history of the Company over its 35 year existence, from its early trials and tribulations as well as from its subsequent spectacular recovery and continuing progress since then, from its failures as well as from its successes, from the courage and dedication of its staff in the face of adversity, from the determination and skill of its expert engineers and chemists in learning the hard way to master on their own one of the world's most secret and well guarded industrial technologies, and last, but far from least, from its record of service to its customers, its employees and the community.

The one lesson that stands out in the case of Tata Chemicals, as in that of other Tata companies which have sought and struggled to establish basic industries in India from the ground up, and with little or no outside assistance, is that the road to success is a long and rocky one requiring relentless pursuit of technical excellence, an immense amount of patient, hard work and efficient, imaginative and socially conscious management.

It is because these qualities have been available to it in abundance that our Company has reached its present position, and to no single person do we owe more than to your present Deputy Chairman and Managing Director who for the last twenty years or so, has provided inspired leadership and technical and managerial skills of the highest order. Perhaps the very fact that the Company went through such hard times for so many years has been in part responsible for the magnitude and determination and persistence of the efforts that had to be made to overcome the initial obstacles in the way, which seemed almost insurmountable at the time, and to develop, without any help from abroad, the present degree of technical expertise perhaps unsurpassed in the world, which the Company has achieved in its specialised field.

Its high technical competence, built-in capacity for growth backed by its growing profitability combined with its ability to design and build virtually all process equipment are, I am sure, a source of satisfaction to the shareholders, but I hope they will also appreciate the high reputation, it has established for itself and maintained at substantial cost, for its industrial and marketing philosophy, and for the manner in which it has discharged its obligations to society, be it to consumers, employees, or the people of the region of the country in which its operations are located.

Social Obligations of Industry ...

While our management have always recognised their prime duty to the shareholders of ensuring to the Company a continuous process of growth and increasing profit, they have been equally conscious of the importance of its social obligations not only from the ethical and humanitarian points of view, but also in the interests of the Company itself and of the good name of Indian private enterprise which has been under so much fire in recent times, unfortunately often with some justification.

... to Consumers

Thus, in the interests of the consumer, your Company has, for many years, not only maintained the selling prices of its principal products at levels below those of other manufacturers, but has also supplied them to the maximum practical extent direct to the ultimate user, thereby protecting him from exploitation by unscrupulous market elements.

... to Employees

The interests of its employees it has constantly promoted and safeguarded, not only through fair wages and bonuses, but also by providing them with good living conditions and civic services, and an ever-widening range of amenities for themselves and their families. Though located in an arid part of India, lacking natural living advantages or scenic beauty, Mithapur has been developed into a pleasant township, in which all those who work in it and their families are well looked after and made to feel part of one big family.

... to the Community

So far as the community is concerned, the Company has always felt a sense of responsibility towards the peasant population of Okhamandal amongst the poorest in the country, who even in normal times have to eke a hard living from a parched and ungenerous land and who suffer great hardship in times of drought, a fate which has overtaken them in acute form during the last three consecutive years.

A Programme of Relief

Treating the whole of Okhamandal and its population of about 80,000 scattered in 42 villages, as the home of Tata Chemicals, the Company has undertaken an intensive programme of relief, providing drinking water to the villagers, medical care and vitamins, subsidised feed for famished cattle, and employment opportunities for thousands of men and women engaged on special capital jobs.

With Okhamandal this year in the grip of the worst drought in living memory, this programme has been intensified and our relief programme now includes the creation of cattle sanctuaries on land donated by village Panchayats and providing them with gajraj grass, cattle sheds, and bio-gas (Gobar Plants) to meet fertiliser and energy needs, planting a hundred thousand trees, drilling tube wells and deepening and desilting existing wells, and other projects of assisted self-help. This programme will be continued until the Okhamandal community is reasonably protected against the vagaries of nature and becomes fully self-reliant.

Apart from these activities based on meeting the relief needs of Okhamandal or supplementing those provided by government we have felt, with the considerable improvement in our fortunes

and the growth of our disposable funds, that the Company should look beyond serving local needs and should apply some of its growing material resources and human skills to a project of national importance. This is the genesis of the creation of the Tata Energy Research Institute (TERI), briefly mentioned in the Directors' Report.

Role and Problems of Energy

The economic progress of any country, particularly of an underdeveloped country such as ours, requires the production and consumption of immense quantities of energy in various forms. One of the major causes of India's continuing poverty and slow economic growth has lain in the inadequacy of its production of usable energy.

The cost of creating additional power capacity in large central plants based, as most of them must be on hydrocarbon fuels, to which must be added the cost of developing coal or oil sources, has become astronomical these days. While this fact applies to all countries of the world, its impact is particularly severe on a poor country like India which faces the additional problem of the large dispersal of its enormous population over hundreds of thousands of villages, many of them deprived of easy access. Thus the cost of distribution of the electric power needed for the development, too long neglected, of our agricultural economy, would itself involve gigantic expenditure and effort. The oil crisis created by the quadrupling of the price of oil by the oil producing countries of the world, has greatly aggravated this problem for us.

Against this background, there is a clear need in our country for a long-term concentrated research and development effort directed at seeking and, where possible, providing alternative and cheaper sources of energy, particularly in those forms which could be produced on a relatively small scale near the actual places of consumption.

That there are potentially additional as well as alternative sources of energy is well known. Apart from fresh discoveries of oil fields, the sun, the winds, the tides, water flows large and small, geophysical heat, amongst others, are all potential additional and alternative sources. So far as solar energy is concerned, it may be noted in passing that no one in India makes greater use of it than Tata Chemicals in the production of salt.

A Project of National Importance

In the light of this great and urgent national requirement, Mr Darbari Seth conceived the idea, wholeheartedly approved by the Board, that Tata Chemicals should establish and support a specific and concentrated programme of research in the problems of conserving and making the use of existing energy more efficient and less polluting; and in the development of new sources of energy, with particular emphasis on non-depleting and non-polluting sources and on energy capable of being economically produced on a small scale and dispersed basis with minimum distribution and transportation costs. As the first step towards implementing such a programme, your Company has launched the Tata Energy Research Institute, registered as a Society at New Delhi, under the Societies Registration Act, 1960, with an initial contribution of Rs 1 crore. This amount, which has been paid by the Company out of its revenues of the past year will, under the enlightened policy of government which recognises the need for maximising research in the country, be fully chargeable to revenue expenditure under the Income-tax Act.

The first step having thus been taken, we are now engaged in studying the many problems of the project in the fields of organisation, technology and personnel, which will have to be resolved before the Institute can begin to function. It will obviously require much larger funds in the years to come. To this your Company will, I hope, make its due contribution, whether in money or in participating in the research work, some of which may well be centred at Mithapur.

I firmly believe, and hope, that shareholders will agree that by launching this project, your Company is making, well within its resources, a national contribution to a cause and a purpose, the fulfilment of which may play a vital role in the future economic development of the country and the welfare of its people. It is particularly apt that this project has been launched in the year which marks the centenary of Tatas in industry.

If I have devoted the bulk of my statement to matters not directly concerned with the operations and profitability of the Company, it is because, as indicated in my opening paragraph, there is this year little that I can usefully add to the detailed information provided in the Directors' Report. Shareholders may be assured that however great the interest that we may take in these exciting programmes of public service at both the local and national levels, they will not be allowed to detract us from our primary duty and purpose of increasing the productivity, efficiency and profitability of the Company in the interests not only of the shareholders but of the country as a whole.

Fertiliser Project

I am sorry, in this context, that no further progress has been made in the Tata Fertiliser Project. While our interest in it and our earnest wish to participate in an activity so vital to the agricultural needs of the country remains undiminished, we still await from government a clear enunciation of policy parameters which could make the manufacture of heavy stock-based fertilisers viable. The seven wasted years that have passed since those hopeful days when the scheme was conceived have enormously increased the magnitude and complexity of the project and I doubt that we can now look to its early revival, particularly in the light of the fuel crisis, credit squeeze and collapse of the investment market.

Issue of Bonus Shares

In order that shareholders may not feel let down by my Statement as mentioning little of direct benefit or interest to them, I have kept for the end my comments on the bonus share issue mentioned in the Directors' Report which your Board have decided to recommend to the shareholders and government and which I am sure is a matter of great interest to the shareholders.

In the days when such matters could be decided on purely rational considerations, free from government control or intervention, it was considered sound practice to issue bonus shares out of free reserves only to the extent, and as and when, the Directors felt it would be possible to maintain the existing rate of dividend per share on the expanded capital. Such a policy used to be welcomed by shareholders themselves.

Times have changed, however, and it is in the light of conditions now prevailing and in conformity with guidelines prescribed by government that your Directors have decided on recommending, on this occasion, the issue of bonus shares in the ratio of 1 for every 2 held. Shareholders will, I am sure, appreciate that even when the present mandatory limitation on dividends is removed, as I hope it will be in the reasonably near future, it will not be possible, at least for some time,

for the Company to restore on the expanded capital the rate of dividend per share paid on the ordinary shares before the dividend restriction ordinance. While it is naturally not possible for the Board to make any commitment at this stage as to the time it will take before we can do so, shareholders may reasonably expect that, barring unforeseen circumstances, the total amount distributed in dividends on ordinary shares after the bonus issue will be somewhat greater than that which would have been distributed this year had not the Dividend Ordinance intervened, and that, with the continuing growth of our operations under our current and future expansion schemes, they could look forward to a still larger distribution in subsequent years.

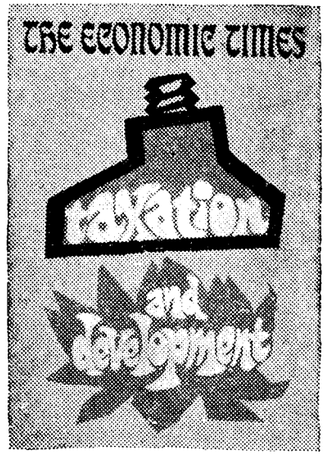
A Tragic Loss

Before closing, I should like to add my own expression of deep sorrow at the tragic death in a car accident, met with in the course of duty, of three valued members of the Tata Chemicals family, including that of my colleague on the Board, Mr H P Shroff, and of Mr D G Pujari, Administration Manager both of whom had played over many years a distinguished part in the growth and technological achievements of your Company. Their premature death is a severe loss to us and I am sure shareholders will wish to associate themselves with the sympathy and condolences conveyed to their bereaved wives and families.

Once again it is my pleasure to end my remarks with an expression of congratulations and gratitude to all members of the organisation, whose loyalty, determination and hard work have brought this Company to its present place of unchallenged leadership in its field of the Chemical industry.

J R D Tata
Chairman

Bombay, 18 November, 1974.

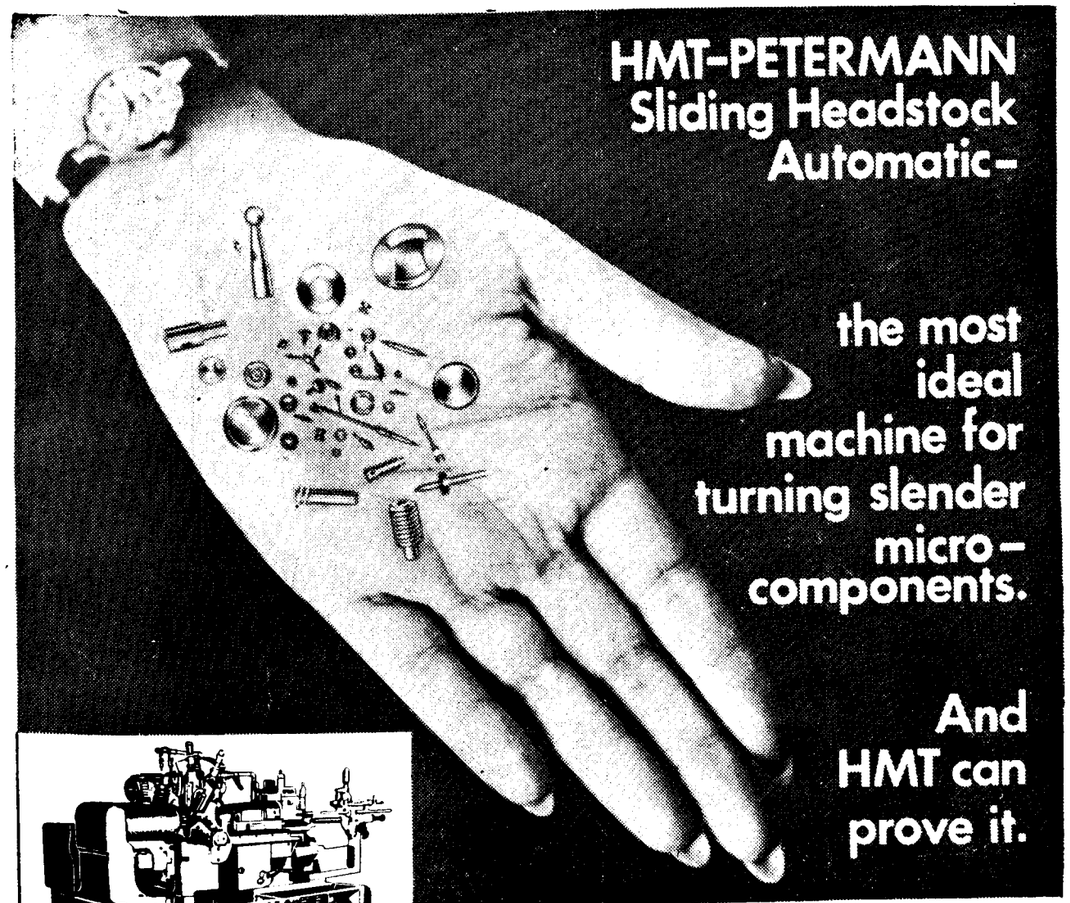


Note: This does not purport to be a record of the proceedings of the Annual General Meeting of the Company.

TAXATION, INFLATION AND DEVELOPMENT

The Economic Times Annual this year turns the spotlight on problems of taxation, inflation and development. Experts examine various aspects of direct taxation and assess the impact of tax policies on investment, development and income distribution.

There are special studies bringing out the differences in personal taxation as between countries, the shifting of corporate taxation, the marginal utility of income and progression in taxation, problems of agricultural taxation, tax exemptions and concessions, inflation, tax evasion and black money.



An entire section is devoted to the concept of the value added tax and its relevance to developing countries like India.

The HMT-Petermann Sliding Headstock Automatic Lathe is perfectly suitable for turning slender microcomponents requiring very high precision. In fact, it is one of the very few makes in the world capable of handling such jobs.

It guarantees tolerances up to 10 microns. It can be used in electronics, opticals, scientific instruments, electrical and water - meters, watch-making and allied industries.

TURNING WITH A DIFFERENCE

Unlike conventional lathes, the basic tooling in the Sliding Headstock Automat does not move longitudinally along the bar stock Every radial tool can turn front as well as behind shoulders. While rotating the material, a sliding headstock carries it past tools. The bar stock is supported rigidly in a carbide lined guide bush and can be withdrawn by merely retracting the headstock.

HIGH PRECISION TURNING

The guide bush acts like a drill bushing, supporting the bar stock and holding it on centre line. All operations carried out by cross slide tools are performed within 0.1 mm of the guide bushing support, ensuring accurate turning with very close concentricity.

DESIGN FEATURES

* Microdifferential adjustment of slides for high precision jobs.
* Adjustable needle bearings of Delta type, for high speeds with very little play.
* Chucking toggles fitted on a swing support, to compensate for the non-uniform wear of toggles.
* Automatic stopping devices for safety of the operator, job and machine.
* A wide range of accessories is available and these can be fitted on the shop floor.

The world had nothing before it got zero

India introduced the concept. The Sanskrit name for the figure was Śūnya meaning void. India was the first to use it in the modern form. The earliest inscription dates back to 800 A.D. But there is evidence in Indian scriptures that the zero was used centuries before.

In this and other spheres Indian talents have enriched the world. We at L&T try to continue the tradition by enriching life through industrial development. We design, manufacture and instal plant and equipment for every vital industry—steel, cement, fertilizer, paper and pulp, nuclear. Leading companies like Toyo Engineering, Snam Progetti, Humphreys and Glasgow, Davy Powergas have called on us for complete engineering, manufacturing and construction services in and outside India.

Who are we? A major industrial complex strategically located to serve the developing world. The success of our service lies in the individual talents of over 10,000 people in our network of offices all over India.

Sinister Calculation ?

FOR whose benefit is this suspense? For a number of months newspapers have felt free to speculate about the future of the Union Minister for Planning, Durga Prasad Dhar. That his exit from the Cabinet is imminent has been taken for granted by everybody, including apparently he himself. On the floor of the Lok Sabha, members have hurled questions at him, enquiring about the fate of the Plan on his exit. D P Dhar, while fielding such questions with his usual quota of grandiloquence — such as about the noble design of Indian planning being impervious to the shuffling of personalities —, has not directly denied the fact that he is on the point of being relocated. Newspapers, apparently supplied with information from altogether unimpeachable sources, have also gone to the length of naming his successor in the Planning Commission.

Such being the case, there is every justification for feeling somewhat Macbethian in regard to the matter: if it were done when it was done, then it is as well that it is done quickly. It is not even quite one year since the government went to town with the draft of the Fifth Plan, and was seemingly prepared to fight till the resignation of the very last member of the Planning Commission for the targets and the instruments of policy delineated therein. The fizz did not last even a few weeks. The erosion of the government's confidence in its ability to push through the physical programmes outlined in the Plan has been extraordinarily rapid; the devaluation of the Planning Commission — and the Planning Minister — has, quite naturally, proceeded at an equally accelerated rate. Now nobody appears to be aware what is to happen to the final draft of the Plan. While some functionary of the Planning Commission goes on record that the basic contours of the Plan are not for mutation, the Union Finance Minister provides an altogether different impression. The developing mystification is thus at two levels, and concerns the following queries: (a) when is the reshuffle of the Commission going to take place, and (b) what is the nature of the changes proposed in the structure and size of the draft Fifth Plan,

It could be that answers to the two queries are inter-connected, and the second one cannot be replied to without providing the reply to the first. If this be the case, there is all the greater reason for hurrying through the change-over and getting rid of the present phase of indecisiveness and uncertainty. From its performance in Parliament in the session just ended, as well as outside, it is quite evident that the government is at bay: it has little clue to the sources of the malady afflicting the economy; its stance has accordingly been reduced to a series of shuffling-about and peremptory recourse to *ad hoc* measures, very few of which are related to, or are coordinated with, each other.

In such a situation, it is natural to develop an obsession for short-term issues, and to let the administrative live from day to day. On the other hand, a large part of the present difficulties could be attributed to precisely such excessive minding of transitory issues, which in turn has stifled the capability of the government to fill in the crucial role of being the leading and guiding sector for promoting accelerated economic growth. Fire-fighting exercises, such as is the current fashion, may temporarily patch up the difficulties, but they are no insurance against continuous recurrence of economic troubles.

The focus has therefore to be refixed on the correlates of integrated, time-phased development; which is to say, planning has to be brought back into the picture. Given the inertia of annual — or, for that matter, six-monthly — budgeting, the shrinkage of public investment would continue, and there would be a corresponding enlargement of the area of operations of autonomous economic factors. But this is exactly what has brought the current difficulties along — both by deliberately distorting the national priorities and by encouraging insensate dissipation of precious resources. Nothing could be more fatal to the long-range economic prospects than the persistence of this drift. It can be ended only by restoring to planning the central location in the gamut of economic decision-making. Every day the current vacuum in planning continues, the damage to the economy aggravates.

The delay in the expected announcement concerning the new set-up of the Planning Commission would thus appear in a somewhat sinister light: could it be that influences are at work trying to prolong, as much as is possible, the present state of limbo, and the rate of private net return thereon too has been carefully calculated?

United States

Predicament of a Besieged President

SO the recession in the United States is no official. The number of registered unemployed had risen to close to 3 million by the end of November; at 6.5 per cent of the labour force, the rate of unemployed is the highest since the early 1940s. But considering the fact that the general price index too is still continuing to advance at a rate between 8 and 10 per cent, any conventional prescription to stimulate the economy would appear to be about equally hazardous. To provide tax relief and to start public works programmes on a selective basis would both entail, other things remaining the same larger fiscal deficit, which can only further push up price, at least in the immediate period. What has become the conventional presumption in the past 40 years is the hypothesis that the initial unfavourable impact on prices notwithstanding, direct tax concessions as well as public investment activity would revive demand, expand employment and generate enough additional output to take care of the initial increase of purchasing power in the system. But it is no longer the simple world of early keynesianism. Through contra-cyclical policy, it might be possible to stimulate demand, but not necessarily in those sector and industries where unemployment has been the most acute. An increased pressure for food articles can scarcely underwrite the resuscitation of hope and faith in Michigan's far-flung automobile industry. In economic text-book there would still be scope for inter-sector movement of the working force, the excess labour from Detroit would join the food-processing industries which would begin to experience a shortage of men, and everything would hence work out fine. No such adjustment is possible in today's real, rigid world. To count the possibility of a still higher level of prices in order to obliterate the recessionary spectre might therefore not appear to be a prudent proposition even in economic terms.

Monetary measures are likely to prove equally unsatisfactory. A general manipulation of the Federal Reserve Board's rates structure might cut both ways. Selective credit controls could, in certain circumstances, be somewhat more effective — the circumstances being defined by the degree of ability of the monetary authorities to assess with precision the necessary extent of restraints and encouragement for the different segments of the economy at each point of time, and by the degree of understanding which obtains between the administration and the decision-makers in the Fedeal Reserve Board. There is, besides, the important desideratum of universality in selective credit controls: these controls will not work it, because of political considerations, those who ought to be treated on equal terms are not treated equally.

The predicament of the badly besieged Republican President is beyond envy. Following the November elections, he does not now have even a tenuous control over the Congress: both wings of the legislature are currently Democratic. The Democratic legislators, irrespective of their personal economic philosophy, would be anxious for special works programmes and tax relief measures with which they could please their constituencies. The inflationary implications of such measures would not immediately detain them, it being for the Republican President to take the hindmost. On the other hand, were President Ford, mindful of these implications, to decide to veto free-spending proposals from the Congress, he would attract more opprobrium for himself and his party; besides, given the lopsided majority the Democrats enjoy in both the Houses, it is not even sure that the vetoes would not be overruled. And in case, the latter happens, the President's powers would experience a further precipitate decline.

The chaos in currency exchange rates and the consequences of the quadrupling of petroleum prices can merely add to the confusion. All things considered, therefore, Henry Kissinger or no Henry Kissinger, the American administration would have little time to any spectacular new initiative in foreign policy. A series of 'holding-out' operations, such as the one arranged with the Soviet Union in Vladivostock, would seem to be the order of the day. It would not quite be isolationism, but temporary lull in forging relations. A president with his back to the domestic wall would have few other options left. To the American recession and the American inflation would hence get added the chapter of American semi-effacement — at least till January 1977 when a new President will take office.

MRTP Act

Monopoly Growth Marginal?

Aurobindo Ghose writes:

"NI big rise in assets of large houses" says a newspaper report *(Times of India,* New Delhi, December 20, 1974). The impression is sought to be created that the growth of monopoly houses in recent times has been marginal and insignificant. Since the news is based on the third annual report on the working of the Monopolies and Restrictive Trade Practices Act, the further impression is sought to be created that the government has at last succeeded in curbing and checking the growth of monopoly houses. All this is misleading and very far from the truth.

The MRTP annual report states "None of the studies so far conducted by the government or by any independent agency would support the view held in certain quarters/individuals that there has been a 'big rise' in the assets of 'big business houses', either in absolute terms or in comparison to the rest". The evidence provided in support are two studies: one prepared in the Department of Company Affairs and the other by a newspaper *(The Economic Times).* The Department study has shown that for 301 companies registered under the MRTP Act, belonging to 23 industrial houses, the average rate of growth of assets between 1969-70 and 1970-71 came to only 8.6 per cent. The *Economic Times* study, on the other hand, showed that the rate of growth of assets of the top 101 industrial giants in the Indian private sector declined from 8.2 per cent in 1971-72 to 7.7 per cent in 1972-73.

It would be far fetched to conclude from these facts that the recent growth of monopoly houses has been only marginal, whether in absolute or in relative terms. An important question here is: how does one measure the annual growth of monopoly houses? By the growth of total assets (consisting both of current and long-term assets), or by the growth of fixed assets alone? The question is significant since the growth rate of total assets may be unduly influenced by fluctuations in the yearly additions to inventory stock — thereby concealing the possible growth of fixed capital. For example, the growth of total gross assets of 350 large public limited companies (each with paid-up capital of Rs 1 crore and above) fell from 9 per cent in 1971-72 to 7.8 per cent in 1972-73 (RBI *Bulletin,* February 1974). This fall in the rate of growth of assets was mainly due to a very steep fall in the rate of growth of inventories, from 15.6 per cent in 1971-72 to 7.6 per cent in 1972-73. During the same period, the growth rate of gross fixed assets increased from 7.6 per cent in 1971-72 to 8.9 per cent in 1972-73. This acceleration in the growth of fixed capital is in fact quite impressive when it is recalled that its rate had been actually falling upto 1970-71.

Even if in absolute terms the growth of monopoly is interpreted to have slackened, it cannot be said that it is growing more slowly than the rest of the private sector. The very *Economic Times* study cited in the MRTP annual report reveals that the fall in the rate of growth of assets of the 101 mini-giants in the Indian private sector (i e, those companies which ranked 101 to 202) between 1971-72 and 1972-73 was even more rapid than that for the top 101 giants. The rate of growth of assets of the mini-giants declined from 7.8 per cent in 1971-72 to 6.4 per cent in 1972-73 *(Economic Times,* February 5, 1974). Thus the growth rate of the largest private companies was higher than that of the next largest lot of companies. The RBI *Bulletin* studies too indicate that the growth rate of 350 large public limited companies during 1971-72 was uniformly higher than that of the 1,650 large and medium public limited companies, whether in terms of total gross assets (9 per cent as against 8.6 per cent), gross capital formation (9.7 per cent as against 9 per cent) or gross fixed assets (7.6 per cent as against 7.2 per cent). A comparison with the growth of small companies would further strengthen the argument.

In any case, it would be quite myopic to take a year-by-year view of the growth of monopoly houses. The growth of fixed capital of the monopoly houses occurs, not smoothly and uniformly over time, but in a jumpy, jerky manner. For instance, the Tatas might in the next four years add only Rs 100 crores to their total houses assets (presently estimated at Rs 800 crores), but in the subsequent two years the possible completion of the TISCO expansion project (worth Rs 1,800 crores by itself) would suddenly treble Tata assets from Rs 900 crores to a cool Rs 2,700 crores! Thus to comment on Tatas' growth rate on a year-by-year basis would be misleading. Monopoly's growth has always to be viewed over a fairly long period. And, from this point of view, it is clear from the available statistics that the growth of the monopoly houses has been phenomenal ever since the inception of the Second Plan.

The other impression regarding the government's successful curbing and checking of the monopoly houses is equally misleading. The MRTP annual report is much more cautious on this question. It states: "It will be hardly correct to conclude that the object of the MRTP Act is only to put down growth of assets of larger industrial houses. The MRTP Act aims at preventing concentration of economic power to the common detriment. The Act envisages restrictions on big business houses only when their growth comes into conflict with public interest." Further on, the report proceeds to bring out the precise attitude of the government towards the monopoly houses by referring to the different industrial policies in operation. This part of the report is a revealing confession of the government's actual intentions and deserves to be quoted in full:

> "In fact the Industrial Policy Resolution announced on February 2, 1973, reserves certain specified sectors for operation and expansion of these larger industrial houses. These include setting up of industrial undertakings in backward areas and investment in machine building, core and other heavy industries for which large capital is required. It is also necessary to emphasise that Section 21 of the MRTP Act, which seeks to regulate expansion of undertakings, itself provides that no approval is required if the expansion is in an existing line of production in which the undertaking is not dominant. Further, the provisions of the MRTP Act do not apply to a number of undertakings shown under large business houses by the ILPIC or by the MIC. They are neither dominant undertakings nor interconnected with other undertakings under Secton 2 (g) of the Act so as to attract the criterion of having assets of Rs 20 crores. The growth in their assets has not been restricted under the MRTP Act."

Despite this confession, the report is still hopeful of the MRTP Act having some impact in checking the growth of the monopoly houses. Only, in view of the "time-lag of 3 to 4 years between the date of issue of an industrial licence or a letter of intent and the commencement of actual production, it may be "necessary to wait for some time more to assess the impact of the MRTP Act on the assets of large industrial houses." The point is clear, however, that we do not have to wait to assess this impact. It is evident from the actual functioning of the MRTP Act that far from restricting the area and scope of the large houses, the Act is meant to rationalise their role in the economy. The underlying rationale of the MRTP Act is to effectively share out the potential areas of investment as between the monopoly or large-scale sector and the small-scale sector as also within the large-scale sector, between indigenous and foreign monopoly and also as between the different indigenous industrial houses. The main sacrificial goat in all this is small capital, as distinguished from small-scale industry. Small capital will be permitted to enter small-scale industries reserved for them and play their due ancillary role, but will not be permitted to become over-ambitious and enter the large-scale sector.

Most of the cases referred to the government under the MRTP Act have been cleared. Only a few have been rejected and that too for reasons of preventing internecine, intra-monopoly quarrels: for instance, Birlas and Tatas have been dissuaded from expanding too much in the caustic soda industry while Hindustan Lever, Modis and the Thapars have been allowed to enter the STPP and synthetic detergents industries *via* the caustic soda industry, which is an essential input for synthetic detergents. Data provided by the MRTP report regarding issue of licences to large houses are quite revealing. The 20 larger houses received 22 letters of intent in 1970, 31 in 1971, 35 in 1972 and 63 in 1973. Similarly, they received 20 industrial licences in 1970, 114 in 1971, 61 in 1972 and 48 in 1973. Nnmbers do not, of course, reveal the large-size of the individual investments that monopoly houses normally undertake. But it is clear that the operation of the MRTP Act is very unlikely to reduce the long-run growth of Indian monopoly houses. Whether such growth is considered in the 'public interest' or

Economic and Political Weekly wishes its readers a happy New Year. There will be no issue dated January 4, 1975. The next issue will be that of January 11.

to the 'common detriment' is, of course, another matter.

Malaysia

A Rude Awakening

MALAYSIA has always been too good to be true. The landed oligarchs had come to a deal with the British planters, and life continued to flow on an even keel for both ever since General Templer ruthlessly put down the communist insurgency in the early 1950s. For a while, the predatory Chinese businessmen presented a few problems, but it was possible to include them too in the grand concordat: all that was needed was a clear-cut understanding about territorial and functional jurisdictions of one another. The British drew in the Malayan princes and princelings in the rubber-and-tin hegemony, and the Chinese traders too were made to disgorge a part of their commercial franchise to the local flunkeys. Given the recently-acquired respect and awe for the People's Republic of China, the Chinese settlers, besides, could be useful for a specific purpose, namely, as conduits for opening trade and economic relationships with Peking.

The booty was thus being shared out. The British hung on to their interests, the Chinese traders to theirs and the Malaysian plutocracy did not seem to mind: they had their share of the rake-off. There has been always a fantastic cleavage between Malaysia's domestic product and its national product, a vast share of the domestic product being consistently siphoned away abroad. But the ruling party, the United Malayan Nationalist Organisation — which is by now a polyglot consisting of all the richer sections of the community — could not care less: for the income and assets of *its* supporters were not at all adversely affected by this drain. It is the huge underprivileged masses at the other end of the spectrum who were made to bear the consequences of the fact that Malaysia's national income during the past decades has risen at a rate which is nearly one-half of the rate of rise of the country's domestic income.

The big plantation owners, whether British or indigenous, always had contempt for the large army of small rubber growers dotting the peninsula. These peasant proprietors have been a persistent irritant. They occupied a substantial proportion of good rubber-raising territory, and to that extent prevented the lateral expansion of the big plantations. What was worse, since they lacked the requisite resources, they were unable to adopt a scientific policy for replantation; to that extent, it could be seriously argued that their presence was harming national interests. There is an even more specific reason for their being disliked by the plantation owners. A stable labour force is crucial for any major enterprise. Apart from the migrant Indians and their descendants, the bulk of the labour supply for the Malaysian plantations come from the families of small growers. The fact that they could always fall back on their family farms has vitally affected the evolution of a separate ethos for the plantation workers, something which has continuously worried the ruling oligarchs.

As in many other countries, the squeezing of the small growers has been a major implicit item in the agenda for action on the part of the Malaysian establishment. The usual tricks of the trade have been played upon them. The state marketing board has cheated them on prices, on the alleged ground of the quality of their produce being substandard. Attempts to eject them from their land have been a regular occurrence, and the standard apologia has been the dire need of consolidation of holdings. State subsidy for re-cycling of plants has flowed in a niggardly manner to the small growers. For them, it has been an unequal battle of survival against the combined onslaught of the government and the big plantations.

Where the working class on their own are unable to fight for their rights, or their circumstances and organisation are too week to make an impression on the ruling elements, it has often happened in recent years in many countries that a section of the student community and the youth have taken the responsibility upon themselves to redress what appears to them blatant social wrongs. The universities are started by the elite in these countries for their own edification and are richly lavished. In no time, however, the instrumentality of these institutions is turned against the elite groups themselves. Something similar is now taking place in Malaysia; there is also a distant echo in the happenings of the events in Thailand fourteen months ago. Once you open up an avenue of educational opportunity, it is not possible to altogether shut out the offspring of the indigent sections of the community from it. Through the process of percolation, the children of Malaysian small peasant proprietors are also receiving, howsoever selectively, the benefits of university education. Their problems and grievances would appear to have received a sympathetic hearing along the corridors of the university at Kuala Lumpur. A radicalisation of thought was in any case taking place during the past few years within the stodgy portals of the university; the cause of the small agriculturists, and the demand of a better deal for them, has now provided the catalysis for an explosion.

Through use of strong-arm methods, the Malaysian government may be able to put down the current series of disturbances. But from now on it would be an unquiet situation, and the days of yore, which were a mixture of neo-colonialism and neo-feudalism, are doubtless over. However reluctantly, the ruling oligarchs in Malaysia would have to be rudely awakened to the socio-economic realities of today's world. It is puerile on the part of the rulers to heap the blame for the present trouble on the evil influence exerted by foreign students in the country. Foreigners can only contribute a marginal mischief; the basic malady is very much the creation of the country's rulers.

In Burma too, the charade over U Thant's dead body was a mere ploy; deeper down at work are perhaps some of the same species of discontent as are operative in Malaysia, and this despite the fundamentally different social framework. When prices soar and people are hungry, anger will be out, and even impeccable credentials will be of little avail for the rulers.

ASSOCIATED CEMENT COMPANIES has skipped dividend for the first time in its 38-year career, as its working during 1973-74 resulted in a loss and the dividend restrictions prohibit any distribution out of past years' profits Even part of the dividends for each of the preceding 15 years were paid out of reserves. N A Palkhivala, chairman, has assured shareholders that the company's financial position is sound and that the price increase from August last has put it back in a profit-making position which should enable declaration of a dividend for the current year. He has also said that since the price increase is backed by escalation clauses to cover the major items of cost, the company's position should remain stable in the coming years. However, he suggests that, instead of granting escalations in the price only once in 12 months as announced by the government, it would be better to adopt the tariff commission's recommendation of a slab system to ensure neutralisation of increase in the cost of manufacture whenever the cost went up by 50 paise per tonne. Palkhivala also comments that, while the company is keen to make its contribution towards meeting the rising demand for cement by putting up new plants and carrying out extensions at the existing works this would be "commercially unthinkable" unless an adequate retention price for new units is announced by the government and substantial concessional loans are made available out of the cement development fund as recommended by the tariff commission.

For the fifth year in succession, ACC's production was unsatisfactory. At 52.95 lakh tonnes, output was 78.6 per cent of the rated capacity of 67.37 lakh tonnes. The shortfall was due to power limitations, coal shortage and inadequate supply of wagons. With costs continuing to increase and the selling price remaining unaltered, except for an interim increase of Rs 10 per tonne from mid-September 1973, the outcome for the company was dismal. The entire remuneration of Rs 4,69,116 paid to the managing director and three whole-time directors is in excess of the statutory limits prescribed under the companies Act, but applications are being made to the government for sanction of the remuneration. Last year, in response to the company's applications, government sanctioned payment of remuneration in accordance with the revised guidelines issued by the department of Company Affairs. The total remuneration of Rs 4,65,584 paid to the managing director and three whole-time directors stood reduced by Rs 85,727.

ACC's Shahabad heavy engineering plant is proposed to be transferred to

* For 1969-70 to 1972-73

ACC-Vickers-Babcock at the instance of the government to enable AVB to double its present manufacturing capacity to 1,000 MW per annum. Total consideration payable by AVB to ACC would be about Rs 547 lakhs — Rs 286 lakhs in equity shares of AVB at par and Rs 261 lakhs in first mortgage debentures bearing interest at a rate "commensurate with the market rate and as may be fixed by the Controller of Capital Issues". AVB will additionally take over the net current assets of the Shahabad heavy engineering unit as at the close of business on July 31, 1974, at book value. ACC will thus be acquiring a larger interest in a line of manufacture which now promises to be very profitable compared to the rate allowed by the tariff commission on the cement industry in its present inquiry. Shareholding of ACC in AVB will increase from 49.8 per cent to 65.1 per cent and the latter will become a subsidiary of the former. ACC is also increasing its shareholding in Asbestos Cement by purchasing additional 4,400 equity shares of Rs 100 each at Rs 150 per share from Turner and Newall of UK, which has to bring down its shareholding in ACL to below 74 per cent in view of the Foreign Exchange Regulation Act. This will increase ACC's holding in ACL from 24.23 per cent to 26.01 per cent.

BHARAT FORGE, while implementing the expansion of its forging and crankshaft finishing facilities from 12,000 tonnes to 24,000 tonnes and 16,800 to 25,000 per annum, respectively, has also undertaken a diversification programme to improve its ability to meet the recessionary situation. The company thinks that, as a consequence of the worldwide oil crisis, it may become necessary to switch the operation of its hammers from steam to compressed air. Borrowings to the tune of Rs 150 lakhs have been arranged with a financial institution and a bank to complete the expansion scheme in respect of the crankshaft finishing facility. The company may have to seek more funds to complete the other programmes. Also, in order to meet a portion of the working capital requirements, the company will be accepting further fixed deposits from the public and loans from shareholders. The borrowing powers of the directors are being increased from Rs 11 crores to Rs 25 crores. The company has produced good results for 1973-74 with higher sales and gross profit, although margins were a little shaded. Inventories in relation to sales were brought down considerably compared to the previous year. Notes appended to the accounts show, among contingent liabilities, municipal octroi (Rs 67 lakhs), managing agency remuneration on account of octroi duty matter (Rs 50,853) and Maharashtra State sales-tax (Rs 9 lakhs) — all of which items are in dispute. The auditors were paid Rs 5,908 for expenses and Rs 6,625 for certification work, besides audit fees of Rs 10,000.

MYSORE KIRLOSKAR's proposal to pay one per cent commission on net profits to non-working directors was not sanctioned by the government some four years ago. The directors now propose to approach the government once again, since they say that conditions have considerably changed because the company's activities have widened and non-working directors are being called upon to "bestow more and more of their valuable time and attention on the affairs of the company". Commenting on the current year's prospects, the directors say that the flow of incoming orders is slowing down and that perhaps the industry may face a recession. During 1973-74, the company showed higher sales and profits. Margins at the gross level, however, were lower compared to the previous year. Wages in relation to sales were considerably lower, but the ratio of inventories to sales was higher compared to the previous year. Exports rose from Rs 24 lakhs to Rs 55 lakhs. Alfred Herbert of the UK has been appointed as sole distributor for UK and Eire for 3 years. Precision Tooling Systems, the subsidiary, proposes to expand its activities and issue additional capital. MK will be required to subscribe to the 'rights' shares when offered.

PHOSPHATE complains that it was not allotted a sufficient quantity of nitrogenous ingredients by the government of West Bengal, with the result that its production of granulated fertilisers went down further last year from 13,490 tonnes to 8,290 tonnes which was around 17 per cent of the installed capacity. The shortage of nitrogenous ingredients apart, production was also affected by go-slow and indiscipline by workmen during the first half of the year and interruption in power supply. Production of superphosphate and alums increased marginally, but that of sulphuric acid went down owing to irregular and inadequate allotment of sulphur by MMTC. The company increased selling prices of its products from time to time because of sharp rise in the cost of raw materials and other nitrogenous ingredients. Thus it was not only able to increase net sales, but also profit-margins. Inventories in relation to sales increased considerably. The directors say that the requirement of working funds has much increased and plead that the fertiliser industry should be given more liberal credit facilities. The company has secured an order for supply and installation of a complete sodium dichromate plant on a turn-key basis.

HINDUSTAN ORGANIC CHEMICALS, a government of India enterprise engaged in the manufacture of intermediates required by the drug and dyestuff industries and certain other organic and inorganic chemicals, has proposed an expansion and diversification plan estimated to involve a capital cost of Rs 35.12 crores including Rs 6.42 crores in foreign exchange. The working capital requirement is placed at Rs 16.44 crores. The plan, intended to be executed during 1975-76 to 1980-81, envisages annual turnover at Rs 39.74 crores and saving in foreign exchange to the tune of Rs 16.50 crores. The plan is expected to provide employment to about 500 people and annual accruals to government by way of income-tax, excise duty and sales-tax are estimated at Rs 8.91 crores. The plan aims at self-sufficiency in critical raw materials like nitric acid, caustic soda, acetic acid, acetic anhydride, etc, for uninterrupted operation of the existing plants and meeting vital requirements of organic chemical industries such as drugs, dyes, rubber chemicals, pesticides and agro-chemicals, fine chemicals, resins, etc, as also diversification of products having high demand and greater profitability to improve the company's overall profitability. The HOC's project, established at Rasayani in a 'backward' area of Maharashtra, was completed in October last at a capital cost of Rs 20.01 crores. The company is already producing on commercial scale acetanilide, meta-amino-phenol, sulphuric acid, oleum, formaldehyde BHC, hydrogen, aniline nitrobenzene, and O-nitrotoluene, P-nitrotoluene and M-nitrotoluene. Trial runs are in progress at plants for making dinitrobenzene, monochlorobenzene, O-dichlorobenzene, O-nitrochlorobenzene, P-nitrochlorobenzene, and dinitrolchlorobenzene (pure and crude) and commercial production will commence on completion of guarantee tests. The annual turnover at fully capacity is placed at Rs 29.89 crores.

Brahmanical Ways of the Third World

G P D

JOHN SCALI, the US delegate to the United Nations, was rather angry with almost everyone present when he spoke to the General Assembly a week or so ago. He did not like the way the august body of one hundred and thirtyeight members was behaving. He was annoyed at almost everything the members were doing there. American officials are not given to liberal cliches, otherwise he would have said that he was speaking more in sorrow than anger. In any case, he was perceptibly perturbed that the United Nations was very much on its way to a state of total irrelevance, eventually to meet the same fate as its no less august predecessor, the League of Nations.

The analogy of the League of Nations is not out of place. The League collapsed, among other reasons, Scali would reckon, because of the failure of the US to join it. He held out a similar threat now. The American people, he said, did not like what was going on at the UN. Their faith in the UN was being eroded. As the US paid for nearly 25 per cent of the budget of the UN, the members had better sit up and think. They can have either their resolutions or the US dollars. Scali forgot to add, presumably in his anger, that he hoped that the bright, well-mannered third world gentry present would see sense and make the proper choice. Established governments the world over should realise that unless they made the right choice the UN would become a subject of history.

John Scali had reason enough to be angry. The UN was misbehaving in a way it had never done before. Come November and you have Arafat, a terrorist, a PLO man, descending upon New York like a head of state. The General Assembly listens to his 'terroristic' verbiage in respectful silence. When did bandits become heads of state? When did the term 'liberation' become respectable in the United Nations? Well, such heresies have no place in the hermeneutics of world peace!

As if this were not enough, the General Assembly treated South Africa in the most unbecoming manner. John Scali of course, had no difficulty in condemning apartheid, But condemning apartheid and asking South Africa to stay out of the Assembly are quite different things. Scali's argument was simple. You cannot level the honest, godfearing South Africans out in the cold. The Chinese could be kept out for a quarter of a century. But how can you equate the yellow Chinese with the white South Africans? To try to do so was to indulge in sterile political gimmicks. John Scali has his white South African's burden to carry.

To top all these blasphemous acts the UNESCO, in its own fit of mindlessness, has declared that no part of its funds would be made available to Israel. It has also made it clear that Israel cannot be a member of the agency's regional groupings. That the 'holy land' should thus be made unholy was a bit too much for a pious man like John Scali.

Religious Fervour

Scali's attack on the United Nations had a religious fervour. Like a priest in communion with god, he spelt out the rewards for the unknowing, undivine masses. They cannot, the priest has warned, exercise "the tyranny of majority" over the religious minority. It is the silent majority the priests have always sought to cultivate. Go to any temple: it is the business of the priests to chant the mantras or deliver the sermons; it is the job of the 'silent majority' to listen, to pray and to meditate.

The majority unfortunately does not seem to behave. It is the pagans who are sermonising for the benefit of the bishop of world peace. In this situation John Scali had no choice but to warn against "the tyranny of majority". It was not merely a warning, though. The priests have nothing but contempt for the pagans. So the American priest has stated categorically that the divine minority cannot "respect or obey" the pagan majority. It is the pagans who need salvation. It is the duty of the priests to deliver it. To think otherwise is a travesty of religion.

But then, religion has never been particularly apolitical. One might even say that you cannot understand any religion fully unless you comprehend its politics. John Scali, the practical realist that he is, did not mince words in stating the politics clearly. He put the matter straight. He had to. Many among the bright and sociable members of the international gentry who gather together in New York every year sometimes swear by liberal democracy. They might even want it to be practised internationally and might actually expect the majority voice to prevail in forums like the United Nations. John Scali's impatience with these international liberals is understandable. He promptly reminded them that "the minority which is often offended may in fact be a practical majority".

Now, this term "practical majority" is an interesting one. The liberal democrats would do well to remember that back in their own countries it was the "practical majority" which counted. John Scali was only demanding that the rules of the game should not be very different in the General Assembly. The Indian or the Arabs or the Africans at the UN could get to New York only because they never "offended" the "practical majority" in their respective countries. What kind of politics was it then for these people to assume that the "practical majority" could be offended internationally?

Scali's indignation would not go in vain. Angry denunciations of what John Scali said on the floor of the General Assembly were voiced and these would probably continue for some time. However, John Scali has hit the third world where it hurts most, The English, French, Spanish and Arabic speaking diplomats who crowd the lobbies of the UN cannot do without the US-financed United Nations. Their clever diplomatic games are possible only because of the tax-free dollars they earn every month. Except for the Arabs who have their oil money, nobody in the developing third world can pretend any serious defiance of the American will. John Scali in his rhetoric was probably making a very simple point. None of the brave governments of the third world can do without American backing an assistance. None of the diplomats can afford to miss the luxuries of American life, tax-free. In the circumstances, the "practical majority" in every small or big developing country should strike a natural alignment with the

"practical majority" of the world. They have already done so in deed. John Scali's innocent question is: if this is possible in deed is it difficult in word?

How we come back to the religion of politics! What the naive Scali does not understand is the love-hate relationship between the third world countries and the US. They love the US, admire it, at times adore it. In words, however, they have to appear to be hating it. As far as the leadership in the third world countries is concerned, it has to appear 'radical' to the vast majority. It is this zeal which Scali does not apparently understand. That is the reason why he is so angry. He does not understand that for most of the third world, anti-Americanism is a ritual; a meaningless religious act, as remote from reality as the Sunday sermon. For most of the third world, radicalism is not a philosophy of action; it is only a part of the ritual of their religion of politics! It is amazing that a seasoned diplomat like John Scali should not understand the Brahmanical ways of the third world.

A Bangkok Diary

A M

THE shop girl at the departmental stores may be Ratri Sulabhabhoga, the counter clerk at the bank is Prasiddh Kittisidho, the police-general, believe it or not, was baptised as Chirasanto Komalanavin. There is a certain lilt in Pali, sweet, soft; even after transmulation into Thai and the passage of two thousand and five hundred years, the lilt remains. But you will come a cropper if you allow yourself to be beguiled by the nostalgia which beautiful-sounding names can evoke. There is a crust of iron somewhere underneath. As they tell you, proudly but without flourish. *Thai* means free: they have survived as a free nation through the ravages of all these centuries. It called for much more than sang-froid to survive the successive probes of the Hindus, the Chinese, and, in the more recent period, the assorted Europeans. The Thais have come through.

Or, to amend oneself, the Thai upper classes have come through. They are at the moment once more engaged in the exercise of survival. Twenty years of flourishing American summer are coming to an end. John Foster Dulles set up his theory of dominoes; the money plant came to bloom; Thai aristocracy reaped a rich harvest. Devout Buddhists are highly pragmatic animals: for proof, you simply delve into any of the *Suttas*. How does it matter if the Americans run amok next door, burn and maim your neighbours, destory their food, rape their young daughters? As long as your hearth and home is not affected, turn a Nelson-eye and collect the loot. The Thai plutocracy collected the loot during all these years. Bangkok, which, twentyfive years ago, was a sleepy backwater of a tourist beat, was transformed to suit the American taste. The rest of the country did not matter, either to the Americans or to the plutocracy. The face of poverty hardly changed over there. But, never mind, the Americans were fighting a moronic war in Vietnam and all was right with the world. Thailand's balance of payments improved by leaps and bounds; the country's national income soared; naturally, the inequality in income distribution became more and more acute with each year.

UNSTABLE ARCADIA

Unfortunately, it proved to be an unstable Arcadia. The bonanza of the Vietnam war came to an end nearly eighteen months ago; the Americans are now going home. Something else, something much worse, also took place. When you import the American way of life, wholesale, you cannot quite shut off the entry of that whiff of radical air among the students. Last year, disaster struck. A group of hot-headed youth revolted in Bangkok's streets against the corrupt military junta which was managing the country on behalf of the plutocracy. Trigger-happy troops and policemen ruined the junta; as the guns roared and the tanks rolled, nearly eighty students lost their lives, and things went beyond control. The leaders of the junta flew away to Taiwan and the United States. At this stage, entered the King, belonging to the Chula dynasty which had reigned in glorious, autocratic splendour till 1932 but whose powers were cut back to mere rituals by the coup launched by the army junta that year. The King proved the uses of royalty last year. He negotiated with the students, promised them a new constitution and a democratic structure, and the exhausted youth went home. The junta was gone, but, long live the King, the plutocracy was saved. A cat has nine lives, the Thai oligarchy obviously many more. The junta is gone, but the rest of the institutions have been saved, the class composition of the government remains what it was. A new constitution, full of liberal froth, is now ready, and the first general elections under universal adult suffrage are about to take place: for 299 seats for which contests are to take place, 2,190 candidates are in the field. Thailand's ruling class is not at all worried: the students, after all, control only a minuscule proportion of the electorate; the bulk of the voters are poor, wretched, illiterate: they can be persuaded, cajoled, bought, bullied. The ballot box never lies: in the remote areas, gunmen can be hired to ensure that the ballot box learns to speak the right kind of truth.

Nonetheless, there is that uneasy, uncertain feeling. The Americans are going home, the Americans have begun to make ingratiating noises in the direction of that erstwhile ogre, the People's Republic of China, the Americans are returning to their shell, they are in a state of shell-shock following the discovery that the man whom they elected their President by the largest recorded plurality in history was a common crook. The Americans are going home, the Japanese too seem to be in an equal jam, their economy is stagnating for the first time in a generation, their rate of inflation is running at a rate exceeding 25 per cent per annum. The old co-ordinates are falling apart, and Thailand's balance of payments is no longer looking as comfortable. Besides, you never know with students. Having tasted blood, they might decide to come back soon for more.

They never lose their cool, Thailand's ruling class. Be pragmatic, say the Buddhist *suttas*. Cultivate what needs to be cultivated; let serendipity be your pole star. Bend with the wind. The Thai plutocracy is bending. You may blink your eyes in wonder, but there it is. These days Bangkok's newspapers are serialising the autobiography of Pridi Banomyong, that great populist, who, after his unsuccessful attempt to overthrow the military dictatorship in February 1949, had led an exile's existence until his death in Peking two years ago, and the mention of whose name was, till yesterday, taboo. Not so any more. Pridi is restored in Thai mythology; it seems this nation had no greater hero. You

are being made to recollect that Pridi was one of the major heroes of the 1932 coup which ended the system of absolute monarchy. It is Pridi's tradition which this nation has sought to observe. Way back in 1933, Pridi had proposed that the State should appropriate all land in exchange for bonds, and all farmers be made civil servants also to be paid in bonds; everyone else was to be on a salary from the age of one to fiftyfive and thereafter on a pension; the salary scale was to be divided into 22 steps according to qualifications, ranging from 80 to 1,000 baht (Rs 35 to Rs 400 at today's rate of exchange) a month; the production and sale of rice were to be made a State monopoly; and so on. What was more natural for a nation, which, as many as forty years ago, dared to think such radical thoughts than that it should normalise its relations with its two great neighbours, the People's Republic of China and the People's Republic of Vietnam? The Thai politicians cannot be restrained; they are in great hurry. The other countries in the area, such as the Philippines, Malaysia and Singapore, have gone ahead in the race, they have established enormously beneficial trade relations with China; Thailand is still lagging behind. What the country loses on the American and Japanese swings must be recovered on the China roundabouts; therefore, meeting in emergency session, the interim National Assembly unanimously passes a bill repealing Revolutionary Decree 53 issued sixteen years ago by the army junta banning trade with China. A state trading corporation is being hurriedly assembled to deal with all matters concerning trade with China and other communist countries: a ten-man delegation is being sent out post-haste to Peking and Pyongyang to finalise trade plans for the next few years with these two fraternal nations.

Sang-froid; when hit on one cheek, to turn the other one. The relations with North Vietnam, which is another great neighbour, must be repaired without fail. Any number of feelers are going out from Bangkok to Hanoi; it could be the case of the love-lorn drawn shortly as scheduled, Hanoi is angry and to the point: 'The main obstacle to the normalisation of relations between the Democratic Republic of Vietnam and Thailand is the latter's pursuance of a policy aimed at furthering US imperialist designs of aggression and intervention in Indo-China'; all American forces must first be ordered out of Thailand before North Vietnam would consider resuming relations with Bangkok. The Thai foreign minister is not however put out: practise impassiveness, say the Buddhist *suttas*. A total of 10,000 American troops, together with a number of US warplanes, will be withdrawn shortly as scheduled, Hanoi is sought to be assured; so let there be amity and understanding: 'We hope to begin our first contact with goodwill and sort out any conflicts later on. Goodwill at the start will mean quick progress can be made'.

Peace, amity, neighbourliness, goodwill, the plutocrats in Bangkok, in their search for survival, will leave not one cliche unused. They are prepared even to go through the rigmarole of a kind of land reforms. The distribution of land holdings here will put to shame pre-World War I Hungary, but this is being looked into, the Government has submitted a major land reform bill to the National Assembly which is supposed "to limit the areas of land allowed for different categories of occupations in order to prevent capitalists from buying up a large acreage without making use of it". Under the bill, a maximum land ownership of 50 *rai* (2.5 *rai* = 1 acre) is to be allowed for agricultural purposes; 10 *rai* for industries; 5 *rai* for commercial purposes, and one *rai* for residential; those who own more land than the prescribed limits will have to sell their 'surplus' land within seven years.

But, then, ruling classes everywhere have long assimilated the tricks of the trade. The tradition of Pridi notwithstanding, the land reform bill is a vast sieve. It is marked by several exemption clauses: where the 50 *rai* limit, for example, is considered 'not adequate for productive yields', agriculturists will be allowed to have upto 100 *rai*. Those who possess land only a little in excess of the prescribed limits will be allowed to retain the excess if it can be proved that selling it would hamper 'productive activity'. Any industry which feels it needs more than the ceiling of 10 *rai* can submit a petition specifying the reasons for claiming a larger area, and the Government will consider whether any concessions are due. Moreover, since, under the bill, one *rai* is allowed for a tomb site, a truly ancient family can claim a thousand *rai* for ensuring the resting in peace of a thousand ancestors: land, after all, belongs as much to the dead as to the living.

Thus even the Buddhist *suttas* might prove to be too clever by half. For meanwhile, study a map of Thailand, observe the chicken's neck down south joining the Prachuap Khiri Khan province with the district of Kui Buri, washed on the eastern side by the Gulf of Thailand and fringed on the western side by the mountainous forests on the Burmese border. The plutocrats in Bangkok would want to hide the fact from you, but, for at least the past eight years, this has been turbulent territory, and communist partisans have continuously kept engaged the army and para-military forces in guerilla warfare. The glitter of Bangkok was, and remains, a fraud: you travel fifty miles out of the city, north or south, it is once more the stark face of Asiatic poverty, a poverty which reflects underdevelopment, but, much more, insensate exploitation by a few of the many. The Buddhist *suttas* were supposed not to apply to the *dasas*, the inferior beings, who have continued to be outside the pale of eternal benediction. The *suttas* may thus in the final round not add up to much when confronted by the dialectics of class antagonisms. The land reform bill may escape through its own sieves, and a district like Kui Buri may become unsalvageable because of the greed of the affluent ones. M-16 assault rifles and such like may temporarily keep away the partisans, but unless the deprived, under-privileged local population can be offered tangible resources, their loyalty will stay with the partisans. In Kui Buri district, the insurgents were driven away from an area, and a modestly ambitious programme was announced for the construction of a fresh water reservoir to help the local people and for an irrigation network for developing agriculture. However, there is this law of economics: where there is promise of development, the price of land inevitably rises and those who have the means and the power to acquire the land quickly stand to make a large profit. In Kui Buri too, a person with strong political influence immediately moved into the development area with men and tractors, and claimed for himself a huge tract of 10,000 *rai* of land. The small farmers, who were occupying this land, are now being pressurised to leave — or pay through the nose for the right to occupy the land. Soon, they will reach their own conclusion: in this system, your coin will always come up tails, so why not stick with the partisans and see it through till the bitter end?

Certain things, apparently, are beyond sang-froid. In Bangkok, the message is yet to sink. And why in Bangkok alone?

Hanoi Diary—I

K N Raj

WHILE in Bangkok earlier this year I came to know that it was not difficult to go from there to Hanoi if one could somehow get a visa. It was only a night's journey by train to Nongkhai, a border town in the north-east of Thailand. Crossing the Mekong River by ferry was no problem, and on the other side was Vientianne in Laos from where there was a bi-weekly Aeroflot service to Hanoi.

So I wrote to Sisir Gupta, an old friend and colleague in the Delhi University, now the Indian Ambassador in Hanoi. His reply was encouraging. Though no tourists were being welcomed yet I could go as his personal guest and it might not be difficult to secure a visa. There was in fact no problem at all.

Sisir Gupta was not sure how much I would be able to see. After all I would not be a State guest. But he thought it would be possible to arrange a few visits in and around Hanoi. That was enough as far as I was concerned, for I had no intention of making an intensive study of North Vietnam. All I wanted was to see what this legendary country and its people looked like, how they survived it all. Even some visual impressions would do.

And so I went with very little expectations of what and how much I could see. They were more than fulfilled. If I stayed on longer I could have seen much more, and was later sorry I had not budgeted for more than a week. But even that one week was a very rich experience, richer than any I could recall. And I am deeply grateful to everyone who made it possible.

How much can one see and learn in a week? Obviously not a great deal. But when one's ignorance is profound even a few glimpses help and this is all one can claim. The curiousity about North Vietnam is intense and when one has had the good fortune of seeing even a little of it one feels one ought to share one's impressions, however general, with others. This is the only reason why I have written them out.

I kept a diary while I was in North Vietnam, recording each day whatever I saw and heard and my instant reactions. Some of them could well be superficial and naive, possibly even downright wrong. But to put down my impressions then and there, I thought, was the most honest thing I could do, and correct them later in the course of the stay if I had reason to. So it was a travelogue, and nothing more than that.

After I returned to India it was difficult not to reflect over all the things I had seen and heard. I tried to recall whatever I had read of North Vietnam earlier, and also read more (particularly the several books and brochures I had brought back). What was the significance of it all for us in India? About some things I had little doubt, but about several matters I was unsure because clearly I did not know enough. Still, despite the hazards of such an exercise, I decided to write down the gist of these ruminations as well.

What is being offered here — with some hesitation — falls therefore into two parts, first the diary and then the later reflections. I hope they will be read and interpreted in the spirit in which they have been written.

November 6

It was clouds all the way from Vientianne to Hanoi, and there was nothing to do but look at others in the plane. It was an unusual mix. More than half were obviously Russians, there was a whole group from Poland, one or two appeared to be Cubans, Some possibly were Yugoslavs, and may be some French. The Ilyushin itself was the usual Soviet austerity type (austere of course by only Western standards), vibrating a little, just one toilet, and no refreshments other than a glass of tomato juice. But the air hostesses were pretty, unlike the hefty ones Aeroflot sometimes circulates around the world.

Hardly an hour had passed before the plane began its descent. In a few minutes we were below the cloud ceiling and one could get a view of the land below. It was somehow different from what I had expected, no tropical at all, more yellowish than lush green, hardly any groves of coconut trees, a far cry it seemed from Vientianne though we were only 400 miles north of it. The fields were large, mostly rectangular, very different from the mosaic of tiny, fragmented plots one sees in Asia. It could have been somewhere in France.

As we came further down, little thatched huts could be seen and small houses made of timber. Out in the distance was Hanoi, stretching over a wide area, with some buildings standing out, but apparently not a very large city. Then we were over the Red River looking like the Cauvery or Krishna in flood, with little boats moored along its banks. Suddenly with a heavy thud the plane touched the runway. As it turned around and moved towards the airport terminal I felt I could be just about anywhere in India. For, at a distance on a patch of grass within the airport, a buffalo was being led along by someone quite unconcerned! Obviously planes do not come or go too often to make this kind of coexistence a danger to either.

But could this really be Hanoi, I wondered? Not a military plane or helicopter around. One sees swarms of them in Bangkok and on a smaller scale even in some of our airports in India. If the North Vietnamese have an air force they certainly know how not to display it.

The first confrontation with official authority was slightly chilling. Someone from the security force, in a green uniform, boarded the plane and said we were all to remain seated till the passports and health certificates had been checked. When this kind of screening was in force in India some years ago it usually meant a tiresome wait, so it might be I feared. I was wrong it was all over in less than five minutes.

Soon we were out of the plane. There was no one to herd us into a group or lead us to the airport building. We were told just to walk on. A few hundred yards away there was a small crowd of no more than 40 or 50 standing around to meet someone or other coming in the plane. There was one group standing with a bouquet (it was for the Poles who, I learnt later, were part of an official delegation). I spotted Sisir Gupta as I came nearer and he guided me to the airport lounge. It was a modest-sized building, no bigger than the ones in our smaller airports like Trivandrum or Madurai.

An officer from the Indian Embassy and the Vietnamese chauffeur had meanwhile taken charge of all the formalities to be gone through. Actually there was not much to be done except fill a form declaring how much currency one had, how many films, etc. The only problem I had was that I was not permitted to take in any colour films (of which I had bought three at Bangkok). The remaining five black-and-white films I could keep and use, said the customs officer.

But what struck one most was that the atmosphere in the lounge was informality itself, even while the cus-

GET THREE SHIRTS EVERY TIME YOU BUY ONE

That may have startled you. But then, 'Terene'® has a number of rather startling advantages.
A shirt in 'Terene' lasts almost thrice as long as an ordinary shirt.

It costs more. Yes, but you get three times the value. That's why it pays to look for the 'Terene' trademark. 'Terene' fabrics are not only lasting.

They are easy to look after—no expensive laundry bills. You can wash a shirt made from 'Terene' easily at home. And wear it without a care or even a crease.

ONLY WHEN YOU SEE THE 'TERENE' TRADEMARK ON THE FABRIC, CAN YOU BE ABSOLUTELY SURE OF QUALITY.

TERENE

® *Registered Trademark of Chemicals and Fibres of India Limited*

CHAITRA-CAFL

toms men were at the job in an adjoining enclosure. Several Vietnamese dressed in simple cotton clothes, wearing plain cross-barred sandals, were sitting all around, chatting and laughing. Some were having beer which, I was told, was the only drink available there. There were no uniforms in sight (except of the customs men), not even a stern face. An airport crowd in a small provincial town could not be more informal and relaxed. This was obviously a very different socialist country from any I had been to so far.

In less than half-an-hour all the formalities were over, and we were on our way in the Embassy car to Hanoi city. I soon discovered one reason why the countryside reminded me of France. The rice fields were more yellowish than green, apparently ready for harvesting. Hanoi gets cold from November on, rather like Delhi, and this is the autumn crop. Like wheat or maize it looks almost golden coloured from a distance.

All along the road there were nothing but bicycles, each carrying a cheerful face topped up with a cone-shaped straw hat (only women however seemed to wear it) or a khaki-coloured 'topee' (a "sun-hat" as it used to be called in India in the old days). Occasionally a truck or two would pass by.

We reached the famous Red River bridge. It had to be crossed very slowly because the rail track was in the middle, the road on either side was narrow, and again there was a stream of bicycles. Walking alongside on a slightly raised platform were girls, old men, women, all carrying something or other; quite a few, I noticed, were bare-footed. The bridge was a good two kilometres long, if not longer.

We passed by areas that had been bombed by the Americans, a railway station, a loco-shed (of which all that remained was the skeleton of an old locomotive), and many buildings. The bridge over the Red River had been bombed too, and was still in the process of being reconstructed. At a distance one could see the pontoon with which they had managed when the bridge had been hit directly in the bombing.

As we entered the city I was more than a little surprised. It didn't in fact look like a city at all. The roads, the shops, the houses, in fact everything I could see on both side, reminded one of a small town in India, though kept conspicuously cleaner. There were plenty of small huts and shacks close together by the side of a pond. There were also carts being dragged along by bullocks, and two women pulling a cart loaded with sacks. Judged by the norms of 'modernisation' we are accustomed to, Hanoi seemed pretty backward.

But there is another side of the city, less crowded, with wider roads and better buildings, looking rather like the not-so-exclusive areas of New Delhi some twenty years ago. That is where the Indian Embassy is. But apart from the roads and the buildings there was not much difference from the other side of the town: the same procession of cycles, and carts drawn manually and by animals.

Sisir's house, the Ambassador's official residence, is in harmony with the setting. It is furnished unobtrusively with taste. The building looks rather like some of the double-storeyed houses one sees around Madras, the old-fashioned type with shuttered windows, but with a slight French touch.

Opposite is a school, and one sees nothing but children all the time apart from the stream of cyclists going along the road. Sisir tells me that there are three shifts in the school, and that therefore it goes on from early morning till nine or so at night. The sight of children clasping books and rushing into or out of schools is of course a very familiar one in Kerala. But the children here, I have the impression, are somewhat better dressed than our poorer children, though the difference might not be very much.

More striking is the visual impact of the citizenry pedalling their way along on cycles. There appears to be nothing like uniforms (except for children going to school) but the dresses worn by all seem very similar. Most men wear just a plain shirt and a trouser (and usually also a 'topee'), women a white jacket worn over a rather loose black pyjama (along with the inevitable cone-shaped straw hat). There are hardly any cars on the roads, so the cyclists seem to be in full possession of the whole wide avenue. Everyone is moving along at a fairly steady pace, the older ones more slowly with an effort, the younger ones much faster and sometimes carrying another at the rear, and frequently parents with little youngsters comfortably seated in a contraption made of cane fixed on the cycle bar (an excellent adaptation of the more expensive kind which Americans use in their cars for keeping strapped little toddlers). The whole scene appears very dignified and it makes a deep impression on one's mind as one goes on watching it.

How poor or rich can they be? Obviously the differences between them are not very much. Watching the crowd going along the road I thought they looked generally as well-off as (or a little better-off than), say, a clerk in our government offices (the ones we call LDCs). Sisir tells me that the monthly wage or salary varies between 50 and 150 dongs and, since very few families have less than two earners, the income of a family would be usually at least 100 dongs. (The official exchange rate for the dong is three per US dollar. The rent charged for accommodation, whatever it is, is only 1 dong per month, and a month's ration of rice does not cost more than about 5 dongs per person. But pork, a favourite food item, is more rare to come by (the ration is only 1 kilogram per month), and its price in the open market is high like of most other things just above the category of bare essentials. So 50 dongs could perhaps provide the absolute minimum requirements but not much more; to live in reasonable comfort probably requires 100 dongs, which could be one reason why there are generally two earners in a family.

Strolling out later in the evening it was almost impossible to cross the street on account of the avalanche of cycles carrying everyone home. Along some roads leading to the centre of the city there were a few tram-cars, and also some buses (mostly, it appeared, originating from Skoda in Czechoslovakia). But within an hour or so the streets had emptied themselves and one could walk in the middle of the road without fear of being run over. We went around a beautiful lake in the centre of the city, along a side-walk with tall, stately trees. A whole contingent of small traders seemed to have taken possession of parts of the lake-side, selling all kinds of things including (to my surprise) tapioca. At a distance loudspeakers were blaring away something, radio broadcasts perhaps, but they seemed a mere whisper compared to the din that greets one's ears from restaurants on Indian streets.

We walked into the largest department store in town. There were several things on display: textiles, pharmaceuticals, household wares, cycle parts, stationery, and various articles made of lacquer. But there were not very many customers around, and a good number seemed to be just taking a stroll. Nor could all the products on display be freely bought, I was told, for one had

to have also coupons (as for textiles which seemed to attract the largest number of window-shoppers). Though the range of the products was wide, the variety in each was very limited, so limited that one could perhaps have found more in even a small shop in India. Prices were not low: a very small hurricane lantern, for instance, cost about 5 dongs.

Looking at the shoppers, the strollers and the pavement salesmen I wondered whether my earlier assessment of minimum consumption levels was right. The clothes some of them wore appeared rather coarse and showed signs of wear. But what else could one expect when the annual cloth ration was only 5 metres or so? Maybe the ones I saw earlier in the day near the Embassy were white-collar workers. Most of those on the street now looked like manual workers. They seemed well fed, but for those engaged in manual work it must be difficult to look elegant as well.

The pavement salesmen were no different from their counterparts in any Indian city or town. They looked poor. There were bigger private shops, I was told, in the bazaar area a little further away. The most prosperous of those engaged in such private enterprise were barbers. Vietnamese women, who had beautiful, long, silky hair were fond of getting their hair dressed frequently, and so apparently were men, obviously not infected by the latest crazes in the West. They were willing to pay 1/2-1 dong for a hair-do or hair-cut, and a barber could make even 6 or 7 dongs a day. Those with shops had to pay a tax, and so their net income might be lower, but I could see that for some of the barbers the pavements were good enough.

Many of the people we saw as we walked around the lake did not look like urban workers, more like peasants. But one could not be sure. Apart from the office- or factory-going crowd who pedalled past us earlier in the evening, there was probably not much difference anyway between urban and rural workers.

After our return from the walk a French journalist dropped in with his wife. He talked about many things, including his impressions from a visit to the Pathet Lao area in Laos from where he had just returned. He was obviously an old hand. The conversation drifted to what would happen at the Soviet Embassy reception tomorrow, the 57th anniversary of the Russian Revolution. The North Vietnamese, I gathered, had spent 1 3/4 hours at the reception of the German Democratic Republic, but only 1 1/4 hours at the Chinese reception on the 25th anniversary of their Revolution, and this had created a minor sensation. How long would they stay at the Soviet reception? Obviously a fascinating subject for speculation for foreigners who had no other way of guessing what was going on among the socialist countries! But did the Chinese and the Russians take such things so seriously, I asked? There was no doubt about that. "It is wonderful to have the luxury of being so independent", added the journalist.

Later Sisir told me that this journalist, who had one arm totally paralysed and had a slight limp, was one of those injured at Dien Bien Phu. He and his wife were returning to France in a couple of days. When Sisir's wife asked whether they would be coming back, the journalist's wife said: "certainly in our next incarnation"! Obviously they were not in love with North Vietnam. Sisir told me later that they were more enthusiastic about China. It appeared to me so like the British who too have this kind of love-hate relationship with their old colonies.

November 7

Hanoi wakes up early and, by six in the morning, the roads are full of children going to school and others pedalling along to their places of work. I had gone to bed after midnight and had intended to sleep till 7. But that was out of the question. There was a fantastic din outside and, when I peeped out, there they were, more than a hundred children all over. They had obviously arrived too early, for the school gate was not open yet. They were having a whale of a time singing, screaming and shouting. Since there was no prospect of getting any sleep I decided to step out for a walk.

My impression of the children yesterday was not wrong. They appeared much better nourished, almost as chubby as those from the middle and upper class homes in India, and full of life. They wore better, newer, gayer dresses than the adults, and had all smart little bags full of books. Some were playing with marbles, a couple of them were having a friendly wrestling match with others egging them on. Soon they were watching me with as much curiosity and interest as I was watching them. One of them pointing at me said somthing that sounded like "Andos" (which I gathered later is how Indians are called in Vietnamese), at which I got a big hail from a whole bunch of beaming faces.

Children of course are the same everywhere, and one is easily moved by this kind of scene. But I recalled Ho Chi Minh's recurring theme about children, "the little slaves" of yesterday who were to be "the masters" of the nation. Certainly whatever investment they could afford was being lavished on the future generation. One does not know what the children are being taught, or how much, for with three shifts running each batch has but four hours of schooling a day. But a lot of discipline is being put into them. one has only to watch them line up, two by two, waiting for a break in the traffic on the road before crossing it, and they do it without anyone asking them to, even the smallest of them.

I had a long morning walk for well over an hour, covering parts of the town we did not go to yesterday evening and later doing the same detour of the lake. Last evening it was getting dark and I could not see much. But it was different now and I could form more vivid impressions of the environment.

The road the Ambassador's residence is on, and all the roads in the vicinity, are very broad avenues with side-walks for pedestrians. They run in straight lines, making rectangles, some diagonals, reflecting evidently the tastes of the French designers. Most of the houses in this area have some land around them; their light yellow wash, and the shuttered windows painted in green, are so like the old houses in Nungumbakam and Kilpauk that one is transported back to the Madras of three or four decades ago. But not the Madras of today, for there is no trace of the horrid, multi-coloured cement concrete structures it is now full of, in fact no trace of any building that might have been built recently.

Suddenly a child would dart from a side-lane, or a small house by the roadside, with just a jacket on and nothing below the waist, and an elder sister or mother running after. In dress, in manner, in almost everything — including the open drains outside these little houses by the roadside — the scene in the same as one might see anywhere in India. The only difference, and a very striking one, is that there are hardly any cars around, no signs of affluence anywhere, and none appears very much better or worse off than the others.

It will probably appear like repeating the obvious, or saying something trite, when one reads this later, but the experience of walking along these roads early in the morning, with hundreds of cyclists going to work, children in uniform marching away to school, old women selling bowls of soup and *pan* along the pavement, and almost none standing idly by, is really overwhelming both visually and emotionally. I had already shed every bit of conspicuous clothing, and left behind even my wrist-watch, not to appear incongruous and out-of-place. But my grey sweater, I began to feel suddenly, was still much posher that any one could see being worn by those around me, and the more conscious I became of this the more uncomfortable I felt, till at last I saw a man on a cycle with a red sweater almost like mine! This amused me later, for one had at times a greater sense of guilt in India (and for good reasons), but there were more "red sweaters" around to rescue one. It does make one extremely sensitive, almost ashamed, to appear more affluent among these people, for they have truly abolished affluence of any kind.

Nor have I ever had such a strong impulse of wanting to be "one of them". It is partly perhaps a sense of kinship one feels instinctively, but there is, I think, more to it than that. They are a very attractive people, cheerful, open and very relaxed, and when one recalls all they have been through one finds it difficult to believe it. There is a sense of sharing one can feel in the air. It cannot be easy, for life is obviously very difficult, but they do not seem to mind. And they are smiling all the time. They command more than just one's respect.

I had already walked two miles or more and, as these thoughts went through my mind, it struck me suddenly that I had not so far seen a single policeman — not even at the crossroads where battalions of cycles still somehow managed to needle their way across. I was rambling all over the place watching everything and everyone with curiosity, but there were evidently no stern eyes watching my movements. The first policemen, two or three standing in a group, were near the big department store, but they were dressed in a buff-coloured uniform (which, I learnt later, were worn only by the traffic police). I look a full round of the lake once again, and over this entire distance I saw only one non-traffic policeman (in green uniform).

If traffic policemen do not regulate the traffic even at the crossroads, what then do they do? They appeared to be merely standing by and watching, just to make sure. Later in the day I discovered one of the things they do while standing by so inconspicuously. As the few cars and trucks that were there sped along, honking all the while to keep cyclists away, one could frequently hear fierce screeching of brakes then a sudden silence, and a little later the vehicles going their way. At first I thought each time it was an accident, or near-accident, and would rush out to see what had happened, but there was nothing one could see, no sign of excitement, no one else rushing to the scene. When I enquired later I was told that this was done only in response to whistles from traffic policemen out to test how good the brakes were. They had to be pretty good, to avoid accidents on roads so full of cyclists unregulated by anything other than self-discipline.

As I continued my walk around the lake I noticed that the pavement traders I had seen yesterday were almost all old women. It was in fact nothing more than petty trade, some vegetables and fruits, a few cigarettes and matchboxes, occasionally some candles. But there were younger women, in their (thirties or early forties) carrying basketfuls of vegetables (fresh celery, cauliflower, green chillies, tomatoes, etc) hung at both ends of a bamboo-pole and walking at a fast pace, almost afraid of slowing down in case they lost their momentum. They reminded me so much of the women who bring head-loads of tapioca and other vegetables into Trivandrum early in the morning, moving with great speed and grace but obviously under great strain as well. The bamboo-pole technique must of course reduce the strain a little, but the baskets seemed full enough to make up for it and the burden could not be very much less.

Going along the road were also hand-drawn carts, drawn by women when they contained only vegetables or fruits, but by men when there were bags of heavier material. There were buses and tram-cars but not as many as one would have expected, certainly far fewer buses than one would see even in a small town in some parts of India. The extent of mechanisation of transport, judged by all this, seems much less than even in Kerala. All one does not see is the depressing spectacle of rickshaw-pullers, a not frequent sight even now in places like Cochin. Instead there are bicycle rickshaws, with only the difference that the passengers are seated in front and not in the back, pedalled along by people who look almost as poor as some of our own in this profession (though again clearly better-nourished). There are no motor taxis anywhere in sight, none at any rate that I could identify as such.

By the time I returned from the walk I could hardly recognise the road from where I had started. The classes had begun and there was hardly a soul around. It had this deserted look till around 10.30 or so when again the whole crowd of children came tumbling onto the pavement and were all over.

Though it is already the second week of November, and it should have been colder, the days seemed actually very warm. The summer, I was told, was hotter, extremely humid, and very exhausting. But there is a nip in the air early in the morning and late in the evening. It is difficult now to visualise how cold it can be in winter. Obviously, if it gets as cold as I gather from everyone, having adequate warm clothes must be a problem; apparently they depend mainly on padded garments to keep warm.

I spent some time in the afternoon with the French journalist who had dropped in yesterday and invited me over to his hotel. It is one of the two hotels where all foreigners are lodged, and it is only outside them that one can see here a bevy of cars. With a number of governments rushing to recognise the DRV after the Paris agreement there has been a serious problem finding accommodation for all the new embassies, and many of them are therefore now located in these hotels. No wonder Hanoi cannot still afford to welcome tourists.

The hotel cannot by any means be described as posh. It is large and spacious, like the ones in India constructed before the Second World War. But by modern standards it would not perhaps qualify for rating as even a three-starred one. The office room of the French journalist was air-conditioned however, perhaps at his own expense. We talked generally about various things, and it confirmed my earlier impression that he was not very happy with North Vietnam. But he was terribly enthusiastic about India, the most fascinating country in the world, he said, not excluding China. He also made a very approving observation about the Indian nuclear explosion, a good thing, he said, because it broke the "monopoly" of the Big Powers. Whether it was meant as friendly small-

KEY ROLE OF FCI

India's biggest undertaking in the field of fertilizer industry, the Fertilizer Corporation of India Limited, is one of the largest producers of plant nutrients in the world.

FCI's Production Units

FCI's five functioning units at Sindhi (Bihar), Nangal (Punjab), Trombay (Maharashtra), Gorakhpur (U.P.) and Namrup (Assam) have the installed capacity of nearly half a million tonnes of plant nutrients. This will rise to over 3.5 million tonnes when additional plants under construction, and in advanced stages of planning, go on stream.

Catalyst know-how

FCI is one of the few organisations in the world to develop and produce a complete range of fertilizer catalysts so vital to the industry.

Total fertilizer technology

Backed by its intensive Research and Development efforts FCI has now developed its own know-how, design and engineering capability and can execute six to eight modern fertilizer plants at a time from the blueprint to the final commissioning stage.

Marketing Set-up

With a vast network of sales outlets and active promotional measures FCI now serves farmers in most parts of the country.

THE FERTILIZER CORPORATION OF INDIA LIMITED

talk to a visiting Indian, or a genuine French view, I do not know. But it was certainly a little startling to find admiration for India now in a place like Hanoi which, I would have thought, was enough to satisfy anyone's appetite, particularly those who had no love for Big Powers. Obviously tastes differ.

The great event of the day however was to be the reception at the Soviet Embassy later in the evening. I had also been invited. The embassies of the socialist countries are all in one cluster, some ten minutes' drive from where we are. As we got near the Soviet Embassy there was a whole row of cars in queue, and traffic policemen were all around. I had not imagined that there could be so many cars and policemen in Hanoi. But obviously it was a great occasion, and no diplomat was likely to miss it.

We arrived about ten minutes ahead of time, a little before 7. A whole array of Russians, some wearing uniforms and medals, was waiting to receive us. We walked into a gaily decorated hall in which there were at least two or three hundred guests standing around, lots of Russians and others as well, but not many Vietnamese. It took some time for me to spot a few Chinese though they were unmistakeable in their buttoned-up tunics. Sisir and his wife had to be with the other ambassadors standing in front facing the rest of us in the hall. So I got talking with others, some Yugoslavs, a few Cubans, a Hungarian, some Frenchmen, an Australian and a couple of Englishmen (who somehow seemed quite out of place).

How long the Vietnamese VIPs would stay at the reception, I found my surprise, was one of the main subjects of conversation. Some thought it would be just 11/4 hours not a minute more. To fraternise freely with the smaller socialist countries was a different thing but with the big ones equidistance had to be carefully maintained. So went the chit-chat.

At the stroke of 7, Prime Minister Phan Vam Dong walked in, followed by the famous Giap and Le Than Nghi (the Minister for National Economy and Planning). General Giap took my breath away. A rather short, chubby person, with a round face and a disarming mischievous smile, he looked anything but a soldier except for his uniform. Even the uniform had only just a lapel on either side, nothing to show that he was a multi-starred general, at any rate nothing I could make out. Could he really be the Giap who struck terror into the French and the Americans? This place is full of surprises. One looks for supermen, and they turn out to be like anyone else.

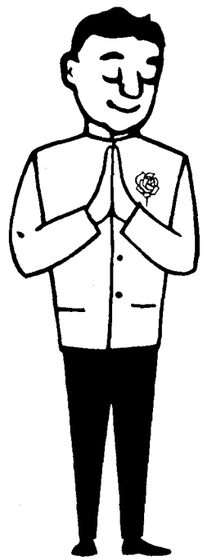
The Soviet Ambassador made a long speech from a written script. Some sentences drew immediate applause from the Russians in the audience, then would follow the Vietnamese translation at the end of which Phan Vam Dong would lead the applause. So it went on for 20 minutes or so. All the time, General Giap was standing to the right of the Prime Minister smiling puckishly, sometimes whispering something to Le Than Nghi (a very distinguished looking individual buttoned up in a black costume). Xuan Thuy, one of the key negotiators at Paris, dressed in Western attire, was standing to the right of Le Than Nghi, watching the crowd in the hall rather like a professor at a convocation.

Phan Vam Dong was listening intently to the Ambassador's speech, shaking his head with approval at times, but otherwise almost expressionless. He had a most interesting face, reflecting in every wrinkle all the suffering and strain of years of struggles, not handsome at all (like Giap or Le Than Nghi), but still very arresting and attractive in a peculiar kind of way. There was nothing elegant about his dress either; his buttoned-up tunic, no different in appearance from those worn by some workers I saw at the department store, hung loosely on his rather tall, lean frame. But when he began speaking he was another man. His words had tremendous power, his eyes seemed to roll forward at times giving emphasis to something he said, and it was not difficult to imagine that he could be firm and unyielding.

General Giap betrayed no such toughness in his demeanour. Though his eyes were piercing, a broad forehead and a genial face softened the impact of his personality. Nor did he look any older than 55, though I was told he was 62. He is the man reported by the Western Press only a month or so back as suffering from a serious ailment with perhaps not more than a few weeks to live. As robust and healthy as anyone could be at that age he apeared to me good for at least another 15 years. Apparently he had an operation for some kidney trouble, and has not been seen in public for some nine months or so, which is all the basis there is to the story.

Le Than Nghi seemed a quiet, serious-minded person. Even his responses to general Giap's light-hearted whispers were grave and restrained. He is supposed to be "the economist" in the present leadership. But he has had only primary school education, not even quite all of it, which clearly shows how much education is needed to make an economist and a planner.

After the speeches, which took perhaps just over half-an-hour, the Soviet Ambassador led the top half-dozen Vietnamese VIPs, and all the ambassadors into another room where tables and chairs had been arranged for them to be served. The rest of us stayed in the big hall helping ourselves to the food and drink spread on rows of tables. A Yugoslav diplomat expressed surprise about the VIPs being hosted in another room. It was unusual, he said, but may be it was because the crowd in the hall was too large. Others were not so sure, and I could see that some eyes were rivetted on what was going on inside the other room.



I was fortunate to be introduced to one of the few Vietnamese left in the hall. He, I gathered, was the Vice-minister for Culture. One could have mistaken him for a school teacher or a railway ticket examiner; he wore a very ordinary crumpled cotton suit and a tie unpretentious person, he appeared rather lost in the diplomatic crowd. When Prabhakar Menon (the Indian Charge d'Affairs) told him that I had been in the Delhi University, and was now in Kerala, he brightened up and entered into a most relaxed conversation in English (which he spoke quite well). I discovered he knew quite a bit about Kerala, its politics and the advances it had made in education.

We talked about the school system in Vietnam. Yes, he said, three shifts were too many and four hours a shift were insufficient. But what could they do? So many school buildings had been destroyed in the bombing, and the number of children had been rapidly growing. The children appeared to be much better equipped with books than in Kerala, I observed. o no, that must be a wrong impression, he said, the school were still very ill equipped and there was an acute shortage of teachers. "Of course we print 3 million books for children, but they are not enough. We need to modernize the books and print many more. But we have not enough paper."

As I looked around I found that the Vietnamese were even fewer in number than I thought. Almost all of them were dressed in very plain clothes. The wives of the Indian diplomatic personnel,

most of them in bright, brocaded silk sarees and wearing jewellery to match were such a contrast to the Vietnamese women who exuded charm wearing the simplest of costumes.

There was no obvious gaiety or camaraderie, which was a little surprising. People stood around and talked in groups, some concentrating more on the food and drink. The atmosphere was a bit too solemn, I thought, considering the occasion. It had occurred to me even while the speeches were going on. Perhaps there were problems of language and communication in this mixed diplomatic crowd.

There was one rather gay character standing near me, he was a Cuban. He was in excellent spirits, and spoke English. So we got talking. Were there many Cubans in North Vietnam, I asked him? Not many, he said, but the relations between the two countries were very rapidly growing. "We are both small and have been clubbed on the head by the same big bully", he added as if to explain why.

There was also a short, stocky Frenchman who appeared quite articulate. I discovered he too could speak English. Like the French journalist I had met earlier he was an old hand from the colonial days. He was all eyes and ears. Why were they taking so long in the other room, he wondered, it was already an hour and a half. That was more than what the Chinese got. But they were not through their food yet, he said, taking a glance at the VIP room.

And so the time passed by, till suddenly there was rustle and we saw Phan Vam Dong coming out of the VIP room followed by the rest. He briskly shook hands with some people, talked briefly to a journalist who had meanwhile intercepted him, and left soon after followed by General Giap and the rest. I could see several looking at their watches. It was fifty minutes past eight.

So it was five minutes longer than at the GDR reception, and this became the immediate subject of comment all around. The Russians had beaten the Chinese to it. But there were differences of opinion. One theory was that the food had been served very slowly, dish by dish, drink by drink, and so the Vietnamese VIPs had no option but to stay on till it was all over. Others thought they had stayed on as a gesture to the Soviet Ambassador who was returning shortly to Moscow after nearly ten years in Hanoi. In any case, someone pointed out, there were only three members from the Politbureau, not four as at the Chinese reception. But that, after all, was for the 25th anniversary of their revolution, said another.

What seemed fantastic to me was that these subtle points of protocol were being noticed and discussed openly by so many, including some belonging to the smaller countries in the socialist bloc. These are the ways, I was told, that the Vietnamese conveyed to their friends what they wanted to. Many seemed to think that relations with China had cooled off lately, though no one was sure whether that meant a gain for anyone else except the smaller socialist countries with whom Hanoi was developing much closer relations. How correct and perceptive these observations were I was in no position to judge, but the evening did give me an insight into the atmosphere of the diplomatic world in Hanoi. Whether the interpretations were right or wrong, it was interesting too that no one thought that Vietnamese could be taken for granted by anybody.

Tamil Nadu Electricity Board

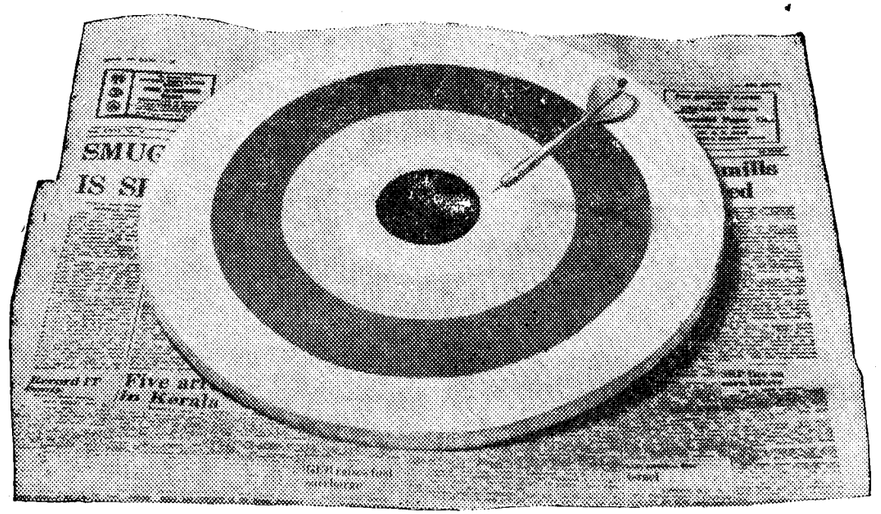
TENDER NOTICE

SPECIFICATION NO. C. 1164

Suruliar Hydro Electric Project — Specification for the supply of portable Diesel Driven Air Compressor for Construction works at Suruliar Hydro Electric Project.

1.0 For and on behalf of the Tamil Nadu Electricity Board, sealed tender in duplicate superscribed, "Specification No. C. 1164 Specification for the supply of 6 Nos. of 5.95 m3/min. (210 cfm. or nearer capacity) portable diesel driven Air Compressor for construction work at Suruliar Hydro Electric Project and the name of the tenderer", will be received by the Superintending Engineer, Technical (Civil), 157, Anna Road, Madras-600002 upto 12.00 Noon on Thursday 23rd January 1975 for the above supply of materials. The tender will be opened on the same day at 2.30 P.M. by Superintending Engineer/ Technical (Civil) or his authorised representative in the presence of such of the tenderers or their representatives as may be present at that time. The name of the tenderer should be clearly mentioned on the sealed covers. Tenders received later will be summarily rejected.

2.0 Copies of Specification No. C. 1164 with schedule can be had from the office of the undersigned on application enclosing the receipt for payment, obtained by tendering a sum of Rs. 20/- (Rupees twenty only) either by cash or by money order towards the cost of one copy of specification to the Deputy Financial Controller (Specification) Tamil Nadu Electricity Board, Madras-Electricity System (Distribution) 1/155, Anna Road, Madras-600002. While making the above payment the specification No. C. 1164 should be clearly furnished to the Deputy Financial Controller and the same number should be quoted in all future correspondence. The above amount is not refundable under any circumstances.



3.0 Tamil Nadu Electricity Board does not bind itself to accept the lowest or any of the tenders. The Board reserves the right to reject any tender or all the tenders without assigning any reasons therefore.

Review of Agriculture is published four times a year, on the last Saturday of March, June, September and December.

Manuscripts intended for publication should reach the Editor at least six weeks ahead of the date of publication.

Dairying for the Rich

ANIMAL HUSBANDRY and dairying are supposed to be among the more important programmes for raising the incomes of the poorer sections of the population. The Draft Fifth Plan claims that "it is intended to develop animal husbandry as an important economic occupation for the small and marginal farmers and agricultural labourers". However, the installation of milk processing plants, to supply milk to the rich and middle classes in the metropolitan cities and other urban areas, has far outstripped the achievement in increasing milk production itself. And yet under the so-called 'Operation Flood' it is proposed to set up one more milk processing plant in each of the four metropolitan cities as well as to expand the capacity of the existing plants. Inevitably, this pattern of development of dairying has meant growing dependence on imported skimmed milk powder (SMP) and butter oil. The country currently spends over Rs 20 crores a year on their import: in addition, large quantities of these products are received as gifts. The Delhi Milk Scheme, for instance, is dependent on SMP and butter oil to the tune of 70 to 80 per cent of the milk distributed by it. And taking the milk schemes in all the metropolitan cities, imports make up more than one-half of the total milk supplied. The Draft Fifth Plan dutifully emphasises the importance of raising milk production, "so that the dependence of these dairies on imported SMP and butter oil is eliminated as early as possible".

But what is proposed to be done to raise milk production? How misconceived the entire official approach to animal husbandry and dairying is from the point of view of raising milk production and, even more, from that of improving the economic levels of small and marginal farmers is brought out by the report by Nyholm, Schaumburg-Muller and Westergaard, published elsewhere in this issue, on the Bangalore Milkshed Area where the Intensive Cattle Development Project has been in operation since 1975. The report suggests that the government's animal husbandry programme will achieve neither the objective of increased production nor that of social justice without basic changes in technology and organisation. The technology of cross-bred cows and reliance on co-operatives for milk collection and marketing, the authors show, cater almost exclusively to the interests of the big farmers.

In the area studied by the authors, it is almost entirely the big farmers who have benefited from the livestock development strategy of increasing the number of cross-bred cows, particularly through artificial insemination of local cows with semen from exotic high-milk-yielding breeds. Only very few middle farmers and hardly any among the poorest groups have acquired cross-bred animals. Few farmers from these groups were able to secure loans for the purchase of the cross-breds. Also, middle and small farmers are reluctant to have their cows artificially inseminated, because of the demand for draught power as well as the long and expensive period before the offspring starts lactating. Similarly, the introduction of the co-operative marketing system has not at all reduced the dependence of the small producers on middlemen and village leaders whose power and influence have, on the contrary, often been enormously enhanced because of the development funds, from the government and financial institutions like commercial banks, put at the disposal of the co-operatives controlled by them.

Nothing short of a basic change in the technology and organisation of the animal husbandry programme will, therefore, make possible the achievement of its objectives. With regard to technology, the authors of the report make out a strong case for substituting the native buffalo for the semi-foreign cross-bred cow. For the small and middle farmer, the buffalo is financially more manageable than the cross-bred cow. And while the production potential of cross-bred baffaloes is smaller than that of cross-bred cows, the small farmer who can afford to feed his cattle only traditional fodder is in a much better placed to exploit this potential. Besides, the buffalo being a traditional milch animal, the small farmers would not hesitate to have their buffaloes artificially inseminated as they would not lose draught power. On the organisational side, the authors suggest a policy of establishing parallel co-operatives of small farmers which would not be open to large farmers.

What has to be recognised, however, is that the reliance on cross-bred cows and on marketing co-operatives dominated by large farmers is not accidental or the outcome of lack of appreciation of the adverse consequences of these policies for the social justice objective of the animal husbandry programme or for that of raising the production of milk. They have come to be accepted because they suit the interests of the larger farmers. And precisely for the same reason it is inconceivable that these policies will be changed however contrary they may be to the avowed objectives of the programme.

Towards a More Stable Grain Price Policy

J Sandee

G R Saini

This article aims to devise a grain price policy which would protect small farmers from the effects of harvest shortfalls and stabilise cash flows in the economy. The exercise assumes that sufficient buffer stocks would be available to keep prices and quantities of grain consumption constant.

It is suggested that, for all grain deliveries, a minimum price be paid immediately, to be followed three months later by a premium which would be increased to a certain maximum when harvests are very poor, or reduced to zero when harvests are plentiful. It is further suggested that minimum prices and premiums (standard and maximum) should be made known before the sowing season.

A numerical investigation has shown that, with reasonable values for prices and premiums, acceptable results may be obtained — except probably in Bihar and Rajasthan.

NO grain policy can be successful without the backing of large stocks. When the harvest has been poor, Government has to be able to dig into ample stocks so that consumer prices are kept down and the poor do not suffer overmuch. When harvests are abundant, Government must be able to absorb the surplus at producer prices which are high enough to maintain the confidence of farmers in the profitability of grains cultivation.

We have not tried to estimate how large the stocks ought to be, or asked ourselves how such stocks can be built up, or who should pay for them, or own them — the Central government, the state governments, foreign governments, or some international agency.

We have suggested a line for a price policy that would stabilise cash flows, even while the poor are protected and the farmers given confidence in grains cultivation, and assuming all the while that sufficient stocks are somehow maintained.

Food grains are so important a part of the national product that fluctuations in harvest may upset the entire economy. When harvests are poor, incomes of both producers and landless labourers decline. Small farmers and workers whose wages are normally paid in kind have to buy the grains for their consumption. These are also groups who have little financial reserves and must, therefore, reduce their outlay on manufactured goods. Even large farmers may prefer to do so, rather than liquidate assets or incur debts. Apart from the misery among small farmers and landless labourers, there will thus be a decline also in industrial demand, causing unemployment, an irretrievable loss of output, and a setback to private investment in industry.

All this will happen even if consumption of foodgrains is maintained at the average level, from the stocks which we assume to be available. The selling from these stocks will cause a large inflow of cash into government treasuries of as much as one per cent of the national product if averaged over all the below-normal harvest periods. The multiplier mechanism will get to work, industrial output will fall, services will decline, and the total loss will be several times the loss on grains alone.

However, it will be comparatively easy for the government to reflate the economy, using the revenues from the grains sold from the stocks. The government can allow producers' prices of grains to rise, and low-priced grain can be offered for consumption in the rural areas where harvests have been particularly poor. Direct income support may do the rest.

Indeed, in these operations, a good harvest presents greater problems. Farmers will receive large revenues from sales to the stock-holding authority. Financing this cash-flow will be far from easy, and the financial authorities would not like to inflate the economy to such an extent, foreseeing irreversible rises in industrial prices and wages as a result of the increased purchasing power of the rural sector. The cash-flow must be hemmed in — through price reduction or taxation; and such measures are far harder to take than price increases or subsidisation.

Prices and Premiums

We suggest that, before the sowing season, three prices be announced for each grain in each state: a standard price, a minimum price, and a maximum price.

Standard prices should be paid in most years, so that farmers can use them as guides for their production plans. Recent developments in the world market have stressed the advantages of approximate self-sufficiency in grains, and the standard prices should be set at such levels that farmers will on average produce the grains the country needs.

Minimum prices, or support prices, protect individual farmers from excessive price declines. Every farmer runs the risk that his harvest results will be below the regional average. As long as some grains have to be grown, without irrigation or assured rainfall, some price protection will be essential.

Maximum prices will deter farmers from speculative withholding grains when harvests are poor. They can have this effect, however, only if Government, backed by sufficient buffer stocks, is able to depress them beyond the maximum price level and if these operations are just as little used as the minimum price operations.

A similar set of three prices was mentioned by Kailash Chandra.[1]

At harvest time, the minimum prices can be paid upon delivery, to be followed by a premium some time later. Excessive payments once made cannot be retrieved. We have assumed three months to be a suitable time-lag between deliveries and premium payments. Only if there is clear evidence of very poor harvest should some premium be paid on delivery. In most cases, the premium paid should be the standard premium — that is, the difference between the standard price and the minimum price. Higher or lower premiums should be reserved for very poor or very good harvests, respectively.

We do not see any advantage in paying one price for part of the grain, and another price for the remainder. Moreover, we believe the premium system can work properly only if the government controls *all* grains procurement. There are various administrative ways of doing this, but for the sake of simplicity we have assumed that Government has taken over the entire wholesale trade in grains.

In Case of Withholding

If the harvest is known to be good, the farmers will not expect any premium; however, they will expect standard premiums to be paid for grains supplied a year later. If these premiums are expected to be high enough, farmers will withhold part of their output, to be delivered later.

In doing this they will incur storage costs. To store a bumper crop, a farmer cannot use his normal storage facilities, and he must either build or hire *pukka* storage space, or accept the losses of *kachha* storage. Withholding of bumper crops will save the stockholding agency the storage cost over the amounts withheld. At the same time, it will have missed the chance to buy the grains cheaply.

The farmers' storage costs — including interest charges — may well be higher than the costs of large-scale storage, and this has made us feel that withholding of bumper crops should be discouraged, through setting minimum prices which are not too below the standard prices. Consequently, the minimum prices will be less affected as an instrument to reduce cash-flows in times of abundance.

A similar reasoning can be followed to determine the span between standard prices and maximum prices. When harvests are about normal, farmers may speculate on a poor harvest in the following year and withhold part of their output hoping of earning the maximum premium on it in that year. The probability of poor harvests is low by definition, however, and maximum prices may, therefore, be put quite high without tempting farmers too much.

Rural Consumer Prices

Small farmers and landless families buy some or all of the grains they consume even in normal years; in bad years they have to buy considerably more. While premiums may be high in bad years, consumer prices would have to be subsidised. The amount of the subsidy has to be limited only by the possibility of its abuse. The disparity between raised producers' prices and reduced rural consumer prices cannot be made too great, otherwise quantities of subsidised consumption grains would be offered in wholesale markets as 'newly harvested' supplies.

In practice, subsidised grains would be made available only after the harvest shortfall has actually occurred. We have assumed that a lag of three months would be required. Improved predictions of harvest results could reduce this delay, and so make subsidisation more effective.

While it is easy enough to invent a scheme such as the above, it is much harder to assess its effectiveness. There is no way of checking beforehand whether the farmers will really behave as we have supposed. But it is possible to put actual figures into a computer to find out the effects of such a scheme under the behavioural assumptions made above.

This is what we have done, and the remainder of this article describes the linear programming model built for this purpose:[2]

The Model in Brief

Our model analyses how the system would have worked around 1975, had sufficient stocks been available by then. We chose this very proximate year because we did not want to take into account output trends in grains and structural changes in the rural sector which will occur by the more distant future. This, indeed, is one of the many avenues of further exploration opened up by our analysis. Prices in our model are centred around a retail price of wheat of Re 1.00 per kg. This should not be taken as our estimate of a 'realistic' or 'correct' price in 1975: it is nothing but a *numeraire*, and our analysis would not be affected if it were doubled or halved. We have also assumed that the supply of grains to urban consumers will not be affected by harvest variations — neither in volume nor in price — and so our model is entirely confined to the rural sector.

The model considers 17 states/regions covering the entire country. The grains considered are rice, wheat, and 'other grains' (which exclude pulses other than gram). The agricultural year is divided into four quarters. Twenty-seven harvest-patterns are considered in the model. Small farmers and landless rural consumers are considered separately from the large farmers.

In each of the four quarters, we chose 17 states and 27 harvest variations, and subsidies and premiums aimed at stabilisation of cash-flows and protection of small farmers. The computer did this for us, using the APEX algorithm of the Control Data Corporation for each of the four quarters seperately. To keep its labours within bounds, we assumed that in any one quarter and state, subsidies and premiums would equally apply to all three

Table 1: Mean Absolute Flow Deviations before and after Policy (Rs abja)

July-September	0.158	0.000
October-December	1.786	0.441
January-March	1.033	0.040
April-June	0.950	0.000

grains.

Stable prices lead to stable consumption, and consumer reactions have no place in our model. The income variations of rural producers (which would anyway be strongly reduced as a result of policy suggested) are not supposed to affect the quantities consumed. The only behaviour patterns incorporated in this model refer to the distribution, by large and small farmers, of their grain crops over sales (to the government, as sole buyer) and stock additions. We have assumed that this behaviour does not depend on prices either. Hence all grain flows can be estimated for any harvest result without considering the grain prices.

Harvest fluctuations differ geographically, and as we want to support the income of *local* groups of small farmers — not of all small farmers clubbed together — instruments will have to vary from area to area. In addition, net cash-flow must to some extent be stabilised locally, because demand for industrial products is localised to an important extent. The geographical unit chosen is the state. Most statistics are arranged by states anyway, and the Indian states are reasonably equal in size. Some gain in policy-effectiveness way be expected from subdividing a large and heterogeneous state such as Uttar Pradesh, and a few of the smaller states could have been aggregated with other states without great damage to the precision (such as it is) of the model. However, we have preferred simply to use the states for our geographical disaggregation.

The Union of India comprises 21 states and nine Union territories. For the purposes of our model, we have grouped the states and Union territories into seventeen states or regions which we hereafter refer to as states. There are Andhra Pradesh, Assam (including Meghalaya, Manipur, Nagaland, Tripura, Arunachal Pradesh and Mizoram), Bihar, Gujarat, Haryana (including Delhi), Himachal Pradesh, Jammu and Kashmir, Karnataka, Kerala, Madhya Pradesh, Maharashtra (including Dadra and Nagar Haveli, Goa, Daman and Diu), Orissa, Punjab (including Chandi-

garh), Rajasthan, Tamil Nadu (including Pondicherry, Andaman, Nicobar and other islands), Uttar Pradesh and West Bengal.

'SMALL' AND 'LARGE' FARMERS

B Venkatappiah[3] defines a 'potentially viable small farmer' as a (marginal) surplus producer, and in the Fourth Five-Year Plan (page 150) it is assumed that the smallest potentially viable farmer may have less than two hectares = 5 acres. For our purposes, we want to know the size of farm above which the farmer will normally have sufficient grain production to meet the consumption requirements of the family. We believe that five acres may well be the best estimate of this size for India as a whole.

In regions with low productivity of land, a larger area would be needed, while in high productivity areas even a smaller area may suffice. To take these differences in productivity among the states into account, we have divided the borderline size of five acres for India as a whole by the ratio of each state's average cereals productivity in 1969-70 and 1970-71 to the all-Inlia cereals productivity. We thus obtained a borderline size for each state — which varied from 2.3 acres in Punjab to 9.0 acres in Maharashtra.

On the basis of these borderline farm sizes, we apportioned the area operated and the number of households over 'small' and 'large' groups, using National Sample Survey Report Number 144 for the distribution of area and households oversize classes by states.

THE STANDARD FLOWS

The following five grain flows (in million tonnes) have been estimated for a normal harvest in 1975-76:

(i) net production
(ii) consumption
(iii) sales
(iv) purchases
(v) farmers' stock variations (balance)

Each of these flows has been separately estimated for

(a) rice, wheat, and 'other grains'
(b) 17 states
(c) large and small farmers (including landless families for consumption)
(d) four quarters

Altogether this comes to 5 x 3 x 17 x 2 x 4 = 2040 standard flows.

Of course, we encountered the well-known gap between production and consumption estimates. Following Madalgi,[4] we ascribed this to over-reporting of consumption.

For sales we assumed that large farmers would sell the entire surplus over their consumption requirements, while small farmers who by definition would have little surplus to sell would nevertheless sell about one-third of their rice and wheat production immediately, as 'distress' sales.

Purchases of grains for cash in rural areas could be taken from National Sample Survey.

In a normal year, as a whole, stock variations should be zero; with our first estimates, this was far from being the case. We therefore adjusted sales, purchases, and the distribution of all flows over large and small farmers until all stock variations, over the year as a whole, disappeared. This we did with the ancient least squares error-smoothing procedure, perhaps for the first time for this purpose.

For the distribution over seasons, we used the scanty information available from NSS and the Ministry of Food and Agriculture.

To assess the effectiveness of the system, it should be tried out in a sufficient number of realistically chosen different harvest situations. We analysed state-wise production data for the seven years, 1965-66 to 1971-72. By means of the 'principal components' analysis, we identified three distinct patterns of variation. These we used to construct a 'grid' of 27 equally probable harvest patterns for the three grains in the 17 states. The centre point of the grid (variation 14) represents the mean or normal pattern: it has a probability of 1/27 just like any of the other patterns.

We then had to estimate how, in each of the quarters, large and small farmers would react to harvest variations. For large farmers, additional output was added to sales and a shortfall subtracted from sales — but no further than to reduce sales to zero. The remaining deficit, if any, was made good from quarterly stock additions.

We assumed that small farmers would use additional supply first to reduce cash purchases, until these fell to five per cent of consumption — a minimum representing the consumption of landless families without income in grains. The remaining surplus, if any, was added to sales. A shortfall in small farmers' output was distributed over a reduction in sales and an increase in purchases, in a manner too complicated to be related here.[5]

BOUNDS ON SUBSIDIES

To represent consumer subsidies, we defined variables ISPRD (for 'issue price reduction') which we made subject to the bounds $0 \leq \text{ISPRD} \leq 0.30$

The upper bound, of Re 0.30 per kg, represents the highest subsidy we believe feasible without too much danger of abuse.

In addition, we stipulated that in each quarter and in each state,

$$\sum_{n=1}^{27} \text{ISPRD}n \leq 0.90$$

In this formula, the letter n stands for the number of the harvest variation (from 1 to 27). By means of this bound we obtain that the full subsidy of Re 0.30 per kg shall not be given more often than three times out of 27, with no other subsidies allowed at other times. Alternatively, smaller subsidies than Re 0.30 per kg may be given more frequently.

The purpose of this bound is to rule out frequent subsidisation in any state or quarter.

We assumed that the standard premium could be Rs 0.15 per kg in all cases. This meant that any premium reduction PRMRD is bounded by:

$$0 \leq \text{PRMRD} \leq 0.15$$

The upper bound on extra premium PRMEX to be paid when harvests are poor can be put further away:

$$0 \leq \text{PRMEX} \leq 0.30$$

To give more meaning to the concept of a 'standard' premium, we felt that variations in the premiums should not happen too often:

$$\sum_{n=1}^{27} \text{PRMRD}_n + \sum_{n=1}^{27} \text{PRMEX}_n \leq 1.80$$

They should not be too one-sided either:

$$-0.45 \leq \sum_{n=1}^{27} \text{PRMRD}_n$$

$$-\sum_{n=1}^{27} \text{PRMEX}_n \leq 0.45$$

The computer has to find the values of subsidies and premiums, within the bounds set, which minimise shortfalls in small farmers' revenues and variations in cash-flow. This is obtained by providing the computer with a suitable objective function. One component of the objective refers to shortfalls in small farmers' revenues; this component bears a suitable negative valuation.

In any one of the 27 harvest variations, the grain flows affecting small farmers are given; the prices that translate them into net revenue components depend on the ISPRD and PRMRD or PRMEX variables. Net revenue thus is a linear function of the subsidies and the premiums.

We define the standard net revenue of small farmers as the revenue they receive when harvests and prices are standard. A shortfall occurs when the net revenue is less than this standard revenue; these shortfalls, if occurring, are added up over the 27 variations and the sum is given a negative valuation in the objective function.

The choice of the standard net revenue as the benchmark from which to measure shortfalls is, of course, somewhat arbitrary.

The net cash-flow to all farmers in all states, together, is also a linear function of 17 x 3 = 51 subsidies and premiums. In any one of the four quarterly models, its average over the 27 variations can be written as a linear function of the 27 x 51 = 1,377 policy instruments. In some of the 27 variations, the net cash-flow will fall short of this average, and in most of the other cases it will be in excess of the average. The sum of shortfalls and excess (both taken positive!) is a measure of the variability of the cash-flow in India as a whole. It is also given a negative valuation in the objective function.

Figures for, the variability of grain outputs, state-wise, indicate that variations are strongly localised and sometimes even opposite comparing one state to another. Although India is a free-trade area for industrial products, divergent grain harvest variations in states could seriously affect the local demand. Only with considerable friction can a downward variation in some states be compensated by upward variations elsewhere. Stabilisation for each state, separately, thus becomes a further aim. This will prevent farmers in one part of the country from complaining that their grain encounters lower purchase prices because harvests have been exceptionally good elsewhere!

Technically, stabilisation by individual states is handled similarly as for India as a whole. The average net cash-flow in each state is again written as a linear function of the instruments. Net cash-flows in each of 27 variations can now be compared to the state average flows. In this case, however, we have two benchmarks disposed symmetrically at either side of the average net cash-flow. A net cash-flow lying between these two benchmarks does not incur any penalty. Only cash-flows below the lower benchmarks are considered to show a showfall, measured from the lower benchmark, Cash-flows above the higher benchmark show an excess, measured from the higher benchmark. The sum of shortfalls and excesses, so defined, is again given a negative valuation in the objective function, and this is done separately for each of the 17 states.

The position of the benchmarks is again somewhat arbitrary: each is fixed at a distance from the average, corresponding to Rs 8 per head of the population in the state concerned. It was left that variations upto Rs 8 per head in any quarter would not call for compensatory action.

The procedure was introduced after it had been observed that the linear programming algorithm gave the same attention to every rupee of shortfall or excess, whether they occurred very close to the average or very far away from it. The refined two-benchmark method at least rules out penalisation of small variations.

If, in our model, all stress is laid on the stabilisation of flows, safeguarding a minmum income to the weaker sections of the rural population, the mean cash-flow taken over all harvest fluctuations may work out to the disadvantage of the treasury. Average terms of trade, between countryside and towns, would change in favour of the rural sector. Though this may appear to be a small price to pay for stabilisation and prevention of extra poverty in rural areas, we feel that mean cash-flow to the rural areas should be made to increase less than, or even decline in conjunction with, stabilisation and minimum incomes policy. A negative weight was therefore attached to the mean cash-flow to the rural areas to achieve this purpose.

SOME RESULTS

Each of the our Simplex tableaux has 1,050 rows and 2,835 columns. They were separately optimised, and only a few of the results will be discussed here.[6] The success of cash-flow stabilisation follows from Table 1.

At standard prices ('before policy') the net cash-flow showed variations around the mean in the order of Rs 100 crores, to be set against a quarterly national product in the order of Rs 100 abja. With judiciously chosen price variations most of this variability could be eliminated.

Only in the second quarter of the agricultural year did a certain variability persist. This is further analysed in Table 2.

It will be seen that of the 27 variations those less than Rs 2 abja are almost all eliminated. One may well ask whether stronger penalties on large aberrations (in the way it was done for state-wise deviations) would not have given better results.

BIHAR AS SPECIAL C371

The two-benchmark system eliminated almost all large state-wise deviations — with the important exceptions of Bihar and Rajasthan in October-

December. We analyse the case of Bihar further in Table 3.

In Table 3, the 27 harvest variations have been ordered by the size of flow, the variable representing the shortfall of net revenue from grains relative to a standard value. This shortfall is greater than Re 1 abja in three out of 27 cases. In four out of 27 cases, however, there is an excess of net revenue greater than Re 1 abja. For India as a whole, 'a variation of Re 1 abja in any one quarter is a quite large amount, compared to the quarterly national product of the order of Rs 100 abja. For Bihar alone, such variations are truly enormous.

Table 3 shows that policy instruments are mainly used to reduce the larger deviations. This is the effect of the two-benchmark procedure: the benchmarks are at Rs 0.474 abja and Rs —0.508 abja, respectively, and little happens between them. It should be remembered that Bihar also contributes to the all-India cash-flow variations, and the use of instruments inside the Bihar benchmarks is designed to reduce the all-India variations.

The total effect of policy is not very impressive, and it may be asked why more cannot be done. It appears from Table 3 that, if an instrument is used at all, it is nearly always used to the fullest extent allowed by the bounds put upon instruments. There is thus little chance to do more, unless one allows much greater price variations than Re 0.30 per kg upwards, or Re 0.15 per kg downwards. But the PRMEX instrument could be used more often, to increase the cash-flow in case of serious harvest failures. The reason why this has not taken place is that the use of premium variations is limited by the requirement:

$$\sum_{n=1}^{27} \text{PRMRD} + \sum_{r=1}^{27}$$

PRMEXn $\leqslant$ 1.80

This requirement was put in to give more meaning to the concept of the standard price. Perhaps in Bihar this is asking too much.

Table 3 also provides information about SYDIF, the shortfall in small farmers' net revenue. It will be seen that this shortfall can be as high as Rs 50 crores even after the maximum grain subsidy has been allowed. Obviously, the grain revenue problems of Bihar cannot be solved by grain price policies alone. It should perhaps be repeated that, under the assumptions of our study, grain consumption is not affected by harvest variations at all. If the harvest has been poor, grains are provided from buffer stocks in any quantity required. But the small farmers in Bihar will have to be given the money to buy these grain supplies, in perhaps one in three years.

It may be that the problems of Bihar look somewhat more serious than they are on average because we estimated the extent of harvest variations from the period 1965-66 to 1971-72 which, for Bihar, may include rather stronger variations than may be expected on average over a longer period. It is doubtful, however, that an extended analysis would much improve a dismal picture.

Bihar and Rajasthan are the only serious cases. In all the other states, grain price policies may be sufficient to stabilise money flows and protect small farmers' income.

CONCLUDING REMARKS

Our study assumes buffer stocks so large that consumption can be completely stabilised. Present stocks are nowhere near such a level. Consumer prices will, therefore, have to vary inversely with harvest results. If a bumper crop should occur (as it must from time to time). government will have a good chance to build up stocks cheaply; but the net cash-flow to the rural sector may rise considerably, and deflatory measures may have to be taken. If another harvest failure occurs, grain prices are bound to rise further, and some groups in the rural population will do very well out of other people's misery and the financial aid the government will have to give to the poorest sections of the community.

To devise optimal policies for these conditions is far beyond the scope of our analysis. Several years will have to pass before our model may be of any practical use. During those years further thought would have to be given to the problem of stabilisation and protection of small farmers' incomes when sufficient grain stocks *are* available.

Asian Electronics

ASIAN Electronics has secured an industrial licence to manufacture annually 40,000 TV picture tubes. The project, being set up at Nasik in Maharashtra, is expected to go on stream by the last quarter of 1975. Estimated to cost Rs 22 lakhs, it is intended to be financed by internal resources and borrowings. Meanwhile, the ceramic capacitors unit, being established at the Santacruz Electronics Export Processing Zone (SEEPS), should commence production by the first quarter of 1975. The factory building is already complete and the bulk of the machinery has arrived. Besides, the company also intends to diversify its product-range by taking up manufacture of poly-propylene capacitors, high voltage resistors, potentiometers and electronic grade ceramics. During the first seven months of the current year, AEL's turnover reached Rs 81 lakhs against Rs 52 lakhs during the same period last year and Rs 118 lakhs during the whole of that year.

A Case of the Process of Tractorisation

N S Jodha

The causes and consequences of farm mechanisation have been discussed largely in the context of well-watered areas which have had substantial improvements in productivity.

This paper seeks to study a case of rapid tractorisation in a dry and, by the standards of the 'green revolution' regions, fairly backward area.

On the face of it, agro-climatic conditions in the region make the tractor a most uneconomic and wasteful innovation. In fact, it is found that it is precisely these conditions which have contributed the most to the quick spread of tractor cultivation in the area.

FARM mechanisation, particularly tractorisation, has been a major issue of debate in India in recent years. However, the causes and consequences of mechanisation have been discussed largely in the particular context of well-watered areas which have had substantial improvements in productivity.[1] The limited objective of the present paper is to illustrate the fast pace of tractorisation in a dry and — from the standards of 'green revolution' regions — fairly backward area. Agro-climatic conditions of the region which, on the face of it, seem to make the tractor a most uneconomic and wasteful innovation for it have, on the contrary, contributed most to the quick spread of cultivation by the use of the tractor in the area.

The study relates to an area within the desert region, traditionally known as *Suhalag* (the term. used for a relatively better area) in the Jayal Tehsil of Nagpur District in the western, dry, part of Rajasthan. The normal annual rainfall of the area is 31.9 cm but the fluctuations even during the last 10 years have ranged between 18.7 and 58.8 cm. Soils of the area are light black and sandy loam with intervening stretches of gravelly uplands.[2] The extent of irrigation hardly exceeds one per cent of the net sown area, but occasionally grows wheat and mustard on the basis of residual moisture when there are good rains. Important kharif crops of the area are jowar, bajra, sesamum and kharif pulses. Cattle and sheep raising are important subsidiary occupations of the farmers.[3]

The data on tractor cultivation and other plot-wise and holding-wise details were initially collected from a cluster of six villages as a part of the author's Ph D work in 1964-65 and 1965-66.[4] Some broad details from these villages were again collected during 1973-74.[5] Some data were culled out for the intervening years too from the patwaris' *Khatoni* and *Girdawari* records, panchayat records, and rudimentary accounts of tractor owners. Further, for one of the villages, which the author visited twice a year and for which he had satisfactory arrangements for collecting and keeping more detailed information for more years, was better covered. Hence, in the discussion that follows, at places where details from all the villages were not available the situation has been illustrated with details from this *one* village.

SPREAD OF TRACTOR CULTIVATION

For the first time, successful tractor cultivation in the area was introduced in 1959, by a landless ex-serviceman.[6] His instant prosperity through tractor-hire service had a strong demonstration effect in the area. A number of people individually, or collectively, acquired tractors and many households, irrespective of the size of their holdings, hired tractors. Table 1 gives details of the progress, village-wise. During 1964-65 to 1973-74, the number of tractors (for all villages taken together) increased from 10 to 59, and the number of tractor owners, from 13 to 160. In terms of the use of tractors — the real indicator of extent of tractorisation — Table shows a phenomenal change. The proportion of households cultivating partly or fully with tractors increased from 7-15 per cent in 1964-65 to 70-90 per cent in 1973-74 in the different villages. The percentages of plots ploughed by tractors in the two corresponding periods, are 3-16 and 70-73, respectively.

The most important reason for the rapid spread of tractorisation in the area — as will be seen from the following discussion — is the highly paying business of customer service which, in turn, has been sustained both by the peculiar climatic conditions and the type of informal customer service arrangements which have developed in the area. The process has also been greatly helped too by the availability of public funds for the purchase of tractors, as is indicated by the increasing share of the Land Development Banks (LDB) loans,[7] in the investment costs of tractors. Thus, even the medium size farmers could acquire tractors by informally pooling together their lands (see Table 2).

TIME FACTOR IN CULTIVATION

The area not only has very low rainfall but the rainfall comes mainly in two to four showers during July and August. This limits the wet periods (or sowing periods) to two to four weeks for the whole season. The wet periods are further shortened by the fast winds in the area. Thus the success of the crop is largely determined by one's capacity to exploit the short wet periods. The consequences of delayed sowing (for want of sufficient draft power) are: need for re-sowing and lower crop yields, as is partly illustrated by Tables 3 and 4. Accordingly, as high as 50 per cent of the area may need partial or full re-sowing if the sowing takes place after one week of soaking rains. The extent of re-sowing increases with the length of the delay period. Crop yields, too, may be adversely affected by this.[8] Hence, at least for technical reasons, any facility which helps the farmers in overcoming the problem, created by short wet periods *vis-a-vis* their limited draft power, would be readily acceptable to them. This provides the first explanation for the fast tractorisation in the selected villages.

A closer observation of the situation indicates that, in economic terms too, tractor cultivation has a merit over bullock cultivation in the area. Even in the absence of precise estimates of the cost of maintaining bullocks, it is well known that, because of their serious under-utilisation, bullocks are an unavoidable burden on the farmer. An indirect and partial — but interesting — indication of this is found in the quantities of fodder (locally known as *Lancha*, i e, finer fodder reserved for bullocks to be fed to them mainly during the work period, which the farmers have been able to sell following the decline in the number of bullocks possessed by them (see Table 5). According to Table 5, small and medium

Shriram Chemicals' equation for national progress...

100% capacity utilisation = 1,000,000 tonnes of Urea produced = $ 100,000,000 saved!

- Total Urea output todate : over 1,000, 000 tonnes.
- Increased foodgrain production todate : over 4,000,000 tonnes.
- Total foreign exchange saving todate : over $ 100,000,000.

Notes : 1 * Percentage of total plots of land which have been partly or fully ploughed by Tractor.
2 Tractors used by the households are not necessarily those belonging to their own villages.
3 Figures in brackets indicate the tractor users as percentage of total households.

farmers' expenses on tractor-hiring services have been more than compensated by the sale of surplus fodder.[9] Of course, the marketing of fodder has been encouraged partly by the transport facilities provided precisely by the newly acquired tractors.

FEATURES OF TRACTOR-CUSTOM-SERVICE

Non-tractor-owning farmers have been greatly induced to hire in tractors because of the facilities which the tractor owners have been able to offer. The extent of these facilities depends partly upon the competition among the tractor owners.

First, the payment for tractor service is invariably on a 'deferred' basis. The customer is required to pay the tractor charges only at the time of harvesting; a crop failure may mean deferment of payment for two years. Thus the non-availability of resources for immediate payment does not act as a constraint on the hiring in of a tractor (as against hiring of a pair of bullocks where immediate payment is the practice).

Secondly, for the hiring of a tractor, payment (either immediate or at harvest-time) is also acceptable in kind — whether grain, fodder, fuel, or labour, etc (see Table 6). The customer does not always feel the burden of tractor-charges in terms of out-of-pocket expenses. In fact, some of the products — such a bajra stalk, which hardly has any market in these villages — are readily accepted by the tractor owners as payment in kind for services rendered, as they can transport the same to markets in distant towns and still earn a fairly large margin.

Thirdly, as the success of the tractor-hiring business of the tractor owners themselves is closely linked with the success of the crops of their customers, the tractor owners try to help the customers in various other ways — such as with providing them seeds, with cash for hiring labour, with arranging transport and marketing of crop, etc. This is an important feature of the customer service system which has informally evolved in these villages. Thus, not only are the farmers' draft-power requirements taken care of,[10] but also their credit and marketing needs, which induce especially the small farmers to go in for increasing employment of tractors.

THE TRACTOR OWNERS

The above-mentioned features of the informal customer service as operated by private tractor owners is quite distinct from the customer service which is operated in a more formal and rigid manner by certain institutions like the panchayats and the co-operatives in the area.

The key factors (from the viewpoint of the tractor owners) in the successful operation of the customer service are: (i) their capacity to offer services on deferred payment basis; (ii) ability to ensure almost cent per cent recovery of dues from every category of customers; and (iii) ability to obtain maximum utilisation (in the specific context

TABLE 2: DETAILS ABOUT (A) TRACTORS AND (B) TRACTOR OWNERS IN THE SELECTED VILLAGES

Details	1964-65	1968-69	1973-74
(A) Tractors			
1. No of Tractors	10	35	59
2. Average total investment per tractor+accessories (Rs)	28,497	36,366	41,803
3. 0/0 share of LDB advances in (2)	32.6	68.8	75.2
(B) Tractor Owners			
4. No of tractor owners (households)	13 (6)	78 (65)	160 (142)
5. Average size of landholding of (4) (Acres).	63.8	47.6	36.2
6. House holds (4), having other incomes from			
a) sheep raising	4	43	112
b) Cattle raising	7	20	61
c) Off-farm employment	5	13	15
d) Trading, etc.	1	4	4
e) Pension/remittance	3	32	78
7. Households having no subsidiary source of income	1	—	—

Notes : 1. Figures in brackets indicate the number of households who own tractors jointly.
2. Other sources of income excludes the income from hiring out tractors.

of the region) of tractor-time during the different seasons.[11]

Tractor owners derive their capacity to hire out tractors on a deferred payment basis because of the multiple sources of income which most of them have (see Table 2, part B). Subsidiary occupations, like sheep raising and employment of some family members in towns, etc, ensure timely availability of funds to make possible the repayment of instalments of LDB loans and the purchase of diesel oil in advance even during scarcity years. People without diversified sources of income simply cannot run the customer service.[11]

Tractor owners have been able to ensure full recovery of their dues from their customers, as they accept payment also in kind, and that too in terms of (i) any farm product ranging from fodder and fuel to manure, (ii) labour, or (iii) land on a share cropping/lease basis. Acceptance of payment in terms of fodder and fuel has proved quite rewarding as these can be transported and sold in distant towns or even in villages with scarcity conditions where fodder has a good price. Thus the linking of customer service with transport and marketing business, on the one hand, and with informal labour contract and land leasing arrangements, on the other, has made the running of customer service a profitable proposition for the tractor owners.

The tractor owners have been able to guard against the under-utilisation of tractors by hiring out the same for cultivation and transportation purposes, not only in their own villages but also in quite distant villages and districts (see Table 7). Guided by news about good rains, they move from place to place in the region, at times covering distances as long as 150 miles. In the off-season, they move to irrigated areas in the state. Besides hiring out the tractor services, they also engage in share-cropping arrangements. By adding a chaff-cutting machine to the tractors, some of them have been able to have regular hiring business during the non-crop season too. Occasionally, faced with little private business, they engage their tractors on contract jobs on public works.

TABLE 3: DISTRIBUTION OF PLOTS SOWN AND RE-SOWN BY PERIOD OF SOWING (1964-65)

Details	Sowing Periods (days following each of the three soaking rains)		
	1-7	8-15	16 and above
No of plots sown (0/0)	323 (100.0)	236 (100.0)	154 (100.0)
No of plots lequired resowing (0/0)	23 (7.1)	119 (50.4)	104 (67.5)

Notes : 1 Total number of plots is 584. Cummulative total of row (1) exceeds 584 because it counts a plot as many times as it was sown/resown during the season.
2 Table excludes the plots where stagnation of water unduly delayed the sowing.
3 Plots required resowing includes all plots which were partly or fully resown as well as those which remained unsown second time due to resource constraints of the farmers.

TABLE 4: AVERAGE YIELD OF BAJRA IN PLOTS BY PERIOD OF SOWING (Kg/ACRE)

Rainfall Period	Period of Sowing in Terms of Days Following the Soaking rains		
	1-7	8-15	16 and above
I July 2nd Week	411.8 (19)	352.7 (22)	248.9 (15)
II August 1st week	372.4 (17)	262.2 (16)	182.5 (17)
III August 4th week	220.3 (21)	81.2 (15)	64.3 (16)

Note : For the above table plots of only those 15 farmers have been considered who had one or more plots falling in each of the categories indicated in the table.

OTHER IMPACT

Land Use Intensity and Employment:

In the dry region, represented by the villages studied, the tractor is probably the first modern innovation which has significantly added to the adaptability of traditional farming systems to the peculiar agro-climatic conditions of the arid region. It has facilitated the ploughing of a maximum area, at appropriate times, during very short wet periods, with the possible consequences in terms of stability and increase of crop production. Extensive fallowing of land, which used to appear unavoidable in the past, is no more so. Table 8, section A, indicates an increase in the net sown area, from 65 to 86 per cent of the cultivatable area, during the 10 years of the selected village. The area under current and old fallow has also declined substantially, indicating an improvement in the land use intensity over a period of time.[12]

Increased land use intensity had consequences for the employment situation in the village. No precise figures are available about employment at the two points of time.[13] However, an indirect and partial indication of the increase in demand for labour could be had from the changes in the wage rates for different farm operations (Table 8, section D).

A more interesting phenomenon is that increase in wages for operations — such as weeding to harvesting — is greater where tractorisation had no labour displacement effect. This also suggests that tractorisation (through increased area under crops) had a greater role to play than other factors, like inflation, in raising the wage rates.[14]

Transport and Marketing:

The villages which had never used any means other than bullock carts and camels for transporting goods in the past,[15] have had vast new avenues for marketing goods opened out to them by the tractors. In fact, some products, like bajra stalks, have become a marketable commodity largely because of tractor-use. The changed situation is partly reflected in the higher prices the farmer is able to receive within the village itself (Table 8, section. E). An important reason for the higher prices, as indicated earlier, is the tractor owners' linking of customer services with their fodder marketing business.

An additional feature of the situation is that, while outside transportation is done by tractors, the transport within the village (farm to home or farm to farm) is done by bullock carts-custom-service operated by some small farmers. This system, non-existence about 10 years ago, has become a fairly paying business in view of the decline in the number of households

TABLE 5: NUMBER OF BULLOCKS ON FARMS, EXPENDITURE ON TRACTOR HIRING AND SALE VALUE OF FODDER BY SIZE OF HOLDING

Landholding Size Groups (Acres)	Average Size of Holding	No of House-holds	1964-65		1973-74		
			Total No of Bullocks	Average Value of Fodder Sold (Rs)	Total No of Bullocks	Average Value of Fodder Sold (Rs)	Average Expenses on Tractor Hiring
Less than 1 to 10	8.5	12	20	57.20	6	378.00	231.10
10 - 20	18.2	31	76	111.32	34	512.25	428.15
20 - 30	23.9	26	68	151.10	24	603.10	798.20
30 and above	37.6	16	64	210.50	38	587.77	655.25
Total	22.2	85	228	134.52	102	535.30	556.27

Notes : 1 Table excludes camels (8 in 1964-65 and 3 in 1973-74) used for ploughing.
2 Expenses on tractor hiring have also been imputed in the case of tractor owners.

having own bullocks — following tractorisation — in the village.

Tendency:

While some small farmers have taken advantage of the bullock cart hiring system, many of them have lost due to the changed circumstances of the land market within the village. Their share in the lands available on lease/share-cropping has declined, from 55 to 11 per cent as at the two points of time. It is significant that the tractor owners now account for more than 76 per cent of the land taken on lease/share-cropping (see Table 8, section B). Of course, the extent of 'tenancy' has thus increased largely because of customer service as indicated earlier.

Ecological Damage?

A serious, long-term, consequence of tractorisation could be in terms of ecological disturbance in the region. Native vegetation, trees, and bushes like *Zizyphus Nummilaria* in the fields have been the biggest victims of tractor cultivation.[16] How this process would influence soil conditions and water balance in the area is difficult to say for want of adequate data. It may be noted, however, that the yield of *Pala* (a fodder from Zizyphus Nummilaria) and also fencing material has considerably declined in the plots regularly ploughed by tractors (Table 8, section F).[17] This is certain indication of natural resource depletion in an area characterised by a very delicate ecological equilibrium.

5 Data for the second period were collected more out of curiosity rather than out of a desire for

TABLE 6: DETAILS ABOUT THE FORMS IN WHICH TRACTOR HIRING CHARGES WERE RECEIVED

Average gross earning per tractor * (Rs)	0/0 share of the following in (1)							
	cash	food grain	Fooder	Fuel Wood	Manure	Labour	Land lease/ share cropping	Others
1	2	3	4	5	6	7	8	9
7050	41.7	7.3	14.6	3.6	2.1	13.4	15.5	1.8

Notes : * 1. The data relate to 12 tractors in village 'A' of Table 1 most of which were 1 to 6 year old Massy Ferguson. 35 horsepower tractors. Earning estimates are based on recovery details aulled out from the records of and discussions with the tractor operators.
2. Rates of hiring tractor differ from operation to operation. During cultivating season per hour charges ranged between Rs 20 and 35. During off season it was as low as Rs 12 per hour.

INDIANOIL SERVICE TO SERVICES

India's Defence Services, no doubt are our valued customers. But we do not look at it that way. As a leading public enterprise, we deem it our prime responsibility and our duty to rally round the Services and help keep round-the-clock vigil across the national frontiers.

Army, Navy or Air Force—Indianoil is there to meet all the requirements of petroleum products conforming to correct specifications wherever they are needed.

The recent Indo-Pakistan hostilities posed a challenge to provide the logistic support. Indianoilmen accepted the challenge and met it squarely, irrespective of the odds, risks and costs, thus earning the nation's gratitude for their efforts in war and no less in times of peace.

INDIANOIL

INDIAN OIL CORPORATION LIMITED

Bellaram-IOC-68

TABLE 7: DETAILS OF PURPOSE-WISE UTILISATION OF TRACTORS

Average Extent of Use* (10 hour-days)	Percentage Shares of the Following in (1)						
	Own Cultivation etc	Custom Service (cultivation) in :			Transport/ Marketing	Contract Job on Public Works, etc	Others
		Own Village	Other Village	Other Districts			
1	2	3	4	5	6	7	8
288	27.2	18.6	28.3	6.5	9.7	7.5	2.2

Notes : – Actua number of days and hours of work varied from season to season. This figure has been arrived at by adding total. work hours during the year and dividing it by ten.

some systematic resurvey. Initial interest in tractorisation was confined to one hypothesis, viz, that tractor cultivation by destroying *Zizyphus Nummularia* (bordi) roots accentuates the process of soil erosion and deprives the farmre of an important source of fodder available even during the drought years. In the absence of benchmark data for comparison the matter ended in 1965-66 itself. During one of the subsequent visits to the area (in 1968-69) it was thought of having some comparable data. Arrangements were accordingly made in some of the villages for the same. In 1972-73 and 1973-74 data from remaining villages were also collected. The data collected threw much more light on several aspects of tractorisation besides resource erosion effects. This paper summarises them. Incidentally, 1964-65 and 1973-74 for which data are presented in the paper were two of the best crop years for the *suhalag* villages and the years immediately preceeding each of them had mild drought conditions.

6 He was an army driver in Jodhpur state forces. He lost his land during land reforms because being in army it was not possible for him to be an owner operator of the land as required by the land reforms legislation. He lost his job because he could not be absorbed in the Indian army as the time of reorganisation of state forces. Deprived of both land and army job, he worked for some period as a driver for a *Marwari* businessman in Assam, who helped him to get a tractor later.

7 While referring to the contribution of public funds in tractorisation in this area some additional facts may be mentioned. Jayal Tehsil possesses nearly 30 per cent of the tractors in the Nagaur district. Nearly 90 per cent of the tractor owners are Jats. Nagaur is predominantly a Jat district and has been represented by one to three ministers in the state cabinet until 1971.

8 Low yields are mainly due to poor germination, poor crop stand of the late sown crops and dessicating winds (known as *Jhola* during mid-September to October which adversely affect the late sown crops at their seed farmation stage.

9 In fact, the sale of fodder is only a partial indicator of the fodder rendered surplus by a decline in the number of bullocks. Other indications are: increase in the number of milking cows and buffaloes (besides the newly acquired red dindhi cows) — from 102 in

TABLE 8: IMPACT OF TRACTORISATION — SOME RELEVANT INDICATORS OF CHANGE IN ONE OF THE SELECTED VILLAGES*

Details	1964-65	1973-74
A. Land use intensity :		
1. Old fallow as 0/0 of cultivable land	21.6	9.3
2. Current fallow as 0/0 of cultivable land	13.2	4.7
3. Net sown area of 0/0 of cultivable land	65.2	86.0
B. Tenancy :		
1. Total area under lease/share cropping (Acres)	173.5	322.7
2. 0/0 share of small farmers (less than 1 to 10 Acres) in receiving [1]	54.8	11.2
3. 0/0 share of tractor owners in receiving [1]	—	76.5
C. Bullock power/tractors.		
1. Number of tractors	1	12
2. Number of working bullocks	228	102
3. Number of small farmers operating bullock-cart custom-service.	—	6
D. Wage rates for farm operations (Rs. per day) [1]		
1. Field cleaning etc.,	1.50	2.0
2. Ploughing (2)	5.00	8.00
3. Weeding	1.50	3.50
4. Harvesting (bajra/jowar)	2.00	5.55
5. Harvesting sesamum	3.00	7.00
6. Harvesting pulse crops and fodder.	1.50	4.00
E. Fodder marketing:		
1. 0/0 of farmers who marketed fodder.	18.9	100.0
2. Price of fodder :		
a) bajra stalk (Rs./per 400 bundles) [3]	8.00	60.00
b) jowar stalk (Rs./per 400 bundles)	25.00	100.00
c) jowar *cheepta* [4] (Rs/per 400 bundles)	80.00	200.00
d) Fine (leaf) fodder of pulses (Rs/qnt)	15.00	40.00
e) *Pala*-bordi bush fodder (Rs/qnt)	12.00	30.00
F. Yield of Pala (Qnt/acre) in selected Plots [5]	160	40

Notes : * The table illustrates the situation in Village "A". of Table 1.

1. Wage rates indicated are for male workers. Female workers employed for the operations (other than ploughing) received one to two rupees less than the male workers. These rates excludes perquisites like tea, tobacco, etc, given to the workers.
2. Ploughmen are normally engaged on ploughing season basis.
3. Weight of a bundle is normally 1½ Kgs.
4. *Cheepta* is jowar stalks, cut in green form before grain formation stage of the crop.
5. Data of *Pala* (zizyphus nummularia) relates to 25 plots where regular tractor ploughing during last 8-10 years has destroyed the roots of the bush. (See footnote 5).

1964-65 to 173 in 1973-74; increased extent of marketing of milk (facilitated partly by stall feeding of milking animals) from nil in 1964-65 to nearly 80 litres a day in 1973-74.

10 The author had occasions to witness a similar phenomenon in Gujarat, where the big farmers who sold water to small farmers, also tried to help the latter through credit, etc, so that their (big farmers) dues were not deferred by the poor harvest. This type of informal arrangements (if happening at macro level) may easily conceal the substantial increase in demand for credit, because the increased credit demand will not be reflected in the acounts of formal channels of farm credit.

11 In the selected villages during last 10 years, there have been only three cases where the tractor owners have been completely ruined by the tractor hiring business and have failed to repay LDB loans. All the three had substantial lands (above 80 acres) but cultivation was their only source of income; which in turn failed to offer adequate cushion for sustaining the tractor-business during scarcity years. Another reason for their failure is said to be the engagement of hired drivers. Practically all the successful tractor owners in this area have their own family members to operate the machine. These are normally not formally educated but can manage their own accounts, etc.

12 The details of Table 9 show the changing situation in one village, which should be understood only as an illustration of the broad situation obtaining in the whole area where tractorisation has become a real force of change.

13 More direct indication of increased demand for labour is given by a new system which has developed in the area. In the concerned village, for example, the enterprising farmers (including tractor owners) bring teams of farm workers from distant villages (where due to poor rains, etc, labour is readily available) during harvesting season. This contract labour is then made available to every farmer on payment. Labourers from neighbouring towns are also brought by tractor owners.

14 Increase in the wage for sesamum harvesting is highest. Area under the crop has increased from 20 per cent to 30 per cent of the cropped area during the period under consideration. To ensure good harvest this crop requires to be sown during early period after the rains and tractors have facilitated this process. Moreover, once ripe, the harvesting of the crop can be delayed only at great loss. This explains the big rise in the wage rate for the operation.

15 The only occasions when trucks visited this village in the past were when wool traders came to village for collecting wool, or when men came from charity organisations, or when government relief departments came to purchase stocked fodder from the village to be distributed in scarcity affected villages in other parts of the state.

16 In some of the areas, vegetation-wise, the face of villages has changed beyond recognition. Tractors not only encourage removal of trees within the field and shelter belts (known as *Matt*) on the field borders to facilitate field operations but they also offer ready facility for marketing the log for fuel to the towns.

17 See footnote 5 also.

Tractorisation and Changes in Factor Inputs

A Case Study of Punjab

Kusum Chopra

Important among the effects of the much-talked-about 'green revolution' in Punjab has been the mechanisation of farming and the consequent changes in factor inputs, particularly in labour input.

Among the forms of mechanisation in Punjab's agrarian economy, tractors occupy a very important place. Punjab accounted for over 20 per cent of the country's total tractor population in 1970-71.

To study the various aspects of tractorisation in Punjab, a field survey was conducted covering 13 villages and 130 tractor-owning households in three districts—Hoshiarpur, Ludhiana and Ferozepur. Some of the results of the survey are presented here.

THE much talked about Green Revolution — brought about mainly by the breakthrough in seeds — has had several other far-reaching effects. Important among these, in Punjab, has been the adoption of mechanised means. As this state adopts mechanisation in agriculture, the consequent changes in factor inputs — particularly in the labour input — become important for enquiry.

Among the forms of mechanisation introduced in Punjab's agrarian economy, tractors occupy a very important place. In 1970-71, over 20,000 tractors — forming more than 20 per cent of India's tractor population — were operating in this region. To study the various aspects of this tractorisation, a field survey was conducted covering 13 villages and 130 tractor-owning households in three districts of Punjab. The three districts were Hoshiarpur, Ludhiana, and Ferozepur,[1] and the sample was taken from five blocks in these three districts.

Village Characteristics

By way of a general introduction to the selected villages, Table 1 puts our village data in a particular perspective. Besides the background depicted in the Table, a broad description of the various blocks and villages may not be given to start with.

In Hoshiarpur, Block I. in the cluster of four villages,[2] less than 50 per cent of the cropped area is irrigated. Though this zone constitutes the sub-mountainous region of Punjab, the area covered in this study is the flat part of this zone. The main rabi crops, on the irrigated and the unirrigated tracts of land, are wheat and wheat-gram, respectively. For the kharif season, unirrigated maize is the most popularly sown crop. The tractor owners in these villages formed about 6.5 per cent of the total number of cultivating families in the villages.

Out of the 'net cultivated', 'total cropped', and 'net irrigated' areas of Punjab, Ludhiana district accounts for 7.8, 8.72, and 8.26 per cent, respectively. the Sidhwan Bet block accounts for 11.33, 10.11 and 12.32 per cent, respectively, of the above-mentioned area categories of the district, and the Mangat block for 11.55, 9.41, and 10.24 per cent respectively. In Sidhwan Bet block, as may be noticed from Table 1 also, village Galib Kalan is the only village where the'net irrigated' area is 100 per cent of the 'net cultivated' area. Villages Sherpur Kalan and Sherpur Khurd, together, have about 90 per cent of the net cultivated area irrigated by the different sources; villages Sowaddi Khurd and Leelan, on the other hand, have a relatively low figure for irrigated area compared to net cultivated area of these villages. The main crops of this block are wheat, groundnut, maize and desi cotton. Although wheat has the largest area under it in absolute terms in each of the sampled VLW circles, maize accounts for relatively more of the entire block's acreage under maize, followed by wheat and cotton crops. Of the cultivating families in the villages, the tractor-owning families form 25, 20.43 and 10.46 per cent, respectively, in Galib Kalan, Sowaddi Khurd (and Leelan), and Sherpur Kalan (and Sherpur Khurd). In Ladian Kalan (and Ladian Khurd), Nurpur Bet and Bagga Khurd, they form 33.33, 8, and 45 per cent, respectively. The main sources of irrigation are tubewells followed by canals in Sidhwan Bet block, and tubewells in Mangat block. In the latter block, next only to wheat, groundnut figures importantly in the block's area under various crops. The VLW circle and village Nurpur Bet contribute more to the block's acreage under sugarcane and cotton, whereas VLW circle Ladian Kalan account for a relatively larger share with respect to paddy and toria.

Moga I block lies on the eastern side of Ferozepur district, and Abohar block on the western side. The soil and climatic conditions are different in these two. Wheat is grown in both blocks, but while it is the main crop in Moga I block, in Abohar block American cotton is the main crop followed closely by wheat. In Moga I block, most of the cotton grown is of the local variety. Desi cotton and maize in the two VLW circles of Ajitwal and Kokri Kalan have a relatively larger share of the block's acreage under these crops. It is encouraging to see that both, Kokri Kalan and Ajitwal, villages have a high percentage of net irrigated area. The number of tractors in these villages is also fairly large, but when the tractor owners are compared to the total number of cultivating families in these villages, the percentage is, by far, the highest in village Dauhdar, at 27.86; followed by 9.18 and 8.25 per cent in villages Ajitwal and Kokri Kalan, respectively.

In villages Gobindgarh, Kala Tibba and Khubban of Abohar block, according to available information, 7.14, 8, and 12 per cent respectively, of the cultivating families, own tractors. The net irrigated area in Abohar block forms approximately 60 per cent of the cultivated area. Canal water is the main source of irrigation here and, since the ground water level here is low, boring tube-wells is an expensive proposition.

Other Characteristics

Almost all the villages of this survey are well connected with roads. They fall either on direct bus routes or within a radius of one mile from the metalled road. Ownership of tractors has made the sample farmers more mobile and their possibilities of interacting with the world outside the village larger.

Ownership of land in Punjab rests mostly with the Jat-Sikhs. In our sample, out of the 120 farmers who

reported their caste, 94 were Jat-Sikhs, 8 non-Jat-Sikhs, and others non-Sikhs. The source of rural tensions is not always caste. It may be a grouse between families, or competition for power or economic inputs. Abohar block, for instance, is mostly irrigated by canal water and since water is a scarce commodity, in many cases, rural tensions mount when some farmers try to steal water from others. Many of the big landlords keep an armed guard to facilitate proper utilisation of the water turn and the irrigation channels. In addition, in parts of Moga block, and also in other neighbouring blocks, tension had mounted during the years of the survey, because of the activities of young radicals. Command of authority within the village is determined either by how much land one owns — which often brings with it control over the operations of the panchayats or the co-operative societies — it depends on how much political influence a group can exert through the political party in power for whom its support may be important. In the socio-economic hierarchy, ownership of tractors has become an important matter of prestige among farmers. Some of them remarked that it makes it easier for them to get bridegrooms for their daughters.

Consolidation of holdings has, of course, been one of the prerequisites of tractor use and purchase. Table 2 shows that there has been a significant increase in the average area per fragment in each size of holding — or a significant *decrease* in the *number of pieces per holding*.

Introduction of high yielding varieties, fertilisers, and increased irrigational facilities, has also affected the demand for tractors in the villages. It is rare for our sampled farmers not to use chemical fertilisers, for one or more crops in a year. Table 3 shows an increase in the net irrigated area as a percentage of the operated area in various sized holdings. Of a total operated area of 5,648 acres, tractors have helped irrigate 376 acres. On the whole, both the average net and average gross irrigated areas show an increase, of 33.32 and 46.31 per cent respectively, when compared to before tractor utilisation.

None of our respondents seems to have lost much land as a result of the operative ceiling on holdings. The big landlords had transferred the titles in anticipation of the ceilings: Some permanent hired labourers have the titles under their names; obviously they cannot hold the effective reins since the landlords command the authoritative and financial power in the village — and are still able to exert moral pressures too.

Although loan facilities have increased the last few years, they are still insufficient, in relation to the demand in the villages. Most finance for tractor purchase is still provided out of own savings of farmers constituting 72.72 per cent of the total finance of all respondents in this study. However, the role of the agencies in this sphere is changing. Village money-lenders do assume an important role, but their role is threatened by the land mortgage banks, commercial banks, and co-operatives. In our sample, money-lenders supplied 8.5 per cent of the finance for tractor purchase, 7.7 per cent came from the land mortgage banks, and all the other sources put together accounted for 11.08 per cent only. If credit were more easily available, an increasing number of farmers are keen to take loans; if given on long-term basis, and at reasonable rates, several other farmers would want to purchase tractors.

TRACTOR OWNERSHIP PATTERN

Considering the ownership of tractors, according to various classifications of holding (see Table 4), the highest number of holdings with tractors fall in the range of 15-30 acres of operated area. The two classifications — 15-30 acers and 30-45 acres — together account for about 63.08 per cent of the owned tractors in the present survey.

TABLE 4: DISTRIBUTION OF TRACTORS ACCORDING TO THE SIZE OF THE OPERATED HOLDING (IN ACRES) AND THE TRACTOR HP*

Holding Size	No of Holdings	Percentage of Holdings	14 HP	20-25 HP	27-30 HP	32-37 HP	42-47 HP	50 HP and above
0-15	10	7.71	6	—	1	3	—	—

INTERNATIONAL TRACTORS WORK HARDER, WORK LONGER

Owership of 31-37 HP tractors has been the highest among the sampled farmers. Except for the 0-15 acre holders who popularly possessed the smaller DT 14 tractors, in most other holdings groups the 35-37 HP tractor is popular, and in the relatively larger holdings the farmers own the larger 50 HP tractors. Some of the farmers, with relatively small holdings, indicated a desire to buy smaller HP tractors, but since a buyer's market does not exist in tractors, farmers do not usually have a choice regarding the purchase of a particular make or HP of tractor as and when desired by them: It is more of a question of availability rather than of choice.

From the view point of literacy standards, more educated farmers were on the whole to own tractors. For comparative purposes, 78 bullock-owners were also surveyed in the 13 sample villages. Both among tractor owners and non-owners, the highest percentage was formed of illiterates.

In all, 35.8 per cent of the owners and 15.38 per cent of the non-owners hold degrees, however. Farmers with degrees are thus found to be significantly more interested in mechanising their farms.

Joint families are still the rule. A little more than 69 per cent of the tractor-owners have joint families. It was also noted that 53 per cent of the tractors are used on operated area which happens to be a joint holding. This is partly also because the machine's potential can be more effeetively used on larger tracts of land, and it is easier besides to finance the purchase of the machine by pooling resources together than otherwise.

Land Ownership Pattern and Factor Proportions

Several factors are responsible for deciding whether or not there is an incentive to invest in an economic asset. In case of tractor purchase, the incentive came partly in the form of the demonstration effect on villagers via some private or governmental agency and partly via a more general economic, social and technical change. It is difficult to decide which particular factor, or which particular type of change, are decisive influences; because most of them are introduced or are accepted at a stage of development when people are already more attuned to accept change and to be instrumental in further diffusing that change. A capital investment, bringing about social, ecoomic and technical change or being incurred as a result of these, brings about a reshuffling of the factor inputs too. In our sample, the *additional* investment made per holding and per acre on mechanisation *after* tractor purchase is shown in Table 6.

As the size of the holding increases, the investment per acre declines. However, the investment per holding on the largest sized holdings is twice as much as on the smallest sized holdings. The larger holdings, therefore, are more capital-intensive, though the investment per acre is seen to be higher in the relatively smaller holdings.

The average operational, owned, and cropped areas of the sample tractor-owners were 43.44, 39.45, and 52.5 acres, respectively; the respective averages of the non-owners are 21.67, 18.92 and 27.54 acres. The tractor-owning farmers operate nearly twice as much area as those farmers who own bullocks. Even compared to before the tractors were purchased by the present owners, on an average nearly 4 acres have been added to the operated area. A percentage increase of 2.71, 10.65 and 36.60, respectively, in the tractor-owners' own, operated, and cropped, area is seen as compared to before. Obviously, a tractor commands more acreage and assumes an important role in getting all the operations done at appropriate times for more than one crop each year.

Another interesting observation is that, at present, owned area forms 90.81 per cent of operated area, whereas formerly, it formed 97 per cent of the operated area. It may be concluded, therefore, that more acreage is taken on lease now and increasing numbers of holdings are leasing in land to benefit from the economies of scale. Previously, more holdings in the 15-30 acre group 'rented in' land; now an increasing number of holdings doing so lie in the 30-75 acre range since a tractor can operate rather larger acreages. It is also obvious from the data that more changes are brought about in the 'cropped' area — signifying that the pattern of land utilisation has changed for the better and that the farmers are now growing more crops in a year. This fact is further clarified by the intensity of cropping as shown in Table 8.

The intensity of cropping remains high in the smaller sized holdings. However, a change at least relative to before, is noticeable in the larger sized holdings after they have purchased tractors. A minimum of change exists in the 0-15 acre holdings, because the level of intensity was already fairly high in this group compared to the other groups. The increase in average intensity, for all the holdings put together, is 16 per cent; the calculated intensity at present is a little over 140. The extent of irrigation, of course, plays an important part too

in determining the cropping intensity. To exclude the impact of irrigational facilities from that of tractorisation, 52 holdings with constant operated and constant net irrigated area, for before and after, were selected — which also indicated a 13 per cent change in the intensity of cropping brought about by the use of tractors.

Among the other inputs in land, labour has been the most talked about; economists and policy-makers would be deeply concerned if mechanisation were seen to displace labour. The emphasis has always been on creating more opportunities for rural employment along with on increasing productivity. Since introduction of tractors and HYVs has brought relatively *larger tracts* under agricultural operations as well as *more crops* within the span of a year, our sample shown an increase in the employment of labour at the macro as well as at the micro levels. It is not always true, therefore, that mechanisation leads to displacement of labour.

What is more important to investigate is the adopted *level* of mechanisation, the *operations* it performs, and the particular *impact* it is likely to have in a region. The changes brought about in labour are studied under three separate groups — family labour, permanent hired labour, and casual labour.

Since the main task undertaken by tractors is seed-bed preparation (on which nearly 50 per cent of their operated time is spent), tractor-use has affected the permanent hired labour which used to perform this function. However, the extent of the hired labour's release is not too great.

Another sub-group, known as 'skilled labour', has had more jobs created for it not only in the non-agrarian sector—as for instance, in manufacturing or a sembling of tractors, tractor-parts, implements, and accessories, or in various repair workshops — but also in the agrarian sector itself. Tractor operators and mechanics are hired to operate as well as to look after the machine. However, hiring of operators, is not very popular in all the blocks in our study — except in Abohar block, where holdings are mostly large and most farmers prefer to stay in nearby towns for enjoying better amenities.

This has also led to an increase among them of the practice of hiring casual labour. In this area, during the last few years, with the in-coming of tractors, farmers have undertaken levelling of land in order to use it for cotton-growing since cotton is an important cash crop and is labour-intensive. Many farmers also reported that, since canal irrigation is the only possible one there, their turn to irrigate the fields would be wasted if certain necessary operations are not performed by the tractor at and within the appropriate time. However, extended area (irrigated and non-irrigated, introduction of HVYs, and application of fertilisers, have certainly led to extended cropped acreage as well as to higher intensity of cropping and higher yields: Together, these have thus raised the demand for labour. In the above mentioned block, female casual labour has recorded a particular increase, because female labour is mainly engaged in cotton-picking and as larger tracts are covered by this crop, more women are employed. On the whole, in Punjab, and especially in our sample villages, female casual labour was 30 to 40 per cent of male casual labour; in some holding groups it has higher employment than men, primarily in cotton picking, rice-planting, vegetable picking, and other special crop operations. Harvesting is the other operation for which female labour is now employed; however it does not exceed 20 to 30 per cent of the labour employed in this.

The details of family labour, permanent hired labour, and casual labour per tractor-holding, may be seen in Tables 9 and 10. As compared to the position before, more family labour is now employed in most holdings. The increase over the earlier situation is much greater for the males, working full-time and part-time,[4] for females, Family labour, however, shows a decline on the smaller holdings groups; but on farms, on the whole, more members of the family are now returning to be farmers and several others are entering as part-time workers. With partial mechanisation of the farms, moreover, it is no longer as irksome, for those who also have other off-farm jobs or are students, to assist in the farm work.

The permanent hired labour in Table 9, shows a slight decline. As was mentioned earlier, seed-bed preparation

— for which these labourers were mainly hired — is now done by tractors. Casual labour, of course, has shown an increase compared to before. The main operations undertaken by casual labour before were hoeing-weeding, harvesting, and threshing; now, whereever paddy is grown, they are also involved in planting and, for other crops, in sowing, digging, FYM application, and spraying. Some of these operations were earlier done by permanent hired labour. Female labour usually helps in cotton-picking, decobbing maize, potato and groundnut digging and washing, rice transplanting, harvesting, and other such operations. On the whole, female casual labour as a percentage of male casual labour, has shown an increase — of almost 12 per cent as compared to before. Because of the decline in family labour and in permanent hired labour on the smaller holdings, casual labour shows a greater per-acre positive change in man-days. Relatively lower variations are found, in terms of work-days, in female labour for the various sized holdings. To exclude the effects of increased irrigation on hiring of labour, 52 holdings with constant irrigated area, both before and after tractor purchase were considered. The data is presented in Tables 11 and 12.

By and large, the pattern of family labour and permanent hired labour and casual labour is more or less the same — as was seen from Tables 9 and 10. On these selected holdings, the negative change in permanent hired labour is more as compared to total holdings. As may be seen, on holdings having constant irrigated area, the per acre change in casual labour is 1.21 work-days for males and 0.81 work-days for females.

On the whole, the increase in demand for casual labour may be attributed to several causes, important among which are: (i) increase in operated area; (ii) increase in level of intensity of cropping; (iii) increase in crop yields; (iv) changes in cropping pattern, such as, increasingly more of cotton, potato, paddy, groundnut etc, being grown all of which are more labour intensive; (v) and even allowing for seed-bed preparation which tractors have more or less completely taken over — thus affecting the permanent hired labour for the purpose — the requirement of human labour in harvesting, hoeing water-channelling, cotton-picking, vegetable and fruit picking, groundnut and potato digging, decobbing of maize, stripping of sugarcane, etc; (iv) changing role of family labour — especially on relatively large holdings on which family members have become more or less 'organisers' of their farms: (vii) changing role of different categories of labour itself. Since part of the work on the farm is undertaken by tractors, other jobs such as threshing, water channelling, weeding, etc — which were earlier done by permanent hired labour — are now being increasingly done by casual labour.

Besides finding other jobs in agro and non-agro business, some of the labour thus moves to nearby districts where work for a relatively longer span of time may be available to them; creates a shortage in the region from where they move out. The wage rates ranged anywhere between Rs 115 to Rs 230 per month (inclusive of meals) for the permanent hired labour, and the average for all sampled blocks was nearly Rs 150. In some cases, a share — anywhere between 1/6th to 1/14th — of the crop is given to adult workers, the share depending upon the crop yields. For casual male labour, the daily wages ranged between Rs 6 and Rs 10.00 (inclusive of a meal). For females, the daily wage is usually 25 to 30 per cent lower than for males.

There has been a definite displacement of drought animals with the incoming of tractors. The land-bullock ratio moved as shown in Table A.

Each bullock now commands a much larger acreage of operated area as compared to before. The number of bullocks kept per holding dropped from 6.19 to 2.58, whereas the average number of buffaloes went up from 2.80 to 3.36. Even on the smaller holdings the bullocks could not be totally relieved, and on an average one pair is kept to serve as a stand-by — in case of breakdown of tractor, for planting of certain crops, and for other jobs on the farm.

CONCLUSION

An important outcome with tractorisation of the village economy in Punjab is that farmers are becoming more conscious of capital investment than they ever were before, and they are more willing to accept change today and incur higher risks as entrepreneurs of their farms — a role they had never assumed earlier. Also, perceptibly more educated persons and family members who were working elsewhere before are now returning to the villages to undertake farming not only as a means of living but also as a means of sizeably raising the marketable surplus. Partly this has led to an increase of about 11 per cent in the operated area and also to some change in the cropping-pattern. Along with a shift in the operated area, there is also an upward shift in the number of household which now seek to rent in land to be able to benefit from the economies of scale. Before tractor purchase, there were 10 per cent of the holdings which, besides owning tracts of land, either rented in land or both rented in and mortgaged-in land; after tractorisation, this percentage went up to 22.35 which is more than twice the figure before. As one aspect of the changing crop pattern, American cotton, for example, has been more widely sown in Ferozepur district and in others where more and better irrigational facilities than before are provided. Besides, farmers are experimenting with bringing larger areas under paddy, *toria, sarson, barseem* and in some cases even under soyabean. The land-bullock ratio certainly shows an increase after the tractor purchase. Because of the displacement of drought animals, each bullock now serves as a stand-by on relatively larger tracts. The displacement of drought animals has led to an increase in the milch cattle kept by our responding farmers, but this shift is not very significant — though in districts like Ludhiana, the shift is more noticeable than for the sample on the whole.

Undeniably, a larger investment on farm capital is being made now in the form of tractors, their accessories and implements, tubewells, threshers, power fodder cutters, power cane-crushers, and similar other assets. Also, since vistas of double-cropping and in some cases even getting a third crop open up to farmers, the use of power to enable them to save time becomes important. Most of our respondents sounded enthusiastic about being behind the wheel and about their drive towards increasing marketable surpluses. There has also been an increased and extended use of fertilisers, high yielding varieties, improved seeds, and increased demand for labour in the villages generally. It is usually believed that tractorisation leads to displacement of labour. Not all kinds of mechanisation necessarily displaces labour. It is important to take into view the utilisation of the machine, the types of operations undertaken by it and the other far-reaching effects it is likely to bring into the economy. Our sample has shown an increase in family labour, skilled labour, and casual labour on the farms after the introduction of tractors.

In family labour, the number of full-time and part-time, males and part-time females, respectively, increased from 1.93, 0.21, 1.1 to 2.39. 0.45 and 1.3 per tractor holding. In casual labour, the percentage increase in man-days is 38.47 among males and 80.33 among females. This is accredited to several, reasons among which are: extended area under operation, higher crop yields, increased intensity of cropping, raising of certain crops which are more labour intensive, changing roles of family labour and permanent hired labour, and finally, existence of certain operations which cannot be undertaken by machines. Moreover, in the non-agrarian sector, employment tends to increase because more hands are needed for the manufacture of tractors, spare parts, tractor implements, accessories and their repairs. Further, more gasoline stations and village oil depots provide employment opportunities. Casual labour is usually more busy during the harvest seasons and a constant complaint of the villagers has been non-availability of labour during this peak season resulting in higher labour costs. If more labour can be made available from other regions during the peak seasons, it can provide employment to those extra hands too. Even now, in some areas there are inter-state or inter-regional movements of labour, but this mobility is not very widespread. If better knowledge and facilities for mobilisation are provided, labour would move to places in search of better returns. However, in the present circumstances, the mobility constraint explains the willingness to adopt mechanised means.

Given the present area under crops and the present cropping intensity, one could probably say that more labour would be utilised if there had been no mechanisation on the farms. But whether, with the lack of it, farmers could really extend cultivation to large acreage and sow more crops in a year, is just anybody's guess. However, it may be mentioned that small power tractors (at cheaper rates) may be more suitable in Indian conditions where most of the farms are small and hence the machine can be put to an optimum use. As was mentioned in the paper earlier, the farmers showed keenness to buy smaller tractors, but in the absence of its availability, they bought whatever was available to them. Finally, it may be of interest to note that relatively larger holdings may be more capital-intensive, but the investment per acre after tractor purchase turns out to be higher in the case of smaller holdings (Table 6). Similarly, though much more casual labour is employed by the larger holding households, the average positive change in hiring casual labour per acre is much higher in case of smaller holdings because of a decline in their family labour and in the permanent hired labour (Table 10). In family labour, a greater positive change is seen in the holdings groups between 30 to 150 acres, the largest change being in the 45-60 and 100-125 acre classifications. At the same time, the number of labourers permanently hired by larger holdings which has been much greater has, as a consequence of mechanisation and more family labour coming in, also been released to a greater extent in the larger holdings groups.

[The original study was done under a Research grant from USAID, New Delhi, 1970-71, under the title "Tractorisation and Its Impact on the Agrarian Economy of Punjab".]

1 One district from each of the three zones (sub-mountainous, central and south-western) was selected, representing highest density of tractors according to the cropped area.
2 In a village, where the required number of informants were not available or were hesitant to provide the required information, other neighbouring villages forming a 'cluster' were selected for the study.
3 The average for all holdings is a weighted mean for all the Tables.
4 Part-time in taken to mean around 50 per cent of the full-time work. The latter represents an 8-hour day on an average.

Socio-Economic Aspects of Dairy Development

Report from the Bangalore Milkshed Area

Klaus Nyholm
Henrik Schaumburg-Muller
Kirsten Westergaad

The government's dairy development programmes, it has been claimed, have been guided by the objectives of increasing milk production in the rural areas, improving the nutritional standards of the people, especially those of the vulnerable groups, and strengthening the economy of the small and marginal farmers and agricultural labourers.

This paper presents the result of a research project undertaken in the Bangalore Milkshed Area of the Karnataka state. The air of the research project was to examine the extent to which the individual measures introduced and the technique and organisational set-up chosen had met, or were likely to meet, the objectives of dairy development as spelt out in the Five-Year Plans.

IN several states dairy development programmes have figured rather prominently in the Five-Year Plans, and specific programmes for the development of modern dairy farming have been started during the past two decades. With the launching of the all India key-village scheme in 1952/53 programmes for the development of modern dairy farming were started in Karnataka state. In 1965 the intensive Cattle Development Project was introduced as a crash programme in the Bangalore Milkshed Area.

The All-India and Karnataka five-year plan state that dairy development programmes have been guided by the following three objectives: (1) increase in the milk production in the rural areas (among other things to satisfy the increasing demand from the urban areas); (2) improvement of the nutritional standard of the population, especially among the vulnerable groups; (3) strengthening of the economy of the small and marginal farmers and agricultural labourers.[1]

During the past several years there has been an increasing awareness that the high expectations from the so-called Green Revolution are not about to be met. Not only did the introduction of high-yielding grain varieties not lead to a sustained increase in agricultural output, but the agricultural strategy followed since the mid-1960s has by and large left the small farmers behind.[2] As is well known, the high-yielding grain varieties were primarily introduced in areas with ensured water supply. Because of the capital-intensive production required for the new grains, it was primarily the already well-off farmers who were able to benefit from the new strategy. Furthermore, there seems to be some validity to the argument of increased returns to scale as regards the production of high-yielding varieties, at least in the wheat growing areas where mechanisation has been introduced.

In the light of this experience of the new agricultural strategy with its strong emphasis on growth, the third objective —strengthening of the economy of the sub-marginal farmers and agricultural labourers — of the dairy development programmes has become especially important. With the present emphasis on Social Justice in the planning documents, dairy farming — or animal husbandry in general — is considered one means of achieving this objective. Seve-

ral arguments are advanced to show that dairy farming is particularly suited for the smaller farmers. For one thing, dairy husbandry is not dependent on the size of land-holding, and secondly the law of increasing returns to scale does not apply, it is argued.

In order to examine the possibilities of improving the economy of the small farmers through dairy development programmes the Institute for Development Research (Denmark) undertook a research project in the Bangalore Milkshed Area of Karnataka state, where the above-mentioned programme, the Intensive Cattle Development Project, is operating. The area is located within a radius of 40 miles from Bangalore city and comprises 9 talukas in Bangalore district, 5 in Kolar district, and 2 in Mandya district.

The aim of the research project was to examine the extent to which the individual measures introduced and the technique and organisational set-up chosen had met, or were likely to meet, the objectives of dairy development as stated in the Five-Year Plans.

The analysis of the research project falls in two parts: the first deals with individual programmes and their consequences for different groups of farmers, and the second is an analysis of the milk producers' co-operatives.

Dairy Development Programmes

Dairy development programmes can be grouped in three categories: the first category deals with measures to *increase the production* at the farm level. This is first and foremost sought to be achieved through an increase in the number of cross-bred cows, particularly through artificial insemination of local cows with semen from exotic high-milk-yielding breeds. There are over 100 artificial insemination units in the Milkshed Area, each unit covering three to five villages. Besides, veterinary and extension services are offered.

The second category is concerned with the *marketing* of milk. It is the aim to establish a modern marketing system which will bypass the traditional private middlemen. Through its price and credit policy the government encourages the establishment of village-based milk producers' co-operatives. Besides, the government has built a modern dairy plant with a daily capacity of 150,000 litres in Bangalore city and also chilling centres in the area.

The last category involves *credit* for the purchase of cross-bred milch cows. Loans from commercial and co-operative banks are administered through the co-operatives and are given against security of land. In the spring of 1972 the Small Farmers Development Agency started subsidising loans to small farmers.

During the Second, Third and Fourth Five-Year Plans (1956-73) for the State of Mysore (Karnataka) the resources devoted to cattle and dairy development comprised around six per cent of the total outlays allocated to the agricultural sector. This share is planned to increase to ten per cent during the Fifth Five-Year Plan (1974-79).

In addition, a new project for dairy development in the southern part of Karnataka is planned to be launched. It is estimated to cost some Rs 50 crores over a ten-year period, two-thirds of which will be paid by the World Bank.[3] The main aim of this project is a many-fold increase in the number of crossbred cows, primarily through artificial insemination of local cows. Through the establishment of about 1,700 insemination units in the southern districts of the state — which now has some 315 units — it is the plan within a five-year period to multiply the number of milk-giving animals by five. In the project outline the average milk yield per crossbred cow is estimated to be very high with the result that big increases in the production and supply of milk are expected. It is further the plan that the vastly increased amounts of milk will be entirely marketed through the expanded co-operatives and state-owned dairies which are expected to capture the entire urban markets and that, in fact, a few years hence private milk vendors will have ceased to exist. This, in turn, requires a considerable expansion of existing dairies as well as construction of new ones, and sixty-three per cent of the World Bank budget is therefore set aside for expansion of the dairy capacity. In the new project, the co-operatives are supposed play a much more central role than now, as they are expected to control the distribution of inputs and to undertake extension work. The big state-owned dairies are expected to change over to co-operative ownership.

Bangalore Milkshed Area

Administratively, the Bangalore Milkshed Area is defined as the area in Karnataka state which is within a radius of 40 miles from Bangalore city. This means that it covers almost the entire Bangalore district as well as parts of Kolar and Mandya districts; and official dairy development programmes are found in most of the talukas within the 40 mile limit.

The climatic conditions make the area well suited for dairy development, the climate being quite dry and alternative uses of the land relatively scarce. The altitude is about 900 meters and the temperature is moderate, seldom exceeding 36°C. About one-fifth of the net sown-area is irrigated, primarily from tanks and wells which aften dry out during the winter months. Because of poor irrigation, it is in many places only possible to harvest one crop a year. The land-holding pattern in the area is characterised by many small holdings. In 1955-56 there were some 114,000 land-holdings in Bangalore District. By the recent agricultural census in 1971 the number had more than doubled and is now estimated at 241,000.[4] The number of small holdings has had the largest increase and, according to the 1971 census 71 per cent of all holdings are below 5 acres, and these occupy 35 per cent of the arable land. While the land distribution is less unequal than in the northern parts of the state and many other parts of India, the big and increasing number of small holdings is a serious problem for the developmet of agriculture in the area.

Uses of Livestock and Supply of Milk

In the Bangalore area the buffalo is the traditional milch animal. Bullocks of the indigenous cattle breed are used as draft animals, and local cows are primarily used for the reproduction of bullocks. Besides, the local cows do give some milk, provide scarce manure and they are often used as draft animals as well. The introduction of crossbred cows through the artificial insemination of local cows thus implies a change in the use of livestock and has implications for the supply of draft power.

In the Bangalore and Kolar districts there is a total of more than 1.2 million heads of cattle and 300,000 buffaloes; and a comparison of the livestock census over the last two decades shows the numbers to be fairly constant. It is estimated that in the area one pair of good bullocks is needed for the cultivation of six to eight acres. If this estimate is compared to the actual number of bullocks, and the area under cultivation, there would seem to be a lack of bullocks, which explains why so many farmers also use local cows as draft animals and why the reproduction of draft animals is so important for the farmers. The farmers do not consider the crossbred animals good draft animals.

Traditionally milk was primarily produced close to where it was consumed being difficult to transport unless converted into ghee. This means that the milk supply for the urban areas was by and large produced in the cities proper. In the centre of Bangalore there are still many big "dairies" (cattle herds), often with crossbred animals with high milk yields. Milch animals are also found in the new suburbs.

During the first two five-year plans the primary aim regarding dairy development was to increase the production in the towns or in their immediate vicinity. It was only with the Third Five-Year Plan that the strategy of locating milk production in the rural areas and integrating it with the agricultural sector was introduced.

Table 1 shows that a considerable part of the milk production in the Bangalore area still takes place in the city. About one-fifth of the milk is produced in the city, where most of the production is from crossbred cows. These have a much higher average daily yield than the crossbred cows in the rural areas. Here the milk production is about equally divided among the three types of cows, but because of the great number of local cows, these provide most of the milk despite their low yield.

According to the 1971 population census, there are 4.5 million people in the area, of whom 1.65 million live in the city proper. It is estimated that the total household consumption of milk is about 250,000 litres a day. An additional 25,000 litres are estimated to be consumed in restaurants, giving a total daily consumption of 275,000 litres, which are procured as shown in Table 2.

A substantial proportion of the city's milk consumption is thus procured through private milk-dealers from areas outside the Milkshed area. As there is no indication that milk is exported out of the area, the average daily consumption of milk per capita in the city comes to approximately 0.17 litre. Outside the city the average daily milk consumption per capita is approximately 0.06 litre, giving a total daily consumption of 175,000 litres.

On the basis of the population increase and expected incomes, it is estimated that the demand for milk in the city will rise by 7 per cent a year. According to the recent livestock census, the number of local cows and buffaloes has not been increasing during the last two decades. However, there seems to be substantial increase in the number of crossbred cows in the city as well as in the rural areas, and provided the present tendencies continue, the increase in milk production necessary to meet the rising demand will have to be from crossbred cows. As outlied above, this is in line with the present development policy.

Table 1: Estimate of Total Daily Production in the Bangalore Area 1972

	Number of Animals	Average Daily Yield Per Animal* (litres)	Total Average Daily Milk Production (litres)
In Bangalore City			
Crossbred cows	15,000	5.3	79,500
Local cows	6,500	0.33	2,100
Buffaloes	8,300	0.67	5,600
Total for the city			87,200
In Bangalore Milkshed Area			
crossbred cows	25,000	3.00	75,000
Local cows	369,000	0.33	121,800
Buffaloes	158,500	0.67	106,200
Total for Milkshed Area			303,000
Total for Bangalore Area			390,200

* Allowance made for seasonal variations.

Source: Average yield of crossbred cows are based on data collected for the present survey. The number of crossbred cattle is estimated from official sources, including Livestock Census 1972. The figures for local cattle and buffaloes are from Daroga Singh, *et al*, Monograph on Estimation of Milk Production, Institute for Agricultural Research Statistics, New Delhi (1970).

Results of Survey

As the development strategy emphasises that milk production shall take place in rural areas, the bulk of the data was collected in villages. In the Milkshed Area, two areas were chosen for study in which the livestock development programmes had been in operation for a long time and where the development of dairy husbandry had received special attention. One area is located 25 kilometers south of Bangalore city, and the other about 50 kilometers north of the city. Eight villages in the southern and nine in the northern area were chosen for study.[5]

In each of the villages about 15 per cent of the households (315 households in all) were selected at random, and these were interviewed in detail about their economic position, about the livestock in their possession, and about their milk production, sale and consumption. Later a survey was made of all the households (330) with crossbred animals in the 17 villages.

One of the objectives of the livestock development programmes is, as mentioned, to improve the economy of the small farmers and landless labourers. In order to analyse whether this objective has been — or is likely to be — met, we examined the effects of the programmes on different groups in

Table 2: Average Daily Procurement of Milk for Bangalore City 1972

Produced in the city and delivered through private distributing channels (approx)	87,000
Produced in the Milkshed Area and delivered through Bangalore Dairy	38,000
Produced in the Milkshed Area and delivered through private distributing channels	90,000
Produced outside the Milkshed Area and delivered through private channels	60,000
Total procurement (approx)	275,000

Note: Almost all the milk produced in the city proper as well as that produced outside the Milkshed Area bypasses the state-owned Bangalore Dairy.

the selected villages. The 315 randomly chosen households were consequently divided into socio-economic groups.

Land-holding size and irrigation determine whether the rural households is capable of producing a surplus which is sold in the market, whether it is capable of meeting its consumption and production needs, or whether it is forced to sell its labour to others in order to meet these needs. On the basis of the size of cultivated holding,[6] occupation and income the households were divided in 5 socio-economic groups, as shown in Table 3. (In one big village many households were engaged outside agriculture, primarily as self-employed, well-off weavers, and it was therefore necessary to distinguish between rich non-cultivating and poor — primarily labourer — non-cultivating households.)

Distribution of Livestock

Table 3 shows the distribution of the 315 households among the 5 socio-economic groups as well as the distribution of land, cattle and buffaloes among these groups. It is especially noteworthy that the crossbred cattle is much more unequally distributed among the socio-economic groups than the local cattle — the 17 per cent big farmers owning 37 per cent of the local cattles,[7] 46 per cent of the buffaloes and 63 per cent of the crossbred cattle.

As mentioned, the buffalo is the traditional milch animal. We have included it in the analysis to show that there are actually more farmers who can afford to keep two types of livestock (milch and draft animals) than is apparent just from the distribution of crossbred animals. In this connection it is interesting to note that it is particularly the middle peasants who rely on buffaloes as milch animals. As is shown in Table 3, they own 48 per cent of the buffaloes, but only 24 per cent of the crossbred cattle. The small farmers and landless labourers, however, can afford neither.

In view of the fact that artificial insemination is offered free of charge, one should have thought that many of the smaller peasants would have had their local cows artificially inseminated in order to acquire crossbreds. However, the farmers hesitate to have their cows artificially inseminated. For most, dairy husbandry is of secondary importance, and farmers are first and foremost occupied with the cultivation of their fields and consequently they are concerned with their need for draught power. In this connection the suitability, or non-suitability, of crossbred cattle as draught animals is important. Opinions differ on this question, although there seems to be agreement that the crossbred animals are as strong as the local bullocks, but that they work more slowly and do not stand the heat as well. In any case, the farmers in our samples do not consider the crossbred cattle well suited as draught animals.

Because of this and because of the uncertainty as to whether the progeny will be a female, many farmers therefore do not want to take the risk of having their local cows artificially inseminated, out of fear of getting a male calf. With the local calves they can use the female as well as the male offspring.

The process of acquiring a crossbred animal through artificial insemination furthermore requires a long time-horizon on the part of the farmers. Our data show that it takes four years from the time of the first insemination until the crossbred progeny gives birth to a calf and starts lactating. During these four years the farmers have to spend more money on fodder than they do for local calves.

The hesitation on the part of the farmers to have their local cows artificially inseminated does not mean, however, that the insemination units are not used. Although few local cows are taken to the insemination units, the crossbred cows are almost always artificially inseminated. Our data show that in 80 per cent of the cases the first crossbred in the household is acquired through purchase. However, when the farmers want their crossbred cows to become pregnant, artificial insemination is then used.

A crossbred cow costs between Rs 1,000 and Rs 2,000 and such a purchase is therefore a considerable investment for the farmers. In order to make such investments possible the commercial and co-operative banks grant loans for the purchase of crossbred animals. In our sample, however, only 40 per cent of the purchased crossbred animals were purchased with bank loans. Of these loans 58 per cent had been granted to big farmers, 33 per cent to middle farmers and 9 per cent to small farmers and landless labourers. As there is no adequate insurance scheme for crossbred animals, the banks only lend against the security of land, which means that the big farmers are in a much more favourable position to get loans than the smaller farmers.

Bullock Trade and Artificial Insemination

In the southern part of the state of Karnataka, there is a lively trade in livestock, especially at the time of the big markets in January and April. It is first and foremost bullocks which are traded, and many farmers often sell their pair of bullocks each year at the January market and then buy a new pair, either at the same market or at the April market.

There are several reasons for this lively bullock trade. When the farmer sells one pair of bullocks and then immediatey afterwards buys a new one, he is often motivated by speculation. During the period immediately prior to the sale he will often feed his bullocks especially well and in general make sure that their appearance enables him to receive a high price. At the same time, he hopes to buy a new pair relatively cheaply. Of course, each gain obtained by one farmer through this kind of speculative trading corresponds to a loss suffered by another farmer.

The individual farmer's decision to buy or sell bullocks may also be dependent on his ability to feed the animals and on his need for draught power throughout the year. At the time of the January markets many smaller farmers sell their bullocks, because they do not need the draught power during the following months. Most of the buyers are either traders from other areas — southern Karnataka is a net export area for bullocks — or big local farmers. The latter do not have an immediate demand for draught power either at that time, but their ability to feed the bullocks is much greater, and the January purchase then represents a short-term investment for the big farmers. The smaller farmers who do not possess bullocks, buy bullocks at the April market, or later if they can afford to. The difference between the high prices from April to June and the low prices in December and January thus, in reality constitutes the payment received by the big farmers for feeding the bullocks during the period when they are not much needed.

The frequent replacement of the bullocks may also have non-economic causes. The decision to sell may for instance be related to the peasants' notion that the cattle may develop "bad eyes". These causes were, however, not dealt with during the present survey.

Livestock experts have argued that the lively bullock trade in fact indicates that the individual farmer does not have to use his local cows for the breeding of bullocks. Since he buys his bullocks anyway, he can use his local cows for the breeding of crossbreds without jeopardising his need for draught power.

In the area examined, almost all the farmers are acquainted with crossbred animals, but nevertheless they only very seldom take their local cows to the artificial insemination units. Some of the reasons for the farmers' hesitation to have their local cows artificially inseminated have been indicated above. Furthermore, the relationship between the bullock trade and the breeding of bullocks or crossbreds, respectively, is a complicated one. First, if we look at the demand for bullocks from a regional point of view (and not merely from the individual farmer's point of view) it is obvious that no matter how big the trade among the farmers, it would not affect the total number of bullocks available. It is therefore necessary that the total reproduction of bullocks is continued, or the existing shortage of bullocks for draught power would be worsened.

The farmer however, considers only the individual economic incentives for breeding bullocks or crossbreds. When he replaces his pair of bullocks once a year he must calculate a cash depreciation, corresponding to one year's use value of the bullocks. In order to make up for this, the farmer will now and then have to use his local cow for breeding a male calf. As the periods between calving is long for local cows — especially those belonging to smaller farmers who also use the cows as draught animals — there would hardly be time also to breed crossbred calves. One could, of course, argue that the farmer could just as well breed a crossbred calf which could be sold in order to pay for the depreciation. However, because of the risk involved, the cost of feeding and the time horizon mentioned above, not only the small farmers but also the big ones prefer to use their local cows for the breeding of bullocks. Farmers in our sample who had actually had their local cows artificially inseminated with a view to getting a crossbred cow explained that this was because the cows in question produced a very low quality of local male calves

Yield of Crossbred Cattle and Feeding Pattern

It was shown in Table 3 that most of the crossbred cattle belongs to the big farmers. Besides, the crossbred cows belonging to the big farmers give a higher milk yield per cow than those belonging to the smaller farmers. Two aspects should be noted in this connection. For one thing, it was found that at the time of interview three-fourths of the crossbred cows belonging to the small farmers and landless labourers did not give any milk at all; half of the cows belonging to the middle farmers did not give milk; but of the crossbred cows belonging to the big farmers more than half gave milk.

Secondly, for the cows who were in milk, the average yields varied considerably among the cows belonging to the different socio-economic groups. The data from the survey comprising all the households (330) with crossbred animals show that the average daily milk yield of the crossbred cows belonging to the small farmers was 2.5 litres, of those belonging to the middle farmers 3.2 litres, of those belonging to the rich non-cultivators 4.2 litres and of those belonging to the big farmers 5.4 litres.

The variations in milk yields are no doubt primarily due to differences in the feeding pattern. The traditional livestock fodder is rice and ragi straw. Most of the local cows and buffaloes still get nothing else, except what little they manage to get while grazing. Despite the extension workers' repeated recommendations to grow fodder grass on part of the irrigated land, hardly any of the farmers will set land aside for green fodder crops. Although many of the farmers are acquainted with fodder grasses they prefer to use their valuable irrigated land for rice or easily marketable crops, such as sugarcane or vegetables.

Since the farmers do not use green fodder, the use of concentrates for feeding becomes very important, especially as regards crossbreds. And it is particularly the use of concentrates which varies among the different socio-economic groups. Our data show that concentrates are used much more by bigger farmers than among the other categories of farmers. Since concentrates have to be bought at fairly high prices, this is hardly surprising Many smaller farmers operate at the subsistence level and few have access to any kind of working capital.

The variation in milk yield applies particularly to crossbred cows. Some variation in the yields of local cows and buffaloes is discernible among the animals belonging to the different socio-economic groups and thus subject to different feeding patterns. As the milk yields of local cows and buffaloes are much less responsive to concentrates, the variations are only slight.

Sale of Milk and Marketing Systems

About 40 per cent of all households in the sample produce milk, either from crossbred cows, from local cows or from buffaloes. Two-thirds of the producing households sell some milk. There are, however, some interesting differences in the selling pattern among the socio-economic groups. It was found that the middle farmers as well as the rich non-cultivators keep a greater proportion of the milk produced for home consumption than other groups. For most of the big farmers, their production is so big that even with big sales they can keep up a big home consumption, relatively speaking. The milk producing households among the small farmers and landless labourers, on the other hand, are forced to sell what little they can produce in order to get some cash, and this therefore affects their home consumption of milk.

At a first glance marketing conditions look very simple; the milk reaches the consumers through two separated and well-defined systems. One marketing system is entirely in private hands; here the milk is collected from the producers by private buyers who resell it to retail dealers in Bangalore city. In the southern area, which is close to the city, the buyer often operates a one-man enterprise, and the milk (about 30 to 50 litres) is transported by bicycle to Bangalore city. In more remote areas it is common to find big private enterprises where the buyer has one or more lorries and several employees.

Every two weeks the buyers settle the account with the producers, and all the buyers who were interviewed give short-term loans to the producers. This seems to be a common practice, and the buyers often supply concentrates to the milk producers on credit. One buyer also supplied the milch cattle on credit. The payment takes place through a reduction in the price paid for the milk procurement.

It is this system that the government wants to stop, the reason being that the buyers allegedly use their position as creditors vis-a-vis the milk producers to make big profits. It is further claimed that the buyers often adulterate the milk, for instance, by adding water. When the consumer price in Bangalore was about Rs 1.40 per litre, the pro-

TABLE 3: DISTRIBUTION OF HOUSEHOLDS INTO SOCIO-ECONOMIC GROUPS AND DISTRIBUTION OF LAND CATTLE AND BUFFALOES

	No of Households	Distribution (Per Cent)	Cultivated Area (St acr)	Distribution (Per Cent)	No of Local Cattle	Distribution (Per Cent)	No of Buffaloes	Distribution (Per Cent)	No of Crossbred	Distribution (Per Cent) Cattle	No of Households with Crossbred Cattle	Per Cent of Households with Crossbred Cattle*

ducers were paid Rs 8.80 to 0.90 at the farm gate.

The government's solution is that all the functions of the middlemen — collection, processing and distribution — shall be carried out by an alternative system of milk producers' co-operatives, chilling centres, milk routes and the government-owned dairy which it is now the plan to transfer to co-operatives. For the last decade this new marketing system has been an integral part of the government's development plans for dairy production.

The co-operatives are supposed to be characterised by collaboration and democratic control by the milk producers. Besides promoting social justice; this strategy should improve the quality of the milk sold as well as increase production and supply of milk from the rural districts to the city. In other words, the co-operative marketing system should alleviate all the ills of the private marketing system.

An analysis of the real situation regarding marketing patterns shows very clearly that there is no sharp division between the two marketing systems. On the contrary, the two systems are often closely integrated. Even where this is not the case, the new co-operative system has many of the traits characteristic of the traditional system, especially at the village level.

Whereas the private buyers pick up the milk at the farm gate, in the co-operative marketing system the producers themselves deliver the milk to a collection place in the village, from where it is transported either directly to Bangalore Dairy or to a chilling centre. The transportation usually takes place in dairy-owned vans, but the co-operatives may transport the milk themselves and thus avoid the transportation fee of 5 paise per litre.

About one-third of the households who sell milk, sell it directly to a co-operative. This marketing pattern is especially used by the big farmers. About one quarter of the households sell to private buyers, and the milk reaches the consumers entirely through private channels. The milk from the remaining households (42 per cent) is marketed through a combination of the private and the co-operative marketing system.

INTEGRATED MARKETING SYSTEMS

It was found that the traditional and the co-operative marketing systems were combined and integrated under several different forms. The most common "marketing chain" would be as follows: the producer sells the milk to a private buyer who then sells the milk to a local co-operative, from where it is taken to the Bangalore Dairy. There are, however, several variations which, render necessary a further description of the systems.

The private buyer acting as middleman between the producer and the co-operative is in most cases a big, local farmer who is often also one of the leaders of the co-operative, generally the chairman or the secretary. The majority of the producers, on the other hand, are small or middle farmers who only produce and sell small amounts of milk.

This type of integration is found in four to five of the nine co-operatives investigated. In each of these co-operatives there are a few such persons, each buying small amounts (about 10 litres a day) and most with a substantial milk production of their own. A few persons, who daily buy big amounts of milk either in their own or in neighbouring villages, hire a person to collect the milk on bicycle. It is difficult to get exact data on the profit earned — partly because the milk is often diluted on its way through the "chain"; but a realistic estimate would be a profit of 7 paise per litre, even when transportation costs are allowed for.

The relation between these co-operative leaders, who buy the milk in their own name and resell it to the co-operatives, and the producers is exactly like the relation between the "real" traditional private buyers and the producers, both as regards settling of accounts and the supply of credit and concentrates. The dilution of the milk also takes place under this system, and represents a major problem for Bangalore Dairy. The co-operative leaders often succeed in bribing the persons who weigh and test the milk in the Dairy and at the chilling centres. However, the milk will often be already diluted when it leaves the farmer.

There are several reasons why the co-operatives are allowed to be exploited the way they are and why the small producers often do not join them and thus get the benefit of direct delivery to the Dairy. One major reason is that the small farmer often is in a dependency

relationship to the co-operative leader who provides credit and working capital. Frequently the relationship is one of general economic and social dependence, and even when the small farmers are actully members of the co-operatives, they might nevertheless be forced to deliver the milk to the co-operative *through* the leader.

Secondly, the advantage of delivering directly to the co-operative is often quite small for a small farmer. Several examples were found where not even the producers delivering directly to the co-operatives were paid the price stipulated by Bangalore Dairy, as in some cases the co-operative leader keeps some of the money for himself. There were several instances where the small farmers did not quite know whether they were in fact selling the milk to the co-operative leader as a private person or to the co-operative leader in his capacity as co-operative secretary, i, e, directly to the co-operative. Given the fact that the co-operative leader will often pocket some money for himself in either capacity, the factual transaction pattern is of only minor importance.

In many instances the co-operative leaders are big farmers who were already engaged in buying and selling of milk as a secondary occupation before the setting up of the co-operatives.

Another type of integration between the traditional and the co-operative marketing system was found in three of the co-operatives. Here a private buyer unconnected with the co-operatives would buy milk from the farmers and sell it to the co-operatives at the price stipulated by Bangalore Dairy minus a commission charged by the co-operative leader. The operation of this type of integration between the two marketing systems is dependent upon two factors, one being the price relationship between the price stipulated by Bangalore Dairy and the one prevailing in the open market.

The relationship is also dependent upon the government's marketing policy, according to which direct sale to the Dairy and the chilling centres is only allowed through co-operatives or persons holding special licences. Such selling licences are no longer issued, and only a limited number of persons still hold them. In periods when the official Dairy price for milk is higher than the one prevailing in the open market the private dealers are therefore interested in selling the milk through a co-operative, even if they have to pay a commission to the co-operative leader. This system is especially prevalent in areas which are located so far from Bangalore that the dealers cannot reach the city market on bicycle.

At a chilling centre in a small town about 30 miles north of Bangalore city the buying and selling transactions take place in a manner which very much resembles that of an auction. What is actually being 'auctioned" is the permit to use someone's licence for a period of time, the "buyer" being the private dealer without a licence, and the "seller" a co-operative leader or a licence-holder. Usually the licence-holder gets a commission of 5 paise per litre, although he has no expenses whatsoever, as the milk is brought right to the chilling centre by the private dealer, the commission thus actually amounts to a monopoly rent. Four out of five co-operatives investigated in the northern villages and one in the southern area have at different times been licence- "sellers". Needless to say, in all cases the beneficiary of the commission was the person running the co-operative and not the co-operative as such.

Licensing system like the one operated by the Bangalore Dairy are, of course, used quite frequently in India. It is part of Indian economic policy to introduce licensing systems and similar measures—such as subsidies for the purchase of various kinds of inputs, food-rationing — when it is felt that desirable social and political goals cannot be attained through reliance on the market mechanism. As is the case with the licensing system introduced by Bangalore Dairy, the desired goals are seldom attained through such measures; the market mechanism is let in through the back-door, and the inevitable result is to enrich the persons holding the licence or the subsidy.

During the course of the investigation one more integrated marketing system was identified. Opposite to what has been described above this was a co-operative chain which became grafted upon a private one due to a relative price change in the market. In the first half of 1973 most food prices including milk, were rising very fast. The government-fixed Dairy prices to the producers were also raised, but not as much nor as fast as the prices in the private market. In areas within bicycle distance from Bangalore (including the southern villages surveyed) several producers stopped delivering to the co-operatives and sold to private buyers instead. In more remote areas, where the co-operatives have a stronger position due to lack of competition, there have been two cases where several co-operatives have joined together and contracted with private lorry-owners to have their milk transported to Bangalore where it is sold to private agents.

Apart from the various forms of integration outlined above, the co-operative marketing system has many traits characteristic of the private system. This is especially true as regards the relationship to the producers. The co-operative leaders often lend money to the small producers who have to pay back when the milk is delivered; and several co-operative leaders were accused of the kind of misuse which was supposed to take place in the private system — e g, underpayment, failure to settle accounts, late payment, use of oversized measuring cups, refusal to pay for one day every month (a local custom practical by private buyers).

But the co-operative leaders have an edge over the traditional private buyers. Usually their local political position is much stronger than that of the private buyers, and they have more means at their disposal, not least from the development resources made available to the co-operatives. Each co-operative has the right to receive a certain amount of subsidised concentrates, which is especially valuable at times of rapidly rising prices. During our investigation we found several instances where the subsidised fodder never reached the village but was sold in the open market in the near-by town by the co-operative leaders.

ROLE OF CO-OPERATIVE IN GRANTING CREDIT

The economic power of the co-operative leaders is even further enhanced through the bank loans for the purchase of crossbreds which are administered through the co-operatives. Eight of the nine co-operatives investigated have administered such loans to local farmers. The total amount of loans administered by a co-operative ranges from Rs 20,000 to Rs 230,000. Each loan amounts to Rs 2,000 and is repayable in 36 monthly instalments which are deducted from the loanee's milk deliveries to the co-operative. The yearly interest varies from 9 to 11 per cent.

The normal procedure is for the co-operative to apply to the commercial or co-operative banks for loans. In practice it is the leaders of the co-operatives who decide which peasants are to receive the loans, as the banks as

a rule automatically approve the candidates suggested by the co-operatives.

The loans for the purchase of crossbred animals are very attractive and are, by the way, often used for other purposes. To the co-operatives and their leaders, it is important that the loanees have to deliver milk to the co-operatives. The income of the co-operative leaders is, in fact, dependent, among other things, on how much milk is delivered through the co-operative (either directly or through the leader acting as a "private" buyer). Thus the control of the loans for crossbreds becomes an important element in the competition with the private buyers.

In two of the co-operatives investigated there are, however, several cases where loanees do not deliver milk to the co-operatives. There are even a few examples where a farmer succeeded in obtaining loans from two different co-operatives, whereupon he returned to his traditional private buyer. In most of the villages the local political position of the co-operative leaders is, however, so strong that such carefree shopping around for loans without paying one's dues to the leader, is simply not possible.

The co-operative leaders also derive some direct income from the administration of loans for crossbreds. In several co-operatives the leaders secure several loans for themselves and then in turn lend the money to others on less favourable terms. One co-operative leader had secured about twenty loans in his own and other people's names for himself. The crossbred cows he purchased were then themselves given as loans to small producers on quite a different real rate of interest. Two co-operative leaders simply charged a commission for themselves on all the crossbred loans administered by the co-operative.

The investigation includes a case study of 18 bank loans channelled through one of the co-operatives. All 18 loans included a subsidy of Rs 500 for small farmers, although only 10 of the loanees met the conditions for being classified as small farmers.[8] When the loans had been approved by the bank they were paid to the co-operative leaders who went to Nilgiris to purchase the animals.[9] Seven of the actual loanees participated in the trip but did not participate in the negotiations and the leaders saw to it that they were not even present when their own animals were bought.

When the deals had been concluded the two leaders of the co-operative had managed to pocket for themselves an average of Rs 400 on each animal. Various methods were used, such as charging the loanee with a price higher than the actual cost of the animal, or charging for non-existent expenses. The actual buyers of the crossbred animals were never informed of the details of the purchase. When the animals were brought to the village they were given to the farmers along with concentrates for which they were charged inflated prices.

Every two weeks accounts were settled between the loanees and the co-operatives, for the milk delivered. Instalments for the loan as well as payment for the overpriced concentrates were deducted from the price of the delivered milk. The farmers, however, had no way of figuring out how the amount they received was actually calculated. Several of the small and middle farmers were quite aware that irregularities were taking place, but because of the political and economic power of the co-operative leaders they considered it futile to protest or to take any action.

Co-operatives and Village Politics

In view of the fact that the leadership of the co-operatives may give considerable advantages, it is not surprising that there is often fierce competition for the leadership among different local groups. As mentioned, the leadership may be economically renumerative, and it also often increases the political power of the individual persons. If, for instance, the co-operative leader arranges a loan — maybe even a subsidy to a farmer who is not really qualified — a dependency relationship develops where the loanee may be obligated, e g, to give favourable witness in a law suit or support him in the village panchayat.

In all the co-operatives studied there had been some conflicts regarding the leadership, and some of these were still unresolved. The conflicts were not between different castes or classes but were more in the nature of factional conflicts. Outside support from administrators or politicians was often decisive for the outcome of the conflict.

The co-operative leaders are always big and influential farmers, but in two of the villages the leaders had become "big people" through their control of the co-operative. In two villages there were bitter conflicts between these upstarts and the traditional village leaders who are still the biggest land-owners. The co-operative leaders have managed to make good use of the various development funds.

In two of the villages the conflict has had the result that two different milk producers' co-operatives were established in each village, and in one of the villages the conflict was being fought in the courts.

Summary and Discussion

The increase in milk production in the Bangalore Milkshed Area has taken place during a period of general economic growth in the area. This growth, with the concomitant rise in the income of the middle classes has, among other things, resulted in an increased demand for milk, especially in the urban areas. It is difficult to hypothesise to what extent the increased milk production is due to the general economic expansion and to what extent it is a direct result of the government's dairy development programmes.

The investigation does indicate, however, that the development programmes have resulted in increased milk production in the villages where there has been a concentration of the various development schemes. In these villages the big farmers at least have a much bigger production than in other villages. The data also show that the introduction of crossbred cows has resulted in increased milk production.

However, with regard to the development objective concerning the strengthening of the economy of the small farmers and agricultural labourers specifically, the investigation clearly shows that it is almost exclusively the big farmers who have benefited from the livestock development strategy. Only very few of the middle peasants and hardly any among the poorest groups have acquired crossbred animals.

The middle and small peasants, who have very little money for investment, find it difficult to acquire crossbred animals, and the few who do possess them are unable to exploit their production potential. Only few peasants among these groups have been granted loans for the purchase of crossbreds, and the data indicate that when they receive loans, the terms are less than favourable. The middle and small peasants are furthermore reluctant to have their local cows artificially inseminated. This reluctance is also found among the big peasants, but these have the possibility of purchasing crossbred animals, if they want to possess them. The negative attitude against artificial insemination is primarily due to the demand for draught power and, especially for the small farmers, to the long, and from a feeding point of view expansive, period before the offspring starts lactating.

The introduction of a co-operative marketing system has not made the small producers less dependent on the local middlemen and village leaders. The supposedly democratic co-operative structure was introduced from above. Because of the social structure in the villages, however, the co-operatives came to serve the interests of the big farmers. In some instances the co-operatives have even become important organisations for the latter, because of the development funds at the disposal of the societies and the income possibilities they provide.

From the above one might draw the conclusion that small peasants do not stand much of a chance in modern dairy development. However, the results of the investigation do not necessarily warrant such a conclusion, whereas the analysis does indicate that the existing dairy development policy — with its specific choice of technique (crossbreds) and organisation (general co-operatives) — is not capable of benefiting the small peasants, given the existing social and political situation at the local level.

On this basis it is relevant to raise the question whether a different dairy development policy might fulfil the Social Justice goal. In other words, would an alternative policy based on a different choice of technique and on a different organisational framework be capable of including the small peasants in modern dairy development — without jeopardising the production growth objective?

From the result of the investigation it is not possible to put forward any definite alternative dairy development policy. However, the investigation does throw light on some of the most important obstacles facing the small peasants, and it is thus possible to outline *possible* elements of an alternative policy.

As is well known, there has for several years been discussion regarding the ideal choices of technology for agricultural development in India. This discussion has included the technology to be adopted for dairy development, and here the question has been whether to choose the buffalo or the crossbred cow as *the* milch animal. The particular needs and constraints of the smaller peasants have never been taken seriously into consideration in this discussion, which is unfortunate as the choice of technology makes a big difference to the smaller peasants in particular. There is ample evidence to show that for the smaller peasants the crossbred cow is economically too unmanageable, as the cost of acquisition as well as feeding is far too high. The buffalo requires much less financially, as the initial outlay as well as the cost of maintenance is much smaller. As shown above, the data collected during the study indicate that the middle peasants figure prominently as buffalo dairy farmers. However, hardly any of the smallest peasants and landless labourers can afford to keep anything but local cattle, if even that.

The production potential of the local buffaloes can be improved through artificial insemination with semen from Indian buffaloes with high milk yield. It is true that the production potential of crossbred buffaloes is smaller than that of crossbred cows. On the other hand, the peasants who can only afford to feed their animals with traditional fodder, are in a much better position to exploit the production potential of crossbred buffaloes of crossbred cows. Besides, the peasants would not hesitate to have their buffalo artificially inseminated as they would not lose draught power — it being a traditional milch animal. Besides, the peasants are familiar with buffalo management. These are some of the arguments for exchanging the semi-foreign crossbred cow for the native buffalo as the future milch animal.

In several other Indian states, e g, in Gujarat, milk production is based on the buffalo. Research data from those areas[10] indicate that the smaller peasants have been better able to participate in dairy development than is the case in Karnataka state.

The results of the investigation regarding marketing and credit show that the organisation of the dairy development programmes is such that the smaller peasants are not given many chances to participate. It is necessary to initiate programmes which exclusively cater to these groups. It is true that one programme is supposed to do exactly this, *viz.* the SFDA loan-subsidies. One of the weaknesses of the SFDA programme, however, is that it is administered through the existing co-operatives which, as pointed out above, are dominated by the big farmers.[11] From the experience gained so far, an alternative policy would be to allow for the establishment of parallel co-operatives which are not open to the big farmers. Whether or not the big farmers could be prevented from influencing such parallel co-operatives. remains an open question, however.

In the Five-Year Plans and in all official declarations it is repeatedly mentioned that the livestock development policy in Karnataka state has two equally important objectives, *viz,* higher production and social justice. However, an analysis of the actual programmes and their implementation leaves no doubt that the decision-makers in actual fact are only interested in the first objective: the aim is to increase production so that there is enough supply to meet the increasing demand for milk from the urban middle classes. Neither the Fifth Five-Year Plan (1974-79) for Karnataka state nor the World Bank Project referred to above contain programmes which give priority to the social justice objective.

Regarding the *production objective* there are strong reasons to expect that the World Bank project will not be able to reach its very ambitious targets. The project calculates on a degree of interest, hitherto unknown, on the part of the farmers to have their local cows artificially inseminated and on average milk yields from crossbred cows which are twice as high as those measured during the present investigation. It therefore seems safe to predict that the projected expansion of dairy capacity — amounting to about two-thirds of the World Bank project funds — will be a misallocation of resources.

The research findings show that, apart from the rather ineffective SFDA programme the *social justice* objective remains an exercise to be referred to only in the plan documents and in official declarations. The groups with an actual stake in the practical consequences of the social justice objective have no political influences *vis-a-vis* the two groups benefiting from the present policy of giving priority to production, *viz,* the urban middle classes and the big farmers.

As mentioned, the present development plans do not contain any significant changes in the dairy development policy. The World Bank project will employ the same technique as has hitherto been used, *albeit* on a much larger scale; and the present co-operative structure will be expanded. For the smaller peasants there thus does not seem to be any chance of an increased participation in modern dairy development in the foreseeable future.

There now seems to be general agreement that India's agricultural development policy during the past decade has led to an increased social polarisation in the rural areas. This paper shows that there are good reasons to believe that the present dairy development policies will contribute to further polarisation. The fact that the social justice objective is not implemented does not necessarily mean that the production objective is automatically met. A policy catering almost exclusively to

the relatively few big farmers does not sufficiently exploit the available resources and will in the long run have negative effects on the increase in production.

Notes

[This paper is based on a research project carried out by the Institute for Development Research, Copenhagen, Denmark, by the authors. The field work was carried out in two periods between October 1971 and December 1973.]

1 Fourth Five-Year Plan, 1969-74, Government of India, esp p 190, and Fourth Five-Year Plan 1969-74, Government of Karnataka esp p 170.

2 For a discussion of the social effects of the so-called "Green Revolution see T J Byres, "The Dialectic of India's Green Revolution", *South Asian Review*, Vol 5, No 2, January 1972, pp 99-116; and Keith Griffin, "The Green Revolution: An Economic Analysis", UN. Research Institute for Social Development, Geneva 1972.

3 "Integrated Dairy Development Project, Karnataka State, Project Outline ", Government of Karnataka, September 1973.

4 Statement Showing the Numbers and Area of Holdings in Karnataka State, State Agricultural Census Commissioner, Bangalore 1973. As is always the case with diachronical analysis in India, there is the question of definition. It is unclear to which extent this will influence the comparison between land-holdings between 1956 and 1971.

5 In both areas a cluster sampling technique was used, and inside each cluster villages were chosen with varying degrees of programme input. (For a detailed description of the selection procedure see IDR paper A 73.8. Report on Livestock (Dairy) Development in the Bangalore Milkshed Area — Socio-Economic Aspects.) Most of the data from the two samples were collected from March to May, 1972. The collection of data from all the households with crossbred cows lasted for a longer period during 1973. In order to allow for seasonal variations (flush and lean seasons), data on production and sale were collected four times during the year.

6 A standardised measure for land was calculated as follows: 1 dry acre equals 1 standard acre; 1 wet acre equals 3.5 standard acres. For details regarding the classification of households, the reader is referred to in the note above.

7 A comparison between column 2 and 3 shows that relative to the size of land cultivated, the smaller households are better covered with regard to draught animals than the big farmers.

8 This subsidy is given by the Small Farmers' Development Agency (SFDA) which operates in three districts in Karnataka State, including Bangalore district. In three of the co-operatives investigated. SFDA subsidies have been given to small farmers for the purchase of crossbred animals. The SFDA defines small farmers as independent small holders with 2½-5 acres dry land (or 1-2½ acres irrigated land).

9 About 5,000 to 6,000 crossbred animals are exported annually from Nilgiris which is situated in the mountains, about 350 kilometers south of Bangalore.

10 Vyas, V S, Tyagi, D S and Misra, V N: Significance of the New Strategy of Agricultural Development for Small Farmers", 1969; and also "Report on Economics of Dairy farming in Mehasana District of Gujarat State", 1971.

11 Besides, the SFDA does not provide subsidy for fodder which is essential for exploiting the production potential of crossbred cows. A similar point was recently made in a study of SFDA in Surat District, see Desai, Mahendra D, "Small Farmers' Development Agency; Experience in Surat District", *Economic and Political Weekly*, Vol IX, No 31, August 3, 1974.

Doing a lot for those who have very little—

CENTRAL BANK

Central Bank has helped the small farmer to overcome his many limitations. Helped him to rotate crops with each season for maximum utilisation of the smallest plot. Helped him to increase and improve agricultural production with loans for sinking and energising wells, for installing pumpsets, for agricultural inputs like seeds, fertilisers, pesticides, etc.

Over 1,75,000 farmers have something to thank Central Bank for financial assistance to the tune of Rs. 73 CRORES.

Do you need help? Come to Central Bank.

Central Bank of India

The Bank that moves out to people and places.

NEW DELHI

Creeping Shadow of Elections

B M

HOW sharply the options before the government have narrowed is highlighted by its desperate position on the question of the payment of dearness allowance to its three million employees. As per the Pay Commission formula, the government is obliged to grant five DA slabs to its employees, each costing the exchequer upward of Rs 50 crores. The government has been procrastinating over this while discontent among the employees has mounted. Pressed by the Opposition parties in Parliament to clarify the government's position, the Finance Minister pleaded that a fresh review of the government's finances was under way and that a decision woud be taken in the light of the results of the review. The excuse did not impress any one. The state of the government's finances is already clear enough: the budgetary deficit is soaring and the government simply does not have the resources to pay its employees the additional DA which is rightfully theirs. No amount of reviewing will improve the government's financial position.

The Finance Minister's statement was, therefore, rightly taken as a clear indication that the government proposes to withhold payment of the DA, at least for the duration of the current financial year. This has understandably given rise to a wave of protest among government employees and a situation of confrontation, on a scale much bigger than even what was witnessed at the time of the railwaymen's strike last May, is developing. The question for the government to consider is whether it can afford such a confrontation and whether it is ready to use the coercive powers of the State to suppress the government employees in the same manner as it did the railway workers.

The developing confrontation with its own employees is clearly a part of the wider context in which the government will have to operate in the coming months. Its present desperate situation is the outcome of a long process of deterioration in its management of the economy. Much before reaching the present stage of near-bankruptcy, the government had been obliged to undertake the so-called economy drive. As a result, there has been a slowing down of development activity in the public sector all along the line, and in the social services in particular. Efforts to raise additional resources have failed to retrieve the government's finances. The desperate moves to secure more and more foreign aid, a good part of it not for development but to finance current consumption and to support the revenue budget, too have not been enough. The so-called anti-inflationary measures launched last July, which consisted almost entirely of a partial wage and salary freeze, too have not achieved the results expected of them.

An economic situation such as the present one is bound to assume political dimensions. The growing discontent in the country has begun to express itself in many forms of protest, organised and unorganised. The furore over various scandals in which political personalities are involved is but a part of the general scenerio of the crisis of the present political leadership.

A snap general elections early next year has become the subject of great controversy. From all indications no decision has yet been taken by the government. But the idea is being seriously considered, which shows that the government itself has reached a point where it thinks that a way out of the present situation can be found only through desperate political means. The argument is that the economic as well as political situation is bound to worsen in the coming year with the confrontation between the government and the people becoming more sharp and intense. This situation, so the argument goes, could be headed off by a mid-term poll to secure the legitimacy of the regime for another full five-year period. Seen in this light, a mid-term poll would appear to be a highly undemocratic and illegitimate use of the electoral process. Given its desperate situation and its objectives in calling the elections, it is hardly to be expected that the ruling party will be particularly concerned about the fairness of the elections; it will certainly not be averse to using all available means to somehow secure a majority in the Lok Sabha.

Whether or not it is finally decided to hold a mid-term election, the prospect of an election has already begun to condition the behaviour of ministers and the administration. The attempt is to tailor everything to electioneering purposes. The Agriculture Minister has bravely announced that the food crisis is a thing of the past and that everytning will be fine with a good rabi crop next year. What exactly is the basis of this optimism is, of course, not made clear. But on an election platform this would certainly be a good talking point. Nobody seems to bother about next year's annual plan, for instance, or about framing a budget which would pull the government out of the financial crisis. The Industry and Civil Supplies Minister is promising everything to everybody, without caring to initiate any action to fulfill any one of his promises. It will not surprise anyone if even the government employees are after all given a part of the DA in cash with the promise that the rest will be paid in instalments in the next financial year. Faced with elections, the government is known to become very liberal with certain types of expenditure and large promises for the future. The UP elections this year were a good indication of the extent to which the government can go.

In a situation like this, it is futile to try to find any sense of direction or purpose in anything that the government might do or say. The contemplated reorganisation of the Planning Commission is illustrative of this state of affairs. The Planning Minsiter and the Deputy Chairman of the Planning Commission, D P Dhar, has been told that he is to be shifted to Moscow. Finding it embarrassing to have to continue in Yojana Bhavan with nothing worthwhile to do, Dhar is known to have approached the Prime Minister with the request to relieve him and let his successor take charge so that the usual discussions with the state governments on the annual plan for the next year could be completed in time. However, he was airly asked why he could not continue for just another couple of months to finish these talks. His successor-designate for the post of Deputy Chairman also does not appear to be

very keen to take over his onerous responsibilities in the present uncertain times. Whether or not the changes in Yojana Bhavan are finally made in the next few days or weeks, the utter casualness with which the work of planning is regarded cannot escape notice. This attitude applies to the conduct of the business of government on a very wide front.

MAHARASHTRA

Breast-Beating by CITU

THE Maharashtra State Committee of the CPI (M)-led Centre of Indian Trade Unions (CITU) held its second three-day conference in Bombay from December 20, after a gap of four years. The first conference, which had marked the formation of the CITU's Maharashtra State Committee, was held in November 1970. The State Committee had decided to hold its second conference in 1972 and had even fixed the dates. However, the conference was never held — according to the explanation contained in the General Secretary's report to this month's conference, because of the acute drought conditions in the state then. Among the reasons mentioned for not holding the conference subsequently is the nation-wide railway strike and the 'unbridled repression" and mass arrests of railway workers. It is not very clear how any of these factors justified the CITU's Maharashtra State Committee going into hibernation.

This month's conference was attended by 380 delegates from all over the state and was inaugurated by B T Ranadive, president of CITU. Godavari Purulekar, general secretary of All-India Kisan Sabha, and P Ramamurti, member of the CPI (M)'s politburo, were also present. Sixty delegates from "fraternal unions" — mostly from the Socialist Party-led Hind Mazdoor Panchayat, following the formation of the joint front between the CPI (M) and the Socialist Party in the trade union area also attended the conference.

Ranadive, in a long speech, reviewed the economic crisis facing the country and the struggles launched by the working class in the last two years, including the railway strike. He disclosed that the CITU's all-India membership had crossed the one-million mark despite the fact that "more than 200 [CITU] unions in West Bengal are unable to function due to terror and their offices continue to be occupied by Congress goondas." Ranadive called upon CITU cadres to make efforts to draw in professionals like doctors and lawyers as well as middle and lower income white-collar groups who, like workers, also bear the burden of the inflation and the wage freeze and other measures taken by the government. Ranadive also spoke at length about the anti-wage freeze struggle to be launched by the CITU in the near future. What, one wonders, has it been wanting for so long?

Apart from the speeches of other CPI (M) and CITU leaders and the resolutions adopted condemning the wage freeze and unequivocally supporting Jaya Prakash Narayan's movement in Bihar, the conference was notable for the 116-page report of the general secretary. The most significant aspect of the report is its frank admission of the CITU's "insignificant" strength in the trade union movement in Bombay city and in the rest of the state. It is frankly conceded that despite the CITU's work in the four years, in pursuance of its political line of "unity and struggle", and its "image" as a disciplined and revolutionary organisation, it has failed to improve its organisational strength. Except for the newspaper and woollen textile industries CITU has no "decisive strength" in any of the major industries. Among workers of Bombay's port, municipal and state transport, the two airlines, etc, the CITU does not have even a toe-hold. In the railways, the CITU's influence is limited to only the Bombay division. With one or two exceptions, CITU unions are restricted to small engineering concerns. The general secretary has pointed to the 'danger of the large section of working class slipping into the hands of the revisionists", meaning, of course, the CPI-led AITUC.

The general secretary said that lack of cadres and the CPI(M)'s failure to attract new recruits to the party have proved major "impediments" to the growth of the CITU and its unions in Bombay city and the rest of Maharashtra. Thus the CITU has no workers to start unions in the emerging and growing industrial cities of Poona, Nasik, Sholapur, etc.

The general secretary has drawn attention to the growth of the Shiv Sena-led Bharatiya Kamgar Sena in Bombay city and the threat posed by it to CITU-led unions. Using terrorist methods and victimisation, the Shiv Sena had already spread its influence among workers. The report calls upon the CPI(M) leadership to give thought to the creation of a militant protection force of workers" to combat the "terrorial methods" used by the Shiv Sena and its trade unions.

The CPI(M) and CITU, the report admits, have also allowed the impression to spread among workers that they have not been able to fit into day-to-day trade union work the politicisation of workers through running of political study circles and raising young communist cadres from among the workers. The CPI(M) workers and activists, the report says, should make efforts to remove this erroneous impression and take steps to create political awareness and class consciousness among workers so that their support would be available for the party's future struggles. The report is also critical of the working of some of the CITU's unions. These unions have stopped functioning on democratic lines. Their managing Committees "exist only in name" and their general bodies hold meetings only once in three or four years.

The report contains two other significant points. It admits that CITU has committed a serious mistake in allowing the Jan Sangh-led Bharatiya Mazdoor Sangh into the action committee of the central trade union organisations and emphasises the need to counter the spreading influence of "reactionary forces" like the Jan Sangh among workers and to prevent them from "hiding" their true class character by entering into the Left trade union movement. Second, the report emphasises the need to organise agricultural workers, particularly the adivasis, by drafting CITU and CPI(M) cadres to work in the villages.

What is conspicuous by its absence from the secretary's report is what the CITU and the CPI(M) propose to do to overcome the many weaknesses in the organisation and working of the CITU and to extend its influence, whether among the professional and white-collar groups in the urban areas or among the landless workers in the rural areas.

This was perhaps understandable, because that would have involved a frank examination of the extent to which the CPI(M)'s weaknesses and failings in the trade union field have to do with its geneal political line and programme. However, till such an examination is undertaken, reports ports such as that referred to above such as that referred to above will remain exercises in breast-beating.

NORTH

Good Collaborators!

VEHEMENT denials by Punjab's Chief Minister Zail Singh and PPCC chief N S Talib of the existence of factions in the state Congress have merely confirmed suspicions about their existence. Declarations about the smooth functioning of the party machine and the claim that the recent reports to the contrary are just malicious talk have merely underlined the dismal state of things in the ruling party. With the hiatus between the party and the people constantly widening because of the poor performance of the Zail Singh ministry over the past three years, a campaign has begun to dislodge men in key offices — especially the Chief Minister and the party president.

Zail Singh seems to be on the defensive. At two well-attended functions this month, he publicly acknowledged that some people were evidently displeased with him; he was even willing to apologise to those whom he might have unwittingly offended. But the persistent reports of the party being faction-ridden, he said, could only be rooted in "personal grouses and differences of opinion in the party"; whenever the organisation faced a crisis, Congressmen always stood together and surmounted the difficulties. This was the time, he said, to unitedly face the growing challenge of "communalists and reactionary forces". Lately, party chief Talib too has been reacting bitterly to the disgruntled Congressmen's campaign. He declared: "I cannot be removed by giving misleading headlines in the newspapers .... Only death or my party can remove me from this post .... The party is working in complete unison."

Such brave postures have not convinced anyone, however. To stem the rot of internal bickerings, the Congress leaders convened a Narora-type camp at Nangal from December 20 to 22. A new political strategy was laid out to garner mass support and to make the party more acceptable to the electorate. To counter Jayaprakash Narayan's drive, the Punjab Congress leaders — following in the footsteps of the central bosses — intend to win over and mobilise student power by establishing a special cadre of youth. The previous Congress camp, held at Nangal many months ago had yielded little; this one too is unlikely to make the Congress more popular.

It is interesting, however, that while in their political manoeuvrings the Akalis and other opposition parties leave no stone unturned to embarrass the Congress, a tacit understanding nevertheless emerges between them all whenever the interests of the landed classes seem threatened. Landlords dominate both the Congress as well as the Akali party. Indeed, this is a major factor impeding the implementation of the agrarian reforms about which tall claims have been frequently made. Moreover, members of both parties and some other legislators are themselves wholesale foodgrain traders or are closely associated with the activities of traders. When, last February, the Punjab and Haryana High Court struck down some vital clauses of the Land Reforms Act, making its implementation virtually impossible, the majority of both Congress and Akali MLAs were clearly pleased. The court ruling came as a windfall to them.

Clandestine collaboration too has been evident for thwarting the state government's official attempts to unearth hidden food-stocks and to compel the big landlords to sell their stocks at the stipulated price. In fact, the government machinery had to eat humble pie on this issue, the net outcome of its effort to unearth hoarded foodgrains being negligible. Nor were the ceilings on grain stocks with private parties enforced. There was collusion at all levels. Some court injunctions also came in handy and virtually nullified the land reforms as well as the foodgrain recovery campaigns. The number of big landlords in Punjab is estimated at 245, among them Ministers who in effect play a double role. Reports have it that every Minister in the Zail Singh team is a big landlord owning farm land much beyond the ceiling. Some of the farms are effectively 500 acres, the law notwithstanding.

Broadly the same story has been repeated in Haryana, the land reforms yielding very little benefit to the landless. Just two per cent of Haryana landlords have holdings each of more than 50 acres. Some four per cent of the holdings are in the 30 to 49.9-acre group. About 43,000 people own more than 25 acres. Holdings in the 5 to 9.9-acre category, on the other hand, account for 46 per cent of all holdings. Finally, since the High Court struck down the concept of the 'family' in the Land Reforms Act, implementation of the Ceilings Act has, of course, been at a standstill. As in Punjab, the bigger holdings were split up on paper to evade the ceiling as well as any strict operation of the Hindu Succession Act. The state government will now go through the motions of introducing in the Assembly's budget session (commencing on January 1) a bill to amend the Land Ceilings Act — introducing a new definition of the 'family' so as to meet the legal hurdle. Although the 34th Amendment to the Constitution protects land ceiling laws by including them in the Ninth Schedule, the state government wishes to make things doubly sure "to make a reality of land reforms". According to official sources, it would be necessary for landowners to submit fresh declarations of their holdings. As if it were all a matter of definitions and submission of declarations.

KARNATAKA

Limits of Student Mobilisation

Bharat Jhunjhunwala

IT started with a study group of students initiated by a post-graduate student of Karnataka University at Dharwar. The 10 members of the group got enthused over a 50-day strike at a nearby paper mill. They came in contact with the Students' Federation of India and inaugurated their unit with a conference on the decadence of the education system. This first conference was attended by about 500 students and some 200 expressed agreement with the SFI analysis. Through personal contacts they established nuclei in the four local colleges and in the University. Further encouraged at state and all-India SFI conferences in 1974, they started their activities in earnest.

In early 1974 in a private high school, a teacher dared question the arbitrary actions of the head clerk who used to issue memos to teachers and even slap them occasionally. The head clerk had this particular teacher beaten by goondas upon which the teacher sought the help of the SFI. The SFI submitted a memorandum to DIG of Police, demanding arrest of the head clerk and threatening a 'dharna'. The head clerk was thereupon transferred before the deadline set by the SFI.

The person who controlled this high school was also chairman of the Kittel College. After having collected the student union fees from the students in August, the college management had notified that there would be no elections to the union this year and that the office-bearers would be nominated by the principal. This was done because (i) the students had supported the SFI demand for the transfer of the high school head clerk and (ii) the progressive teacher, who was the head of the staff association, was supported by the students. While the SFI activists were discussing the problem in the college premises, there was a spontaneous lightning strike. The students boycotted classes and the scheduled inauguration of the nominated union was not held the next day. The college chairman then conceded the students' demand and an SFI sympathiser was elected president of the union.

The Vice-Chancellor of the Karnatak University had reduced the number of post-graduate students to be admitted by about 50 per cent because she felt that too many students had been admitted the previous year because of the vested interest of the previous Vice-Chancellor. Again the SFI submitted a memorandum and had the decision reversed. These activities got the SFI some support. In the University Gymkhana elections for 56 representatives, six were won by the SFI. Then the SFI decided to contest the post of General Secretary. The management candidate was the son of the Dean. On the day of the elections, he was able to frighten 20 of the representatives with stories that two of the contestants were planning to kidnap them and take them to his home and lock them up. He polled 21 votes against the SFI's 13. Thereafter the kidnapped students were allegedly offered fee concessions, scholarships, etc, and they kept quiet.

Some other attempts were also made to educate and mobilise students on the issues of employment and right to work, corruption in employment exchanges and room rent in hostels, but with negligible impact so far.

The Life Insurance Corporation held interviews for jobs and on their basis a waiting list of 153 was announced. Of these 100 were absorbed and then the remaining 53 were "informed" that the waiting list stood cancelled. The SFI hesitantly gave a call for dharna. Immediately, the Divisional Manager of the LIC individually called more than half of the 53 candidates and requested them not to participate in the dharna and assured them that he would give them jobs. Actually only 12 out of 53 sat in the dharna with some 20 SFI activists for three days. The other students were also passive.

Some of the student activists participate in trade union processions and dharnas and Ryot Sangha protests. The students look upon questions like the price of kerosene or hoarding as not being 'their' demands. In all attempts to forge an alliance with other sections, the experience has been extremely disappointing. The students are just not interested.

The SFI activists point out that the class background of college students is basically upper middle class, for, after all, it takes about Rs 200 a month to maintain a student. As a mass, they may support democratic demands such as those against the price rise, unemployment and corruption in employment exchanges. But it is difficult to either organise them or to involve them in the demands of the poor sections as a mass. It may be possible to briefly mobilise the student masses on an emotional demand like cancellation of elections, but it is not possible to get them to support the trade unions in their wage struggles or agricultural labourers on the slogan of "land to the tiller". However, it may be possible to use the mass mobilisation on democratic demands as an arena from which to recruit more serious individuals to work with the poor. This, it appears, ought to be a major objective of mass student mobilisation.

BIHAR

Six Blind Men

Sudhir Sonalkar

NINE months after the beginning of the agitation in Bihar, no one, neither Marxist analysts nor supporters of the 'movement', are clear as to what it is all about. The contradictory views run somewhat as folows.

It is a mass movement: look at the massive support that JP is able to mobilise. This is countered by the CPI and Congress: "it is a fascist movement" and fingers are pointed at Anand Margi and Jan Sangh participation.

Then there is either the CPI-type attempt to satirise 'total revolution' and sit on one's backside or a genuinely frustrated but naive 'if only' attitude towards JP's failures.

The CPI is losing the chance of a life-time, some maintain. This sort of statements, however, shows the close link between opportunism and lack of analysis. After all, is the CPI a progressive party of any shade any longer?

The movement is leading to the domination of reactionary forces. This is from the CPI(M). A party that has been virtually paralysed in its functioning in West Bengal by the state machinery and Congress terror, does the CPI(M) still see the Government of Siddartha Shankar Ray's party in Bihar as part-progressive?

Then there is the attempt to assert *ad nauseum* that caste is the main problem before Indian society and that this, is after all, is still the main obstacle before the 'successful' completion of the Bihar movement.

Before some attempt is made to draw the minimum of lessons from the events in Bihar, a few things have to be made clear.

Apart from the dissolution of the Assembly, JP has not given any programme to the people. And in fact the greatest danger lies now in the twist he seeks to give to the 'movement' in leading it willy-nilly towards new elections, a process that, in the present framework, has lost much of its credibility among those few that tried to vote consciously.

A non-programmatic movement can only be the movement of a class like the petty bourgeoisie, which has a sort of in-between social existence, and which in semi-feudal conditions does not experience even a recognisable transformation towards economic proletarianisation. There is a certain strength in such a movement, negatively, as long as it retains its non-programmatic character, in that it does not offer tangible confusions, or clear lines of class collaboration to the people as the rationale for pseudo-revolution.

The talk of a 'fascist movement' must also be quickly brushed aside. In a country that still retains pre-capitalist relations, fascism is a meaningless word. If white terror is what is meant, it always comes in answer to a revolutionary movement. If the general reactionary terror of semi-feudal, semi-colonial conditions in a state of crisis is meant, then, this terror comes from the State and nowhere else. The various terms are therefore more applicable to the Congress than to anyone else — count the dead, the injured, the arrested and the number of the CRP-type forces present all over Bihar.

What a movement without direction can do, if it diverts the people towards participation in our pseudo-parliament, is that the lumpenisation of the petty bourgeoise youth that proceeds apace in such conditions is made utilisable by reactionary forces in future as the social base of their terror. As for the Anand Margi fantasy, well, one-and-three-quarter Anand Margis do not constitute a menace to anyone except the wonder-weavers of Azad Bhavan. The Jan Sangh's hold over the movement, too, is not political but organisational by default. The Chatra Sangharsha Samiti runs because of Akhil Bharatiya Vidyarthi Parishad youth primarily. Many of them do not know what they are doing, and represent petty bourgeoise youth in rebellion more than anything else.

Looking for what JP does not do helps JP rather than anyone else, since it means taking him more seriously than is his due. As for the problem of caste, of course, it does operate. But it is only the illusion, created by some, of the extent of the movement that makes it even possible to think that the movement of its own accord can overcome caste prejudice.

All the same the ideology of semi-feudal, semi-colonial rule has been definitely loosened in Bihar today. People do think, they do talk politics. A sort of cultural awakening can be seen to have taken place. In this sense, its anti-authoritarian content is stronger than in Gandhi's movement, since it hits out at local authority. If the effect of the latter lasted for a while, the effect of the present movement will remain in Bihar for quite some time to come. And culture can sustain when other things do not happen. In quite another sort of context, one can see this in Telengana, where the region's revolutionary culture carried on the flame when struggles had temporarily died down.

A couple of incidents quite separate from the movement need to be taken seriously. In one region of Bihar, an adivasi organisation is running a parallel government these last few months. It is not, of course, fully political in a revolutionary sense, but has not the general anti-authoritarian atmosphere in Bihar something to do with its occurrence at this stage? Or an even more recent incident: some peasants in Motihari rescued some of their political leaders from the police after they were arrested and were being taken away in a van.

Unlike in West Bengal, the petty bourgeoisie in Bihar has acted purely for itself. In West Bengal, its attempt to dominate working class politics has led to a paralysis in the face of the terror let loose by the State. The petty bourgeoisie in Bihar dares to act. In Bengal it is biting its nails in frustration. In this sense, an anti-corruption struggle is not an altogether meaningless one.

Bihar, for all practical purposes, has no bourgeoisie of its own. Even its bureaucracy has been aptly described by some as a 'kleptocracy'. The anti-parliamentary feeling too, it must be remembered, has emerged in the background of almost daily changes in coalition governments, reshuffling of cabinets, etc. Even a semi-feudal petty bourgeoisie can take so much and no more.

GUJARAT

Economics and Politics of Growing Grass

Gautam Appa

GRASS is gold. Grass is god-send for sleeping landlords for it does not have to be cultivated; it just grows. No need to sow or tend it and no weeding. What is more, it is a cash crop. The government's procurement price is Rs 130 per 500 kg this season, but in Bombay's free market you can earn anything from Rs 300 to Rs 350 for 500 kg.

In western India, the best pasture-lands where grass is grown for sale are in Kutch, Thana, Nasik, Kolabo, Konkan, and South Gujarat. Valasa district in South Gujarat and Pardi taluka in particular are perhaps the most famous in the whole of India as grass-lands because, starting with Gandhi, many famous politicians have participated in political agitations on these grass-lands.

The conditions in Pardi today are as follows. Of the total of 98,000 acres of land, 40,000 acres are under grass. One acre of grass requires 30 man-days of labour to cut and to prepare the grass into bales. Grass is cut in October. So 40 per cent of the land in Pardi provides employment only for a month in the year. Mainly, the tribal population of Pardi comes out from the hinterland in October to cut the grass. By law, the daily minimum wage should be Rs 3, but anything from Rs 1.50 to Rs 3 is paid. The minimum wage has in fact become the maximum.

The landowners claim that they cannot afford the minimum wage. Their costs, for the government unit of 500 kg and assuming average production at 1,500 kg per acre, are roughly as follows:

	(Rs)
Cutting	30
Wire for bales	5
Making 5 bales (of 100 kg each)	5
Transport (within 15 miles)	10
Loading	5
Miscellaneous	10
Total	65

The costs may vary regionally, but are unlikely to exceed the above figures as these are the maximum.

The government, however, considers the cost to be Rs 130 per 500 kg. Why? Because you have to pay rent to the landlords for the great sacrifice they make in owning the land and doing nothing with it. A typical big grass-land owner of Pardi is a Baniya or a Parsi who acquired the land from his debtors in compensation for default in paying debts, has managed to keep hundreds of acres, the ceiling laws notwithstanding, and has no appetite for the rigours of farming. For his 'enterprise' we pay Rs 175 to Rs 200 acre or say Rs 60 to Rs 65 per 500 kg. Hence the 'cost price' of Rs 130.

To help the 'poor farmer' make a 'reasonable' profit, the Gujarat government has allowed him to sell 20 per cent of the produce in the open market in Bombay. There are many varieties of grass: mushi, bhelsel, ful, etc. The best, mushi, can fetch upto 10 per cent more than the lowest quality, viz, ful. Moreover, some bales are

made up of smaller straws. There are many other ways in which the quality of a bale may be below average. It is not difficult to guess where the poorer quality stuff goes — to the government, of course, as procurement at the fixed price! Procurement is fixed at 80 per cent of the produce. This is only legal requirement and laws are there for their makers to break!

The farmers have a political organisation which carries on propaganda that the farmers cannot afford the minimum wage of Rs 3 per day, that they are being ruined, that the tribals have started a class war, and so on. The tribals also have a political organisation. Founded by PSP veterans, its Gandhian leaders are now in the Congress(R), but it is a class-based organisation of landless adivasis or tribals in the main. To achieve its short-term aim of a wage of Rs 3 per day it boycotted some of the biggest grass operators. The clamour of class war was the result of this action. The organisation of adivasis has claimed over 80 per cent success for its agitation. However, it should be noted that the only reason for this success was direct action. Those who took farmers to court were frustrated as usual. A big farmer employing 5,000 cutters a day was fined Rs 40 on conviction of the crime of paying Rs 2.50 instead of the statutory minimum!

But the victory claimed by the organisation of adivasis is a hollow one. Previously the cutter got a day's food and Rs 2 per day on average. Now he may get Rs 3, but he gets no food. At the current prices of grain, therefore, his real income is lower. No wonder the adivasis are restless. they want some action on those old promises of putting pastures under the plough. The land is fertile and can grow paddy or fruits. A Patel who returned from Portuguese Africa ten years ago bought 40 acres of grass-land and grew paddy and fruit on it so successfully that he has earned a national award. But the sleeping landlords love grass that lets you sleep in peace. The adivasis, on the other hand, want more secure employment for longer periods. The young ones have worn red PSP caps and sung songs of 'land to the tiller' for long enough. 'Put that land under the plough or we will' is their message. So far the threat was not made because the leadership is wedded to non-violence. Now some of the big farmers' grass-lands have been grazed by young herdsmen and no landlord has been able to do a thing. The adivasi leaders say these were stray incidents, and that if they had given a call for destruction of the crop, not a bale of grass could have come out of Pardi. But the exasperated adivasis will not be contained by tough talk and mild actions for ever. There is no class war today in the grass-lands, but this situation could change — and quickly.

POWER

Industry Crippled in the North

THE total shut down in Haryana of power supply to industries, other than sugar and flour mills, was scheduled for eight days starting from November 21. It came in the wake of the standing cut of 60 per cent in industrial consumption. The shut-down was ordered on industry in order to conserve energy for the tubewells so as to enable them to work 16 hours a day during rabi sowing. In October, in view of the low level in the Bhakra reservoir, the generation from the Bhakra-Nangal stations was reduced, from 11.5 GWh per day to 9.0 GWh per day, and the average daily output from the Badarpur thermal station in Delhi was reallocated so as to provide relief to Haryana, Punjab and Uttar Pradesh, again to meet the needs of the rabi operations there.

Of the 23.72 GWh per day power deficit in the entire country, the northern region accounts for as much as 9.84 GWh per day — that is, for over two-fifths. The recent reallocation between agriculture and industry underlines the sharp competition for power between the two sectors.

This competition is most striking in Punjab, where agriculture consumes about 4 million units per day, domestic and commercial consumers about a million units, leaving industry with the meagre available balance of 1.2 million units. In fact, only about 25 to 30 per cent of industry's needs are met. The state has 1.26 lakh tubewells, and another 75,000 tubewells are proposed under the Fifth Plan. Although electric tubewells were thought of to make profitable use of the 'secondary seasonal power', which was available virtually free from Bhakra at one time, as industry's needs were not high, the growing requirement of industry now has changed the situation. Industry claims that as a result of the acute shortage, industrial production worth Rs 2 crores is being daily lost.

This does not mean, however, that adequate energy is available for agriculture. The state's overall needs are about 8 million units a day, while availability has declined from 6.2 million units per day in November 1973 to 5.46 million units per day in December 1973. It went up to 6.64 million units in March 1974, but dropped sharply again to 5.28 million units in June 1974, then rose slightly to 5.9 million units in November 1974.

Haryana, which is more industrialised than Punjab, has had a similar situation with regard to energy. Against its needs of 6 million units a day (agriculture needs 3 million units and industry 2.4 million units) the deficit is 2 million units. Again, agriculture gets top priority leaving industry to bear the brunt of the 33 per cent deficit and the uncertain supplies. This has crippled production in the three industrial complexes of Faridabad, Sonepet, and Ballabhgarh in the state, resulting in a production loss estimated by industry at upto Rs 3 crores per day. For instance, in July and August, out of 3,696 normal working hours, industries in the three complexes got power for only 926 hours. By the end of September, nearly 60,000 of the 1,10,000 workers employed in the Faridabad-Ballabhgarh belt had been laid off. By early November 40,000 workers had been laid off in the Sonepat area.

The Haryana government has been explicitly insisting that industrial units instal diesel generator sets to reduce their dependence on power supplies from the State Electricity Board. Some of the industrial units in any case have their own generators capable of meeting 20 to 40 per cent of their power needs. During the eight-day shut-down, these units could therefore maintain partial production.

However, industry has argued that, unlike in agriculture which needs small high-speed sets as are already manufactured in the country and are easily available, industry needs large slow-speed sets which have to be imported or can be bought at home only after a 30-month waiting period. Therefore, it is agriculture that should be asked to switch to diesel power. Besides, agriculture's needs are seasonal. The real objection from industry to installing its own generation capacity is traceable to the high cost of such power

What Bugs the Public Sector?

Managerial Compensation and Motivation in Public Enterprises by Laxmi Narain, Oxford and IBH, New Delhi, 1973, pp XV + 157, Rs. 25.

THIS book is mainly a research report on three significant aspects of the managements in public sector enterprises: *viz*, what motivates public enterprise personnel; how their compensation compares with that of private sector personnel; and what they *think of the public sector as an instrument* of economic policy in India and of its performance.

The study was carried out by questionnaires given out in 47 public sector enterprises. Of the 47, 26 were classified as industrial, 8 as commercial, and 13 as insurance and banking enterprises. The capital invested in the enterprises covered here aggregates Rs 1,878.87 crores.

The sample included managers in the pay-scale 700-1,250 and upwards to the top level. The sample was divided into three categories and their responses were compared. The classifications were: lower-level managers drawing salary of upto Rs 1,400; middle-level managers drawing a salary of Rs 1,400-2,000; and higher-level managers drawing a salary of Rs 2,000 and above.

The respondents were asked to rank, separately, the factors that contributed to their job performance and the factors that inhibited it. Eight factors were identified in each set. The two sets contained different factors; but the contributing factors were not the opposite of the inhibiting factors. The first three factors contributing to job performance were (i) feeling of worthwhile accomplishment; (ii) recognition of good work done; (iii) decision-making authority; (iv) opportunity for personal growth. The third and the fourth factors were rated equally. The inhibiting factors were (i) lack of consistency in management policies; (ii) lack of clear definition of responsibility; (iii) inadequate communication; (iv) sloth and bureaucracy in management. The third and fourth factors were ranked equally.

Narain's findings were that money and job security are rated lower than the factors mentioned earlier. Among the inhibiting factors the research listed *practises within* the enterprise to be the more decisive ones than those that lie outside of it such as government interference, audit, and attitude of workers and their unions.

The findings are thus similar to some of the findings in the industrial countries of the West. Herzberg and his associates conducted studies in 14 countries. They postulated what is often called the two-factor theory of motivation. The theory suggests that (i) factors that motivate are different from the factors that provide necessary conditions for job performance called 'hygiene factors', and (ii) factors that motivate are intrinsic factors relating to the man-work relationship. Herzberg suggests that achievement, recognition, initiative, and such factors motivate people to work.

The criticism against Herzberg's two-factor theory is that it is methodology-bound: it creates a 'response set'. In the event, the response is unconsciously directed by the methodology employed by the research. This danger is common in social science research, and is often corrected by exercising caution in sampling, and where possible, using appropriate statistical methods to remove chance errors or dispersion. The present book's author has tried to be careful to avoid possible errors in his research methodology.

The other difficulty in using perceptual data is that a particular hypothetical response is not necessarily an index of how the respondent would actually behave if he were placed in the given situation. Herzberg used the recall method to avoid the discrepancy between perceived value and behaviour. He asked his respondents to recall an experience and to express their feelings about that experience.

Narain has not used the incident method or any behavioural index to ensure that the responses have not been influenced by socially acceptable values of respondents. In the present case, the direction of research findings, suggesting that at the managerial levels intrinsic factors seem more important than extrinsic factors is supported by other research, however. The implications of those findings for management are important. To motivate managers, conditions in which they can derive a sense of achievement, recognition, opportunity for personal growth, etc, have to be created.

The second part of Narain's research compares emoluments and frige-benefits between executives in the public sector and the private sector. He finds that, job for job, the private sector pays more than the public sector. This is a fairly clear and generally accepted conclusion. The researcher recommends emoluments, etc, of executives in the public sector should be brought up to be in line with those in the private sector — because a continuing difference will lead to a 'brain drain' from the public sector. Yet surely, the author's recommendations are inconsistent with the author's own findings regarding motivation! The earlier data show that money has low ranking as a contributory factor in job performance. How can higher salary attract, or keep, managers in the public sector? The data in Chapter 3 show also that people, at all levels, still keep entering the public sector. Equalisation in salary could have other advantages and the author may have reasons to recommend this measure; but the data suggest that the measure has no particular relevance to motivation of managers, and its advance could not cause brain drain.

The third part of the study is concerned with the view which managers in the public sector have of the public sector itself. The questions asked included both the philosophy and the performance of the public sector. The findings show that most managers neither believe in, nor subscribe to, the economic philosophy of the public sector; they also do not believe that the public sector's performance is good. The higher echelons are more negative in their views than the lower. Assuming these findings to be true, the implications of the negative feelings are severe: without faith among its personnel in the philosophy of it, the public sector cannot possibly function effectively.

This is on the whole a worthwhile study and the findings have much significance for public sector industry. If the author had handled the discussion of the findings and their application more adequately than he has done, it might have been more useful. Besides, the data are poorly organised and the tables are not fully explained. Even so, the teacher would find this book extremely useful.

National Accounts and the Regression Enthusiast

Sri Lanka: A Study

Arun Shourie

National accounts of countries are used to assess current developments and to view these developments in the perspective of the past. Small changes are dutifully reported and various sorts of ratios are compiled. These changes and ratios are then compared to the values of similar changes and ratios in the past in the particular country and to the corresponding values for other countries.

In using national accounts for time-series models and in pooling them for cross-country regressions one should be aware of the ways in which the accounts are put together and of the many puzzles then contain. This note provides a very brief account of the procedures by which different components of the series are put together in Sri Lanka and of a few problems associated with them. Neither the approximations nor the puzzles are, however, peculiar to Sri Lanka.

The discussion suggests a number of morals for users of national accounts.

(a) One should be extremely wary of reading much into small changes in items like Gross Domestic Product, Gross Domestic Investment and Gross Domestic Savings — aggregates which have become the subjects of close scrutiny in the current wave of macro regression models.

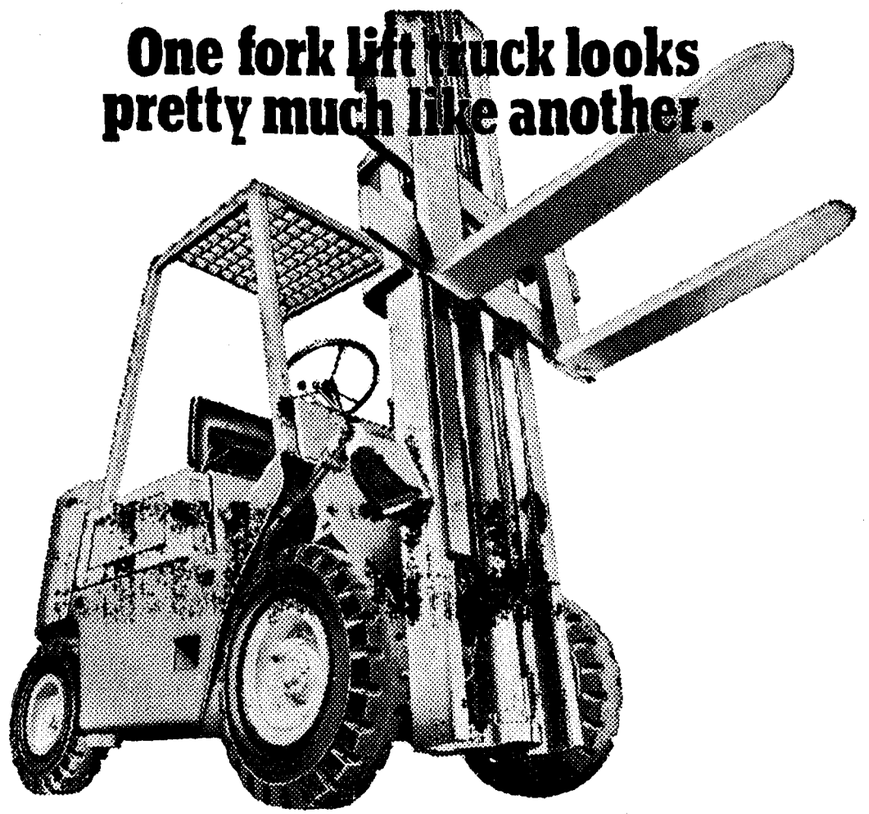
(b) In studying changes, rate of growth, etc, one should study changes of the commodity sector separately from changes in the service sectors.

(c) The constant price series of national account for countries such as Sri Lanka obscure almost as much as they reveal — partly because of the doubtful relevance of many of the deflators used and partly because of the wide fluctuations in export prices. Analysis of changes in GDP at constant prices needs to be supplemented by estimates, however crude, of changes in net commodity availabilities.

(d) Finally, the optimism of the time-series enthusiast should be somewhat dampened by the fact that, in Sri Lanka's case, even in the final accounts, one-third of GDP (not counting tea and rubber) is estimated indirectly and about one-seventh is simply assumed to grow at a trend rate. Unless he is careful, the time-series enthusiast may well find himself regressing one variable on another variable from which it was estimated in the first place!

A NUMBER of agencies, within and outside Sri Lanka, use Sri Lanka's national accounts to assess current developments and to view them in the perspective of the past. Small changes are dutifully reported and various sorts of ratios are compiled. These changes and ratios are then compared to the values of similar changes and ratios in the past in Sri Lanka and to the corresponding values for other countries. Various studies have utilised these accounts for time-series and cross-country econometric work.

Typically, macro-regression models relate individual aggregates to other aggregates.[1] In such models, imports, for example, will be broken down into three or four categories and each category will be regressed on some part of gross domestic product, on the sources side or the uses side. Thus, imports of consumer goods may be related to disposable personal income or to total consumption expenditure; imports of intermediate goods may be related to value added in sectors such as manufacturing; imports of construction material may be regressed on value added in the construction sector; and imports of capital goods may be 'explained' by or may be used to 'explain' gross fixed investment in the economy. Over the past few years, a number of cross-section studies have appeared which set out to explain variations in growth rates, savings rates, structures of output, patterns of employment and other characteristics, of a host of very dissimilar economies.[2] Typically such studies explain the differences in the characteristics with reference to variables such as per capita income, size, capital inflow, dependence on trade, and so on.



In using the accounts for time-series models and in pooling them for cross-country regressions, one should be aware of the ways in which the accounts are put together and of the many puzzles they contain. This note provides a very brief account of the procedures by which different components of the series are put together in Sri Lanka and of a few problems associated with them. However, neither the approximations nor the puzzle are peculiar to Sri Lanka.

The Central Bank of Sri Lanka and the Department of Census and Statistics release separate series for Gross Domestic Product ad Expediture. Appendix Table 1 shows the ways in which different parts of GDP are estimated by the Central Bank. The following features are particularly noteworthy:

(a) The estimates for many items are arrived at indirectly. That is, they are derived from estimates for other items. A number of other items are simply assumed to grow at a certain trend rate of growth. The shares of these two types of items in Sri Lanka's GDP are as shown in Table 1.

(b) In almost all the cases which are assumed to grow at a certain trend rate of growth, the rate of growth of value added at *current prices* is assumed to equal a given figure (e g, the rate of growth of population). *Prima facie* this seems to be a peculiar assumption; for, in most of the items for which a growth rate equivalent to, e g, that of population, is assumed, one would have thought that *real* output rather than output at current prices would be grow-

One fork lift truck looks pretty much like another.

So why should you pay more for a Godrej C 500?

At first glance, all diesel fork lift trucks look alike. So it's not surprising that some companies opt for the cheapest, without trying to find out why they cost less.

And the simple truth is that when a fork lift truck costs less to buy, it eventually ends up costing a lot more to run and maintain.

UNIQUE GODREJ TRANSMISSION MULTIPLIES POWER:

The typical fork lift operation is a start-stop-lift-lower process. Unfortunately, most fork lift trucks use conventional automobile transmissions, which run into problems in such situations.

On the other hand, each Godrej C 500 fork lift truck has constant-mesh gears and a fully automatic hydraulic transmission called Hydratork, at the core of which is a remarkable torque convertor which multiplies engine output 2.2 times.

AND LEADS TO OPTIMUM PERFORMANCE:

You get faster acceleration because of Hydratork. A 4.4 : 1 pre-reduction gear on the drive axle gives you the greatest tractive power right at the wheels—where it really counts. It also boosts braking power, so you can stop faster and with less effort. You can even inch these trucks forward—slowly and with perfect control—and at the same time lift heavy loads at high speeds. It all adds up to making your materials handling speedier and more efficient.

CONSTRUCTION IS TOUGHER:

While the C 500 trucks themselves are rated for 2.25 and 3 tonnes, the transmission drive line components are rated for 6 tonnes. This gives them enough strength and durability to handle shock and impact overloads under which other trucks collapse altogether.

AND HANDLING IS EASIER, SAFER:

With the C-500, heavier the load, slower the descent speed. Positive-action control levers are all mounted right on the cowl, where they're easiest to reach. So your truck operator goes through his day with less strain. And you get higher productivity per man-hour.

BETTER OUTPUT-COST RATIO:

When you add up all the costs, you'll find a Godrej C 500 works o a lot cheaper in the long run. Even if it does cost a little more initially.

Godrej® C 500 DIESEL FORK LIFT TRUCKS

Manufactured by
GODREJ & BOYCE MFG. CO. PVT. LTD.
Godrej Bhavan, 4A Home Street, Fort, Bombay 400 001.
In technical collaboration with Clark Equipment Company, U.S.A.—world leaders in materials handling equipment.

HT-GB-9009(A)

TABLE 1: PERCENTAGE SHARES IN GDP, 1970

(Final Estimates for a Year)

	Items Estimated Indirectly	Items for Which a Trend is Assumed
Commodity production	15*	11
Construction	100	—
Service sectors	44	22
Total GDP	33	15

Notes: * Even though estimates of tea and rubber are made in large part from customs returns, they have not been included in this figure. If they are included, then 45 per cent of commodity production and 48 per cent of GDP are indirectly estimated.

ing at the rate of growth of population.

(c) In making provisional estimates, a number of departures are made from the normal assumptions. Rough notions, based on general, vague, circumstantial evidence, come to play an extremely prominent part; also many additional items too are assumed to grow at a certain trend rate. Even allowing for the fact that 1971, the year of the insurrection, might have posed special problems for such calculations, it is clear that the rate of growth provisionally recorded for a year is a very rough figure indeed. In the services sectors, not a single item (not even public administration and other government services) is estimated from direct returns (Table 2). Unfortunately, all too often, visiting economists and discussants within country focus most heavily on the changes in the year that has just ended — or is about to end — and for which only provisional estimates are available. And, once the provisional figure is circulated, cited, and debated, it acquires a certain permanence of its own. In the subsequent rounds, the authority which puts out the initial estimate is naturally a bit reluctant to revise it in too dramatic a manner

(d) As noted in Appendix Table 1, value added in a number of sectors is estimated indirectly with the help of certain rules of thumb and by relying on some indirect sources (e g, customs returns) for primary data about developments in the sector. In most cases, the rules of thumb are based on surveys conducted in 1953 and 1963. An example of such rules is to be found in the method by which value added is estimated in the building component of the construction sector (as distinct from the sector's installation of the machinery component). A 1963 survey of private investment indicated that the value added in building was 4.47 times the value of the construction materials used. From then on, the sum of the cif value of imported building materials and the value of locally produced building materials is multiplied by 4.47 and the result is taken as the value added in building. The value added within the construction sector in installing equipment is also estimated indirectly: it is assumed to be 30 per cent of the CIF value of imported heavy machinery. Indirect sources — such as exports and imports recorded by customs authorities — are, however, more reliable for some items than for others: In the case of customs returns, for example, exports of graphite fall in the first group and those of gems (large amounts of which are said to be smuggled out of the country, and Sri Lanka's new Plan that was released in November 1971 says that estimates of gems smuggled go as high as Rs 300 million a year) into the latter.

TABLE 2: PERCENTAGE SHARE IN GDP, 1970

Provisional Estimates for 1971

	Items Estimated Indirectly	Items Assumed to Grow at a Trend Rate	Items Estimated on the Basis of a General Circumstantial Evidence
Commodity production	12*	11	22
Construction	100	—	—
Service sectors	4	43	53
Total GDP	14	24	34

Note: * Does not include and rubber even though these are estimated primarily from customs returns. If these are included then 40 per cent of value added in the commodity sectors and 28 per cent of GDP are estimated indirectly.

(e) In obtaining the constant price series, a wide assortment of deflators is used. These are displayed in Appendix Table 2, and it will be clear from the list that the use of some of them is hardly appropriate in this context. The cost of living index, which figures frequently, is based on a 1950 survey of 455 households in the Colombo area.

The series compiled by the Department of Census and Statistics differs in many ways from the one prepared by the Central Bank.

(a) The most important difference in the concepts used by the two agencies is that, while the Central Bank assigns value added in the manufacturing processes of tea and rubber to the manufacturing sector, the Department of Census and Statistics retains the entire value added in tea and rubber in the agricultural sector's accounts.

(b) The Department's methods of estimating value added in a given sector often differ from those of the Central Bank. The building component of the construction sector provides an example. As noted above, the Central Bank multiplies the imports and domestic production of building materials by 4.47 to obtain value added by the construction sector. The Census Department proceeds in a different way: it first estimates value added in the government's construction work directly and also estimates the amount of building materials used in this work; from the total availability of building materials (imported and locally produced) it subtracts the amounts used by the government; the rest, which is assumed to have been used by the private sector, is doubled to obtain value added in private construction work; the total is then obtained by adding the government and private figures. It is hardly surprising, then, that the value added at current prices by the construction sector differs considerably in the two series (Table 3). Similarly, in estimating timber output, the Central Bank assumes a trend rate of growth whereas the Census Department estimates total limber output as 1½ times the output of timber on crown lands. The procedures used for estimating ownership of dwellings are also different but curiously, in this case, the figures of the two series follow each other very closely.

(c) Even the sources of primary data differ: for instance, in the case of the manufacturing sector (other than tea, rubber and cottage industries) the Census Department relies on such returns from registered units as are available with the Ministry of Industries and Fisheries whereas Central Bank relies on a special survey of selected manufacturing units. In 1970, this survey covered 132 firms.

(d) As Appendix Table 2 shows, the deflators used by the two agencies differ in many instances.

Apart from the real effects they have on Sri Lanka's economy, the numerous price distortions that characterise the economy and the wide fluctuations in

the prices of Sri Lanka's exports affect the meaningfulness of the national accounts also. The most significant difficulties arise because of the sharp changes in the international prices of tea, rubber, and coconut. In computing cross-country regressions or in constructing time-series models for individual countries, analysts most often use constant price series of GDP and its components rather than the series at current prices. Their expectation is that by doing so, they are removing the veil, are eliminating the effects of price increases, and are obtaining an account of the 'real' growth of the economy.

Now, the accounts at constant prices assure us that Sri Lanka's GDP has been growing at about 4.3 per cent in the last 10 years — a rate that is not unusually low in comparison with the rates at which other developing countries have been growing. However, this figure obscures the fact that, as the prices of Sri Lanka's major exports declined considerably in this period, net commodity availabilities in the economy grew much less than the accounts at constant prices indicate. For countries such as Sri Lanka, (in which foreign trade is a very large proportion of GDP and which have suffered huge losses in the terms of trade), the *constant* price series do *not* portray the evolution of commodity availabilities. For this reason, it is misleading to pool the constant price series of countries such as Sri Lanka with those of countries where foreign trade is not a significant proportion of total activities or which have not suffered severe losses in their terms of trade. Even though, nominally, the series for both sets of countries are at constant prices, the availabilities of goods and services are much better portrayed by the series of the one set of countries than of the other.

Furthermore, considering Sri Lanka's estimates themselves, the failure to allow for changes in the exchange rate and the progressive introduction of Foreign Exchange Entitlement Certificates[3] has dramatic effects on the estimates of gross domestic investment: a large part of the very impressive increase, of 45 per cent, in fixed investment during 1969 was directly attributable to the Certificates. This is so, partly because a significant proportion of Gross Domestic Investment consists of imported capital goods and partly because a large part of the rest is calculated on the basis of imports of capital goods.

The introduction of devices, such as the FEECs, can affect cross-country comparisons in other ways also. The current rage for devising and calculating 'performance criteria' for different countries can be used to illustrate the point. A favourite criterion is a ratio (such as that of Gross Domestic Savings to Gross Domestic Investment) which indicates the extent to which a country is helping itself. Now, gross domestic savings are calculated as the difference between gross domestic investment and the current account deficit. If imports of capital goods are converted at a higher rate than was the case in the past, gross domestic investment and the current account deficit are both increased by the same absolute amount. As the savings figure remains unchanged in absolute terms, the ratio of gross domestic savings to investment — the index of self-help that we are interested in — falls. To the extent that estimates for the non-imported component of investment are indirectly derived from the imports of capital goods the estimates of both gross investments and savings will increase, and the ratio between the two may increase, decrease, or remain unchanged.[4]

Table 1 indicates that, in some instances where estimates are made by contacting the production units, the compiling authorities uncritically accept the figures reported by many production units. This feature and its consequences are brought out most dramatically in estimates of gross investment by the public corporations. As the corporations are few in number and as each of them is owned directly by the government, one would expect that at least for these corporations unambiguous series would be available. Yet, towards the end of 1971, the Treasury and the Central Bank were using two widely different series for gross investments in these corporations — even though both agencies were using similar concepts of investment. The Treasury series is meant to cover financial years whereas the Central Bank series covers calendar years. This fact alone could hardly account for the large differences in the two series as given below. The fact is that, both the Treasury and the Central Bank accept uncritically the figures which the corporations report to them.

TABLE 3: VALUE ADDED IN CONSTRUCTION

(At current prices; factor cost; Rs million)

	1963	1964	1965	1966	1967	1968	1969
Central Bank							
Department of	285	306	286	317	380	509	676
Census and		(7.3)	(—6.3)	(10.4)	(19.8)	(33.9)	(26.9)
Statistics	356	383	381	412	470	560	696
		(7.5)	(0.0)	(7.8)	(14.3)	(19.1)	(24.3)

Note: Figures in parentheses give percent change over the preceding year.

The accounting systems in the corporations greatly differ, one from the other, and the corporations themselves probably add to this difference by using different concepts to report investment figures to the two agencies (Table 4).

This brief account — in which questions about the reliability or accuracy of the data have not even been touched — suggests a number of morals for users of national accounts.

(a) One should be extremely wary of reading much into small changes in items such as the Gross Domestic Product, Gross Domestic Investment and Gross Domestic Savings — aggregates which have become the subjects of close scrutiny in the current wave of macro regression models. This is particularly so for the years for which provisional accounts alone are available.

(b) In studying changes, rates of growth, etc, one should study changes in the commodity sectors separately from changes in the service sectors. Both the commodity sectors and the service sectors, in turn, should be further subdivided into items that are directly estimated, items that are indirectly estimated, and items for which trends have been assumed.

(c) As things stand at present, the constant price series for countries such as Sri Lanka obscures almost as much as it reveals — partly because of the somewhat doubtful relevance of many of the deflators used, and partly because of the wide fluctuations in export prices. Analysis of the changes in *GDP at constant prices* needs to be supplemented by estimates, however crude they may be, of changes in *net commodity availabilities*. One has

TABLE 4: GROSS FIXED INVESTMENTS IN PUBLIC CORPORATIONS

Treasury Series		Central Bank Series	
1965-55	210	1965	150
1966-67	435	1966	220
1967-68	406	1967	187
1968-69	563	1968	278
1969-70	610	1969	563
1970-71	708	1970	437

to be specially wary of pooling the data of countries such as Sri Lanka, with the data of countries over which the terms of trade movements do not cast such a long shadow .

The foregoing account suggests that pooling is dangerous for an additional reason. It often happens that one cannot formulate an unambiguous rule for putting the figures together, even in relation to the most elementary aggregates. Consider, for instance, the case of tea and rubber. Tea accounts for 55 per cent of Sri Lanka's exports and 10 per cent of its GDP. Because of its extremely perishable nature, there is no market for the green leaf of the tea plant. The leaf is processed on the estates and it leaves the estate as a 'manufactured' product. The Central Bank, as noted above, partitions the value added in tea production between the agricultural and manufacturing sectors in accordance with the procedure outlined in Appendix Table 1. The Department of Census and Statistics, on other hand, attributes the entire value added in tea growing and tea manufacturing to the agricultural sector. The case of natural rubber is no different: the Central Bank apportions the value added between agriculture and manufacturing, while the Department of Census and Statistics attributes the entire amount to the former. While the rationale for one convention may be no stronger than that for the other, the difference does — rather should, if the attitudes towards the national accounts were less cavalier — inconvenience the econometrician who is trying to 'explain cross- country variations in the structure of production or employment. He can either rely on the convention of the Department of Census and Statistics and assume that the 'manufacturing' sector accounts for about 9.5 per cent of Sri Lanka's GDP, or he can use the Central Bank's accounts as they are and assume that the share (at 13.5 per cent) is 45 per cent higher.

(d) The optimism of the time series enthusiast should be somewhat dampened by the fact that, even in the final accounts for a year, one-third of GDP (not counting tea and rubber) is estimated indirectly (i e, each item is taken as a multiple of other items) and about one-seventh is simply assumed to grow at a trend rate. The purpose of drawing attention to the role which trends and indirect estimations play, is not to assert that these procedures render the accounts unreliable. Indeed, as has been noted above, in many cases indirect sources may well be very appropriate. But, unless he is careful, the time series enthusiast may well find himself regressing one variable on another variable from which the first was estimated to start with! For instance he may find himself regressing value added in construction on the imports and domestic production of construction materials. In such cases, the regressions will accomplish no more than the discovery of the assumptions used by the agencies responsible for putting the accounts together, and the impressive t-ratios and co-efficients of determination may record no more than the fact that these agencies have used these assumptions consistently for a number of years!

Notes

1 UNCTAD, "Trade Prospects and Capital Needs of Developing Countries", United Nations, New York 1968, contains time series models for eighteen countries. ECAFE, "Feasible Growth and Trade Gap Projections in the Ecafe Region", Bangkok, 1968, contains similar time series models for eight countries other than Thailand. The model for Thailand is the same in the two volumes. For additional examples, see my review "The Use of Macro-Economic Regression Models of Developing Countries for Forecasts and Policy Prescription", *Oxford Economic Papers*, Volume 24, No 1, March 1972, pp 1-35.

2 A host of examples can be cited: a few representative ones will have to suffice. Studies that use cross-section and time series data for analyzing patterns of output growth are exemplified by the following: H B Chenery, "Patterns of Industrial Growth", *American Economic Review*, 1960, pp 624-654;
— and T Watanabe, "International Comparisons of the Structure of Production", *Econometrica*, 1958, Volume 26, pp 487-521.
— and Lance Taylor, "Development Patterns: Among Countries and Over Time", *Review of Economics and Statistics*, Vol L, 1968, pp 391-416.
M J Bruton, "Productivity Growth in Latin America", *American Economic Review*, Vol LVII, 1967, pp 1099-1117.
D B Keesing, "Population and Industrial Development: Some Evidence from Trade Patterns", *American Economic Review*, Vol LVIII, 1968, pp 448-455.
The following two represent studies using such data for making inferences about overall growth strategies:
P M Sommers and D B Suits, "A Cross Section Model of Economic Growth", *Review of Economics and Statistics*, Vol LIII, 1971, pp 121-128.
P A Yotopoulos and L J Lau, "A Test for Unbalanced Growth", *Review of Economics and Statistics*, Vol 41, 1970, pp 376-384.
Apart from the well known work of Houthakker and Modigliani, the following are typical of the numerous studies that utilize cross-country and time series data for analysing savings-income relationships:
L Landau, "Differences in Saving Ratios Among Latin American Countries", PhD Thesis, Harvard University, 1969.
D W Johnson and J Sy Chin, "The Saving-Income Relation in Underdeveloped Countries", *Economic Journal*, Vol LXXVIII, 1968, pp 321-333.
S K Singh, "The Determinants of Aggregate Saving", IBRD Economic Staff Working Paper No 127, March 1972.

3 Imports under the Foreign Exchange Entitlement Certificates come in at Rs 9.2 to the dollar, while other imports come in at the official exchange rate of Rs 5.95 to the dollar. Over the years, imports of all capital goods have been progressively put on the FEEC rate. Imoprts of a few major consumer items, such as rice, continue to be allowed at the official rate.

4 A simple numerical example will clarify the point. Assume that Column 1 depicts the starting position. Assume that FEEC — type device is introduced and imports of capital goods are exchanged at a rate that is twice as high as the official rate. The latter continues to apply to other imports and to all exports. Column 2 then depicts the resulting situation. Column 3 depicts the situation in which the estimate of the non-imported component of investment is derived in part from the imports of capital goods so that the domestic component of investment increases by, say, one-half of the increase in the value of imported capital goods.

	Value in Rupees

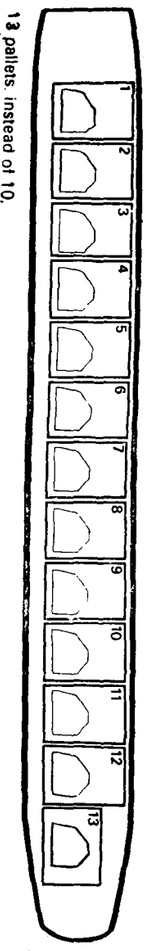
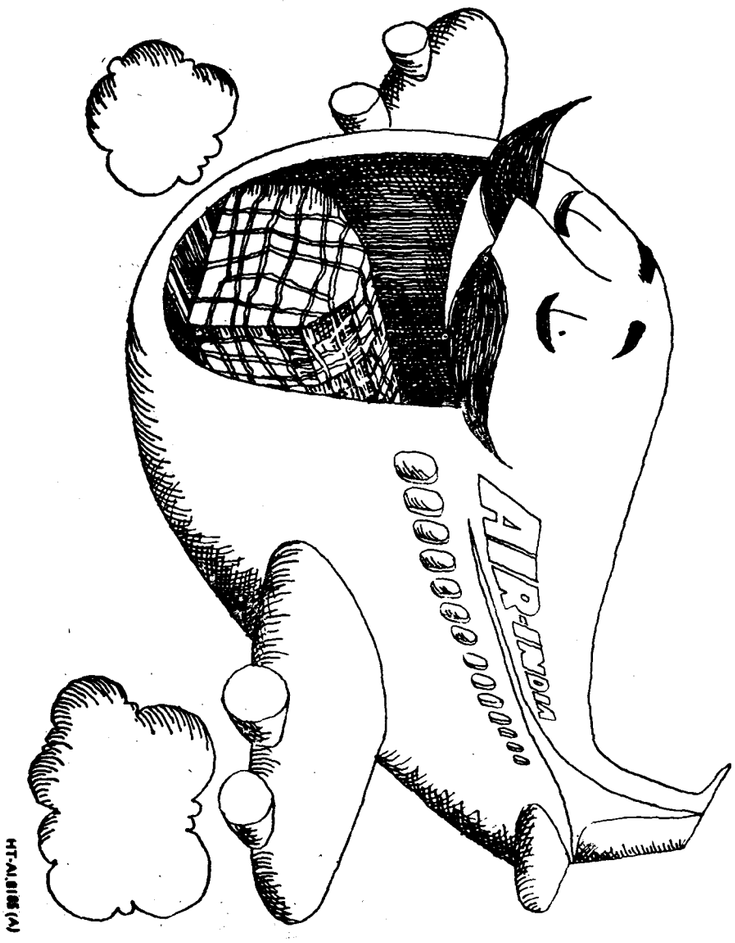
Back with a bigger appetite for cargo.

• 76 tonnes, instead of 60, on our twice-weekly all-cargo services.



• Plus new all-cargo service to Hong Kong and Tokyo every week.

• Ex Bombay



Our 38 regular weekly flights, with a total cargo capacity of 290 tonnes, are back again. Besides, we are increasing the space on our all-cargo services by over 25% and extending it right up to the Far East once a week.

Effective April 2, 1975

13 pallets instead of 10, to increase the capacity by 8 tonnes from April 2.

	Spices-local consumption	Cost of living index: vegetables
	Hides	Output index
	Agricultural services of Corporations	Output index
	Forestry	Wage rate index of workers in agriculture
2 Mining and quarrying		Wage rate index for workers in industry and commerce
3 Manufacturing		
(a) Manufacturing		Cost of living index: domestic group (weighted index of ex-factory prices)
(b) Tea, rubber and coconut-processing		Output index
4 Construction		Cost of living index: domestic group (Cost of living index and an index of cost of constructing a unit of floor space)
5 Electricity, water and sanitary services		Wage rate index of Govt. technical and clerical employees. (For electricity and gas: indices of electricity and gas produced)
6 Transport, storage and communication		
Railway		Wage rate index of all Central Government employees.
Ceylon Transport Board		Wage rate index for workers in industry and commerce.
Air Ceylon		Wage rate index of all Central Government employees
Post and Telecommunication		Wage rate index of all Central Government employees
Port Commission		Wage rate index for workers in industry and commerce
Motor cars and lorries		Indices of passenger mileage of omnibus and railway services.
	(Passenger Transport)	Index of passengers carried by Air Ceylon.
		Nos of hiring cars and private cars.
	(Goods Transport)	Index of goods train mileage, Index based on the No of lorries, quantity index of ships entered and cleared at all ports of Ceylon.
	(Post and Telecommunication)	Combined weighted index of the No of letters, parcels and telephone calls made.
7 Wholesale and retail trade		Cost of living index: Domestic Group (Wage rate index for workers in industry and commerce)
8 Banking, insurance		Wage rate index for workers in industry and commerce.
9 Ownership of dwellings		Cost of living index: domestic group (index of urban and rural rental workers)
10 Public administration and defence		Wage rate index of all Central government employees. (index of No of employees).
11 Services		Cost of living index.
Education and health		Indices of the No of employees in these services.
Other Govt services		Wage rate index of Govt employees
Domestic and hotel services		Colombo cost of living index
Professional services not subject to tax		Wage rate index
Personal services		Wage rate index

(1) The deflators used by the Central Bank are shown first. If the deflators used by the Department of Census and Statistics differ from the ones used by the Central Bank, they are shown in parentheses.

Entry in table indicates base year for which consumption (e g consumption per head) was originally estimated.

2 Basis of the 4.47 multiplier: Survey of Private Investment, 1963, Central Bank.

3 Basis of (30:70) ratio: Survey of Distribution, 1951, Department of Census and Statistics.

4 The same basis as for final estimates except that data for first eight months was used along with the assumption that the share of value added in the last four months in the year's total will be the same as in 1970.

5 *Ad hoc* assumption on the basis of general, circumstantial evidence.

6 The Central Bank figures for "ownership of dwellings" very closely parallel the figures of the Census Department. The latter obtained the average rents per housing unit from the Census of Population and Housing, 1963, and the Socio-Economic Survey, 1969. For the intervening years the Department assumed that average rental values grew at a fixed rate. The number of housing units was also estimated from that Housing Census of 1963 and the estimate is updated in a manner that is not very clear. The per cent increase over the previous year is value added from "ownership of dwellings" is as follows:

	Department of Census and Statistics	Central Bank
1964	7.5	5.7
1965	7.3	6.9
1966	7.2	6.0
1967	7.3	6.0
1968	8.1	9.9
1969	7.9	6.2

7 In 1970, 132 out of 1,952 registered establishments were canvassed.

FROM THE CHAIR

Association of Synthetic Fibre Industry

Speech of the President, Lala Sohanlal Singhania

THE following are excerpts from the Speech of Lala Sohanlal Singhania, President, Association of Synthetic Fibre Industry, at the Second Annual General Meeting of the Association held on 23rd December 1974 in Taj Mahal Hotel, Bombay.

MR BAGCHI, DISTINGUISHED GUESTS AND FRIENDS:

It is a privilege and pleasure to be amidst you all at this annual get-together of our Association. I am particularly indebted to Mr. Bagchi for having kindly accepted to join us in the meeting despite other heavy pre-occupations.

Before dealing with the synthetic fibre industry, let me dwell briefly on the general world economic trend.

ECONOMIC HORIZON

As you all know, today even the economically and industrially advanced countries are victims of inflationary pressures, the genesis of which could be traced to the energy crisis resulting from the cut and squeeze in crude output and manifold increase in its prices. When the richest nations are under the grip of severe economic malaise, the plight of developing countries like ours could only be worse. During the year, inflation in our economy assumed massive proportion with the result that the prices of all commodities — consumer as well as industrial — scaled new heights and the wholesale price index registered a rise of over 20 per cent in one year. In order to arrest this trend, the Government did venture upon some drastic measures, i e, credit curb, compulsory deposit of additional wages, drive against hoarding of essential goods, unauthorised foreign exchange dealings, smuggling, black money, etc, and it is gratifying to note that these steps did succeed to some extent in checking the price rise.

Coming to the case of our industry, I must say that its plight has been

Mr Lala Sohanlal Singhania

pathetic for sometime past. Acute shortage of raw material, unimaginative raw material pricing policies, heavy excise burden, high power tariff rates, drastic power cuts, etc, were the main hurdles with which the industry had to live.

INDUSTRY'S PERFORMANCE IN 1973-74

During the year, there was no indigenous production of the raw material for nylon industry, i e, caprolactum, and the industry had to depend on 100 per cent import. For want of adequate raw material — reasons for which are explained subsequently — there existed an idle capacity of about 35-40 per cent. Compared to an output of about 15000 tonnes of nylon filament including tyre cord during 1972-73 against an installed capacity of 14800 tonnes, the output during the year was about 11600 tonnes though the licensed capacity was higher at 17764 tonnes. The same was the case in polyester fibre, production of which during 1973-74 was about 7900 tonnes against 8000 in 1972-73, in spite of two more units going into production during 1973-74. During the current year i e 1974-75 also the declining trend is continuing as can be seen from the nylon yarn output in the first half being just 5200 tonnes as against about 6000 tonnes during the corresponding period of 1973-74.

RAW MATERIAL SUPPLY POSITION AND PRICE

As indicated earlier the industry could not work to full capacity during 1973-74 for want of raw material. As against the minimum requirement of about 20000 tonnes, the State Trading Corporation — through which the import is canalised — could procure and supply only about 11000 tonnes. It cannot be denied that there was a scarcity of caprolactum in the world market during 1973-74. Although the industry had alerted the Government and the STC about the impending world shortage, STC was not quick enough to take the opportunity to enter into long-term firm commitments for supply of the material in bulk by overseas producers. In the meanwhile other countries quickly cornered whatever meagre quantities that were available. As can be expect-

ed, the price of the commodity started rising rapidly and steadily and touched the dizzy height of $ 2400-2600 per tonne from $ 450-500 at the beginning of the year. Even at that time the STC did not rise to the occasion and try to get whatever was available. In short, the industry was virtually starved of its raw material.

Even after commencement of production of caprolactum by the Gujarat State Fertilizers Company Ltd during August/September 1974 and international prices coming down to about $ 1000-1200, the position has not changed. At a time when the nylon spinning industry is in deep economic ills, the GSFC has fixed the price of caprolactum arbitrarily at a very high figure. Added to this, the industry has to pay excise duty at a fantastic rate of 50 per cent *ad valorem* on the indigenous caprolactum. With this excise and other incidental expenses the price of GSFC caprolactum was around Rs 41,000/- per tonne against the cost of imported product at about Rs 18,000/-. With the ceaseless efforts by the Association, only a marginal reduction of about 12½ has been announced by the GSFC with effect from 1st December 1974 and the gross price still remains at about Rs 36 per kg. I sincerely hope that the GSFC will scale down their prices at least to the level of Rs 16 per kg which will mean a gross price around Rs 25 per kg without which I am afraid the industry will not be able to work to full capacity without incurring loss.

Excise Duty

Instead of helping to curb undue consumption, the present high excise burden on nylon yarn, fabrics and the raw material (caprolactum) is in fact strangling the natural growth and development of this young and promising industry. You will be surprised to know that the excise duty on nylon yarn has been progressively raised to the level of 700% in just over a decade. This apart there is *ad valorem* excise at the rate of 15% on fabrics. To add fuel to fire, an unrealistically high excise duty at the rate of 50% *ad valorem* has been imposed on the already inflated price of indigenous caprolactum. In short, the natural growth and development of the industry is arrested mainly because of unimaginative excise impost at various stages.

Price and Distribution

I am sure all of you will agree that selling price of any commodity should basically depend upon the cost of inputs. In view of the steep rise in the cost of raw material coupled with crushing excise burden on the one side and a falling market on the other, the industry has been in doldrums for sometime past. Lack of demand and consequential steep fall in the market prices has nullified the working of the voluntary agreement on price and distribution, which was in existence from September 1973 onwards. The sudden decline in the market has however upset the whole equilibrium and a state of panic and uncertainty is casting a gloom on the industry. In the present unremunerative market prices, the industry is in fact incurring losses. In order to restore normalcy in the industry, it is necessary that the price of the GSFC caprolactum should be scaled down substantially with simultaneous withdrawal of excise duty on the raw material, caprolactum.

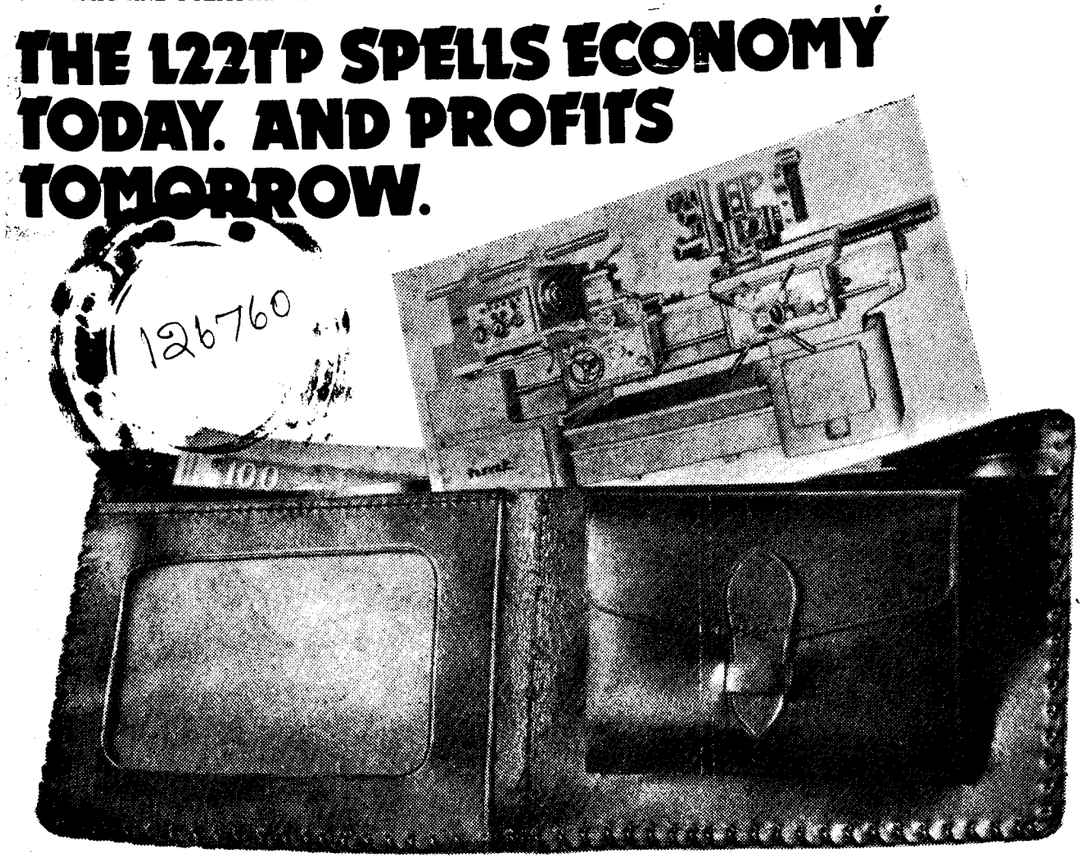
High Cost of Nylon *Vis-a-Vis* Smuggling

You will be surprised to known that governmental imposts like excise duties and other taxes alone account for about 50% of the cost of the nylon/synthetic fabrics at the consumer end which is mainly responsible for the high cost of nylon/synthetic fabrics. I am afraid that the common man in our country can hardly afford to buy nylon/synthetic fabrics even it offered at a price equivalent to the government impost only. The high incidence of excise is the prime source of encouragement for smugglers of nylon and other synthetic goods into our country. It is heartening to note that of late the Government have come down with a heavy hand on such antisocial elements and let us hope the Government will be able to eradicate this menace for all time to come. But I may hasten to add here that punitive actions alone will not perhaps be able to put an end to this highly profitable underground activity. Simultaneously the Government should slash the excise duties at all levels, i e, on caprolactum, yarn/fibres and fabrics so as to enable the industry to offer its products somewhat on par with the international prices.

Future Prospects

Ours is a vast country with its population getting multiplied rapidly. Clothing the teeming millions should be a grave concern for the Government. If past performance is any guide, it can be safely predicted that cotton alone is not able to provide the bare minimum clothing. Even with scientific cultivation and usage of improved seed varieties, there is no significant rise in the cotton output which is stagnant at around 62 lakh bales per annum. The Planning Commission had estimated a target of 17.5 metres per capita by the end of the fifth plan period as against the current per capita level of about 14.1 metres. In any case there is no dispute that the cloth output has to be increased and if we are going to bridge the gap, it would be necessary to step up cotton output by nearly 50%, which in the context of what has been stated above is impossible. Thus logically the additional requirements will have to be met by man-made fibres — cellulosics and synthetics. Here again, the synthetics will definitely have an edge over cellulosics because they are not dependent upon land or forest-based raw materials but are based on patroleum crude. When the Government is bent upon the speedy growth of the oil and pertochemical industries and consumption of crude for the manufacture of synthetic fibre is only about 0.4% of the world crude production, there is no reason why this industry, which could be easily developed simultaneously, should not be given its rightful scope for expansion.

Fabrication of Machinery and R and D



From the stage of 100% dependence on imported machinery and know-how, the industry has not only been able to fabricate quite a substantial part of the machinery but of late it has even procured certain overseas orders for setting up nylon plants. In other words, we are now in a position to export knowhow as well as plant and machinery. The industry is fully alive to the developments taking place in this field in developed countries and it is not lagging behind. All the indigenous units are spending a lot of their resources — man and money — for constant research and development with a view to improve the quality of their products.

Conclusion

In brief, what is urgently needed is to allow the industry to utilise its full capacity by assured supply of raw material at reasonable prices with a simultaneous reduction of excise imposts on the raw material and the finished product. This should be followed by grant of permission to expand by raising the unit capacities to the international levels or by creation of few more units. In the case of new units however there would be a long gestation period from conception to commercialisation. As such it would be prudent if the existing units are allowed to expand to the standard international levels of capacity, so as to make them techno-economically viable.

Thank you.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

AND HMT CAN PROVE IT.

L22TP Turret Lathe from HMT. Lowest priced in its class to operate with consistent accuracy, both for large and small batch production. High on versatility, high on value. The L22TP rough turns, faces, plunges, cuts grooves, opencuts, chip stream turns, finishturns and reams, with preselecting feeds and speeds to effect reductions on time and labour.

Higher Accuracy:

1. Guarantees consistent accuracy and interchangeability of parts.
2. A large, alloy steel pin held on the hardened guide bush in the saddle ensures precise indexing.
3. Hardened steel guideways are designed for lasting accuracy.

Hi-Safety:

Drop Worm arrangement partnered by indexing drumstops operates the engagement and disengagement of feeds at the point you want it.

Improved design features:

1. Improved drum-stops for better performance.
2. Gib locking screw for hex turret redesigned for effective locking.
3. Keeper plate for hexagonal saddle redesigned for effective rigidity.
4. Hex turret completely redesigned for effortless indexing.
5. Positive locking mechanism for hex turret centre shaft.
6. Bigger hand wheel for square apron.
7. Hand wheel for cross slide.
8. Anti-friction bearings for the feed rod to accommodate higher speeds.

More Profits:

Both small and large batch production runs need accuracy and precision — and the L22TP guarantees round-the-clock performance, round-the-year profits.

The Escorts story. There must be something behind it all.

In October 1974, Escorts completed its 30th anniversary. To mark this occasion, the people of Escorts are doing a little introspection. Asking themselves some searching questions.

Looking back: Just 30 years ago, Escorts started as a small agency house. Today it is playing a vital role in enlarging the country's agricultural and industrial base. And the Escorts fraternity now includes over 10,000 shareholders, 6000 workers and over 1500 small scale ancillary units making various components - sharing the fruits of success.

Where did all this success come from ?

The answers

Escorts is no longer just the genius of one or two men. It is a conglomerate of talents. Of a group of enlightened people. They have been able to motivate and spur the company to great achievements.

Escorts has never made anything fancy. There, perhaps, lies the secret of its continuous growth. All Escorts products - agricultural and industrial tractors, motorcycles and scooters, auto and railway ancillaries - satisfy the core needs of the country : Agriculture, Transport, Industry. Growth, dictated by the needs of the people and in step with national objectives.

Escorts has been able to project itself into the future. Anticipating tomorrow's needs. Researching and developing new, improved concepts.

And finally, there's that undefinable something - call it fire, genius, madness - of people in Escorts, which refuses to be confined; that transforms everything that comes within its ken.

30 years. Our investment for the future.
